EXPLANATION OF REFERENCE STYLE

THE references have a uniform typographical style, but the manner of referring to particular works varies in certain respects. The Explanation of Reference Style describes the typographical construction of the references, with some comment on the variations. It is divided into four parts:

I. General Typographical Style
II. Style of Bible References
III. Punctuation, Symbols, Abbreviations
IV. Table of Authors, Titles, and Author's Divisions Cited

I. GENERAL TYPOGRAPHICAL STYLE

The two examples below illustrate the general typographical pattern of the references to *Great Books of the Western World*; and the headings above the examples call attention to the five elements commonly present in the construction of the references.

Volume Number	Author's Name	Title of Work	Author's Divisions	Page Sections
35	LOCKE:	*Human Understanding,*	BK II, CH XXI	178a-200d
41	GIBBON:	*Decline and Fall,*		365b-378d

(1) Volume Number:

The volume number indicates in which volume of *Great Books of the Western World* the work or passage referred to can be found. Most volumes contain the work of one author. When a single volume contains the works of two or more authors, the volume number is given for each author. When the work of a single author is contained in two volumes, the volume number is assigned according to the contents of the volume.

(2) Author's Name:

The author's name immediately follows the volume number, except in the case of the American State Papers and the Federalist, which are included in Volume 43. Authors' names are usually given in shortened form.

(3) **Title of Work:**

The title follows the author's name, with the two exceptions above noted. Titles are also frequently abbreviated or shortened. When two or more works are cited for a single author, the titles are listed in the order in which the works appear in the volume.

(4) **Author's Divisions:**

By "author's divisions" is meant all such subdivisions of a work as book, part, section, chapter, paragraph, line number. The phrase "author's divisions" does not necessarily mean divisions made by the author; they may have been made by an editor of his work.

Author's divisions are given only for some works, according as, in the judgment of the editors, their inclusion would prove meaningful or helpful to the reader. References to Locke, for instance, as in the example, always cite author's divisions; whereas references to Gibbon, as in the example, do not.

For some works, author's divisions are completely given, as for Locke. For other works, only the most important or largest divisions are given. Thus for Rabelais only the book but not the chapter is given.

Line numbers, in brackets, are given for all works of poetry, including those published in prose translations. For Goethe's *Faust*, the line numbers cited refer to the lines of the English translation as well as to the lines of the original German. For other poetical works in translation—the works of Homer, the Greek dramatists, Lucretius, Virgil, and Dante—the line numbers cited refer to the lines of the works in their original languages; for these works, the line numbers printed on the pages of this edition furnish only an approximate indication of the location of the equivalent lines in the English translation. For all poetical works written in English, the line numbers are the numbers of the English lines. In the case of Chaucer's *Canterbury Tales*, the numbering of the lines is consecutive for all the tales written in verse.

In references to the works of Aristotle (in Volumes 8 and 9), the figures and letters enclosed in the brackets signify the page, column, and approximate line in the Berlin edition of the Greek text edited by Immanuel Bekker. In references to the American State Papers (in Volume 43),

the bracketed line numbers refer to the lines on the pages of this edition only.

In references to the *Summa Theologica* of Thomas Aquinas (in Volumes 19 and 20), the author's division "Part I–II" stands for Part I of the Second Part, and "Part II–II" stands for Part II of the Second Part. In the case of the *Summa Theologica*, the author's divisions cited may include not only questions and articles, but the subdivisions of articles. In such cases the page sections correspond in extent to that of a whole article, to enable the reader to see the subdivision of an article, when it is cited, in the context of other parts to which it is related.

Author's divisions precede page sections except in the case of footnote and note numbers, which follow page sections. When more than one passage is cited within the same author's division, the author's division is not repeated; as, for example:

38 ROUSSEAU: *Social Contract*, BK II, 403a-404a; 405d-406a

(5) **Page Sections:**

The pages of *Great Books of the Western World* are printed in either one or two columns. The upper and lower halves of a one-column page are indicated by the letters **a** and **b**. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand column, the letters **c** and **d** to the upper and lower halves of the right-hand column. These half and quarter page sections are based on divisions of a full text page.

Page sections give the page numbers and locate the sections of the page in which the passage referred to begins and ends. For example, in the reference:

53 JAMES: *Psychology*, 116a-119b

the passage cited begins in the upper half of page 116 and ends in the lower half of page 119. In the reference:

7 PLATO: *Symposium*, 163b-164c

the passage cited begins in the lower half of the left-hand column of page 163 and ends in the upper half of the right-hand column of page 164.

In references to works printed in two columns, the format of the page

sometimes places continuous reading matter in the a and c sections of the upper half of the page, or in the b and d sections of the lower half of the page. This occurs when a work or an author's division begins in the lower, or ends in the upper, half of the two-column page. Where continuous reading matter thus appears in discontinuous page sections, it is indicated by a,c or b,d. For example:

14 PLUTARCH: *Solon* 64b,d-77a,c

means that the work cited begins in the lower half of page 64 and ends in the upper half of page 77.

Footnotes or notes are sometimes specifically cited by themselves in the references, in which case the page sections given correspond to their location on the pages referred to. When a footnote or a note is not specifically cited, the page sections given mark the beginning and the end of the text referred to. The reader is expected to consult the footnotes or notes indicated in the body of that text.

Chaucer's works (in Volume 22) are printed in two columns; the inside column of each page contains the Middle English text, the outside column a Modern English version. Since both columns contain equivalent passages, the references to this volume employ page sections (a and b) which divide each page only into an upper and a lower half.

II. STYLE OF BIBLE REFERENCES

All Bible references are to book, chapter, and verse in both the King James and Douay versions of the Bible. When the King James and Douay versions differ in the title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows. For example:

OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46

In references to the Bible, a colon is used to separate chapter and verse numbers; and a comma separates the numbers of verses in the same chapter. For example:

OLD TESTAMENT: *Exodus*, 6:1–4,16–18

III. PUNCTUATION, SYMBOLS, ABBREVIATIONS

(1) Punctuation

Diagonal line: When a series of references to one author includes two or more of his works published in the same volume, a diagonal line is used to separate references to one work from references to another. The diagonal line is used in the same way to separate references to different books of the Bible. For example:

OLD TESTAMENT: *Exodus*, 33:12–23 / *Job*, 11:7–9

43 MILL: *Liberty*, 302d-303a / *Representative Government*, 327b,d-332d

Semi-Colon: When a series of references includes the citation of two or more passages in the same work, a semi-colon is used to separate the references to these passages. For example:

OLD TESTAMENT: *Genesis*, 1:12–14; 9:1–11

38 ROUSSEAU: *Social Contract*, BK II, 403a-404a; 405d-406a

46 HEGEL: *Philosophy of History*, PART II, 265c-266a; PART IV, 346c-348a

Comma: When a comma separates the title of a work, or an author's division of a work, from the page sections which follow, passages cited are only a part of the whole work or of the author's division indicated. For example, in the references:

14 PLUTARCH: *Lycurgus*, 36a-b; 44d-45c

36 SWIFT: *Gulliver*, PART II, 73a-74b

the passages from Plutarch are only a part of *Lycurgus*, and the passage from Swift is only a few pages from Part II of *Gulliver's Travels*.

When the title of a work, or an author's division of a work, is *not* separated by a comma from the page sections which follow, the reference is to the whole work or to the whole of the indicated author's division. For example, in the references:

14 PLUTARCH: *Lycurgus* 32a-48d

36 SWIFT: *Gulliver*, PART II 45a-87b

the whole of *Lycurgus* and the whole of Part II of *Gulliver's Travels* are cited.

(2) Symbols

esp: The abbreviation "esp" precedes one or more especially relevant passages which are contained within the page boundaries of a larger passage or a whole work that has just been cited.

Whenever passages contained within a single reference are especially referred to, a comma after the page sections separates these passages. For example:

42 KANT: *Science of Right*, 435a-441d esp 435c-436b, 437c-d, 438d-441d

Whenever passages contained within a single reference to the Bible are especially referred to, a comma is also used to separate these passages. For example:

NEW TESTAMENT: *Romans*, 1–8 esp 2:11–16, 2:27–29, 7:21–25, 8:27

passim: The word "passim" following a reference signifies that the work or passage referred to discusses the topic under which it is cited, intermittently rather than continuously. For example:

9 ARISTOTLE: *Politics*, BK II, CH 7 461d-463c passim / *Athenian Constitution*, CH 1–41 553a-572d passim

(3) Abbreviations

The following is a list of the abbreviations used in the references. Unless an abbreviation for the plural is listed below, the singular abbreviation is used for both singular and plural words.

A . . .	ARTICLE	[n] . . .	note
AA . . .	ARTICLES	OT . . .	OLD TESTAMENT

[fn] . . .	footnote	TR . . .	TRACTATE
INTRO . .	INTRODUCTION		

IV. TABLE OF AUTHORS, TITLES, AND AUTHOR'S DIVISIONS CITED

The following pages present a tabulation of the contents of *Great Books of the Western World,* Volumes 4–54. The authors are enumerated in the order in which they appear in the successive volumes of the set; and under each author's name the titles of his works are listed in the order of their appearance.

In the references, the name of the author is frequently given in shortened form. In this table, their full names are given, followed by their life dates when these are ascertainable. Because some volumes contain the works of two or more authors who may be separated by centuries, the order in which the authors are cited in the references sometimes departs from the strict chronological order. The life dates help the reader to place the authors and their works in the right chronological order.

In the references, the title of a work is frequently given in an abbreviated or shortened form. In this table, the titles are first given exactly as they appear in the references. Whenever this is an abbreviated or shortened title, the full title follows.

The table also includes a notation of the author's divisions that are used in references to particular works.

A dash in the column headed "Author's Divisions Cited" means that references to the work or works in question cite page sections only. Where the author's divisions cited are the same for several titles, they are named only once, either opposite the set of titles as a whole, or opposite the last title in the group.

Titles in brackets are collective titles which appear on the title page of the work, but do not appear in the references. The names of the authors of *The Federalist* (in Volume 43) are bracketed because they do not appear in the references.

Volume Number, Author, and Title		*Author's Divisions Cited*

THE GREAT IDEAS: II

Chapters 51–102: MAN *to* WORLD

Chapter 51: MAN

INTRODUCTION

WHETHER or not the proper study of mankind is man, it is the only study in which the knower and the known are one, in which the object of the science is the nature of the scientist. If we consider every effort men have made in response to the ancient injunction "know thyself," then psychology has perhaps a longer tradition than any other science. But by a stricter conception of science, more is required than individual insight or self-consciousness. Definitions, principles, analyses applicable to all men must be established, and it has been questioned whether the method of introspection suffices for this purpose. What methods should be used by the psychologist depends in part upon the precise object and scope of his inquiry. According as different subject matters and different methods define psychology, there seem to be several disciplines bearing that name, each with its own tradition in western thought.

In one conception, psychology begins with the dialogues of Plato and with Aristotle's treatise *On the Soul.* As Aristotle's title indicates, and as the Greek roots of the word "psychology" connote, the soul rather than man is the object of the science. Anthropology, Kant later suggests, would be a more appropriate name for the science of man. The Greek inquiry into the soul extends, beyond man, to all living things. It is because "the soul is in some sense the principle of animal life," Aristotle writes, that "the knowledge of the soul admittedly contributes greatly to the advance of truth in general, and, above all, to our understanding of Nature."

Nevertheless, psychology for the Greeks is principally concerned with the study of man. The analysis of the parts or faculties of the human soul is an analysis of the properties of human nature—the powers which man has and the characteristically human acts or functions he can perform. The methods by which this analysis is developed are, for the most part, the same methods which the Greek philosophers use in physics. "The study of the soul," Aristotle writes, "falls within the science of Nature." The definitions of the psychologist, like those of the physicist, give "a certain mode of movement of such and such a body (or part or faculty of a body) by this or that cause and for this or that end." In the case of the human soul, however, the psychologist can employ a method not applicable to other things. The human intellect is able to examine itself. Mind can thus know things about mind which are not otherwise observable.

The subject matter of psychology narrows somewhat when, at a later moment in the tradition, the study of mind tends to replace the study of man. This narrowing takes place gradually. Though Descartes identifies soul with mind or intellect, he treats of the passions and the will as well as thought and knowledge. Differing from Descartes with regard to body and soul, Hobbes and Spinoza also give as much attention to the emotions as to ideas and reasoning. But with Locke, Berkeley, and Hume there is an increasing tendency to analyze the contents of consciousness and the acts of the understanding, treated exclusively as a faculty of thinking or knowing. Where in the earlier tradition the observation of human behavior and the behavior of other animals appears to be useful in psychology, here the main source of psychological knowledge seems to be introspection.

The *Principles of Psychology* by James and the writings of Freud represent a return to the broader conception of the science. According to James, "it is better . . . to let the science be as vague as its subject . . . if by so doing we can throw any light on the main business in hand."

If psychology "takes into account the fact that minds inhabit environments which act on them and on which they in turn react" and "takes mind in the midst of all its concrete relations, it is immensely more fertile than the old-fashioned 'rational psychology,' which treated the soul as a detached existent, sufficient unto itself, and assumed to consider only its nature and properties. I shall therefore feel free," James goes on to say, "to make any sallies into zoology or into pure nerve-physiology which may seem instructive for our purposes."

Though in the hands of James and Freud the scope of psychology extends no further than the range of topics Aquinas covers in his treatise on man and his treatise on human acts and passions, their return to the study of man as a whole is accompanied by an interest in or invention of new methods, experimental and clinical. "As a science," Freud writes, "psychoanalysis is characterized by the methods with which it works, not by the subject matter with which it deals." Those who distinguish between science and philosophy in terms of empirical research date the beginning of psychology from the inception of these new methods. They regard most psychological writings earlier than James and Freud as works of speculation or philosophy.

Controversy over the validity of conclusions in psychology sometimes turns on the conflicting claims of rival methods to be the *only* way of arriving at the truth; and sometimes, as with Kant, the issue of method seems to be subordinate to the issue of subject matter. Kant admits the possibility of an empirical psychology which would confine its inquiries to the phenomenal processes of thought and feeling, because with respect to such an object "we could call in aid observations on the play of our thoughts," and thence derive "natural laws of the thinking self." But, he goes on to say, "it could never be available for discovering those properties which do not belong to possible experience."

What Kant calls "rational psychology" aims at what is for him impossible, namely, knowledge of the reality or substance of the soul itself. It is impossible, he says, to make "any dogmatical affirmation concerning an object of experience beyond the boundaries of experience." Kant's critique of rational psychology thus appears to be based on the same principles which underlie his critique of metaphysical assertions concerning God's existence and the freedom of the will.

Those principles are in turn based on an elaborate theory of the human faculties, such as sense, understanding, and reason, and the role they play in the constitution of experience and knowledge. But Kant does not regard his own theory of the faculties as psychology. Writers like Locke and Hume, on the other hand, seem to make their psychology—certainly in its principal concern with how the content of the mind is acquired and formed—the basis for appraising the validity of all other knowledge. They do not question the validity of psychology itself. They seem to assume that self-knowledge has unique advantages over all other inquiries.

These issues of the scope and validity of psychology are in one sense more relevant to the chapters on Knowledge, Mind, and Soul than to this one. Their relevance here is limited by their connection with the main issues about the nature of man. Not merely the tradition of psychology, but the whole tradition of western thought seems to divide on the question of man's essence.

The question can be put in a number of ways. Is man a rational animal, and does that definition imply that only man has reason? Does it imply that man has free will, and that only man has free will? Like the question about the distinction between living and non-living things or the similar question about the difference between plants and animals, this question can also be asked in terms of the contrast between difference in kind and difference in degree. Does man differ essentially or in kind from other animals, or do all animals possess the same fundamental properties? Does man differ from the others only in the degree to which he possesses some of these shared qualities?

Some, like Darwin, think that "the difference in mind between man and the higher animals, great as it is, certainly is one of degree and not of kind. We have seen," he writes, "that the senses and intuitions, the various emotions and faculties, such as love, memory, attention, curiosity, imitation, reason, etc., of which man

boasts, may be found in an incipient, or even sometimes in a well-developed condition, in the lower animals. They are also capable of some inherited improvement, as we see in the domestic dog compared with the wolf or jackal. If it could be proved that certain high mental powers, such as the formation of general concepts, self-consciousness, etc., were absolutely peculiar to man, which seems extremely doubtful, it is not improbable that these qualities are merely the incidental results of other highly-advanced intellectual faculties; and these again mainly the result of the continued use of a perfect language." Such a view clearly takes the position that man varies from other animals in the same way that one species of animal varies from another.

Those who take the opposite position do not always agree on the precise nature of the difference in kind. For the most part, they attribute rationality to man alone and use the word "brute" to signify that all other animals totally lack reason, no matter how acute their intelligence or the apparent sagacity of their instinctive reactions. Milton, for example, in common with many others, describes man as

> . . . a creature who not prone
> And brute as other creatures, but endued
> With sanctity of reason, might erect
> His stature, and upright with front serene
> Govern the rest, self-knowing, and from thence
> Magnanimous to correspond with heaven.

Those who find a difference in kind between man and other animals also tend to think that human society and human language are essentially different from the beehive or the ant mound, from bird calls, jungle cries, or parroting, because they are the work or expression of reason. Unlike Darwin, some of them find in human speech not the cause of man's *apparent* difference in kind from other animals, but the consequence of his *real* difference in kind—his distinctive rationality. The fact that man does certain things that no other animal does at all means to them that man possesses certain powers which no other animal shares to any degree, even the slightest. They would therefore interpret Darwin's admission that an anthropoid ape could not fashion "a stone into a tool" or "follow a train of metaphysical reasoning, or solve a mathematical problem, or reflect on God, or admire a grand natural scene," as an indication that the ape totally lacked human reason or intellect, however acute his animal intelligence. But the writers who agree that man is radically different from the brutes do not all agree in the account they give of human reason; nor do they all affirm free will as the natural accompaniment of rationality.

Locke, for example, begins his essay on *Human Understanding* with the remark that "the understanding . . . sets man above the rest of sensible beings." Men and other animals alike have the powers of sense, memory, and imagination, but, he says, "brutes abstract not. . . . The power of abstracting is not at all in them." This power of having "general ideas is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain to." But Locke denies that man has free will in the sense of a free choice among alternatives. Rousseau, on the other hand, declares that "every animal has ideas . . . and it is only in degree that man differs, in this respect, from the brute. . . . It is not, therefore, so much the understanding that constitutes the specific difference between the man and the brute, as the human quality of free agency . . . and it is particularly in his consciousness of this liberty that the spirituality of his soul is displayed."

James agrees with Locke that "it is probable that brutes neither attend to abstract characters nor have associations by similarity," but it is the latter fact which James himself makes the principal distinction between man and brute. "We may," he asserts, "consider it proven that the most elementary single difference between the human mind and that of brutes lies in this deficiency on the brute's part to associate ideas by similarity." James enumerates "other classical *differentiae* of man besides that of being the only reasoning animal." Man has been called, he says, "the laughing animal" and "the talking animal," but these distinctive traits, like human reasoning, James regards as "consequences of his unrivalled powers . . . to associate ideas by similarity."

Reason and speech are for James the effects, where for Adam Smith they are the cause, of man's peculiarly human attributes. "The propensity to truck, barter, and exchange one

thing for another," Smith writes, is "common to all men, and to be found in no other race of animals." This seems to him to be a "necessary consequence of the faculties of reason and speech" which are peculiar to man. Hobbes, as we shall see presently, takes still another position, since he explains man's reasoning power in terms of his faculty of speech, a faculty which is possessed by no other animal.

Despite all these variations in theory or explanation, writers like Locke, Rousseau, James, Smith, and perhaps Hobbes seem to agree that man and brute differ in kind. On that point they agree even with writers like Plato, Aristotle, Augustine, Aquinas, Descartes, Spinoza, Kant, and Hegel who hold, as they most definitely do not, that man has a special faculty of mind, reason, or intellect. The contradictory position is, therefore, not to be found in the denial of some particular theory of reason, but rather in the denial that any faculty or attribute which man possesses warrants our calling him "rational" and other animals "brute."

THE ISSUE IS sharply drawn between these contradictory positions. Yet it is avoided by those who go no further than to see in human civilization certain distinctive features, such as the arts and sciences, or law, government, and religion. Mill, for example, discussing the sentiment of justice, finds its root in the natural impulse "to resent, and to repel or retaliate, any harm done or attempted against ourselves, or against those with whom we sympathise . . . common to all animal nature." Man differs from other animals, he writes, "first, in being capable of sympathising, not solely with their offspring, or, like some of the more noble animals, with some superior animal who is kind to them, but with all human and even with all sentient beings. Secondly, in having a more developed intelligence, which gives a wider range to the whole of their sentiments, whether self-regarding or sympathetic. By virtue of his superior intelligence, even apart from his superior range of sympathy, a human being is capable of apprehending a community of interest between himself and the human society of which he forms a part."

A view of this sort would seem to leave open the question whether such typically human developments signify the possession by man of special powers which set him apart as *different in kind*. While admitting extraordinary differences between the behavior or accomplishments of men and other animals, this view does not reject the possibility that such accomplishments may represent merely wide differences in degree of power, which give the *appearance* of differences in kind.

As we have already observed, the issue about man and brute cannot be separated from the controversy about the so-called "higher faculties" of man. Except for the view that man is a purely spiritual being, who merely inhabits or uses a physical body, no theory of human nature doubts that man, as a living organism, possesses in common with plants and animals certain bodily powers or functions. The vegetative functions which Galen calls "the natural faculties" are indispensable to human as to all other forms of corporeal life. Similarly, the powers of sensitivity and appetite or desire are obviously present in man as in other animals. To the observer, who sees only the externals of human and animal behavior, men and the higher animals appear to react to the physical stimulation of their sense organs with a similar repertoire of bodily movements, which vary only as their skeletal structure and their organs of locomotion differ. They also manifest outward signs of inner emotional disturbance sufficiently similar to warrant treating emotions like fear and rage as common to men and other animals.

On all this there seems to be little dispute in the tradition of the great books. But difficult questions arise when the inner significance of these external movements is considered. Both men and animals have the familiar sense organs and such powers as touch, taste, smell, hearing, and vision. But do sensations give rise to knowledge in the same way for both men and animals? Do the powers of memory and imagination extend an animal's range of apprehension as they do man's? Do these powers affect the perception of present objects in the same way for men and animals?

Such questions are not readily answered by observation of external behavior alone. What seems to be called for—a comparison of human and animal experience—cannot be obtained. The difficulty of the problem becomes most in-

tense when a special faculty of knowledge or thought is attributed to man, for animal and human sense perception, imagination, or even emotion may be incommensurable if a special factor of understanding or reason enters into all human experience and is totally absent from that of animals.

In the ancient and mediaeval periods, the sensitive faculty, including the interior sensitive powers of memory and imagination, is generally distinguished from another faculty, variously called "intellect," "reason," or "mind." Writers like Plato, Aristotle, Plotinus, Lucretius, Augustine, and Aquinas have different conceptions of intellect or mind, in itself and in its relation to sense and imagination, but they do not question its existence as a separate faculty. The range of the sensitive powers does not extend to ideas or intelligible objects, nor is sensitive memory or imagination for them the same as rational thought.

Not only does it seem unquestionable in the ancient and mediaeval tradition that man has these two distinct faculties of knowledge, but it is generally assumed that other animals have to a greater or less degree, the power of the senses alone. Only men can understand as well as perceive; only men can know the universal as well as the particular; only men can think about objects which are neither sensible nor, strictly, imaginable—objects such as atoms and God, the infinite and the eternal, or the intellect itself. The affirmation of an essential difference between reason and sense seems to be inseparable from the affirmation of an essential difference between men and brutes.

DOUBTS OR DENIALS with regard to both affirmations achieve considerable prevalence in modern times. But though the two affirmations appear inseparable, they are not always denied together. Montaigne, for example, does not so much doubt that men have reason as he does that other animals lack it. He considers the matter in the light of external evidences, in terms of the comparable performances of men and animals. The light of reason seems to shine in both.

He repeats many stories from Plutarch and Pliny which supposedly reveal the comparable mentality of animals and men. One is the story of the hound who, following the scent, comes to a triple parting of the ways. After sniffing along the first and second paths and discovering no trace of the scent, the hound, without a moment's hesitation or sniffing, takes up the pursuit along the third trail. This, Montaigne suggests, is a kind of syllogizing; as if the dog reasoned thus with himself: "I have followed my master by foot to this place; he must, of necessity, be gone by one of these three ways; he is not gone this way nor that; he must then infallibly be gone this other."

It is noteworthy that Aquinas tells exactly the same story in order to make the point that such *appearances* of reasoning in animals can be explained as instinctively determined conduct. "In the works of irrational animals," he writes, "we notice certain marks of sagacity, in so far as they have a natural inclination to set about their actions in a most orderly manner through being ordained by the supreme art. For which reason, too, certain animals are called prudent or sagacious; and not because they reason or exercise any choice about things." That such behavior is not the work of reason, he claims, "is clear from the fact that all that share in one nature invariably act in the same way."

Unlike Montaigne, Machiavelli seems to imply that men and brutes are alike not in having reason, but in lacking it. The passions control behavior. Intelligence exhibits itself largely as craft or cunning in gaining ends set by the passions. Man is no less the brute in essence because in the jungle of society he often succeeds by cunning rather than by force. He may have more cunning than the fox, but without armor he also has less strength than the lion. The prince, Machiavelli remarks, "being compelled knowingly to adopt the beast, ought to choose the lion and the fox, because the lion cannot defend himself against snares and the fox cannot defend himself against wolves."

For the most part, however, the modern dissent from the ancient and mediaeval view takes the form of denying that reason and sense are distinct powers. In its most characteristic expression, this denial is accompanied by a denial of abstract ideas as in the writings of Hobbes, Berkeley, and Hume. Their position, discussed more fully in the chapter on UNIVERSAL AND PARTICULAR, is that men only give the appear-

ance of having abstract or general ideas because they employ common names which have general significance.

Language, according to Hobbes, is the root of all other differences between man and brute. Sense and imagination are "common to man and beast." Reasoning, or the "train of thoughts," can take place in any animal which has memory and imagination. But that type of understanding which Hobbes describes as "conception caused by speech" is peculiar to man. His statement that "by the help of speech and method, the same faculties" which belong to both men and beasts "may be improved to such a height as to distinguish men from all other living creatures," would seem to imply that Hobbes regards man as superior to other animals only in degree. Yet, on the other hand, he enumerates a variety of institutions peculiar to human life, such as religion, law, and science, which imply a difference in kind.

Like Hobbes, Berkeley thinks that men use general names but do not have general or abstract ideas. But he seems much less willing than Hobbes to assert man's clear superiority, even on the basis of man's attainments through the power of speech. If the fact that "brutes abstract not," he says in reply to Locke, "be made the distinguishing property of that sort of animals, I fear a great many of those that pass for men must be reckoned into their number." Hume goes further than either Berkeley or Hobbes. Agreeing with them that man has no faculty above sense and imagination, and hence no faculty which animals do not also possess, he alone explicitly draws the conclusion which that implies.

"Animals as well as men," he writes, "learn many things from experience and infer that the same events will always follow from the same causes." Such inferences, in animals or men, are not "founded on any process of argument or reasoning." They are the result of the operation of custom and instinct. "Were this doubtful with regard to men, it seems to admit of no question with regard to the brute creation; and the conclusion being once firmly established in the one, we have a strong presumption, from all the rules of analogy, that it ought to be universally admitted, without any exception or reserve."

But if custom and instinct underlie the appearance of reasoning in both men and animals, it may be asked, says Hume, "how it happens that men so much surpass animals in reasoning, and one man so much surpasses another?" His answer seems to be entirely in terms of degree of the same factors. The same sort of difference which obtains between a superior and an inferior intelligence among men obtains between men and other animals.

All the evidence which Darwin later assembles on the characteristics of human mentality is offered by him in proof of the same point. But to those who think that man alone has an intellect or a rational faculty, over and above all his sensitive powers, such evidence remains inconclusive. As in the case of the dog, whose behavior Aquinas and Montaigne interpret differently, the same observed facts seem to be capable of quite opposite explanation by those who hold opposite theories of human and animal intelligence.

Is THERE INTERNAL evidence, obtained from man's introspective experience of his own thought, which can resolve the controversy? As Descartes sees it, the interpretation of such evidence also seems to depend on the prior assumption one makes about the sameness or difference of men and brutes.

"We cannot help at every moment experiencing within us that we think," he writes; "nor can anyone infer from the fact that it has been shown that the animate brutes can discharge all these operations entirely without thought, that he therefore does not think; unless it be that having previously persuaded himself that his actions are entirely like those of the brutes, just because he has ascribed thought to them, he were to adhere so pertinaciously to these very words, '*men and brutes operate in the same way*,' that when it was shown to him that the brutes did not think, he preferred to divest himself of that thought of his of which he could not fail to have an inner consciousness, rather than to alter his opinion that he acted in the same way as the brutes."

On the other hand, Descartes continues, those who hold "*that thought is not to be distinguished from bodily motion*, will with much better reason conclude that it is the same thing in us and

in them, since they notice in them all corporeal movements as in us; they will add *that a difference merely of greater and less makes no difference to the essence*, and will infer that, though perchance they think that there is less reason in the beasts than in us, our minds are of exactly the same species."

THE ISSUE concerning the senses and the reason is more fully discussed in the chapters on MIND and SENSE, and also in the chapters on IDEA and UNIVERSAL AND PARTICULAR, where the problem of abstract ideas or universal notions is considered. The issue concerning soul in general and the human soul in particular belongs primarily to the chapter on SOUL, and also to the chapter on MIND. But like the issue about sense and intellect, its bearing on the problem of man's nature deserves brief comment here.

The question is not whether man has a soul, but whether only man has a soul; a rational soul; a soul which is, in whole or in part, immaterial; a soul capable of separate existence from the body; an immortal soul. If soul is conceived as the principle of life in all living organisms—as Aristotle conceives it—then having a soul does not distinguish man from plants or animals. If, furthermore, the rational soul is distinguished from the sensitive and vegetative soul in the same way that men are distinguished from brute animals and plants, namely, by reference to certain powers, such as intellect and will, then the statement that men alone have rational souls would seem to add nothing to the statement that men alone are rational.

But if the human soul, through being rational, confers a mode of immaterial, or spiritual, being upon man, then man's possession of such a soul sets him apart from all other physical things, even further than the special power of reason separates him from the brutes. The position of Lucretius illustrates this distinction in reverse. He does not deny that man has a soul. Unlike other living things which also have souls, man's soul includes a special part which Lucretius calls "mind." He describes it as the part "which we often call the understanding, in which dwells the directing and governing principle of life, [and] is no less part of the man than hand and foot and eyes are parts of the whole living creature."

So far as his having this special faculty is concerned, man is set apart. But for Lucretius nothing exists except atoms and void. Consequently, "the nature of the mind and soul is bodily," consisting of "seeds exceedingly round and exceedingly minute, in order to be stirred and set in motion by a small moving power." In his physical constitution man does not differ in any fundamental respect from any other composite thing. The materiality of his soul, furthermore, means that it is as perishable as any composite body.

At the other extreme from Lucretius, Descartes conceives man as a union of two substances. "I possess a body," he writes, "with which I am very intimately conjoined, yet because, on the one side, I have a clear and distinct idea of myself inasmuch as I am only a thinking and unextended thing, and as, on the other, I possess a distinct idea of body as it is only an extended and unthinking thing, it is certain that this I (that is to say, my soul by which I am what I am), is entirely and absolutely distinct from my body and can exist without it." Nevertheless, "sensations of pain, hunger, thirst, etc." lead Descartes to add: "I am not only lodged in my body as a pilot in a vessel, but . . . I am very closely united to it, and so to speak so intermingled with it that I seem to compose with it one whole."

Only man has a dual nature, thus compounded. Other living things, Descartes seems to hold, are merely bodies, having the structure and operation of complex machines. If, like the "*automata* or moving machines . . . made by the industry of man," there were "such machines, possessing the organs and outward form of a monkey, or some other animal without reason, we should not have . . . any means of ascertaining that they were not of the same nature as those animals."

It is indifferent to Descartes whether other animals are conceived as automata or whether, because they have life, sensation, and imagination, they are granted souls. "I have neither denied to the brutes," he writes, "what is vulgarly called life, nor a corporeal soul, or organic sense." What he has denied is thought, and it is this one factor which makes it impossible for a

machine to imitate human speech and action. It is this one factor which also requires man's soul, unlike that of the brute, to be an incorporeal substance.

Unlike sensations and passions, acts of thought and will, according to Descartes, cannot be functions of bodily organs. "Even though I were to grant," he says, "that thought existed" in dogs and apes, "it would in nowise follow that the human mind was not to be distinguished from the body, but on the contrary rather that in other animals also there was a mind distinct from their body." When Descartes affirms man's uniqueness, he is therefore affirming more than that man alone has reason and free will. He is affirming that of all things man alone is "formed of body and soul"—not a corporeal soul, but a spiritual substance. The angels, in contrast, are simply spirits.

The remark of Plotinus, that "humanity is poised midway between the gods and the beasts," applies with somewhat altered significance to the Cartesian view. But there are other conceptions of the human constitution which, though they preserve the sense of man's dual nature, do not make him a union of two separate substances.

Spinoza, for example, gives man special status in the order of nature by conferring on him alone participation in the divine mind. "The human mind," he writes, "is a part of the infinite intellect of God." The human body, on the other hand, is "a mode which expresses in a certain and determinate manner the essence of God in so far as He is considered as the thing extended." Man is thus "composed of mind and body," but for Spinoza this duality in human nature is a duality of aspects, not a duality of substances.

There is still another way in which a certain immateriality is attributed to man. In Aristotle's theory, the soul is not a substance in its own right, but the substantial form of an organic body. This is true of all kinds of souls—whether of plants, animals, or men. But when Aristotle enumerates the various powers which living things possess—such as "the nutritive, the appetitive, the sensory, the locomotive, and the power of thinking"—he assigns to man alone, or "possibly another order like man or superior to him, the power of thinking, *i.e.*, mind." Furthermore, of all the parts or powers of the soul, thinking seems to Aristotle to afford "the most probable exception" to the rule that "all the affections of soul involve body."

Apart from thinking, "there seems to be no case," he says, "in which the soul can act or be acted upon without involving body." Whereas the sensitive powers are seated in bodily organs and cannot act except as bodily functions, the intellect is immaterial. It has no bodily organ which is comparable to the eye as the organ of vision and the brain as the organ of memory and imagination. The act of understanding is not a function of physical matter.

According to this theory, man as a whole is a single substance, composite of correlative principles of being—matter and form, or body and soul. But man differs from all other physical substances which are similarly composite in that he has a faculty and mode of activity separate from matter. In the later development of this theory by Aquinas, the immateriality of the intellect becomes the basis for arguing that the rational soul of man can exist apart from matter when the composite human substance is disintegrated by death.

As indicated in the chapters on IMMORTALITY and SOUL, this is not the only argument for the immortality of the soul. We are not here concerned, however, with the various arguments and their merits, but only with the fact that certain conceptions of man's constitution attribute to man something more than the power of rationality, namely, the distinction of having a spiritual and immortal life.

HIS FUTURE AND his past color the present life of man and alter the aspect under which he conceives his place in the general scheme of things. Immortality promises release from mutability as well as salvation from death. With an immortal soul, man belongs to eternity as well as to time. He is not merely a transient character in the universe. His stature and his dignity are not the same when man regards himself as completely dissolvable into dust.

The question of man's past or origin is, perhaps, even more critical in its bearing on man's present status. Ancient poetry and history contain many myths of man's kinship with the gods. The heroes trace their lineage back to the

gods. Through them or through the progenitors of the race, man conceives himself as of divine descent or, at least, as having more affinity with the immortal gods than with all other earth-bound things.

In the *Descent of Man*, Darwin paints a different picture of human origin. Two propositions determine its general outlines. The first, already stated, is that man belongs to the animal kingdom without any differentiation except in degree. Not only in anatomy, physiology, and embryology are there marks of man's affinity with the mammals; man's behavior and mentality also show, according to Darwin, that man possesses no attribute so peculiarly human that some trace of it cannot be found in the higher forms of animal life.

The second proposition is that man's origin on earth has come about by a process of natural variation from an ancestral type, exactly as other new species of plants or animals have originated by descent with variation from a common ancestor. This theory of the origin of species is discussed in the chapter on EVOLUTION. Its special application to the human species involves the notion of a common ancestor for both man and the anthropoid apes, and the disappearance not only of the ancestral form, but of the intermediate varieties—the so-called "missing links" in the chain of variation.

These two propositions are logically interdependent. If the proposition is false that man differs from other animals only in degree, the proposition cannot be true that man originated along with the anthropoid apes by descent from a common ancestor. Conversely, if the Darwinian theory of man's origin is true, it cannot be true that men and brutes differ in kind. But though the truth of each of these two propositions implies the truth of the other, the problem of the difference between man and other animals has a certain logical priority over the problem of man's origin, simply because more evidence is available to solve it. That question calls for an examination of man as he is today in comparison with other extant species; whereas the other question necessarily requires the collection and interpretation of historical evidence, which may have some bearing on hypothetical missing links.

It should be added that if, in regard to the first question, the evidence favored the affirmation of a difference in kind, that would not entail the denial of biological evolution, though it would necessarily challenge the Darwinian theory of how such evolution took place. One alternative to the Darwinian hypothesis is the theory of emergent evolution, according to which lower forms of life may give rise to new organic forms which are not only higher but are distinct in kind.

Whether or not Christian theology and some theory of biological evolution can be reconciled, there seems to be an inescapable contradiction between Darwin's view of man's origin and the Judaeo-Christian conception of man as a special creation, special above all in the sense that "God created man in his own image."

As God is in essence a perfect intelligence and a spiritual being, man, according to Aquinas, "is said to be to the image of God by reason of his intellectual nature." In all creatures "there is some kind of likeness to God," but it is only in man that that likeness is an image. Man's finitude, imperfection, and corporeal existence make the image a remote resemblance; yet, according to the theologians, it is precisely that likeness which separates man from all other earthly creatures and places him in the company of the angels.

But man is no more an angel than he is a brute. He is separated from the one by his body as from the other by his reason. Nor does he in the present life have the spiritual existence of a disembodied and immortal soul. To these three negatives in the definition of man—*not* an angel, *not* a brute, *not* a soul—the Christian theologian adds a fourth, drawn from man's past. Man is of the race begotten by Adam, but he does not have the attributes which Adam possessed before the fall.

The dogma of man's fall from grace is discussed in the chapter on SIN. Here we are concerned only with its implications for the understanding of man's present nature, as not only being deprived of the extraordinary gifts of life and knowledge which Adam lost through disobedience, but as also being wounded in perpetuity by Adam's sin. Weakness, ignorance, malice, and concupiscence, Aquinas declares, "are the four wounds inflicted on the whole of human nature as a result of our first parent's

sin." Man in the world is not only disinherited from Adam's gifts, but with the loss of grace, he also suffers, according to Aquinas, a diminution in "his natural inclination to virtue."

THERE ARE OTHER divisions in the realm of man, but none so radical as that between Eden and the world thereafter. As retold by Plato, the ancient myths of a golden age when men lived under the immediate benevolence of the gods also imply a condition of mankind quite different from the observable reality, but they do not imply a decline in human nature itself with the transition from the golden age to the present. The modern distinction between man living in a state of nature and man living in civil society considers only the external circumstances of human life and does not divide man according to two conditions of his soul. Other dichotomies—such as that between prehistoric and historic man, or between primitive and civilized man—are even less radical, for they deal even more in gradations or degrees of the same external conditions.

These considerations lead us to another phase of man's thinking about man. Where the previous problem was how man differs from everything else in the universe, here the question is how man is divided from man. If men are not equal as individuals, to what extent are their individual differences the result of the unequal endowment of the natures with which they are born, and to what extent are they the result of individual acquirement in the course of life?

The range of human differences, whether innate or acquired, may itself become the basis for a division of men into the normal and the abnormal, a division which separates the feebleminded and the insane from the competent and sane. From a moral and political point of view, this is perhaps the most fundamental of all classifications. It must be admitted, however, that traditionally the problem of the difference between men and women and the problem of the difference between the ages of man from the extreme of infancy to the extreme of senility seem to have exercised more influence on the determination of political status and moral responsibility.

One other differentiation of man from man seems to have significance for the theory of human society and the history of civilization. That is the division of men into groups, sometimes by reference to physical and mental traits which separate one race from another—whether these traits are supposed to be determined biologically as inheritable racial characteristics or are attributed to environmental influences; sometimes by reference to the customs and ideals of a culture. Both sets of criteria appear to be used in the traditional discussion of the opposition between Greek and barbarian, Jew and gentile, European and Asiatic.

THE ULTIMATE questions which man asks about himself are partly answered by the very fact of their being asked. The answer may be that man is the measure of all things; that he is sufficient unto himself or at least sufficient for the station he occupies and the part he plays in the structure of the universe. The answer may be that man is not a god overlooking the rest of nature, or even at home in the environment of time and space, but rather that he is a finite and dependent creature aware of his insufficiency, a lonely wanderer seeking something greater than himself and this whole world. Whatever answer is given, man's asking what sort of thing he is, whence he comes, and whither he is destined symbolizes the two strains in human nature—man's knowledge and his ignorance, man's greatness and his misery.

Man, writes Pascal, is "a nothing in comparison with the Infinite, an All in comparison with the Nothing, a mean between nothing and everything. Since he is infinitely removed from comprehending the extremes, the end of things and their beginning are hopelessly hidden from him in an impenetrable secret; he is equally incapable of seeing the Nothing from which he was made, and the Infinite in which he is swallowed up.

"Man," Pascal goes on, "must not think that he is on a level either with the brutes or with the angels, nor must he be ignorant of both sides of his nature; but he must know both." In recognizing both lies his wretchedness and grandeur. "Man knows that he is wretched. He is therefore wretched, because he is so; but he is really greater because he knows it."

OUTLINE OF TOPICS

PAGE

1. Definitions of man: conceptions of the properties and qualities of human nature 13

1*a*. The conception of man as essentially distinct, or differing in kind, from brute animals: man's specific rationality and freedom 15

1*b*. The conception of man as distinguished from brutes by such powers or properties as abstraction or relational thought, language and law, art and science 16

1*c*. The conception of man as an animal, differing only in degree of intelligence and of other qualities possessed by other animals

2. Man's knowledge of man 17

2*a*. Immediate self-consciousness: man's intimate or introspective knowledge of himself

2*b*. The sciences of human nature: anthropology and psychology; rational and empirical psychology; experimental and clinical psychology

(1) The subject matter and scope of the science of man

(2) The methods and validity of psychology 18

(3) The relation of psychology to physiology: the study of organic factors in human behavior

(4) The place of psychology in the order of sciences: the study of man as prerequisite for other studies

3. The constitution of man

3*a*. Man as a unity or conjunction of matter and spirit, body and soul, extension and thought

(1) Man as a pure spirit: a soul or mind using a body 19

(2) Man's spirituality as limited to his immaterial powers or functions, such as reason and will

3*b*. Comparisons of man with God or the gods, or with angels or spiritual substances 20

3*c*. Man as an organization of matter or as a collocation of atoms

4. The analysis of human nature into its faculties, powers, or functions: the id, ego, and super-ego in the structure of the psyche

4*a*. Man's vegetative powers: comparison with similar functions in plants and animals 21

4*b*. Man's sensitive and appetitive powers: comparison with similar functions in other animals

4*c*. Man's rational powers: the problem of similar powers in other animals 22

4*d*. The general theory of faculties: the critique of faculty psychology 23

5. The order and harmony of man's powers and functions: contradictions in human nature; the higher and lower nature of man

5*a*. Cooperation or conflict among man's powers 24

5*b*. Abnormalities due to defect or conflict of powers: feeble-mindedness, neuroses, insanity, madness 25

PAGE

6. Individual differences among men 25

6*a*. The cause and range of human inequalities: differences in ability, inclination, temperament, habit

6*b*. The differences between men and women: their equality or inequality 27

6*c*. The ages of man: infancy, youth, maturity, senescence 28

7. Group variations in human type: racial differences 29

7*a*. Biological aspects of racial type

7*b*. The influence of environmental factors on human characteristics: climate and geography as determinants of racial or national differences

7*c*. Cultural differences among men: Greek and barbarian, Jew and gentile, European and Asiatic 30

8. The origin or genealogy of man 31

8*a*. The race of men as descendants or products of the gods

8*b*. God's special creation of man

8*c*. Man as a natural variation from other forms of animal life

9. The two conditions of man

9*a*. The myth of a golden age: the age of Kronos and the age of Zeus

9*b*. The Christian doctrine of Eden and of the history of man in the world 32

(1) The condition of man in Eden: the preternatural powers of Adam

(2) The condition of man in the world: fallen man; corrupted or wounded human nature

(3) The Christian view of the stages of human life in the world: law and grace 33

9*c*. Secular conceptions of the stages of human life: man in a state of nature and in society; prehistoric and historic man; primitive and civilized man

10. Man's conception of himself and his place in the world

10*a*. Man's understanding of his relation to the gods or God

10*b*. Man as the measure of all things 35

10*c*. Man as an integral part of the universe: his station in the cosmos

10*d*. The finiteness and insufficiency of man: his sense of being dependent and ordered to something beyond himself

10*e*. Man's comparison of himself with other creatures and with the universe as a whole 36

11. The theological conception of man 37

11*a*. Man as made in the image of God

11*b*. The fatherhood of God and the brotherhood of man

11*c*. God incarnate in human form: the human nature of Christ 38

12. Man as an object of laughter and ridicule: comedy and satire

13. The grandeur and misery of man 39

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a *(D)*, follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—*(D) II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Definitions of man: conceptions of the properties and qualities of human nature

OLD TESTAMENT: *Genesis*, 1:20–30 / *Psalms*, 8:5–9

5 SOPHOCLES: *Antigone* [332–375] **134a-b**; [683–684] **137a**

5 EURIPIDES: *Suppliants* [195–213] **260a-b**

6 THUCYDIDES: *Peloponnesian War*, BK I, **368b-c**; BK IV, **461d-462a**; BK V, **506b-c**

Chapter 52: MATHEMATICS

INTRODUCTION

IT is necessary for us to observe the difference between problems *in* mathematics and the problem of the truth *about* mathematics. In the case of any science—in physics, logic, or metaphysics, as well as mathematics—it is one thing to examine the discourses or treatises of the scientists on the special subject matter of their field, and quite another to examine discussions of the science itself, its scope, branches, and unity, its objects, its methods and its relation to other disciplines. The chapter on QUANTITY deals with the subject matter of arithmetic, geometry, and other branches of mathematics; here we are primarily concerned with the nature of mathematical science itself.

Sometimes reflections on the nature of a science are expressed by experts in its subject matter who comment on the scientific enterprise in which they are engaged in prefaces or interspersed remarks. Sometimes such reflections are the commentary on a particular science by those who may claim to speak with competence on the processes of the human mind, the nature of knowledge or of science in general, but who claim no special competence in the particular science under consideration. This is usually the commentary of philosophers who may assert their right to make all knowledge, as well as all reality, their province. The same man may, of course, be both a mathematician and a philosopher; as, for example, Plato, Descartes, Pascal.

In the case of mathematics, the disparity between discourse *in* and *about* the science could hardly escape notice. Even if no preliminary rule of caution were laid down, we should be struck by the contrast between the agreement mathematicians have been able to reach in the solution of their problems and the disagreement of the commentators on basic questions about mathematics. To this there may be one significant exception. Mathematics is honored for the precision of its concepts, the rigor of its demonstrations, the certitude of its truth. Even its detractors—like Swift or Berkeley—concede the exactitude and brilliance of mathematics while questioning its utility; or they admit its intellectual austerity while challenging some application of its method. Its "clearness and certainty of demonstration," Berkeley writes, "is hardly anywhere else to be found."

This general agreement about the quality of mathematical thought may explain why in all epochs mathematics has been looked upon as the type of certain and exact knowledge. Sometimes it is taken as more than a model for other sciences; it is regarded as the method of pure science itself or as the universal science. Sometimes its excellences are thought to be qualified by the limited or special character of its objects; or it is contrasted with other disciplines which, employing different methods, deal with more fundamental matters no less scientifically. But always the conclusions of mathematics serve to exemplify rational truth; always the method of mathematics represents the spirit of dispassionate thought; always mathematical knowledge symbolizes the power of the human mind to rise above sensible particulars and contingent events to universal and necessary relationships.

Mathematics means this not only to mathematicians and philosophers, but also to moralists and statesmen. "The objects of geometrical inquiry," writes Alexander Hamilton, "are so entirely abstracted from those pursuits which stir and put in motion the unruly passions of the human heart, that mankind, without difficulty, adopt not only the more simple theorems of the science, but even those abstruse paradoxes which, however they may appear susceptible of demonstration, are at variance with the natural conceptions which the mind, without the aid

of philosophy, would be led to entertain upon the subject. . . . But in the sciences of morals and politics, men are found far less tractable." This, Hamilton points out, is not due merely to the passionate interest in their problems. "It cannot be pretended," he says, "that the principles of moral and political knowledge have, in general, the same degree of certainty with those of mathematics."

ADMIRATION FOR MATHEMATICS often extends beyond enthusiasm for its exemplary virtues or delight in its intellectual beauty to the recognition of its influence on the whole history of thought. Yet here differences of opinion begin to appear.

In the ancient world Plato and Aristotle represent opposite estimates of the importance of mathematics for the rest of philosophy. For the Platonists, Aristotle says, "mathematics has come to be identical with philosophy, though they say that it should be studied for the sake of other things." He complains of those students of science who "do not listen to a lecturer unless he speaks mathematically." They make the error of supposing that "the minute accuracy of mathematics is . . . to be demanded in all cases," whereas, according to Aristotle's own view, "its method is not that of natural science."

In the modern world, thinkers who are both mathematicians and philosophers, like Descartes and Whitehead, represent a return to the Platonic point of view; while Kant, even more than Aristotle, insists that the philosopher is grievously misled if he tries to follow the method of mathematics in his own inquiries. Whitehead charges Aristotle with having deposed mathematics from its high role "as a formative element in the development of philosophy"—a demotion which lasted until, with Descartes and others in the 17th century, mathematics recovered the importance it had for Plato.

Attempting to qualify his own enthusiasm, Whitehead admits that he would not "go so far as to say that to construct a history of thought without a profound study of the mathematical ideas of successive epochs is like omitting Hamlet from the play which is named after him. That would be claiming too much. But it is certainly analogous to cutting out the part of Ophelia. This simile is singularly exact. For Ophelia is quite essential to the play, she is very charming—and a little mad. Let us grant that the pursuit of mathematics is a divine madness of the human spirit, a refuge from the goading urgency of contingent happenings."

For Kant the madness lies not in the pursuit of mathematics itself, but in the delusion of the philosopher that he can proceed in the same way. "The science of mathematics," Kant writes, "presents the most brilliant example of how pure reason may successfully enlarge its domain without the aid of experience. Such examples are always contagious, particularly when the faculty is the same, which naturally flatters itself that it will meet with the same success in other cases which it has had in one." The expectation naturally arises that the method of mathematics "would have the same success outside the field of quantities." But philosophers who understand their own task, Kant thinks, should not be infected by the "confidence . . . of those who are masters in the art of mathematics . . . as to their ability of achieving such success" by applying its method in other fields.

"The exactness of mathematics," Kant holds, "depends on definitions, axioms, and demonstrations. . . . None of these can be achieved or imitated by the philosopher in the sense in which they are understood by the mathematician," because, according to Kant, the validity of the mathematician's definitions and demonstrations ultimately depends on the fact that he is able to *construct* the concepts he uses. The point is not that mathematics obtains its objects from reason rather than experience, but rather that it obtains them from reason by construction; as, for example, Euclid begins by constructing a triangle which corresponds with his definition of that figure.

Hence, Kant maintains, "we must not try in philosophy to imitate mathematics by beginning with definitions, except it be by the way of experiment. . . . In philosophy, in fact, the definition in its complete clearness ought to conclude rather than begin our work"; whereas in mathematics we cannot begin until we have constructed the objects corresponding to our definitions. "It follows from all this," Kant concludes, "that it is not in accordance with the

very nature of philosophy to boast of its dogmatical character, particularly in the field of pure reason, and to deck itself with the titles and ribands of mathematics."

Differences of opinion about mathematics represent, for the most part, philosophical controversy concerning the nature of science or the objects of its knowledge. Mathematicians who engage in such controversy assume the role of philosophers in doing so, for mathematics itself is not concerned with questions of this sort. But there are some questions about mathematics which seem to call for a close study of the science itself and even for proficiency in its subject matter and operations. They are questions about the scope of mathematics and about the divisions of the science, in relation to one another and to its unity. On these issues, mathematicians disagree not only with philosophers, but among themselves and in their capacity as mathematicians.

These issues usually involve different interpretations of the history of mathematics. The problem is not one of the origin of mathematics.

The ancient opinion, found in Herodotus, Plato, and Aristotle, that the mathematical arts, especially geometry, were first developed by the Egyptians, is of interest because of the questions it raises about the circumstances of the origin of mathematics. Herodotus seems to suggest that geometry arose as an aid in the practice of surveying land. "From this practice," he says, "geometry first came to be known in Egypt, whence it passed into Greece." Aristotle, on the other hand, separating from the useful arts those which "do not aim at utility," thinks the latter arose "first in the places where men first began to have leisure. That is why the mathematical arts were founded in Egypt, for there the priestly caste was allowed to be at leisure."

The Greek development of mathematics very early distinguishes between the pure sciences of arithmetic and geometry and their useful applications in the arts of measurement. The Greeks conceived mathematics as essentially speculative rather than practical or productive. They also divorced it from empirical investigation of the sensible world. As arithmetic is concerned with numbers, not with numbered things, and geometry with figures, not with physical shapes, areas, or volumes, so Plato points out that music and astronomy belong to the mathematical sciences when they deal not with audible harmonies but with their numerical ratios, not with visible celestial motions but with their geometrical configurations.

Provoked by Glaucon's interest in the usefulness of the mathematical arts, Socrates excludes their utility as being of no interest to the philosopher. He recommends arithmetic and its sister disciplines only so far as these sciences entirely ignore the world of sensible things. The reason why the philosopher "who has to rise out of the sea of change and lay hold of true being . . . must be an arithmetician," he explains, is that arithmetic can have "a very great and elevating effect," when it compels "the soul to reason about abstract number" and rebels "against the introduction of visible or tangible objects into the argument." In the same way, only when it concerns itself with "knowledge of the eternal," not with measuring earthly distances, will geometry "draw the soul towards truth, and create the spirit of philosophy." The astronomer, like the geometer, "should employ problems, and let the heavens alone, if he would approach the subject in the right way"; and, like the astronomer, the student of harmony will work in vain, if he compares "the sounds and consonances which are heard only" and so fails to "reach the natural harmonies of number."

About the non-empirical or non-experimental character of mathematics there has been little dispute. It is seldom suggested that the growth of mathematical knowledge depends upon improvement in methods of observation. But on the relation of mathematics to physics, which raises the whole problem of pure and applied mathematics, or of mathematical and experimental physics, there has been much controversy, especially in modern times.

Bacon, for example, adopts the ancient division of mathematics into pure and mixed, the former "wholly abstracted from matter and physical axioms." Though he regards mathematics as a useful instrument in physics—"the investigation of nature" being "best conducted when mathematics are applied to physics"—he also insists upon the primacy of physics and

upon its essentially experimental character. Physics has been corrupted, he says, by logic and by mathematics when these seek to dominate instead of to serve it. "It is a strange fatality that mathematics and logic, which ought to be but handmaids to physics, should boast their certainty before it, and even exercise dominion against it."

The certainty and clarity which Hume is willing to attribute to mathematics cannot, in his opinion, be extended to mathematical physics. "The most perfect philosophy of the natural kind," he thinks, "only staves off our ignorance a little longer. . . . Nor is geometry, when taken into the assistance of natural philosophy, ever able to remedy this defect, or lead us into the knowledge of ultimate causes, by all that accuracy of reasoning for which it is so justly celebrated. Every part of mixed mathematics," Hume continues, "proceeds upon the assumption that certain laws are established by nature in her operations; and abstract reasonings are employed, either to assist experience in the discovery of these laws, or to determine their influence in particular instances, where it depends upon any precise degree of distance or quantity." When mixed with physics, mathematics remains subordinate—at best an aid in the formulation and the discovery of the laws of nature.

A different view seems to be taken by the great mathematicians and physicists of the 17th century. Galileo, Descartes, and Newton tend to make mathematical analysis an integral part of physics. As the structure of the world is mathematical, so, too, must the science of nature be mathematical. Geometry, says Descartes, is "the science which furnishes a general knowledge of the measurement of all bodies." If we retain the ancient distinction between geometry and mechanics, it can only be in terms of the assumption, "confirmed by the usage" of these names, that "geometry is precise and exact, while mechanics is not."

In the preface to his *Mathematical Principles of Natural Philosophy*, Newton also says that "geometry is founded in mechanical practice, and is nothing but that part of universal mechanics which accurately proposes and demonstrates the art of measuring." What is called "rational mechanics" must not be confused with the manual arts of measurement which are imperfect and inexact; and it is therefore wrong to distinguish geometry from mechanics as that which is perfectly accurate from that which is less so. "But since the manual arts are chiefly employed in the moving of bodies, it happens that geometry is commonly referred to their magnitude, and mechanics to their motion."

Newton himself does not abide by this distinction. His aim is to subject all the phenomena of nature "to the laws of mathematics" and to cultivate mathematics as far as it relates to natural philosophy. "I offer this work as the mathematical principles of philosophy, for the whole burden of philosophy consists in this—from the phenomena of motions to investigate the forces of nature and from these forces to demonstrate the other phenomena." He regrets that he has not been able to deduce *all* the phenomena of nature "by the same kind of reasoning from mechanical principles."

Fourier goes even further. "Mathematical analysis," he says, is "as extensive as nature itself." Mathematical analysis has "necessary relations with sensible phenomena." In laying hold "of the laws of these phenomena," mathematics "interprets them by the same language as if to attest the unity and simplicity of the plan of the universe, and to make still more evident that unchangeable order which presides over all natural causes." This much had been said or implied by Descartes and Newton. But in addition to all this, Fourier, from his own experience in developing a mathematical theory of heat, comes to the conclusion that "profound study of nature is the most fertile source of mathematical discoveries." Mathematics itself benefits from its alliance with physics; it increases in analytical power and in the generality of its formulations as physical inquiries extend the range of phenomena to be analyzed and formulated.

THE RELATIONS OF mathematics to physics are considered in the chapters on ASTRONOMY, MECHANICS, and PHYSICS. Mathematical physics must be examined in the light of the opinion that mathematics and physics are separate sciences, distinct in object and method. Furthermore, whereas some of the major contributions to mathematics appear in the great books of

physics or natural philosophy (*e.g.*, Archimedes, Kepler, Newton, Fourier), even more fundamental formulations of the science occur in great books devoted exclusively to mathematics: Euclid's *Elements* (on geometry), Apollonius' treatise *On Conic Sections*, Nicomachus' *Introduction to Arithmetic*, Descartes' *Geometry*, and Pascal's mathematical papers. Others belonging to this latter group are listed in the Additional Readings. The great modern advances in mathematics are exemplified by the works of Gauss, Lobachevski, Hamilton, Riemann, Boole, Dedekind, Peano, Frege, Cantor, Hilbert.

It would be both natural and reasonable to inquire about the relation between the great works of mathematics included in this set and the equally great treatises or monographs, listed in the Additional Readings, which represent for the most part the contributions of the 19th century. But since the major question which immediately confronts us in such an inquiry concerns the relation of modern to ancient mathematics, we can examine the problem in terms of the works included in this set, for they represent both the continuity and the discontinuity in the tradition of mathematical science.

Galileo and Newton are disciples of Euclid and Archimedes; Fourier is a disciple of Newton and Descartes. But Descartes is the great innovator. He seems to be quite self-conscious of his radical departure from the ancients and from the state of mathematics as he found it in his own day. Yet the truth and power of his mathematical discoveries seem so evident to him that he cannot doubt the ancients must have had some inkling of it.

"I am quite ready to believe," he writes, "that the greater minds of former ages had some knowledge of it, nature even conducting them to it. We have sufficient evidence that the ancient Geometricians made use of a certain analysis which they extended to the resolution of all problems, though they grudged the secret to posterity. At the present day also there flourishes a certain kind of Arithmetic, called Algebra, which designs to effect, when dealing with numbers, what the ancients achieved in the matter of figures. These two methods," he claims, "are nothing else than the spontaneous fruit sprung from the inborn principles of the discipline here in question."

Descartes does not regard his success as consisting in the advance of mathematical truth through discoveries based upon principles or conclusions already established. Nor would he even be satisfied to say that his use of algebra in developing analytical geometry created a new branch of mathematics. Rather, in his own view, it tended to unify all existing branches and to form a single universal method of analysis. In effect, it revolutionized the whole character of mathematics and laid the foundation for the characteristically modern development of that science since his day. "To speak freely," he writes, "I am convinced that it is a more powerful instrument of knowledge than any other that has been bequeathed to us by human agency, as being the source of all others."

One need not quite agree with Bertrand Russell that pure mathematics was not discovered until the 19th century, in order to perceive that the discoveries made in that century carry out the spirit of the Cartesian revolution. If one understands the difference between the universal mathematics of Descartes and the separate sciences of arithmetic and geometry as developed by the ancients; if one understands the difference between the theory of equations in Descartes and the theory of proportions in Euclid; if one understands how algebraic symbolism, replacing numbers by letters, frees both arithmetic and geometry from definite quantities, then the profound discontinuity between modern and ancient mathematics begins to be discernible.

There are other differences contributing to that discontinuity, such as the modern treatment of the infinite, the invention of the calculus, and the theory of functions. But what is of prime importance for the purpose of understanding the nature of mathematics, its objects, and its methods, is the perception of the discontinuity in any one or another of its manifestations. Here is a fundamental disagreement about the nature of mathematics which is not an issue between philosophers disputing the definition of the science, but rather an issue made by the actual work of mathematicians in ancient and modern times.

In his *Battle of the Books*—ancient and modern—Swift sees only the great poets and philosophers of the two epochs set against one

another. The battle between the ancient and the modern books of mathematics might be as dramatically represented. In such affairs there is a natural tendency to prejudge the issue in favor of the modern contender. That prejudice has reason on its side in certain fields of knowledge where the perfection of new instruments and the discovery of new facts work to the advantage of the latecomer. But it is questionable whether in this dispute over the nature of mathematics the same advantage prevails.

When the issue is fairly explored by an examination of the differences between the great masterpieces of ancient and modern mathematics, it may be found impossible to say that truth lies more on one side than on the other, or that one conception of mathematics is more fruitful than another, because the two versions of the science may seem to be incommensurable in their aims, methods, and standards of accomplishment.

ONE EXAMPLE WILL illustrate this incommensurability. The ancient notion of number, as may be seen in Nicomachus' *Introduction to Arithmetic*, limits the variety of numbers. A number always numbers a number of things, even though we can deal with the number itself apart from any set of numbered things. It is always a positive and integral quantity which, excepting unity itself, "the natural starting point of all numbers," contains a multitude of discrete units.

Numbers are classified according to the way in which they are constituted of parts and according to the constitution of these parts. The primary division of numbers is into even and odd. "The even is that which can be divided into two equal parts without a unit intervening in the middle; and the odd is that which cannot be divided into two equal parts because of the aforesaid intervention of a unit."

The even numbers are capable of subdivision into the even-times-even, the odd-times-even, and the even-times-odd; and the odd into the prime and incomposite, the secondary and composite, and the number which, in itself, is secondary and composite, but relatively is prime and incomposite. The peculiarities of these types of number are explained in the chapter on QUANTITY. There are still further classifications of numbers into superabundant, deficient, and perfect; and of the parts of numbers in relation to the numbers of which they are parts.

Finally, numbers are considered in terms of their geometrical properties, to be observed when their units are disposed discretely in spatial patterns, and in one, two, or three dimensions. There are linear, plane, and solid numbers, and among plane numbers, for example, there are triangular, square, pentagonal, hexagonal numbers, and so on.

The arithmetic operations of addition, subtraction, multiplication, and division are performed in the production of numbers or in the resolution of numbers into their parts. But though any two numbers can be added together or multiplied, the inverse operations cannot always be performed. A greater number cannot be subtracted from a less, for subtraction consists in taking a part from the whole, and leaving a positive remainder. Since division is the decomposition of a number into its parts, a number cannot be divided by one greater than itself, for the greater cannot be a part of the less.

In short, in Nicomachus' theory of numbers what later came to be treated as negative numbers and fractions can have no place. Nicomachus will not carry out arithmetical operations in all possible directions without regard to the result obtained. He refuses to perform these operations when the results which would be obtained do not have for him the requisite mathematical reality. He does not find it repugnant to reason that subtraction and division, unlike addition and multiplication, are not possible for any two numbers; as, for example, subtracting a larger from a smaller number, or using a divisor which does not go into the dividend evenly, and so leaves a fractional remainder. On the contrary, Nicomachus finds it repugnant to reason to perform these operations in violation of their proper meaning, and to produce thereby results, such as negative quantities and fractions, which are for him not numbers, *i.e.*, which cannot number any real thing.

Understanding the nature of square numbers, Nicomachus would be able to understand a square root, but he would not see why the operation of extracting the square root should be

applied to numbers which are not square. Hence another kind of modern number, the irrational fraction which is generated by such operations as the extraction of the square of positive integers which are not perfect squares, would never appear in Nicomachus' set of numbers; nor would the imaginary number, which is the result of applying the same operation to negative quantities.

When the arithmetical operations are performed algebraically, with unknowns as well as definite quantities, the solution of equations requires the employment of terms which Nicomachus would not admit to be numbers—negatives, fractions (both rational and irrational), imaginaries, and complex numbers, which are partly real and partly imaginary. Descartes finds nothing repugnant in these novel quantities. On the contrary, he would find it repugnant not to be able to perform the basic arithmetical operations without restriction. Algebra would be impossible, and with it the general method of analysis that proceeds in terms of the purely formal structure of equations from which all definite quantities have been excluded. It would also be impossible to do what Descartes thinks essential to the unity of mathematics, namely, to represent geometrical operations algebraically and to perform most algebraic operations geometrically.

Geometrical loci cannot be expressed by algebraic formulae or equations, unless there are as many numbers as there are points on a line. The number series for Nicomachus, without fractions and irrationals, is neither dense nor continuous. There are fewer numbers than there are points on a line. And without the use of zero, negative numbers, and fractions—none of which would be regarded as numbers by Nicomachus—it would be impossible for Descartes to construct a set of coordinates for the geometrical representation of equations, whereby all the points in a plane have their unique numerical equivalents.

The Cartesian synthesis of algebra and geometry, which in his view vastly increases the power of each, violates the ancient distinction between continuous and discontinuous quantities—magnitudes (like lines and planes) and multitudes (or numbers). Euclid, for example, treats the irrational or the incommensurable always as a relation of magnitudes, never of multitudes, or numbers; for him certain geometrical relationships cannot be expressed numerically. Arithmetic and geometry are not even coordinate, much less co-extensive sciences. Arithmetic is the simpler, the more elementary science, and is presupposed by geometry.

Other examples arising from the innovations of Descartes might be employed to show the chasm between the arithmetic and geometry of the ancients, and modern mathematics—such as the treatment of infinite magnitudes and numbers, the theory of functions, and the method of the calculus. But the multiplication of examples does not seem necessary to suggest that there may be no answer to the question, Is Descartes right, and Nicomachus and Euclid wrong? or to the question, Are the modern innovations improvements or corruptions of the mathematical arts and sciences?

These questions are not like questions concerning the truth or falsity of a proposition in mathematics or the validity of a proof. A given theorem in Euclid must, in the light of his definitions, axioms, and postulates, be either true or false; and accordingly Euclid's demonstrations or constructions are either cogent or fallacious. The same rules apply to Descartes. But whether Euclid's or Descartes' conception of the whole mathematical enterprise is right seems to present a choice between disparate worlds, a choice to be made by reference to principles and purposes which are themselves not mathematical.

Modern mathematics may be much more useful in its physical applications, especially in the analysis and calculation of variable notions or quantities. It may have a special elegance and simplicity, as well as greater unity and even systematic rigor. But it may also purchase these qualities at the expense of the kind of intelligibility which seems to characterize ancient mathematics as a result of the insistence that its objects have an immediately recognizable reality. Ancient mathematics never occasioned such an extreme remark as that made by Bertrand Russell about modern mathematics—that it is "the science in which we never know what we are talking about, nor whether what we are saying is true."

THE QUESTION OF the reality of the objects of mathematics is in part a problem for the mathematician and in part a question for the philosopher. The problem for the mathematician seems to be one of establishing the existence of the objects he defines. This can be illustrated by reference to Euclid's *Elements*.

The basic principles, as Euclid expounds the science, seem to be threefold: definitions, postulates, and axioms or common notions. The axioms are called "common notions" because they are truths common to other branches of mathematics as well as to geometry. The common notions are called "axioms" because their truth is supposed to be self-evident. In contrast, the postulates are peculiar to geometry, for they are written as rules of construction. They demand that certain operations be *assumed* possible, such as the drawing of a straight line or a circle, or the transposition of a figure from one portion of space to another without alteration of its form or quantity.

Euclid's definitions include the definition of a straight line and a circle. His first two postulates, therefore, seem to ask us to assume that space is such that these defined geometrical objects exist in it as they are defined; or, in other words, that objects corresponding to the definitions have geometrical reality. But there are many definitions—of a triangle, of an equilateral triangle, of a parallelogram—for which Euclid states no postulate demanding that we assume the geometrical reality of the object defined. Hence before he undertakes to demonstrate the properties of these figures, he finds it necessary to prove that they can be constructed. Until they are constructed, and the construction demonstrated, the definitions state only possibilities to which no geometrical realities are *known* to correspond in the space determined by Euclid's postulates.

In his first constructions, Euclid can employ only the definition of the figure itself, his axioms, and those postulates which permit him to use certain mechanical devices—the straight edge and the compass, which are the mechanical equivalents of his postulates that a straight line can be drawn between any two points and a circle described with any radius from any point upon a plane. When, for example, in the first proposition of Book I, Euclid thus demonstrates the construction of an equilateral triangle, he has proved the geometrical existence of that figure, or, in other words, its reality in the space of his postulates.

A number of questions can be asked about this and many other similar demonstrations. The postulates being assumptions, their truth can be questioned and an effort made to prove or disprove them. This type of questioning led to the development of the non-Euclidean geometries. After centuries of trying unsuccessfully to prove Euclid's postulate about parallel lines, geometers like Lobachevski and Riemann postulated other conditions concerning parallels, with consequences for the properties of other geometrical figures.

The interior angles of a Euclidean triangle, for example, equal the sum of two right angles; in certain non-Euclidean triangles, they add up to more or less than two rights. One interpretation of this situation is that the truth of conclusions in geometry is entirely dependent on arbitrary assumptions. Another is that the several variants of the parallel postulate indicate the selection of different spaces in which to construct figures; and under each set of spatial conditions postulated, there is only one body of geometrical truths concerning the properties of the figures therein constructed.

Another type of question concerns the logical, as opposed to the geometrical, conditions of geometrical proof. In his essay *On Geometrical Demonstration*, Pascal declares the geometric method to be the most perfect available to men, for it "consists not in defining or in proving everything, nor in defining or proving nothing, but in maintaining itself in the middleground of not defining things which are clear to all men and in defining all others; and not proving everything known to men, but in proving all the other things." This method, it seems, is not restricted to the subject matter of geometry; to Descartes and Spinoza, at least, it seems to be the method for demonstrating any theoretical truth. Descartes presents "arguments demonstrating the existence of God and the distinction between soul and body, drawn up in geometrical fashion"; and as its title page indicates, the whole of Spinoza's *Ethics* is set forth "in geometrical order."

It may be questioned whether the postulates

ARCHBISHOP MITTY HIGH SCHOOL LIBRARY
San Jose, California

which Descartes adds to his definitions and axioms, or those which Spinoza introduces beginning with Proposition 13 of Book II, function as postulates do in geometry, *i.e.*, as rules of construction; it may similarly be questioned whether Spinoza is following the geometrical method in Book I where he proceeds without any postulates at all. But the more general question concerns the criteria for testing the consistency and the adequacy of the primitive propositions—the definitions, axioms, postulates—laid down as the foundation for all that is to be demonstrated. The investigation of this problem calls for an examination of the whole process of proof, from which has developed the modern theory of mathematical logic that challenges the universality and adequacy of the traditional logic of Aristotle, and asserts that mathematics and logic are continuous with one another—essentially the same discipline.

THE ISSUES RAISED by mathematical logic or the logic of mathematics are considered in the chapters on HYPOTHESIS, LOGIC, and REASONING. Here we must turn finally to one other question which is of interest principally to the philosopher rather than the mathematician. It concerns the objects of mathematics. It is a question about their reality or mode of existence which cannot be answered by the mathematical proof of a construction.

When, for example, Euclid constructs an equilateral triangle, the figure established cannot be the one imperfectly drawn upon paper. The postulated permission to use a ruler and compass does not remove the imperfection of these mechanical instruments or the inaccuracy in their physical use. The triangle whose properties the geometer tries to demonstrate must be perfect, as no actually drawn figure can be. The philosophical question, therefore, concerns the reality or existence of this ideal, perfect figure. The same question can be asked about pure numbers—numbers apart from all numbered things.

Are the objects of mathematics purely intelligible beings existing apart from the sensible world of material things? Or are they ideal entities—not in the sense of existing outside the mind, but in the sense of being ideas in the mind itself rather than perceptible particulars? As indicated in the chapters on BEING, FORM, and IDEA, Plato and Aristotle seem to answer these questions differently. But there are further differences among those who regard mathematical objects as having being only in the mind.

Aristotle, Aquinas, Locke, and James, for example, think of the objects of mathematics as universals formed by abstraction from the particulars of sense and imagination. "The mathematicals," such as numbers and figures, Aquinas writes, "do not subsist as separate beings." Apart from numbered things and physical configurations, numbers and figures "have a separate existence only in the reason, in so far as they are abstracted from motion and matter." Hobbes, Berkeley, and Hume, on the other hand, deny abstract ideas or universal concepts. "Let any man try to conceive a triangle in general," Hume declares, "which is neither *isosceles* nor *scalenum*, nor has any particular length or proportion of sides; and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas."

Despite these differences, there seems to be general agreement in the tradition of the great books that the truths of mathematics are rational rather than empirical; or, in the language of Kant and James, *a priori* rather than *a posteriori*. But the meaning of this agreement is not the same for those who think that truth in mathematics does not differ from truth in other sciences and those who think that mathematical truths stand alone precisely because they are not about matters of fact or real existence.

Plato, for whom all science is knowledge of purely intelligible objects, regards the mathematical sciences as inferior to dialectic in the knowledge of such objects "because they start from hypotheses and do not ascend to principles." The students of such sciences, Plato writes, "assume the odd and the even and the figures and three kinds of angles and the like in their several branches of science; these are their hypotheses, which they and everybody are supposed to know, and therefore they do not deign to give any account of them either to themselves or others; but they begin with them, and go on until they arrive at last, and in a consistent manner, at their conclusion."

For Aristotle, what differentiates mathematics from physics and metaphysics is the special character of its objects. Physics and metaphysics both deal with substances as they exist outside the mind, whereas the objects of mathematics are abstractions. Though figures and numbers "are inseparable in fact" from material substances, they are "separable from any particular kind of body by an effort of abstraction." This does not deny, for example, that physical things have perceptible figures. It merely insists that the geometer does not treat figures *as* sensible, but *as* intelligible, that is, as abstracted from matter. Nevertheless, the truths of mathematics, no less than those of physics and metaphysics, apply to reality. All three sciences are further alike in demonstrating their conclusions rationally rather than by experiment. All three employ induction to obtain their principles, though metaphysics alone attains to the first principles of all science.

For Kant, "mathematical cognition is cognition by means of the *construction* of conceptions." To explain this he cites the example of the construction of a triangle. "I construct a triangle, by the presentation of the object which corresponds to this conception, either by mere imagination (in pure intuition) or upon paper (in empirical intuition); in both cases completely *a priori* without borrowing the type of that figure from any experience. . . . We keep our eye merely on the act of the construction of the conception, and pay no attention to the various modes of determining it, for example, its size, the length of its sides, the size of its angles." The *a priori* character of such intuitions, on which rests the *a priori* character of mathematical truths, does not mean that mathematics has no relevance to experience. Arithmetic and geometry are like physics, according to Kant; they are sciences of experience or nature but like pure (as opposed to empirical) physics, they are *a priori* sciences. Since Kant holds that experience itself is constituted by *a priori* forms of perception, he can ascribe the validity which mathematics has for all possible experience to the "*a priori* intuition of the pure forms of phenomena—space and time."

Bertrand Russell rejects this "Kantian view which [asserts] that mathematical reasoning is not strictly formal, but always uses intuitions, *i.e.*, the *a priori* knowledge of space and time. Thanks to the progress of Symbolic Logic . . . this part of the Kantian philosophy," Russell holds, "is now capable of a final and irrevocable refutation." Leibnitz, before Kant, had advocated "the general doctrine that all mathematics is a deduction from logical principles," but, according to Russell, he had failed to substantiate this insight, partly because of his "belief in the logical necessity of Euclidean geometry." The same belief is, in Russell's opinion, the cause of Kant's error. "The actual propositions of Euclid . . . do not follow from the principles of logic alone; and the perception of this fact," he thinks, "led Kant to his innovations in the theory of knowledge. But since the growth of non-Euclidean geometry, it has appeared that pure mathematics has no concern with the question whether the axioms and propositions of Euclid hold of actual space or not."

Russell asserts that "by the help of ten principles of deduction and ten other premises of a general logical nature (*e.g.*, 'implication is a relation'), all mathematics can be strictly and formally deduced." He regards "the fact that all Mathematics is Symbolic Logic" as "one of the greatest discoveries of our age; and when this fact has been established, the remainder of the principles of Mathematics consists in the analysis of Symbolic Logic itself." Though this view of mathematics may not be worked out in detail except in such treatises as Russell's *Principles of Mathematics* and in the *Principia Mathematica*, on which he collaborated with Whitehead, the conception of mathematics as a purely formal science, analogous to (if not identical with) logic, does have some anticipations in the great books. For James, as for Locke and Hume, mathematics is strictly a science of the relations between ideas, not of real existences. "As regards mathematical judgments," James writes, "they are all 'rational propositions' . . . for they express results of comparison and nothing more. The mathematical sciences deal with similarities and equalities exclusively, and not with coexistences and sequences." Both James and Locke, however, differ from Hume in thinking that there are sciences other than those of number and quantity which can demonstrate their conclusions with certitude.

The foregoing discussion indicates *some* of the differences among philosophers concerning the objects of mathematics, the conditions of its truth, and its relation to other sciences. These disagreements do not seem to take the form of an opposition between ancient and modern thought, like that between ancient and modern mathematicians concerning the nature of their science. The two oppositions do not run parallel to one another.

On the contrary, the objections which modern philosophers, especially Berkeley, Hume, and Kant, raise against the notion of infinite quantities seem to favor the ancient rather than the modern tenor of mathematical thought. Though the reasons they give do not derive from the same principles as those to which Plato and Aristotle appeal, they, like the ancients, appear to insist upon a certain type of intelligibility in the objects of mathematics, which seems to have been sacrificed in the mathematical development initiated by Descartes.

OUTLINE OF TOPICS

PAGE

1. The science of mathematics: its branches or divisions; the origin and development of mathematics 53

1*a*. The distinction of mathematics from physics and metaphysics: its relation to logic

1*b*. The service of mathematics to dialectic and philosophy: its place in liberal education 54

1*c*. The certainty and exactitude of mathematical knowledge: the *a priori* foundations of arithmetic and geometry

1*d*. The ideal of a universal mathesis: the unification of arithmetic and geometry 55

2. The objects of mathematics: number, figure, extension, relation, order

2*a*. The apprehension of mathematical objects: by intuition, abstraction, imagination, construction; the forms of time and space

2*b*. The being of mathematical objects: their real, ideal, or mental existence 56

2*c*. Kinds of quantity: continuous and discrete quantities; the problem of the irrational

3. Method in mathematics: the model of mathematical thought 57

3*a*. The conditions and character of demonstration in mathematics: the use of definitions, postulates, axioms, hypotheses

3*b*. The role of construction: its bearing on proof, mathematical existence, and the scope of mathematical inquiry 58

3*c*. Analysis and synthesis: function and variable

3*d*. Symbols and formulae: the attainment of generality

4. Mathematical techniques

4*a*. The arithmetic and algebraic processes

4*b*. The operations of geometry 59

4*c*. The use of proportions and equations

4*d*. The method of exhaustion: the theory of limits and the calculus

5. The applications of mathematics to physical phenomena: the utility of mathematics

5*a*. The art of measurement 60

5*b*. Mathematical physics: the mathematical structure of nature

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 53: MATTER

INTRODUCTION

AFTER we came out of the church," says Boswell in his *Life of Johnson*, "we stood talking for some time together of Bishop Berkeley's ingenious sophistry to prove the non-existence of matter, and that everything in the universe is merely ideal. I observed that though we are satisfied his doctrine is not true, it is impossible to refute it. I shall never forget the alacrity with which Johnson answered, striking his foot with mighty force against a large stone, till he rebounded from it, 'I refute it thus.'"

But Berkeley's argument anticipated Dr. Johnson's style of refutation. "I do not argue," he says, "against the existence of any one thing that we can apprehend either by sense or reflexion. That the things I see with my eyes and touch with my hands do exist, really exist, I make not the least question. The only thing whose existence I deny is that which *philosophers* call Matter or corporeal substance. And in doing this there is no damage done to the rest of mankind, who, I dare say, will never miss it."

The rest of mankind does need to be instructed, however, that when they use the word "matter," they speak of *nothing*. They may from careless habit suppose they are referring to the most obvious something there is in the world—the solid, massy, concrete stuff of which tangible, visible, movable, and moving things are made. Of them, Berkeley would ask how they know such stuff exists. It is not itself perceptible.

We perceive a variety of qualities—colors, shapes, temperatures, textures, sizes, or extensions—but these, Berkeley argues, have their being *in being perceived*. Even if certain of these sensible qualities, sometimes called "primary," such as figure, size, or weight, are supposed to belong to bodies when they are not actually being sensed, they are not matter, but only its properties. Matter itself is not sensible. Those who assert its existence postulate it as a substratum or support for the sensible qualities they perceive.

The question, therefore, is whether such a substratum is a necessary or an unnecessary hypothesis. Berkeley does not deny the existence of beings which cannot be directly sensed. He affirms the existence of the human spirit or mind, of minds other than his own, and the spiritual being of God. These must be inferred to exist in order to explain the phenomena of our sensible experience and the experience of our own activities in thinking, imagining, willing. If, in addition, the existence of matter or a material substance were necessary to explain the phenomena, Berkeley would not object to affirming its existence by inference, even if it could in no way be directly perceived.

His argument therefore involves, first, a denial of Locke's distinction between primary and secondary qualities. Supposing it to be generally agreed that colors, sounds, odors have no actual existence except in the perceiving mind, he denies that perceptible figure, size, or motion can exist otherwise. "It having been shown that none even of these can possibly exist otherwise than in a Spirit or Mind which perceives them, it follows that we have no longer any reason to suppose the being of Matter."

Matter is not needed as a substratum or support for the qualities we perceive. This is the second main point in Berkeley's argument. "Though we give the materialists their external bodies, they by their own confession are never the nearer knowing how our ideas are produced; since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible it should imprint any idea in the mind. Hence it is evident that the production of ideas or sensations in our minds can be no reason why we should suppose Matter or

corporeal substances, since that is acknowledged to remain equally inexplicable with or without this supposition."

BERKELEY'S ARGUMENTS against matter, which occupy the greater part of his *Principles of Human Knowledge*, may not have the same force when they are applied against different theories of matter. Berkeley seems to regard his attack on materialism as the refutation of an error at the root of skepticism, atheism, and irreligion. He also thinks materialism creates difficulties for the sciences. But are all affirmations of matter to be lumped together as materialism *in the same sense*? Are Aristotle, Plotinus, Descartes, Spinoza, and Locke materialists in the same sense as Lucretius, Hobbes, and perhaps Marx? Does it make no difference whether bodies are said to be the only real existences, or whether, in addition to bodies, immaterial substances or spiritual beings are also said to exist?

Does it make no difference how matter is conceived—whether as a self-subsistent substance in its own right, capable of existing apart from any qualities except extension and motion which belong to its very essence, or merely as one factor in the constitution of bodies, the factor of potentiality which, as will be presently explained, has no existence apart from the forms which actualize it? Are skepticism, atheism, and irreligion to be associated with all affirmations of matter, in view of the fact that theologians like Augustine and Aquinas seem to think that a sound view of matter supports the truths of religion against the errors of the materialists?

There seem to be, in short, three distinct positions to which Berkeley's blanket denial of matter stands opposed. The diametrically opposite view seems to be the blanket denial of anything except bodies, or of anything which cannot be reduced to a property or function of matter. The atomism of Lucretius, discussed in the chapter on ELEMENT, may be taken as representative of this view, though Engels would insist that materialism can be dialectical rather than atomistic or mechanical.

Between the two extremes, there appear to be two middle positions which are alike insofar as both affirm the immaterial as well as the material. Although they are alike in asserting the existence of spiritual substances, they may, of course, define the nature of these immaterial things differently, and differently interpret their relation to the realm of matter. But, as theories of matter, their principal difference consists in the way in which they conceive the being of bodies, material substances, or the bodily mode of substance.

In the conceptions of Descartes and Locke, for example, it is matter which gives actuality to sensible bodies. We have "no other idea or notion of matter," Locke writes, "but something wherein those many sensible qualities, which affect our sense, do subsist." The entire substance of sensible bodies consists of matter. All their properties derive from the essence or nature of matter. But in the conceptions of Aristotle and Plotinus, bodies would not exist at all if they were composed only of matter, for matter is no more than a capacity for being, not something which by itself actually is. Sensible bodies derive their being and all their attributes from the forms which matter assumes when its potentialities are actualized. Matter totally devoid of form is not the *nothing* Berkeley calls it, but it is so near to nothing that Plotinus says it is "more plausibly called a non-being . . . a bare aspiration towards substantial existence."

These theories of matter or corporeal being seem to be as contrary to one another as together they are contrary to Berkeley's doctrine. Yet each of the two middle positions leans toward one of the opposite extremes.

The conception of matter seems to be very much the same in the complete materialism of Lucretius and Hobbes and in the view of Descartes, Spinoza, and Locke. In the former, only bodies exist. In the latter, bodies do not comprise the whole of existence, but matter is the whole substance of bodies. The separation of body and mind, or matter and spirit, into distinct substances, or modes of substance, leaves matter the same kind of stuff that it is in a world which admits of no other reality. Atomism, furthermore, may be common to both theories, at least to the extent that it is held that the complex bodies we perceive are composed of minute and insensible particles. Unlike Lucretius, Locke may not insist upon the absolute indivisibility of the particles, or upon the eternity of the uncreated atoms of matter;

but he, like Hobbes and Newton, carries the division of the familiar bodies of sense-experience down to parts which cannot be perceived and yet have, in a way, a more ultimate reality as units of matter than the complex bodies they constitute.

"Had we senses acute enough to discern the minute particles of bodies, and the real constitution on which their sensible qualities depend," Locke writes, "I doubt not but that would produce quite different ideas in us; and that which is now the yellow color of gold, would then disappear, and instead of it we should see an admirable texture of parts, of a certain size and figure."

At the other extreme, Berkeley's complete denial of matter has less in common with the view of Aristotle, Plotinus, Augustine, and Aquinas than the theory of Descartes, Spinoza, and Locke has with the materialism of Lucretius and Hobbes. They would appear to be close enough, for one seems to hold that matter is almost non-being and the other that matter is simply nothing at all. But where Berkeley denies any role to matter, Aristotle and those who take his view affirm matter to be an indispensable factor in the constitution of physical things. They do not question the reality of bodies or their existence apart from mind. On both of these points they are as opposed to Berkeley as they would be if they were complete materialists. Nevertheless they lean toward Berkeley rather than toward the other extreme in one respect. Where Berkeley denies the existence of matter, they deny its substantiality. Where Berkeley says matter has no being, they say it has the lowest grade of being—on the very verge of not being!

IN SPITE OF ALL the differences noted, the idea of matter has a certain constant meaning throughout the tradition of the great books.

It is generally associated with the idea of quantity, and especially the basic magnitudes, such as time, space, and mass. Sometimes it is said that the essence of matter itself is extension; sometimes that bodies—not matter itself—have the property of tridimensionality. But in either case that which *is* or *has* matter in it necessarily occupies space.

The manner of that occupation is also generally agreed upon. Two bodies or two distinct quantities of matter cannot occupy the same place at the same time. A body may not be impenetrable in the sense of being indivisible, but so long as it remains the whole that it is, it offers resistance to other bodies tending to move into the place it occupies.

There is another connection between matter and quantity. To those who ask what makes two otherwise identical things two in number—or what is involved in the merely numerical difference of things alike in every other respect—the usual answer is in terms of matter. Matter is traditionally spoken of as "the principle of individuation." Aquinas, for example, holds that angels, unlike physical substances, cannot differ from one another as do numerically distinct individuals. Because they are immaterial, they can differ only as do species or kinds. "Such things as agree in species," he writes, "but differ in number, agree in form, but are distinguished materially. If, therefore, the angels be not composed of matter and form, it follows that it is impossible for two angels to be of one species; just as it would be impossible for there to be several whitenesses apart, or several humanities, since whitenesses are not several, except in so far as they are in several substances."

The way in which matter is related to individual differences can be exemplified in works of art. Two coins, stamped out of the same kind of matter by the impression of the same die, may differ in no other discernible respect than that they are *two* of the same kind. Their *twoness* seems to be somehow related to the fact that each consists of a distinct quantity of matter. But it may be asked how two units of matter have the distinction of being two while they differ in no other respect. One answer to this difficult question is that their distinction consists in their occupying different places. In the Platonic theory of the origin of many particulars all participating in the same form, diversity of place seems to play the role which matter plays for Aristotle and Aquinas.

Plato's doctrine of the receptacle, which is discussed in the chapter on FORM, is sometimes interpreted by conceiving the receptacle as space, and sometimes by conceiving it as matter. The receptacle, it is said in the *Timaeus*, is that which, "while receiving all things, never

departs at all from her own nature and never in any way, or at any time, assumes a form like that of any of the things which enter into her." This, according to Plotinus, means that "its one form is an invincible formlessness."

But Plotinus, who combines Plato's doctrine of the receptacle and the forms with Aristotle's theory of potentiality and actuality, holds that it is matter, not space, which is "the receptacle and nurse of all generation." He says that "recipient and nurse" is a better description of matter than the term "mother," for that term "is used by those who think of a mother as matter to the offspring, as a container only, giving nothing to them." In his own view, matter is more than space or mere receptivity. He is willing to admit the "parallel with motherhood" only to the extent that "matter is sterile, not female to full effect, female in receptivity only, not in pregnancy."

TRADITIONALLY, the distinction between universal and particular is understood as a distinction between the intelligible and the sensible. This indicates another traditional meaning of matter or the material. The realm of sensible things is the realm of bodies. But the atoms which are the elementary bodies are also usually called "insensible particles of matter." This, however, can be interpreted to mean, not that a definite material mass or bulk is in itself absolutely *intangible* or *imponderable*, but that, because of the limitation in our senses, it is imperceptible to us. On this interpretation it would then seem possible to say that *all* bodily existence is sensible existence.

But if we ask about the sensibility of matter itself, rather than of bodies large or small, questions arise which are more difficult to solve. On one theory of matter, matter devoid of form is as insensible as it is unintelligible, yet forms which are not material, that is, not in matter, are also insensible but not unintelligible. On the contrary, they are regarded as more perfectly intelligible than embodied forms. How, then, does matter which is itself insensible cause the forms which it assumes to become sensible when they are materialized?

The theory of matter which does not regard it as a co-principle with form seems to be confronted with a different problem of sensibility. It is supposed that some of the qualities which we sense in bodies are actually in them whether we sense them or not—such properties as size, figure, weight, motion. Other sensible qualities, such as colors, odors, temperatures, or sounds, are supposed to be effects produced by the motions of material particles acting on the sensitive apparatus of animals. This distinction between what Locke calls "primary and secondary qualities"—found also in Lucretius and Descartes—is more fully considered in the chapters on QUALITY and SENSE, but here it calls attention to the problem of how matter, devoid of certain sensible qualities, causes these qualities to arise.

For Lucretius the peculiar difficulty of the problem seems to lie in the fact that the sensitive animal is itself nothing but a material system. All its powers and acts are conceived as functions of matter in motion. How, then, does moving matter within the organism generate certain qualities which do not belong to moving matter outside the organism? For Locke the problem raises a difficulty of still another sort. Secondary qualities, such as colors, sounds, odors, exist only as sensations in the mind. In corporeal substances, or bodies, such qualities, he writes, "are nothing but the powers those substances have to produce several ideas in us by our senses; which ideas are not in the things themselves, otherwise than as anything is in its cause." Though they result from the impact of moving particles on the bodily sense-organs, they do not belong to the world of matter at all, but to the realm of spirit. How, then, do the motions of matter cause effects which exist only in the immaterial domain of mind?

These questions indicate some of the problems of matter as an object, condition, or cause of knowledge. They also show how the nature of the problem varies with different conceptions of matter, both in itself and in its relation to mind. There are still other problems which confront those theories of mind which separate reason or intellect from the sensitive faculty.

In such theories the consideration of matter's relation to mind goes beyond the question of the origin of sensations. It takes sensations and images as somehow the functions of living matter—the acts of the various sense-organs and the brain. But sensations and images, because they are acts of corporeal organs, have the

same limitation which belongs to everything material. As matter is said to cause the individuality or numerical diversity of bodies, so is it said to make sensations and images "particular intentions of the mind"—that is, capable of representing only particular objects, not general kinds or classes. Hence such theories face the problem of the relation of sensations and images to the "universal intentions of the mind," its general concepts or abstract ideas.

ONE MORE TRADITIONAL meaning of matter remains to be mentioned. The sciences of physics or mechanics are concerned with change or motion. They are not concerned with mutability in general, but with the kind of mutability that is manifested by material things. Material things are never conceived as unmovable or unchangeable.

The question whether matter itself is immutable has different meanings for different theories of matter. On the theory (discussed in the chapter on CHANGE) that matter and form are together principles of change in changing substances, it is neither matter nor form but the substance composite of matter and form which changes. Those who think that the motions of the physical world are without beginning and end, attribute a similar eternity to matter and conceive it as imperishable. The theologians who think that God can annihilate whatever He creates, do not hold that matter is indestructible, but they nevertheless attribute everlasting endurance to matter in God's plan. Aquinas, for example, in his treatise on the end of the world, describes the final conflagration which will purge the material universe but leave its matter in existence under the forms of the elements and the heavenly bodies. "The world will be renewed," he writes, "in such a way as to throw off all corruption and remain forever at rest." Hence nothing can be "the subject of that renewal, unless it be a subject of incorruption," such as "the heavenly bodies, the elements, and man."

On other theories of matter the fact that motion is regarded as an intrinsic property of bodies seems to be similarly consistent with the notion that matter itself is immutable or indestructible. This indestructibility may be conceived in terms of the absolute indivisibility of the atoms, as in Lucretius and Newton; or, as in Spinoza, it may be established by the uncreated and eternal nature of God. "By body," Spinoza writes, "I understand a mode which expresses in a certain and determinate manner the essence of God in so far as He is considered as the thing extended."

In the modern development of the science of mechanics the law of the conservation of matter seems to be another expression of the same insight. "We may lay it down as an incontestable axiom," Lavoisier writes, "that in all the operations of art and nature, nothing is created; an equal quantity of matter exists both before and after the experiment." What appears to be the destruction of a body is merely the transformation of its matter into another physical condition, without loss of mass unless there is an equivalent gain in energy. The total quantity of matter and energy remains constant throughout all physical changes.

But though change or motion seems to be inherent in the material world, the mutability of bodies, as well as the immutability of matter, seems to be differently conceived according to different conceptions of matter. The difference between the physics of Aristotle and the physics of Descartes can be expressed in terms of contrary definitions of motion, or divergent notions of causality, but neither of these differences is fully intelligible apart from the variance of these theories from one another on the nature of matter.

When matter is an actual substance, whose essence is extension and whose chief property is local motion, the principles of physics are mechanical. The laws of mechanics, with time, space, and mass as their fundamental variables, seem to have a universality adequate for describing all natural phenomena. All changes in material things are either the local motions of bodies or the result of the local motions of their parts. Motions are determined in their magnitude and direction by the impressed force which one body exerts upon another and the resistance of that other. Motion is itself completely actual, as matter is; and the only type of cause to which physics need appeal is the efficient cause, that is, the push or pull of one body upon another.

Physicists who share this conception of mat-

ter may not agree, as Descartes and Newton do not, in their mechanical formulations. They may or may not be atomists. They may, like Lucretius, think that local motion is an absolutely intrinsic property of the eternal particles; or, like Descartes and Newton, they may think that God first imparted motion to matter at the world's creation. They may hold that all subsequent motions issue therefrom in a continuous chain of cause and effect. But when matter is the only factor in the constitution of bodies, and one body differs from another only in its quantitative determinations, the consequence for physical theory seems to be one or another sort of mechanical formulation.

When matter is nothing more than a body's potentiality for change, and when neither what the body is nor how it changes can be explained by reference to its matter alone, physical theory seems to be constructed in other than mechanical terms. Its concepts and principles resemble those of biology. It finds natural tendencies or desires, and ends or final causes, in the motion of inert as well as animate bodies.

Central to Aristotle's physics are his theory of the four causes, discussed in the chapter on CAUSE, and his theory of the four types of change, discussed in the chapter on CHANGE. But even more fundamental is his definition of motion as the actualization of that which is potential in a respect in which it is potential. With motion so defined, the principles of physics must include the correlative factors of potentiality and actuality which Aristotle conceives in terms of matter and form.

REMOVE MATTER entirely from a thing and, according to Aristotle, you remove its capacity for physical change. Remove form, and you remove its existence, for nothing can exist without being actual or determinate in certain respects. When a thing changes physically, it loses certain determinate characteristics and acquires others. The determinations it acquires it had previously lacked, yet all the while it must have had a capacity for acquiring them. The thing is "capable both of being and of not being," Aristotle says, "and this capacity," he goes on to say, "is the matter in each." The matter of an existing substance is thus conceived as that which has certain forms (the respects in which the substance is actually determinate), and lacks certain forms which it can assume (the respects in which the substance is both indeterminate and potential).

As the chapter on ART indicates, Aristotle frequently uses artistic production to afford a simple illustration of his theory of matter and form as principles of change. When a man sets out to make a bed, he chooses material, such as wood, which can be shaped in a certain way. The same wood could have been made into a chair or a table. With respect to these various possible determinations in structure, the wood is itself indeterminate and determinable.

Before the artist has worked on it productively, the wood is in a state of both privation and potentiality with regard to the form of a bed, a chair, or a table. The transformation which the artist effects consists in his actualizing certain potentialities in the material for forms or determinations which the material at the moment lacks. When the bed is made, the wood or matter which is now actually in the form of a bed may still have the potentiality for being *remade* into a chair or table.

The wood, of course, remains actually wood throughout these artificial changes, as it does not when it suffers the natural change of combustion. This indicates that though the wood may be called matter or material by the artist, it is not matter, but a substance, a thing composite of matter and form; for when the wood is reduced to ashes by fire, the matter which had the form of wood assumes another form.

In the analysis of accidental change, which artistic production illustrates, it suffices to treat a composite substance, like wood or iron or bronze, as the material principle. But in the analysis of substantial change, when matter itself changes from being one kind of matter to being another in the coming to be or perishing of composite substances, the material principle must be pure matter—matter totally devoid of form. Where a whole substance can be regarded as the matter or substratum of accidental change (in quality, quantity, or place) the substratum of substantial change, which Aristotle calls "generation and corruption," must be matter in a condition of absolute indeterminacy and pure potentiality.

Referring to this ultimate substratum as "the

underlying nature," Aristotle says that it "is an object of scientific knowledge by analogy. For as the bronze is to the statue, the wood to the bed, so is the matter and the formless before receiving form to anything which has form, and so also is the underlying nature to substance, *i.e.*, the actually existing."

ARISTOTLE'S DEFINITION of matter as "the primary substratum of each thing, from which it comes to be without qualification, and which persists in the result" not only signifies an object which the physicist must apprehend analogically (*i.e.*, by comparison with substantially formed matter like wood and bronze), but also indicates that matter, by definition, must be in itself both unintelligible and non-existent. What Aristotle calls "the primary substratum" is later called by Plotinus "primal matter," by Augustine "formless matter," and by Aquinas "prime matter." Since they all agree that that which is without form lacks all determination and actuality, they deny that it can have existence by itself or be an object of knowledge, either by sense or reason.

Augustine and Aquinas go further. They deny even to God's omnipotence the power of creating matter without form. They speak of matter not as created, but as *concreated*, that is, united at the very instant of its creation with the forms it must assume in order to exist. God "made formless matter of absolutely nothing, and the form of the world from this formless matter," Augustine writes. Yet He "created both simultaneously, so that form came upon matter with no space of time intervening."

IN THE TRADITION of Aristotle's physics and metaphysics, especially as developed by Aquinas, matter and form become basic analytic terms, often having a significance remote from their original meaning in the analysis of change. The conception of prime (or formless) matter as the substratum of substantial change leads to the designation of the formed matter underlying accidental change as "second matter." This, in turn, is called "signate matter" when, considered as the matter of an individual substance, it is viewed as having the limiting determinations of individuality.

"Matter is twofold," Aquinas writes, "common, and signate or individual; common, such as flesh and bones; and individual, as this flesh and these bones." When the intellect forms concepts of different kinds of physical substances, it abstracts "from the individual sensible matter, but not from the common sensible matter." In defining the nature of man, for example, we abstract, Aquinas says, from "this flesh and these bones, which do not belong to the species as such, but to the individual"; but we do not abstract from the fact that man, consisting of body and soul, is a thing of flesh and bones.

To say that man consists of body and soul is to indicate that common matter enters into the definition of man as a physical substance. But in distinction from definitions of this type, which are proper to physics, mathematical and metaphysical definitions carry the abstraction from matter still further. In mathematics, Aquinas declares, the intellect abstracts "not only from individual sensible matter, but also from common sensible matter." In conceiving numbers and figures, the intellect does not, however, abstract from matter entirely, but only from individual intelligible matter. The common intelligible matter which is represented by "substance as subject to quantity" underlies all mathematical notions. "But some things," Aquinas maintains, "can be abstracted even from common intelligible matter, such as *being*, *unity*, *potency*, *act* and the like, all of which can exist without matter." Such abstraction characterizes the concepts of metaphysics. Aquinas thus differentiates the three speculative sciences of physics, mathematics, and metaphysics in terms of three grades of abstraction, each distinguished by the type of matter from which the concepts of the science are abstracted.

With one exception physical matter is not said to be of different kinds when it exists under different forms. The one exception for both Aristotle and Aquinas is the matter of terrestrial and celestial bodies.

Basing his inference on the observations available to him, Aristotle holds that the heavenly bodies are eternal—"not subject to increase or diminution, but unaging and unalterable and unmodified." Immutable in every other way, they are, however, subject to local motion. Since they are eternal, both their matter and

their motion must be different from that of perishable terrestrial bodies. "All things that change have matter," Aristotle writes, "but matter of different sorts; of eternal things those which are not generable but are movable in space have matter—not matter for generation, however, but for motion from one place to another." That motion from place to place is, unlike terrestrial motion, circular; it has the appropriate characteristic of endlessness.

Kepler challenges this theory of a radical difference between celestial and terrestrial matter or motion, and as the chapter on ASTRONOMY shows, by so doing he not only gives impetus to the Copernican system, but also paves the way for Newton to frame laws of motion applicable to matter everywhere in the universe. Because their matter is the same, it is possible, Kepler insists, to explain the motion of the heavenly bodies by the same principles which account for the motion of bodies on earth.

OUTLINE OF TOPICS

PAGE

1. The conception of matter as a principle of change and as one constituent of the being of changing things: the receptacle or substratum 71

   1*a*. Matter and the analysis of change: prime and secondary matter; privation and form; participation and the receptacle

   1*b*. Matter in relation to the kinds of change: substantial and accidental change; terrestrial and celestial motion 72

   1*c*. Matter and the distinction between individual and universal: signate and common matter; sensible and intelligible matter

2. The conception of matter as extension, as a bodily substance, or as a mode of substance: atoms and compound bodies 73

   2*a*. The properties of matter: hypotheses concerning its constitution

   2*b*. The motions of matter or bodies

   2*c*. Matter as the support of sensible qualities 74

   2*d*. The diremption of body and mind, or matter and spirit

3. The existence of matter

   3*a*. Matter as the sole existent: materialism, atomism

   3*b*. Matter as the most imperfect grade of being or reality 75

   3*c*. Matter as a fiction of the mind

   3*d*. The relation of God to matter: the creation of matter and its motions

4. Matter as an object or condition of knowledge

   4*a*. The knowability of matter: by sense, by reason

   4*b*. The role of matter in the concepts and definitions of the several sciences: the grades of abstraction in physics, mathematics, and metaphysics 76

   4*c*. The material conditions of sensation, imagination, and memory

   4*d*. The material conditions of thought: the relation of matter to the existence and acts of the mind

5. Matter in relation to good and evil 77

6. Criticisms of materialism and its consequences

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265-283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265-283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 54: MECHANICS

INTRODUCTION

MECHANICS, taken as the name for just one of the physical sciences, would merit no place on a small list of basic, focal terms. But the word "mechanics" means more than that. In the tradition of western thought it signifies a whole philosophy of nature, and it connotes a set of fundamental principles under which, it has been thought, all the physical sciences can be unified.

The principles of mechanics have been applied not only in statics and dynamics, which are concerned with the action and reaction of bodies at rest or in motion, but also in acoustics and optics and the sciences of heat, magnetism, and electricity. They have been extended to astronomical phenomena to constitute what is called "celestial mechanics." They have been thought to govern the action or motion of invisible particles or waves as well as the familiar bodies of ordinary experience. In the range and variety of the phenomena it covers, mechanics would seem to be co-extensive with physics. Such at least appears to be its scope at one stage in the development of natural science.

We shall presently consider the dissatisfaction with the mechanical point of view which causes scientists in our own day to hail the replacement of "classical mechanics" by the "new physics" as a great advance in science. The intellectual significance of this change can be compared with that earlier revolution in the 17th century when the new natural science founded on the achievements of Galileo, Huygens, and Newton replaced the physics of Aristotle which had long reigned as the traditional philosophy of nature. What Einstein calls "the rise and decline of the mechanical point of view" thus seems to provide an apt title for the story of three stages in the history of science, in only one of which does the whole of physics appear to be dominated by mechanics.

One way, then, of understanding the importance of mechanics is in terms of that story. Other chapters, such as ASTRONOMY, CHANGE, ELEMENT, MATTER, PHYSICS, SPACE, and TIME —and perhaps also CAUSE and HYPOTHESIS— tell part of that story, especially the part which turns on the differences between Aristotle's physics (which is neither experimental nor mathematical) and modern physics (which is both). This chapter focuses on issues which fall largely within modern physics—issues belonging to that part of the story which, in the great books, begins with Galileo, Huygens, and Newton and runs to Fourier and Faraday. The story itself does not end there, but the point to which Faraday carries it suggests the sequel in Clerk Maxwell and Einstein, just as Galileo's point of departure reflects antecedents in Aristotle. The great books state the issues sufficiently well, though they do not tell the whole story. That can be fully documented only by a host of supplementary scientific classics in various fields, such as the works listed in the Additional Readings.

IN MODERN TIMES it is accepted that physics should be both experimental and mathematical. No one questions the ideal of unifying the physical sciences and finding the unity in nature's laws. But the question is whether that unification can be achieved under the aegis of mechanics; and the issue is whether physics should gather its experimental findings together under purely mathematical formulations or should also try to give those mathematical formulae a mechanical interpretation.

The issue involves more than a question of scientific method. It concerns the ultimate aim of natural science and the kind of concepts it should employ to fulfill this aim. Should the scientist seek to do no more than describe the

phenomena of nature in terms of the simplest and most universal mathematical relations? Or should he go beyond description to an explanation of the phenomena in terms of their causes?

When the issue is thus stated as a choice between being content with description or striving for explanation, it appears to be broader than the question whether physics should or should not be mechanical. Even granted that explanation is desirable, does it necessarily follow that physical explanation must employ the principles and concepts of mechanics? Aristotle's physics, it can be argued, provides a negative answer. His various physical treatises represent a natural science which tries to explain the phenomena without doing so mechanically, just as it tries to describe the phenomena without doing so mathematically.

That the connection of these two features of Aristotle's physics is not accidental seems to be indicated by the conjunction of their opposites in modern physics. When in the 17th century the physicist describes natural phenomena in mathematical terms, he explains them—if he tries to explain them at all—in mechanical terms. "The laws of Mechanics," writes Descartes, "are the laws of Nature." Huygens opens his *Treatise on Light* by referring to optics as the kind of science "in which Geometry is applied to matter"; but he at once expresses the desire to advance this branch of mathematical physics by investigating "the origin and the causes" of the truths already known, in order to provide "better and more satisfactory explanations." Such explanations, he thinks, will be found only if we conceive "the causes of all natural effects in terms of mechanical motions." He declares it his opinion that "we must necessarily do this, or else renounce all hopes of ever comprehending anything in Physics."

Galileo and Newton, as will be noted, do not unqualifiedly share Huygens' view that it is proper for the mathematical physicist to inquire about causes. But they would agree that if any explanation is to be given for laws of nature expressed in mathematical form, one or another type of mechanical hypothesis would be required to state the causes. Postponing for the moment the consideration of whether the investigation of causes belongs to mathematical physics, let us examine what is involved in giving a mechanical explanation of anything and why this type of explanation tends to occur in the causal interpretation of mathematically formulated laws of nature.

Two points seem to constitute the essence of mechanical theory. Both are fundamental notions and both are philosophical in the sense that they do not seem to result from the findings of experimental research. The first point is an exclusive emphasis upon efficient causes, which means the exclusion of other types of causes, especially final and formal causes, from mechanical explanation. As the chapter on CAUSE indicates, efficient causality consists in *one thing acting on another*. But not every sort of action by which one thing affects another is mechanical. According to the doctrine, an efficient cause is mechanical only if it consists in a moving body acting on another by impact, or if it consists in a force exerted by one body to cause motion in another or to change its quantity or direction. The notion of a force which does not work through the impact of one moving thing upon another raises the problem of action-at-a-distance to which we shall return subsequently.

The second fundamental point is an exclusive emphasis upon quantities. Mechanical explanation makes no references to qualities or other attributes of things. Paradoxically this point is sometimes expressed in terms of a distinction between primary and secondary *qualities*; but, as the chapters on QUANTITY and QUALITY point out, the primary qualities are all quantities. According to Locke, they are "solidity, extension, figure, motion or rest, and number"; according to Newton, "the universal qualities of all bodies whatsoever" are "extension, hardness, impenetrability, mobility, and inertia." Others, like Galileo and Descartes, give still different enumerations, but the point remains that the only attributes of bodies which have mechanical significance are measurable quantities. Such secondary qualities, for example, as colors and tones belong to the physical world (as it is mechanically conceived) only by reduction to the local motion of particles or waves having certain velocities, lengths, or other quantitative attributes.

We need not be concerned here with what sort of reality is assigned to secondary qualities, or how their presence in experience is accounted for. These problems are discussed in other chapters, such as QUALITY and SENSE. However they are solved, the philosophy of mechanism excludes from the physical world whatever does not consist in, or cannot be reduced to, quantities of matter (or mass), motion, or force, and such related quantities as those of time and space (or distance).

The two points of mechanical theory are obviously connected, for the kind of cause which mechanical explanation employs to the exclusion of all others consists in a quantity of motion or of force. Just as obviously, mechanical explanation, dealing only in quantities and in causes which are quantitatively measurable, is precisely the type of explanation which would seem to be appropriate if one felt called upon to give an interpretation of the mathematical relationships which the mathematical physicist formulates as laws of nature. These mathematical laws are after all statements of the relations among physical quantities which have been subjected to experimental determination or measurement.

AS A PHILOSOPHICAL theory the mechanical view of nature antedates modern physical science. The atomistic conception of the world, which Lucretius expounds, contains both of the fundamental points of mechanism—the doctrine of primary and secondary qualities and the doctrine that all effects in nature are produced by efficient moving causes.

The controversy over mechanism is also ancient. Aristotle denies both points of doctrine in his criticism of the Greek atomists, Democritus and Leucippus; and in the exposition of his own physical theories he states an opposite view. To qualities and qualitative change he assigns physical reality. He explains change in terms of four types of causes, not one. He does not exclude the mechanical type of cause in his explanation of local motion. On the contrary, with respect to local motion his theory that a body in motion must be directly acted upon by a moving cause throughout the period of its motion, seems to be more mechanical than the modern theory that no cause need be assigned for the continuing uniform motion of a body along a straight line but only for a change in its direction or velocity.

What is new in modern times is not the philosophical doctrine of mechanism, but the introduction of mechanical explanation into experimental and mathematical physics, and the controversy about whether it belongs there or can be defended as useful. The so-called rise and decline of the mechanical view in modern physics is connected with experimental discoveries and mathematical formulations. It is not an alternation between success and failure on the level of philosophical argument concerning the ultimate truth of mechanical conceptions. When these conceptions are rejected, it is not for the sake of returning to opposite notions in physical theory, such as those of Aristotle, but rather because, as Einstein says, "science did not succeed in carrying out the mechanical program convincingly, and today no physicist believes in the possibility of its fulfillment."

There is a touch of prophecy in the conversation Swift imagines taking place between Aristotle and the physicists of the 17th century. According to Swift, when Aristotle was confronted with Descartes and Gassendi, he "freely acknowledged his own mistakes in natural philosophy, because he proceeded in many things upon conjecture, as all men must do; and he found that Gassendi, who had made the doctrine of Epicurus as palatable as he could, and the *vortices* of Descartes, were equally exploded. He predicted the same fate to *attraction*, whereof the present learned are such zealous asserters. He said that new systems of nature were but new fashions, which would vary in every age; and even those who pretend to demonstrate them from mathematical principles, would flourish but a short period of time, and be out of vogue when that was determined."

BOTH GALILEO and Descartes re-state the philosophical doctrine which first appears in ancient atomism, but both re-state it in a way that suggests its utility for an experimental investigation of nature. It is significant that Galileo's statement occurs in the context of his concern with the nature and causes of heat. He wishes to explain, he writes in *Il Saggiatore*, why he thinks that "motion is the cause of

heat." To do this he finds it necessary to question a prevalent notion "which is very remote from the truth"—the belief that "there is a true accident, affection, or quality, really inherent in the substance by which we feel ourselves heated." He denies the physical reality of heat as an inherent quality of bodies on the same ground that he denies the physical reality of other qualities. "I do not believe," he declares, "that there exists anything in external bodies for exciting tastes, smells, and sounds, but size, shape, quantity, and motion, swift or slow; and if ears, tongues, and noses were removed, I am of the opinion that shape, quantity, and motion would remain, but there would be an end of smells, tastes, and sounds, which, apart from the living creature, I regard as mere words."

Descartes' statement of the doctrine is bolder, perhaps, in its suggestion of a mechanical program for physical research. "Colors, odors, savors, and the rest of such things," he writes, are "merely sensations existing in my thought." They differ from the real properties of bodies just as much as "pain differs from the shape and motion of the instrument which inflicts it." The true physical properties, such as "gravity, hardness, the power of heating, of attracting and purging" consist, in Descartes' opinion, "solely in motion or its absence, and in the configuration and situation of [bodily] parts."

As a philosophical doctrine, the mechanical view is not necessarily tied to atomism. Descartes opposes atomism as plainly as does Aristotle. Furthermore, Newton, who is an atomist, disagrees with both Descartes and the Greek atomists on one fundamental point in mechanical theory. The ancient atomists make the actual motion of one particle in collision with another the indispensable cause of a change of motion in the latter. Descartes likewise requires one motion to be the cause of another and explains gravity in terms of actual bodily motions. Newton rejects Descartes' mechanical hypothesis of material vortices as the cause of gravitation. He seems to have this in mind, and to put Descartes in the same class with Aristotle, when he says that "hypotheses, whether metaphysical or physical, whether of occult qualities or mechanical, have no place in experimental philosophy."

The force of gravity, according to Newton, is a power of attraction which one body exercises on another without the first being in motion or coming into contact with the second. Newton acknowledges the problem of action-at-a-distance which his theory raises. For the most part he lets it stand as a problem which does not affect the mathematical results of his work. But in the Queries he attaches to his *Optics* he suggests, by way of solution, the hypothesis of an ether as the continuous medium through which gravitational force is exerted. In the opinion of later physicists, Newton's hypothesis is no less mechanical than Descartes'. Nor does there seem to be any philosophical grounds for preferring one hypothesis to the other.

But Newton's quarrel with Descartes is not on a philosophical issue. It turns on which mechanical conception, if any at all is to be offered, fits best with the mathematical laws of terrestrial and celestial motion which Newton had succeeded in formulating as universal laws of nature. Those mathematical laws, moreover, had the merit of fitting the observed phenomena and so, of realizing the scientific ideal of accurate description stated in the most generalized form. Newton's triumph over Descartes, then, is a triumph in mathematical and experimental physics, not a triumph in philosophy.

Pope's couplet

> Nature and Nature's Laws lay hid in Night,
> God said, Let Newton be, and all was light

records that triumph, and celebrates the illumination of nature by the mechanical as well as the mathematical principles of Newton's physics. Newton's picture of the world dominates the mind of a century and controls its science. Locke speaks of "the incomparable Mr. Newton" and of "his never enough to be admired book"; Hume refers to him as the philosopher who, "from the happiest reasoning . . . determined the laws and forces, by which the revolutions of the planets are governed and directed"; and even Berkeley, who challenges his theories of space, time, and attraction, regrets that he must take issue with "the authority of so great a man," a man "whom all the world admires" as the author of "a treatise on Mechanics, demonstrated and applied to nature."

NEWTON'S ACHIEVEMENT is to have accomplished an extraordinary synthesis of all that was good in previous scientific work, and a sweeping criticism of all that was considered stultifying. That so many and such varied phenomena should be organized mathematically by a theory as simple as Newton's, is altogether impressive. Equally astonishing is the predictive power of Newton's laws and the explanatory power of his mechanics, not to mention the technological fruits of the latter in mechanical engineering and the invention of machinery of all sorts. Whatever difficulties are implicit in the Newtonian mechanics—subsequently to become, with new discoveries, more and more perplexing—the scope and grandeur of Newton's book gives mechanics a commanding position with respect to the future of science for at least two centuries.

In the century between the publication of Newton's *Mathematical Principles* and the publication in 1787 of Lagrange's *Mécanique analytique*, "the notion of the mechanical explanation of all the processes of nature," writes Whitehead, "finally hardened into a dogma of science." In the next century, the mechanical dogma spreads from physics and chemistry throughout the whole domain of natural science—into biology and psychology—and even beyond that, into economics and sociology. Books bear such titles as *The Mechanistic Conception of Life*, *The Mechanism of Human Behavior*, *Social Statics*, *Social Dynamics*. At the end of the 19th century, James notes the conquests which are being made on all sides by the mechanical idea. "Once the possibility of *some* kind of mechanical interpretation is established," he writes, "Mechanical Science, in her present mood, will not hesitate to set her brand of ownership upon the matter."

James himself testifies to the persuasiveness and success of the mechanical dogma, though not without some resentment. "The modern mechanico-physical philosophy, of which we are so proud," he says, "because it includes the nebular cosmogony, the conservation of energy, the kinetic theory of heat and gases, etc., etc., begins by saying that the *only* facts are collocations and motions of primordial solids, and the only laws the changes in motion which changes in collocation bring. The ideal which this philosophy strives after," he continues, "is a mathematical world-formula, by which, if all the collocations and motions at a given moment were known, it would be possible to reckon those of any wished-for future moment, by simply considering the necessary geometrical, arithmetical, and logical implications."

Laplace had in fact pictured a lightning calculator who, given the total configuration of the world at one instant, would be able to bring the whole future "present to his eyes." And James quotes Helmholtz to the effect that the whole problem of physical science is "to refer natural phenomena back to unchangeable attractive and repulsive forces whose intensity depends wholly upon distance. The solubility of this problem is the condition of the complete comprehensibility of nature."

In commenting on this, James admits that "the world grows more orderly and rational to the mind, which passes from one feature of it to another by deductive necessity, as soon as it conceives it as made up of so few and so simple phenomena as bodies with no properties but number and movement to and fro." But he also insists that it is "a world with a very minimum of rational *stuff*. The sentimental facts and relations," he complains, "are butchered at a blow. But the rationality yielded is so superbly complete in *form* that to many minds this atones for the loss, and reconciles the thinker to the notion of a purposeless universe, in which all the things and qualities men love . . . are but illusions of our fancy attached to accidental clouds of dust which will be dissipated by the eternal cosmic weather as careless as they were formed."

WITH THE 20TH CENTURY a change occurs. The dogma of mechanism may continue to spread in other sciences and gain even wider acceptance as a popular philosophical creed, but within the domain of the physical sciences, certain mechanical conceptions become suspect and a wholesale rejection of classical mechanics (which becomes identified with Newtonian physics) is called for.

Einstein, for example, quotes the passage from Helmholtz that James had cited, in which Helmholtz goes on to say that the vocation of physics "will be ended as soon as the reduction

of natural phenomena to simple forces is complete." This "*mechanical view*, most clearly formulated by Helmholtz," Einstein concedes, "played an important role in its time"; but, he adds, it "appears dull and naive to a twentieth century physicist."

Einstein reviews the assumptions which physicists had to make in order to construct a mechanical theory of light, gravitation, and electricity. "The artificial character of all these assumptions," he says, "and the necessity for introducing so many of them all quite independent of each other, was enough to shatter the belief in the mechanical point of view. . . . In the attempt to understand the phenomena of nature from the mechanical point of view," he continues, "throughout the whole development of science up to the twentieth century, it was necessary to introduce artificial substances like electric and magnetic fluids, light corpuscles, or ether." According to Einstein, "attempts to construct an ether in some simple way" have been "fruitless"; but what is more important in his opinion, such failures "indicate that the fault lies in the fundamental assumption that it is possible to explain all events in nature from a mechanical point of view."

Does this mean that the contemporary physicist has found another and better way of explaining nature? Is there a non-mechanical way of explaining the phenomena, which fits the mathematical laws of experimental physics; or does discarding mechanics mean relinquishing all efforts to explain nature?

Eddington suggests an answer. "One of the greatest changes in physics between the nineteenth century and the present day," he writes, "has been the change in our ideal of scientific explanation. It was the boast of the Victorian scientist that he would not claim to understand a thing until he could make a model of it; and by a model he meant something constructed of levers, geared wheels, squirts, and other appliances familiar to the engineer. Nature in building the universe was supposed to be dependent on just the same kind of resources as any human mechanic. . . . The man who could make gravitation out of cogwheels would have been a hero in the Victorian age." Today, however, Eddington continues, "we do not encourage the engineer to build the world for us out of his material, but we turn to the mathematician to build it out of his material."

We may turn to the mathematician's construction of the world in his terms; but in the tradition of western thought, mathematically formulated laws of nature are not, with the single exception perhaps of the Pythagoreans, regarded as explanations of why things behave as they do or how they work. The change from the 19th to the 20th century with respect to "our ideal of scientific explanation" cannot, then, be the substitution of the mathematical for the mechanical account of why and how. The shift from mechanics to mathematics is rather a shift from explanation as the scientific ideal to the statement of laws which, while having maximum generality, remain purely descriptive. What Eddington means by building the world out of the material of mathematics seems to be the same as what Galileo means, four centuries earlier, when he says that the book of nature "is written in mathematical language." The materials are such symbols as "triangles, circles, and other geometrical figures." Without the help of these, Galileo writes to Kepler, nature "is impossible to comprehend."

But does the mathematical comprehension of nature mean a causal explanation of it? More explicitly than Eddington, Galileo insists that explanation—at least in the sense of stating the causes—is not the business of the mathematical physicist. In a passage which cannot be read too often or examined too closely, he names three opinions which the philosophers have expressed about "the cause of the acceleration of natural motion." Some, he says, "explain it by attraction to the center, others to repulsion between the very small parts of the body, while still others attribute it to a certain stress in the surrounding medium which closes in behind the falling body and drives it from one of its positions to another. Now all of these fantasies," he continues, "and others too, ought to be examined, but it is not really worthwhile."

They ought to be examined by philosophers, perhaps, but debating them is not worthwhile in "those sciences where mathematical demonstrations are applied to natural phenomena." Perfectly defining the program of mathematical physics, Galileo sets himself a limited task:

"merely to investigate and to demonstrate some of the properties of accelerated motion (whatever the cause of this acceleration may be)." It should be noted that of the three opinions about causes which Galileo mentions, the first, which anticipates Newtonian attraction, is no less summarily dismissed than the third, which summarizes the Aristotelian theory.

"What I call Attraction," Newton later writes, "may be performed by impulse or by some other means unknown to me. I use that word here to signify only in general any force by which bodies tend towards one another, whatsoever be the cause." It is well known, he asserts in the same passage of the *Optics*, "that bodies act one upon another by the attractions of gravity, magnetism, and electricity"; but, he goes on, "how these attractions may be performed I do not here consider."

Newton's attitude toward causes and explanation would seem to be identical with Galileo's. Galileo calls opinions about causes "fantasies" and dismisses them; Newton calls them "hypotheses" and seems to banish them as resolutely. "Hypotheses are not to be regarded in experimental philosophy," he declares in one place; and in another, having just referred to predecessors who feigned hypotheses "for explaining all things mechanically," he says that, on the contrary, "the main business of natural philosophy is to argue from phenomena without feigning hypotheses."

The task of the physicist who is both experimental and mathematical in his method, Newton plainly states, is "to derive two or three general principles of motion from phenomena, and afterwards to tell us how the properties and actions of all corporeal things follow from those manifest principles. [This] would be a very great step in philosophy, though the causes of those principles were not yet discovered. And therefore," he says of his own work, "I scruple not to propose the principles of motion above mentioned, they being of very general extent, and leave their causes to be found out."

The two or three principles of motion mentioned in this passage from the *Optics* are the foundation of Newton's other great work, the *Mathematical Principles of Natural Philosophy*. Its title indicates the clearly conceived intention of its author to limit himself to the program of mathematical physics on which both he and Galileo seem to agree. He will not try to define "the species or physical qualities of forces"; he will only investigate "the quantities and mathematical proportions of them." In the General Scholium with which the *Mathematical Principles* concludes, Newton disavows once more any knowledge of the cause of gravity. "To us it is enough," he says, "that gravity does really exist, and acts according to the laws which we have explained, and abundantly serves to account for all the motions of the celestial bodies, and of our sea." Admitting that he has "not been able to discover the causes . . . of gravity from phenomena," Newton flatly reiterates his policy: "I frame no hypotheses."

In view of this policy, how does the name of Newton come to be associated with the triumph of the mechanical point of view in physics? Why do contemporary scientists like Einstein identify Newtonian physics with classical mechanics? If a mathematical physicist, like Newton or Galileo, refrains from guessing at or asserting causes, how can he be charged with having indulged in the impurity of a mechanical explanation of the phenomena, and with having foisted a mechanical conception of the universe upon mankind?

The answer to these questions, so far as Newton is concerned, may be partly found in his own writings. He did not, it seems, entirely disavow an inquiry into the cause of attractive force, as in itself either misguided or irrelevant to science. "We must learn from the phenomena of nature," he tells us, "what bodies attract one another, and what are the laws and properties of the attraction, before we enquire the cause by which the attraction is performed." This statement postpones, but does not exclude, an inquiry into causes. In another statement, Newton even gives us a reason for the postponement. "In mathematics," he says, "we are to investigate the quantities of force with their proportions consequent upon any conditions supposed; then, when we enter upon physics, we compare those proportions with the phenomena of nature, that we may know the several kinds of attractive bodies. And this preparation being made, we argue more safely

concerning the physical species, causes, and proportions of the forces."

These remarks of Newton do not give the whole answer. For the other and perhaps more important part of it, we must go to the actual development of physical science in the 17th century. The steps in this development—largely discoveries and formulations made by Galileo, Huygens, and Newton—lead to crises from which the scientists could not extricate themselves without discussing causes—the causes of gravity and of the propagation of light. We may thus be able to understand why Newton could not abandon the search for causes; and why, in the Queries he appended to the *Optics*, he proposes a mechanical hypothesis in order to explain how the attractive force of gravity exerts itself across great distances, and also defends his mechanical theory of light against the equally mechanical but different hypothesis of Huygens.

It might well be argued that, though Galileo's pure position initiated modern mathematical physics, it was the persistence of impurity in the worrying about causes, or even the inescapability of such concern, which caused great scientific advances to be made. The concern about causes seems to provide, time and time again, the pivot for new discoveries. The causes are not found, but new hypotheses are made, and these, when employed, lead to wider, more general results in the form of more inclusive, unifying laws. We see this happen not only in the study of gravitation and light, but also in the investigation of heat and electricity. The concern of Faraday, for example, to explain electrical attraction and repulsion in terms of the action of contiguous particles, and to establish the existence of physical lines of force, leads to Maxwell's theory of the electro-magnetic field; and his field equations, combined with Faraday's speculations concerning the relation between electrical and gravitational attraction, lead to the attempt, on the part of contemporary physics, to construct a unified field theory covering all physical phenomena.

Physics may return in the 20th century to the purely mathematical character it had at the beginning of its modern development. But as may be seen in any introduction to recent physics written for the layman, it is necessary to mark the influence of mechanical conceptions upon scientific discovery and thought, in order to understand the difference between the unifying mathematical laws of the 17th and the 20th centuries. As we retrace the steps we see how fertile is the interplay between mathematical insights and mechanical hypotheses.

As FOURIER TELLS the story of "rational mechanics," the "discoveries of Archimedes" begin the science. "This great geometer," he says, "explained the mathematical principles of the equilibrium of solids and fluids. About eighteen centuries elapsed before Galileo, the originator of dynamical theories, discovered the laws of motion of heavy bodies." Statics and dynamics are related as the two parts of mechanics when that is conceived narrowly as the science which treats of the local motions of inert or inanimate bodies. The rest or equilibrium of bodies, which is the subject of statics, can be thought of as a limiting case of their motions, to which the principles of dynamics apply.

In the eighteen centuries between Archimedes and Galileo, little progress is made in mechanics. So far as statics is concerned, Archimedes, according to Galileo, by the "rigor of his demonstration" established the science in all its essentials; "since upon a single proposition in his book on Equilibrium depends not only the law of the lever but also those of most other mechanical devices." Pascal may later enlarge statics, by showing in his treatise *On the Equilibrium of Liquids* that "a vessel full of water is a new principle of Mechanics, a new machine which will multiply force to any degree we choose"; in other works Pascal extends these conceptions further, as in his treatment of the pressure of air. But at the time of Galileo, it could be said that although Archimedes had offered an exemplary model of mathematical physics, no progress was made until the work of Galileo's immediate predecessors.

Not without assistance from certain predecessors like Stevin, Galileo founds the science of dynamics. It may be wondered why, with the start made by Archimedes, no earlier application of his principles and method had been made. The answer may be found in the physics of Aristotle. His theory of the four elements

carried with it a doctrine of natural motions to different natural places, drawn from the observation of fire rising, stones dropping, air bubbling up through water. Such a doctrine would prevent the search for laws of motion applicable to all bodies; and the general character of Aristotle's physics, treating qualities as well as quantities, seems to have discouraged the application of mathematics even to the study of local motions.

The mathematical expression of the laws of motion is Galileo's objective. His interest in the new astronomy which affirmed the motion of the earth led him, he told Hobbes, to the careful study of movements on the earth. His aim is simply to describe with precision the motions to be found in a child's play—stones dropped and stones thrown, the one the natural motion of free fall, the other the violent motion of a projectile. It is clear to observation that the motion of a freely falling body is accelerated. But though, as a mathematical physicist, Galileo refrains from asking why this is so, he is not satisfied to know simply that it is so. He wants to know the properties of such acceleration. What is the relation of the rate of increase in velocity to the durations and distances of the fall? How much increase in velocity is acquired and how fast? What is the body's velocity at any given point in the fall? Similarly, when Galileo turns to projectiles, he wants to know, not merely that their trajectory is consistently curvilinear, but precisely what curve the path of the projectile describes.

Galileo succeeds in answering all these questions without being perturbed by any of the philosophical perplexities connected with space and time; nor does he allow questions about the forces involved in these motions to distract him from his purpose to "demonstrate everything by mathematical methods." With mathematical demonstration he combines observation and experiment and uses the latter to determine which mathematical conclusions can be applied to nature—which principles can be empirically verified as well as mathematically deduced.

One of Galileo's principles, however, seems to outrun ordinary experience and to defy experimental verification. In the interpretation of his experiments on inclined planes, Galileo expresses an insight which Newton later formulates as the first law of motion, sometimes called the "law of inertia." It declares that "every body continues in its state of rest, or of uniform motion in a right line, unless it is compelled to change that state by forces impressed upon it." Though Newton describes his method as one of "making experiments and observations, and in drawing general conclusions from them by induction," the law of inertia seems to be an exception; for it is difficult to say, as Hume does, that "we find by experience that a body at rest or in motion continues forever in its present state"—that is, *unless* it is acted on by some new force.

The condition introduced by "unless" raises Poincaré's question: "Have there ever been experiments on bodies acted on by no forces?" If not, and if they are impossible, then James may be right in saying that "the elementary laws of mechanics" are "never matters of experience at all, but have to be disengaged from under experience by a process of elimination, that is, by ignoring conditions which are always present." Because "the idealized experiment [which it calls for] can never be performed," the law of inertia, according to Einstein, can be derived "only by speculative thinking consistent with observation."

In any case, the first law of motion initiates a new departure in physics. So far as local motion is concerned, Aristotle and his followers look for the cause which keeps a moving body in motion or a stationary body at rest. According to Galileo and Newton, uniform motion continues naturally without cause. Only a change in the velocity or direction of that motion requires a cause, such as a force impressed upon it.

How radical this innovation is may be judged from its consequences in celestial mechanics, which in turn lead to a completely unified dynamics for both celestial and terrestrial motions. These advances are the work of Newton's mathematical genius, but the ground for them had been laid by the investigations of Galileo. Galileo had resolved the curvilinear motion of a projectile into the imparted rectilinear motion and the deflecting pull of gravity. This composition of forces—sometimes called the "parallelogram law"—explains why the path of

the projectile is a parabola. The path of the planets in their orbits, Kepler had previously shown, is another conical curve—an ellipse. But Kepler, lacking the first law of motion, could theorize physically about the cause of the planetary orbits only by looking for a force, projected outward from the sun, which would sweep around to keep the planets moving in their paths. On the other hand, a follower of Galileo, as Whitehead points out, would seek "for normal forces to deflect the direction of motion along the curved orbit." He would look for a force pulling the planet off its own rectilinear course inward toward the sun.

That is precisely what Newton did. When the problem, which others had been able to formulate, was put to Newton, he simply went to his study for the solution. He had solved that problem some years before. He had found the law of the force which, attracting the planets to the sun, would produce their elliptical paths and the other proportionalities stated in Kepler's purely descriptive laws.

With that single discovery, Galileo's terrestrial dynamics becomes a celestial one, too; and the traditional separation of the heavens from the earth is overcome. Newton goes even further. He guesses, and then shows by arithmetic, that the force deflecting the planets around the sun and the moon around the earth, is the same force which makes apples fall and stones heavy in the hand. He generalizes this insight in his famous inverse-square law: "Every particle of matter attracts every other particle of matter with a force proportional to the mass of each and to the inverse square of the distance between them."

Accordingly, the world can be pictured as one in which material particles each have position in absolute space and a determinate velocity. The velocity of each particle causes the change of its position, and changes in velocity are caused by forces, the amounts of which are determined by positions. From his laws of motion and this simple law of force Newton is able, by mathematical deduction, to account for the perturbations of the moon, the oblateness of the earth, the precession of the equinoxes, the solar and lunar tides, and the paths of the comets.

But is Newton's law of force as simple as it appears to be at first? Its mathematical meaning is plain enough, and its application to measured phenomena reveals its descriptive scope. When we ask, however, about its physical significance, we raise difficult questions concerning the nature of this attractive force and how it operates. To call it the "force of gravity" and to point out that this is a familiar force which everyone experiences in his own person hardly answers the question.

GALILEO WOULD NOT have tried to answer it. In his *Dialogues Concerning the Two Great Systems of the World*, one of the characters, Simplicio, refers to that manifest cause which "everyone knows is gravity." To this Salviati replies: "You should say that everyone knows it is *called* gravity. I do not question you about the name," he continues, "but about the essence of the thing"; and that, he concludes, is precisely what cannot be defined.

A physicist like Huygens, who expects the explanation of natural effects to be expressed in the familiar mechanical terms of bodily impact, has other objections. "I am not at all pleased," he writes to Leibnitz about Newton, "with any theories which he builds on his principle of attraction, which seems to me absurd." What shocks Huygens is a scandal that Newton himself cannot avoid facing. It is the scandal of action-at-a-distance—of the force of gravity being propagated instantaneously across great distances and producing effects at some remote place but no effects along the way. Newton recognizes the strangeness of such a force. In a letter to Bentley, he echoes Huygens' protest to Leibnitz. "That gravity should be innate, inherent and essential to matter," he says, "so that one body may act on another at a distance through a vacuum, without the mediation of anything else, by and through which their action and force may be conveyed from one to another, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent faculty of thinking, can ever fall into it."

The absurdity of action-at-a-distance seems to be recognized by common sense and philosophy alike. "No action of an agent," Aquinas remarks, "however powerful it may be, acts at a distance except through a medium"; and

Kant, who regards Newtonian physics as the model of a rational science of nature, speaks of "*a force of attraction without contact*" as a "chimerical fancy" which "we have no right to assume." How can Newton avoid this absurdity without violating his rule of method in mathematical physics—not to frame hypotheses?

Newton's dilemma can perhaps be stated in the following alternatives: *either* the inverse-square law of gravitational attraction is to be treated as a purely mathematical, and hence a purely descriptive, proposition of great simplicity and generality; *or* it must be given physical meaning by a causal explanation of how gravitational force operates. On the first alternative, Newton can avoid framing hypotheses, but the physical meaning of the concepts he employs to state the mathematical law is then left dark. On the second alternative, he can solve the mechanical problem created by such words in his law as "attracts" and "force," but only by going beyond mathematical physics into the realm of mechanical hypotheses.

Newton seems to take the first alternative in his *Mathematical Principles of Natural Philosophy*, and the second in his *Optics*. There he proposes the hypothesis of an ethereal medium to explain the attractive force of gravity. "Is not this medium," he asks, "much rarer within the dense bodies of the sun, stars, planets, and comets, than in the empty celestial spaces between them? And in passing from them to great distances, doth it not grow denser and denser perpetually, and thereby cause the gravity of those great bodies towards one another, and of their parts towards the bodies; every body endeavoring to go from the denser parts of the medium towards the rare? . . . And though this increase of density may at great distances be exceeding slow, yet if the elastic force of this medium be exceeding great, it may suffice to impel bodies from the denser parts of the medium towards the rarer, with all that power which we call gravity."

The hypothesis fits the law of gravitation if, as Maxwell points out, "the diminution of pressure [in the ether] is inversely as the distance from the dense body." Newton recognized, according to Maxwell, that it then becomes necessary "to account for this inequality of pressure in this medium; and as he was not able to do this, he left the explanation of the cause of gravity as a problem for succeeding ages. . . . The progress made towards the solution of the problem since the time of Newton," Maxwell adds, "has been almost imperceptible."

The problem of the mechanical properties of an ethereal medium occurs in another form in the field of optics. Here it is complicated by the rivalry between two theories of light—Newton's corpuscular theory and Huygens' undulatory or wave theory. Each involves a mechanical hypothesis—one concerning the motion of particles emitted from the light source, and one concerning the wave-like propagation of the light impulse through a medium. Both theories involve the motion of particles. In their explanation of the oar which appears bent in the water, both appeal to the action of the particles in the refracting medium on the light corpuscles or the light waves.

Both theories, furthermore, are expressed by their authors in a mathematical form which permits the deduction of quantitative facts like the equality of the angles of incidence and of reflexion, the bending of the light ray in refraction according to the law of sines, and the recently discovered fact of the finite velocity of light. Huygens' book gives prominence to the explanation of the strange phenomena of double refraction found in "a certain kind of crystal brought from Iceland"—Iceland spar. But both theories seem to be equally competent in dealing with the established facts of reflexion and refraction, and the new facts about dispersion.

For a century at least, their rivalry resembles that between the Ptolemaic and Copernican theories at a time when they seemed equally tenable so far as accounting for the phenomena was concerned. Later, new discoveries, such as those by Young and Fresnel, tend to favor the wave theory of light; but the rivalry continues right down to the present day. It remains unresolved, at least to an extent which prompts Eddington, in reviewing contemporary controversy about the nature of light and electricity, to suggest the invention of the word "wavicle" to signify the complementary use of both particles and waves in the modern theory of radiation.

Unlike the rivalry between the Ptolemaic and Copernican systems, which seemed for a while to be entirely a matter of different mathematical descriptions of the same phenomena, the conflict between these two theories of light involves from the very beginning an issue between diverse mechanical hypotheses to explain the phenomena. That issue is argued not only with respect to the adequacy of either theory to explain such phenomena as the rectilinear propagation of light and its different behavior in different mediums; but it is also debated in terms of the underlying mechanical conceptions. As gravitational force acting at a distance raises a mechanical problem which Newton's ether is not finally able to solve, so Huygens' ether as the medium through which light is propagated in waves raises mechanical problems which, if insoluble (as they seem to be), contribute even more heavily to the general scientific scandal of mechanics.

The two authors take different attitudes toward hypotheses and mechanical explanation. Huygens, as we have seen, begins his book with the express intention to "investigate . . . the causes" and to express them "in terms of mechanical motions." Newton, on the other hand, begins his with a reiteration of his disavowal of hypotheses. "My design in this book," he writes, "is not to explain the properties of light by hypotheses, but to propose and prove them by reason and experiments." Nevertheless, Newton's explanation of how the prism produces from white light the band of colors in the spectrum seems to require the assumption of a distinct kind of light corpuscle for each color; and, in addition, the assumption that, although all light particles have the same velocity when they travel together making white light, separate particles for different colors are differently refrangible, that is, differently susceptible to the action of the particles in the refracting medium of the glass.

Perhaps only in Newton's somewhat artificially restricted sense of the word "hypothesis" could these assumptions escape that denomination. In any case, the existence of Huygens' rival theory prevented his escaping a controversy about hypotheses. In the Queries attached to his *Optics*, he engages in that controversy with an acumen which shows another side of his genius.

HUYGENS' WAVE THEORY requires what anybody would have to call an hypothesis and requires it from the very start. "It is inconceivable," he writes, "to doubt that light consists in the motion of some sort of matter." He immediately rejects the notion that light rays consist in the "transport of matter coming to us from the [luminous] object, in the way in which a shot or an arrow traverse the air"—if for no other reason, because "the rays traverse one another without hindrance." The similarity between the phenomena of light and the phenomena of sound suggests to him the "way that light spreads," and causes him to extend the mechanics of sound—conceived as a wave motion—to light.

"We know that by means of air, which is an invisible and impalpable body," Huygens argues, "sound spreads around the spot where it has been produced, by a movement which is passed on successively from one part of air to another; and that the spreading of this movement, taking place equally on all sides, ought to form spherical surfaces ever enlarging and which strike our ears. Now there is no doubt at all that light also comes from the luminous body to our eyes by some movement impressed on the matter which is between the two. . . . If, in addition, light takes time for its passage . . . it will follow that this movement, impressed on the intervening matter, is successive; and consequently it spreads, as sound does, by spherical surfaces and waves; for I call them waves from their resemblance to those which are seen to be formed in water when a stone is thrown into it."

Huygens is aware, however, that the analogy between light and sound is far from perfect. "If one examines," he says, "what this matter may be in which the movement coming from the luminous body is propagated, one will see that it is not the same that serves for the propagation of sound. . . . This may be proved," he goes on, "by shutting up a sounding body in a glass vessel from which the air is withdrawn." An alarm clock beating its bell in a jar without air makes no sound, but a jar without air is no less transparent than one with air. Since when "the air is removed from the vessel the light does not cease to traverse it as before," and since waves have to be waves of something, and light waves cannot be waves of air, they

must be waves of a substance, says Huygens, "which I call ethereal matter."

This ether, a transparent medium permeating the whole universe, proves to be what Einstein calls the *enfant terrible* in the family of hypothetical physical substances. Postulated by Huygens in order to explain light mechanically, it in turn calls for a mechanical account of its own extraordinary properties. Huygens does not avoid this new problem, but neither does he undertake to solve it completely.

Suppose "one takes a number of spheres of equal size, made of some very hard substance, and arranges them in a straight line, so that they touch one another." Then, says Huygens, "one finds, on striking with a similar sphere against the first of these spheres, that the motion passes as in an instant to the last of them, which separates itself from the row, without one's being able to perceive that the others have been stirred." This type of motion in the ether would account for "the extreme velocity of light" and yet "this progression of motion is not instantaneous," as the motion of light also is not.

"Now in applying this kind of movement to that which produces light," Huygens continues, "there is nothing to hinder us from estimating the particles of the ether to be of a substance as nearly approaching to perfect hardness and possessing a springiness as prompt as we choose." Beyond this Huygens does not go. "It is not necessary to examine here," he says, "the causes of this hardness, or of that springiness. . . . Though we shall ignore the true cause of springiness we still see that there are many bodies which possess this property; and thus there is nothing strange in supposing that it exists also in little invisible bodies like the particles of the ether."

But difficulties which Huygens did not foresee make his ether more than a strange supposition—almost a mechanical impossibility. Huygens had thought that light waves are transmitted in the ether in the way that sound waves are in the air, that is, longitudinally, the direction in which the individual particles vibrate being the same as the direction of the wave motion itself. But when, in the 19th century, it was found that the phenomena of the polarization of light could not be explained by the corpuscular theory, but only by the wave theory (thus shifting the scales decisively in favor of the latter), it was also found that the wave theory could explain polarization *only* on the assumption that the motion of the ether particles which produce the light waves is not longitudinal, but transverse, that is, in a direction perpendicular to the waves produced by the vibration of the particles.

As Fresnel pointed out at the time, "the supposition that the vibrations were transverse was contrary to the received ideas on the nature of the vibration of elastic fluids." They had all involved, as in the case of air as the medium for sound, a longitudinal transmission. The character of the ether is changed by the requirement that its particles vibrate transversely. It ceases to be an air-like ether and must be imagined as a jelly-like ether.

The task which Huygens had postponed—that of giving a mechanical explanation of the ether he had posited in order to state the mechanics of light—becomes in consequence far more difficult, if not impossible. In their efforts to construct "the ether as a jelly-like mechanical substance, physicists," according to Einstein, had to make so many "highly artificial and unnatural assumptions," that they finally decided to abandon the whole program of mechanical explanation.

Of Newton's two objections to the wave theory of light, the second by itself seems to create an insuperable difficulty for Huygens' ether, even before the realization that it must be a jelly-like medium.

Newton's first objection is that any wave theory is inconsistent with the fact of the rectilinear propagation of light. "If light consisted in pression or motion, propagated either in an instant or in time, it would bend into the shadow; for," he points out, "pression or motion cannot be propagated in a fluid in right lines, beyond an obstacle which stops part of the motion, but will bend and spread every way into the quiescent medium which lies beyond the obstacle. . . . The waves, pulses or vibrations of the air, wherein sound consists, bend manifestly, even though not so much as the waves of water."

This objection loses its force when, in the

19th century, light's bending is experimentally discovered. But Newton's other objection gains force when, two centuries after he made it, a jelly-like density is imposed upon the ether by the experimental facts of polarization. This second objection does not point to the inadequacy of the wave theory with respect to the phenomena which must be described, but rather calls attention to its inconsistency with celestial mechanics.

Light travels through inter-stellar space. But so also do the planets. Newton's astronomy accounts for the motion of the planets with great precision, *only on the supposition of no resistance from a medium.* "To make way for the regular and lasting motions of the planets and comets," he writes, "it is necessary to empty the heavens of all matter, except perhaps . . . such an exceedingly rare ethereal medium as we described above." Here he refers to the ether he himself had posited as a possible cause of gravitational attraction. Its resistance, he thinks, is "so small as to be inconsiderable." The "planets and comets and all gross bodies [can] perform their motions more freely in this ethereal medium than in any fluid, which fills all space adequately without leaving any pores." Such "a dense fluid . . . serves only to disturb and retard the motions of those great bodies, and make the frame of nature languish." Since it "hinders the operations of nature," and since "there is no evidence for its existence," Newton concludes that "it ought to be rejected."

The next conclusion follows immediately. "If it be rejected, the hypotheses that light consists in pression or motion, propagated through such a medium, are rejected with it." Newton would seem entitled to draw these conclusions because, no matter how slight the density of ethereal matter, the use of the ether in the wave theory of light involves some interaction between the particles of ether and the particles of matter. Unless such interaction takes place, no explanation can be given of the change in the velocity of light when it enters a medium like glass or water. Since in Newton's universe there is no difference between terrestrial and celestial matter, Newton cannot accept an ether which interacts with the matter of glass or water, but does not interact with the matter of the planets.

This objection of Newton's, pointing to an inconsistency between the kind of ether required by the wave theory of light and the unretarded motion of the heavenly bodies, appears not to have been answered, but only waived, at the time of the wave theory's ascendancy. The famous Michelson-Morley experiment on ether drift later re-opens Newton's penetrating query about the ether. But this occurs at a time when physicists are prepared to give up not only the ether, but also with it the mechanical explanations of gravity and light which it had brought into conflict with one another.

BEFORE THE MECHANICAL dogma runs its course, it has a career in other fields of physical inquiry. The phenomena of heat, magnetism, and electricity are explored and explained under its inspiration. The history of these subjects is marked by a very rash of hypotheses. Each time mechanical explanation is attempted for a new domain of phenomena, new substances are added.

The postulated entities—calorific, magnetical, and electric fluids—are unobservable and without weight. In Newton's terms, they are "occult"; though, it must be added, they are no more occult than the ether Newton himself postulated to explain gravity or the ether Huygens postulated to explain light. In fact, each of these new substances seems to resemble the aeriform or fluid ether, just as each is conceived, as the gravitational or optical ether was earlier conceived, in the context of the issue of action-at-a-distance as opposed to action-by-contact. They would seem to be unavoidable in a mechanical account of the radiations of heat, magnetism, and electricity.

The phenomena of heat, Lavoisier writes, are "difficult to comprehend . . . without admitting them as the effects of a real and material substance, or very subtle fluid. . . . . Wherefore," he continues, "we have distinguished the cause of heat, or that exquisitely elastic fluid which produces it, by the term of caloric." Lavoisier declares himself "unable to determine whether light be a modification of caloric, or if caloric be, on the contrary, a modification of light." But in terms of observed effects he does attribute ether-like properties to caloric. "This

subtle matter," he says, "penetrates through the pores of all known substances"; for "there are no vessels through which it cannot escape."

The theory of caloric serves its purpose before it gives way to the theory of heat as molecular motion, a conception which can be integrated with the molecular, or kinetic, theory of gases. "The development of the kinetic theory of matter," writes Einstein, "is one of the greatest achievements directly influenced by the mechanical view." It is all the more striking, therefore, that in the opening pages of Fourier's *Analytical Theory of Heat*—wherein he reviews the triumphs of explanation achieved by Newton and his successors—Fourier should so flatly assert: "But whatever may be the range of mechanical theories, they do not apply to the effects of heat. These make up a special order of phenomena which cannot be explained by the principles of motion and equilibrium."

It is equally striking that Lavoisier seems to have anticipated not only the mechanical theory of heat, but the possibility of a purely mathematical treatment of the phenomena. "We are not obliged to suppose [caloric] to be a real substance," he writes; it is sufficient "that it be considered as the repulsive cause, whatever that may be, which separates the particles of matter from each other, so that we are still at liberty to investigate its effects in an abstract and mathematical manner."

The second of these two things is precisely what Fourier proposes to undertake, but he disavows any interest in the first, namely, the explanation of heat in terms of the mechanical separation of particles by repulsion. In language which resembles Newton's disavowal of concern with the cause of attraction, Fourier declares that "primary causes are unknown to us, but are subject to simple and constant laws, which may be discovered by observation."

In another place he writes: "Of the nature of heat only uncertain hypotheses could be formed, but the knowledge of the mathematical laws to which its effects are subject is independent of all hypothesis." Fourier's aim, therefore, with respect to "the very extensive class of phenomena, not produced by mechanical forces, but resulting simply from the presence and accumulation of heat," is "to reduce the physical questions to problems of pure analysis" and "to express the most general conditions of the propagation of heat in differential equations." He expresses his indebtedness to Descartes for "the analytical equations" which that mathematician "was the first to introduce into the study of curves and surfaces," but "which are not restricted to the properties of figures, and those properties which are the object of rational mechanics." These equations, he insists, "extend to all general phenomena," and "from this point of view, mathematical analysis is as extensive as nature itself."

This strongly worded statement affirms the mathematical character of nature as the support and justification for a purely mathematical physics. If Fourier's remarks about causes and hypotheses are reminiscent of Newton in his mathematical mood, how much more is Fourier's faith in pure mathematical analysis reminiscent of Galileo. Like Galileo, and unlike Newton, Fourier never deviates from his indifference to causes and never softens his judgment of the incompetence and irrelevance of mechanics to the subject he is investigating. His trust in mathematical analysis, which is able by itself to yield and organize physical discoveries, not only revives the spirit of Galileo, but also seems to have inspired Clerk Maxwell to turn from a mechanical to a mathematical theory of electricity.

Certain of Fourier's mathematical achievements, such as his theory of dimensions, prove useful to Maxwell. More important, perhaps, is the fact that Maxwell's predictions about the propagation of electro-magnetic waves, later experimentally verified by Hertz, are the result of mathematical analysis. With such a demonstration of the power of mathematics to work fruitfully with experiment, *and without any aid from mechanical hypotheses*, Maxwell gives up the attempt to formulate a mechanics for his equations describing the electro-magnetic field. He is quite content to let his field theory state the mathematical structure of the phenomena.

Between Fourier and Maxwell comes Faraday. One of the greatest experimenters in the whole tradition of science, Faraday discovers the phenomena whose mathematical structure Maxwell later develops. He prepares the way

for Maxwell's application to electricity and magnetism of the method Fourier had practiced. His speculations concerning the relation of electrical and gravitational force point ahead, beyond Maxwell, to the possibility of a field theory which might unify all physical phenomena under a single set of mathematical laws.

Faraday sees no incompatibility between experimentation and speculation. On the contrary he says that "as an experimentalist I feel bound to let experiment guide me into any train of thought which it may justify; being satisfied that experiment, like analysis, must lead to strict truth, if rightly interpreted; and believing also that it is in its nature far more suggestive of new trains of thought and new conditions of natural power." Faraday's faith seems to have been amply justified. His experiments not only discovered a stunning number of new facts, but the speculations to which they led transformed the whole mode of thinking about electricity and magnetism, and, to some extent, the whole of physics.

The Elizabethan Gilbert, with his bold and brilliantly handled thesis that the earth is a magnet, had made magnetism appear something more than a random phenomenon occasionally met with in nature. But not until Faraday's discovery of diamagnetism, announced in a memoir *On the Magnetic Condition of All Matter*, would anyone have dared to say that "all matter appears to be subject to the magnetic force as universally as it is to the gravitating, the electric and the chemical or cohesive forces." Of electricity, he can only predict, as the result of his protracted experimental investigations, that "it is probable that every effect depending upon the powers of inorganic matter . . . will ultimately be found subordinate to it."

These remarks indicate the controlling theme of Faraday's researches, namely, the convertibility and unity of natural forces. It seems to have been suggested to him by the discovery that both electrical and magnetic forces obey the same simple inverse-square law as the force of gravitational attraction. The fact that certain forces obey the same law or that their action can be described by the same equations, would not of itself reveal whether one of these forces is primary or all are derivative from some other primary force. But it would suggest questions to be asked by experiment.

Gilbert compares magnetism and electricity but he is not able to convert one into the other. Oersted, before Faraday, is the first to establish one aspect of their convertibility. He shows that an electric current has a magnetic effect. Faraday succeeds in showing the reverse—that a magnetic current has electrical power. He expresses his fascination with such reversibilities in his remarks on the electrical torpedo fish. "Seebeck," he writes, "taught us how to commute heat into electricity; and Peltier has more lately given us the strict converse of this, and shown us how to convert electricity into heat. . . . Oersted showed how we were to convert electric into magnetic forces, and I had the delight of adding the other member of the full relation, by reacting back again and converting magnetic into electric forces. So perhaps in these organs, where nature has provided the apparatus by means of which the fish can exert and convert nervous into electric force, we may be able, possessing in that point of view a power far beyond that of the fish itself, to reconvert the electric into the nervous force."

Faraday demonstrates still another such reversibility in nature. The nature of his discovery is indicated by the titles of the papers in which he announces it: *On the Magnetization of Light and the Illumination of Magnetic Lines of Force* and *The Action of Electric Currents on Light*. These papers, in his opinion, "established for the first time, a true, direct relation and dependence between light and the magnetic and electric forces"; and he concludes them with an explicit statement of the central theme of all his researches and speculations.

"Thus a great addition is made," he writes, "to the facts and considerations which tend to prove that all natural forces are tied together and have one common origin. It is no doubt difficult in the present state of our knowledge to express our expectation in exact terms; and, though I have said that another of the powers of nature is, in these experiments, directly related to the rest, I ought, perhaps, rather to say that another form of the great power is distinctly and directly related to the other forms."

One form of the "great power" remained to be connected with such "other forms" as those of light, heat, electricity, and magnetism. That was the power of gravitational force. Faraday comes to this last stage of his speculations concerning the unity of nature's powers in terms of his conception of "lines of force" and of what later came to be called "the field of force."

The earliest theories of electricity and magnetism, in an orthodox atomistic vein, had conceived them as exerting an influence by means of the effluvia which they emitted. Newton, for example, speculates on "how the effluvia of a magnet can be so rare and subtle, as to pass through a plate of glass without any resistance or diminution of their force, and yet so potent as to turn a magnetic needle beyond the glass." When electrical conduction is later discovered, effluvia are replaced by fluids, on the analogy of caloric as the fluid conductor of heat. But when Faraday finds that he can induce from one current to another, he becomes interested in the dielectric, non-conducting medium around the circuits. He is strongly averse to any theory which involves action-at-a-distance, and so he argues that induction takes place by the action of contiguous particles. To support that argument he shows experimentally that electrical induction can "turn a corner."

From his study of all the phenomena of magnetism, Faraday forms the conception of "lines of force" and concludes that there is "a center of power surrounded by lines of force which are physical lines essential both to the existence of force within the magnet and to its conveyance to, and exertion upon, magnetic bodies at a distance." He says of this "idea of lines of force" that "all the points which are experimentally established with regard to [magnetic] action, *i.e.*, all that is not hypothetical, appear to be well and truly represented by it"; and he adds: "Whatever idea we employ to represent the power ought ultimately to include electric forces, for the two are so related that one expression ought to serve for both."

Subsequently Faraday satisfies himself as to the physical reality of electrical lines of force in addition to the magnetic lines. The compulsion of his interest in the unity of nature then drives him to speculate about gravitational force. He begins by admitting that, "in the case of gravitation, no effect sustaining the idea of an independent or physical line of force is presented to us; as far as we at present know, the line of gravitation is merely an ideal line representing the direction in which the power is exerted." But encouraged, perhaps, by Newton's repeated references to "the attractions of gravity, magnetism, and electricity," and by Newton's letter to Bentley which he interprets as showing Newton to be "an unhesitating believer in physical lines of gravitating force," Faraday goes to work experimentally.

The report of these researches *On the Possible Relation of Gravity to Electricity* opens with the re-statement of Faraday's central theme. "The long and constant persuasion that all the forces of nature are mutually dependent, having one origin, or rather being different manifestations of one fundamental power, has made me often think of establishing, by experiment, a connexion between gravity and electricity, and so introducing the former into the group, the chain of which, including also magnetism, chemical force and heat, binds so many and such varied exhibitions of force together by common relations." His experiments, he tells us, unfortunately "produced only negative results," but that does not shake his "strong feeling of the existence of a relation between gravity and electricity."

Though Faraday fails to prove "that such a relation exists," he does bequeath, as a legacy to 20th century physics, the problem of a field theory which would embrace both gravitational and electrical force. But whereas Faraday conceives the problem mechanically in terms of the physical reality, as well as unity, of all lines of force, in which contiguous particles act on one another, those who inherit the problem from him cease to concern themselves with the physical existence of "lines of force" and their mechanical basis in the action and reaction of bodies. Influenced by the amazing generality implicit in Maxwell's field equations, they proceed to search for a purely mathematical statement of nature's structure.

In the judgment of the 20th century physicist mathematics may at last succeed in doing precisely what mechanics, from Newton to Faraday, kept promising but forever failing to

do. If the unity of nature can be expressed in a single set of laws, they will be, according to Einstein, laws of a type radically different from the laws of mechanics. Taking the form of Maxwell's equations, a form which appears "in all other equations of modern physics," they will be, he writes, "laws representing the *structure* of the field."

In saying that "Maxwell's equations are structure laws" and that they provide "a new pattern for the laws of nature," Einstein means to emphasize their non-mechanical character. "In Maxwell's theory," he writes, "there are no material actors." Whereas "Newton's gravitational laws connect the motion of a body here and now with the action of a body at the same time in the far distance," Maxwell's equations "connect events which happen now and here with events which will happen a little later in the immediate vicinity." Like the equations which describe "the changes of the electromagnetic field, our new gravitational laws are," according to Einstein, "also structure laws describing the changes of the gravitational field."

The heart of the difference between a "structure law" and a mechanical law seems to be contained in Einstein's statement that "all space is the scene of these laws and not, as for mechanical laws, only points in which matter or changes are present." This contrast between matter and space brings to mind the difference between physics and geometry. Yet Einstein's repeated reference to "changes" in these space-structures also reminds us that the electrical and gravitational fields are not purely geometrical, but physical as well.

The structure laws of the new physics may be geometrical in form, but if they are to have any physical meaning, can they entirely avoid some coloring by the mechanical conceptions which have been traditionally associated with the consideration of matter and motion? At least one contemporary physicist appears to think that mechanics survives to bury its undertakers. After describing the development in which geometry progressively "swallowed up the whole of mechanics," Eddington observes that "mechanics in becoming geometry remains none the less mechanics. The partition between mechanics and geometry," he continues, "has broken down and the nature of each of them has diffused through the whole"; so that "besides the geometrisation of mechanics, there has been a mechanisation of geometry."

According to this view, it is not mechanics, but *classical* mechanics, which the new physics has abandoned. The character of the mechanics seems to have altered with the character of the mathematical formulations. Field theory, dealing with contiguous areas and successive events, avoids the problem of action-at-a-distance and also apparently that problem's classical solution in terms of the action of contiguous particles. But another sort of mechanics may be implicit in the field equations which connect events in one area with events in the immediate vicinity. If those equations had been available to him, Newton might have expressed his theory of a variably dense ether—analogous to the modern conception of a variably filled or variably curved space—in terms of structure laws describing the gravitational field.

WE ARE LEFT with a number of questions. Is the story of mechanics the story of its rise and decline or the story of its changing role—now dominant, now subordinate; now more manifest, now more concealed—at all stages in the development of a physics which is committed to being both mathematical and experimental? Do the status and character of mechanical conceptions change with changes in the form of the mathematical laws which describe the phenomena? Can physics be totally devoid of mechanical insight and yet perform experiments which somehow require the scientist to act on bodies and to make them act on one another? Could a pure mathematical physics have yielded productive applications in mechanical engineering without the intermediation of mechanical notions of cause and effect?

Whichever way these questions are answered, we face alternatives that seem to be equally unsatisfactory. *Either* experimental physics is purely mathematical and proclaims its disinterest in as well as its ignorance of causes; *or* physics cannot be experimental and mathematical without also being mechanical, and without being involved in a search for causes which are never found.

To the layman there is something mysterious

about all this. He stands in awe of the physicist's practical mastery of matter and its motions, which he naively supposes to depend upon a scientific knowledge of the causes, while all the time the scientists protest that the causes remain unknown to an experimental and mathematical physics. Mechanical explanations may be offered from time to time, but the various "forces" they appeal to can be understood only from their effects, and are nothing more than verbal shorthand for the formulae or equations which express the mathematical laws. Yet they remain cause-names, and seem to stimulate advances in science—both experimental and mathematical—almost as a consequence of the exasperating elusiveness of these hidden causes.

Certain philosophers hold a view which suggests that the clue to the mystery may lie in the word "hidden." Causes exist and we can control them to build machines and explode bombs, but we cannot with our senses catch them in the very act of causing, or perceive the inwardness of their operation. If the fact that they are thus unobservable means that they are occult, then all causes are occult—not least of all the mechanical type of cause which consists in the impact of one body upon another. In the century in which physicists tried to avoid the scandal of forces acting at a distance by postulating mechanical mediums through which one body acted directly on another, philosophers like Locke and Hume express their doubts that such causal action is any less occult than Newton had said Aristotle's causes were.

"The passing of motion out of one body into another," Locke thinks, "is as obscure and unconceivable, as how our minds move or stop our bodies by thought. . . . The increase of motion by impulse, which is observed or believed sometimes to happen, is yet harder to understand. We have by daily experience, clear evidence of motion produced both by impulse and by thought; but the manner how, hardly comes within our comprehension; we are equally at a loss in both." In Locke's judgment we will always remain "ignorant of the several powers, efficacies, and ways of operation, whereby the effects, which we daily see, are produced." If scientific knowledge is knowledge of causes, then "how far soever human industry may advance useful and experimental philosophy in physical things, scientifical will still be out of our reach."

When we try to observe efficient causes at work, what do we see? Hume answers that we only see one thing happening after another. "The impulse of one billiard-ball is attended with motion in the second. This is the whole that appears to the *outward* senses." Nor can we form any "*inward* impression" of what takes place at the moment of impact. "We are ignorant," he writes, "of the manner in which bodies operate on each other"; and we shall always remain so, for "their force or energy is entirely incomprehensible."

As the chapter on CAUSE indicates, Aristotle holds an opposite view of the matter. What takes place in efficient causation may be imperceptible, but it is not incomprehensible. All causes may be occult so far as the senses are concerned, but they are not obscure to the intellect. But Aristotle would also insist that the action of efficient causes cannot be understood if they are totally isolated from other causes—material, formal, final. A purely mechanical physics, in his opinion, defeats itself by its basic philosophical tenets, which exclude all properties that are not quantitative and all causes except the efficient. Only a different metaphysics—one which conceives physical substances in terms of matter and form, or potentiality and actuality—can yield a physics which is able to deal with causes and explain the phenomena; but such an Aristotelian physics, from the modern point of view, stands condemned on other grounds. It is not experimental. It is not productive of useful applications. It is not mathematical; nor is it capable of comprehending all the phenomena of nature under a few simple, universal laws.

OUTLINE OF TOPICS

PAGE

1. The foundations of mechanics 101

1*a*. Matter, mass, and atoms: the primary qualities of bodies

1*b*. The laws of motion: inertia; the measure of force; action and reaction

1*c*. Space and time in the analysis of motion 102

2. The logic and method of mechanics

2*a*. The role of experience, experiment, and induction in mechanics

2*b*. The use of hypotheses in mechanics 103

2*c*. Theories of causality in mechanics

3. The use of mathematics in mechanics: the dependence of progress in mechanics on mathematical discovery

3*a*. Number and the continuum: the theory of measurement

3*b*. The geometry of conics: the motion of planets and projectiles

3*c*. Algebra and analytic geometry: the symbolic formulation of mechanical problems 104

3*d*. Calculus: the measurement of irregular areas and variable motions

4. The place, scope, and ideal of the science of mechanics: its relation to the philosophy of nature and other sciences

4*a*. Terrestrial and celestial mechanics: the mechanics of finite bodies and of particles or atoms

4*b*. The explanation of qualities and qualitative change in terms of quantity and motion

4*c*. The mechanistic account of the phenomena of life

5. The basic phenomena and problems of mechanics: statics and dynamics 105

5*a*. Simple machines: the balance and the lever

5*b*. The equilibrium and motion of fluids: buoyancy, the weight and pressure of air, the effects of a vacuum

5*c*. Stress, strain, and elasticity: the strength of materials

5*d*. Motion, void, and medium: resistance and friction

5*e*. Rectilinear motion 106

(1) Uniform motion: its causes and laws

(2) Accelerated motion: free fall

5*f*. Motion about a center: planets, projectiles, pendulum

(1) Determination of orbit, force, speed, time, and period

(2) Perturbation of motion: the two and three body problems

PAGE

6. Basic concepts of mechanics 106

6*a*. Center of gravity: its determination for one or several bodies

6*b*. Weight and specific gravity: the relation of mass and weight

6*c*. Velocity, acceleration, and momentum: angular or rectilinear, average or instantaneous 107

6*d*. Force: its kinds and its effects

(1) The relation of mass and force: the law of universal gravitation

(2) Action-at-a-distance: the field and medium of force

(3) The parallelogram law: the composition of forces and the composition of velocities 108

6*e*. Work and energy: their conservation; perpetual motion

7. The extension of mechanical principles to other phenomena: optics, acoustics, the theory of heat, magnetism, and electricity

7*a*. Light: the corpuscular and the wave theory

(1) The laws of reflection and refraction

(2) The production of colors

(3) The speed of light

(4) The medium of light: the ether 109

7*b*. Sound: the mechanical explanation of acoustic phenomena

7*c*. The theory of heat

(1) The description and explanation of the phenomena of heat: the hypothesis of caloric

(2) The measurement and the mathematical analysis of the quantities of heat

7*d*. Magnetism: the great magnet of the earth

(1) Magnetic phenomena: coition, verticity, variation, dip

(2) Magnetic force and magnetic fields

7*e*. Electricity: electrostatics and electrodynamics 110

(1) The source of electricity: the relation of the kinds of electricity

(2) Electricity and matter: conduction, insulation, induction, electrochemical decomposition

(3) The relation of electricity and magnetism: the electromagnetic field

(4) The relation of electricity to heat and light: thermoelectricity

(5) The measurement of electric quantities

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 55: MEDICINE

INTRODUCTION

MEDICINE is the name of an art, of a science or group of sciences, and of a learned profession whose members are proficient in these sciences and experienced in the practice of the art. By derivation it is also the name for curative drugs, physics, or other remedies prescribed by the physician. The archaic usage of the English word "physic" as the name for the art, practice, and profession of what is now generally called "medicine" suggests what the word's Greek root signifies, namely, that the physician, no less than the physicist, is a student of nature.

There is one other historic use of "medicine" which indicates its scope and connections in the western tradition. When mediaeval institutions first shaped the university, the basic divisions of learning then embodied in its structure reflected different uses of learning as well as differences in subject matter. The three faculties of medicine, law, and theology not only disciplined their students in different branches of knowledge, but also trained them for distinct applications of knowledge to practice.

The faculty of medicine represented all the natural sciences, especially those which have come to be called "biological sciences," just as the faculty of law or jurisprudence represented all the moral sciences and their later offshoots, now called "social sciences." The doctor of medicine was concerned with knowledge bearing on the relation of man to nature, as the doctor of laws was concerned with knowledge bearing on the relation of man to man, and the doctor of theology with knowledge bearing on the relation of man to God.

It is a curious accident that the word "doctor," which in origin signified the competence to teach others who might practice in each of these great fields of learning, has come in popular usage to designate, not the teacher, but the practitioner, and chiefly the practitioner in only one of the learned professions. Medicine may not deserve the implied emphasis upon the learning of its practitioners, but there would be some truth in granting it the distinction of being the oldest of the professions in the sense that it comprises a group of men who not only share a common training in the relevant sciences and arts, but who also have adopted a code of practice and obligated themselves to perform a service to their fellow men.

The Hippocratic Oath, sworn to in the name of "Apollo the physician and Aesculapius, and Health . . . and all the gods and goddesses," is the first explicit formulation of a professional ideal. In the collection of writings attributed to Hippocrates, *The Law* explicitly indicates as *The Oath* implies that there are intellectual as well as moral conditions to be fulfilled by those who would dedicate themselves to the service of health. Only those who have satisfied all requisites for the study of medicine and by diligent application have acquired a true knowledge of it shall be "esteemed physicians not only in name but in reality."

The same high conception of medicine appears in the Bible. We read in Ecclesiasticus: "Honor the physician for the need thou hast of him: for the most High hath created him. For all healing is from God, and he shall receive gifts of the king. The skill of the physician shall lift up his head, and in the sight of great men he shall be praised. The most High hath created medicines out of the earth, and a wise man will not abhor them. . . . The virtue of these things is come to the knowledge of men, and the most High hath given knowledge to men, that he may be honored in his wonders. By these he shall cure and shall allay their pains, and of these the apothecary shall make sweet confections, and shall make up ointments of health,

and of his works there shall be no end. For the peace of God is over all the face of the earth."

Five of the authors of the great books—Hippocrates, Galen, Gilbert, Harvey, and Freud—belonged to the profession of medicine. They were major figures in its history. Practitioners of its arts, they were also contributors to the sciences concerned with health and disease. Three others combined medicine with other pursuits. Copernicus studied medicine at Padua and devoted considerable time to its practice; Locke was Lord Shaftesbury's personal physician; James took a medical degree at Harvard after years spent in the biological sciences. Still another, Rabelais, not only studied and practiced medicine, but also edited the *Aphorisms* of Hippocrates and Galen's little treatise on the medical art. His knowledge of medicine and his observation of its contemporary practices can be readily discerned in his comic exaggerations of anatomical and physiological detail, and of regimens of diet or exercise.

The discussion of medicine in the great books is not limited to its professors or practitioners. Montaigne has many doubts about medical diagnosis and the possibility of charting the causes of disease or the remedies which cure. The patient's ignorance permits the physician to claim credit for his successes and to blame fortune for his failures.

Montaigne, characteristically, delights in observing that the doctors disagree. He offers, as "one example of the ancient controversy in physics," the following: "Herophilus lodges the original cause of all disease in the humours; Erasistratus, in the blood of the arteries; Asclepiades, in the invisible atoms of the pores; Alcmaeon, in the exuberance or defect of our bodily strength; Diocles, in the inequality of the elements of which the body is composed, and in the quality of the air we breathe; Strato, in the abundance, crudity, and corruption of the nourishment we take; and Hippocrates lodges it in the spirits." There is no great danger, he adds, "in our mistaking the height of the sun, or the fraction of some astronomical computation; but here where our whole being is concerned, 'tis not wisdom to abandon ourselves to the mercy of the agitation of so many contrary winds."

Such commentary as this bears more on the history of medicine than on the abiding problems of its science or art, which, from Hippocrates to Freud, have been more generally agreed upon than the theories proposed for their solution. Of similar historical significance are the passages in the great works of history which describe the phenomena of disease as they appeared to contemporary observers, the plagues which ravaged Athens, Rome, and London, or the maladies which afflicted eminent individuals. Poetry, as well as history and biography, contributes to this record. The novels of Tolstoy and Fielding, the plays of Shakespeare, the tales of Cervantes and Chaucer, the Greek tragedies, and the Homeric epics furnish evidence of both the constant and the changing elements in the conception of disease, the vocation of medicine, and the social acceptance of the physician.

The history of medicine is an epitome of the history of the natural sciences. The researches of the Hippocratic school inititate specific methods of empirical investigation, such as the systematic collection and comparison of observations and the painstaking record of individual case histories. The fundamental concepts of medical theory reflect the philosophy of nature and of man. Conflicting notions of the causes of disease focus major issues in biology, such as the controversy in which Galen engages with Asclepiades and Erasistratus in the defense of what he supposes to be Hippocrates' and Aristotle's organic view of nature against mechanism and atomism.

Medicine, moreover, provides some of the clearest examples of the interdependence of theory and practice, for the rules of the healing art put theories to work and to the test; and as the rules are refined or altered by the accumulated experience of particular cases, inductive insight leads to new theoretical generalizations. As the work of Dr. Harvey illustrates, biological science is both the source and the reflection of medical knowledge. Medicine also affords Bacon and Descartes the prime example of a useful application of the knowledge gained by the new methods they propose.

More than engineering or the invention of mechanical utilities, medicine represents for them knowledge in the service of mankind.

That science shall bear fruit in technology "is not merely to be desired," writes Descartes, "with a view to the invention of an infinity of arts and crafts . . . but principally because it brings about the preservation of health, which is without doubt the chief blessing and the foundation of all other blessings in this life . . . It is true that the medicine which is now in vogue contains little of which the utility is remarkable; but, without any intention of decrying it, I am sure that there is no one, even among those who make its study a profession, who does not confess that all that men know is almost nothing in comparison with what remains to be known."

The subsequent history of medicine, some of the great documents of which are cited in the list of Additional Readings under the names of Jenner, Bichat, Virchow, Claude Bernard, and Koch, seems to substantiate Descartes' prophecy. But it also seems to be true that the major problems of medical practice are not greatly altered or diminished by the tremendous increase in our knowledge of the causes of specific diseases and our vast store of well tested remedies.

What sort of art medicine is; to what extent the physician should let nature run its course; with what restraint or prudence the physician should apply general rules to particular cases; whether health is better served by the general practitioner treating the whole man or by a specialist treating a special organ; how the relation of the physician to his patient is itself a therapeutic factor and underlies the effectiveness of his skill in all other respects; to what extent mind and body interact both in the origin and in the cure of disease—these are the problems of medicine concerning which Hippocrates and Galen can converse with Osler and Freud almost as contemporaries.

THE DISTINCTION made in the chapter on ART between the simply productive and the cooperative arts associates medicine with agriculture and teaching, and separates these arts, which merely help a natural result to come about, from the arts which produce an effect that would never occur without the work of the artist. Plants grow and reproduce without the help of farmers. The mind can discover some truth without the aid of teachers. Animals and men can preserve and regain their health without the care of physicians. But without shoemakers or house builders, shoes and houses would not be produced.

The art of medicine does not produce health in the sense in which the shoemaker produces a shoe, or the sculptor a statue. These other arts imitate nature by embodying natural forms or functions in materials wherein they do not naturally arise. An art like medicine seems to imitate nature by cooperating with natural processes. It follows the course of nature itself and, by working with it, enables the natural result to eventuate more surely than it might if art made no attempt to overcome the factors of chance.

Socrates expresses this understanding of the physician's art when he uses the metaphor of midwifery to characterize his own method of teaching. As it is the mother who labors and gives birth, so it is the student who is primarily active in the process of learning. The teacher, like the midwife, merely assists in a natural process which might be more painful, and might possibly fail, without such help. "The teacher," writes Aquinas, "only brings exterior help as does the physician who heals; just as the interior nature is the principal cause of the healing, so the interior light of the intellect is the principal cause of knowledge.

"Health," he continues, "is caused in a sick man, sometimes by an exterior principle, namely, by the medical art; sometimes by an interior principle, as when a man is healed by the force of nature. . . . Just as nature heals a man by alteration, digestion, rejection of the matter that caused the sickness, so does art. . . . The exterior principle, art, acts not as a primary agent, but as helping the primary agent, which is the interior principle, and by furnishing it with instruments and assistance, of which the interior principle makes use in producing the effect. Thus the physician strengthens nature, and employs food and medicine, of which nature makes use for the intended end."

The subordination of the medical art to nature seems to be the keystone of the whole structure of Hippocratic medicine. It is implied in the emphasis which Hippocrates places on the control of the patient's regimen, espe-

cially the elements of his diet, the exercise of his body, and the general circumstances of his life. Even in the treatment of acute diseases, Hippocrates looks to the regimen first, prescribing changes or special articles of diet.

Medicines or drugs perform an auxiliary function. Surgery is always a last resort, to be used primarily in the treatment of injuries, and not to be employed in diseases which will yield to a course of regimen and medication. There is an element of violence in surgery which puts it last among the means of an art which should work by cooperating with nature rather than by operating on it. And among medicines, those are preferable which, like ptisan, a special preparation of barley water, derive their efficacy from properties similar to those of normal nutriment.

According to Hippocrates, the control of regimen is not only the primary factor in therapy, but also the original principle of medicine. In the treatise *On Ancient Medicine*, he points out that "the art of medicine would not have been invented at first, nor would it have been made the subject of investigation (for there would have been no need for it), if when men are indisposed, the same food and other articles of regimen which they eat and drink when in good health were proper for them, and if no other were preferable to these. . . . The diet and food which people in health now use would not have been discovered, provided it suited man to eat and drink in like manner as the ox, the horse, and all other animals. . . . What other object, then, has he in view who is called a physician, and is admitted to be a practitioner of the art, who found out the regimen and diet befitting the sick, than he who originally found out and prepared for all mankind that kind of food which we all now use, in place of the former savage and brutish mode of living?"

THE SAME CONCEPTION of medicine's relation to nature seems to be fundamental in Galen's thought. He attributes to Hippocrates his own reformulation of the insight that the art of healing consists in imitating the health-giving and healing powers of nature itself. The medical doctrines which he criticizes were based on the atomism of Epicurus. They regarded the body as a complex piece of machinery. When it gets out of order, it needs a mechanic and mechanical remedies to fix it. On the contrary, it seems to him, the living body is an organic unity, not an aggregation of atoms, or a system of interlocking parts.

"Nature is not posterior to the corpuscles, but a long way prior to them," Galen writes. "Therefore it is nature which puts together the bodies both of plants and animals; and this she does by virtue of certain faculties which she possesses—these being, on the one hand, attractive and assimilative of what is appropriate, and, on the other, expulsive of what is foreign. Further, she skillfully moulds everything during the stage of genesis; and she also provides for the creatures after birth, employing here other faculties again."

Nature, according to Galen, works not by the external impact of part upon part, but by its faculties or powers for the performance of natural functions and the production of natural effects. Galen's polemic against the mechanists thus leads him to reverse the usual statement. Where Hippocrates looks upon nature as the model for art to follow, Galen calls Nature the artist, in order to set his view in sharp contrast to all mechanical conceptions. "Instead of admiring Nature's artistic skill," he declares, "they even go so far as to scoff and maintain that . . . things have been made by Nature for no purpose!" Nature, Galen holds, produces effects according to its powers and in conformity to its needs. It seems to work with intelligence and for an end, not blindly and by chance. The true art of medicine, therefore, borrows its method from "Nature's art."

The conception of nature as an artist may be taken metaphorically or literally, but the insight controlling the practice of medicine remains the same. The physician is a servant, not a master, of nature. Aristotle's doctrine of final causes, summarized in the maxim Galen so often repeats—that "nothing is done by Nature in vain"—furnishes a principle for physiological research, as well as the rules of medical art. Whether because of faulty observation on his part, or because of a failure to apply his own principle, Galen leaves to Harvey one of the great discoveries which can be credited to close attention to final causes. Always observant of the relation between structure and function,

always questioning the purpose which bodily organs serve, Harvey establishes the fact that the blood circulates, and finds therein the reason for the structure of the heart, its motions, and its relation to the lungs.

It may also be possible for a principle to be carried to excess. Montaigne, for example, expresses his distrust of medical theory and the physician's remedies by an unqualified trust in nature's own resourcefulness. Drugs, especially purgatives, do violence to nature. "Men disturb and irritate the disease by contrary oppositions; it must be the way of living that must gently dissolve, and bring it to an end. The violent gripings and contest betwixt the drug and the disease are ever to our loss, since the combat is fought within ourselves, and that the drug is an assistant not to be trusted, being in its own nature an enemy to our health, and by trouble having only access into our condition. Let it alone a little; the general order of things that takes care of fleas and moles, also takes care of men, if they will have the same patience that fleas and moles have, to leave it to itself."

Nor is there any need for an art of medicine when nature can do better by herself. "We ought to grant free passage to diseases; I find they stay less with me, who let them alone; and I have lost some, reputed the most tenacious and obstinate, by their own decay, without help and without art, and contrary to its rules. Let us a little permit Nature to take her own way; she better understands her own affairs than we." The Hippocratic doctrine seems to occupy a middle ground between this view of nature as an unerring artist and the opposite extreme which permits all sorts of tampering and tinkering with the machinery of the body.

THE ART OF MEDICINE "consists in three things," writes Hippocrates: "the disease, the patient, and the physician. The physician is the servant of the art, and the patient must combat the disease along with the physician." With regard to diseases, the physician must "have two special objects in view . . . to do good, and to do no harm."

This celebrated summary indicates the two kinds of knowledge which the physician should possess. He should know about disease in general, so that he can classify diseases according to their special causes, their symptoms, and the typical course each seems to take. Such knowledge underlies the doctor's diagnosis of the patient's malady. That in turn determines his prognosis of the stages through which the illness will run, from its onset through various crises or turning points to its *sequelae* or consequences. Upon the accuracy of his diagnosis and the certainty of his prognosis may depend the effectiveness of any remedy the physician prescribes in the individual case.

But individual cases are seldom completely alike. The physician must therefore know the patient as an individual, and all the relevant circumstances of his life as well as the particular characteristics of this instance of the disease; even though its general characteristics are familiar to him from much experience in the treatment of similar cases. The *Book of Prognostics* and the treatise *Of the Epidemics* in the Hippocratic collection seem to combine both these kinds of knowledge. They enumerate the symptoms by which diseases can be recognized and their future foretold. They also set forth individual case histories from which such generalizations can be drawn.

The practice of medicine thus appears to require more than scientific knowledge of health and disease in general, and more than general rules of art. It requires the sort of experience which can be gained only from actual practice. Without prudence born of experience, general rules can be misapplied, for no general rule, in medicine as in law, fits all cases alike. The most famous of Hippocratic aphorisms conveys a sense of the hazards of medical practice: "Life is short, and Art long; the crisis fleeting; experiment perilous, and decision difficult. The physician must not only be prepared to do what is right himself, but also to make the patient, the attendants, and the externals cooperate."

To persuade the patient to cooperate is the first maxim governing the physician's relation to his patient. Plato contrasts the right and wrong relation between doctor and patient by comparing the practice of the physicians who treated slaves and those who treated free men. "The slave-doctor," he says, "prescribes what mere experience suggests, as if he had exact knowledge, and when he has given his orders, like a tyrant, he rushes off with equal assurance

to some other servant who is ill.... But the other doctor, who is a freeman, attends and practices upon freemen; and he carries his enquiries far back, and goes into the nature of the disorder; he enters into discourse with the patient and with his friends, and is at once getting information from the sick man, and also instructing him as far as he is able, and he will not prescribe for him until he has first convinced him; at last, when he has brought the patient more and more under his persuasive influences and set him on the road to health, he attempts to effect a cure."

In the treatment of mental diseases, as Freud points out, the proper development and management of the relationship between patient and physician is itself a major factor in psychotherapy. "It presupposes a profound interest for psychological incidents, as well as a personal sympathy for the patient," he writes. "It requires the full consent and the attention of the patients, but above all, their confidence, for the analysis regularly leads to the inmost and most secretly guarded psychic processes." Since fears, anxieties, or other temperamental dispositions on the part of the patient may affect the course of an organic ailment, the patient's confidence in the physician and, even more generally, his emotional response to the physician's character play an important role in the successful treatment of bodily ills as well as of mental or functional disorders.

Hippocrates recommends that the physician cultivate prognosis, not only for the guidance of his own actions, but also for the sake of the patient. "By foreseeing and foretelling, in the presence of the sick, the present, the past, and the future, and explaining the omissions which patients have been guilty of, he will be the more readily believed to be acquainted with the circumstances of the sick; so that men will have confidence to entrust themselves to such a physician."

The relation of physician and patient raises a question about the organization of the practice of medicine, to which opposite answers have been given in both ancient and modern times. Herodotus reports a high degree of medical specialization in Egypt. "Medicine is practised among them on a plan of separation," he writes; "each physician treats a single disorder, and no more: thus the country swarms with medical practitioners, some undertaking to cure diseases of the eye, others of the hand, others again of the teeth, others of the intestines, and some those which are not local." The fact that the next paragraph begins a discussion of funerals can hardly be taken as revealing the attitude of Herodotus toward specialization, though his comment on the Egyptian practice does imply a contrast to Greek medicine.

One sentence in the Hippocratic Oath—"I will not cut persons laboring under the stone, but will leave this to be done by men who are practitioners of this work"—indicates some division of labor in the organization of Greek medicine. But apart from the special tasks and skills of surgery, the Hippocratic conception of the physician's work favors the practice of general medicine rather than specialization. The man, not the disease, is to be treated, and to treat him well the physician must examine the man as a whole, not merely the organ or bodily part in which the disorder seems to be located. The Hippocratic formula for getting a case history calls for an inquiry into the background of the individual's life, his antecedents, his occupation, his temperament, "the patient's habits, regimen, and pursuits; his conversation, manners, taciturnity, thoughts, sleep, or absence of sleep, and sometimes his dreams, what they are and when they occur; his picking and scratching; his tears." From these as well as from the symptoms, says Hippocrates, "we must form our judgment."

The defense of general practice against specialization is part of Galen's argument with his adversaries. Treatment of the disordered part as if it could be isolated from the living unity of the whole man is, to Galen, one of the deplorable consequences in medical practice of atomism or mechanism in medical theory.

This issue is argued again and again in the history of medicine, with each side pressing the advantages in its favor. Montaigne, for example, states the case for the specialist by analogy with the advantages of specialization in other arts. "As we have doublet and breeches makers, distinct trades, to clothe us, and are so much the better fitted, seeing that each of them meddles only with his own business, and has less to

trouble his head with than the tailor who undertakes them all; and as in matter of diet, great persons, for their better convenience, have cooks for the different offices . . . so also as to the cure of our maladies." With Freud and the development of a greater awareness of the psychological origin of many bodily disorders, a new factor enters into the argument. It tends to favor the general practitioner who, from his acquaintance with the patient as a person, may be better able than the specialist to detect hidden psychological causes.

THE CONCEPTION of disease is usually determined by the conception of health. The abnormality is judged and measured as a deviation from the norm. Hippocrates uses the outward appearance of man in a healthy condition as the standard for discerning the visible signs of illness. The physician, he says, "should observe . . . first the countenance of the patient, if it be like those of persons in health, and more so, if like itself, for this is the best of all; whereas the most opposite to it is the worst." He should also take note when he finds the patient reclining in a posture which resembles the normal disposition of the healthy body. "To find the whole body lying in a relaxed state" is a more favorable sign than to find him "upon his back, with the hands, neck, and the legs extended."

The history of medicine, especially on the side of its science and theory, if not so much with regard to its art and practice, can be told in terms of refinements in the classification of diseases and progressive discovery of their specific causes, both internal and external, predisposing and exciting. But the analysis of diseases according to their aetiology and by reference to the typical picture of the disease process leaves unanswered the general question about the nature of disease as a loss of health.

Apart from its causes and its symptoms, its modes and its patterns, what is disease? This is the question of major speculative interest in the tradition of the great books. The answers given have a certain uniformity in spite of the varying terms in which they are expressed.

The humoural hypothesis of ancient medical theory, for example, conceives health as that condition of the body in which the physiological elements are in a proper proportion or balance, and in which the various parts or powers function harmoniously with one another. As health is harmony or good order in the body, so disease consists in imbalance and disharmony—an excess or defect with consequent disproportion of the elements, or the disorder of conflicting bodily processes.

In the *Timaeus*, Plato first states this theory in terms of the four physical elements. "There are four natures out of which the body is compacted, earth and fire and water and air, and the unnatural excess or defect of these, or the change of any of them from its own natural place into another . . . produces disorders and diseases." He then considers the diseases which result from excess or defect of one or another of the four humours—blood, phlegm, black and yellow bile.

The humoural hypothesis, which Hippocrates and Galen share with Plato and Aristotle, undergoes many transformations in the history of medicine. The four elements or humours are replaced by other physiological factors, such as the hormones or internal secretions, or the elements of modern biochemistry. But constant throughout these changing formulations is the conception of health as an equilibrium, and of disease as its loss through disorder and disproportion.

This broad conception of health and disease seems to apply to mental as well as bodily ills. There is not only a basic continuity between Plato's and Freud's discussion of the bodily origin of mental disorders and the psychic origin of physical ailments; but the Freudian emphasis upon conflict and disintegration in the neurotic character—milder forms of the schizophrenia or "split personality" which characterizes insanity—also appeals to harmony as the principle of health. The language of modern psychiatry which refers to "the integrated personality" or "the well-balanced and adjusted individual" defines the norm or the ideal of mental health.

The various kinds and degrees of mental disorder, especially those which seem to be entirely functional rather than organic, represent abnormalities which, though they differ in cause, symptom, and tendency, have in common some excess or defect in the psychic struc-

ture or some unresolved conflict in the nature of man. Freud's psychoanalytic method in the treatment of mental ills places psychotherapy in the main tradition of medical practice; for in addition to insisting that the patient shall help to cure himself, it is directed toward the resolution of conflict, restoring the harmony which is health.

OUTLINE OF TOPICS

PAGE

1. The profession of medicine, its aims and obligations: the relation of physician to patient; the place of the physician in society 121

2. The art of medicine 122

2a. The scientific foundations of the art of medicine: the contrast between the empiric and the artist in medicine

2b. The relation of art to nature in healing: imitation and cooperation

2c. The comparison of medicine with other arts and professions 123

3. The practice of medicine

3a. The application of rules of art to particular cases in medical practice

3b. General and specialized practice: treating the whole man or the isolated part 124

3c. Diagnosis and prognosis: the interpretation of symptoms; case histories

3d. The factors in prevention and therapy

(1) Control of regimen: climate, diet, exercise, occupation, daily routine

(2) Medication: drugs, specifics 125

(3) Surgery

4. The concept of health: normal balance or harmony 126

5. The theory of disease

5a. The nature of disease

5b. The classification of diseases 127

5c. The disease process: onset, crisis, after-effects

5d. The causes of disease: internal and external factors

(1) The humoural hypothesis: temperamental dispositions 128

(2) The psychogenesis of bodily disorders

5e. The moral and political analogues of disease

6. Mental disease or disorder: its causes and cure 129

6a. The distinction between sanity and insanity: the concept of mental health and the nature of madness

6b. The classification of mental diseases

6c. The process and causes of mental disorder

(1) Somatic origins of mental disease 130

(2) Functional origins of mental disease

6d. The treatment of functional disorders: psychotherapy as a branch of medicine

7. The historical record on disease and its treatment: epidemics, plagues, pestilences 131

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the works or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 56: MEMORY AND IMAGINATION

INTRODUCTION

CONCERNING memory and imagination, the tradition of western thought seems to be involved in less dispute than it is on other aspects of human and animal life. There are, as we shall see, points of difficulty and debatable theories. But these arise only within the framework of certain fundamental insights which are widely, if not universally, shared. Here at least we can begin without having to deal with verbal ambiguities. Unlike many of the words which are the traditional bearers of the great ideas, "memory" and "imagination" have a constant core of meaning in almost everyone's discourse.

It is understood that memory and imagination depend upon sense-perception or upon previous experience. Except for illusions of memory, we do not remember objects we have never perceived or events in our own life, such as emotions or desires, that we have not experienced. The imagination is not limited in the same way by prior experience, for we can imagine things we have never perceived and may never be able to.

Yet even when imagination outruns perception, it draws upon experience for the materials it uses in its constructions. It is possible to imagine a golden mountain or a purple cow, though no such object has ever presented itself to perception. But, as Hume suggests, the possibility of combining a familiar color and a familiar shape depends upon the availability of the separate images to be combined.

"When we think of a golden mountain," Hume writes, "we only join two consistent ideas, *gold* and *mountain*, with which we were formerly acquainted . . . All this creative power of the mind amounts to no more than the faculty of compounding, transposing, augmenting, or diminishing the materials afforded us by the senses and experience." A congenitally color-blind man who lived entirely in a world of grays would not be able to imagine a golden mountain or a purple cow, though he might be able to imagine things as unreal as these.

Because of their dependence on sense-perception, memory and imagination are usually regarded as belonging to the same general faculty as the external senses. Not all writers, however, conceive of a generic power of sense, which they then divide into the exterior senses such as sight, hearing, and touch, and the interior senses such as memory and imagination. Some, like Hobbes, treat imagination as "nothing but decaying sense," and use the word "memory" to "express the decay, and signify that the sense is fading, old, and past."

The image, whether it is a memory-image or fancy-free, *re-produces* or *re-presents* sensory material. It may be less vivid, less sharp in outline, and less definite in detail than the sensation or perception from which it is derived. But in one important respect the image does not differ from the original sense-impression. That is the respect in which ideas or concepts do differ from sense-impressions—at least according to those who hold that ideas or concepts have a certain universality and abstractness which is not found in sensations and sensory images. Those who, like Berkeley and Hume, call sensations or images "ideas" deny the existence of abstract ideas or universal notions precisely because they, too, agree that sense-impressions or sensory images are always particular in their content and meaning.

THE FUNDAMENTAL controversy about what an idea is and the verbal confusion occasioned by the ambiguity of the word (which appears in the chapter on IDEA) do not seem to affect the understanding of the nature of images or their role in the activities of memory and imagina-

tion. As William James points out, in discussing the "blended" or "generic" image which is somehow associated with abstract or universal meaning, "a blurred thing is just as particular as a sharp thing, and the generic character of either sharp image or blurred image depends on its being felt *with its representative function.*" He speaks of this function as "the mysterious *plus*, the understood meaning," but he denies the possibility of universal or abstract *images*, whatever may be the truth about ideas which are not images at all. Certainly those who deny the presence of anything abstract or universal in the understanding do so on the ground that the content of the mind is basically sensory, whether the mind is perceiving or remembering, imagining or thinking.

The controversy about the nature of the mind does not seem to affect the conception of memory or imagination. As neither is confused with sense-perception, so neither is confused with rational thought. This remains the case whether the theory of mind looks upon the intellect as a faculty separate from the sensitive faculty (including memory and imagination), or conceives the understanding as a single faculty which is active in judgment and reasoning as well as in perceiving, remembering, and imagining.

This and related issues are considered in the chapter on MIND. Except for one point, perhaps, such issues can be ignored here. Sensation is attributed to both animals and men—to all organisms which give evidence of having sense-organs or some sort of sensitive apparatus. Whether all animals, even those which have the most rudimentary sensorium, also have memory and imagination may be disputed; but no one doubts that the higher animals, with central nervous systems and brain structures resembling those of men, can remember and imagine as well as perceive.

All agree, furthermore, that memory and imagination require bodily organs, though the assignment of these two functions to the brain as their organic seat is more uniformly a tenet of modern than of ancient physiology, and can be more clearly expounded as the result of modern researches in neurology. But the question whether the memory or imagination of men and other animals differs more than their bodies do, elicits opposite answers from those who affirm that man alone has reason and those who deny that man has powers of knowing or thinking not possessed by other animals to some degree.

Nevertheless, if man alone is considered, the nature of memory and imagination is clear. The object remembered or imagined need not be physically present to the senses like the object perceived. The object imagined need not be located in the past like the object remembered; nor, for that matter, need it have any definite location in time and space. It need have no actual existence. It may be a mere possibility, unlike the object which cannot be known without being known to exist. As the object of memory is an event which no longer exists, so the object of imagination may be something which has never existed and never will.

Thus memory and imagination greatly enlarge the world of human experience. Without them, man would live in a confined and narrow present, lacking past and future, restricted to what happens to be actual out of the almost infinite possibilities of being. Without memory and imagination, man could be neither a poet nor an historian; and unless he had an angelic sort of intellect which in no way depended on sense-experience, he would be impeded in all the work of science, if memory and imagination did not extend the reach of his senses.

THE PSYCHOLOGICAL analysis of memory usually divides it into a number of separate acts or phases. Recollection presupposes the retention of the material to be recalled. The ingenious experiments of Ebbinghaus that James reports —using the memorization of nonsense syllables to isolate the factors influencing memory— seem to show that retention is affected by the strength of the original associations. But retention is also affected by the interval between the time of learning and the time of revival. The amount of forgetting seems to be a function of two separate factors: the force with which the material to be recalled is originally committed to memory, and the lapse of time.

That retention is not the same as recall may be seen from Ebbinghaus' experimental discovery of the fact that forgetting is never com-

plete. Material which lies below the threshold of recall is nevertheless retained, and manifests its presence by its effect on attempts to relearn the material which *appears* to have been forgotten.

Nothing can be utterly forgotten if, as Augustine suggests, what seems to be forgotten remains in the memory. He considers the effort men make to remember a forgotten name. "Where does that name come back from," he asks, "except from the memory? For even when it is through being reminded of something else that we recognize someone's name, it is still by memory that we do it, for we do not hold it as some new thing learned, but by memory we are sure that this is what the name was. But, were the name utterly blotted out of mind," Augustine argues, "we should not remember it even if we were reminded. For if we had utterly forgotten it, we should not even be able to think of looking for it."

Freud considers forgetting from another point of view. He describes the psychoanalytic method at its inception as a "talking cure" involving efforts in reminiscence. The things which we have put out of mind, he claims, are "hindered from becoming conscious, and forced to remain in the unconscious by some sort of force." He calls this "repression." Freud observed that it occurred when" a wish had been aroused, which was in sharp opposition to the other desires of the individual, and was not capable of being reconciled with the ethical, aesthetic, and personal pretensions of the patient's personality. . . . The end of this inner struggle was the repression of the idea which presented itself to consciousness as the bearer of this irreconcilable wish. This was repressed from consciousness and forgotten."

On this view things which have been put out of mind because we find them unpleasant to contemplate, things which are repressed in order to avoid conflict, are not forgotten when they cannot be consciously remembered. Nor are they below the threshold of recall in the sense that our retention of them has been so weakened by time that no effort at recollection can revive them. On the contrary, they may be capable of quite vivid revival when the emotional obstacles to recollection are removed. Freud applies his theory of the "obliviscence of the disagreeable" to such everyday occurrences as the forgetting of familiar names as well as to the repression of memories connected with the emotional traumas of early life.

Recollection is distinct not only from retention, but also from recognition. The illusion known as *déjà vu* consists in the experience of intense familiarity with a place or scene that, so far as one can recall, has never been witnessed before. In contrast, normal recognition depends upon previous acquaintance with the object being cognized again, *i.e.*, *re-cognized*. The fact, noted by many observers, that recognition may or may not be accompanied by recollection of the previous circumstances, indicates the separation of recall and recognition as acts of memory. Whereas recollection is remembering through the recall of images, recognition consists in remembering at the very moment of perceiving. Both, however, depend upon what seems to be memory's fundamental act —retention.

WITH REGARD TO retention, there are two problems which have been the subject of inquiry throughout the whole tradition. The first concerns what is usually called "the association of ideas." From Aristotle through Hobbes and Hume to James and Freud, there have been various formulations of the laws of association and various interpretations of what such laws signify about the mind. Ebbinghaus, for example, used nonsense syllables in order to measure the effect upon retention of the associations formed by repetition of a series of sounds. All meaning had been removed in order to avoid the influence upon recollection of associations resulting from meaningful connections of the sort which exists among ordinary words. The repetition of nonsense syllables in pairs or series illustrates association by contiguity or succession. According to most writers, the elements of experience become associated through other modes of relation also, such as their similarity or contrast with one another in any significant respect.

It is not the association itself which is remembered. Rather it is through the association of one part of experience with another that memory seems to work, one particular tending to recall others with which it has been asso-

ciated in one or more ways. Recollection seems to occur through activating connections which have been formed and retained. The modern differentiation of controlled and free association indicates two ways in which this can happen—either by a purposeful pursuit of the past or by the apparently chance recall of one thing by another. The ancients make a parallel distinction between reminiscence and reverie. The former is a process in which recollection resembles reasoning in proceeding step by step through a series of related terms; the latter is more like daydreaming or spontaneous fantasy.

The second problem can be stated, perhaps, as the mystery of retention itself. In describing the capacity of the memory to hold the innumerable things which are not now in mind but can be recalled, the ancients speak of memory as "the storehouse of images." Every variety of thing which can be perceived can be "stored up in the memory," says Augustine, and "called up at my pleasure. . . . When I speak of this or that," he goes on, "the images of all the things I mention are at hand from the same storehouse of memory, and if the images were not there I could not so much as speak of the things . . . The things themselves are not brought into the memory; it is only their images which are seized with such marvellous speed, and stored away marvellously as if in cabinets, and as marvellously brought forth again when we remember."

The marvel of memory deepens into a mystery when we ask what the metaphor of the storehouse literally means. Where actually are the images when they are not actually in mind? If an image is by its nature an act of consciousness, whereby we apprehend objects not immediately present to our senses, how do images exist outside of consciousness during intervals when they do not function in remembering, imagining, or other acts of knowing? Their return to consciousness seems to imply that they have been retained, but where and how is the problem not solved by the metaphor of things stored away in a capacious barn.

The physical storehouse does not require any fundamental transformation in the being of the things it holds between periods when they are actually in use. The memory does. This problem of the nature and causes of retention William James seems to think can be solved only in terms of the retentive power of nervous tissue—what he calls "physiological retentiveness"—though in the view of others the problem becomes no easier (and may even be more complicated) when it is transferred from mind to matter. On either view, there seems to be no question that changes in the brain are somehow causally connected with the activity of memory and imagination, especially retention and recall. Aquinas, for example, observes that the imagination and memory may be "hindered by a lesion of the corporeal organ . . . or by lethargy," an observation many times extended by more recent investigations of the brain pathology underlying amnesia and aphasia.

James' treatment of retention as somehow based on pathways traced in the brain, with recall the result of a retracing of these paths, tends to emphasize the affinity between memory and habit. His theory, discussed in the chapter on Habit, that the plasticity of matter, certainly living matter, underlies learning or habit formation, while the inertia or retentiveness of matter, especially the neural matter of the brain, explains memory or the persistence of habits during periods of disuse, seems almost to identify habit and memory. Ice skating after many years of absence from the sport is as much remembering how to ice skate as reciting a poem committed to memory in youth is the exercise of an old habit.

Not all conceptions of habit and memory permit this fusion of the two—or even their affinity as related aspects of the same phenomenon. Aquinas, for example, restricts memory to an act of knowledge. The performance popularly called "reciting from memory" would not be for him an act of memory, though it might involve memory if the recitation were accompanied by knowledge of the time or place and occasion when the poem was first learned. Such knowledge would be a memory, but the recitation itself would not be, any more than ice skating is. These performances represent the exercise of habits of skill or art.

In view of this, Aquinas raises the question whether the act of knowledge, of the sort involved in reconsidering a geometric proof

learned at some earlier moment and now recalled to mind, is an act of memory. The knowledge of the proof which is retained by the intellect during periods when it is not actually exercised, he would call an intellectual habit or habit of knowledge. But should the recollection of this retained knowledge, or the activation of this intellectual habit, also be called an act of memory? Aquinas answers No, on the ground that no reference to the past need be involved in reworking a geometrical problem solved at some earlier time. But if the individual also happens to recall *when* he first solved the problem, that is another matter. Even so, Aquinas claims that "if in the notion of memory we include its object as something past, then the memory is not in the intellectual, but only in the sensitive part." The intellect is said to remember only in the sense of recalling a truth retained by habit, and "not in the sense that it understands the past as something here and now."

Memory is considered in still another way in relation to speculative truths about scientific or philosophical matters. The question is one of the origin of such knowledge. In the usual conception of memory as knowledge of past particulars, one traditional view, found in Aristotle, holds that "out of sense-perception comes to be what we call memory, and out of frequently repeated memories of the same thing develops experience"—the generalized experience which gives rise to induction and the apprehension of the universal. But in the tradition of the great books we also find a more radical and, perhaps, less familiar conception of memory as the chief source of knowledge.

This is Plato's doctrine of reminiscence, in which all learning is a kind of remembering of knowledge already present in the soul. All teaching takes the form of helping the learner to recollect things he may not be aware he knows, by reminding him through a process of questioning which awakens the knowledge already latent in him.

In the *Meno*, Meno asks Socrates, "What do you mean by saying that we do not learn, and that what we call learning is only a process of recollection?" Socrates undertakes to show Meno what he means by taking a slave boy who appears not to know the solution of a certain geometrical problem and merely by questioning him, without ever giving him a single answer, getting the slave boy to find the right solution for himself. Meno assures Socrates that the slave boy had never been taught geometry. Since the boy was not told the answer, he must have always known it, and needed only some reminding to remember what he knew. Socrates suggests the explanation that the boy's soul always possessed this knowledge, bringing it from another life.

Before he undertook the demonstration with the slave boy, Socrates had proposed this hypothesis. "The soul, being immortal, and having been born again many times, and having seen all things that exist . . . has knowledge of them all; and it is no wonder that it should be able to call to remembrance all that it ever knew about virtue, and about everything; for as all nature is akin, and the soul has learned all things, there is no difficulty in her eliciting, or as men say learning, out of a single recollection all the rest, if a man is strenuous and does not faint; for all enquiry and all learning is but recollection."

Though he differs from Plato in his conception of the soul and the origin of the knowledge which it innately possesses, Augustine seems to hold a similar view. As he examines his own memory, it appears to contain much that has not been implanted there by sense-experience. Certain things, referred to by words he understands, he says, "I never reached with any sense of my body, nor ever discerned them otherwise than in my mind; yet in my memory have I laid up not their images, but themselves. How they entered into me, let them say if they can; for I have gone over all the avenues of my flesh, but cannot find by which they entered." If the seeds of learning are in the soul at its creation, memory can draw from these "seminal reasons" the full fruit of knowledge.

THE DOCTRINE OF reminiscence changes the meaning of both learning and memory at the same time. When learning consists in remembering knowledge not acquired in this life, then the activity of memory cannot be, as it is usually conceived, a recollection of knowledge previously acquired in this life by learning. In order to understand a doctrine in which famil-

iar meanings are so profoundly altered, it is perhaps necessary to understand the problem it tries to solve.

That problem exists only for those who make an absolute distinction between particular sensory images and universal ideas or abstract concepts. Those who, like Hobbes, Berkeley, or Hume, deny universals or abstractions as any part of the mind's content, see no special problem in the origin of that part of the mind's content which is not received as sense-impressions. The original impressions are somehow externally caused, and all the rest of the mind's content—its images and memories and all constructions of the sort Locke calls "complex ideas"—then arise by natural derivation from the original sense-impressions.

But those who, on the contrary, maintain that ideas or concepts are *not* images of any sort, cannot avoid the problem of how the mind comes by its ideas. One solution of this problem attributes existence to ideas as intelligible objects, and attributes to the mind the power to apprehend them by direct intuition, just as the senses directly apprehend sensible objects. But if ideas, whether or not they exist outside the mind, cannot be apprehended intuitively, then what is the origin of the ideas whereby the mind understands intelligible objects?

To this question, the doctrine of reminiscence is one answer. Another answer is the doctrine of abstraction, as formulated by Aristotle and Aquinas. Locke and James also seem to recognize a distinction in kind between abstractions and other mental content, but they do not appear to find any need for a special power to perform the act of abstracting general ideas or universal concepts from the sensory particulars of perception and imagination. Aquinas, however, thinks that a special faculty called "the active intellect" must be postulated to account for the mind's possession of the ideas or concepts whereby it actually understands what it cannot perceive or imagine.

THESE THEORIES are considered in the chapters on IDEA and MIND. But just as the doctrine of reminiscence is relevant here for its bearing on the discussion of memory, so the doctrine of abstraction which posits an active intellect is relevant to the discussion of imagination.

"Imagination," writes Aristotle, "is different from either perceiving or discursive thinking, though it is not found apart from sensation or judgment without it. That this activity is not the same kind of thinking as judgment is obvious. For imagining lies within our own power whenever we wish (*e.g.*, we can call up a picture, as in the practice of mnemonics by the use of mental images), but in forming opinions we are not free; we cannot escape the alternatives of falsehood or truth."

The point is not that images cannot be false. They frequently are, as (according to Aristotle) sensations never are. But the falsity of our imaginations involves a judgment that things really are as we imagine them to be. If imagination is not accompanied by judgment, the question of truth or falsity does not arise, for in pure imagination we are not concerned with the way things actually exist, but with the possible, *i.e.*, the imaginary rather than the real. "Everyone knows the difference," says James, "between imagining a thing and believing in its existence."

Conceiving imagination as an activity depending upon the prior activity of the senses, Aristotle holds that imagination is "incapable of existing apart from sensation." In this he does not differ from other psychologists. But he also holds that rational thought, which for him is quite distinct from imagination, cannot exist apart from imagination. "To the thinking soul images serve as if they were the contents of perception. . . . That is the why the soul never thinks without an image."

Aristotle is here saying more than that a special faculty of mind or intellect abstracts the universal form—or what Aquinas calls "the intelligible species"—from the sensory matter of the image, or what Aquinas calls "the phantasm." Aristotle is, in addition, insisting that the act of understanding is always accompanied by imaginative activity. The kind of thinking which depends upon the abstraction of ideas from imagery also depends upon the presence of images when the thinking takes place. "The faculty of thinking," says Aristotle, "thinks the forms in the images"; or, as Aquinas expresses it, "for the intellect to understand actually, not only when it acquires new knowledge, but also when it uses knowledge already acquired, there is need for the act of imagination. . . It must of

necessity turn to the phantasms in order to perceive the universal nature existing in the individual." The cooperation of the imagination with the intellect is shown, furthermore, by the fact that "when the act of imagination is hindered by a lesion of the corporeal organ . . . we see that a man is hindered from understanding actually even those things of which he had a previous knowledge."

Augustine, on the contrary, refers to things "which we know within ourselves without images." When we consider numbers, for example, "it is not their images which are in [our] memory, but themselves." The question of imageless thought—of thinking abstractly without the use of images—seems to be peculiarly insistent in sciences like mathematics, metaphysics, and theology, in which the conceivable may not be imaginable. The objects peculiar to these sciences seem to require the scientist to do without imagery, or, as Aquinas says, "to rise above his imagination."

This may be true even in physics. Atoms, according to Lucretius, are conceivable, but they are no more imaginable than they are perceptible. If we need images to think of them, we must use imagery in a metaphorical way, picturing the atom as the smallest particle imaginable—only more so! To the objection that there must be imageless thought if we can think of incorporeal beings, of which there can be no images or phantasms, Aquinas replies that we do so "by comparison with sensible bodies of which there are phantasms."

ARISTOTLE'S THEORY that the operations of thinking are always dependent on (though not reducible to) acts of imagination, does not imply that imagination is always accompanied by abstract or rational thought. Normally, human thinking and knowing is a work which combines both sense and intellect, both reason and imagination, but sometimes even in man imagination may be active without judgment or reasoning. Brute animals, according to Aristotle, are largely guided by their imaginations "because of the non-existence in them of mind." But when imagination takes the place of thought in men, it is "because of the temporary eclipse of their minds by passion or disease or sleep."

Dreaming seems to be the striking case of imagination divorced from reason's judgment or control. It has long been suspected that animals also dream, but the question whether they can distinguish their dreams from their waking perceptions may prove forever unanswerable. Philosophers and psychologists have, however, asked themselves whether there is any way of being certain of the difference between waking thought and the phantasmagoria of dreams.

Descartes, for example, asks, "How do we know that the thoughts that come in dreams are more false than those that we have when we are awake, seeing that often enough the former are not less lively and vivid than the latter?" It seems to him that "there are no certain indications by which we may clearly distinguish wakefulness from sleep." Even as he writes these words, he can almost persuade himself that he is dreaming. Yet he does find one probable sign whereby to tell dreaming from waking. "Our memory," he observes, "can never connect our dreams with one another, or with the whole course of our lives, as it unites events which happen to us while we are awake."

Aquinas finds other evidences of the difference. When a man is fully asleep, he does not dream at all, for his imagination is inactive as well as his senses and his mind. But as sleep passes gradually into waking, his faculties begin to act again, not merely the imagination, but the reason also, so that "a man may judge that what he sees is a dream, discerning, as it were, between things and their images. Nevertheless, the common sense remains partly suspended, and therefore, although it discriminates some images from reality, yet it is always deceived in some particular. Even while a man is asleep, his sense and imagination may be to some extent free, and similarly the judgment of his intellect may be unfettered, though not entirely. Consequently, if a man syllogizes while asleep, when he wakes up he invariably recognizes a flaw in some respect."

APART FROM QUESTIONS of truth and falsity, or reality and illusion, the nature and causes of dreaming are perennial themes in the tradition of western thought. As different suppositions are made concerning the cause of dreams, so different interpretations are given of their content.

When it is supposed that the dream is inspired by the gods or is a divine visitation, it becomes a medium of divination or prophecy—a way of foretelling the future, or of knowing what the gods intend in general, or for the guidance of some particular man. In the great books of ancient poetry and history, and in the Old Testament as well, dreams, like oracles, are interpreted as supernatural portents, and figure as one of the major sources of prophecy. Aristotle discounts both the fulfillment of dreams and their non-fulfillment, "for coincidences do not occur according to any universal or general law." Regarding prophetic dreams as mere coincidences, he does not find it surprising that "many dreams have no fulfillment." From the fact that "certain of the lower animals also dream," he thinks "it may be concluded that dreams are not sent by God, nor are they designed for the purpose of revealing the future."

Instead, Aristotle proposes natural causes for the origin of dreams. Slight stimulations of the sense-organs awaken the dream process and determine its content. "Dreamers fancy that they are affected by thunder and lightning, when in fact there are only faint ringings in their ears . . . or that they are walking through fire and feeling intense heat, when there is only a slight warmth affecting certain parts of the body." Lucretius similarly explains dreams by natural causes, but attributes their content to events which have dominated the thought of waking life.

"On whatever things we have before spent much time," he writes, "so that the mind was more strained in the task than is its wont, in our sleep we seem mostly to traffic in the same things; lawyers think that they plead their cases and confront law with law, generals that they fight and engage in battles, sailors that they pass a life of conflict waged with winds." This is true even of animals. "Strong horses, when their limbs are lain to rest," Lucretius continues, "yet sweat in their sleep, and pant forever, and strain every nerve as though for victory. . . . And hunters' dogs often in their soft sleep yet suddenly toss their legs, and all at once give tongue, and again and again sniff the air with their nostrils, as if they had found and were following the tracks of wild beasts."

In the tradition of the great books, modern writers like their ancient forebears appeal thus to sensation and memory as the natural causes of the origin and content of dreams. But, except for daydreams or waking fantasy, they do not observe that dreaming may be even more profoundly a product of desire. If Freud's extraordinary insight on this point is supported by all the evidences he assembles in his great work, the *Interpretation of Dreams*, then the lateness of this discovery may be thought even more extraordinary than the theory itself.

The theory is not simply that the content of dreams is determined by desires. When Oedipus tells Jocasta of his fear that in taking her to wife he has unwittingly married his mother, she tells him to fear not, for "many men ere now have so fared in dreams also." If that is so, then such dreams do not call for the interpretation which Freud gives. If there are men who suffer from what Freud calls "the Oedipus complex," involving repressed incestuous desires, then the expression of those desires in dreaming will not take the form of imagining them to be actually fulfilled.

On the contrary, Freud's theory of dream symbolism holds that "the dream as remembered is not the real thing at all, but a distorted substitute." Beneath what he calls "the manifest dream-content"—the actual moving images which occupy the dreaming consciousness—lie "the latent dream-thoughts" which are distorted in the actual dream. This distortion "is due to the activities of censorship, directed against the unacceptable unconscious wish-impulses . . . invariably of an objectionable nature, offensive from the ethical, aesthetic, or social point of view, things about which we do not dare to think at all, or think of only with abhorrence." The repressed desires or wishes, the loves or fears, which the dreamer refuses to acknowledge consciously must, therefore, appear in dreams in a disguised form. The imagery of dreams seems to Freud to be a kind of language in which the repressed materials of thought and feeling employ a special symbolism to express what the moral censor will not permit us to express in the ordinary language of our conscious thought or social conversation.

As ordinary language contains symbols conventionally agreed upon, so Freud finds that

the recurrence again and again of certain images in the dreams of neurotic patients, and of normal persons as well, gives them the character of conventional symbols. "The number of things which are represented symbolically in dreams is," according to Freud, "not great." They are, he says, "the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness—and one thing more. The only typical, that is to say, regularly occurring, representation of the human form as a whole is that of a *house*. . . . When the walls are quite smooth, the house means a man; when there are ledges and balconies which can be caught hold of, a woman. Parents appear in dreams as *emperor* and *empress*, *king* and *queen*, or other exalted personages . . . Children and brothers are less tenderly treated, being symbolized by little *animals* or *vermin*. Birth is almost invariably represented by some reference to *water*. . . . For dying we have setting out upon a *journey* or *travelling* by train. *Clothes* and *uniforms* stand for nakedness." The one thing more, which Freud mentions in his enumeration, comprises the sexual organs and acts. In contrast to all the others, these, he says, "are represented by a remarkably rich symbolism. . . . An overwhelming majority of symbols in dreams are sexual symbols."

Freud points out why it would be a mistake to treat dream symbols like the words of an ordinary language. "Their object is not to tell anyone anything; they are not a means of communication; on the contrary, it is important to them not to be understood." Wresting their secret from such symbols is a remarkable achievement. Aristotle's remark, which Freud quotes, that "the most skilful interpreter of dreams is he who has the faculty of observing resemblances," seems to be borne out in the Freudian method of discovering the latent content of the dream symbolism. But Freud's therapeutic use of what can thus be discovered makes the psychoanalytic method a thing totally unanticipated by any of his predecessors.

OUTLINE OF TOPICS

	PAGE
1. The faculties of memory and imagination in brutes and men	143
1*a*. The relation of memory and imagination to sense: the *a priori* grounds of possible experience in the synthesis of intuition, reproduction, and recognition	
1*b*. The physiology of memory and imagination: their bodily organs	144
1*c*. The distinction and connection of memory and imagination: their interdependence	
1*d*. The influence of memory and imagination on the emotions and will: voluntary movement	
2. The activity of memory	145
2*a*. Retention: factors influencing its strength	
2*b*. Recollection: factors influencing ease and adequacy of recall	
2*c*. The association of ideas: controlled and free association; reminiscence and reverie	
2*d*. Recognition with or without recall	146
2*e*. The scope and range of normal memory: failure or defect of memory and its causes	
(1) Forgetting as a function of the time elapsed	
(2) The obliviscence of the disagreeable: conflict and repression	
(3) Organic lesions: amnesia and the aphasias	
(4) False memories: illusions of memory; *déjà vu*	147

PAGE

3. Remembering as an act of knowledge and as a source of knowledge 147

3*a*. Reminiscence as the process of all learning: innate ideas or seminal reasons

3*b*. Sensitive and intellectual memory: knowledge of the past and the habit of knowledge

3*c*. The scientist's use of memory: collated memories as the source of generalized experience 148

3*d*. Memory as the muse of poetry and history: the dependence of history on the memory of men

4. The contribution of memory: the binding of time

4*a*. Memory in the life of the individual: personal identity and continuity

4*b*. Memory in the life of the group or race: instinct, legend, and tradition

5. The activity of imagination, fancy, or fantasy: the nature and variety of images 149

5*a*. The distinction between reproductive and creative imagination: the representative image and the imaginative construct

5*b*. The image distinguished from the idea or concept: the concrete and particular as contrasted with the abstract and universal 150

5*c*. The pathology of imagination: hallucinations, persistent imagery

6. The role of imagination in thinking and knowing 151

6*a*. Imagination as knowledge: its relation to possible and actual experience

6*b*. The effect of intellect on human imagination: the imaginative thinking of animals

6*c*. The dependence of rational thought and knowledge on imagination

(1) The abstraction of ideas from images: the image as a condition of thought

(2) The schema of the imagination as mediating between concepts of the understanding and the sensory manifold of intuition: the transcendental unity of apperception 152

6*d*. The limits of imagination: imageless thought; the necessity of going beyond imagination in the speculative sciences

7. Imagination and the fine arts

7*a*. The use of imagination in the production and appreciation of works of art

7*b*. The fantastic and the realistic in poetry: the probable and the possible in poetry and history 153

8. The nature and causes of dreaming

8*a*. Dreams as divinely inspired: their prophetic portent; divination through the medium of dreams

8*b*. The role of sensation and memory in the dreams of sleep 154

8*c*. The expression of desire in daydreaming or fantasy

8*d*. The symbolism of dreams 155

(1) The manifest and latent content of dreams: the dream-work

(2) The recurrent use of specific symbols in dreams: the dream-language

8*e*. Dream-analysis as uncovering the repressed unconscious

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 57: METAPHYSICS

INTRODUCTION

IN this chapter, as in MATHEMATICS, we must distinguish controversies about the science we are considering from controversies in it. But here the situation is complicated by many ambiguities. In the tradition of western thought, the name of science has never been denied to mathematics, no matter how its subject matter has been defined or what conception of science has prevailed. But controversies about metaphysics often begin, in modern times at least, by questioning our right to use the word "science" when we speak of metaphysical inquiry or speculation. The challenge usually implies that metaphysics cannot be regarded as a body of valid knowledge because the peculiar objects it has chosen to investigate are not susceptible to scientific inquiry.

If experimentation were the *sine qua non* of scientific knowledge, it would follow, of course, that a discipline which could not perform experiments or even less rigorous types of empirical research could not be called a science. But by that standard mathematics would also be ruled out. It does not seem to be the case, however, that mathematics and metaphysics stand or fall together.

Hume, for example, admits the one and excludes the other. If we are persuaded of his principles concerning science, what havoc, he says, must we make when we run over our libraries. "If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames; for it can contain nothing but sophistry and illusion."

Nor does Kant make experimentation or empirical research indispensable to valid and certain knowledge. On the contrary, pure, as opposed to empirical, physics is for him like mathematics in having the superior status of *a priori* knowledge. They are both sciences in the highest sense of the term because they consist of valid synthetic judgments *a priori*. Kant, therefore, does not exclude metaphysics from the ranks of science because he thinks that "metaphysic, according to its proper aim, consists merely of synthetic propositions *a priori*." Not the method of metaphysics, nor the form of its propositions, but the character of its objects seems to be the cause of its frustration, reducing it to what Kant calls an "illusory dialectic" rather than a valid science.

It might be supposed that those who take the opposite view—that metaphysics is a science, even, perhaps, the highest of the sciences—would agree in defining its objects or the scope of its inquiry. This does not seem to be the case, any more than it seems to be true that all those who criticize metaphysics conceive its subject matter in the same way.

Following what he takes to be the traditional conception of metaphysics in the mediaeval schools, which appears to him to be continued in the writings of Descartes, Leibnitz, and Wolff, Kant says that "metaphysic has for the proper object of its inquiries only three grand ideas: God, Freedom, and Immortality." This also seems to be at least part of what Hume has in mind when he refers to "school metaphysics" and associates it with "divinity," by which he means theology, natural or sacred. Yet we find William James saying that "Hume is at bottom as much of a metaphysician as Thomas Aquinas," because he is engaged in speculations concerning the relation or lack of relation, the identity or lack of identity, in the discrete elements of immediate experience. Here the question seems to be not about God, freedom, and immortality, but about the existence of enduring

substances underlying all perceptible qualities, or about a fixed order of reality behind the sequence of phenomena in experience. According to James, "the whole question of interaction and influence between things is a metaphysical question, and cannot be discussed at all by those who are unwilling to go into matters thoroughly."

In the Preface to his *Principles of Psychology*, James declares his plan to limit his own inquiries to what can be known by the empirical methods of the natural sciences. Psychology like physics must assume certain data. The discussion of these assumptions, he says, "is called metaphysics and falls outside the province of this book. . . . . The data assumed by psychology, just like those assumed by physics and the other natural sciences, must sometime be overhauled. The effort to overhaul them clearly and thoroughly is metaphysics; but metaphysics can only perform her task well when distinctly conscious of its great extent." The implication seems to be not that metaphysics is impossible but rather that metaphysics, as James conceives it, does not yet exist in any mature or satisfactory development. "Only a metaphysics alive to the weight of her task," he writes, can hope to be successful. "That will perhaps be centuries hence."

WE CANNOT FULLY explore the issue concerning the objects of metaphysics without observing that other names are used in the tradition of the great books to designate the discipline which, rightly or wrongly, claims to be the highest human science. The Greeks initiated the conception of a discipline which should be preeminent because it deals with first principles and highest causes. It not only searches for wisdom about the ultimate realities; it also lays the foundations for all other sciences. But the Greeks do not have one name for this discipline, nor is "metaphysics" even among the various names they use.

Aristotle, whose *Metaphysics* is the first great book to have this word in its title, never uses the word to refer to the science which he is trying to define and establish. In the opening chapters, he speaks of it under the name of wisdom, for "all men suppose what is called Wisdom to deal with the first causes and the principles of all things." There are other theoretical sciences, such as physics and mathematics, which investigate causes or deal with principles, but they do not reach to the highest causes or first principles, nor do they take all things in their most universal aspect as the object of their inquiry.

Though "physics also is a kind of Wisdom," says Aristotle, "it is not the first kind"; and elsewhere he says that "both physics and mathematics must be classed as *parts* of Wisdom." Physics deals only with material things in motion; and "the mathematician investigates abstractions"—objects which, except as abstracted, cannot exist apart from matter and motion. "If there is something which is eternal and immovable and separated from matter, clearly the knowledge of it belongs to a theoretical science —not, however, to physics nor to mathematics, but to a science prior to both." It is that science which is the highest part of wisdom.

Aristotle gives two names to the supreme form of human wisdom or the highest of the theoretical sciences. He denominates it both from the position it occupies in relation to all other disciplines and also in terms of the kind of substance which it alone investigates. If there is "no substance other than those which are formed by nature, natural science (*i.e.*, physics) will be the first science, but if there is an immovable substance, the science of this must be prior and must be first philosophy." But this highest science also deserves to be called "theology" as well as "first philosophy." There are, Aristotle says, "three theoretical philosophies, mathematics, physics, and what we may call theology, since it is obvious that if the divine is present anywhere, it is present in things of this sort," *i.e.*, the eternal, immutable, immaterial.

THERE IS STILL another name for the highest speculative discipline in the Greek conception of the order of the sciences. "Dialectic" is the name which Plato gives to the search for first principles and for the knowledge of the most intelligible realities. As appears in the chapter on DIALECTIC, Aristotle contrasts the dialectician and the philosopher as respectively concerned with opinion and knowledge, but Plato regards the dialectician as preeminently the

philosopher. Not only does dialectic belong to the realm of knowledge rather than opinion, but in the realm of knowledge, mathematics occupies the lower, dialectic the upper part. The mathematical sciences build upon hypotheses which they do not and cannot establish. Dialectic uses hypotheses only "as steps and points of departure into a world which is above hypotheses, in order that she may soar beyond them to the first principle of the whole; and . . . by successive steps she descends again without the aid of any sensible object from ideas, through ideas, and in ideas she ends."

Despite all the relevant differences between Plato and Aristotle concerning being and becoming, reason and sense, the intelligible and the sensible, it seems possible to compare the knowledge which Plato calls "dialectic" with what Aristotle calls "first philosophy" or "theology."

Both, for example, proceed from first principles and establish the foundations of the inferior sciences. On its downward path, dialectic, according to Plato, brings the light of reason to bear on the understanding of the hypotheses which are the principles of mathematics. Though Aristotle thinks that mathematics rests on axioms or self-evident truths, he also says that "it must be the business of first philosophy to examine the principles of mathematics" because the mathematician only uses them in a special application without investigating their general truth. Furthermore, the question concerning how the objects of mathematics exist is a question for the first philosopher, not the mathematician.

In the *Sophist*, Plato, to illustrate the difference between the sophist and the dialectician or philosopher, develops an analysis of such terms as being and non-being, true and false, same and other, one and many, rest and motion. These, it seems, are the fundamental concepts in the philosopher's knowledge of the ultimate reality. But these are also the fundamental concepts in Aristotle's *Metaphysics*. In the mediaeval period when "metaphysics" generally replaces "dialectic" as the name for the first philosophy, the so-called transcendental terms—such as *being*, *essence*, *other*, *one*, *true*, *good*—are treated as the basic metaphysical concepts; and what is characteristic of them as abstractions helps to characterize the nature of metaphysics as a science.

The word "metaphysics" comes into use as a result of the title supposedly given by the Alexandrian librarians to the work in which Aristotle treats the problems of the first philosophy. The word is short for "the books which come after the books on physics." Plotinus uses the word and connects it with the Platonic meaning of "dialectic. "In the training of the metaphysician he says, dialectic is the ultimate study.

Dialectic, according to Plotinus, "is the method, or discipline, that brings with it the power of pronouncing with final truth upon the nature and relation of things—what each is, how it differs from others, what common quality all have, to what kind each belongs and in what rank each stands in its kind and whether its being is real-being, and how many beings there are, and how many non-beings to be distinguished from beings." But we must not think of dialectic, Plotinus declares, "as the mere tool of the metaphysician." It goes beyond metaphysics as vision or contemplative wisdom goes beyond discursive reasoning and demonstration. "It leaves to another science all that coil of premises and conclusions called the art of reasoning."

THE QUESTION which Plotinus raises—whether there is a higher science or form of knowledge than metaphysics—is naturally considered by the great Christian theologians. In part their answer resembles that of Plotinus; in part it differs. Where Plotinus speaks of dialectic as "the most precious part of philosophy" because it transcends reasoning and argument and reaches the sort of immediate apprehension of reality which cannot be expressed in words, theologians recognize the supremacy of mystical knowledge—a foretaste in this life of what the vision of God will be like in the life to come. But, unlike Plotinus, they do not think such knowledge, here or hereafter, is natural wisdom. Rather it is supernatural knowledge, the divine gift to man of a contemplative wisdom to which his nature cannot attain by its own unaided powers.

The subordination of metaphysical science to knowledge which is both supernatural and non-scientific (*i.e.*, neither discursive nor analytical nor demonstrative) is considered in the chap-

ters on THEOLOGY and WISDOM. Another subordination of metaphysics, considered there also, must be mentioned here as well. That is the subordination of metaphysics to theology. Both metaphysics and theology may be conceived as sciences which are engaged in reasoning and argument and in trying to demonstrate conclusions from principles. But one is merely a human science working with the principles of reason, whereas the other is what Aquinas calls "sacred doctrine," in order to signify that its principles are articles of religious faith.

In the hierarchy of human sciences, metaphysics remains supreme—the first philosophy. It suffers only by comparison with theology insofar as the latter rests upon divine revelation and, since it enjoys the certainty of faith, escapes the insecurity of reason. Though metaphysics and theology differ in their principles and somewhat in their methods, they do not differ entirely in their subject matter. Both, for example, may treat of God and of the existence of immaterial and imperishable beings. Aquinas, therefore, must face the objection that there is no need for any knowledge in addition to metaphysics because "everything that is, is treated of in philosophical science—even God Himself, in that part of philosophy called theology, or the divine science, by Aristotle." To this he replies by giving two reasons for sacred theology.

It is necessary, he says, "for the salvation of man that certain truths which exceed human reason should be made known to him by divine revelation. Even as regards those truths about God which human reason could have discovered, it was necessary that man should be taught by a divine revelation; because the truth about God such as reason could discover, would only be known by a few, and that after a long time, and with the admixture of many errors." Furthermore, he continues, there is no reason "why those things which may be learnt from philosophical science, so far as they can be known by natural reason, may not also be taught us by another science so far as they fall within revelation. Hence the theology included in sacred doctrine differs in kind from that theology which is a part of philosophy."

These two kinds of theology are traditionally distinguished as natural and sacred. When Francis Bacon divides the sciences "into theology and philosophy," he adds that "in the former we do not include natural theology." Natural theology is the divine part of philosophy, yet it is clearly distinct from sacred theology or what Bacon calls "inspired divinity."

This distinction, in whatever language it is made, raises two problems. The first concerns the relation of natural to sacred theology, especially with regard to the scope of natural theology and the precise nature of its independence of sacred doctrine. On this question there seems to be considerable difference between such writers as Augustine and Aquinas, or Bacon and Descartes. As already noted, the various issues involved are reserved for discussion in the chapter on THEOLOGY. The second problem is directly pertinent to metaphysics alone. The question is whether metaphysics and natural theology are identical in subject matter or scope, or whether natural theology is only a part of metaphysics.

Aristotle seems to answer this question when he suggests that "first philosophy" and "theology" are interchangeable designations for the highest branch of speculative knowledge. To the extent that he declares this science to be an inquiry concerning the existence and nature of immaterial and imperishable substances, his definition of the object of metaphysics would seem to justify the title of theology.

Descartes, who also separates metaphysics from physics by reference to the immateriality and materiality of the substances which are their objects, even more explicitly seems to give the whole of metaphysics a theological character. In the Preface to his *Meditations on the First Philosophy*, he says that he is concerned to treat of "God and the human soul"; for, as he explains to the professors of Sacred Theology of the Sorbonne, "I have always considered that the two questions respecting God and the soul were the chief of those that ought to be demonstrated by philosophical rather than theological argument."

Though he adds the freedom of the human will to the existence of God and the immortality of the soul, Kant's definition of the objects of metaphysical speculation similarly makes metaphysics an inquiry into things which lie outside the realm of physics and associates it

with the traditional subject matter of theology, at least in the sense that here reason tries to prove propositions which are the main tenets of religious faith. In his Preface to the first edition of the *Critique of Pure Reason*, Kant remarks that when reason "finds itself compelled to have recourse to principles which transcend the region of experience," it "falls into confusion and contradictions. . . . The arena of these endless contests is called Metaphysic."

If nothing immaterial exists, if there are no beings apart from the changing things of sense-experience, or if, although such things exist, they cannot be known by reason proceeding in the manner of speculative science, does it follow that metaphysics must also be denied existence, at least as a speculative science? The answer seems to be clear. If the declared objects of a science do not exist, or if those objects are unknowable by the methods which that science proposes to follow, then it seems difficult to defend its claims to be a valid science against those who challenge them. The controversy over the validity of metaphysics would thus appear to turn on the truth or falsity of the two "ifs" just mentioned.

But the matter cannot be so resolved if natural theology does not exhaust the whole of metaphysics; that is, if metaphysics considers objects other than the immaterial, and if it inquires into their nature rather than their existence. Aristotle's definition of the subject matter of the first philosophy seems to contain an alternative conception of metaphysics, one which may be quite consistent with the conception of it as theology, but which, however, gives it problems to solve in the realm of physical things.

"There is a science," Aristotle writes, "which investigates being as being and the attributes which belong to being in virtue of its own nature." This definition of the first philosophy seems to differentiate it from mathematics and physics as sharply as the other definition in terms of immaterial and imperishable substances. The other sciences, according to Aristotle, do not treat of "being *qua* being universally." The properties of anything which is "in so far as it has being, and the contraries in it *qua* being, it is the business of no other science to investigate; for to physics one would assign the study of things not *qua* being, but rather *qua* sharing in movement"; and mathematics is concerned with the attributes of things insofar as they are "quantitative and continuous." These sciences "mark off some particular kind of being, some genus, and inquire into this, but not being simply, nor *qua* being. . . . Similarly, these sciences omit the question whether the genus with which they deal exists or does not exist, because it belongs to the same kind of thinking to show what it is and that it is."

Only the first philosophy "does not inquire about particular subjects in so far as each has some attribute or other, but speculates about being, in so far as each particular thing is." Its subject matter, then, includes *all* existing things as existing, and involves not only the question how anything which exists exists (*i.e.*, the properties of being), but also the question whether certain things, whose existence can be questioned, do in fact exist. Whatever truths hold good for all things *qua* being—such as the principle that the same thing cannot both be and not be in the same respect at the same time—belong to the first philosophy, even though, as in this case Aristotle points out, the law of contradiction may also belong to logic as the principle of demonstration.

This broader conception of the first philosophy explains, as its restriction to natural theology could not explain, why the central books in Aristotle's *Metaphysics* treat of sensible, physical substances; their nature as substances; the distinction between substance and accident, form and matter, potentiality and actuality, as principles of the composite nature of changing substances; and the properties of such existences in virtue of their having being, *e.g.*, their unity and divisibility, their sameness and otherness.

Aristotle does not inquire whether such substances exist. He seems to take their existence as unquestionable, for he frequently refers to physical things as "the readily recognized substances." But in addition to the question "how sensible substances exist," there are such questions as "whether there are or are not any besides sensible substances. . . and whether there

is a substance capable of separate existence, apart from sensible substances, and if so why and how." These latter questions lead to the concluding books of the *Metaphysics* which inquire into the existence of the non-sensible, the immaterial, the immutable. If Aristotle's theology begins here, then theology is only a part—the crowning part, perhaps—of a larger science whose object is not a special realm of being, but all of being.

Hobbes and Bacon go further than Aristotle in the direction of opposing the identification of metaphysics with theology. Where Aristotle seems to admit theological subject matter as a part of the first philosophy, they exclude it entirely.

Hobbes does not use the word "metaphysics" in his own classification of the sciences; he employs it only as a term of derogation to refer to scholastic doctrines which he repudiates. His own classification makes *philosophia prima* that branch of natural philosophy which is prior to the mathematical and mechanical sciences. The latter deal with determinate quantity and motion. The antecedent science deals with "quantity and motion *indeterminate*." These "being the principles or first foundation of philosophy," the science which deals with them "is called *Philosophia Prima*."

Bacon distinguishes between first philosophy and metaphysics and between metaphysics and natural theology. First philosophy, he says, is "the common parent of sciences." It is concerned with "axioms, not peculiar to any science, but common to a number of them" and also with "the adventitious or transcendental condition of things, such as little, much, like, different, possible, impossible, entity, nonentity, etc." Natural theology, which is the divine part of philosophy because it inquires about "God, unity, goodness, angels, and spirits," is separate from the rest of natural philosophy.

"But to assign the proper office of metaphysics, as contra-distinguished from primary philosophy and natural theology," Bacon writes, "we must note that as physics regards the things which are wholly immersed in matter and movable, so metaphysics regards what is more abstracted and fixed; that physics supposes only existence, motion, and natural necessity, whilst metaphysics supposes also mind and idea. . . . As we have divided natural philosophy into the investigation of causes and the production of effects, and referred the investigation of causes to theory, which we again divide into physical and metaphysical, it is necessary that the real difference of these two be drawn from the nature of the causes they inquire into." Physics, according to Bacon, inquires into efficient and material causes; metaphysics, into formal and final causes; and as mechanics is the practical application of physical theory, so what Bacon calls "magic" is the practical doctrine that corresponds to the metaphysical theory of forms.

AGREEMENT OR disagreement concerning the subject matter and problems of that which claims to be the highest human science, however named, does not seem to be uniformly accompanied by agreement or disagreement concerning the status and development of the discipline in question.

There seems to be some similarity, for example, between Plato's dialectic as an inquiry into forms and Bacon's notion of metaphysics as concerned with formal causes—a similarity which Bacon himself observes. But where Plato seems to think that dialectic exists, to be taught and learned, Bacon's judgment is that this part of metaphysics, if not the part dealing with final causes, has not yet been developed because the right method has not been employed.

Again, Aristotle's conception of metaphysics as concerned with the primary axioms, the universal principles applicable to all existence, and the transcendental properties of being, seems to bear some resemblance to Bacon's primary philosophy. But Bacon writes as if Aristotle's *Metaphysics* had not been written, or at least as if it had not succeeded, as Aristotle might have supposed it had, in establishing the science which Bacon finds for the most part in a defective or undeveloped condition.

If we turn to natural theology, either as a part of metaphysics (with Aristotle), or as separate from metaphysics (with Bacon), or as identical with metaphysics (with Descartes), we find the same situation. Aside from some verbal and some real differences concerning the objects of the inquiry, Aristotle, Bacon, and Descartes think that the existence of beings

apart from the sensible world of matter and change can be demonstrated and that something can be known of their nature—whether they are called immaterial substances, spirits, and intelligences, or God, angels, and souls.

With some alterations in language and thought, Plato and Plotinus, Augustine and Aquinas, Spinoza and Locke can be added to this company. They are theologians in that sense of "theology" which implies a rational knowledge—without religious faith, and either by intuition or demonstration—of beings which really exist, yet are not sensible or material or mutable or finite. Spinoza, for example, does not use the word "metaphysics," but he holds that "the human mind possesses an adequate knowledge of the eternal and infinite essence of God." Although Locke's use of the word "metaphysics" is derogatory, and though the purpose of his *Essay Concerning Human Understanding* is to prevent human inquiries from extending beyond man's capacities, he attributes greater certainty to our knowledge of God and the soul than to our knowledge of bodies, and finds no greater difficulty in our speculations about spirits than about particles of matter.

"Experimenting and discovering in ourselves knowledge, and the power of voluntary motion, as certainly as we experiment, or discover in things without us, the cohesion and separation of solid parts, which is the extension and motion of bodies," Locke writes, "we have as much reason to be satisfied with our notion of immaterial spirit, as with our notion of body, and the existence of the one as well as the other. . . . But whichever of these complex ideas be clearest, that of body, or immaterial spirit, this is evident, that the simple ideas that make them up are no other than what we have received from sensation or reflection; and so is it of all our other ideas of substances, even of God himself."

As we have already seen, Hume and Kant deny metaphysics (so far as it is identified with what is traditionally natural theology) the status of a valid theoretical science. For them it is incapable of taking its place beside physics and mathematics. Hume, in addition, denies validity to metaphysical speculation concerning causes and substances in the natural order. Unlike Hume, who simply removes metaphysical problems from the realm of questions worth thinking about, Kant does not reject the problems but rather offers alternative methods of stating and solving them. He hopes thereby to accomplish a reformation rather than an abolition of metaphysical inquiry.

The existence of God, freedom, and immortality must be affirmed, Kant thinks, in the order of practical, not speculative reason. They are indispensable "conditions of the necessary object of our will . . . . that is to say, conditions of the practical use of pure reason." Yet, he adds, "we cannot affirm that we *know* and *understand*, I will not say the actuality, but even the possibility, of them."

Furthermore, by redefining metaphysics to mean "any system of knowledge *a priori* that consists of pure conceptions," Kant not only gives his fundamental treatises in morals and ethics a metaphysical character, but sees the possibility of a genuine metaphysic emerging from the *Critique of Pure Reason*. Once "the dogmatism of metaphysic" has been removed, "that is, the presumption that it is possible to achieve anything in metaphysic without a previous criticism of pure reason. . . . it may not be too difficult to leave a bequest to posterity in the shape of a systematical metaphysic, carried out according to the critique of pure reason."

Kant's transcendental philosophy, and especially what he calls "the architectonic of pure reason," is in a sense that metaphysic already begun. In subject matter, if not in its method or conclusions, it resembles the traditional inquiry concerning the universal principles and transcendental properties of being. The objects of natural theology are, of course, excluded as being beyond the power of reason to know in a speculative manner.

Metaphysics as a possible science is for Kant "nothing more than the inventory of all that is given us by *pure reason*, systematically arranged. . . . Such a system of pure speculative reason," he says in his original preface to the *Critique*, "I hope to be able to publish under the title of *Metaphysic of Nature*." And in the last pages of the *Critique*, wherein he criticizes all speculative efforts in the sphere of natural theology, Kant reaffirms "the speculative and the practical use of pure reason" to constitute "a Metaphysic of Nature and a Metaphysic of

Ethics." The former, he says, is "what is commonly called Metaphysic in the more limited sense." Both together "form properly that department of knowledge which may be termed, in the truest sense of the word, philosophy. The path which it pursues is that of science, which, when it has once been discovered, is never lost, and never misleads."

CONTROVERSIES ABOUT metaphysics can be distinguished from metaphysical controversies—that is, disputes within the field of metaphysical thought. We have confined our attention to the former throughout this chapter. But it may not be possible to judge, much less to resolve, the issues about the scope, methods, and validity of metaphysics without engaging in, or at least facing, issues which are themselves metaphysical.

The only way to escape this would be to suppose that psychology (as an analysis of the powers of the mind) or epistemology (as a theory of the criteria of valid knowledge) could determine in advance of any examination of metaphysical discussion whether the matters to be discussed fall within the range of questions concerning which the human mind has the power to find and validate answers. But if this supposition is untenable in itself; or if it is untenable because psychology and epistemology, when they are treated as the first philosophy, themselves presuppose a metaphysics or conceal their metaphysical presuppositions; then no alternative remains but to judge metaphysics directly by its fruits.

In that case, the issues surveyed in this chapter require an examination of the metaphysical discussions to be found in such chapters as GOD, ANGEL, IDEA, SOUL, IMMORTALITY, WILL (which are relevant particularly to the problems of natural theology); and (as relevant to other parts or problems of metaphysics) such chapters as BEING, CAUSE, FORM, MATTER, ONE AND MANY, RELATION, SAME AND OTHER.

OUTLINE OF TOPICS

PAGE

1. Conceptions of the highest human science: dialectic, first philosophy, metaphysics, natural theology, transcendental philosophy 166

2. The analysis of the highest human science: the character of dialectical, metaphysical, or transcendental knowledge 167

   2*a*. The distinctive objects or problems of the supreme science

   2*b*. The nature of the concepts, abstractions, or principles of the highest science

   2*c*. The method of metaphysics: the distinction between empirical and transcendental methods

   2*d*. The distinction between a metaphysic of nature and a metaphysic of morals: the difference between the speculative treatment and the practical resolution of the metaphysical problems of God, freedom, and immortality 168

3. Metaphysics in relation to other disciplines

   3*a*. The relation of metaphysics to theology

   3*b*. The relation of metaphysics to mathematics, physics or natural philosophy, psychology, and the empirical sciences

   3*c*. The relation of metaphysics to logic and dialectic

4. The criticism and reformation of metaphysics 169

   4*a*. The dismissal or satirization of metaphysics as dogmatism or sophistry

   4*b*. Reconstructions of metaphysics: critical philosophy as a propaedeutic to metaphysics

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 58: MIND

INTRODUCTION

IN the tradition of the great books, the word "mind" is used less frequently than "reason," "intellect," "understanding," or "soul." There are still other words, like "intelligence," "consciousness," and even "spirit" or "psyche," which often carry some part of the connotation of the word "mind." Certain authors use "mind" as a synonym for one or another of these words, and give it the meaning which other writers express exclusively in terms of "reason" or "understanding." Some discuss mind without reference to soul, some identify mind with soul or spirit, and some conceive mind as only a part of soul or spirit.

For the purpose of assembling in a single chapter references to all discussions which fall within the area of meaning common to all these terms, it was necessary to adopt some single covering word. Our choice of "mind" is partly the result of its present currency, partly the result of the fact that it is somewhat more neutral than the others and therefore less prejudicial to the conflicting theories which are juxtaposed in this chapter.

Words like "reason" or "intellect" usually imply a sharper distinction between the functions or faculties of sensation and thought than does the word "mind." Imagination and memory, for example, are attributed to the understanding in the writings of Locke and Hume, whereas, in the analytical vocabulary of Aristotle and Aquinas, imagination and memory belong to sense, not to reason or intellect. Similarly, words like "soul" or "spirit" usually connote a substantial as well as an immaterial mode of being, whereas "mind" can have the meaning of a faculty or a power to be found in living organisms.

The adoption of the word "mind" is purely a matter of convenience. It begs no questions and decides no issues. The relations between what is here discussed and the matters considered in the chapters on SOUL, SENSE, MEMORY AND IMAGINATION, remain the same as they would be if "reason" or "intellect" were used in place of "mind." Different formulations of these relationships are not affected by the words used, but by different theories of what the mind is, however it is named.

Before we consider the diverse conceptions of the human mind which are enumerated under the seven main divisions of the first section in the Outline of Topics, it may be useful to examine the elements of meaning more or less common to the connotation of all the words which "mind" here represents. Even here we must avoid begging the question whether mind is a peculiarly human possession. Other animals may have minds. Mind may be, as it is on one theory, a universal property of matter. According to another theory, there may be superhuman minds or intelligences, or a single absolute mind, a transcendent intelligence.

What, then, does the universe contain because there is mind in it, which would be lacking if everything else could remain the same with mind removed? The facts we are compelled to mention in answering this question should give us some indication of the elements of meaning common to "mind" and all its synonyms.

FIRST IS THE FACT of thought or thinking. If there were no evidence of thought in the world, mind would have little or no meaning. The recognition of this fact throughout the tradition accounts for the development of diverse theories of mind. None of the great writers denies the phenomenon of thought, however differently each may describe or explain it; none, therefore, is without some conception of mind.

It may be supposed that such words as "thought" or "thinking" cannot, because of their own ambiguity, help us to define the sphere of mind. But whatever the relation of thinking to sensing, thinking seems to involve more—for almost all observers—than a mere reception of impressions from without. This seems to be the opinion of those who make thinking a consequence of sensing, as well as of those who regard thought as independent of sense. For both, thinking goes beyond sensing, either as an elaboration of the materials of sense or as an apprehension of objects which are totally beyond the reach of the senses. To the extent that this insight is true, the elements or aspects of thought discussed in the chapters on IDEA, JUDGMENT, and REASONING have an obvious relevance to the various theories of mind discussed in this chapter.

THE SECOND FACT which seems to be a root common to all conceptions of mind is that of knowledge or knowing. This may be questioned on the ground that if there were sensation without any form of thought, judgment, or reasoning, there would be at least a rudimentary form of knowledge—some degree of consciousness or awareness by one thing of another. Granting the point of this objection, it nevertheless seems to be true that the distinction between truth and falsity, and the difference between knowledge, error, and ignorance, or knowledge, belief, and opinion, do not apply to sensations in the total absence of thought. The chapter on KNOWLEDGE reports formulations of these distinctions or differences. Any understanding of knowledge which involves them seems to imply mind for the same reason that it implies thought.

There is a further implication of mind in the fact of self-knowledge. Sensing may be awareness of an object and to this extent it may be a kind of knowing, but it has never been observed that the senses can sense or be aware of themselves. Take, for example, definitions of sense, or theories of sensation and the objects of sense. Such definitions and theories must be regarded as works of reflective thought; they are not products of sensation.

Thought seems to be not only reflective, but reflexive, that is, able to consider itself, to define the nature of thinking and to develop theories of mind. This fact about thought—its reflexivity—also seems to be a common element in all the meanings of "mind." It is sometimes referred to as "the reflexivity of the intellect" or as "the reflexive power of the understanding" or as "the ability of the understanding to reflect upon its own acts" or as "self-consciousness." Whatever the phrasing, a world without self-consciousness or self-knowledge would be a world in which the traditional conception of mind would probably not have arisen.

THE THIRD FACT is the fact of purpose or intention, of planning a course of action with foreknowledge of its goal, or working in any other way toward a desired and foreseen objective. As in the case of sensitivity, the phenomena of desire do not, without further qualification, indicate the realm of mind. According to the theory of natural desire, for example, the natural tendencies of even inanimate and insensitive things are expressions of desire. But it is not in that sense of desire that the fact of purpose or intention is here taken as evidence of mind.

It is rather on the level of the behavior of living things that purpose seems to require a factor over and above the senses, limited as they are to present appearances. It cannot be found in the passions which have the same limitation as the senses, for unless they are checked they tend toward immediate emotional discharge. That factor, called for by the direction of conduct to future ends, is either an element common to all meanings of "mind" or is at least an element associated with mind.

It is sometimes called the faculty of will—rational desire or the intellectual appetite. Sometimes it is treated as the act of willing which, along with thinking, is one of the two major activities of mind or understanding; and sometimes purposiveness is regarded as the very essense of mentality. Considerations relevant to this aspect of mind are discussed in the chapter on WILL.

THESE THREE OR FOUR FACTS—thought, knowledge or self-knowledge, and purpose—seem to be common to all theories of mind. More than that, they seem to be facts which require the

development of the conception. They are, for the most part, not questioned in the tradition of the great books; but they are not always seen in the same light. They are not always related in the same way to one another and to other relevant considerations. From such differences in interpretation and analysis arise the various conflicting conceptions of the human mind.

The conflict of theories concerning *what* the human mind is, what *structure* it has, what *parts* belong to it or what *whole* it belongs to, does not comprise the entire range of controversy on the subject. Yet enough is common to all theories of mind to permit certain other questions to be formulated.

How does the human mind operate? How does it do whatever is its work, and with what intrinsic excellences or defects? What is the relation of mind to matter, to bodily organs, to material conditions? Is mind a common possession of men and animals, or is whatever might be called mind in animals distinctly different from the human mind? Are there minds or a mind in existence apart from man and the whole world of corporeal life?

Such questions constitute the major topics of this chapter. Other topics which appear here, such as the moral and political aspects of mind, are reserved for discussion in the many other chapters devoted to the great ideas of moral and political thought. Still others, like the problem of insanity—the loss or derangement of mind—are obviously relevant here even though the more general consideration of psychopathology belongs elsewhere, *e.g.*, in the chapter on MEDICINE.

The intelligibility of the positions taken in the dispute of the issues which are here our major concern depends to some degree on the divergent conceptions of the human mind from which they stem. It seems necessary, therefore, to examine the seven notions of mind which appear in the great books. This will at least provide the general context for the reader's further explorations, even if it is not possible to trace the implications each of these notions may have for the great controversial issues.

Seven is, of course, a fiction of analysis. There are, from one point of view, more—perhaps as many as there are, among the great authors, thinkers who have dwelt at length on the subject. From another point of view, there may be fewer than seven, for when the lines are drawn according to certain basic differences, several of these theories appear to be variants of a single doctrine.

"THAT IN THE SOUL which is called mind," Aristotle writes, is "that whereby the soul thinks and judges." For him, as for Plato, the human intellect or reason is a part or power of the soul of man, distinct from other parts or faculties, such as the senses and the imagination, desire and the passions. Though the human soul is distinguished from the souls of other living things by virtue of its having this part or power, and is therefore called by Aristotle a "rational soul," these writers do not identify mind and soul. As soul is the principle of life and all vital activities, so mind is the subordinate principle of knowledge and the activities of thinking, deliberating, deciding.

Within the general framework of this theory, many differences exist between Plato and Aristotle and between them and others who share their views. These differences arise not only with respect to the soul of which the intellect is a part, but also with respect to the power or activity of the intellect itself. For example, the distinction which Aristotle initiates, between mind as an active and as a passive power, is more explicitly formulated by Aquinas in his theory of the active intellect and the intellect as potential.

The human intellect, Aquinas writes, "is in potentiality to things intelligible, and is at first *like a clean tablet on which nothing is written*, as the Philosopher says. This is made clear from the fact that at first we are only in potentiality towards understanding, and afterwards we are made to understand actually. And so it is evident that with us to understand is *in a way to be passive*." But the forms of things, or what Aquinas calls their "intelligible species," are not actually intelligible as they exist in material things. He therefore argues that in addition to the "power receptive of such species, which is called the *possible intellect* by reason of its being in potentiality to such species," there must also be another intellectual power, which he calls the active or "agent" intellect.

Nothing, he says, can be "reduced from potentiality to act except by something in act" or already actual. "We must therefore assign on the part of the intellect some power to make things actually intelligible, by the abstraction of the species from material conditions. Such is the necessity for positing an agent intellect."

The more explicit formulation which Aquinas gives of the distinction between the active and the possible intellects as distinct powers has further consequences for the analysis of three states of the passive or possible intellect distinguished by Aristotle. The intellectual power which is receptive of the intelligible species may either be in complete potentiality to them, as it is when it has not yet come to understand certain things. Or it may be described as in habitual possession of the intelligible species when it has previously acquired the understanding of certain things, but is not now actually engaged in understanding them. In the third place, the potential intellect may also be actual or in act whenever it is actually exercising its habit of understanding or is for the first time actually understanding something.

In this traditional theory of mind, many other distinctions are made in the sphere of mental activity, but none is thought to require a division of the mind into two distinct powers, or even to require the discrimination of several states of the same power. Just as Plato regards the intuition or direct apprehension of intelligible objects as an activity of the same intelligence which is able to reason discursively about the ideas it can contemplate, so Aristotle and Aquinas assign three different activities to the intellectual power which apprehends intelligible objects, not by intuition, but only as the result of the abstraction of forms from matter by the active intellect.

Once the possible intellect is actualized by the reception of the abstracted species, it can act in three ways. It can express in concepts the species which have been impressed upon it. This—the first act of the intellect—is conception. Its second and third acts—of judgment and of reasoning—consist in forming propositions out of concepts and in seeing how one proposition follows from others in inference or proof.

Unlike abstraction and conception, which Aquinas assigns to the active and the possible intellect respectively, conception, judgment, and reasoning do not, in his opinion, require distinct powers. Nor do the two kinds of thought or reasoning which Aquinas calls "speculative" and "practical." The speculative and practical intellects, he maintains, "are not distinct powers," for they differ only in their ends. The speculative intellect "directs what it apprehends, not to operation, but to the sole consideration of truth"; the practical intellect "directs what it apprehends to operation" or action. But to the nature of intellect as a power of apprehension, "it is accidental whether it be directed to operation or not."

Not all the foregoing distinctions are made, or made in the same way, by Plato, Aristotle and other authors like Plotinus, Augustine, or Aquinas, who stand together in regarding mind as only a part of the human soul. Lucretius belongs with them on this point, though he differs radically from them on the issue of mind and matter. Mind, for him, is only "the directing principle" of the soul, "the head so to speak, and reigns paramount in the whole body." It is only the thinking or deciding part of the soul. But Plato, Aristotle, and their followers make a distinction in kind between sensations or images and universal ideas or abstract concepts. Sense and intellect are for them distinct faculties of knowing and have distinct objects of knowledge. For Lucretius, on the other hand, thinking is merely a reworking of the images received by the senses. In this one respect at least, Lucretius is more closely associated with the theory of mind to be found in Hobbes, Locke, and Hume.

In the consideration of mind, agreement on one point seems everywhere to be accompanied by disagreement on another. Locke does not agree with Lucretius or Hobbes about the materiality of mind; and though he agrees with Berkeley that mind is a spiritual entity, he does not agree with him, any more than he agrees with Hobbes and Hume, about the abstraction of general concepts from particular sense-impressions. Plato and Aristotle agree that the senses and the intellect or reason are quite distinct, but they do not agree about the relation of these faculties, especially not on the extent

to which the mind can act independently of sense and imagination. Augustine seems to share Plato's doctrine of reminiscence as an account of how the senses recall actively to mind ideas it has always somehow possessed. Aquinas adopts Aristotle's doctrine of abstraction as the quite contrary account of the role the senses play in providing the materials on which the mind works to obtain ideas. But Augustine and Aquinas come together on another point in which they depart alike from Aristotle and Plato. They distinguish with precision between the intellect and will as separate faculties of the soul, whereas Plato and Aristotle treat thinking and willing (or knowing and loving) as merely diverse aspects of mental life.

THE SAME SITUATION prevails with respect to the other theories of mind which we must now consider in their own terms. Descartes, for example, resembles Plato and Augustine on the point on which we have seen that they together differ from Aristotle and Aquinas, namely, the relation of mind or reason to the senses or imagination. Yet he is also closer to Aristotle and Plato in a respect in which they together differ from Augustine and Aquinas, namely, in regarding thinking and willing as acts of the mind rather than as belonging to completely separate faculties.

These agreements and differences occur in the context of a basic opposition between Descartes and all the other writers so far mentioned. Unlike all of them, he *identifies* the human mind with the rational soul of man. In the dual nature of man, he says, "there are certain activities, which we call corporeal, *e.g.*, magnitude, figure, motion, and all those that cannot be thought of apart from extension in space; and the substance in which they exist is called *body*. . . . Further, there are other activities, which we call *thinking* activities, *e.g.*, understanding, willing, imagining, feeling, etc., which agree in falling under the description of thought, perception, or consciousness. The substance in which they reside we call a *thinking thing* or *the mind*, or any other name we care, provided only we do not confound it with corporeal substance, since thinking activities have no affinity with corporeal activities, and thought, which is the common nature in which the former agree, is totally different from extension, the common term for describing the latter." Descartes denies that brutes possess thought, but "even though I were to grant," he says, "that thought existed in them, it would in nowise follow that the human mind was not to be distinguished from the body, but on the contrary that in other animals also there was a mind distinct from their body."

The two components of human nature are, according to Descartes, each of them substances —a *res cogitans* or a thinking substance and a *res extensa* or an extended substance. Descartes uses the phrases "rational soul" and "mind" interchangeably. Reason or intellect—the capacity to think—is not a power of the soul. Nor is thinking an act which the soul sometimes performs, sometimes does not. It is the very essence of the soul itself, even as extension is the essence of body. Just as bodies cannot exist without actually having three dimensions, so the mind cannot exist without thinking.

Though it is literally translated into English by "I think, therefore I am," Descartes' *cogito, ergo sum* can be rendered by "Thinking is; therefore, the mind is," or by the strictly equivalent statement, "The mind exists; therefore, there is thinking." It is precisely this equation of the mind's existence with the activity of thought which Locke challenges. "We know certainly, by experience," he writes, "that we sometimes think, and thence draw this infallible consequence, that there is something in us that has the power to think; but whether that substance perpetually thinks or not, we can be no farther assured than experience informs us. . . . I grant that the soul in a waking man is never without thought, because it is the condition of being awake: but whether sleeping, without dreaming, be not an affection of the whole man, mind as well as body, may be worth a waking man's consideration. . . . Methinks every drowsy nod shakes their doctrine, who teach that the soul is always thinking."

What is striking about this disagreement is that Locke and Descartes agree in their conception of man as a union of two distinct substances—the union of a material substance or body with a spiritual substance, a mind or soul. It is not surprising, however, that Berkeley

should hold the Cartesian view against Locke. Considering the flow of time in terms of the succession of ideas, Berkeley affirms it to be "a plain consequence that the soul always thinks." To try to "abstract the *existence* of a spirit from its cogitation" is, he adds modestly, "no easy task." He might have said it is impossible, for since he holds that bodies do not exist and that man consists of mind or spirit alone, he need not hesitate to assert that the mind cannot cease to think without ceasing to be. Neither he nor Descartes is, in James' opinion, "free to take the appearances for what they seem to be, and to admit that the mind, as well as the body, may go to sleep."

Despite these differences, Descartes, Locke, and Berkeley seem to agree on the range of activities within the sphere of mind. The mind is a thinking substance for Descartes, yet it also senses and imagines, suffers passions, and exercises acts of will. What Descartes says in terms of acts, Locke says in terms of powers. Mind has many distinct powers, among which Locke includes all the cognitive faculties (not only the powers of abstract thought and reasoning, but also those of sense and imagination), and such voluntary faculties as choosing and willing. Berkeley also includes the whole range of psychological phenomena—sensation, imagination, memory, the passions, reasoning, and choice.

Hume takes a similar view, though in his case one basic qualification must be added. He does not conceive the mind as a soul or a spirit or any other sort of substance. He even has some difficulty with the notion of its continuity or identity from moment to moment in the flow of experience. Yet, he says, "it cannot be doubted that the mind is endowed with several powers and faculties, that these powers are distinct from each other. . . . There are many obvious distinctions of this kind, such as those between will and understanding, the imagination and the passions, which fall within the comprehension of every human creature." What the mind is or how it exists, we may not be able to say; but Hume thinks that "if we can go no farther than this mental geography, or delineation of the distinct parts and powers of the mind, it is at least a satisfaction to go so far."

Descartes' theory of mind seems to serve as a point of departure in another direction from that taken by Locke. Spinoza agrees that the mind is a thinking thing. He agrees that man consists of an individual body united with an individual mind. But he differs from Descartes on the meaning of substance. By its very nature, substance is infinite; and because it is infinite, there can be only one substance, which is God. Finite individual things, whether bodies or minds, do not exist as substances, but as modes of the divine attributes.

"The human mind is a part of the infinite intellect of God, and therefore," Spinoza declares, "when we say that the human mind perceives this or that thing, we say nothing less than that God has this or that idea." He includes love and desire, as well as perception and imagination, among the affections of the mind, even calling them "modes of thought." He adds, however, that these do not exist apart from the idea of the thing loved or desired, "though the idea may exist although no other mode of thinking exist."

Of the remaining three of the seven conceptions of mind here being considered, two bear certain resemblances to theories already mentioned.

Hegel's view of the human mind as a phase or dialectical moment of the Absolute Mind or Spirit seems comparable to Spinoza's conception of the human mind as a part of God's infinite intellect. The Hegelian theory of mind, developed in such works as the *Phenomenology of Mind* and the *Philosophy of Mind*, is reflected in his *Philosophy of History* and in his *Philosophy of Right*. The expression of his view of mind appears, therefore, in the chapters on History and State, as well as here.

There seems to be similar justification for associating the views of William James with those of Locke and Hume. Willing to posit a soul "influenced in some mysterious way by the brain states and responding to them by conscious affections of its own," James goes on to say that "the bare phenomenon, however, the immediately known thing which on the mental side is in apposition with the entire brain-process is the state of consciousness and not the soul itself."

What the soul is and whether it exists belong to metaphysics. So far as psychological obser-

vation and analysis are concerned, the phenomena of mind are to be found in the stream of thought or consciousness. States of mind are states of consciousness. James uses the words "feeling" or "thought" to cover every type of mental operation, every state of mind, every form of consciousness, including sensations and emotions, desires and wishes, as well as conception and reasoning.

Locke and Hume distinguish powers of the mind according to different types of mental operation. James tends rather to analyze the mind in terms of its diverse states according to different types of mental content. But he also lays great stress on the dynamic interconnection of the various elements of consciousness in the continuous flow of the stream of thought.

Freud too presents an analysis of different types of mental content, and accompanies it by a theory of the different layers of mind—or psychic structure. He holds, for example, that "we have two kinds of unconscious—that which is latent but capable of becoming conscious, and that which is repressed and not capable of becoming conscious in the ordinary way. . . . That which is latent, and only unconscious in the descriptive and not in the dynamic sense, we call *preconscious*; the term unconscious we reserve for the dynamically unconscious repressed, so that we have three terms, conscious (Cs), preconscious (Pcs), and unconscious (Ucs)."

Like James, Freud is concerned with the dynamic interaction of various mental operations or contents. In addition, a further point of similarity exists between them. James says that "the pursuance of future ends and the choice of means for their attainment are . . . the mark and criterion of the presence of mentality . . . No actions but such as are done for an end, and show a choice of means, can be called indubitable expressions of Mind." Freud goes further in the same direction. By identifying "psychic energy in general" with what he calls "libido," he implies that mind in its most primitive form has entirely the aspect of desire or seeking. It expresses itself in "two fundamentally different kinds of instincts, the sexual instincts in the widest sense of the word . . . and the aggressive instincts, whose aim is destruction."

FINALLY, THERE IS the theory in which mind is neither one of the faculties of the soul, nor itself a thinking substance; nor is it a soul or spirit with a diversity of powers. "All our knowledge," Kant writes, "begins with sense, proceeds thence to understanding, and ends with reason beyond which nothing higher can be discovered in the human mind for elaborating the matter of intuition and subjecting it to the highest unity of thought." These three faculties have distinct functions for Kant. The sensitive faculty is a faculty of intuition. The faculty of understanding is a faculty of judgment and scientific knowledge. The faculty of reason, when properly employed, performs a critical and regulative function in the realm of thought, but when employed beyond the province of its power leads thought into blind alleys or dialectical frustrations.

Mind is not one of these faculties, nor is it the being in which these faculties inhere. The notion of mind seems to have significance, for Kant, primarily in a collective sense. It represents the unity and order of the triad of cognitive faculties. The faculties of feeling and will—which Kant adds to these in his enumeration of "the higher faculties"—belong to the "transcendental ego," but they do not fall within that part of the transcendental structure which is mind. Kant's distinction between the speculative and the practical use of reason, and his distinction between the moral and the aesthetic judgment, involve different relationships between mind—or its triad of faculties—and these other faculties.

THE FOREGOING SURVEY of conceptions of the human mind gives some indication of the way in which other questions about mind are answered.

With regard to the relation of mind and matter, for example, the theories of Descartes, Spinoza, Locke, and James seem to affirm a duality of substances, or of modes of substance, or at least of realms—the physical and the mental. They are confronted by the problem of the relation which obtains between the two—their independence or interaction.

"Mental and physical events," writes James, "are, on all hands, admitted to present the strongest contrast in the entire field of being.

The chasm which yawns between them is less easily bridged over by the mind than any interval we know. Why, then, not call it an absolute chasm," he asks, "and say not only that the two worlds are different, but that they are independent?"

James thinks that to urge this theory of the complete independence of mind and body "is an *unwarrantable impertinence in the present state of psychology*." He prefers the common-sense theory that each acts on the other somehow. But earlier writers who consider body and mind as distinct substances, find grave difficulties in the way of conceiving their interaction. "How our minds move or stop our bodies by thought, which we every moment find they do," is, according to Locke, "obscure and inconceivable." According to Hume, there is no "principle in all nature more mysterious than the union of soul with body." He interprets one consequence of the union to be that "a supposed spiritual substance acquires such an influence over a material one, that the most refined thought is able to actuate the grossest matter. Were we empowered by a secret wish, to remove mountains, or control planets in their orbit; this extensive authority," Hume thinks, "would not be more extraordinary, nor more beyond our comprehension."

Denying that bodies exist, Berkeley nevertheless argues that even if they did, they could exert no influence upon mind. "Though we give the materialists their external bodies," he says, "they by their own confession are never the nearer knowing how our ideas are produced; since they own themselves unable to comprehend in what manner body can act upon spirit, or how it is possible that it should imprint any idea in the mind. Hence it is evident that the production of ideas or sensations in our minds can be no reason why we should suppose matter or corporeal substances, since that is acknowledged to remain equally inexplicable with or without this supposition."

Those who deny the existence of matter, like Berkeley, or the existence of anything immaterial, like Lucretius or Hobbes, are confronted by problems of their own. Berkeley must explain the mind's perception of bodies or why the mind thinks of matter. Lucretius must explain perception, thought, and choice as functions of material particles in motion.

The reduction of mind to matter raises a question which leads in the opposite direction. Why may it not be supposed that thought and feeling are present in the universe wherever matter is—an atom of mind inseparably conjoined with every atom of matter, as in the "mind-stuff" or "mind-dust" theory which William James considers and criticizes? Still another formulation of the relation of mind to matter is found in the theory of Aristotle and Aquinas, according to whom the rational soul is "the substantial form of an organic body," but the intellect—one of its powers—is not united to matter in any way. Mind is said to be immaterial in that understanding or thought does not require a bodily organ.

The angelic intellect, according to Aquinas, is a "cognitive power which is neither the act of a corporeal organ, nor in any way connected with corporeal matter." The human mind is not so completely divorced from matter, for, though man's intellect "is not the act of an organ, yet it is a power of the soul, which is the form of the body." Among all bodily forms, the human soul alone has the distinction of possessing "an operation and a power in which corporeal matter has no share whatever." But Aquinas also maintains that "the body is necessary for the action of the intellect, not as its organ of action, but on the part of the object" —the phantasm or image produced by the sensitive faculty. He conceives this dependence in the following manner. "For the intellect to understand actually . . . there is need for the act of the imagination and of the other powers" that are acts of bodily organs. "When the act of the imagination is hindered by a lesion of the corporeal organ, for instance, in a case of frenzy, or when the act of the memory is hindered, as in the case of lethargy, we see that a man is hindered from understanding actually even those things of which he had a previous knowledge."

The problem of body and mind is discussed more fully in the chapter on MATTER. Other problems involved in the theory of mind similarly occur in other chapters as well as in this one, *e.g.*, the problem of mind in animals and men (in the chapters on ANIMAL and MAN); the problem of the existence of minds superior to that of man (in the chapters on ANGEL and

GOD); the problem of the origin of ideas in the human mind (in the chapters on IDEA and MEMORY AND IMAGINATION). It should be noted, however, that agreement or disagreement on the nature of the human mind does not always determine agreement or disagreement with respect to these other questions.

Sharing the view that the mind is a spiritual substance, Locke and Descartes do not agree about innate ideas or principles. Locke tends to agree with Aristotle when he says that the mind is a *tabula rasa*, "void of all characters, without any ideas. How comes it to be furnished?" he asks. "Whence has it all the *materials* of reason and knowledge? To this I answer in one word, from *Experience*. In that all our knowledge is founded; and from that it ultimately derives itself. Our observation employed either about external sensible objects, or about the internal operations of our own minds, is that which supplies our understandings with all the *materials* of thinking."

But Locke does not accept Aristotle's sharp distinction between the faculties of sense and reason, nor does he find it necessary to adopt Aristotle's notion of an active intellect to explain how the mind abstracts general ideas from the particulars of sense-perception. So far as his theory attributes to mind the power of sense, Locke has more affinity with Berkeley and Hume than with Aristotle; yet on the question of abstract ideas or the distinction between men and brutes, he is as much opposed to them as they are to Aristotle.

These few observations may be taken as a sample of the many intricately crossing lines of thought which make the complex pattern of the traditional discussion of mind. With few exceptions, almost any other choice of authors and topics would provide similar examples. That fact, combined with the fact that almost every major topic in this chapter leads into the discussion of other great ideas, tends to make the chapter on MIND a kind of focal point for perspective on the whole world of thought. It is not surprising that this should be the case, for on any theory, mind is somehow the place of ideas or, as Aristotle says, "the form of forms."

OUTLINE OF TOPICS

PAGE

1. Diverse conceptions of the human mind 182

1*a*. Mind as intellect or reason, a part or power of the soul or human nature, distinct from sense and imagination

(1) The difference between the acts of sensing and understanding, and the objects of sense and reason

(2) The cooperation of intellect and sense: the dependence of thought upon imagination and the direction of imagination by reason 183

(3) The functioning of intellect: the acts of understanding, judgment, and reasoning

(4) The distinction of the active and the possible intellect in power and function

1*b*. Mind as identical with thinking substance 184

(1) The relation of the mind as thinking substance to sense and imagination

(2) Thinking and willing as the acts of the thinking substance

1*c*. Mind as a particular mode of that attribute of God which is thought

(1) The origin of the human mind as a mode of thought

(2) The properties of the human mind as a mode of thought

1*d*. Mind as soul or spirit, having the power to perform all cognitive and voluntary functions

(1) The origin of the mind's simple ideas: sensation and reflection

(2) The activity of the understanding in relating ideas: the formation of complex ideas

PAGE

1*e*. Mind as a triad of cognitive faculties: understanding, judgment, reason 185
(1) The relation of understanding to sense or intuition: its application in the realm of nature; conformity to law
(2) The relation of judgment to pleasure and displeasure: its application in the realm of art; aesthetic finality
(3) The relation of reason to desire or will: its application in the realm of freedom; the *summum bonum*

1*f*. Mind as intelligence or self-consciousness, knowing itself as universal: the unity of intellect and will

1*g*. Mind as the totality of mental processes and as the principle of meaningful or purposive behavior
(1) The nature of the stream of thought, consciousness, or experience: the variety of mental operations
(2) The topography of mind
(3) The unity of attention and of consciousness: the selectivity of mind

2. The human mind in relation to matter or body 186

2*a*. The immateriality of mind: mind as an immaterial principle, a spiritual substance, or as an incorporeal power functioning without a bodily organ

2*b*. The potentiality of intellect or reason compared with the potentiality of matter or nature

2*c*. The interaction of mind and body
(1) The physiological conditions of mental activity
(2) The influence of mental activity on bodily states 187

2*d*. The parallelism of mind and body

2*e*. The reduction of mind to matter: the atomic explanation of its processes, and of the difference between mind and soul, and between mind and body

3. Mind in animals and in men 188

3*a*. Mind, reason, or understanding as a specific property of human nature: comparison of human reason with animal intelligence and instinct

3*b*. Mentality as a common property of men and animals: the differences between human and animal intelligence in degree or quality 189

3*c*. The evolution of mind or intelligence

4. The various states of the human mind

4*a*. Individual differences in intelligence: degrees of capacity for understanding

4*b*. The mentality of children 190

4*c*. The states of the possible intellect: its potentiality, habits, and actuality

4*d*. The condition of the mind prior to experience
(1) The mind as completely potential: the mind as a *tabula rasa*
(2) The innate endowment of the mind with ideas: instinctive determinations
(3) The transcendental or *a priori* forms and categories of the mind 191

4*e*. The condition of the human mind when the soul is separate from the body

4*f*. Supernatural states of the human intellect: the state of innocence; beatitude; the human intellect of Christ

PAGE

5. The weakness and limits of the human mind 191

5*a*. The fallibility of the human mind: the causes of error

5*b*. The natural limits of the mind: the unknowable; objects which transcend its powers; reason's critical determination of its own limits or boundaries 192

5*c*. The elevation of the human mind by divine grace: faith and the supernatural gifts 193

6. The reflexivity of mind: the mind's knowledge of itself and its acts

7. The nature and phases of consciousness: the realm of the unconscious 194

7*a*. The nature of self-consciousness

7*b*. The degrees or states of consciousness: waking, dreaming, sleeping

7*c*. The conscious, pre-conscious, and unconscious activities of mind 195

8. The pathology of mind: the loss or abeyance of reason

8*a*. The distinction between sanity and madness: the criterion of lucidity or insight

8*b*. The causes of mental pathology: organic and functional factors

8*c*. The abnormality peculiar to mind: systematic delusion 196

9. Mind in the moral and political order

9*a*. The distinction between the speculative and practical intellect or reason: the spheres of knowledge, belief, and action

9*b*. The relation of reason to will, desire, and emotion

9*c*. Reason as regulating human conduct: reason as the principle of virtue or duty 197

9*d*. Reason as the principle of free will: rationality as the source of moral and political freedom 198

9*e*. Reason as formative of human society: the authority of government and law 199

9*f*. The life of reason, or the life of the mind, as man's highest vocation: reason as the principle of all human work

10. The existence of mind apart from man 200

10*a*. The indwelling reason in the order of nature

10*b*. *Nous* or the intellectual principle: its relation to the One and to the world-soul

10*c*. The realm of the pure intelligences: the angelic intellect

10*d*. The unity and separate existence of the active or the possible intellect

10*e*. Mind as an immediate infinite mode of God

10*f*. Absolute mind: the moments of its manifestations 201

(1) The unfolding of mind or spirit in world history

(2) The concrete objectification of mind in the state

10*g*. The divine intellect: its relation to the divine being and the divine will

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 59: MONARCHY

INTRODUCTION

OF all the traditionally recognized forms of government, monarchy is the easiest to define and to identify. As the word indicates, it is government by one man. It is indifferent whether that man is called king or prince, Caesar or Czar. Of all such titles, "king" is the most frequent; and in consequence monarchy is often called kingship or referred to as the royal form of government.

When monarchy is thus defined in terms of the principle of *unity*, other forms of government, such as aristocracy or oligarchy and democracy, tend to be characterized as government by the few or the many. But the numerical criterion by itself is obviously inadequate. To those who distinguish between aristocracy and oligarchy, it makes a difference whether the few who rule are selected for their pre-eminence in virtue or in wealth. A tyranny, like a monarchy, may be government by one man. Hence those who wish to use the word "monarch" or "king" eulogistically cannot be satisfied with a definition that fails to distinguish between king and tyrant.

It has been said—by Aristotle, for example—that the perversion of, or "deviation from, monarchy is tyranny; for both are forms of one-man rule. But," he adds, "there is the greatest difference between them; the tyrant looks to his own advantage, the king to that of his subjects." Both Aristotle and Plato also say that as tyranny is the worst form of government, so monarchy at the opposite extreme is the best. But though in their opinion tyranny is *always* the worst form of government, Aristotle at least does not seem to think that monarchy is always—*under all conditions*—best.

Further complications appear when other views are taken into consideration. The chapters on CITIZEN, CONSTITUTION, and GOVERNMENT discuss the basic opposition between absolute and limited government in the various terms in which that opposition is traditionally expressed: royal as opposed to political, despotic as opposed to constitutional government; or government by men as opposed to government by law. That opposition seems to be relevant to the theory of monarchy, certainly to any conception of monarchy which tends to identify it with absolute rule, or which sees some affinity between royal and despotic government.

The word "despotic" is, of course, sometimes used in a purely descriptive rather than a disparaging sense. Used descriptively, it designates the absolute rule exercised by the head of a household over children and slaves, neither of whom have any voice in their own government. Aristotle sometimes characterizes the royal government of a political community as despotic to signify its resemblance to the absolute rule of the father or master. He expresses the same comparison in reverse when he says that "the rule of a father over his children is royal."

The derogatory sense of "despotic" would seem to apply to those cases in which grown men are ruled as if they were children, or free men as if they were slaves. The great issue concerning monarchy, therefore, is whether royal government is despotic in this sense. Always, or only under certain conditions? And if despotic, is it also tyrannical? Is monarchy in principle the foe of human liberties? To all these questions there are opposite answers in the great books of political theory. Where Hegel says that "public freedom in general and an hereditary monarchy guarantee each other," others, like Rousseau and Mill, identify the freedom of citizenship with republican or representative government.

This central issue is complicated not only by

the various meanings of "despotism" (discussed in the chapter on TYRANNY), but also by variations in the meaning of the word "monarchy" as it is used by different writers. The word is even used by the same writer in a number of senses. Rousseau, for example, says in one place that "every legitimate government is republican," and in another that "monarchical always ranks below republican government." But he also treats monarchy or royal rule as one form of legitimate government. He describes the king, in whose hands all political power is concentrated, as only having "the right to dispose of it in accordance with the laws." He distinguishes not only between king and tyrant, but also between king and despot.

To avoid what may be only verbal difficulties here, Kant suggests the use of the word "autocrat" to signify "one who has *all* power" and who in his own person "*is* the Sovereign." In contra-distinction "monarch" should signify the king or chief magistrate (sometimes called "president") who "merely represents the sovereignty" or the people who "are themselves sovereign."

SOME POLITICAL theorists distinguish between absolute and limited (or constitutional) monarchy. This in turn raises new problems of definition and evaluation.

Is absolute government always monarchical in form, so that absolute government and absolute monarchy can be treated as identical? Hobbes, who seems to think that government by its very nature must be absolute, nevertheless treats aristocracy and democracy along with monarchy as forms of absolute government. Furthermore, as Rousseau points out, "the Roman Empire saw as many as eight emperors at once, without it being possible to say that the Empire was split up." The absolutism of the government was not diminished by the fact that two or more Caesars often held power at the same time. The triumvirates were also absolute dictatorships.

It would seem, therefore, that the principle of absolute government can be separated from the principle of monarchy. But can monarchy as a form of government be separated from absolute rule?

The question is not whether, in a republic, the monarchical principle is present in the sense that *one* man may hold the office of chief executive. On the issue of a single as opposed to a plural executive, Hamilton and Madison—and with them Jefferson—emphatically favor the principle of unity in the executive branch of the government. "Energy in government," according to *The Federalist*, "requires not only a certain duration of power, but the execution of it by a single hand." The qualities essential to a good executive, such as "decision, activity, secrecy, and dispatch," Hamilton says, "will generally characterize the proceedings of one man in a much more eminent degree than the proceedings of any greater number; and in proportion as the number is increased, these qualities will be diminished."

Yet the authors of *The Federalist*, and Jefferson too, are equally emphatic in insisting upon the difference in kind, not degree, between the power granted the President of the United States and that enjoyed by the King of Great Britain. For them, monarchies and republics are fundamentally opposed in the spirit of their institutions. Despotism is inherent in the nature of monarchy—not only absolute, but even limited monarchy.

If the Constitution of the United States does not set up a constitutional monarchy, even though it provides for one man as chief executive, then a constitutional monarchy must have some other principle in it which distinguishes it from a republic. That may be hereditary succession to the throne; or it may be a certain symbolic identification of the king with the state. But in a monarchy, no matter how attenuated, so long as it does not become purely and simply constitutional government, the king also seems to retain some degree of despotic power—the absolute power exercised by a sovereign person who is free from the supervision of law.

Aristotle takes a similar view. Enumerating five types of kingly rule, he sets one form apart from all the rest—the form in which one man "has the disposal of everything. . . . This form corresponds to the control of a household. For as household management is the kingly rule of a family, so kingly rule is the household management of a city or of a nation." The other forms are all, in one way or another, kingships accord-

ing to law. Of these, most clearly exemplified in the Spartan constitution, Aristotle says that "the so-called limited monarchy, or kingship according to law . . . is not a distinct form of government, for under all governments, as for example, in a democracy or aristocracy, there may be a general holding office for life, and one person is often made supreme over the administration of a state."

Whether or not there is a supreme commander or a chief magistrate, elected or hereditary, the government is not distinctively royal if the man called "king" is subject to the laws and if the other men in the state are not his subjects but his fellow citizens. For somewhat different reasons, Hobbes agrees with the view that only absolute monarchy is monarchy. When the king is limited in power, he says, the sovereignty is always "in that assembly which had the right to limit him; and by consequence the government is not monarchy, but either democracy or aristocracy; as of old time in Sparta, where the kings had a privilege to lead their armies, but the sovereignty was in the *Ephori*." Hobbes uses the government of one people over another people—the mother country over colonies, or the conqueror over a subjugated nation—to illustrate what he means by absolute monarchy. This suggests a significant parallelism between the problems of monarchy and the problems of empire.

If there were universal agreement on the point that only absolute monarchy is truly monarchy, the issue concerning monarchy could be readily translated into the basic opposition between rule by men and rule by law. But such agreement seems to be wanting, and the problems of monarchy are, in consequence, further complicated.

Plato, for example, distinguishes in the *Statesman* between three forms of government according to established laws, of which one is monarchy. Monarchy is better than aristocracy and democracy, obviously not with respect to the principle of the supremacy of law, but simply because government by one seems to be more efficient than government by a few or many; just as tyranny is the worst form of government because, in violating or overthrowing the laws, one man can succeed in going further than a multitude, which is "unable to do either any great good or any great evil."

But all these forms of government, good and bad, better and worse, are compared by Plato with a form of government which he says "excels them all, and is among States what God is among men." It seems to be monarchical in type, but, though not lawless like tyranny, it is entirely above the need of written or customary rules of law. "The best thing of all," Plato writes, "is not that the law should rule, but that a man should rule, supposing him to have wisdom and royal power." Whether such government can ever exist apart from divine rule, or perhaps the advent of the "philosopher king," the point remains that Plato seems to conceive monarchy in two quite distinct ways—both as an absolute rule and also as one of the legally limited forms of government.

Montesquieu separates monarchy from absolute government entirely. At the same time, he distinguishes it from republics, whether aristocracies or democracies. According to him, monarchy is as much a government by law, as much opposed to despotism or absolute government, as are republics. Monarchies and republics are the two main kinds of constitutional government, just as aristocracies and democracies are the two main kinds of republic.

Where Aristotle holds that constitutional monarchy is not a distinct type of government, Montesquieu holds that absolute monarchy does not deserve the name of "monarchy," but should be called "despotism" instead. He criticizes Aristotle's fivefold classification of kingships, saying that "among the number of monarchies, he [Aristotle] ranks the Persian empire and the kingdom of Sparta. But is it not evident," he asks, "that the one was a despotic state and the other a republic?" Since Montesquieu's own view of monarchy involves, in addition to a king, a body of nobles in whom intermediate and subordinate powers are vested, he thinks no true notion of monarchy can be found in the ancient world.

Hegel agrees with Montesquieu that constitutional monarchy is the very opposite of despotism, but he goes much further than Montesquieu in the direction of identifying monarchy with constitutional government. For him constitutional monarchy is the ultimately true

form of government. "The development of the state to constitutional monarchy is the achievement of the modern world." He thinks Montesquieu was right in recognizing that the ancient world knew only the patriarchal type of monarchy, a kind of transference of familial government to larger communities still organized on the domestic pattern. But according to Hegel, Montesquieu himself, in stressing the role of the nobility, shows that he understands, not the type of monarchy which is "organized into an objective constitution" and in which "the monarch is the absolute apex of an organically developed state," but only "feudal monarchy, the type in which the relationships recognized in its constitutional law are crystallized into the rights of private property and the privileges of individuals and corporations."

It may be questioned, however, whether Hegel's theory of constitutional monarchy avoids the issue raised by republicans who think that monarchy is inseparable from some form of absolutism, or that monarchy, if entirely devoid of absolutism, has no special character as a form of government. In spite of his acceptance of the traditional distinction between constitutional government and despotism, Hegel seems to regard the sovereignty of the state as absolute in relation to its own subjects at home—no less absolute than is its sovereignty in external affairs *vis-à-vis* foreign states. The crown is the personification of the absolute sovereignty of the state at home. The absolute power of the state comes into existence only in the person of a monarch who has the final decision in all matters.

"The sovereignty of the people," writes Hegel, "is one of the confused notions based on the wild idea of the 'people.' Taken without its monarchy and the articulation of the whole which is the indispensable and direct concomitant of monarchy, the people is a formless mass and no longer a state." Hegel thus dismisses the notion of popular sovereignty (which to Rousseau, Kant, and the Federalists is of the essence of republican government) as inconsistent with "the Idea of the state in its full development." A profound opposition, therefore, exists between Hegel's theory of constitutional monarchy and republican theories of constitutional government. Even though the issue cannot be stated in terms of government by men *vs.* government by laws, a monarchy as opposed to a republic still seems to represent the principle of absolutism in government.

THERE IS STILL another conception of a type of government which is neither a pure republic nor an absolute monarchy. What the mediaeval writers call a "mixed regime" is not a constitutional monarchy in the Hegelian sense, nor is it what Aristotle means when he uses that term. The mediaeval mixed regime is a combination of two distinct principles of government—the *royal principle*, according to which absolute power is vested in the sovereign personality of an individual man; and the *political principle*, according to which the supremacy of law reflects the sovereignty of the people, who have the power of making laws either directly or through their representatives.

This conception of a mixed regime—of government which is *both royal and political*—appears at first to be self-contradictory. In Aristotle's terms, it would seem impossible to combine the supremacy of law, which is the essence of constitutional government, with the supremacy of a sovereign person, which is the essence of royal government. The mixed regime would also seem to be impossible in terms of Hobbes' theory of the indivisibility of sovereignty. Impossible in theory, the mixed regime nevertheless existed as a matter of historic fact in the typical mediaeval kingdom, which derived its character from the feudal conditions under which it developed.

Does not the fact of its historic existence refute the incompatibility of the principles which the mixed regime combines? The answer may be that, like a mixture of oil and water, royal and political government can only exist as a mixture in unstable equilibrium. Originating under feudal conditions, the mixed regime tends toward dissolution as these conditions disappear with the rise of the modern nation-state. It first tends to be supplanted by a movement toward absolute monarchy. Then, in the course of re action and revolution, it tends toward constitutional monarchies or republics through added limitations on the power of the throne.

These historic developments seem to indicate that the principles of the mixed regime are ulti-

mately as irreconcilable in fact as they are in theory.

Montesquieu's remark that the ancients "had not a clear idea of monarchy" can be interpreted to mean that they did not have the conception of a mixed regime. Before the accidents of history brought it into existence, it is unlikely that anyone would have conceived of a government both royal and political. Montesquieu does not adopt the mediaeval description of a mixed regime, which, as stated by Aquinas, is "partly kingdom, since there is one at the head of all; partly aristocracy, in so far as a number of persons are set in authority; and partly democracy, *i.e.*, government by the people, in so far as the rulers can be chosen by the people, and the people have the right to choose their rulers." Yet Montesquieu's theory of monarchy seems to be determined by characteristics peculiar to the mediaeval kingdom.

This seems to be the point of Hegel's observation, already quoted, that Montesquieu's theory of monarchy identifies it with the feudal kingdom. The point is confirmed in another way by the fact that Montesquieu's ideal of monarchy is the government of England at the end of the 17th century, which, he says, "may be justly called a republic, disguised under the form of a monarchy." Locke's conception of the English government in his own day tends to clarify this point.

The form of a government, says Locke, "depends upon the placing of the supreme power, which is the legislative." When the power of making laws is placed in the hands of one man, then it is a monarchy. But, according to Locke, "the legislative and executive power are in distinct hands . . . in all moderated monarchies and well-framed governments."

What Locke here calls a "moderated monarchy" (intending to describe the government of England), seems to be the mixed regime, the form of government which Fortescue had earlier called a "political kingdom," and Bracton a *regimen regale et politicum*. The legislative power is in the hands of the people or their representatives. If it belonged exclusively to the king as a right vested in his sovereign person, and not merely as the people's representative —or, in the language of Aquinas, their vicegerent—the government would be in form an absolute monarchy. If, on the other hand, the king were merely a representative, the government would be a republic.

The sovereign character of the king in a mixed regime seems to stem from his unique relation to the laws of the land. In one way, he is above the laws, and has certain powers not limited by law; in another way, his whole power is limited by the fact that he does not have the power to make laws in his own right or authority. When a people are free and able to make their own laws, Aquinas writes, "the consent of the whole people expressed by custom counts far more in favor of a particular observance, than does the authority of the sovereign, who has not the power to frame laws, except as representing the people." But Aquinas also says that the sovereign is "*exempt from the law*, as to its coercive power; since, properly speaking, no man is coerced by himself, and law has no coercive power save from the authority of the sovereign."

The coercive power of the law belongs to the sovereign as executive, not legislator. Admitting the king to a share in legislative power, Locke conceives his essential function—that which belongs to him alone—as executive. The absoluteness of this executive power Locke defines in terms of the royal prerogative, that "being nothing but a power in the hands of the prince to provide for the public good in such cases which, depending upon unforeseen and uncertain occurrences, certain and unalterable laws could not safely direct." Prerogative, he then goes on to say, is the power "to act according to discretion for the public good without the prescription of law, and sometimes even against it."

Locke thus gives us a picture of the mixed regime in which the king's sovereign power is limited to the exercise of an absolute prerogative in performing the executive functions of government. In the executive sphere, the king's power is absolute, yet his sovereignty is not absolute; for in the legislative sphere, he either has no voice at all where ancient customs prevail, or, in the making of new laws, he can count himself merely as one representative of the people among others.

The extent of the prerogative permitted the king depends upon the extent to which mat-

ters are explicitly regulated by law. When in the infancy of governments the laws were few in number, "the government was almost all prerogative," as Locke sees it. He thinks that "they have a very wrong notion of government who say that the people have encroached upon the prerogative when they have got any part of it to be defined by positive laws. For in so doing they have not pulled from the prince anything that of right belonged to him, but only declared that that power which they indefinitely left in his or his ancestors' hands, to be exercised for their good, was not a thing they intended him, when he used it otherwise."

Here we see the seed of conflict between sovereign king and sovereign people in the combination of incompatible principles that constitute a mixed regime. As the king, jealous of his prerogative, tries to maintain or even extend his power, royal and political government tends toward absolute monarchy. As the people, jealous of their sovereignty, try to safeguard their legislative power from royal usurpations, the mixed regime tends to dissolve in the other direction. This happens as it moves toward republican government through various stages of limited or constitutional monarchy in which the sovereignty of the king becomes more and more attenuated.

When the king's prerogative includes the power of calling parliament into session, nothing short of revolution may resolve the issue; for, as Locke observes, "between an executive power in being, with such a prerogative, and a legislative that depends upon his will for their convening, there can be no judge on earth."

IN THE DISCUSSION of monarchy, as in the discussion of democracy or other forms of government, the fundamental terms and issues do not have the same meaning in the various epochs of western thought. The continuity of discussion in the tradition of the great books must be qualified, especially in the field of political theory, by reference to the differing historic institutions with which their authors are acquainted and concerned. Ancient and modern controversies over the merits of monarchy in relation to other forms of government seem to be comparing institutions of government as different as the ancient and modern forms of the democratic constitution.

In the ancient world, the choice between purely royal and purely political government underlies the meaning and evaluation of monarchy. In the modern world, with its heritage from the feudal institutions of the Middle Ages, either the mixed regime or constitutional monarchy is thought to offer a third alternative. The praise of monarchy may therefore be the corollary of a justification of absolute government or the absolute state, as with Hobbes and Hegel; it may be accompanied by an attack on absolute or despotic power, as with Locke and Montesquieu; or in defense of purely republican principles, monarchy may be attacked, as by Rousseau and the Federalists, without differentiation between its absolute and limited forms.

This does not mean that there is no continuity between ancient and modern discussion. It seems to exist with respect to both elements in the idea of monarchy—the unification of government through its having one head, and the rightness of absolute power. On the point of unity, Plato's argument that monarchy is the most efficient of the several forms of government which are otherwise equally just, seems to be paralleled by modern arguments for a unified executive in the constitution of a republic. It is also reflected in the reasoning of Montesquieu and Rousseau concerning the greater competence of monarchies to govern extensive territories. On the point of absolute power, there is some continuity between ancient and modern discussions of government by men versus government by law. But here there seems to be greater similarity between ancient and modern arguments against giving sovereignty to an individual human being than there is between the modern defense of monarchy and ancient speculations concerning royal government.

Taking different shape in Hobbes and Hegel, the argument for the *necessity* of absolute government seems to be peculiarly modern. It is not simply the point made by the ancients, that under certain circumstances it may be right for the man of superior wisdom to govern his inferiors in an absolute manner, as a father governs children, or a god men. The point is rather that the very nature of government and the

state requires a unified repository of absolute power. Hobbes does not ask whether the monarch in whose hands such power is placed deserves this by reason of personal superiority to his subjects. Hegel explicitly repudiates the relevance of any consideration of the monarch's particular character. Neither Hobbes nor Hegel argues for the divine right of kings, or their divine appointment; though Hegel does insist that the constitution itself, which establishes the supremacy of the crown, is not something made by man, but "divine and constant, and exalted above the sphere of things that are made."

That kings have absolute power by divine right is another peculiarly modern argument for absolute monarchy. "Not all the water from the rough rude sea," says Shakespeare's Richard II, "can wash the balm off from an anointed king. The breath of worldly men cannot depose the deputy elected by the Lord." According to the theory of divine right, the king is God's vicar, not, as Aquinas thinks, the vicegerent of the people. The theory of the divine right of kings does not seem to be a mediaeval doctrine. It appears later in such tracts as those by Barclay and Filmer, which Locke undertakes to answer.

The controversy involves its adversaries in dispute over the interpretation of Holy Writ. The anointing of Christian kings is supposed to draw its significance from the establishment of this practice among the ancient Hebrews. But the story of the origin of the Hebrew kingship can be given an opposite interpretation.

The people of Israel, after the leadership of Moses and Aaron, first submitted their affairs to the government of judges, and "there was no king in Israel, but every one did that which seemed right to himself." Later they went to Samuel, their judge, saying: "Make us a king to judge us like all the nations." This displeased Samuel. Samuel prayed unto the Lord, and the Lord said unto Samuel: "Hearken to the voice of the people in all that they say unto thee; for they have not rejected thee, but they have rejected me, that I should not reign over them." The Lord then describes the tribulations the people will suffer at the hands of an earthly ruler with absolute power, a punishment they deserve for wanting to be ruled by a king, instead of by God and God's law, administered for them by judges.

The great poems and histories of ancient Greece and Rome would seem to indicate that the divinity of kings is not a modern notion. The deification of emperors and kings certainly appears to be a common practice. But the assumption of divinity by kings is not supposed to signify divine appointment, or election by the gods; nor do the rulers of the ancient world justify their absolute power as a god-given right.

Furthermore, in the political theory of Plato and Aristotle, the analogy between royal rule and divine government works in the opposite direction. According to their view, the right to absolute government depends upon a radical inequality between ruler and ruled. If a god were to rule men on earth, as in the myth retold in Plato's *Statesman*, he would govern them absolutely, deciding everything by his wisdom and without recourse to written laws or established customs. If there were a god-like man, or if a true philosopher were to become king, he too would deserve to be an absolute monarch. It would be unjust, says Aristotle, to treat the god-like man merely as a citizen, and so to treat him as no more than "the equal of those who are so far inferior to him in virtue and in political capacity." It would also seem to be unjust for a man who does not have great superiority over his fellow men to rule them like a king, instead of being merely a citizen entitled to hold public office for a time.

Aristotle frequently refers to royal government as the divine sort of government, but he does not justify its existence except when one man stands to others as a god to men. Though some of the historic kingships which Aristotle classifies are absolute monarchies, none is royal government of the divine sort. That seems to remain for Aristotle, as for Plato, a purely hypothetical construction.

Actual royal government has a patriarchal rather than a divine origin. It is the kind of government which is appropriate to the village community rather than to the city-state. The kingly form of government prevails in the village because it is an outgrowth of the family. That is why, says Aristotle, "the Hellenic states were originally governed by kings; the Hellenes

were under royal rule before they came together, as the barbarians still are."

In thinking that absolute or despotic government befits the servile Asiatics, but not the free men of the Greek city-states, Aristotle takes a position which has a certain counterpart in the views of Montesquieu and Mill. These modern opponents of absolute monarchy do not assert that constitutional government is unconditionally better than despotism. For certain peoples, under certain conditions, self-government may not be possible or advantageous. "A rude people," Mill writes, "though in some degree alive to the benefits of civilized society, may be unable to practice the forbearance which it demands: their passions may be too violent, or their personal pride too exacting, to forego private conflict, and leave to the laws the avenging of their real or supposed wrongs. In such a case, a civilized government, to be really advantageous to them, will require to be in a considerable degree despotic; to be one over which they do not themselves exercise control, and which imposes a great amount of forcible restraint upon their actions." Montesquieu seems further to suppose that different races—largely as a result of the climate in which they live—are by nature inclined toward freedom or servitude. The Asiatics are for him a people whose spirit perpetually dooms them to live under despotism.

In contrast, Mill's conditional justification of absolute government demands that despotism serve only a temporary purpose. It must seek not merely to keep order, but by gradual steps to prepare the people it rules for self-government. "Leading-strings are only admissible," he says, "as a means of gradually training the people to walk alone." When they have reached that stage of development where they are able to govern themselves, the despotic ruler must either abdicate or be overthrown.

There is a deeper contrast between Mill on the one hand, and Aristotle and Plato on the other, one which goes to the very heart of the issue concerning royal and political government. Both Aristotle and Plato seem to be saying that if the superior or god-like man existed, then royal government would be better than the best republic, even for the civilized Greeks. In calling royal rule the divine form of government, they imply that it is the ideal, even if it can never be realized. This Mill most emphatically denies.

The notion that "if a good despot could be ensured, despotic monarchy would be the best form of government, I look upon," he writes, "as a radical and most pernicious conception of what good government is." The point at issue is not whether the good despot—the god-like ruler or philosopher king—can be found. Suppose him to exist. The point then to be made is that the people ruled by "one man of superhuman mental activity" would of necessity have to be entirely passive. "Their passivity is implied in the very idea of absolute power. . . . What sort of human beings," Mill asks, "can be formed under such a regimen?" Men must actually engage in self-government in order to pass from political infancy to maturity. Whenever it is possible, representative or constitutional government is therefore better than absolute monarchy.

OUTLINE OF TOPICS

PAGE

1. The definition of monarchy and the classification of the types of kingship 213

1*a*. The distinction between royal and political government

(1) Absolute or personal rule contrasted with constitutional government or rule by law

(2) The theory of absolute government: the nature of absolute power; the rights and duties of the monarch; the radical inequality between ruler and ruled in absolute government 214

1*b*. Modifications of absolute monarchy: other embodiments of the monarchical principle

(1) The combination of monarchy with other forms of government: the mixed regime

PAGE

(2) Constitutional or limited monarchy 215

(3) The monarchical principle in the executive branch of republican government

1*c*. The principle of succession in monarchies

2. The theory of royalty

2*a*. The divinity of kings

2*b*. The analogy between divine government and rule by the best man: the philosopher king

2*c*. The divine institution of kings: the theory of the divine right of kings 216

2*d*. The myth of the royal personage: the attributes of royalty and the burdens of monarchy

3. The use and abuse of monarchical power 217

3*a*. The good king and the benevolent despot in the service of their subjects: the education of the prince

3*b*. The exploitation of absolute power for personal aggrandizement: the strategies of princes and tyrants 218

4. Comparison of monarchy with other forms of government

4*a*. The patriarchical character of kingship: absolute rule in the family or tribe, and paternalism in the state 219

4*b*. The line which divides monarchy from despotism and tyranny

4*c*. The differences between kingdoms and republics with respect to unity, wealth, and extent of territory

4*d*. The defense of monarchy or royal rule

(1) The necessity for absolute government

(2) Monarchy as the best or most efficient of the several good forms of government 220

(3) The preference for the mixed regime: defense of royal prerogatives as absolute in their sphere

4*e*. The attack on monarchy or absolute government

(1) The paternalistic or despotic character of monarchy: the rejection of benevolent despotism; the advantages of constitutional safeguards

(2) The justification of absolute rule or benevolent despotism for peoples incapable of self-government

(3) The illegitimacy of absolute monarchy: the violation of the principle of popular sovereignty

(4) The illegality of royal usurpations of power in a mixed regime: the limitations of royal prerogative in a constitutional monarchy 221

5. The absolute government of colonies, dependencies, or conquered peoples

5*a*. The justification of imperial rule: the rights of the conqueror; the unifying and civilizing achievements of empire

5*b*. The injustice of imperialism: exploitation and despotism 222

6. The history of monarchy: its origin and developments

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] 12d, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 60: NATURE

INTRODUCTION

NATURE is a term which draws its meaning from the other terms with which it is associated by implication or contrast. Yet it is not one of a fixed pair of terms, like necessity and contingency, one and many, universal and particular, war and peace. When things are divided into the natural and the artificial, or into the natural and the conventional, the opposite of the natural does not represent a loss or violation of nature, but rather a transformation of nature through the addition of a new factor. The unnatural, on the other hand, seems to be merely a deviation, a falling away from, or sometimes a transgression of nature.

Most of the terms which stand in opposition to nature represent the activity or being of man or God. As appears in the chapter on MEDICINE, Galen thinks of nature as an artist. Harvey later develops this notion. But with these two exceptions, the traditional theory of art conceives it not as the work of nature, but of man. Despite other differences in the great books on the theory of art, especially with regard to art's imitation of nature, there seems to be a common understanding that works of art are distinguished from productions of nature by the fact that man has added something to nature. A world which man left exactly as he found it would be a world without art or any trace of the artificial in it.

The ancient authors who contrast the natural and the conventional and the modern authors who distinguish man's life in a state of nature from his life in civil society seem to imply that without something done by man there would be nothing conventional or political. Locke appears to be an exception here. He thinks that there is a natural as well as a civil, or political, society. Natural society is the society of "men living together according to reason without a common superior on earth, with authority to judge between them." Unlike Hobbes or Kant or Hegel, Locke does not think that the state of nature is necessarily a state of war. But this difference between Locke and others does not affect the point that the political institutions of civil society are things of man's own devising.

There may be, among the social insects, natural organizations such as the bee-hive and the ant-mound. It may even be, as Locke supposes, that in a state of nature, "men living together according to reason" would constitute a society. But in neither case does the society we call "a state" result. States differ from one another in many features of their political organization. In this sense the state or political community is conventional rather than natural; its institutions are humanly contrived.

The social contract theory of the origin of the state is not necessarily involved in the recognition that the state is partly conventional. Aristotle, for example, who regards the state as natural—he speaks of it as "a creation of nature"—does not think of the political community as natural in the sense in which a bee-hive is natural. That men should form political communities is, in his view, the result of a natural desire, a tendency inherent in the nature of man as a political animal. But what form the political community will take is at least partly determined by the particular arrangements men voluntarily institute. Man-made laws are conventional, but so also are other institutions which vary from state to state or change from time to time.

THE ISSUES IN political theory raised by any consideration of what is and is not natural about society or the state are discussed in other chapters, *e.g.*, FAMILY and STATE. What is true in this connection is likely to be true of each of the other fundamental oppositions in which

the notion of nature is involved. The issues raised by the relation of art to nature are, for example, considered in the chapter on ART; those raised by the distinction between nature and nurture are considered in the chapter on HABIT, and so on. Here we are concerned not with the theoretical consequences of different conceptions of nature, but with the various meanings of the term itself as it is used in different contexts.

Common to all meanings is the notion that the natural is that which man's doing or making has not altered or enlarged. The distinction between nature and nurture confirms this. Man's activities are the source of modifications in his own nature as well as in the nature of other things. The human nature man is born with undergoes transformations in the course of life: the acquirement of knowledge, the formation of habits (which are often called "second nature"), the modification of instincts. The sum of these changes represents what nurture adds to nature.

When changes of this sort are looked at collectively they give rise to the notions of culture or civilization—two more terms which present a contrast to nature. In Rousseau and others we meet the feeling that man may have lost, not gained, by exchanging the natural for the civilized life. The ideal of a return to nature involves more than a return to the soil, or an exodus from the city to the country. In its most radical form, this ideal calls upon man to divest himself of all the artifices and conceits with which he has thought to improve on nature—"by renouncing its advances," Rousseau says, "in order to renounce its vices."

But why, it may be asked, is the whole world which man creates not as natural as the materials which man finds to work with—the resources of physical nature and the native equipment which is man's nature at birth? If man himself is a natural entity, and if all human activities are somehow determined by human nature, then why are not the works of art and science, the development of political institutions, the cultivation of human beings by education and experience, and all other features of civilization—why are not all these just as natural as the falling stone, the flourishing forest, or the bee-hive? Why, in short, should there by any contrast between the works of nature and the works of man?

THIS QUESTION points to one of the fundamental issues in the traditional discussion of nature. Those who uphold the validity of the contrast defend its significance in terms of something quite special about human nature. If man were entirely a creature of instinct—if everything man did were determined by his nature so that no choices were open to him and no deviation from the course of nature possible—then the human world would seem to fade into the rest of nature. Only on the supposition that man is by nature rational and free do those human works which are the products of reason or the consequences of free choice seem to stand in sharp contrast to all other natural existences or effects of natural causes.

Of these two factors—rationality and freedom—the element of freedom is usually the one most emphasized. The line is drawn between that which natural causes determine and that which man determines by his own free choice. The laws of nature are often conceived as expressing an inherent rationality in nature itself, but they also state the uniformity of nature's operations. Such maxims of nature as 'nature does nothing in vain,' 'nature abhors a vacuum,' or 'nature does nothing by jumps' are usually interpreted as describing nature's invariable way of doing things. Aristotle's distinction between things which happen naturally and those which happen by chance turns on the regularity of the events which result from causes in the very nature of things. The natural is that which happens either always or for the most part.

Hence, even if there is rationality of some sort in the structure of nature, that supposition does not seem to affect the position of those who connect human reason with human freedom and who, in consequence, divide the things which happen as a result of man's free choice from everything else which happens in the course of nature. This may be exemplified by the Greek understanding of the difference between nature and convention. The laws of Persia vary from the laws of Greece, the political institutions of the city-states vary from those of the Homeric age, customs and consti-

tutions differ from city to city. Unlike such conventions, "that which is by nature," Aristotle writes, "is unchangeable and has everywhere the same force, as fire burns both here and in Persia." The conventional is the variable, the natural the uniform. The variability of conventions, moreover, seems to suggest that they are products of freedom or choice.

The difference between the bee-hive and the human city is that one is *entirely* a creation of nature, a social organization entirely determined by the instincts of the bees, so that wherever bees form a hive, it is formed in the same way; whereas the human city involves something more than a natural desire of men, since when these political animals associate in different places, they set up different forms of government and different kinds of law. The same comparison can be made between the spider's web or the beaver's dam and such products of human art as cloth and houses. The variability of the works of reason, as opposed to the uniformity of instinctive productions of all sorts, implies the factor of choice in reason's work.

THE CONCEPTION OF nature which tries to separate the natural from what man contributes thus seems to depend upon the conception of man. Controversies concerning man's difference from other animals, especially the dispute about human freedom (considered in such chapters as MAN and WILL), bear directly on the issue of the naturalness of the things which result from man's doing and making.

Spinoza, for example, in holding that human actions constitute no exception to the reign of necessity throughout nature, removes any ground for distinguishing the effects of human operation from other effects. Man exercises no freedom of choice; nor does man in any other way introduce a new principle into the order or process of nature. Hobbes and Locke concur in the denial of free will, but they separate the inventions of man's mind or his social institutions from what happens without human contrivance in the realm of thought or action. The difference between simple and complex ideas for Locke seems to parallel the ancient distinction between nature and art.

At the other extreme from Spinoza, Kant separates the order of nature and the order of freedom into worlds as radically asunder as the Cartesian realms of matter and mind. The world of nature is the system or order of the objects of sense—"the sum total of phenomena insofar as they . . . are connected with each other throughout." For Kant this means two things which are strictly correlative. Nature is the object of the theoretic sciences and it is also the realm of time, space, and causality. Like Spinoza, Kant identifies the order of nature with the order of causal necessity. But, unlike Spinoza, Kant places the moral and political life of man in an order unconditioned by time, space, and causality. This realm of freedom is the sphere of the moral or practical sciences. The natural or theoretic sciences do not extend to what Kant calls the "supersensible" or the "noumenal" order—the world of things lying outside the range of sense-experience.

There is an alternative to Spinoza's location of all events within the order of nature and to Kant's separation of the realm of nature from the domain of freedom. It takes the form of Aristotle's or Aquinas' distinction between the natural and the voluntary. The voluntary is in one sense natural, in another not. It is natural in the sense that what happens voluntarily in the realm of animal and human motions proceeds from causes as natural as those responsible for the motions of inert bodies. A voluntary act, according to Aquinas, comes from "an intrinsic principle," just as the falling of a stone proceeds from "a principle of movement in the stone." But among the factors responsible for voluntary acts is "knowledge of the end"—knowledge of the object being sought. The sphere of the voluntary can therefore be equated with the sphere of conscious desire, *i.e.*, with desire aroused by an object known, whether known by sense or reason. The natural in the sense in which it is distinguished from the voluntary is the sphere of motions in line with natural desire, *i.e.*, with tendencies founded in the very nature of a body or organism and unaccompanied by any awareness of the goal toward which it is thus inclined to move.

Aristotle's distinction between natural and violent motion (which Galileo and other physicists adopt) seems to throw light on a double

use of the term 'natural' here. Galileo treats the motion of a freely falling body as natural, in contrast to the motion of a projectile. In the former case, it is the nature of heavy bodies to gravitate toward the earth; whereas in the latter case, in addition to the motion of gravitation, another motion is imparted to the body when it is shot from a gun—a motion which does not proceed from the body's own nature but is caused by the motions of other bodies. In terms of this distinction, voluntary motions are natural rather than violent. In fact, the violent is sometimes thought to be even more opposed to the voluntary than to the natural, in the sense that a man acting contrary to his will under external coercion suffers violence. When he does what he wishes, his conduct is not only voluntary but natural, *i.e.*, free from the violence of external forces.

It is necessary to consider the additional distinction between the voluntary and the free. Animals acting from desires caused by the perception of certain objects act voluntarily, but, in the theory of Aristotle and Aquinas, only men freely choose among alternative objects of desire or between means for accomplishing an end. The effects of voluntary action differ from other natural events only because knowledge enters into their determination. But that which happens as the result of man's free choice is determined neither by his nature nor by his knowledge. Hence whatever comes into existence through man's choice stands apart from all that is naturally determined to exist.

One other matter bears on this consideration of the natural in relation to the voluntary and the free. Spinoza excludes the operation of final causes, as well as free choice, from the order of nature. Purposes or ends are not principles of nature. Aristotle, on the other hand, thinks that final causes are operative in every part of nature. He finds them in the sphere of inert bodies which naturally tend toward certain results. He finds them in the sphere of animal and human motions, where the final cause or end may be an object of conscious desire.

So far as the search for causes is concerned, nature presents the same kind of problems to the physicist as to the biologist or psychologist. In only one sense are final causes peculiarly present in human conduct; that is the sense in which the change effected is not the ultimate end, but only a means to some further end desired. Here there is an extrinsic final cause as well as a final cause intrinsic to the change itself. It may be with regard to this special sense that Bacon says of final causes that they are "more allied to man's own nature than to the system of the universe." Yet Bacon, far from denying their presence in the scheme of things, assigns the investigation of final causes to metaphysics (as a branch of natural philosophy) rather than to physics. For him the ascertainment of final causes does not discover a purpose in the nature of things. Rather it looks to God's plan and providence.

We have so far dealt with that consideration of nature which opposes the natural to the works of man. The discussion of nature also moves on a theological plane. Here, on one traditional view, the natural is not opposed to, but rather identified with the work of God. "Things which are said to be made by nature," Plato writes, "are the work of divine art." Those who conceive the universe as God's creation, and think of God alone as uncreated being, tend to use the word "nature" collectively for the whole world of creatures and distributively for each type of thing which has its being from God.

The distinction between the supernatural and the natural has many interpretations in Christian theology, but none more basic than that which divides all being into the uncreated and the created. On this view, the order of nature includes more than the world of physical, sensible things. It includes the spiritual creation—angels and souls—as well. Immaterial beings are no more supernatural than bodies. They, too, are created natures. Only God is uncreated being.

Those who do not have or who deny a doctrine of creation use the word "nature" in a *less* and in a *more* comprehensive sense. The Greek philosophers, for example, seem to restrict the natural to the physical, *i.e.*, to the realm of material, sensible, changing things. Change is an element in the connotation of the Greek word *phüsis*, of which *natura* is the Latin equivalent. As Greek scientists conceive the

study of nature, it is the business of physics to investigate the principles, causes, and elements of change.

Things which are thought to be untouched by change, such as the objects of mathematics, self-subsistent ideas, or separate forms; or things which are thought to be eternal and immutable, such as immaterial substances or intelligences, do not belong to the realm of physics or *natural* science. In Aristotle's classification of the sciences such beings are the objects of mathematics and metaphysics, or theology. Since, for him, whatever is both sensible and mutable is also material, the realm of nature includes no more than the whole material universe, celestial as well as terrestrial.

The *more* comprehensive sense of nature appears in Spinoza's identification of nature with the infinite and eternal substance of God. "Besides God," says Spinoza, "no substance can be nor be conceived. . . . Whatever is, is in God, and nothing can either be or be conceived without God." All finite things are modes of the divine substance or, more precisely, of the attributes of God, such as extension and thought. Nature, therefore, is the totality of finite things, both material and immaterial. But nature exceeds even this totality, for the infinite substance of God is greater than the sum of its parts.

To make this clear, Spinoza employs the distinction between *natura naturans* and *natura naturata*. "By *natura naturans* we are to understand that which is in itself and is conceived through itself, or those attributes of substance which express eternal and infinite essence; that is to say, God in so far as He is considered as a free cause. But by *natura naturata* I understand everything which follows from the necessity of the nature of God, or of any one of God's attributes in so far as they are considered as things which are in God, and which without God can neither be nor be conceived."

Viewed under the aspect of time rather than eternity, the order of nature (*i.e.*, *natura naturata*) is as much an order of ideas as it is an order of things. "The order and connection of ideas is the same as the order and connection of things," Spinoza writes. "Whether we think of nature under the attribute of extension or under the attribute of thought, or under any other attribute whatever, we shall discover one and the same order, or one and the same connection of causes."

Except perhaps for the Stoics, like Marcus Aurelius and Epictetus, Spinoza seems to stand alone in this conception of nature as all-embracing. The Stoics too regard nature as the system of the universe, with man a part of its cosmic structure, and with God or divinity inherent in nature as the rational principle governing all things. But with or without reference to God and creation, thinkers like Descartes and Hume tend to identify nature not with the totality of finite things, but with the world of bodies in motion or changing sensible things.

For Descartes, nature does not include the realm of thought or thinking substances, though these, like bodies, are finite and dependent creatures of God. For Hume, nature seems to be that which lies outside experience—in a way, the reality which underlies appearances. Where Spinoza thinks that the system of ideas is as much a part of nature as the system of bodies in motion, Hume speaks of "a kind of pre-established harmony between the course of nature and the succession of our ideas."

Hume's distinction between knowledge of the relation between our own ideas and knowledge of matters of fact or real existence seems furthermore to imply that nature is the reality known (however inadequately) when we assert certain things to be matters of fact. Here we perceive another meaning of nature, defined by another basic opposition, this time between the real and the ideal or the imaginary. It is in this sense that mediaeval writers oppose *entia naturae*, *i.e.*, natural or real beings, to *entia rationis*, or things which have their being in the mind.

THIS DISTINCTION, like most of the others in which nature is concerned, does not have universal acceptance. Kant, as we have seen, far from making nature the reality which exists independently of our experience or knowledge, conceives the realm of nature as identical with all possible experience. "We possess two expressions," Kant writes, "*world* and *nature*, which are generally interchanged. The first denotes the mathematical total of all phenomena and the totality of their synthesis. . . . And

the world is termed nature, when it is regarded as a dynamical whole—when our attention is not directed to the aggregation in space and time . . . but to the unity in the *existence* of phenomena."

On quite different principles of analysis, Berkeley also treats as natural things the ideas or sensations which "are not produced by, or dependent on, the wills of men." Natural beings do not exist apart from the mind, but unlike imaginary ones, natural beings are those ideas which are not subject to our will or the human mind's own constructive activities. Such ideas are produced in our minds immediately by God.

To the question whether "Nature hath no share in the production of natural things," Berkeley answers: "If by *Nature* is meant the visible series of effects or sensations imprinted on our minds, according to certain fixed and general laws, then it is plain that Nature, taken in this sense, cannot produce anything at all. But, if by *Nature* is meant some being distinct from God, as well as from the laws of nature, and things perceived by sense, I must confess that word is to me an empty sound without any intelligible meaning annexed to it. Nature, in this acceptation, is a vain chimera, introduced by those heathens who had not just notions of the omnipresence and infinite perfection of God."

Berkeley's view represents one extreme position on a theological issue of the utmost difficulty. According to him God is not only the creator or first cause, but the sole cause of everything which happens in the course of nature. There are no natural causes. Nature has no productive power. Everything is the work of God or the work of man—nothing the work of nature.

Within the limits of this issue, the other extreme consists in denying not the creativity of God, but the role of divine causality in the production of natural effects. It relegates them entirely to the efficacy of natural causes. Lucretius, of course, denies both the creation of the world and the intervention of the gods in the processes of nature. But others, like Descartes, seem to say that once God has created the physical world, once He has formed matter into bodies and given them their initial impetus, their motions henceforward need only the laws of nature which God laid down for them to follow. For everything that happens in the course of nature, natural causes, operating under these laws, suffice.

There is a third position which distinguishes between the work of God in the creation of nature, and the work of nature in the production of effects of all sorts, such as the natural motions of bodies or the propagation of animals. But though it ascribes efficacy to natural agents or second causes in the production of natural effects, it also regards natural causes as instrumental to the hand of God, the first or principal cause of everything which happens as well as of everything which is. Aquinas seems to hold that God acts alone only in the original creation of things; whereas in the preservation of created natures and in their causal interaction, God works through secondary, or natural, causes.

"Some have understood God to work in every agent," Aquinas writes, "in such a way that no created power has any effect in things, but that God alone is the immediate cause of everything wrought; for instance, that it is not fire that gives heat, but God in the fire, and so forth. But this is impossible. First, because the order of cause and effect would be taken away from created things, and this would imply a lack of power in the Creator. . . . Secondly, because the operative powers which are seen to exist in things would be bestowed on things to no purpose, if things produced nothing through them. . . . We must therefore understand that God works in things in such a manner that things have also their proper operation."

In other words, according to Aquinas, "God is the cause of action in every agent." Furthermore, "God not only moves things to operate . . . but He also gives created agents their forms and preserves them in being." With regard to the being of things, Aquinas holds that God "established an order among things, so that some depend on others, by which they are conserved in being, though He remains the principal cause of their conservation."

WITH REGARD TO NATURE itself this theological doctrine raises two sorts of problems. The first concerns the efficacy of natural causes,

which are sufficient for the scientist to appeal to in explaining natural phenomena, yet are insufficient by themselves for the production of natural effects. The second concerns the distinction between the natural and the supernatural, now not in terms of the created and the uncreated, but in terms of what happens naturally (or even by chance) as opposed to what happens as a result of God's intervention in the course of nature.

Miracles, for example, are supernatural rather than natural events. They are not produced by natural causes; nor do they happen by accident. They are attributed by the theologian to divine causality, yet not in such a way that violence is done to nature. "The term *miracle*," Aquinas explains, "is derived from admiration, which arises when an effect is manifest, whereas its cause is hidden. . . . A miracle is so called as being full of wonder; in other words, as having a cause absolutely hidden from all. This cause is God. Therefore those things which God does outside the causes which we know are called miracles."

The miraculous is that which is beyond the power of nature to accomplish. "A thing is said to be above the ability of nature," Aquinas writes, "not only by reason of the substance of the thing done, but also because of the manner and the order in which it is done"; and "the more the power of nature is surpassed, the greater the miracle." Aquinas distinguishes three grades of miracles.

The first, he says, surpasses nature "in the substance of the deed; as, for example, if two bodies occupy the same place, or if the sun goes backwards, or if a human body is glorified. Such things nature is absolutely unable to do; and these hold the highest rank among miracles. Secondly, a thing surpasses the power of nature, not in the deed, but in that wherein it is done; as the raising of the dead, and giving sight to the blind, and the like. For nature can give life, but not to the dead, and it can give sight, but not to the blind. Such hold the second rank in miracles. Thirdly, a thing surpasses nature's power in the measure and order in which it is done; as when a man is cured of a fever suddenly by God, without treatment or the usual process of nature. . . . These hold the lowest place in miracles."

Though "each of these kinds has various degrees, according to the different ways in which the power of nature is surpassed," no miracle, according to Aquinas, transgresses the order of nature in the sense of accomplishing the impossible. Unlike the impossible, which would destroy nature, the improbable can be elicited by God's power within the general framework of nature.

Hume, on the other hand, thinks that "a miracle is a violation of the laws of nature." And since, in his view, a firm and unalterable experience has established these laws, the proof against a miracle, from the nature of the fact, is as entire as any argument from experience can be. "Why is it more than probable," he asks, "that all men must die; that lead cannot, of itself remain suspended in the air; that fire consumes wood, and is extinguished by water; unless it be, that these events are found agreeable to the laws of nature, and there is required a violation of these laws, or in other words, a miracle to prevent them?

"Nothing is esteemed a miracle," Hume continues, "if it ever happens in the common course of nature. . . . There must, therefore, be a uniform experience against every miraculous event, otherwise the event would not merit that appellation. And as a uniform experience amounts to proof, there is here a direct and full *proof*, from the nature of the fact, against the existence of any miracle; nor can such a proof be destroyed, or the miracle rendered credible, but by an opposite proof which is superior."

Hume does not think that miracles can be proved against our uniform experience of the order of nature. But he also thinks that they are "dangerous friends or disguised enemies to the *Christian religion*" who would try to defend its beliefs "by the principles of human reason. . . . The *Christian religion* not only was at first attended with miracles," he declares, "but even at this day cannot be believed by any reasonable person without one. Mere reason is insufficient to convince us of its veracity: and whoever is moved by *Faith* to assent to it, is conscious of a continued miracle in his own person . . . which gives him a determination to believe what is most contrary to custom and experience."

ONE OTHER TRADITIONAL conception of nature, implicit in much of the foregoing, should be noted. The various senses of the term so far explicitly considered are alike in this: that they justify the use of the word "Nature" with a capital N and in the singular. This other sense of the term appears when we speak of each thing as having a nature of its own, and of the world as containing a vast plurality and radical diversity of natures.

In this sense we attribute a nature even to things which are contrasted with Nature and the natural. We speak of the nature of God and the nature of freedom, the nature of art, the nature of reason, the nature of ideas, the nature of the state, the nature of customs and habits. This could, of course, imply a theory that things which are not completely natural, nevertheless have a natural basis, as art, the state, or habit. Another meaning, however, seems to be involved.

The phrase "nature of" appears almost as frequently in the great books as the word "is," and frequently it is unaccompanied by any explicit theory of Nature or the natural. The discussion of the *nature of* anything seems, for the most part, to be a discussion of *what* it is. To state the nature of anything is to give its definition; or if for any reason definition in a strict sense cannot be given, then the attempt to state the nature of the thing consists in trying to say what characterizes this thing or kind of thing, in distinction from everything else or all other kinds.

Enumerating the senses of the term 'nature,' Aristotle gives this as the fifth meaning. The first four comprise senses which distinguish the natural from the artificial or the immutable, and which indicate that the natural or the physical has an immanent principle of movement in itself and involves matter or potency. The fifth sense is that in which 'nature' means "the *essence* of natural objects"; and, as he goes on to say, this implies the presence in them of form as well as matter. "By an extension of meaning from this sense of 'nature' every essence in general has come to be called a 'nature,' because the nature of a thing is one kind of essence." This is the sixth and most general sense, according to which the nature or essence of anything is the object of definition.

Does each individual thing have a nature peculiarly its own, even if it cannot be defined? Or is a nature or essence always something common to a number of individuals, according to which they can be classified into kinds, and the kinds ordered as species and genera? Do John and James, for example, have individual natures in addition to the common nature which they share through belonging to the human species; and does their human nature entail certain properties which are generic rather than specific, *i.e.*, which seem to be determined by their having the generic nature common to all animals as well as the specific nature common to all men?

Such questions about individual, specific, and generic natures raise problems of definition and classification which are discussed in the chapter on EVOLUTION. They also raise problems about the existence or reality of the *kinds* which men define and classify. Are they merely what Locke calls "nominal essences," or do our definitions signify real essences, *i.e.*, the natures of things as they really are? Is the real world one which, as William James says, "plays right into logic's hands"? Does Nature consist of a *hierarchy* of natures or distinct kinds; or is it a *continuum* of things all having the same nature and differing from each other only individually or accidentally, but not essentially? These problems are discussed elsewhere, in such chapters as ANIMAL, DEFINITION, EVOLUTION, LIFE AND DEATH, and SAME AND OTHER.

OUTLINE OF TOPICS

PAGE

1. Conceptions of nature 234

1*a*. Nature as the intrinsic source of a thing's properties and behavior

(1) The distinction between essential and individual nature: generic or specific properties, and individual, contingent accidents

(2) Nature or essence in relation to matter and form 235

PAGE

1*b*. Nature as the universe or the totality of things: the identification of God and nature; the distinction between *natura naturans* and *natura naturata* 235

1*c*. Nature as the complex of the objects of sense: the realm of things existing under the determination of universal laws

2. The antitheses of nature or the natural 236

2*a*. Nature and art: the imitation of nature; cooperation with nature

2*b*. Nature and convention: the state of nature and the state of society 237

2*c*. Nature and nurture: the innate or native and the acquired; habit as second nature

2*d*. Natural and violent motion 238

2*e*. The natural and the unnatural or monstrous: the normal and the abnormal

2*f*. The order of nature and the order of freedom: the phenomenal and the noumenal worlds; the antithesis of nature and spirit 239

3. The order of nature

3*a*. The rationality of nature: the maxims and laws of nature

3*b*. Continuity and hierarchy in the order of nature 240

3*c*. Nature and causality 241

(1) The distinction between the regular and the chance event: the uniformity of nature

(2) The determinations of nature distinguished from the voluntary or free

(3) Teleology in nature: the operation of final causes 242

(4) Divine causality in relation to the course of nature: the preservation of nature; providence; miracles 243

4. Knowledge of nature or the natural 244

4*a*. Nature or essence as an object of definition

4*b*. Nature in relation to diverse types of science: the theoretic and the practical sciences; natural philosophy or science, mathematics, and metaphysics 245

4*c*. Nature as an object of history

5. Nature or the natural as the standard of the right and the good 246

5*a*. Human nature in relation to the good for man

5*b*. Natural inclinations and natural needs with respect to property and wealth

5*c*. The naturalness of the state and political obligation 247

5*d*. The natural as providing a canon of beauty for production or judgment

6. Nature in religion and theology 248

6*a*. The personification and worship of nature

6*b*. Nature and grace in human life

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page **12**.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page. the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 61: NECESSITY AND CONTINGENCY

INTRODUCTION

THE basic meaning of the words *necessity* and *contingency* is made known to us by the fact that we can substitute for them the familiar words *must* and *may*. "Is there any being which *must* exist?" asks the same question as, "Does anything exist of *necessity*?" "Are all things of the sort which *may* or *may not* exist, or are they divided into those which *must* exist and those which *may* or *may not* exist?" means the same as, "Is everything *contingent* in being or do some things exist *necessarily* and some *contingently*?"

The great issues which involve the opposition between necessity and contingency are concerned with more than questions about being or existence. They also deal with cause and effect, judgment and reasoning, happenings or events, the actions and decisions of men, human history and social institutions. In each case, the problem is formulated by such questions as: Does everything which happens in nature or history happen necessarily? Is everything contingent? Or are some events necessary and others contingent? Is the relation between cause and effect a necessary connection, or do some causes produce their effects contingently?

Are there some propositions which the mind *must* affirm because their truth is necessary? Or are all propositions such that they *may* or *may not* be true, our affirmation or denial of them being contingent upon factors which lie outside the propositions themselves? In reasoning, does the conclusion always follow by necessity from the premises if it follows at all? And are all conclusions which follow necessarily from their premises necessarily true, or may some be necessary truths and some contingent?

Are men necessitated in all their acts, or are certain actions contingent upon the exercise of their will and in this sense free? Does human liberty consist merely in the freedom of a man's action from the external necessity of coercion or constraint; or does it consist in a man's being able to choose whatever he chooses, freely rather than necessarily? Is every act of the will necessarily determined, or are some acts of the will acts of free choice?

Are certain human institutions, such as the family and the state, necessary? Are men compelled to live socially or can they choose the solitary life? If domestic and political society are necessary, are the ways in which they are organized also necessary, or are such things as monogamy in the family and monarchy in the state contingent? Are such things as war, slavery, poverty, and crime necessary features of human society, or are they the result of circumstances which are contingent and which can therefore be remedied?

These questions indicate the range of subject matters in which issues are raised concerning the necessary and the contingent. They also indicate that the other ideas to which necessity and contingency have relevance are too manifold to permit an enumeration of all the other chapters in which some aspect of necessity and contingency is discussed. This chapter stands to the others as a kind of summary of the theme of necessity and contingency. It assembles in one place the various topics, problems, or subject matters which traditionally engage the human mind with that theme.

Two chapters alone demand specific mention as, in a sense, being concerned with ideas that seem to be inseparable from the notions of necessity and contingency. They are FATE and CHANCE. Though they stand opposed to one another as the necessary to the contingent, they do not cover every application of this opposition. They are largely concerned with necessity and contingency in the realm of change, in the causation of the events of na-

ture or the happenings of history. They do not deal, at least not directly, with necessity and contingency in being or existence, in thought or knowledge, in human acts and social institutions.

THE NECESSARY AND the contingent do not seem to be opposed in exactly the same way in each of the four areas—namely, being, change, thought, and action—in which they raise basic issues.

In the sphere of human action, for example, writers like Hobbes, Locke, and Hume substitute the notion of liberty for contingency as the opposite of necessity. The meaning of necessity alters in consequence. Liberty, according to these authors, implies the absence not of all necessity, but only of external necessity in the form of compulsion. An internal necessity, they think, is quite compatible with complete freedom.

Hume therefore dismisses the supposed conflict between liberty and necessity as groundless. "By liberty," he writes, "we can only mean *a power of acting or not acting, according to the determinations of the will*; that is, if we choose to remain at rest, we may; if we choose to move, we also may. Now this hypothetical liberty is universally allowed to belong to everyone who is not a prisoner and in chains.... Liberty, when opposed to necessity, not to constraint, is the same thing with chance; which is universally allowed to have no existence."

Similarly, Locke defines liberty as a man's power "to do or forbear doing any particular action, according as its doing or forbearance has the actual preference in the mind, which is the same thing as to say, according as he himself wills it." Liberty in this sense, he adds, belongs not to the will, the acts of which are necessitated by their causes, but to the man who is under no external necessity, in the form of compulsion, to do what is contrary to his will or to refrain from doing what he wills.

Hobbes seems to go even further along the same line of thought. Holding that liberty is destroyed only by external impediments to action, he uses "necessity" in a sense which makes it consistent with liberty, or inseparable from it. "The actions which men voluntarily do," he says, "because they proceed from their will, proceed from *liberty*; and yet, because every act of man's will, and every desire, and inclination, proceeds from some cause, and that from another cause, in a continual chain (whose first link is in the hand of God, the first of all causes), they proceed from *necessity*."

Yet if what Hobbes means by "external impediments" represents the same nullification of liberty which others call "compulsion" or "restraint," then there is at least one meaning of "necessity" which stands opposed to liberty. Enumerating the meanings of "necessary," Aristotle lists as one sense "the compulsory or compulsion, *i.e.*, that which impedes or tends to hinder, that which is contrary to impulse or purpose . . . or to the movement which accords with purpose and with reasoning." It is in a related sense that Plato opposes necessity to intelligence. Necessity represents for him those resistant factors in nature which the mind of man or God must overcome, or persuade to give way, if reason or purpose is to prevail in the coming to be of anything. In this sense, necessity like chance is opposed to purpose. Blind necessity and blind chance both exclude the operation of final causes; both exclude the possibility that the events of nature are directed toward an end.

WE SEEM TO HAVE found almost universal agreement on the point that there is one sense in which necessity conflicts with liberty. But this agreement does not affect the issue whether liberty is more than freedom from external coercion. There are those, like Aquinas, who think that man's will is free in its acts of choice with regard to "particular contingent means." Aquinas agrees that what is called "necessity of coercion" is "altogether repugnant to the will." The same act cannot be absolutely coerced and voluntary. But the question is whether the will's acts are necessarily determined by causes operating within the sphere of the will itself.

Aquinas names two modes of necessity which operate *within* the sphere of the will and restrict its freedom. One is the natural necessity that the will should desire an ultimate end, such as the complete good or happiness. If a man wills any object at all as the ultimate goal of his life, he cannot will anything other or less than that which can satisfy all his natural desires. The

other necessity is that which concerns the use of those means which are absolutely indispensable conditions for reaching the end being sought. This may be an absolute or a conditional necessity. When the end is itself necessary (*e.g.*, happiness), whatever means are necessary thereto necessitate the will absolutely. When a certain end is not necessary, but has been freely adopted (*e.g.*, a certain destination), and when *only one* means is available (*e.g.*, one mode of transportation), then it becomes necessary to choose that means. But this necessity is conditional since it remains in force only on the condition that we continue to have a certain end in view—an end we can relinquish at any time as freely as we adopted it.

According to Aquinas, this leaves a great many acts of the will which are in no way necessitated: those in which there is no necessary connection between the means and a given end, and those in which a given means is necessary only on the condition that a certain end is sought. If the end need not be sought, then the will is free not to choose the means of achieving it; and if, when the end is necessarily sought, alternative means are available, then the will is free to choose one rather than another.

According to this theory, liberty consists in the absence of internal as well as external necessity. Furthermore, liberty seems to be related positively to contingency, insofar as freedom of choice depends on a contingent connection between means and ends, or upon the contingent, *i.e.*, the conditional, character of the end. On the other hand, those who hold that the will is never free from internal necessity insist that the act of choice, even with respect to contingent means, is always caused. If being caused is equivalent to being determined—which seems to be the view of Hobbes, Locke, and Hume—then whether or not we know what causes a particular choice, our wills are so determined that we could not have chosen otherwise.

THE PROBLEM OF the freedom of the will in relation to the causes which determine its acts is considered in the chapter on WILL. The foregoing discussion suffices here for the purpose of throwing light on the meaning of necessity.

If now we shift from human action to the realm of becoming, change, or motion, we face the question of the relation between necessity and causation in its most general form.

In the realm of nature the alternatives to necessity are referred to as "chance" and as "contingency." The significance of these alternatives depends on the theory of causation. According to one opinion, every effect is necessarily determined by its causes, and every cause necessarily produces certain effects. Given the causal chain of past events leading up to the present, every future event is necessarily determined. Nothing that ever happens could happen otherwise. Nothing happens contingently or by chance. This theory of causation is accordingly a doctrine of universal necessity or absolute determinism in the realm of change.

"In nature," writes Spinoza, "there is nothing contingent, but all things are determined from the necessity of the divine nature to exist and act in a certain manner." Though nothing which exists or happens is contingent, "God alone exists from the necessity of His own nature and acts alone from the necessity of His own nature." The divine necessity is therefore different from the necessity of everything else which follows from the divine nature. One is the necessity of freedom or self-determination, the other the necessity of compulsion, or determination by another. "That thing is called free," says Spinoza, "which exists from the necessity of its own nature alone, and is determined to action by itself alone. That thing, on the other hand, is called necessary, or rather compelled, which by another is determined to existence and action in a fixed and prescribed manner."

Hume's statement that there is "no such thing as *Chance* in the world," would appear to agree with Spinoza's denial of contingency. But Hume also seems to deny the perception of any necessary connection between cause and effect. This is not to say that events happen without cause, but only that "our ignorance of the real cause of any event has the same influence on the understanding" as if nothing were necessarily determined by its causes.

"We are never able," Hume thinks, "to discover any power or necessary connexion, any quality, which binds the effect to the cause,

and renders the one an infallible consequence of the other. . . . One event follows another; but we never can observe any tie between them. They seem *conjoined*, but never *connected*. . . . Our idea, therefore, of necessity and causation arises entirely from the uniformity observable in the operations of nature, where similar objects are constantly conjoined together, and the mind is determined by custom to infer the one from the appearance of the other. These two circumstances form the whole of that necessity, which we ascribe to matter. Beyond the constant *conjunction* of similar objects, and the consequent *inference* from one to the other, we have no notion of any necessity or connexion."

But the question remains whether in the order of nature itself particular events are necessarily determined or happen contingently. The fact that we may be ignorant of real necessities does not, as Hume seems to admit, imply their non-existence. Our saying it is only probable that the sun will rise tomorrow may reflect our inadequate knowledge of causes rather than a real indeterminacy in the order of nature. On the other hand, to say as Hume does that chance has no place in nature, may mean only that "nothing exists without a cause of its existence," rather than that whatever happens is necessarily determined by its causes.

As INDICATED IN the chapter on CHANCE, two things must be distinguished here: the absolutely uncaused—the spontaneous or fortuitous—and the contingently caused, or that which depends upon the coincidence of a number of independent causes. A given condition may be necessary to produce a certain result, as, for example, oxygen may be necessary for combustion. But by itself it may not be sufficient for the production of that effect. If the maxim, "nothing exists without a cause of its existence," requires a cause or causes adequate to produce the effect, then the maxim is equivalent to the principle of sufficient reason. Whenever two or more causes, each of which may be necessary, are not sufficient in separation, the existence of the effect depends upon their combination; and the effect is contingent if the required combination of causes is itself not necessarily caused.

The issue concerning contingency in nature thus seems to be more sharply stated when there is no reference to our knowledge or ignorance of causes. On this issue, Aristotle and Spinoza appear to be more clearly opposed to one another than Hume is to either.

If things do not take place of necessity, "an event," according to Aristotle, "might just as easily not happen as happen; for the meaning of the word 'fortuitous' with regard to present or future events is that reality is so constituted that it may issue in either of two opposite directions." For example, "a sea-fight must either take place tomorrow or not, but it is not necessary that it should take place tomorrow, neither is it necessary that it should not take place, yet it is necessary that it either should or should not take place tomorrow." Though Aristotle holds that "one of the two propositions in such instances must be true and the other false," he also insists that "we cannot say determinately that this or that is false, but must leave the alternative undecided."

Aristotle's view with regard to propositions about future particular events is that our judgments cannot be either true or false, not because of insufficient knowledge on our part, but because future particulars are in themselves always contingent. Nothing in the nature of things or causes—existent in the past or present—necessarily determines them to happen. They will occur only if independent causes happen to coincide. Since these causes are independent—not determined to combination by their natures—the coincidence will be a matter of chance, not of necessity.

This theory of contingency in the realm of change—involving an affirmation of the real existence of contingent events—raises problems for the theologian concerning God's knowledge and will. Does the fact that nothing happens contrary to God's will imply that whatever happens happens necessarily? Aquinas answers that "God wills some things to be done necessarily, some contingently. . . . Therefore, to some effects, He has attached necessary causes that cannot fail; but to others defectible and contingent causes, from which arise contingent effects . . . it being His will that they should happen contingently."

Similarly, the fact that God knows all things

infallibly does not seem to Aquinas to be inconsistent with the real contingency of some things. He explains that "whoever knows a contingent effect in its causes only, has merely a conjectural knowledge of it." But "God knows all contingent things not only as they are in their causes, but also as each one of them is actually in itself. . . . Hence it is manifest that contingent things are infallibly known by God, inasmuch as they are subject to the divine sight in their presentiality; yet they are future contingent things in relation to their own causes."

This has a bearing on the difference between human and divine apprehension of future contingent things. "Things reduced to actuality in time," Aquinas declares, "are known by us successively in time, but by God they are known in eternity, which is above time. Whence to us they cannot be certain, since we know future contingent things only as contingent futures; but they are certain to God alone, Whose understanding is in eternity above time. Just as he who goes along the road does not see those who come after him; whereas he who sees the whole road from a height sees at once all those travelling on it. Hence," Aquinas continues, "what is known by us must be necessary, even as it is in itself; for what is in itself a future contingent cannot be known by us. But what is known by God must be necessary according to the mode in which it is subject to the divine knowledge . . . but not absolutely as considered in its proper causes." It does not follow, therefore, that *everything known by God must necessarily be*; for that statement, according to Aquinas, "may refer to the thing or to the saying. If it refers to the thing, it is divided and false; for the sense is, *Everything which God knows is necessary*. If understood of the saying, it is composite and true, for the sense is, *This proposition, 'that which is known by God is,' is necessary*."

With regard to human knowledge, Aquinas makes another distinction in answering the question whether man can have scientific or certain knowledge of contingent things. If, as Aristotle seems to hold, the objects of knowledge are necessary, not contingent things, then the realm of contingency belongs to opinion, conjecture, or probability. Insofar as the particular events of nature are contingent, they cannot be objects of scientific knowledge. But, according to Aquinas, "contingent things can be considered in two ways: either as contingent or as containing some element of necessity, since every contingent thing has in it something necessary; for example, that Socrates runs is in itself contingent; but the relation of running to motion is necessary, for it is necessary that Socrates moves if he runs."

The contingency that Socrates *may* or *may not* run does not alter the hypothetical necessity that *if* he runs, he *must* move. In its concern with contingent things, natural science is concerned only with such hypothetical necessities. Unlike physics, other sciences may deal with absolutely necessary things. That the objects of mathematics are of this sort seems to be an opinion shared by James and Kant, Hume and Descartes, Plato and Aristotle. But they do not agree on whether the necessities of mathematics belong to reality or have only ideal existence, *i.e.*, whether they exist apart from or only in the human mind. This issue is connected with another major issue concerning necessity and contingency, namely, whether any reality has necessary existence.

AS WE HAVE SEEN, those who discuss necessity and contingency in the domain of human acts and natural events seem to construe these alternatives differently, according as they conceive liberty and chance in terms of different theories of causation. With regard to being or real existence, however, there seems to be a common understanding of the alternatives, even among those who do not agree that God alone is a necessary being because they think that this world is also determined to exist as a necessary consequence of God's existence.

In the preceding discussions, one meaning of contingency has repeatedly appeared. The contingent is that which can be otherwise. "That which cannot be otherwise is necessarily as it is," writes Aristotle, "and from this sense of 'necessary' all its other meanings are somehow derived." This insight is sometimes expressed by the statement that the opposite of the necessary is the impossible, whereas the contingent—which is neither necessary nor impossible—includes contrary possibilities.

In logical analysis what is called the "modal-

ity of necessity" is attributed to judgments the contradictories of which are self-contradictory; *e.g.*, if the proposition 'the whole is *not* greater than any of its parts' represents an impossible judgment, then the contradictory proposition 'the whole *is* greater than any of its parts' represents a necessary judgment. In contrast, as Hume points out, "*that the sun will not rise tomorrow* is no less intelligible a proposition, and implies no more contradiction than the affirmation *that it will rise*." These two propositions represent contrary possibilities. No matter which turns out to be true, the event could have been otherwise.

In logical analysis some complication seems to arise from the fact that the necessary has two opposites: the impossible on the one hand, and the possible or contingent on the other. This is usually clarified by the recognition that the possible is the opposite of the impossible as well as of the necessary. In that sense of "possible" which excludes only the impossible, the necessary is, of course, possible, for what is necessary cannot be impossible. But in that sense of "possible" which implies contrary possibilities, the possible excludes the necessary as well as the impossible.

"From the proposition 'it may be' it follows," according to Aristotle, "that it is not impossible, and from that it follows that it is not necessary; it comes about therefore that the thing which must necessarily be need not be; which is absurd. But again, the proposition 'it is necessary that it should be' does not follow from the proposition 'it may be,' nor does the proposition 'it is necessary that it should not be.' For the proposition 'it may be' implies a two-fold possibility, while, if either of the two former propositions is true, the twofold possibility vanishes. For if a thing may be, it may also not be, but if it is necessary that it should be or that it should not be, one of the two alternatives will be excluded. It remains, therefore, that the proposition 'it is not necessary that it should not be' follows from the proposition 'it may be.' For this is true also of that which must necessarily be."

Of the same thing we can say that it *may* be and that it *may not* be; but we cannot say of the same thing both that it *may* be and that it *must* be, or that it *may not* be and that it *cannot* be. As Aristotle traces the implications of these modes of 'to be,' we see that *may-be* implies *may-not-be*, which contradicts *must-be*; and similarly that *may-not-be* implies *may-be*, which contradicts *cannot-be*.

When we pass from the analysis of propositions or judgments to the consideration of being or existence, the situation is simpler. Since the impossible is that which cannot exist, whatever does exist must either be necessary or possible. Here the necessary and the possible are generally understood to exclude one another. The necessary is that which *cannot* not be, the possible that which *can* not be.

IN SPITE OF THIS common understanding of the alternatives, there are basic differences among the authors of the great books in regard to the analysis or demonstration of necessary being.

Aristotle, for example, tends to identify the possible with the perishable—with that which both comes into being and passes away. Those substances are necessary, in contrast, which are not subject to generation and corruption. Holding that the matter of the celestial bodies differs from that of terrestrial bodies with respect to the potentiality for substantial change, Aristotle seems to regard the heavenly bodies as necessary beings, eternal in the sense of always existing, even though changeable in regard to place, *i.e.*, subject to local motion. The changing things of this earth are all contingent in being, for the mutability to which their matter inclines them includes coming to be and passing away.

This analysis of necessity and contingency in terms of matter's potentialities leads to another conception of necessary being—that of a totally immutable being which has necessary existence because it lacks matter entirely and, since it consists of form alone, is purely actual. Whether or not there are for Aristotle substances other than the prime mover which are necessary because they are immaterial beings, he attributes pure actuality only to that one necessary being which is an *unmoved* mover.

Aquinas seems to adopt both of Aristotle's senses of "necessary being." He treats the celestial bodies and the angels as having necessity to the extent that they are immutable. But their immutability is limited in his opinion to the

fact that they are by nature imperishable—the celestial bodies because of their matter; the angels because they are simple substances, not composed of matter and form. Since they are creatures they cannot be altogether immutable. "All creatures," Aquinas writes, "before they existed, were possible"—and in this sense contingent as regards their being, not necessary. "As it was in the Creator's power to produce them before they existed in themselves," he continues, "so likewise is it in the Creator's power when they exist in themselves to bring them to nothing." Furthermore, at every moment of their existence, their contingent being depends upon God's power. God preserves them in being, Aquinas says, "by ever giving them existence," for "if He took away His action from them, all things would be reduced to nothing."

In the strict sense then of "necessary being," no creature, but only God, the uncreated being, is truly a necessary being—because in God alone existence is identical with essence. Only a being whose very essence it is to exist is incapable of not existing; only such a being is necessary in the sense of being purely actual. All created things must be contingent, for if in their case to exist belonged to their very natures, God could not have created them by causing their natures to exist, nor when they did exist would His power be necessary to sustain them in being.

Where Aquinas defines God's necessity in terms of the *identity* of essence and existence, Descartes and Spinoza tend to conceive God as necessary because his essence is such that his existence *follows from* it. The difference may affect the meaning with which it is said that God is uncaused or that God is self-caused. "If its existence is caused," Aquinas writes, "nothing can be the sufficient cause of its own existence." According to Descartes, to say that God is "cause of His own existence . . . merely means that the inexhaustible power of God is the cause or reason why he needs no cause."

Descartes' position seems to be that that which is self-caused in the sense of having its existence determined by its own nature or essence, is also uncaused in the sense that its existence is not caused by anything outside itself. "Existence," he writes, "is involved in the essence of an infinite being, no less than the equality of its angles to two right angles is involved in that of a triangle." But though this suggests the notion of God's existence following from His essence, Descartes also says that "in God existence is not distinguished from essence."

For Descartes as for Aquinas the basic point remains that that which does not depend for its being upon any external cause, exists necessarily. Descartes, furthermore, associates the necessary existence of an independent being with that being's infinity or perfection of nature. That which is conceived as infinite or perfect cannot be conceived as lacking existence. "The notion of possible or contingent existence," he says, "belongs only to the concept of a limited thing."

Like Descartes, Spinoza conceives God as the only infinite and immutable being which exists necessarily in the sense of being "that whose essence involves existence." But unlike him Spinoza also attributes necessity in another sense to every finite and mutable thing which God causes to exist; for in his view, God not only exists necessarily but, acting from the necessity of His own nature, God also necessitates whatever follows as a consequence of His action. No other world than this is possible. "Things could be produced by God," Spinoza writes, "in no other manner and in no other order than that in which they have been produced." Furthermore, since whatever is in God's power "necessarily follows from it, and consequently exists necessarily," it is impossible for this world not to have existed. The existence of this particular world is as inseparable from God's existence as God's own existence is inseparable from His essence or nature.

In the tradition of western thought, there is, perhaps, no deeper theological issue than that which opposes the freedom of God's will to the necessity of God's acting according to His nature; and which, in consequence, sets the possibility of other worlds (or even of no world at all) against the necessity that, if God exists, this particular world inevitably follows.

Taking the other side on both points, Aquinas, for example, argues that "since the goodness of God is perfect, and can exist without other things inasmuch as no perfection can

accrue to Him from them, it follows that His willing things apart from Himself is not absolutely necessary." As for the particular features of this world, Aquinas says that "since God does not act from natural necessity" nor from a will that is "naturally or from necessity determined" to the things which exist, it follows that "in no way at all is the present course of events produced by God from any necessity, so that other things could not happen. . . . Wherefore, we must simply say that God can do other things than those He has done." Other, and even better, worlds than this are possible, for "God could make other things, or add something to the present creation; and then there would be another and a better universe."

Nor does the Christian theologian admit that the divine nature is subject to any necessity. "We do not put the life of God or the foreknowledge of God under necessity," writes Augustine, "if we should say that it is necessary that God should live forever, and foreknow all things; as neither is His power diminished when we say that He cannot die or fall into error—for this is in such a way impossible to Him, that if it were possible for Him, He would be of less power. But assuredly He is rightly called omnipotent, though He can neither die nor fall into error. For He is called omnipotent on account of His doing what He wills, not on account of His suffering what He wills not; for if that should befall him, He would by no means be omnipotent. Wherefore, He cannot do some things for the very reason that He is omnipotent."

One other traditional issue is raised by the conception of God as a necessary being; or, more strictly, as the only necessary being in the sense of having a nature which involves existence. It is formed by opposite views of the validity of the so-called "ontological" or *a priori* argument for God's existence.

Both Descartes and Spinoza argue, like Anselm and others before them, that since God cannot be conceived as not existing, it is impossible in fact for God not to exist. Those who reject such reasoning do not deny that it is unintelligible or self-contradictory to think of God as merely possible rather than necessary, *i.e.*, as requiring a cause outside Himself in order to exist. Kant, for example, admits that existence must be included in the conception of God as *ens realissimum*—the most real and perfect being. But he denies that the real existence of the object so conceived is implied by the logical necessity of the conception itself.

This amounts to saying that it is possible for a being we cannot conceive except as existing, not to exist. Aquinas seems to make the same critical point when he says that even if everyone understood by the word "God" something than which nothing greater can be conceived, and therefore a being necessarily existing, still it would not follow that "he understands that what the word signifies actually exists, but only mentally."

Stated in its most general form, the problem is whether that which is inconceivable by the human mind is impossible in reality; or whether that which is logically necessary, or necessary in thought, is also necessary in fact or existence. However that issue is resolved, it must be noted that among the so-called *a posteriori* demonstrations of God's existence, or arguments from the existence of certain effects to the existence of their cause, one mode of reasoning turns upon the distinction between contingent and necessary being.

If contingent beings exist (as it is evident they do, from the mutability and perishability of physical things), *and if* each contingent being is by definition incapable of causing its own existence, *and if* one contingent being cannot cause the existence of another, *and if* everything which exists must have a cause for its existence, either in itself or in another; *then* from all these premises it would seem to follow that a necessary being exists.

Here the conclusion may follow with logical necessity from the premises, but whether it is necessarily true depends upon the truth of the premises. That in turn seems to depend upon the understanding of what it means for anything to be contingent or necessary in being. It may also depend on whether or not the reasoning escapes Kant's criticism of all *a posteriori* arguments for the existence of a necessary being, namely, that such reasoning always implicitly contains the ontological argument, and is thereby invalidated.

OUTLINE OF TOPICS

PAGE

1. The meaning of necessity and contingency: the possible and the impossible 260

2. Necessary and contingent being or existence 261

   2*a*. The independent or unconditioned as the necessarily existent: the uncaused or self-caused; the identity of essence and existence

   2*b*. The argument for the existence of a necessary being: the problem of logical and ontological necessity

   2*c*. Mutability in relation to necessity in being

   2*d*. The necessary and contingent with respect to properties, accidents, and modes 262

3. Necessity and contingency in the realm of change: chance and determinism

   3*a*. The distinction between the essential and the accidental cause: the contingent effect; contingency and chance 263

   3*b*. The necessity of contingent events: absolute and hypothetical or conditional necessity; necessitation by efficient or material and final or formal causes

   3*c*. The grounds of contingency in the phenomenal order: real indeterminacy or ignorance of causes

4. Necessity and contingency in the realm of thought 264

   4*a*. The necessary as the domain of knowledge, the contingent as the object of opinion: certainty, doubt, and probability; necessary truths

   4*b*. Practical necessity as a cause of belief

   4*c*. The truth of judgments concerning future contingents

   4*d*. Mathematical necessity: necessity in the objects of mathematics and in mathematical reasoning

   4*e*. Necessity and contingency in logical analysis

      (1) The modality of propositions or judgments: modal opposition

      (2) Modality in reasoning: the logical necessity of inference; the necessity and contingency of premises and conclusions 265

5. Necessity and contingency in human life and society

   5*a*. Liberty and necessity in human conduct: the voluntary and the compulsory

      (1) The necessitation of the will: the range of its freedom 266

      (2) Categorical and hypothetical imperatives as expressing necessary and contingent obligations

      (3) Human freedom as knowledge or acceptance of necessity

   5*b*. The necessity of family and state: the contingency of their forms and institutions

   5*c*. Necessity and contingency in relation to the natural and conventional in law 267

   5*d*. The necessity or inevitability of slavery, poverty, war, or crime

   5*e*. Economic necessities or luxuries

   5*f*. Necessity and contingency in history 268

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 62: OLIGARCHY

INTRODUCTION

IN the great books of political theory the word "oligarchy" is usually listed along with "monarchy" and "democracy" among the traditional names for the forms of government. According to the meaning of their Greek roots, "oligarchy" signifies the rule of the few as "monarchy" signifies the rule of one and "democracy" the rule of the people—or the many. These verbal meanings are somewhat altered, however, when we consider the actual conflict between oligarchy and democracy in Greek political life. It involved an opposition, not simply between the few and the many, but between the wealthy and the working classes. The contest between these factions for political power dominated more than a century of Greek history around the Periclean age; and that fact justifies Aristotle's remark that oligarchy and democracy are the two principal conflicting forms of government.

We would not so describe the political struggle of our time. We would not speak of oligarchy as one of the principal forms of government in the world today. Instead we tend to think in terms of the conflict between democracy and dictatorship or despotism. Even when we look to the background of present issues, it is the age-old struggle between absolute and constitutional government—or between monarchies and republics—which seems to supply the obvious historical parallels for the contemporary conflict between the principles of arbitrary and legal government. The traditional terms of political theory, with the exception of oligarchy, thus appear to have a certain liveliness in the consideration of current problems. But though it does not have such frequency in our speech or familiarity in our thought, oligarchy may be much more relevant to the real issues of our day than appears on the surface.

Certainly within the framework of constitutional government oligarchical and democratic principles are the opposed sources of policy and legislation. In modern as in ancient republics the division of men into political parties tends to follow the lines of the division of men into economic factions. The ancient meanings of oligarchy and democracy, especially for those observers like Thucydides and Aristotle who see the rich and the poor as the major rivals for constitutional power, indicate the fusion of political and economic issues.

The difference between oligarchy and democracy, says Aristotle, is not well-defined by reference to the few and the many, unless it is understood that the few are also the rich and the many the poor. The issue is not whether the few are wiser than the many, or whether it is more efficient to have the government in the hands of the few rather than the many. Such issues have been debated in the history of political thought, but they are more appropriate to the alternatives of aristocracy and democracy than to the conflict between oligarchy and democracy.

The historic struggle between oligarchs and democrats—whether described as a struggle between rich and poor, nobility and bourgeoisie, landed gentry and agrarian peons, owners and workers, classes and masses—is a struggle over the political privileges of wealth, the rights of property, the protection of special interests. In the tradition of the great books, Marx and Engels may be the first to call this struggle "the class war," but they are only the most recent in a long line of political and economic writers to recognize that the economic antagonism of rich and poor generates the basic political conflict in any state. "Any city, however small," says Socrates, "is in fact divided into two, one the city of the poor, the other of the rich: these are at war with one another."

OLIGARCHY IS NOT always defined as the rule of the wealthy, nor is it always conceived as the opponent of democracy on constitutional questions. In the *Statesman*, for example, Plato first divides the forms of government into "monarchy, the rule of the few, and the rule of the many," and then divides "the rule of the few into aristocracy, which has an auspicious name, and oligarchy." Here aristocracy and oligarchy seem to be regarded as opposites, the one a government in which the few rule according to the laws, the other lawless government by the few. In both, the few are the wealthy; hence wealth is no more characteristic of oligarchy than of aristocracy.

Some political theorists make no reference to wealth at all in the discussion of oligarchy. Hobbes divides the forms of government according to whether the sovereign power is in the hands of one or more; and if in the hands of more than one, then whether it is held by some or all. He calls the several forms of government monarchy (one), aristocracy (some), and democracy (all). There are "other names of government in the histories and books of policy," he adds, such as "*tyranny* and *oligarchy*. But they are not the names of other forms of government, but of the same forms misliked. For they that are discontented under *monarchy* call it *tyranny*, and they that are displeased with *aristocracy* call it *oligarchy*." Like Hobbes, both Locke and Rousseau use no criterion except numbers to distinguish the forms of government, Locke calling government by the few "oligarchy" and Rousseau calling it "aristocracy."

Barely outlined in this way, the alternatives of monarchy, aristocracy *or* oligarchy, and democracy seem to raise issues only of expediency or efficiency rather than of justice. Whether oligarchy is intrinsically a good or bad form of government tends to become a question only when other factors are considered; when, for example, the distinction between aristocracy and oligarchy is made to turn on whether the few are men of virtue or men of property, or when, in the comparison of oligarchy with democracy, the emphasis is not upon numbers but on the principles of wealth and liberty.

Nevertheless, the numerical criterion does not seem to be totally irrelevant to the comparison. "Oligarchy and democracy," Aristotle writes, "are not sufficiently distinguished merely by these two characteristics of wealth and freedom." Though the "real difference between democracy and oligarchy is poverty and wealth," and though "wherever men rule by reason of their wealth, whether they be few or many, that is an oligarchy," Aristotle does not seem to think we can neglect the political significance of what he calls the "accidental fact that the rich everywhere are few, and the poor numerous."

With regard to aristocracy and oligarchy, the chief question does not seem to be one of principle, but of fact. Plato in the *Republic* and Aristotle in the *Politics* define aristocracy as government by the few best men, or the most virtuous. They also place it next to what is for them the ideal government by the supremely wise man—the rule of the philosopher king, or what Aristotle calls "the divine sort of government." In this context, oligarchy represents a perversion of aristocracy, as tyranny represents a corruption of monarchy.

Plato describes oligarchy as arising when "riches and rich men are honored in the State" and when the law "fixes a sum of money as the qualification for citizenship" and allows "no one whose property falls below the amount fixed to have any share in the government." But according to Socrates, wealth does not qualify men to rule, as virtue and wisdom do. "Just think what would happen," he says, "if pilots were to be chosen according to their property, and a poor man were refused permission to steer, even though he were a better pilot." To which Adeimantus agrees that in government, as in navigation, the probable result would be shipwreck.

But though there may be no question of the superiority of aristocracy over oligarchy in principle, the critics of aristocracy question whether any historic state in which the few hold political power is not in fact an oligarchy. It may not always be the case that the power of the few rests directly on wealth. The privileged class may be a military clique or an hereditary nobility. Yet these distinctions are seldom unaccompanied by the control of land or other forms of wealth, so that indirectly at least the oligarchical factor is thought to be operative.

The criticism of aristocracies as masked oligarchies is discussed in the chapter on Aristocracy. The critical point seems to be that nothing except superior virtue or talent justifies a political inequality between the few and the many. The meaning of oligarchy is generalized in consequence to include any government in which the special privileges or powers held by the few cannot be justified, whether it is wealth or some other title to pre-eminence that is substituted for superiority in virtue or talent. When it is so understood, the word "oligarchical" tends to become like "tyrannical," a term of reproach.

In describing different forms of democracy, Aristotle observes that their common principle is to give a share in the government to all who meet whatever minimum qualification is set by law. "The absolute exclusion of any class," he says, "would be a step towards oligarchy." To the same effect is Mill's comment on the steps away from oligarchy accomplished by English constitutional reforms in the 19th century.

"In times not long gone by," Mill writes, "the higher and richer classes were in complete possession of the government. . . . A vote given in opposition to those influences . . . was almost sure to be a good vote, for it was a vote against the monster evil, the over-ruling influence of oligarchy." But now that the higher classes are no longer masters of the country, now that the franchise has been extended to the middle classes, a diminished form of oligarchy still remains. "The electors themselves are becoming the oligarchy"—in a population where many are still disfranchised. "The present electors," Mill continues, "and the bulk of those whom any probable Reform Bill would add to the number, are the middle class; and have as much a class interest, distinct from the working classes, as landlords or great manufacturers. Were the suffrage extended to all skilled laborers, even those would, or might, still have a class interest distinct from the unskilled."

Oligarchy remains, according to Mill, so long as there is any unjustifiable discrimination among classes in the population. It is not in his view limited to discrimination based on the extremes of wealth and poverty, as he plainly indicates by his remarks on the special interests of different parts of the working class, or their relation as a whole to the lower middle classes. He makes this even plainer by what he has to say on political discrimination as between the sexes. Suppose the suffrage to be extended to all men, he writes, "suppose that what was formerly called by the misapplied name of universal suffrage, and now by the silly title of manhood suffrage, became the law; the voters would still have a class interest, as distinguished from women."

The oligarchical defect in representative government which Mill is here criticizing seems to have little or no basis in economic class divisions. The exclusion of any class in the population from a voice in government renders that government oligarchical with respect to them. The excluded class may even be a minority. So conceived, oligarchy no longer means the rule of either the rich or the few.

When the meaning of oligarchy is generalized in this way, the discussion of oligarchy seems to presuppose the typically modern conception of democracy. As indicated in the chapter on Democracy, the distinguishing feature of the modern democratic constitution is universal suffrage. By this criterion, the conflict between the democrats and the oligarchs of the ancient world appears to be a conflict between two forms of the oligarchical constitution—one in which the wealthier few and one in which the poorer many have political rights, but in neither of which membership in the political community includes all normal adult human beings in the population.

Where ancient political theory could conceive of a mixed constitution—somehow combining oligarchical and democratic principles—the modern conception of democracy seems to make any compromise with oligarchy impossible. Certain modern writers, notably Mosca, Michels, and Pareto, seem to insist, on the contrary, that oligarchy is present in all forms of government, and is especially prevalent in representative democracies where the actual conduct of government—the effective power—is in the hands of a bureaucracy or an elite, whether popularly chosen or self-appointed. But the contradiction may be more verbal than real if on one side the word "oligarchy" means some degree of restriction in the franchise or citizenship, and, on the other, it applies to any situa-

tion in which the whole people are not directly active in all the affairs of government and, consequently, a small number of men administers the state. Understood in the latter sense, the oligarchical principle does not seem to be incompatible with representative democracy. Those who use the word in this sense merely call attention to an inevitable characteristic of representative government. A representative democracy may also have an aristocratic aspect when it follows the principle that the men best qualified by virtue or talent for public office should be chosen by the suffrage of all their fellow-citizens.

FULLER DISCUSSION of these aspects of oligarchy is found in the chapters on ARISTOCRACY and DEMOCRACY. Here we are primarily concerned with political issues which have their source in the opposition of economic classes in the state, primarily that extreme division of men into those who live by their labor and those who live on their property and the labor of others. It is in terms of this extreme division between men of leisure and working men that the conflict between oligarchy and democracy takes place in the ancient world.

At a time when citizenship meant a much more active and frequent participation in government than it does under the modern institutions of the ballot box and the representative assembly, the ancient defenders of oligarchy could argue that only men of wealth had the leisure requisite for citizenship. Oligarchy could be further defended on the ground that, in many of the Greek city-states, public officials were either not compensated at all or at least not substantially. Only men of sizeable property could afford to hold public office.

Aristotle weighs the arguments for and against oligarchy. On the point of leisure, for example, he holds that "nothing is more absolutely necessary than to provide that the highest class, not only when in office, but when out of office, should have leisure." Yet "even if you must have regard to wealth in order to secure leisure," it is "surely a bad thing," he thinks, "that the greatest offices, such as those of kings and generals, should be bought. The law which allows this abuse makes wealth of more account than virtue."

Aristotle seems to regard democratic and oligarchical claims as complementary half-truths. "Both parties to the argument," he says, "are speaking of a limited and partial justice, but imagine themselves to be speaking of absolute justice." According to an adequate conception of political justice, it is as unjust to treat equals unequally as it is to treat unequals equally. The oligarch violates the first of these principles, the democrat the second. "Democracy arises out of the notion that those who are equal in any respect are equal in all respects; because men are equally free, they claim to be absolutely equal. Oligarchy is based on the notion that those who are unequal in one respect are in all respects unequal; being unequal, that is, in property, they suppose themselves to be unequal absolutely."

Both forms of government have "a kind of justice, but, tried by an absolute standard, they are faulty; and, therefore, both parties, whenever their share in the government does not accord with their preconceived ideas, stir up revolution. . . . . In oligarchies the masses make revolution under the idea that they are unjustly treated, because . . . they are equals and have not an equal share; and in democracies, the notables revolt, because they are not equal, and yet have only an equal share."

What can cure this situation in which perpetual revolution seems to be inevitable, as democracy succeeds oligarchy, or oligarchy democracy, in the government of the Greek cities? Aristotle describes many forms of oligarchy and democracy, but none seems to remove the cause of revolution. When, in an attempt to preserve their position, the wealthier families turn to the more extreme forms of oligarchical constitution, that tendency eventually leads to a kind of despotic government which Aristotle calls "dynasty," or the lawless rule of powerful families.

To establish a stable government which shall be less subject to revolution in favor of a contrary principle of government, and which shall resist the tendency toward lawless rule, by either the masses or the powerful few, Aristotle proposes the mixed constitution, which shall combine the elements of both democratic and oligarchical justice. But this will not work in actual practice, he thinks, unless the middle class

"is large, and stronger if possible than both the other classes. . . . . Great then is the good fortune of a state in which the citizens have a moderate and sufficient property; for where some possess much, and the others nothing, there may arise an extreme democracy, or a pure oligarchy; or a tyranny may grow out of either extreme. . . . . These considerations will help us to understand why most governments are either democratical or oligarchical. The reason is that the middle class is seldom numerous in them, and whichever party, whether the rich or the common people, transgresses the mean and predominates, draws the constitution its own way, and thus arises either oligarchy or democracy."

From the point of view which sees no justice in granting any special privileges to property, Aristotle's position on oligarchy seems open to question. For one thing, in admitting a partial justice in the principle that those who are unequal in wealth should be treated unequally in the distribution of political power, Aristotle appears to affirm that the possessors of wealth *deserve* a special political status. For another thing, in his own formulation of an ideal polity, Aristotle advocates the exclusion of the working classes from citizenship. "The citizens must not lead the life of mechanics or tradesmen, for such a life is ignoble and inimical to virtue. Neither must they be husbandmen, since leisure is necessary both for the development of virtue and the performance of political duties." All these classes of men are necessary for the existence of the state, but they are to be no part of it in the sense of political membership. "The best form of state will not admit them to citizenship," though it will include as necessary "the slaves who minister to the wants of individuals, or mechanics and laborers who are the servants of the community."

Some of the great speeches in Thucydides' *History*, which deal with domestic issues as well as the issues of war and peace, eloquently argue the opposite side of the case. Debating with Hermocrates before the Syracusan assembly, Athenagoras answers those who say that "democracy is neither wise nor equitable, but that the holders of property are the best fitted to rule. I say, on the contrary, first, that the word *demos*, or people, includes the whole state, oligarchy only a part; next, that if the best guardians of property are the rich, and the best counsellors the wise, none can hear and decide so well as the many, and that all these talents, severally and collectively, have their just place in a democracy. But an oligarchy gives the many their share of the danger, and not content with the largest part, takes and keeps the whole of the profit."

In modern political thought, the discussion of oligarchy seems to occur on two levels. There is a controversy on the level of constitutional principles with regard to suffrage and representation and the qualifications for public office. Here the issues concern the justice of the fundamental laws of republican or popular government. There is also a consideration of the way in which men of property or corporate concentrations of wealth are able to exert influence upon the actual course of government. Here the problem becomes, not so much the justice of the constitution or of the laws, but the weight which wealth seems able to throw onto the scales of justice.

The great modern defense of the oligarchical constitution does not seem to be as plainly or forcefully made in any of the great books as in the speeches of Edmund Burke, especially those in opposition to the suffrage reform measures proposed by Charles James Fox, wherein Burke argues for the principle of *virtual* representation. It is unnecessary, he claims, for the franchise to be extended to the working classes if their economic betters—who also happen to be their superiors in talent and education—deliberate on what is for the common good of all.

The Federalists seem to take an opposite view. Reflecting on the system of British representation in their day, they observe that, for the eight millions of people in the kingdoms of England and Scotland, "the representatives . . . in the House of Commons amount to five hundred and fifty-eight." But, they go on, "of this number one ninth are elected by three hundred and sixty-four persons and one half by five thousand seven hundred and twenty-three persons. It cannot be supposed," they argue, "that the half thus elected and who do not even reside among the people at large, can add anything either to the security of the people

against the government, or to the knowledge of their circumstances and interests in the legislative councils. On the contrary, it is notorious that they are more frequently the representatives and instruments of the executive magistrate than the guardians and advocates of the popular rights." Nevertheless, they do not condemn such an oligarchical system of representation as entirely inimical to the virtues of parliamentary government. "It is very certain," they declare, "not only that a valuable portion of freedom has been preserved under all these circumstances, but that the defects in the British code are chargeable, in a very small proportion, on the ignorance of the legislature concerning the circumstances of the people."

Some of the American constitutionalists may be influenced by Burke's defense of oligarchy in terms of the virtues of an aristocracy, but they state their own position in terms which are more plainly oligarchical. They argue for poll tax clauses and property qualifications for public office on the ground that the country should be run by the people who own it. Furthermore, those who are not economically independent are not in a position to exercise political liberty. "Power over a man's subsistence," Hamilton declares, "amounts to power over his will."

Facing the issue which had been raised on the floor of the constitutional convention, Madison remarks that "the most common and durable source of factions has been the various and unequal distribution of property. Those who hold and those who are without property have ever formed distinct interests in society." He proposes a representative—or what he calls a "republican"—system of government to avoid the excessive factionalism of the pure or direct democracies of Greek city-states.

"Theoretic politicians, who have patronized this species of government," Madison writes, "have erroneously supposed that by reducing mankind to perfect equality in their political rights, they would, at the same time, be perfectly equalized and assimilated in their possessions, their opinions, and their passions." By a weighted system of representation, the power of sheer numbers may be counter-balanced by the power given to other factors, thus preventing the "accomplishment of the secret wishes of an unjust and interested majority. . . . A rage for paper money, for an abolition of debts, for an equal division of property, or for any other improper or wicked project, will be less apt to pervade the whole body of the Union than a particular member of it."

In another paper, the Federalists answer the charge that the constitution is oligarchical, because "the House of Representatives . . . . . will be taken from that class of citizens which will have least sympathy with the mass of the people and be most likely to aim at an ambitious sacrifice of the many to the aggrandizement of the few." This objection, they say, while "leveled against a pretended oligarchy," in principle "strikes at the very root of republican government."

The method of election provided for by the Constitution aims "to obtain for rulers men who possess most wisdom to discern, and most virtue to pursue, the common good of the society. . . . . Who are to be the electors of the federal representatives? Not the rich, more than the poor; not the learned, more than the ignorant; not the haughty heirs of distinguished names, more than the humble sons of obscurity and unpropitious fortune. . . . . Who are to be the objects of popular choice? Every citizen whose merit may recommend him to the esteem and confidence of the country. No qualification of wealth, of birth, of religious faith, or of civil profession, is permitted to fetter the judgment or disappoint the inclination of the people."

WHETHER THE AMERICAN Constitution in its original formulation is an oligarchical document has long been a matter of dispute. Whether the Federalists favor devices for protecting the rights of property or repudiate oligarchical restrictions in favor of the rights of man has also been the subject of controversy. That this is so may indicate at least a certain ambiguity in their position. But on the question of the oligarchical influences on government—the political pressures exerted by propertied classes to serve their special interests—the opinion of the modern authors of the great books seems much clearer.

The most extreme statement of this opinion is, of course, to be found in the *Communist Manifesto*. There government, in fact the state it-

self, is regarded as an instrument which the economic oppressors wield against the oppressed. The final step in the bourgeois revolution, according to Marx and Engels, occurred when the bourgeoisie "conquered for itself, in the modern representative State, exclusive political sway." In the bourgeois state, legislation is nothing but the will of this one class made into a law for all. One aim of the communist revolution, beyond the temporary dictatorship of the proletariat, is the withering away of that historic formation of the state in which "political power . . . is merely the organized power of one class for oppressing another."

Though much less radical in intention than Marx, Smith and Mill make statements which seem to be no less radical in their criticism of the oligarchical influences on modern parliamentary government. It has been said, Smith observes, that "we rarely hear . . . of combinations of masters, though frequently of those of workmen. But whoever imagines, upon this account, that masters rarely combine, is as ignorant of the world as of the subject. Masters are always and everywhere in a sort of tacit, but constant and uniform combination, not to raise the wages of labor above their actual rate . . . . Masters too sometimes enter into particular combinations to sink the wages of labor even below this rate." Furthermore, the parties to the conflict do not have equal access to legislative protection. "Whenever the legislature attempts to regulate the differences between masters and their workmen, its counsellors are always the masters."

Almost a century later, Mill writes in a similar vein concerning "the persevering attempts so long made to keep down wages by law . . . . Does Parliament," he asks, "ever for an instant look at any question with the eyes of a working man? . . . . On the question of strikes, for instance, it is doubtful if there is so much as one among the leading members of either House who is not firmly convinced that the reason of the matter is unqualifiedly on the side of the masters, and that the men's view of it is simply absurd." The remedy for this inequity, according to Mill, is not communism, but constitutional reforms in the direction of universal suffrage which will no longer leave the working classes "excluded from all direct participation in the government."

OUTLINE OF TOPICS

PAGE

1. The oligarchical constitution: the principles and types of oligarchy 277

2. The relation of oligarchy to monarchy, aristocracy, and democracy

3. The instability of oligarchical government 278

   3*a*. The revolutionary changes to which oligarchy is subject: the change to despotism or democracy

   3*b*. The preservation of oligarchies against revolution

4. The defense of oligarchy: the political rights and privileges of property

5. The attack on oligarchy and on the political power of wealth 279

   5*a*. The objection to property as a basis for privilege with regard to citizenship or public office

   5*b*. The character of the oligarch: the man of property; the capitalist

   5*c*. Economic status and power as a political instrument: oligarchy in relation to the class war

6. Historical observations of oligarchy: the rise and fall of oligarchies 280

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 63: ONE AND MANY

INTRODUCTION

IN *Pragmatism* and in his unfinished last work, *Some Problems of Philosophy*, William James uses the problem of the one and the many as one of the crucial tests of the philosophical mind. In his famous table of doctrines or "isms" he aligns monism with rationalism and idealism in the column headed "tender-minded," and in the other column, headed "tough-minded," he places their opposites—pluralism, empiricism, and materialism. But as his own theories show, "isms" like monism and pluralism tend to oversimplify the issues.

Whoever emphasizes the oneness of the world, for example, may also acknowledge its manyness and recognize that it is somehow a pluriverse as well as a universe. Some, like Bradley, may qualify this view by regarding the unity as ultimate reality, the plurality as appearance or illusion. Whoever finds the multiplicity of things the primary fact may, nevertheless, find some unity in the order and connection of things. Some, like James himself, may insist that the connection is a loose concatenation of relatively independent parts of reality, rather than an interpenetration of each part with every other in the solid whole which James calls the "block universe."

There may be another oversimplification in James' consideration of the problem of the one and the many. He seems to be concerned largely, if not exclusively, with the alternatives of the block and the concatenated universe as conceptions of the structure of reality. But, as some of the great books of antiquity make evident, that is only one of the problems of the one and the many. Perhaps it should be said, not that there are many problems of the one and the many, but that there is one problem having many aspects or applications, for in every statement of the problem there is at least this singleness of theme; that the one and the many are opposed, that the one is *not* a many and the many *not* a one. Yet even that does not seem to be quite accurate for, as Socrates tells Protarchus in the *Philebus*, it may also be said that the one is a many and the many a one. These are "wonderful propositions," he says, wonderful because "whoever affirms either is very open to attack."

At this early moment in the recorded tradition of western thought, the dialogues of Plato, so thorough in their exploration of the problems of the one and many, make no claim to having discovered or invented them. They were ancient even then. They seem to hang in the very atmosphere of thought, usually befogging those who try to see the truth about anything else without first clearing away their obscurities.

Socrates refers to "the common and acknowledged paradoxes of the one and the many . . . that everybody has by this time agreed to dismiss as childish and obvious and detrimental to the true course of thought." These aside, some genuine perplexities remain. Protarchus asks Socrates to instruct him about "those other marvels connected with this subject which," as Socrates seems to have implied, "have not yet become common and acknowledged."

Socrates begins by calling his attention, not to the unity of *this* man or *this* ox, but to the sense in which it is said that "man is one, or ox is one, or beauty one, or the good one." It is necessary to ask, he says, first, whether such unities exist; then, such unities being always the same, and admitting neither generation nor destruction, how each is itself alone, is not only one but *this* one; finally, how these unities can be conceived as dispersed and multiplied in the world of things which come to be and pass away. This last question seems to be the most difficult because it asks about the *being* of the same and one as it *becomes* in the one and many.

Protarchus is impatient to begin clearing up these problems. Willing to undertake what he calls "this great and multifarious battle, in which such various points are at issue," Socrates is also anxious to let Protarchus and the other youths know the intellectual perils which lie ahead for novices who enter upon this inquiry. "The one and many," he tells them, "become identified by thought . . . They run about together, in and out of every word which is uttered . . . This union of them will never cease, and is not now beginning, but is . . . an everlasting quality of thought itself, which never grows old."

That is why, he explains, "any young man, when he first tastes these subtleties, is delighted, and fancies that he has found a treasure of wisdom; in the first enthusiasm of his joy, he leaves no stone, or rather no thought, unturned, now rolling up the many into the one, and kneading them together, now unfolding and dividing them; he puzzles himself first and above all, and then he proceeds to puzzle his neighbors, whether they are older or younger or of his own age—that makes no difference; neither father nor mother does he spare; no human being who has ears is safe from him, hardly even his dog; and a barbarian would have no chance of escaping him, if an interpreter could only be found."

WHETHER IT IS full of exasperating subtleties or is a treasure of true wisdom, the discussion of the one and the many—in itself and in relation to being and becoming, the intelligible and the sensible, the definite and the infinite, the same and other, universals and particulars, wholes and parts, the simple and the complex, the indivisible and the continuous—is a discussion which seems unavoidable to the ancients. In the dialogues of Plato and in Aristotle's treatises, especially his *Metaphysics*, the one and the many are connected with the basic terms of philosophical thought.

For Plato, the distinction between the one and the many enters into the analysis of almost any object—such as pleasure or virtue or knowledge. Anything, viewed under the aspect of its being or its becoming, its definite sameness or its indefinite otherness and variety, must be discussed both as a one and as a many. The motion of Plato's dialectic may be from the one to the many or from the many to the one; or it may be on the level of the many as an intermediate stage through which analysis must go in proceeding from the infinite to the one. Those who pass at once from unity to infinity, says Socrates, do not recognize "the difference between the mere art of disputation and true dialectic."

For Aristotle, first philosophy or metaphysics, concerned as it is with "being *qua* being and the attributes which belong to anything *qua* being," also investigates unity. Unity is the first property of being. The meanings of one or unity are as various as the meanings of 'to be.' If there is a difference between essential and accidental being, there is a parallel difference between essential and accidental unity. If natural and artificial things differ in substance or being, so too must they differ in unity. "Being and unity are the same," Aristotle says, "and are one thing in the sense that they are implied in one another as are principle and cause." Unity is nothing apart from being, and nothing can be without being one in some sense of unity which is determined by the way in which the thing exists. Aristotle's analysis of any subject matter, proceeding as it does by reference to contraries, always appeals to the one and the many. "All contraries," he says, "are reducible to being and non-being and to unity and plurality, as for instance, rest belongs to unity and movement to plurality . . . And everything else is evidently reducible to unity and plurality. . . . For all things are either contraries or composed of contraries, and unity and plurality are the principles of all contrariety."

THE PROBLEMS IN whose analysis one and many seem to be involved recur in every period of western thought. The question, for example, whether there is an irreducible duality in the relation of knower and known, or whether, in the act of knowledge, knower and known are one, is discussed by Hobbes and William James as well as Plotinus and Aristotle. The question whether the state—which is a multitude somehow united for a common life—has, or should have, the same degree of unity as the family, is discussed by Locke and Hegel as well as Plato and Aristotle.

The earlier controversy over the indivisibility of sovereignty becomes at a later stage the central issue of federal union, to which *e pluribus unum* is the solution offered by the Federalists. Questions concerning the simple and the complex, or wholes and parts, as objects of knowledge, or questions concerning the unity and divisibility of time, space, or matter, engage the attention of inquirers and analysts no less in modern than in ancient times.

But there are certain problems which are treated with unusual speculative vigor by the ancients alone. Unlike the problems just mentioned, which deal with applications of the contrast between unity and multiplicity, these are questions about the One itself—what it is, whether it exists, whether it is identical with Being, whether it is itself a substance or the substance of all things.

The sustained inquiry into such matters in antiquity seems to testify to the extraordinary power exerted upon ancient thought by Parmenides of Elea. The person called "the Eleatic Stranger" represents his theories in such dialogues of Plato as the *Sophist* and the *Statesman*. Parmenides, or his disciple Zeno, is probably the source of many of the paradoxes and riddles which Socrates, in the *Philebus*, dismisses as no longer worthy of serious attention. One whole dialogue, named *Parmenides* because of his part in the discussion, exhibits the Eleatic demonstration that 'all is one.' It abounds in the subtleties of the various arguments which try to defend the reality of the many or try to reduce that position to absurdity.

Questioned by Socrates concerning his paradoxes, Zeno says that his writings "were meant to protect the arguments of Parmenides against those who make fun of him and seek to show the many ridiculous and contradictory results which they suppose to follow from the affirmation of the one." When he addresses himself to the partisans of the many, Zeno says that he returns "their attack with interest by retorting upon them that their hypothesis of the being of many, if carried out, appears to be still more ridiculous than the hypothesis of the being of one."

Aristotle also deals with the Eleatic arguments. In the *Physics*, he says first that inquiring about whether being is one, cannot contribute to the study of nature. He then adds that such inquiry anyway would be "like arguing against any other position maintained for the sake of argument . . . or like refuting a merely contentious argument." This description, he says, "applies to the arguments both of Melissus and Parmenides: their premises are false and their conclusions do not follow . . . Accept one ridiculous proposition and the rest follows—a simple enough proceeding." Aristotle's treatment of Parmenides and Zeno in the *Metaphysics* seems to be no more sympathetic, though it tacitly admits the relevance of the Eleatic speculations to the study of being, if not to the study of change and the principles of nature. Nevertheless, many of the questions concerning the one and the many which both Plato and Aristotle deem worthy of discussion appear to have some connection with the perplexities propounded by Parmenides and his school.

Those who do not deny either the unity of being or its multiplicity tend to make the primary fact about reality either its oneness or its manyness. This may seem at first to be of slight significance, but if the two views of the world which result from this difference are examined, it may be found that the disagreement on this single point changes the perspective on everything else. The philosophers who magnify either the one or the many behold universes more radically dissimilar than the same object looked at from opposite ends of a telescope. But that is not all. Almost every other fundamental conception—of God and man, of the mind and knowledge, of matter and motion, of cause and necessity—seems also to be altered.

Spinoza, for example, criticizes those who attribute to finite things, of which there are necessarily many, the properties which belong to the infinite being, of which there can be only one. This man, this stone, or any comparable individual thing, is not a substance, having the power to exist in and of itself; it consists merely "of certain modifications of the attributes of God," the one infinite substance in which everything else "both is and is conceived." According to Spinoza, those who suppose that the finite many are substances "have not observed a proper order of philosophic study."

They begin with the objects of sense which have the least reality and come last to the di-

vine nature, the infinite one, which "ought to be studied first because it is first in the order of knowledge and in the order of things . . . Hence it has come to pass," Spinoza continues, "that there was nothing of which men thought less than the divine nature while they have been studying natural objects, and when they afterwards applied themselves to think about God, there was nothing of which they could think less than those prior fictions upon which they had built their knowledge of natural things, for these fictions could in no way help to the knowledge of the divine nature."

Starting with the definition of substance as that which exists in itself and is conceived through itself, and with the definition of God as absolutely infinite being, "that is to say, substance consisting of infinite attributes," Spinoza undertakes to prove that there cannot be two or more substances having the same nature or attributes, that substance is necessarily infinite, and hence that it is impossible for more than one substance to exist. Since he regards it as axiomatic that "everything which is, is either in itself or in another," it follows for Spinoza that if anything at all exists, God (or substance) must necessarily exist—as that which alone exists in itself and as that in which everything else has its finite being as a mode or affection of the attributes of God.

Certain other consequences seem to follow. The one infinite substance is indivisible: it is not a whole made up of parts which can have independent existence, as the parts of a quantitative whole seem able to exist when the quantity is divided. Furthermore, God, according to Spinoza, "is the immanent, and not the transitive, cause of all things." God causes them not as one thing acting on another when both are independent in existence, but rather as the being *in which* all things are. God is not present in the world, as other theologians seem to think, in the manner in which a cause exists in an effect that depends upon it. Rather the whole world is in God as an effect which can in no way be separated from the existence of the cause, any more than an aspect can be separated from that of which it is an aspect.

For Spinoza, the unity and totality of being can be called "nature," as well as "infinite substance" or "God." His distinction between *natura naturans* and *natura naturata*, discussed in the chapter on NATURE, seems to permit him to distinguish between the infinite or eternal and the finite or temporal—the one and the many—without implying a real separation between God and the world. Since God is immanent in the world, and since God not only exists necessarily but also acts from the necessity of His own nature, it follows (as is indicated in the chapter on NECESSITY AND CONTINGENCY) that every finite and temporal aspect of nature is necessarily determined. Nothing is contingent. Nothing could be otherwise than it is.

THIS EXAMINATION of a doctrine in which the primacy of the one absorbs as well as subordinates the many, serves to exemplify the point that making the one primary is more than a matter of emphasis. It also shows that almost every fundamental question is affected. It presents a picture of what William James appears to mean when he speaks of the block universe, though he himself usually seems to have in mind Hegel's Absolute rather than Spinoza's God.

Aristotle advances a contrary doctrine. Like Spinoza he uses the term 'substance.' Like Spinoza he defines substance as that which exists in itself, not as an accident (a quality, for example) which exists in another, *e.g.*, the redness in the rose. But for him substance is not necessarily infinite, nor is it indivisible. A rose or a man is a substance. Every physical thing which has a natural unity is a substance.

Each is a finite whole, or rather each is a whole in a number of different senses. Insofar as it has essential unity, it is a whole composed of matter and form which, according to Aristotle, are represented in the formulation of a definition by the genus and the differentia. Insofar as it is composed of matter, it also has the unity of a quantitative whole in virtue of which it moves as one thing or uniquely occupies a place. Since quantitative unity involves continuity, and continuity entails divisibility, a substance remains one only so long as it is not divided into its quantitative parts, just as it remains one essentially only so long as its matter and form are not separated.

A substance is individual not because it is absolutely indivisible—as for Lucretius the atom

is because it is simple rather than composite. Its individuality rather consists, first, in its being divided from other substances in such a way that it can perish without necessarily destroying them, or they can perish without destroying it; and, second, in the fact that, though divisible into parts, it is one whole when these parts remain undivided. Yet as one substance it has more unity than a mere collection of things.

The difference between a man and a machine, according to Aristotle's differentiation between the unity of natural substances and of artificial things, is that a man is not composed of substances (though the parts of a living organism may come to exist as substances when it is decomposed or they are separated from it), whereas a machine, made up of separate pieces of metal, is nothing but a number of individual substances arranged in a certain way. The unity of man does not appear to be the same, therefore, when soul and body are conceived by Descartes as two substances and by Aristotle not as distinct substances but as form and matter which through their union constitute a single substance.

Unity, in short, belongs essentially to the individual natural substance. Because each individual substance is necessarily a one among a many, Aristotle, unlike Spinoza, cannot affirm the unity of substance without also affirming a plurality of substances. Not itself a substance, but only an aggregation of substances, the world is primarily a many rather than a one. The unity it possesses derives from the order and connection of the substances which are its component parts; and that in turn largely derives from the way in which distinct substances causally interact.

Since, according to Aristotle, causality includes contingency and chance, the causal interdependence of substances, with respect to their generation and their motions, does not lock them together into a solid block. To use James' imagery again, a vast plurality of individual substances, causally yet also contingently related, constitutes a loosely-knit world, a concatenated universe.

The relation of the world as a whole to God does give it greater unity, if the supposition of a plurality of finite individual substances remains the fundamental feature of the world God creates. The Christian doctrine of creation may attribute to the world a greater unity than that possessed by any work of human art, in proportion as the infinitely greater wisdom of the divine plan orders the separate things of nature with an infinitely greater perfection than man can achieve in putting things together or in ordering them to his purpose. But if, according to the theologian, God in creating the world creates not one substance, but many substances, forming a single whole through the pattern of their connection with one another, then in a sense the world has less unity than each of its component substances.

For Aquinas, one kind of substance may have greater unity than another. The immaterial has more than the material; and God more than any finite substance, since each of these is composed of matter and form, or essence and accidents, or at least of essence and existence, whereas the infinite being of God is absolutely simple. The divine nature is without matter, without accidents; its attributes are identical with its essence, and its essence with its existence.

This cardinal point about the divine nature is crucial to the conception of God, and of the world's relation to God. In the formation of Christian theology, God's absolute simplicity seems to exclude all but one resolution of the issue concerning the Trinity. According to the position Augustine takes in criticizing the Arian heresy, the position which is expressed in the Nicene Creed, God is not a trinity of substances, but a trinity of persons—aspects of, or relations within, one substance. The plurality of things which constitutes the world puts the world entirely outside the divine substance. Immanent only as a cause, the simple being of God transcends the complex whole of the created world.

This transcendence seems, furthermore, to imply for theologians like Augustine and Aquinas a fundamental duality in the realm of existence. God and the world are two, not one. Infinite being is absolutely prior to and independent of finite beings. The one can exist without the many. Though the many are said to participate in being, when they do exist, they do not enter into the being of the one, or share it in any way.

The being they have is not only separate from the being of God, but even their mode of being is only analogical to the divine being.

The doctrine that each thing has its own being, and that, as Aquinas says, "being is common to all things only in an analogical sense," seems to put diversity above unity in the structure of reality, and to leave the ultimate plurality of this world unaffected either by the fact that it was created as one or by the fact of its relation to a transcendent One.

IN THE TRADITION of the great books, the problem of the one and the many is often stated without using the notion of substance as the pivotal term.

It appears in Plato's consideration of being and becoming. It is sometimes present in his treatment of the relation between intelligible forms and sensible things—between the universal ideas and the particulars which resemble them through some manner of imitation or participation. It even runs through the discussion of the realm of ideas itself; for the idea of the one is one idea among many, and yet each of the many ideas is in some way one.

The problem of the one and the many appears in Hume's consideration of the absolute distinctness of each unit of experience from every other, accompanied as it is by his skepticism concerning our ability to discover any connections which might tie these units together into a real unity. It appears in Kant's theory of the transcendental unity of apperception, which reduces the sensory manifold to a unity of order; and in Hegel's theory of the one Absolute Idea which contains within itself all the variety that becomes manifest as the Idea unfolds in the processes of nature or history.

The substitution of one set of terms for another does not seem to alter the fundamental issue. Nor does it enable the mind to escape taking sides with those who give primacy to the one or to the many, except perhaps by trying to balance them as correlatives. Among the great books, however, the *Enneads* of Plotinus develops a theory of the One which, putting it above being and beyond knowing, seems to transfigure all the traditional terms of analysis.

The One of Parmenides is, after all, Being; and this identification of Being with One raises a question of the reality of the many. But, according to Plotinus, "there exists a Principle which transcends Being; this is The One, whose nature we have sought to establish so far as such matters lend themselves to proof. Upon The One follows immediately the Principle, which is at once Being and the Intellectual-Principle. Third comes the Principle, Soul." These are what Plotinus calls the three hypotases. He finds some analogy for his trinity in a doctrine he ascribes to Plato's *Parmenides*, in which he finds a threefold distinction "between the Primal One, a strictly pure Unity, and a secondary One which is a One-Many, and a third which is a One-and-Many."

The One, according to Plotinus, not only transcends being; it also transcends intelligence. Knowing or thinking requires an object. The relation of knower and known entails a duality which would fracture the utter simplicity of The One. Even the complete reflexivity of The One knowing only itself is excluded. The supereessential is for Plotinus also the supra-cogitative. "What stands above Being stands above intellection," he says; "it is no weakness in it not to know itself, since as pure unity it contains nothing which it needs to explore." Multiplicity begins with the effort of the Intellectual-Principle to know the Transcendent. "It knows the Transcendent in its very essence but, with all its efforts to grasp that prior as pure unity, it goes forth amassing successive impressions, so that, to it, the object becomes multiple . . . The Intellectual-Principle is established in multiplicity."

What is the All of which The One is not all, since the Intellectual-Principle and the Soul also belong to it? Plotinus answers that "The One is all things and no one of them. The source of all things is not all things . . . It is precisely because there is nothing within the One that all things are from it." Everything else in the totality of which the Transcendent is the source emanates from it.

"Seeking nothing, possessing nothing, lacking nothing," Plotinus declares, "The One is perfect and, in our metaphor, has overflowed, and its exuberance has produced the new: this product has turned again to its begetter and has filled and has become its contemplator and so an Intellectual-Principle . . . It is simulta-

neously Intellectual-Principle and Being; and, attaining resemblance in virtue of this vision, it repeats the act of the One in pouring forth a vast power. This second outflow is a Form or Idea representing the Divine Intellect as the Divine Intellect represented its own prior, The One. This active power sprung from essences (from the Intellectual-Principle considered as Being) is Soul. Soul arises as the idea and act of the motionless Intellectual-Principle. . . . It takes fullness by looking toward its source; but it generates its image by adopting another, a downward, movement. This image of Soul is Sense and Nature, the vegetal principle."

Nothing, writes Plotinus, "is completely severed from its prior. Thus the human Soul appears to reach as far down as to the vegetal order." In these successive emanations "all that is not One is conserved by virtue of the One, and from the One derives its characteristic nature." Everything except the One is a one-many. "If it had not attained such unity as is consistent with being made up of multiplicity, we could not affirm its existence." The Transcendent alone is "a really existent One, wholly and truly One, while its sequent, poured down in some way from the One, is all, a total which has participation in unity and whose every member is similarly all and one."

If reason cannot fully grasp the Transcendent One, that may be because discursive reason is itself a thing of multiplicity. The unity of an all-embracing vision may be required to apprehend the ineffable unity of the Transcendent. But the mysteriousness of unity is not confined to the Transcendent One. It confronts the mathematician as well as the philosopher. It challenges Nicomachus and Euclid as well as Plotinus.

"Unity," writes Nicomachus, "occupying the place and character of a point, will be the beginning of intervals and numbers, but is not itself an interval or a number." What, then, is unity or a unit in itself? Euclid answers with this definition: "A unit is that by virtue of which each of the things that exist is called one." Unity is not only the measure of existence, but also of numbers; for, according to Euclid, "a number is a multitude composed of units." In mathematics no less than in metaphysics or in theology the relation of unity to number seems to be the heart of the problem of the one and the many.

"Number," according to Locke, "applies itself to men, angels, actions, thoughts; everything that either does exist, or can be imagined." Unity or *one* is, in his view, not only the simplest of all our ideas, but the most omnipresent. "Every object our senses are employed about; every idea in our understandings; every thought of our minds, brings this idea along with it. And therefore it is . . . in its agreement to all other things, *the most universal idea we have.*"

OUTLINE OF TOPICS

PAGE

1. The transcendental one: the Absolute; the unity of being, of nature, of the universe 290

1*a*. The relation of the one and the many: emanation of the many from the one 291

1*b*. The unity or duality of God and the world: the immanence and transcendence of God

1*c*. The one and the many in relation to the universal and the particular: the abstract and the concrete universal 292

2. The modes of unity: comparison of numerical, essential, and divine unity

2*a*. Numerical unity or identity: the number *one*

2*b*. The unity of the indivisible or the simple: the individual thing, the point, the atom, the quality 293

2*c*. The complex unity of a whole composed of parts: the distinction between the indivisible and the undivided

PAGE

3. Kinds of wholes or complex unities 293

3*a*. Quantitative wholes: oneness in matter or motion 294

(1) The continuity of a quantitative whole

(2) The unity and divisibility of a motion

(3) The unity and divisibility of matter

(4) The unity and divisibility of time and space 295

3*b*. Natural or essential wholes: the oneness of a being or a nature

(1) The distinction between essential and accidental unity

(2) The comparison of the unity of natural things with man-made compositions or aggregations: artificial wholes

(3) The unity of a substance and of substantial form

(4) The unity of man as composite of body and soul, matter and spirit, extension and thought 296

(5) The unity of the human person or the self: the order of man's powers; the split personality

4. Unity in the realm of mind: unity in thought or knowledge 297

4*a*. The unity of mind or intellect, the cognitive faculties, or consciousness

4*b*. The unity of sense-experience: the unity of attention; the transcendental unity of apperception

4*c*. Unity in thinking or understanding: the unity of complex ideas and definitions; the unity of the term, the judgment, and the syllogism

4*d*. The unity of science: the unity of particular sciences 298

4*e*. The one and the many, or the simple and the complex, as objects of knowledge: the order of learning with respect to wholes and parts

4*f*. The unity of knower and known, or of subject and object 299

5. Unity in moral and political matters

5*a*. The unity of virtue and the many virtues

5*b*. The unity of the last end: the plurality of intermediate ends or means

5*c*. The unity of subjective will and objective morality in the ethical realm

5*d*. The unity of the family and the unity of the state: the limits of political or social unification

5*e*. The unity of sovereignty: its divisibility or indivisibility; the problem of federal union 300

6. Unity in the supernatural order

6*a*. The unity and simplicity of God

6*b*. The unity of the Trinity 301

6*c*. The unity of the Incarnation

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The transcendental one: the Absolute; the unity of being, of nature, of the universe

7 PLATO: *Parmenides*, 491d-511d / *Theaetetus*, 532c-533a / *Sophist*, 566a-567a

Chapter 64: OPINION

INTRODUCTION

THE noble Houyhnhnms are paragons of reason. They have no conceptions or ideas of what is evil in a rational nature. "Their grand maxim," according to Swift, their creator, "is to cultivate reason and to be wholly governed by it. Neither is reason among them a point problematical as with us, where men can argue with plausibility on both sides of the question; but strikes you with immediate conviction, as it needs must do where it is not mingled, obscured, or discolored by passion and interest."

What Captain Gulliver finds most striking in the contrast between men and this noble race of horses is that the perfect rationality of the Houyhnhnms lifts them entirely above the vagaries and vicissitudes of opinion. "I remember it was with extreme difficulty," he says, "that I could bring my master to understand the meaning of the word *opinion*, or how a point could be disputable; because reason taught us to affirm or deny only where we are certain, and beyond our knowledge we cannot do either. So that controversies, wranglings, disputes, and positiveness in false and dubious propositions, are evils unknown among the Houyhnhnms."

Among men it is not the meaning of "opinion" but of "knowledge" which causes trouble. If men had no conception of knowledge at all, as the Houyhnhnms seem to have no conception of opinion, they would find themselves disagreeing about many matters of opinion, but probably not about the nature of opinion itself. The great controversies concerning opinion in the tradition of western thought all relate to its distinction from knowledge, both with regard to the difference in their respective objects and with regard to the way in which the mind works when it knows and when it opines.

Only when something better than opinion is proposed as attainable do the characteristics of opinion come to be questioned. That something may stand in relation to opinion as certainty to probability, as fact to conjecture, as adequate to inadequate knowledge, as demonstration to persuasion. The chief source of disagreement about the nature of opinion seems to be the meaning of the other term in the comparison. Yet a few commonly recognized features of knowledge—if that is taken as the contrasting term—throw some light on the characteristics of opinion. Certain things which are never said about knowledge seem to be generally said of opinion.

AN OPINION, it is said, may be either true or false. But knowledge is never said to be false. For a great many writers, though not for all, doubt and belief are attitudes of mind which accompany the holding of opinions, but not the possession of knowledge. It is possible to opine and doubt at the same time, but not to know and doubt. Belief overcomes doubt with respect to opinion, but in those matters in which the mind is convinced of the truth of its judgments, an act of belief does not seem to be necessary.

In the sense in which belief implies a willingness to assent where assent might reasonably be withheld, belief seems to be appropriate to opinion but incompatible with knowledge. The opposite of an opinion may be reasonably maintained, whereas the opposite of that which is known must be error or falsehood, and therefore untenable. The traditional distinction between axioms and postulates (or assumptions) exemplifies this difference between knowledge and opinion. If a proposition is axiomatic, its contrary must be false. But if something is proposed as an assumption to be taken for granted,

then its opposite can also be postulated, and probably will be postulated by those who are unwilling to grant what has been proposed.

This last point in the comparison of knowledge and opinion appears to have political significance. It is not merely that men are accustomed to expect more disagreement in the sphere of politics than in science; they take a different attitude toward scientific and political controversy, largely because one is supposed to occur in the domain of knowledge and the other in the realm of opinion. Men speak of having a right to their own opinions, which includes a right to persist in them despite the conflicting opinions of others. The notion of a right to a certain obstinacy in differing from one's fellow men seems to follow from the nature of opinion and to accord with its distinction from knowledge. With regard to matters concerning which it is supposed that knowledge rather than opinion is possible, disagreement may of course occur, but never without the expectation that reasonable men should be able to reach agreement on the disputed point by re-examining the facts.

The differences between men which we appeal to a consensus to resolve are differences of opinion, not knowledge. Sometimes conflicts of opinion cannot be settled in any other manner, and for practical purposes it may be necessary to accept the opinion of the majority. The theory of majority rule raises many questions on which the great books take opposite views, but for the most part they restrict the application of the theory to matters of opinion. Disputed issues in mathematics or other theoretic sciences are seldom, if ever, settled by counting heads. The weight of numbers seems to be peculiarly relevant to measuring the worth of conflicting opinions.

The traditional consideration of opinion naturally divides, therefore, into two major lines of discussion. The first deals with the theoretical problem of the difference between knowledge and opinion, and involves such related terms as doubt, belief, faith, certitude, and probability. The second assumes that distinction for the most part, and deals with the problems of decision and responsibility in the sphere of opinion—the problem of liberty of conscience, of freedom of thought and expression, of majorities and minorities, and of individual judgment in difficult cases of conscience.

THE DISTINCTION between knowledge and opinion is sometimes made in terms of a difference in their objects, and sometimes in terms of a difference in the way the mind works when it knows and when it opines. These two modes of differentiation may, of course, supplement one another—the object of opinion being such that the mind must operate in a certain way with respect to it. The same authors usually treat the matter both ways. But not all the great books in which these things are discussed use the words "knowledge" and "opinion" to signify the basic opposition.

Locke, for example, says that "the mind has two faculties conversant about truth and falsehood: first, knowledge, whereby it certainly *perceives* and is undoubtedly satisfied of the agreement or disagreement of any ideas; secondly, judgment, which is the putting ideas together, or separating them from one another in the mind, when their certain agreement or disagreement is not perceived, but *presumed* to be so." To the faculty of judgment belongs "belief, assent, or opinion, which is the admitting or receiving of any proposition for true, upon arguments or proofs that are found to persuade us to receive it as true, without certain knowledge that it is so."

As demonstration is to persuasion, as certainty is to probability, so for Locke knowing or perceiving stands to judging or presuming. Others, like Hume, tend to use the term 'belief' in the place of 'opinion' as the opposite of 'knowledge'; or, like Spinoza, to assign opinion along with imagination to the domain of inadequate as opposed to adequate knowledge. But such differences in vocabulary do not seem to obscure the fact that these authors are making distinctions which, if not identical, are at least analogous.

A certain parallelism or analogy exists between different statements of the objects of knowledge and opinion. The knowable seems to have the properties of necessity and immutability, of universality, clarity, and distinctness. That which is contingent and variable, or confused and obscure, is usually regarded as the object of opinion.

Plato, for example, says that that which is apprehended by intelligence and reason "always is, and has no becoming," whereas "that which is conceived by opinion with the help of sensation and without reason, is always in a process of becoming and perishing and never really is." As understanding and reason divide the realm of knowledge, whose object is the immutable being of the intelligible forms, so fancy and perception divide the realm of opinion, whose objects are the sensible things which come to be and perish.

According to Aristotle, the object of science is the essential and the necessary, the object of opinion the accidental and the contingent. To whatever extent sensible particulars involve contingent accidents of all sorts, they belong to opinion, while the intelligible essences of things, universal in the sense of being common to many individuals, belong to science. The parallel which so far seems to be present between Plato's and Aristotle's statements of the objects of knowledge and opinion does not continue when we consider the consequences of their analyses.

For Aristotle, it is possible to have scientific knowledge as well as probable opinion about the changing things of the physical world, to the extent that these things are both intelligible and sensible, and have aspects both of necessity and contingency. But for Plato the realm of becoming belongs exclusively to opinion, as the quite separate realm of being belongs exclusively to knowledge. In consequence, Aristotle's enumeration of the sciences includes physics along with mathematics and theology, whereas the study of the physical world does not yield a science, according to Plato, but only, as he says in the *Timaeus*, "a likely story"—a plausible composition of probable opinions.

At first glance, Hume seems to provide a closer parallel to Plato. "All the objects of human reason or enquiry may naturally be divided into two kinds," he writes, "*relations of ideas*, and *matters of fact*." Objects of the first sort are capable of demonstratively certain knowledge, *e.g.*, the mathematical sciences. Matters of fact, which include questions concerning the real existence of anything or the causal connection of one thing with another, do not permit demonstration. They are objects of belief or opinion.

It would seem, therefore, that Hume, like Plato, regards the objects of knowledge and opinion, or science and belief, as belonging to altogether distinct realms. They even seem to agree that physics cannot be classified as a science, though the probabilities it establishes may be quite sufficient for action. But this agreement must be qualified by the fact that the realm of ideas is for Plato the reality which changing things image, while for Hume ideas have no reality at all. They exist only in the mind, which obtains them from the impressions of sense-experience.

A parallel between Hume and Aristotle might also be drawn, at least insofar as both connect opinion with the contingent—that which can be otherwise. If the opposite of a proposition is not impossible or does not lead to self-contradiction, then the proposition and its contrary are matters of opinion. This criterion, in Aristotle's terms, excludes all self-evident and demonstrable propositions. Such propositions, for both Hume and Aristotle, express knowledge, not opinion. Yet Aristotle, unlike Hume, does not seem to think that the real existence even of immaterial beings is indemonstrable, or that no necessary connections can be discovered between cause and effect.

THESE EXAMPLES might be extended to include similar observations concerning Locke, Spinoza, Kant, James—in fact, almost every writer who distinguishes between knowledge and opinion by reference to characteristically different objects. In the tradition of western thought the major controversies concerning the objects of knowledge and opinion occur with regard to the kind of being or reality assigned to each type of object; and, in consequence, with regard to applications of the distinction. One writer treats as knowledge what another, by apparently the same criterion, calls opinion. The term 'opinion' gets its skeptical impact from this circumstance. The skeptic never denies that men can form opinions about a given subject; he denies that the topic can be a matter of certain or unquestionable knowledge.

Skepticism approaches its limit when it is maintained that everything is a matter of opinion. At the furthest extreme, it is sometimes said that nothing is either true or false, though

Aristotle and others argue that such skepticism is self-destructive since the proposition 'nothing is true or false' is inconsequential if it is false, and self-contradictory if it is true. But the proposition 'everything is a matter of opinion' can itself be an opinion, and its opposite an opinion also.

The position which Montaigne takes in the *Apology for Raimond de Sebonde* is not the provisional skepticism of universal doubt in order to discover the foundations of certain knowledge. It is rather a resolute skepticism which reduces all human judgments to the status of equally tenable opinions and gives man no hope that he will ever be able to do better than adopt opinions on insufficient grounds or else suspend judgment entirely. No axioms, according to Montaigne, have ever won the universal consent of mankind; no demonstrations have ever escaped the need to assume their initial premises. Unless men beg the question in this way, they cannot avoid an infinite regress in reasoning. There is no proposition about which men have not disagreed or changed their minds. Illusions and hallucinations suggest the pervasive unreliability of the senses, as errors of judgment and reasoning suggest the radical infirmity of the mind.

"How variously do we judge of things?" Montaigne asks. "How often do we alter our opinions? What I hold and believe today," he continues, "I hold and believe with my whole belief. . . .I could not embrace nor preserve any truth with greater assurance than I do this; but has it not befallen me, not only once but a thousand times, and every day, to have embraced some other thing with the same instruments, and in the same condition, which I have since judged to be false? A man must, at least, become wise at his own expense; if I have often found myself betrayed under this color, if my touch prove ordinarily false and my balance unequal and unjust, what assurance can I now have more than at other times? . . . We ought to remember that whatever we receive into the understanding, we often receive things that are false; and that it is by the same instruments that so often give themselves the lie, and are so often deceived."

Montaigne exempts religious faith from the uncertainty of all beliefs or opinions which man arrives at through the unaided efforts of his senses and his reason. Though we must "accompany our faith with all the reason we have," we must do so "always with this reservation, not to fancy that it is upon us that it depends, nor that our arguments and endeavors can arrive at so supernatural and divine a knowledge." Faith is distinguished from ordinary belief, according to Montaigne, only "if it enter into us by an extraordinary infusion."

What is an article of faith to one man may, however, be merely a matter of opinion to another. This seems to be generally recognized by all who differentiate religious faith from secular belief. The difference lies not in the object, but in the causes of belief.

Those who distinguish between knowledge and opinion also admit that a difference in the way the mind judges, is able to produce either knowledge or opinion concerning the same object. It is impossible, according to Aristotle, for the same mind with regard to the same object to know and opine at the same time. A given individual, for example, cannot hold a proposition of geometry to be true *both* as a matter of knowledge and of opinion. But this does not prevent the individual who once held the proposition to be true merely on the authority of his teacher—and thus as a matter of opinion—from subsequently learning the reasons for its truth and thus coming to know what formerly he merely opined. Two individuals may likewise assert the same truth in different ways, the one as knowledge, the other as opinion.

The traditional account of the difference in the activity of the mind when it knows and when it opines appears to involve two related points. The point which both Plato and Aristotle emphasize is that the man who knows does not merely assert something to be true, but has adequate reasons for doing so. The truth of right opinion is no less true than the truth of knowledge. It differs, as the discussion in Plato's *Meno* and *Theaetetus* seems to show, in that the man of right opinion cannot explain why what he asserts is true. He cannot give the causes of its truth, or trace its connections with other truths which help to demonstrate it. The fact that an opinion is true does not prevent its being overturned or given up, since without adequate reasons it is insecure against attack. Un-

supported by reasons, opinion is not only unstable as compared with knowledge, but it is also unteachable in the sense in which knowledge can be learned and taught. The man of right opinion, unable to explain satisfactorily why he thinks as he does, cannot help others understand the rightness of his opinions.

The other characterization of the mind's activity in forming opinions seems to follow from the preceding observation. If reasons do not determine the mind to think *this* rather than *that*, what is the cause of its judgment? If the mind is not compelled by the object under consideration to think of it in a certain way, what does move the mind in its act of assent or dissent to that which is proposed? To such questions, the traditional answer seems to be wish or desire, whether an act of free choice on the part of the will or an inclination determined by the driving power of the emotions.

Pascal makes this point when he observes that there are two ways in which men come to think as they do. The more natural way "is that of the understanding, for one should only agree to demonstrated truths; but the more usual . . . is that of the will; for all men are nearly always led to believe, not by proof, but by inclination." Hobbes similarly differentiates knowledge, which rests upon definitions and demonstrations, from the opinions or beliefs which the mind adopts, not as the result of reasoning, but by an act of will.

The assent of reason is not, according to Aquinas, subject to command by the will in respect to all matters on which the reason can judge. If "that which the reason apprehends is such that it naturally assents thereto, *e.g.*, first principles, it is not in our power to assent to it or to dissent. For in such cases," he holds, "assent follows naturally, and consequently, properly speaking, is not subject to our command. But some things which are apprehended do not convince the intellect to such an extent as not to leave it free to assent or dissent, or at least suspend its assent or dissent for some cause or other; and in such things, assent or dissent is in our power, and is subject to our command." Knowledge, it would seem, consists in those judgments wherein the mind is moved to assent solely by the matter being considered, whereas all matters about which we are free to make up our minds one way or the other are matters of opinion.

Though they vary in the terms of their analyses, Descartes, Locke, and Hume seem also to agree that when the mind is moved to assent by the relations it perceives between ideas, especially when these are clear and distinct, it knows beyond doubt or the possibility of error. But when the mind, lacking such intuitive or rational grounds, nevertheless forms a judgment concerning what is not evident, then the result is opinion entertained as merely probable, accompanied by doubt, and subject to error.

For Descartes, the will, freely exercised, moves the mind to such fallible judgments. Except when it is so moved the mind, responding to its object alone, is naturally infallible. For Hume, the mind is free to imagine whatever it pleases, but its beliefs are determined by a sentiment or feeling of instinctive origin, "which depends not on the will, nor can be commanded at pleasure." The issue between those who connect opinion with free will and those who deny that beliefs are voluntarily formed is discussed in the chapter on WILL. It does not seem to affect the fairly general agreement on the point that opinion is an act of the mind caused by *something other than the object itself* which the mind is considering.

DOES THIS DISTINCTION between knowledge and opinion exhaustively divide all the acts of the mind? As we have seen, Montaigne appears to reject both alternatives and substitutes instead supernatural faith and ordinary belief. Aquinas, on the other hand, accepts knowledge and opinion as exhaustive on the plane of the mind's natural operations and makes religious faith a supernatural alternative to both.

He calls faith a mean or intermediate between science and opinion because he conceives it as having some of the characteristics of each. "To believe," he says, "is an act of the intellect assenting to the truth at the command of the will." In this faith resembles opinion. The act of faith is due to the will rather than to the rational evidence of the object. Faith is "the evidence of things unseen." But faith also resembles science because the affirmations of faith have the certitude or freedom from doubt

which characterizes knowledge. According to Aquinas, faith has greater certitude than natural knowledge, since, as intellectual virtues, "science, wisdom, and understanding. . . are based upon the natural light of reason, which falls short of the certitude of God's word, on which faith is founded." Faith differs from knowledge in that the object of faith exceeds the intellect's comprehension. That is why faith requires an act of the will to move the intellect to assent; but whereas ordinary opinions are adopted by a man's own volition, Aquinas attributes faith to God. "Faith," he writes, "as regards the assent which is the chief act of faith, is from God moving man inwardly by grace."

Just as skepticism with respect to science takes the form of reducing all human judgments to opinion, so skepticism with respect to religion takes the form of attributing all belief to purely natural causes. If Freud is correct that all beliefs are the product of wishful thinking, then it is difficult to separate religion from superstition or prejudice—or even, perhaps, to separate science from religion.

James finds the will to believe in science as well as religion. Like Freud, he explains belief in terms of emotion and desire. "Will and Belief, meaning a certain relation between objects and the Self," he writes, "are two names for one and the same *psychological* phenomenon." Except for those necessary truths which concern only ideal relationships, the mind in thinking about reality is free to choose between alternative theories, in the sphere of science as well as in religion. To believe is to attribute reality to a theory. Though the operation of the will to believe is not for James entirely independent of objective criteria, neither is it mainly determined thereby.

"That theory will be most generally believed," he says, "which, besides offering us objects able to account for our sensible experience, also offers those which are most interesting, those which appeal most urgently to our aesthetic, emotional, and active needs. . . .So-called 'scientific' conceptions of the universe have so far gratified the purely intellectual interests more than the mere sentimental conceptions have. But. . .they leave the emotional and active interests cold. *The perfect object of belief would be a God or 'Soul of the World,' represented both optimistically and moralistically (if such a combination could be), and withal so definitely conceived as to show us why our phenomenal experiences should be sent to us by Him in just the very way in which they come.*"

OPINION RAISES moral and political as well as psychological issues of liberty. One of them is the problem of freedom of discussion. This problem has aspects which belong to other chapters—freedom in scientific inquiry to SCIENCE, freedom in artistic or poetic expression to ART and POETRY, freedom of conscience and worship to RELIGION, freedom in teaching to EDUCATION, and the general issue of freedom of thought and speech to the chapter on LIBERTY. Yet what is common to all these related questions seems to be determined by the nature of opinion, particularly in its distinction from knowledge.

None of the books which argue for freedom of expression—Milton's *Areopagitica*, Locke's *Letter Concerning Toleration*, or Mill's essay *On Liberty*—defends the right to disseminate error or falsehood *knowingly*. All of them argue that the individual who claims the right to be heard is morally bound by the duty to speak the truth as it appears to him. Nor do those, like Plato and Hobbes, who recommend political censorship seek thereby to fortify the state by suppressing truth. In saying that the sovereign should "judge of what opinions and doctrines are averse, and what conducing to peace," Hobbes observes that "though in matters of doctrine, nothing ought to be regarded but the truth, yet this is not repugnant to regulating the same by peace. For doctrine repugnant to peace can no more be true, than peace and concord can be against the law of nature."

Since knowledge as distinct from opinion has the character of incontrovertible truth, the issue of freedom or censorship cannot be stated in terms of knowledge. But what some men hold to be knowledge others regard as opinion. The issue of free expression applies therefore to the entire range of human thought on the supposition that *no* proposition or doctrine is exempt from controversy, and no human judgment secure from contradiction. This supposition does not abolish the distinction between knowledge and opinion; nor does it flout the law of

contradiction by treating opposite answers to the same question as in fact equally true.

"If all mankind minus one were of one opinion, and only one person were of the contrary opinion, mankind," according to Mill, "would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. . . . The peculiar evil of silencing the expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth; if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth produced by its collision with error."

Mill advances four distinct reasons for recognizing "the necessity to the mental well-being of mankind (on which all their other well-being depends) of freedom of opinion, and freedom of the expression of opinion. . . . First, if any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this is to assume our own infallibility. Secondly, though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and . . . it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied. Thirdly, even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but, fourthly, the meaning of the doctrine itself will be in danger of being lost, or enfeebled."

The aim is not to perpetuate controversy; nor is it to keep all doctrines perpetually on the level of debatable opinion. "As mankind improve," Mill writes, "the number of doctrines which are no longer disputed or doubted will be constantly on the increase; and the well-being of mankind may almost be measured by the number and gravity of the truths which have reached the point of being uncontested. The cessation, on one question after another, of serious controversy, is one of the necessary incidents of the consolidation of opinion; a consolidation as salutary in the case of true opinions, as it is dangerous and noxious when the opinions are erroneous."

As Mill argues the case for freedom of thought and discussion, it appears to be based on the hypothesis that the public debate of all matters, carried on without any restriction except those minimum restraints needed to prevent violence, serves the end of separating true from false opinion and, by the clarification of opinion as well as the correction of error, discovering the reasons which turn opinion into knowledge. It is not to multiply opinions but to advance knowledge, not to encourage skepticism but to invigorate the search for truth, that Mill advocates the submission of all matters to open dispute so long as any disagreement remains.

His fundamental principle, like that of Locke, consists in divorcing political from logical criteria. Logically, the disputants may stand opposed to each other as one who knows and one who merely opines, or as one who holds a true and one a false opinion, or even as one who enjoys God's gift of supernatural faith and one who lacks such light; but considered politically, the opponents represent a conflict of opinion, with each party equally deserving the benefit of the doubt that it may have the truth on its side. If the state were to intervene, it would be deciding a disputed question, not by reason, but by force, in an area to which force is inapplicable.

"The business of laws," Locke writes, "is not to provide for the truth of opinions, but for the safety and security of the commonwealth, and for every particular man's goods and person. And so it ought to be. For the truth certainly would do well enough if she were once left to shift for herself. . . .She is not taught by laws, nor has she any need of force to procure her entrance into the minds of men. Errors indeed prevail by the assistance of foreign and borrowed succours. But if Truth makes not her way into the understanding by her own light, she will be but the weaker for any borrowed force violence can add to her."

Those who argue that state censorship is justified, whether the matters whose debate is prohibited are speculative or practical, moral,

political, or theological, appear to extend the safeguarding of the common good beyond security from immediate peril of violence; or to proceed upon the hypothesis of sufficient wisdom in the rulers to discriminate unerringly between truth and falsehood. Those who distinguish between church and state with regard to censorship tend to limit the application of ecclesiastical authority to questions of faith and morals, on which the church is supposed to have supernatural guidance in deciding what is true or sound.

THE PRINCIPLE OF majority rule in matters of opinion seems to be opposite to the principle that the voice of a minority should be heard. To settle a difference of opinion by taking a vote gives a decisive weight to numbers which, it may be thought, is as illegitimate as resolving a debate by force. But when it is necessary to legislate or to act, debate must be terminated and issues resolved.

On speculative questions, which may be answerable by knowledge rather than by opinion, and with respect to which agreement may be possible, the end of truth seems to be served by permitting discussion to go on as long as reason opposes reason. But if the discussion is for the sake of determining action and if, in addition, the subject under discussion is strictly a matter of opinion concerning which it is possible for reasonable men perpetually to disagree, then it may be necessary to appeal to some principle other than reason.

Traditional political theory appears to offer only two solutions. One principle of decision is to follow the opinion of a single man—an absolute monarch or an elected chief magistrate—whether or not that one man also has the wisdom commensurate with such responsibility. The other principle is to accept the opinion of the majority. According to Aristotle, this second principle is operative in every form of government except absolute monarchy. It is not only in democracy, he says, that "the greater number are sovereign, for in oligarchy, and indeed in every government, the majority rules." It is characteristic of every form of constitutional state that "whatever seems good to the majority of those who share in the government should have authority."

Considered in this way, the principle of majority rule leaves open the question whether the majority should be a preponderance of the many or the few. Should it be a democratic majority or, according to some aristocratic standard, the majority of the few who are wiser, more expert, or more virtuous than the many? With regard to some questions, Aristotle suggests, the multitude may be a better judge than any individual, even the most expert. "If the people are not utterly degraded, although individually they may be worse judges than those who have special knowledge, as a body they are as good or better."

The opposing claims of the greater number and the more competent, as well as the possibility of combining the merits of both, are discussed in the chapters on DEMOCRACY and ARISTOCRACY. The problem of majority rule also appears in those chapters as a factor in the theory of representation, especially the question considered by Mill—whether the representative shall exercise his own judgment or act on the opinion of the majority of his constituents.

Mill tries to separate those problems of government which should be submitted to representative assemblies and decision by majorities from those which should be solved by experts. But even on matters subject to deliberation by representatives of the people, Mill advocates such measures as plural voting and minority representation to offset the sheer weight of numbers and prevent its being the decisive force in settling political differences and determining action.

Such qualifications of the principle of majority rule do not seem necessary to those who, like Rousseau, think that "the general will is found by counting votes." What Rousseau says of any individual opinion applies to minority opinions as well, namely, that when a contrary opinion prevails, it proves that what the minority "thought to be the general will was not so." On the question of how large a majority should be decisive, he thinks that "the more grave and important the questions discussed, the nearer should the opinion that is to prevail approach unanimity. . . .The more the matter in hand calls for speed, the smaller the prescribed difference in the number of votes may be allowed to become."

There is, according to Rousseau, only one political decision which requires unanimity, and that is the decision to enter upon the social contract, to set up popular government under which individual liberty endures as long as "the qualities of the general will still reside in the majority." When the principle of majority rule is unanimously adopted, each individual agrees to substitute the general will for his own particular opinion.

OUTLINE OF TOPICS

PAGE

1. The different objects of knowledge and opinion: being and becoming; universal and particular; the necessary and the contingent 312

2. The difference between the acts and sources of knowing and opining 313

   2*a*. The influence of the emotions on the formation of opinion: wishful thinking, rationalization, prejudice

   2*b*. The will as cause of assent in acts of opinion 314

   2*c*. Reasoning and argument concerning matters of opinion: comparison of demonstration and persuasion, principles and assumptions, axioms and postulates

   2*d*. Reason, experience, and authority as sources of opinion

3. Opinion, knowledge, and truth 315

   3*a*. The truth of knowledge and of right opinion: their difference with respect to manner of acquisition, stability, and teachability

   3*b*. Certain and probable, adequate and inadequate knowledge: degrees of certitude; modes of assent

   3*c*. The skeptical reduction of human judgments to opinion 316

4. Opinion, belief, and faith

   4*a*. Comparison of supernatural or religious faith with science and opinion 317

   4*b*. Criticism of superstitious or dogmatic belief as opinion without foundation or warrant

5. Freedom in the sphere of opinion 318

   5*a*. Rights and duties with respect to the expression of opinion

   5*b*. Advantages and disadvantages of freedom of discussion

6. Opinion in the realm of morals

   6*a*. Good and evil as matters of opinion: moral standards as customs or conventions reflecting prevalent opinion

   6*b*. The inexactitude of moral principles as applied to particular cases 319

7. The social and political significance of public opinion

   7*a*. The value of the majority opinion: the distinction between matters to be determined by the expert or by a consensus

   7*b*. Majority rule, its merits and dangers: protections against the false weight of numbers 320

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265-283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265-283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 65: OPPOSITION

INTRODUCTION

CERTAIN words in the vocabulary of common speech, used at almost every turn of discourse, indicate ideas so indispensable to human thought that they are often employed without analysis. The word "is" is one of these, signifying the idea of being or existence. The word "not" and the pair of words "either. . . . or" have the same character. Taken together, "not" and "either. . . .or" signify the idea of opposition. The quality of redness is *not* the same as the quality of hotness, yet this negative relation by itself does not make them opposite, for something can be red-hot. It is only when a thing can have *either* one quality *or* another, but *not* both, that the qualities are said to be opposed. Opposites are more than merely distinct; they exclude one another.

Opposition seems to be as pervasive as the familiar words which signify it. Even if it were not itself one of the great ideas, it would be manifest in all the other basic notions which come in antithetical pairs, *e.g.*, good and evil, life and death, war and peace, universal and particular, pleasure and pain, necessity and contingency, same and other, one and many, virtue and vice. Each of these notions seems to imply its opposite and to draw its meaning from the opposition. There are other terms in the list of great ideas which, though not paired in the same chapter, stand opposed to one another: art to nature, chance to fate, liberty to slavery, time to eternity, knowledge to opinion, matter to form, democracy to oligarchy and similarly other forms of government. Still other terms cannot be discussed without reference to their opposites, even though we have not explicitly listed them, such as being and non-being, truth and falsity, love and hate, justice and injustice, wealth and poverty.

The enumeration might extend to include every fundamental notion, except for the inconvenience in certain cases of not having readily familiar names to designate the opposites. In some instances, moreover, the opposition seems to involve more than a pair of terms, as, for example, is the case with poetry, history, and science; or physics, mathematics, and metaphysics.

In the tradition of the great books we not only find the opposition of one idea to another, but we also find opposite points of view, conflicting theories or doctrines, in the discussion of almost every basic topic under the heading of these ideas. We find the same word used with contrary meanings, the same proposition affirmed and denied. We find reasoning opposed to reasoning. The same conclusion is reached from apparently opposite principles, or opposite conclusions are drawn from premises apparently the same.

But though opposition seems to be inherent in the realm of ideas and in the life of thought, the idea of opposition is not itself explicitly thought about in many of the great books. This does not mean that in the consideration of other matters the significance and consequences of opposition go unnoted. On the contrary, all the chapters dealing with the nature and conduct of man, or with the institutions and history of society, give evidence of the general recognition—by poets and historians, by scientists and philosophers—that opposition in the form of active conflict characterizes the phenomena. The fact of warring opposites not only enters into descriptions of the way things are, but also poses problems for psychologists, moralists, economists, and statesmen to solve.

The study of nature, as well as of man and society, discovers opposition at the root of change. The physics of antiquity, for example, defines the elements or the bodily humours in terms of contrary qualities; according to Aristotle, contraries are among the ultimate prin-

ciples of nature—the terms of change. The cosmology of Lucretius makes the conflict of opposites the principle of growth and decay in the universe. Destruction struggles against creativity; life against death. "The death-dealing motions," the poet writes, "cannot keep the mastery always nor entomb existence for evermore, nor on the other hand can the birth and increase-giving motions of things preserve them always after they are born. Thus the war of first-beginnings waged from eternity is carried on with dubious issue: now here, now there, the life-bringing elements of things get the mastery and are overmastered in turn."

Modern mechanics deals with action and reaction in the impact of bodies and the resolution of forces tending to produce opposite results. The theory of evolution pictures the world of living organisms as engaged in the struggle for survival, organism competing with organism or against an adverse environment for the means of subsistence or reproduction.

These indications of the prevalence of conflict in the realm of thought itself, or as a fundamental conception in man's thinking about nature and society, do not alter the point that only in logic or metaphysics is opposition abstracted from special subject matters, to become itself the object of thought. Even so, not all of the great speculative works develop an explicit theory of opposition—classifying its types, analyzing its structure, formulating it as a universal principle of being, mind, or spirit.

Four authors especially treat opposition as a primary theme, though not out of the context of such other notions as being, relation, one and many, same and other, or identity and difference. They are Plato, Aristotle, Kant, and Hegel. It should not be surprising that the same authors are the principal figures in the chapter on DIALECTIC. Their disagreement about the nature or meaning of dialectic has a parallel here in their conflicting theories of opposition.

SOCRATES ARGUES, in the *Protagoras*, for the unity of virtue by using the principle that "everything has one opposite and not more than one." If wisdom is the opposite of folly, and if it also appears that folly is opposed by temperance, then either wisdom and temperance are the same, or a thing may have more than one opposite. Protagoras reluctantly accepts the first alternative; he is apparently unwilling to re-open the question concerning the pairing of opposites. But the question is reopened by others. It is one of the great problems in the theory of opposition, relevant to the distinction of different kinds of opposites.

The problem can most readily be stated in terms of the logical processes of division and definition. On the hypothesis that opposites always come in pairs, every class can be divided into two sub-classes which not only exclude each other, but also exhaust the membership of the divided class. Such division is called dichotomy. Many of the Platonic dialogues—notably the *Sophist* and the *Statesman*—exemplify the method of dichotomous division, used as a device for constructing definitions. The object to be defined, the character of the statesman or the sophist, is finally caught in the net of classification when, division after division having been made, two sub-classes are reached which leave no other possibilities open. The thing is either one or the other.

In the *Sophist* a preliminary exercise is undertaken in the method of division as preparation for the use of this method to define the sophist. It will serve us here as an example of dichotomy. All the arts are first divided into two kinds, the productive and the acquisitive; then the acquisitive arts are divided into those making voluntary exchanges and those which obtain goods by coercion; the coercive divides into fighting and hunting according to the alternatives of open or secret attack; hunting into the hunting of the lifeless and the living; hunting of the living into hunting of swimming or walking animals; the hunting of swimming animals into the hunting of winged animals and the hunting of water animals; the hunting of water animals into opposite methods of catching fish, with further sub-divisions made until the art of angling can be defined as an acquisitive art which, being coercive, is a form of hunting, distinguished from other forms of hunting by the character of its object—animals which swim in water rather than air—and by the method used to catch them—hooks or barbs rather than nets or baskets.

Aristotle objects to this process of division as a way of defining things. "Some writers," he

says, "propose to reach the definitions of the ultimate forms of animal life by bipartite division. But this method is often difficult, and often impracticable." For one thing, it tends to associate or dissociate natural groups arbitrarily, *e.g.*, the classification of birds with water animals, or of some birds with fish and some birds with land animals. "If such natural groups are not to be broken up, the method of dichotomy cannot be employed, for it necessarily involves such breaking up and dislocation."

Aristotle also calls attention to the fact that the method of dichotomy often uses negative terms in order to make an exhaustive division into two and only two sub-classes. But the class which is formed by a negative characterization cannot be further sub-divided. "There can be no specific forms of a negation, of featherless for instance or of footless, as there are of feathered and of footed." It is impossible, Aristotle says, to "get at the ultimate specific forms of animal life by bifurcate division." He therefore proposes a method of defining by genus and difference, according to which it is possible in biological classification to sub-divide a genus into more than two species. To avoid sub-division into two and only two, that which differentiates each species from the others within the same genus must be some positive characteristic.

As ALTERNATIVE methods of definition, dichotomous division and the differentiation of species within a genus are discussed in the chapter on DEFINITION. Here we are concerned with the problem of the number of opposites produced by the exhaustive division of a class or kind. For example, how many species of color are there? If the primary colors are more than two, it would appear that each primary color has more than one opposite, since the same object at the same time and in the same respect cannot be both red and yellow, red and green, green and yellow. But Aristotle seems to restrict the notion of contrariety to pairs of opposite qualities. "Red, yellow, and such colors, though qualities, have no contraries," he says. Whether or not he would have regarded them as contraries if he had been acquainted with the chromatic series of the spectrum, remains a conjecture.

To find a single opposite for red, it is necessary to employ the negative term 'not-red.' But then another difficulty arises which Aristotle recognizes when he calls the negative term "indefinite" and which Kant discusses when he treats the infinity of the negative. The not-red includes more than other colors which are not red, such as green and yellow. It includes everything in the universe, colored or colorless, which is *not* red, *e.g.*, happiness or atoms or poetry.

Perfect dichotomy can be achieved by using positive and negative terms as opposites, or what Aristotle sometimes calls "contradictory terms"—such as man and not-man or just and not-just. But the class which is thus divided is absolutely indeterminate. It is the universe, everything, the infinite. It is necessary, furthermore, to distinguish between the opposition of 'just' and 'not-just' and the opposition of 'just' and 'unjust.' The term 'unjust' is the contrary rather than the contradictory of 'just,' for these opposites apply only to men, or laws, or acts; only certain kinds of things are either just or unjust, and that is why it is said that contraries are always opposites within a genus or a definite kind. In contrast, 'not-just' is the contradictory rather than the contrary of 'just,' for these opposites apply to everything in the universe; everything is either the kind of thing to which just and unjust apply or it is the kind of thing to which neither of these terms apply, and so it is the not-just.

In addition to separating contraries (both of which are positive terms) from contradictory opposites (one of which is a positive, the other a negative term), Aristotle distinguishes two sorts of contraries. On the one hand, such contraries as odd and even exhaustively divide a limited class (*e.g.*, integral numbers): on the other hand, such contraries as white and black represent the extremes of a continuous series of shades, in which any degree of grayness can be considered as the opposite of either extreme or of a darker or a lighter gray.

There are still other kinds of opposite pairs, according to Aristotle, such as the terms 'double' and 'half,' which have the peculiarity of implying each other; or the terms 'blindness' and 'sight,' which are opposite conditions of the same subject. In this last case, one of the opposites naturally belongs to a certain kind of

thing, and the other represents a loss of that natural property or trait. It is therefore called a "privation."

Considering these various modes of opposition, Aristotle proposes a fourfold classification of opposite terms: *correlative* opposites, like double and half; *contrary* opposites, like odd and even, white and black, just and unjust; the opposites of *possession* and *privation*, such as sight and blindness; the opposites of *affirmation* and *negation*, such as man and not-man, or just and not-just. He discusses the special characteristics of each type of opposition, but it is only contrariety which he thinks requires further subdivision.

Even though both are always positive terms, some contraries, like odd and even, exhaust a definite class, just as positive and negative opposites exhaust the infinite. They admit of no intermediate terms and hence they differ from contraries like white and black. White and black are extreme limits of a continuous series and thus permit an indefinite number of intermediates which fall between them. Things which differ only in degree are like the sort of contraries which find their place in a continuous series. Things which differ in kind are like the sort of contraries between which no intermediates are possible.

One of the great problems of classification, especially with respect to living organisms, is whether the diverse species which fall within a single genus differ in kind or only in degree. The answer would seem to depend on whether the several species are related by one or the other sort of contrariety. As the chapter on EVOLUTION indicates, the basic meaning of the word "species" changes when the possibility of "intermediate forms" is rejected or admitted. When a class is divided by contraries without intermediates, the genus can have only two species, as for example, the division of animals into brutes and men. When a genus is divided into more than two sub-classes, (*e.g.*, the division of vertebrates into fish, amphibians, reptiles, birds, and mammals), it would seem to follow that the species are like points in a continuous series and admit the possibility of intermediate types.

According to Darwin's conception of species, their contrariety always tends to take the latter form. Aristotle, on the other hand, seems to use the word "species" in two distinct senses which correspond to the two kinds of contrariety—with and without intermediates. "A thing's difference from that from which it differs in species," he writes, "must be a contrariety." But though contrariety is always a "complete difference," the fact that "contraries are so-called in several senses" leads him to observe that "their modes of completeness will answer to the various modes of contrariety which attach to the contraries."

THE LOGICAL OPPOSITION of propositions or judgments depends in part on the opposition of terms or concepts. If contrary things are said about the same subject of discourse (*i.e.*, if the same number is called odd and even, or the same act is called cowardly and courageous, or the same animal is called a bird and a mammal), pairs of contrary statements are made, of which both cannot be true. But it does not seem to follow that one of the two statements must be true. Both can be false. In the examples given, the number may be a fraction and neither odd nor even; the act may be foolhardy and neither courageous nor cowardly; the animal may be a reptile and neither bird nor mammal.

This characteristic of contrary statements—the impossibility of their both being true combined with the possibility of their both being false—can also be found, according to Aristotle, in propositions which have the same subject and do not contain contrary terms as predicates. The propositions 'All men are white' and 'No men are white' cannot both be true, but they can both be false. The contrariety of these two statements, which can be taken as typifying the opposition of all universal affirmations and negations, does not depend on contrary predicates, but on the opposed meanings of 'all are' and 'none is.'

Keeping the terms constant and varying only the quality and quantity of the propositions, Aristotle formulates two other typical modes of opposition between pairs of statements. When both statements are particular or limited, but one is affirmative and the other negative, both cannot be false though both can be true, *e.g.*, 'Some men are white' and 'Some men are not white.' This pair of opposites Aris-

totle calls "sub-contraries." When one statement is universal and affirmative and the other is particular and negative—or when one is universal and negative, the other particular and affirmative—the two propositions are, according to Aristotle, contradictory. Contradiction is the most complete type of opposition, for contradictory statements are opposite in both quality and quantity. Of a pair of contradictories, both cannot be true and both cannot be false. One must be true and the other false, *e.g.*, it must be true either that all men are white or that some men are not white.

The formal scheme of opposite statements, traditionally known as "the square of opposition," appears to exhaust all possibilities. It indicates, moreover, that every statement may have two opposites, a contradictory and either a contrary or a sub-contrary; for example, 'All men are white' is contradicted by 'Some men are not white' and opposed in a merely contrary fashion by 'No men are white.' The latter is a weaker form of opposition since it permits the dilemma to be avoided by the truth of a third statement, that some men are white and some are not. The dilemma set up by a contradiction cannot be avoided in this way.

The propositions 'God exists' and 'God does not exist,' or 'The world had a beginning' and 'The world did not have a beginning,' constitute contradictions from which there seems to be no escape. It would seem to make a difference, therefore, in facing the great controversies in the tradition of western thought, to know whether the opposite views which men have taken on fundamental issues are genuine contradictions, requiring everyone to take sides, or whether they are merely contrary positions. In the latter alternative, the inconsistency of the theories prevents us from agreeing with both parties to the dispute, but it does not require us to agree with either, for contrary doctrines never exhaust the possibilities. Between such extreme positions, for example, as that everything is in flux and nothing changes, both of which cannot be true, the truth may lie in the doctrine that some elements of permanence are involved in all change; or it may be in the theory of a realm of becoming that lacks permanence and a realm of being that is free from change.

ONE OF THE BASIC controversies in the tradition of the great books concerns opposition itself. Is the principle of contradiction the ultimate test of the truth of judgments and reasoning? Is the truth of indemonstrable propositions or axioms certified by the self-contradiction of their contradictories? For example, is the truth of the proposition 'The whole is greater than the part' made necessary by the impossibility of the contradictory statement 'The whole is *not* greater than the part,' on the theory that this latter statement is impossible because it is self-contradictory? And when a conclusion is demonstrated by propositions which seem to be necessarily true, must not the contradictory of this conclusion be false—or at least be incapable of demonstration by propositions which are also necessarily true?

On both these questions Kant and Aristotle seem to be opposed. According to Aristotle, no truths are necessary or axiomatic unless their contradictories are self-contradictory. But Kant makes a distinction between analytical and synthetical propositions (discussed in the chapter on JUDGMENT) and in terms of it he restricts the principle of contradiction to serving as a criterion of truth for analytical judgments alone. "In an analytical judgement," he writes, "whether negative or affirmative, its truth can always be tested by the principle of contradiction." But though we must admit, Kant continues, that "the principle of contradiction is the general and altogether sufficient principle of all analytical knowledge, beyond this its authority and utility, as a sufficient criterion of truth, must not be allowed to extend." In "the synthetical part of our knowledge, we must no doubt take great care never to offend against that inviolable principle, but we ought never to expect from it any help with regard to the truth of this kind of knowledge."

The reason, Kant explains, is that "in forming an analytical judgement I remain within a given concept, while predicating something of it. If what I predicate is affirmative, I only predicate of that concept what is already contained in it; if it is negative, I only exclude from it the opposite of it." For example, if the meaning of the concept 'whole' involves 'being greater than a part,' self-contradiction results from denying that the whole is greater than a part.

"In forming synthetical judgements, on the contrary, I have to go beyond a given concept, in order to bring something together with it, which is totally different from what is contained in it. Here," Kant declares, "we have neither the relation of identity nor of contradiction, and nothing in the judgement itself by which we can discover its truth or its falsehood"; for example, the judgment that everything which happens has a cause. The truth of such synthetical judgments, according to Kant, is as necessary and as *a priori* as the truth of analytical judgments, but the principle of contradiction does not provide their ground or validation.

For Aristotle, in contrast, those propositions which do not derive necessity from the principle of contradiction belong to the sphere of opinion rather than to the domain of knowledge. They can be asserted as probable only, not as true or false. In the domain of knowledge, it is impossible to construct valid arguments for contradictory conclusions, for if one must be true and the other false, one can be validly demonstrated and the other cannot be demonstrated at all. But in the sphere of opinion, dialectical opposition is possible. Because the contradictory of a probable statement is itself also probable, probable arguments can be constructed on the opposite sides of every dialectical issue.

For Kant dialectical issues do not consist in a conflict of opposed probabilities. Far from setting probable reasoning against probable reasoning, dialectical opposition consists in what appear to be *demonstrations* of contradictory propositions. For example, in that part of the *Critique of Pure Reason* devoted to the Transcendental Dialectic, Kant presents opposed arguments which look like demonstrations of contradictory propositions—such as the thesis that "the world has a beginning in time" and its antithesis that "the world has no beginning"; or the thesis that "there exists an absolutely necessary being" and its antithesis that "there nowhere exists an absolutely necessary being." These are two of the four issues which Kant calls the "antinomies of a transcendental dialectic."

Such issues, Aristotle would agree with Kant, do not belong to the sphere of opinion or probability. But Kant would not agree with Aristotle that such issues belong to the domain of science or certain knowledge. The problem of the world's beginning or eternity, for example, is one which Aristotle treats in his *Physics* and appears to think is solved by the demonstration that motion can have neither beginning nor end. The problem of the existence of a necessary being is one which Aristotle treats in his *Metaphysics* and which he also appears to think is capable of a demonstrative solution. For him, therefore, both are problems to which scientific answers can be given. But for Kant the demonstration of the antitheses, or contradictory propositions, in both cases is as cogent as the demonstrations of the theses; and therefore, since we know that both of a pair of contradictory propositions cannot be validly demonstrated, we must conclude that the arguments advanced are only counterfeit demonstrations, or as Kant says, "illusory." He calls these demonstrations "dialectical," and the issues they attempt to resolve "antinomies," precisely because he thinks the reasoning goes beyond the limits of scientific thought and because he thinks the issues are problems reason cannot ever solve.

With respect to conclusions affirming or denying matters beyond experience, the antinomies can be interpreted either as showing that contradictory arguments are equally sound or as showing that they are equally faulty. On either interpretation, Kant and Aristotle seem to be opposed on the applicability of the principle of contradiction to conflicting arguments and conclusions (except, of course, those which are merely probable). This difference between them accords with the difference in their conceptions of science and dialectic, and in their theories of the scope and conditions of valid knowledge.

THE OPPOSITION between Kant and Aristotle may not present the only alternatives. Hegel's theory of the dialectical process seems to offer a third. Where Aristotle appears to think that all contradictions must be resolved in favor of one of the opposites, and where Kant appears to think that some contradictions cannot be resolved at all, Hegel proposes the resolution of all contradictions, not by a choice between

them, but by a synthesis uniting the opposites and reconciling their differences.

According to Aristotle, opposites exclude one another in existence as well as in thought. A thing cannot both exist and not exist at the same time; nor in any particular respect can it simultaneously both be and not be of a certain sort. Only with the passage of time and in the course of change can opposites be realized, when a thing passes from being to non-being, or gives up one attribute in order to assume its contrary.

The difference for Aristotle between becoming and being (or between change and complete actuality) seems to be that the one includes and the other excludes opposites. Change cannot occur except as one opposite comes into existence *while* the other passes away. But opposites cannot co-exist with complete actuality. So far as reality consists of co-existent actualities, it is limited by the principle of contradiction—as a principle of being—to those which are not contradictory. All possibilities cannot, therefore, be simultaneously realized, for, as Leibnitz states the principle, all possibilities are not "compossible."

According to Hegel, every finite phase of reality—everything except the Absolute Idea itself—has its contradictory, as real as itself, and co-existent with it. Contradictories imply one another and require each other, almost as correlative opposites do. Whatever is partial and incomplete presupposes something which is partial and incomplete in an opposite respect. The opposition between them can therefore be overcome by a synthesis which includes them both, and which complements each by uniting it with the other.

For example, the category of being is opposed by non-being. These opposites both exclude and imply one another. They are in a sense even identical with one another, insofar as the notion of being contains the notion of non-being, and, conversely, the notion of non-being, the notion of being. Except for the Absolute, everything which is also is not, and everything which is not also is. The apparent contradiction involved in this simultaneous application of opposite categories to the same thing is overcome by a third category, becoming, which is the synthesis of being and non-being. Being and non-being are united in becoming.

This reconciling of opposites, by their union in a more inclusive whole embracing both, typifies the Hegelian dialectic of thesis, antithesis, and synthesis. The motion repeats itself as the synthesis of one contradiction faces its own opposite and requires a higher synthesis to overcome the contradiction it has generated. Thus every opposition in reality or thought is a phase in the progressive realization of the Absolute, wherein all contradictions are resolved.

In Hegel's *Philosophy of History* and in his theory of the development of the state in the *Philosophy of Right*, the dialectical process is exemplified at every stage of progress. The conflict of interdependent opposites—of opposite classes or forces in society, of opposite political institutions or principles—calls for a resolution which shall unite rather than exclude the opposites.

Considering the division of labor, for example, Hegel writes: "When men are dependent on one another and reciprocally related in their work and the satisfaction of their needs, subjective self-seeking turns into a contribution to the satisfaction of the needs of everyone else. That is to say, by a dialectical advance, subjective self-seeking turns into the mediation of the particular through the universal, with the result that each man in earning, producing, and enjoying on his own account is *eo ipso* producing and earning for the enjoyment of everyone else." The opposition between the particular good of each individual and the universal good of all is thus overcome by that advance in social organization which is the division of labor.

Each of the stages of world history is, according to Hegel, "the presence of a necessary moment in the Idea of the world mind." But the world mind itself is a synthesis, a resolution of the conflicting opposites—of the various national minds "which are wholly restricted on account of their particularity. Their deeds and destinies in their reciprocal relations to one another are the dialectic of the finitude of these minds, and out of it arises the universal mind, the mind of the world, free from all restrictions, producing itself as that which exercises its right —and its right is the highest right of all—over these finite minds in the 'history of the world which is the world's court of judgment.' "

OUTLINE OF TOPICS

PAGE

1. Opposition in logic 331
   - 1*a*. Kinds of opposition among terms: correlation, contrariety, privation, negation
   - 1*b*. The analysis of contrariety: the kinds of terms which can be contrary; contrariety with and without intermediates between extremes
   - 1*c*. The exclusiveness of opposites as a principle of logical division 332
     - (1) Dichotomous division: positive and negative terms
     - (2) Division of a genus by differentia: the contrariety of species
   - 1*d*. The opposition of propositions or judgments
     - (1) The square of opposition: contradictories, contraries, subcontraries
     - (2) Modal opposition: the necessary and the contingent
   - 1*e*. Opposition in reasoning and proof: the conflict of dialectical arguments; the antinomies of a transcendental dialectic

2. The metaphysical significance of opposition 333
   - 2*a*. Opposition as limiting coexistence: noncontradiction as a principle of being
   - 2*b*. Opposites in the realm of being, mind, or spirit: the one and the many; the dialectical triad of thesis, antithesis, and synthesis
   - 2*c*. Nonbeing as the opposite of being
   - 2*d*. The opposition of good and evil in the world and in relation to God
   - 2*e*. The reconciliation of opposites in the divine nature: the synthesis of all contraries in the Absolute 334

3. Opposition in the realm of physical nature
   - 3*a*. The contraries as principles of change
   - 3*b*. Contrariety of quality in the theory of the elements or humours 335
   - 3*c*. The opposition of motion and rest, and of contrary motions
   - 3*d*. The opposition of physical forces and its resolution
   - 3*e*. The struggle for existence: the competition of species

4. Opposition or conflict in the psychological and moral order
   - 4*a*. The conflict of reason and the passions
   - 4*b*. Conflicting emotions, humours, instincts, or habits 336
   - 4*c*. Conflict as the cause of repression and as a factor in neurotic disorders 337
   - 4*d*. The conflict of loves and loyalties, desires and duties
   - 4*e*. Conflict in human life: opposed types of men and modes of life 338

5. Conflict in society and history 339
   - 5*a*. Competition in commerce and the rivalry of factions in politics
   - 5*b*. The class war: the opposition of the rich and the poor, the propertied and the propertyless, capital and labor, producers and consumers
   - 5*c*. The inevitability of civil strife and war between states 340
   - 5*d*. Opposition or strife as a productive principle or source of progress

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and **b** refer to the upper and lower halves of the left-hand side of the page, the letters c and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a *(D)*, follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—*(D) II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Opposition in logic

1*a*. Kinds of opposition among terms: correlation, contrariety, privation, negation

7 PLATO: *Protagoras*, 49a-50b / *Phaedo*, 226d-227a; 242d-245c / *Republic*, BK IV, 351b-c

8 ARISTOTLE: *Categories*, CH 10 **16d-19c** / *Prior Analytics*, BK I, CH 46 **70b-71d** / *Topics*, BK II, CH 8 **159b-160a**; BK IV, CH 4 [124^a35–$^b34$] **173a-d**; BK V, CH 6 **187a-188c**; BK VI, CH 9 **201a-202a** / *Metaphysics*, BK IV, CH 2 [1004^a9–17] **523a-b**; [1004^b27–1005^a2] **523d-524a**; BK V, CH 10 **539a-c**; BK IX, CH 1 [1046^a29–36] **571b**; CH 2 [1046^b7–15] **571c-d**; BK X, CH 4 [1055^a34–$^b28$] **582b-d**; BK XI, CH 3 [1061^a18–28] **589b-c**

Chapter 66: PHILOSOPHY

INTRODUCTION

THE difficulties which attend the consideration of any great idea—by philosophers or others—appear with peculiar force in the traditional discussion of philosophy itself. The word "philosophy" not only varies in its descriptive significance, now designating one part of learning, now another, and sometimes even an attitude of mind or a way of life; but it also varies as a term of evaluation. It is seldom used without expressing either praise or dispraise of the methods and accomplishments of philosophy, or of the calling and character of the philosopher.

On the descriptive side the meaning of the word ranges from a conception of philosophy which covers *all* branches of scientific knowledge and which contrasts philosophy with poetry, history, and religion, to a conception of philosophy in which the primary point is its contrast to science and its association with poetry and religion as works of vision, speculation, or belief rather than of knowledge.

On its evaluative side, the word "philosophy" sometimes eulogizes the love and search for truth, the pursuit and even the attainment of wisdom. At the other extreme, it derogates vain learning, idle disputation, and the dogmatism of unsupported opinion. At one time, the good name of the philosopher stands in contrast to the questionable reputation of the sophist. At another, "philosopher" carries almost the same invidious connotation as "sophist." The dismissal of philosophy as useless, or at best ornamental, in the practical affairs of society is sharply opposed to the vision of an ideal state which can come to pass only if philosophers are kings, or kings philosophers.

THESE SHIFTS IN the meaning of the words "philosophy" and "philosopher" record crises in the history of western thought. They reflect the characteristic formations of our culture in its major epochs.

The great books of antiquity, for example, seem to give no intimation of a division between science and philosophy. Particular bodies of knowledge, such as physics or mathematics, are indifferently regarded as sciences or branches of philosophy. The crown of knowledge is wisdom, approached as one rises in the hierarchy of knowledge to the highest science or the first philosophy. Aristotle and Plato may disagree in naming or defining the type of knowledge which deserves to be called wisdom, yet for both it is the ultimate attainment of philosophical inquiry or scientific work.

The differences between Plato and Aristotle discussed in the chapters on DIALECTIC and METAPHYSICS—the one using "dialectic" as the name for the supreme form of knowledge, the other using "theology" to name the summit of the sciences—do not affect their agreement that the philosopher is a man of knowledge, not opinion, and that his ultimate goal is wisdom.

If there is any distinction in antiquity between science and philosophy, it seems to find expression in the sense in which Socrates speaks of philosophy as the love of wisdom, implying thereby its pursuit rather than its attainment. A man would not be called a scientist in a particular field—mathematics, let us say—unless he actually had some mathematical knowledge; but a man who is not actually wise can be called a philosopher by virtue of his effort to become wise. Apart from this point of distinction, the Greeks tend to identify philosophy with the fundamental sciences, which somehow yield speculative or practical wisdom.

Considering the whole of human learning, all its arts and disciplines, we see that the things the ancients distinguish from philosophy are poetry, history, and the particular productive

arts or crafts. Here again Plato and Aristotle do not make the distinction in the same terms. Plato compares the poet unfavorably with the philosopher in the *Republic*. The poet is an imitator of imitations and moves on the level of images and beliefs, whereas the philosopher rises above the imagination to the level of ideas which are the only true objects of knowledge. Aristotle, on the other hand, seems to pay poetry a compliment when in the *Poetics* he says that it is more philosophical than history because it deals with the universal rather than the particular. These attitudes toward poetry in relation to philosophy are somewhat reversed by the fact that for Plato myth and poetry provide materials from which philosophical insights can sometimes be distilled, whereas for Aristotle sense-experience is the source from which, by induction, the principles or axioms of philosophical knowledge are obtained. Despite these differences their accord on the supremacy of the philosopher remains unaffected.

More than poetry and history—and all the knowledge that can be applied productively—philosophy represents the highest use of man's faculties. On this Aristotle and Plato seem to be agreed, even though Aristotle distinguishes the philosophical from the political life and assigns the most perfect happiness to the contemplative activity of the philosopher, whereas Plato—in the *Republic* at least—brings the philosopher back to the shadows of the cave after he has seen the light of truth itself, so that he can put his wisdom to practice in the government of his less fortunate fellow man.

THE PRACTICE OF philosophy seems to become, for the Roman writers, more important than the content of philosophy as a body of doctrine. "What is that which is able to conduct a man?" asks Marcus Aurelius. "One thing and only one, philosophy." It keeps the inner man "free from violence and unharmed, superior to pains and pleasures, doing nothing without a purpose." It enables him to "accept all that happens and all that is allotted . . . and finally to wait for death with a cheerful mind, as being nothing else than a dissolution of the elements of which every living being is compounded." To Aurelius his imperial court is like a stepmother to whom one must be dutiful, philosophy like a mother from whom one gains solace and help. "Return to philosophy frequently and repose in her," he tells himself, so that "what thou meetest with in the court appears to thee tolerable, and thou tolerable in the court."

The Stoic conception of philosophy as a moral discipline and as a consolation creates that sense of the word in which the familiar injunction to a person in distress—"Be philosophical"—carries the same meaning as "Be stoical." Philosophy provides only peace of mind, not worldly riches or external power. "Philosophy does not promise to secure to man anything outside himself," says Epictetus. Nor does it fulfill its promise of inner strength without stern resolution to withdraw desire from the goods of fortune.

"Do you suppose that you can be a philosopher if you do as you do now?" Epictetus asks. "Do you suppose that you can eat and drink as you do now, and indulge your anger and displeasure just as before? No, you must sit up late, you must work hard, conquer some of your desires. . . When you have carefully considered these drawbacks, then come to us . . . if you are willing to pay this price for peace of mind, freedom, tranquility." Do not try to be "first a philosopher, then a tax-collector, then an orator, then one of Caesar's procurators. These callings do not agree . . . You must be busy either with your inner man, or with things outside, that is, you must choose between the position of a philosopher and that of an ordinary man."

There seems to be no difference between the Stoic and Epicurean conception of philosophy. Lucretius praises Epicurus, "thanks to whom sweet solaces of life soothe the mind," for as soon as his philosophy "begins to proclaim aloud the nature of things, the terrors of the mind fly away."

But for Lucretius philosophy achieves this boon not merely by curbing the passions and quieting desires, but also, and primarily, by the truth of its teachings about the constitution of the world and the causes of things. Nor is it merely that the philosophical mind is able "to dwell in the calm high places, firmly embattled on the heights by the teaching of the wise, whence you can look down on others, and see

them wandering hither and thither, going astray as they seek the way of life." Philosophy provides a more specific remedy for the deepest of human ills by "freeing the mind from the close bondage of religion."

Men fear the thunderbolts of the gods, their intervention in the course of nature and human affairs, and the punishments of the after-life. Before Epicurus taught them the mortality of the soul and the atomic determination of all things, "the life of man lay foul to see and grovelling upon the earth, crushed by the weight of religion." His teaching concerning "what can come to be and what cannot, and in what way each thing has its power limited," rids the mind of the terrors fostered by religion. This "darkness of mind must needs be scattered . . . by the outer view and the inner law of nature."

Except for Lucretius, the triumph of philosophy over religion does not seem to be central to ancient conceptions of philosophy's contribution to the mind and life of man. In the pagan world, religious belief is either combined with philosophy to constitute the worship of the gods, which seems to be Plato's view in the *Laws*; or it represents the superstitions of the ignorant as opposed to the sophistication of the educated. Gibbon describes the rift between religion and philosophy not as a matter of intellectual controversy, but as a division of society into classes lacking or having the benefits of education—or, what is the same in the ancient world, instruction in philosophy.

But in the mediaeval world, the distinction between philosophy and religion seems to be essential to the consideration of the nature and value of philosophy. The importance of the distinction appears alike in the great books of the Christian tradition and in the great writings of the Mohammedan and Jewish cultures—in Augustine and Aquinas, Avicenna, Averroës, and Maimonides—though the problem of philosophy's relation to religion and theology may be quite differently solved by each. In all three religious communities secular learning and sacred doctrine are set apart by their origin—the one from the efforts of human reason, the other from the word of God as revealed to the faithful. Even when it is held in highest esteem as the best achievement of secular learning, philosophy is for the most part regarded as inferior to the teachings of religion.

There are those—the simply religious, the devout, the mystical—who abominate the pretensions of reason and the vanity of philosophers who claim either merit or need for any knowledge beyond the truths which God himself has revealed. This position is expressed by such Christian writers as Tertullian, Peter Damian, Bernard of Clairvaux; or, in the Arabic tradition, by Al-Ghazzali's *The Destruction of Philosophy*. Al-Ghazzali is answered by Averroës in his *Destruction of the "Destruction"* which asserts the supremacy of philosophy. Averroës reserves philosophy for men of requisite intellectual strength and relegates theology and religion to those who must substitute opinion and imagination for reason.

Neither Augustine nor Aquinas goes to these extremes. They do not dismiss philosophy as useless learning or as dangerous folly, subversive of the wisdom of faith; but neither do they admit the sufficiency of philosophy for knowledge of God—the mysteries of the divine nature, God's providence and His gracious gift of salvation to man.

Quoting St. Paul's warning to "beware lest any man spoil you through philosophy and vain deceit according to the tradition of men and the rudiments of the world, and not according to Christ," Augustine defends his praise of the Platonic philosophy which in his judgment comes nearest to the Christian faith, on the ground that the Apostle also said to the gentiles that "that which is known of God is manifest among them, for God has manifested it to them." Yet he adds that "the Christian man who is ignorant of their writings . . . is not, therefore, ignorant that it is from the one true and supremely good God that we have that nature in which we are made in the image of God, and that doctrine by which we know Him and ourselves, and that grace with which, by cleaving to Him, we are blessed."

Philosophy, according to Augustine, can thus be dispensed with in all the major concerns of knowledge, love, or action. But Augustine does not argue that it should therefore be discarded. "If those who are called philosophers," he says, "and especially the Platonists, have said aught that is true and in harmony with our faith, we

are not only not to shrink from it, but to claim it for our own use from those who have unlawful possession of it," even as the spoils of the Egyptians belong to the Jews.

Though Augustine and Aquinas conceive the relation of faith and reason differently, they seem to share a conception of philosophy as the handmaiden of theology when faith seeks understanding. For Aquinas this does not appear to imply lack of dignity or even the loss of a certain autonomy on the part of philosophy. On the contrary, so highly does he regard the demonstrations of Aristotle, whom he calls "the philosopher," that he opens the *Summa Theologica* with the question "Whether, besides the philosophical sciences, any further doctrine is required."

He answers that "it was necessary for the salvation of man that certain truths which exceed human reason should be made known to him by divine revelation. Even as regards those truths about God which human reason can investigate, it was necessary that man be taught by a divine revelation. For the truth about God, such as reason can know it, would only be known by a few, and that after a long time, and with the admixture of many errors; whereas man's whole salvation, which is in God, depends upon the knowledge of this truth. . . . It was, therefore, necessary that besides the philosophical sciences investigated by reason, there should be a sacred science by way of revelation." That sacred science is theology—not the theology which is a part of philosophy, but the theology whose principles come from faith rather than from reason.

"There is no reason," Aquinas writes, "why those things which are treated by the philosophical sciences, so far as they can be known by the light of natural reason, may not also be treated by another science so far as they are known by the light of the divine revelation." On this view, sacred theology may treat of certain things, such as the mystery of the Trinity, which do not belong properly to the philosopher because they exceed the power of reason to demonstrate; but other matters concerning nature, man, and God may belong both to the philosopher and to the theologian, who consider them according to their different lights. Since a truth cannot conflict with a truth, though reason sponsors one and faith the other, there can be no conflict between philosophy and theology.

SOME MODERN philosophers, like Bacon and Locke, seem to agree with mediaeval theologians about the subordination of philosophy to theology. But for the most part the modern tendency, increasingly evident in the writings of Descartes, Spinoza, Kant, and Hegel, is to insist upon the complete autonomy of philosophy.

Hegel, for example, challenges "the imputation against Philosophy of being shy of noticing religious truths, or of having occasion to be so," and the insinuated "suspicion that it has anything but a clear conscience in the presence of these truths. So far from this being the case," Hegel remarks, "the fact is that in recent times Philosophy has been obliged to defend the domain of religion against the attacks of several theological systems."

The diverse aspects of the problem of the relation of philosophy to theology, and of theology to faith, are discussed in the chapters on METAPHYSICS, THEOLOGY, and RELIGION. The problem which is more characteristic of the modern consideration of philosophy concerns its relation to science.

To state the problem some distinction between the two is necessary, and making this distinction represents a novel departure, both in thought and language. As we have seen, philosophy and science are almost identified throughout the ancient and mediaeval tradition. Insofar as the word "science" means knowledge rather than opinion, the result of philosophical inquiry is science, and philosophy as a whole is divided into a number of sciences. There may be, as ancient writings seem to suggest, sciences which aim at useful productions rather than at speculative or practical wisdom, and fall below the level of philosophy; or there may be, as some Christian theologians hold, a sacred science superior in its wisdom to all the philosophical sciences. But these exceptions to the identity of philosophy and science merely confirm the point that in the ancient or mediaeval view philosophy is scientific and consists of sciences, even though there may be sciences which are not philosophical.

This use of the words "science" and "philos-

ophy" persists well into modern times. Hobbes, for example, presents his classification of the types of knowledge under the heading "science, that is, Knowledge of Consequences, which is also called Philosophy." Bacon proposes to "divide sciences into theology and philosophy." Descartes uses the words "science" and "philosophy" interchangeably. "Among the different branches of Philosophy," he says, "I had in my younger days to a certain extent studied Logic; and in those of Mathematics, Geometrical Analysis and Algebra—three arts or sciences which seemed as though they ought to contribute to the design I had in view." In the Prefatory Letter to his *Principles of Philosophy*, he likens "philosophy as a whole" to "a tree whose roots are metaphysics, whose trunk is physics, and whose branches, which issue from this trunk, are all the other sciences. These reduce themselves to three principal ones, *viz.*, medicine, mechanics, and morals."

Even as near the end of the eighteenth century as Hume, the word "philosophy" continues to be the general name for the particular sciences. It covers the experimental study of natural phenomena as well as what are for Hume the non-experimental sciences of mathematics and psychology. But it excludes divinity or theology, insofar as "its best and most solid foundation is *faith* and divine revelation"; metaphysics, which is "nothing but sophistry and illusion"; and all inquiries into particular as opposed to general facts, such as "history, chronology, geography, and astronomy."

Nor is this use of terms confined to what readers today would call books of philosophy. The authors of the books which are today regarded as among the foundations of modern science—Galileo, Newton, Huygens and, in the eighteenth century, Lavoisier and Fourier—refer to themselves as philosophers and to the science in which they are engaged, *e.g.*, mathematics, mechanics, physics, chemistry, as parts or aspects of natural philosophy. They do, however, indicate an awareness of how they differ from ancient and mediaeval scientists (who also called themselves philosophers) by calling their own work "experimental philosophy."

In this phrase lies the root of the distinction between philosophy and science as that distinction is generally understood by writers since the eighteenth century. The word "experimental" applied to philosophy signifies a radical difference in the method of inquiry and even in the objects to be investigated, for certain objects can be known only by experimental or empirical research. Kant appears to be the first (in the great books at least) to make a sharp separation between the investigation of either nature or mind by what he calls "empirical" as opposed to "rational" methods. He still uses the name "science" for both sorts of investigation, but he appears to restrict "philosophy" to the latter—the pure, the *a priori*, the rational sciences.

Two other innovations must be noted. Though Kant regards it as a rational discipline, he excludes mathematics entirely from philosophy and criticizes its misleading influence upon those philosophers who have tried to imitate mathematical thought. And though he sometimes uses "metaphysic" narrowly to designate the critical examination of pure reason itself, he also says that "this name of metaphysic may be given to the whole of pure philosophy . . . excluding all that belongs to the empirical and the mathematical employment of reason." Considering that it has only two objects, nature and freedom—that which *is* and that which *ought to be*—Kant divides philosophy into the speculative and the practical use of pure reason, which gives rise to a *metaphysic of nature* and a *metaphysic of morals*. "Metaphysic, therefore, that of nature as well as that of morals, and particularly the criticism of our adventurous reason which forms the introduction to and preparation for it, constitute together," Kant writes, "what may be termed philosophy in the true sense of the word. Its only goal is wisdom, and the path to it, science."

Kant's innovations in vocabulary plainly announce the separation of philosophy from mathematics and experimental science, which is only intimated by earlier modern writers. But Kant still uses the word "science" for both the philosophical and the empirical sciences. The final step is taken in the nineteenth century when the word "science" is restricted to mathematics and to such knowledge of nature, man, and society as can be obtained by the methods of experimental or empirical research. William James, for example, stresses the fact that he is trying to expound psychology as one of the natural

sciences, and to that end he tries to separate the problems which are capable of empirical investigation from those which belong to philosophical speculation. For Freud that separation is an accomplished fact, and one which leaves to philosophy no problem that can be solved by science.

According to Freud, "it is inadmissible to declare that science is one field of human intellectual activity, and that religion and philosophy are others, at least as valuable, and that science has no business to interfere with the other two." On the contrary, Freud thinks it is right for scientific research to look "on the whole field of human activity as its own," and to criticize the unscientific formulations of philosophy. The trouble with philosophy is that "it behaves itself as if it were a science . . . but it parts company with science, in that it clings to the illusion that it can produce a complete and coherent picture of the universe." It is this illusion which science continually punctures, since, in Freud's opinion, "that picture must needs fall to pieces with every new advance in our knowledge."

WHEN SCIENCE AND philosophy are set apart at last, it is possible to make sense of the typically modern questions concerning philosophy. How does it stand in relation to science? Does it consist of verifiable knowledge comparable to that which can be obtained in the natural and social sciences? If not, what is the standard of truth in philosophy? Does it consist of definitions and postulates leading to rigorously demonstrated conclusions in a manner comparable to mathematics, especially in its modern construction? If not, must it not be regarded as opinion or speculation rather than as knowledge in any strict sense? Or if philosophical thought can be compared with mathematics, does not the diversity of definitions and postulates employed by different philosophers reduce philosophy to a collection of competing "systems" rather than a single discipline in which philosophers work cooperatively as do scientists and mathematicians?

However the foregoing questions are answered, there are still others. Does philosophy have distinct branches, divided according to their objects of study like the natural sciences, or is philosophy to be identified with metaphysics? If, in addition to metaphysics, there is a philosophy of nature, how are its principles and conclusions related to the findings of the natural sciences which appear to study the same object? Similarly, if psychology is a branch of philosophy, how is it related to experimental or clinical psychology? What is the relation of moral and political philosophy to the empirical social sciences concerned with describing, not judging or regulating, human conduct and social institutions? Is economics a science or is it a branch of moral philosophy; or, if it is both, how are the two related?

What is the use of philosophy, especially in its theoretic branches, if, unlike science, it cannot be applied to the mastery of physical nature and the production of utilities, whether bridges or bombs? What, finally, at the end of its long history, does philosophy come to if, in such marked contrast to the continuously accelerated progress of the sciences, it cannot claim any signal advance on which all philosophers are agreed, but instead must admit that most of its problems seem to be perennially debated, now as in every preceding century?

SOME OF THESE questions, as well as certain answers to them, are considered in other chapters: the comparison of empirical research and philosophical thought as constituting different types of science, in the chapter on SCIENCE; the distinction and relation between natural philosophy and natural science, in the chapter on PHYSICS; the difference between philosophical and scientific psychology, in the chapter on MAN; the function of definitions, hypotheses, postulates, or axioms in the foundation and method of philosophy and science, in the chapter on PRINCIPLE; the difference between the practical use of philosophy in the sphere of morals and the use of science in the sphere of the productive arts, in the chapter on KNOWLEDGE; the accumulation of truth as measuring advances in science and philosophy, in the chapter on PROGRESS.

Here we must observe that such answers to these questions as tend to subordinate philosophy to science originate exclusively with modern views of the nature of knowledge, of the criteria of truth, and of the capacities of the

human mind, especially the power of reason. Even those modern authors who write at a time when the words "science" and "philosophy" are, for the most part, interchangeable tend in this direction. The points they make about the nature, aim, and method of what they call either science or philosophy have the effect of giving the status of *knowledge* only to mathematics and the empirical sciences, and of reducing philosophical speculation to the status of *opinion*.

Bacon's insistence, for example, that genuine knowledge gives us power over nature and generates productions, seems to have this effect, certainly upon any part of traditional philosophy which cannot meet this test. Hume's insistence upon experimental reasoning with respect to all matters of fact seems to eliminate not only metaphysics, but any science or philosophy of nature which is not experimental. The methodological reforms in philosophy which these philosophers and others, like Hobbes, Descartes, and Spinoza, propose seem to be reforms which eliminate whatever in philosophy cannot become either experimental science or a quasi-mathematical system of thought.

Among the modern reformers of philosophy, Kant represents the exception. By his critical method he hopes to establish philosophy above and independent of all the empirical sciences; and to institute metaphysics as a science which neither imitates mathematics nor accepts it as an equal in the scale of reason's accomplishments. Yet even Kant seems to betray the typically modern attitude toward philosophy. The intellectual revolution which he projects as the philosophical parallel to the Copernican revolution in astronomy is motivated by his desire to secure for philosophy a stability and development comparable to that enjoyed by mathematics and the empirical sciences.

"In the progress of society," writes Adam Smith, "philosophy or speculation becomes, like every other employment, the principal or sole trade and occupation of a particular class of citizens. Like every other employment too, it is subdivided into a great number of different branches, each of which affords occupation to a peculiar tribe or class of philosophers; and this subdivision of employment in philosophy, as well as in every other business, improves dexterity and saves time. Each individual becomes more expert in his own peculiar branch, more work is done upon the whole, and the quantity of science is considerably increased by it."

Despite his use of the word "philosophy," it seems likely that Adam Smith is describing the division of labor in scientific research and the specialization of scientists. Though philosophy has divisions, and though the distinction and order of its parts are discussed by the great philosophers, their own work exhibits a spirit opposed to specialization. In fact, one measure of the greatness of a philosopher is the comprehensiveness of his thought, the range of subject matters and the scope of the problems with which he deals.

Those philosophers, like Aristotle, Bacon, Hobbes, or Kant, who show great interest in the divisions of philosophy seem to be largely concerned with distinguishing the different objects of philosophical thought and differentiating the concepts or principles peculiarly relevant to each. Other chapters deal with subject matters, sciences, or disciplines that have been regarded, by one philosopher or another, as major divisions of philosophy, *e.g.*, Logic, Metaphysics, Theology, Dialectic, Mathematics, Physics, and psychology (in the chapter on Man). But one group of sciences or disciplines is not discussed elsewhere and must be briefly noted here. Traditionally within the province of the philosopher, they are sometimes expanded to his whole domain. They come nearer to what the ordinary man means by "philosophy" when he speaks of having a philosophy of life—an over-all yet personal view of the human situation, illuminated by a sense of the values which should direct conduct.

The disciplines in question are traditionally called ethics and politics, or moral philosophy. Socrates is credited with having accomplished the first great reform in philosophy when he turned to such subjects and away from the inquiries of his predecessors. "I do not mean to speak disparagingly of the students of natural philosophy," he says at his trial, "but the simple truth is, O Athenians, that I have nothing to do with physical speculations." Subsequently he tells his judges that he "will never cease from the practice and teaching of philosophy"—re-

proaching those whom he questions with "under-valuing the greater and over-valuing the less," enjoining them not to take thought of their persons or their properties, "but first and chiefly to care about the greatest improvement of the soul." He will not foreswear philosophy even to save his life. "I cannot hold my tongue," he says. "Daily discourse about virtue . . . is the greatest good of man," for "the unexamined life is not worth living."

The conception of ethics and politics and of their relation to other branches of philosophy seems to depend upon the acceptance or rejection of a fundamental principle in the division of philosophy. Aristotle and Kant, for example, divide the philosophical sciences into the theoretic or speculative and the practical or moral, according as they consider what *is* (the nature and causes of things) or what *ought to be* (the objects of choice, the ends and means, in the conduct of life and the institutions of society). According to this conception of the practical, the practical sciences are ethics and politics, and with them economics and jurisprudence; or in another statement of the same divisions, the parts of practical philosophy are moral philosophy, the philosophy of right, the philosophy of law. They are all conceived as normative, prescriptive, or regulative disciplines, determining what is good and evil or right and wrong, and directing action in the sphere of human freedom.

Hobbes proceeds on a different principle. He separates natural philosophy (including *philosophia prima*) from civil philosophy, or the theory of the body politic. But he includes ethics and poetics under natural philosophy as part of the theoretic study of human nature. The distinction between the theoretic and the practical seems to be here ignored, or even implicitly denied insofar as Hobbes would reject the basis of the distinction—the difference between natural necessity and human freedom. Necessity governs the motions of the human body and of the body politic as much as it does the bodies studied by the physicist, and so ethics, politics, and physics are alike sciences of determined consequences.

Still another view seems to be taken by Bacon who separates natural from human and civil philosophy and divides natural philosophy into two main speculative branches (physics and metaphysics) and two main practical branches (mechanics and magic). Psychology, logic, and ethics belong to human philosophy; politics and jurisprudence to civil philosophy. But with respect to all of these Bacon does not apply the distinction between the speculative and the practical which seems to him of the utmost importance in natural philosophy. The reason seems to be that Bacon uses the word "practical" to mean the production of effects resulting from the knowledge of causes, rather than actions to be performed by men as the result of choice. His practical sciences correspond, therefore, to what Aristotle conceives as arts, or productive sciences—the sphere of making or poetics in general—not to what Aristotle means by the practical, the sphere of doing rather than of making, of prudence rather than of art. These matters are discussed in the chapters on ART and POETRY.

The problem of the relation of science to art becomes, if restated in Bacon's terms, the problem of the relation of the theoretic to the practical (*i.e.*, productive) sciences. But in terms of Aristotle, Aquinas, or Kant, the problem of the relation between the speculative and practical branches of philosophy becomes the quite different problem of how knowledge of being or nature relates to knowledge of what should be sought or ought to be done. In Hobbes' terms the problem shifts in still another direction to the consideration of the bearing of physics upon psychology, ethics, and politics.

How, on any of the foregoing views, do speculations concerning the nature of things affect the theory of human life and society, or the practical principles by which man tries to lead a good life and organize a good society? What relation do the truths of physics and metaphysics, or the major philosophical issues in these fields, bear to the truths and issues in psychology, ethics, and politics? Or, as William James puts the question, must not any man who has a philosophy of life also have, implicitly at least, a metaphysics?

Upon the answers to such questions depends the varying esteem in which philosophy is held in the great periods of western culture. Unlike supernatural religion and empirical science, and especially when separated from them, philoso-

phy does not promise eternal salvation or earthly prosperity. The uses of philosophy, as compared with religion and science, must somehow be assessed in the terms which, from the beginning of philosophy, are of its essence—the love of wisdom, and through it the search for a human wisdom which shall be at once speculative and practical.

OUTLINE OF TOPICS

PAGE

1. The definition and scope of philosophy 351

1*a*. The relation of philosophy to theology or religion

1*b*. The relation of philosophy to mathematics 352

1*c*. The relation of philosophy to experimental or empirical science

1*d*. The relation of philosophy to myth, poetry, and history 353

2. The divisions of philosophy

2*a*. The distinction between theoretic or speculative and practical or moral philosophy: the distinction between natural and civil philosophy

2*b*. The branches of speculative philosophy: the divisions of natural philosophy

2*c*. The nature and branches of practical or moral philosophy: economics, ethics, politics, jurisprudence; poetics or the theory of art 354

3. The method of philosophy

3*a*. The foundations of philosophy in experience and common sense

3*b*. The philosopher's appeal to first principles and to definitions 355

3*c*. The processes of philosophical thought: induction, intuition, definition, demonstration, reasoning, analysis, and synthesis

3*d*. The methodological reformation of philosophy 356

4. The uses of philosophy: diverse conceptions of its aim, function, and value

4*a*. The philosophic mode of life: contemplation and happiness

4*b*. Philosophy as a moral discipline: the consolation of philosophy

4*c*. The social role of philosophy: the philosopher and the statesman; the philosopher king 357

5. The character and training of the philosopher: the difficulty of being a philosopher

6. Praise and dispraise of the philosopher and his work 358

6*a*. The philosopher as a man of science or wisdom: the love and search for truth

6*b*. The philosopher and the man of opinion: sophistry and dogmatism, idle disputation, perpetual controversy

6*c*. The philosopher as a man of reason: the limits of reason; its supplementation by experience or faith 359

6*d*. The philosopher as a man of theory or vision: neglect of the practical; withdrawal from the affairs of men and the marketplace

7. Observations on the history of philosophy: the lives of the philosophers in relation to their thought 360

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a *(D)*, follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—*(D) II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The definition and scope of philosophy

7 PLATO: *Lysis*, 20a / *Euthydemus*, 74b-76b / *Republic*, BK II, 320b; BK V, 368c-373c; BK VI–VII, 383d-398c / *Sophist*, 570a-574c esp 571a-c / *Philebus*, 633a-635a esp 634b-635a / *Seventh Letter*, 809a-811a

Chapter 67: PHYSICS

INTRODUCTION

CONCERNING the subject matter of physics, one thing seems to be traditionally taken for granted. The object of its study is the sensible world of changing things or matter in motion. When Plato, for example, conceives astronomy as dealing not with the actual and observable motions of the heavenly bodies, but with the possible forms of the motions of solids, he gives it the character of a mathematical rather than a physical science. He associates it with geometry, as for a similar reason he associates music—divorced from concern with audible harmonies—with arithmetic. In anyone's view, if a science does not investigate sensible realities, if it does not undertake to account for the motions of actual bodies, or, stated most generally, if it has no concern with the phenomena of change, then it does not have the character of physical or natural science.

The early Greek physicists, the pre-Socratics, to whom Plato and Aristotle refer, inaugurate the study of change with speculations about ultimate origins, the underlying principles or causes of natural phenomena. Sometimes they are called philosophers and sometimes scientists —or, at least, precursors of empirical science. But there seems to be no difference of opinion about their title as physicists. Their undisputed claim to this title derives, not from the method they employ, but from the object they study—change. In that primary meaning of the word "nature" which comes from the Latin *natura*—the equivalent of *phüsis* in Greek—they can be called "naturalists" or "physicists" indifferently. The realm of nature is the realm of change.

It is for this reason that Aristotle, considering the theories of his predecessors in the opening chapters of his *Physics*, sets Parmenides apart from all the rest. Parmenides' affirmation of the unity of being, which leads to his denial of the reality of change or motion, cannot be treated as a physical theory. On the contrary, it is, according to Aristotle, a complete negation of the subject matter of physics. No matter what other points physicists may dispute among themselves, they must all at least agree in taking a stand against Parmenides. Aristotle does not even seem to think that a book on physics is the proper place to argue against Parmenides. That argument belongs to another part of philosophy. The reality of change seems to him sufficiently evident to assure the physicist that he has a subject matter to investigate.

THE QUESTION whether the early physicists were scientists or philosophers calls attention to different methods of investigating natural phenomena. Agreement on the subject matter of physics may prevail, therefore, only in very general terms. When, in a manner to accord with the method employed, the object of physical inquiry is more specifically defined, there seem to be two physics, not one—a philosophical and a scientific physics, a philosophy of nature and a natural science, or, to use Kant's phrasing, a rational or pure physics and an empirical or experimental physics.

Though Newton may call his work a philosophy of nature, he also refers to it as an experimental philosophy, in order to distinguish it from the work of earlier natural philosophers who did not perform experiments. The difference between the physics of Newton and that of Aristotle seems, however, to involve more than a divergence in method. The problems which Newton and Aristotle try to solve indicate a difference in subject matter as well. Nevertheless, this difference falls within what, in the most general terms, must be conceived as the domain of physics. For all their differ-

ences, both are physicists, though both are not philosophers or scientists in the same sense.

There are other sources of variation in the definition of physics. The problem of the relation of physics to other disciplines—whether these are other branches of philosophy or other fields of empirical research—raises issues about the object and scope of physics. Aristotle, Bacon, Descartes, and Kant, for example, do not seem to have a common understanding of the relation of physics to mathematics and metaphysics. In consequence they conceive physics itself differently.

On the level of empirical research, physics is sometimes regarded as just one of the natural sciences and sometimes as the whole group of natural sciences. In the latter case it includes such fields as astronomy, mechanics, optics, acoustics, thermodynamics, magnetism, and electricity; and sometimes chemistry, biology, and even psychology are included under the head of physical or natural sciences, contrasted in the broadest terms to the social sciences. The conception of physics obviously changes when its scope is determined by a boundary line which separates it from chemistry, or from biology and psychology, or from the study of society.

The separation of these other sciences from physics does not necessarily imply a discontinuity in nature or the natural sciences. The biologist and the psychologist, for example, consider the physical bases of life and the physical conditions or correlates of mental phenomena. Hybrid sciences like biophysics and psychophysics have developed. Even the study of society draws upon physics to the extent that the laws of matter in motion and considerations of space and time must be appealed to for an understanding of the physical foundations of economic and political life.

Other chapters deal with specific physical sciences, *e.g.*, Astronomy and Mechanics. The latter tries to cover the various branches of mechanics and related fields of study, such as dynamics, optics, the theory of heat, magnetism, and electricity; particularly so far as these are represented in the work of Galileo, Newton, Huygens, Gilbert, Fourier, and Faraday. The basic concepts of mechanics and its branches or affiliates are also treated in that chapter. Still other chapters deal with fundamental terms representing concepts or problems in the larger domain of physics, philosophical or scientific, *e.g.*, Cause, Change, Element, Infinity, Matter, Principle, Quantity, Space, and Time—not to mention Nature and World, terms which represent in the most comprehensive way the reality studied by the physicist.

Our discussion here can therefore be restricted to the problems raised in the great books concerning the conception of physics, its subject matter and method, its relation to other sciences or other parts of philosophy. It will lead to such questions as whether physics is supreme among the sciences studying reality or the nature of things and, at the other extreme, whether physics is at all possible as a science, whether there can be scientific knowledge of bodies in motion or of the whole realm of change and becoming.

The problem of the distinction between philosophical and scientific physics would appear to be only a special case of the distinction between philosophy and science in general. But it is more than that. It is the case which tests the main distinction itself, since here both philosopher and scientist claim to be expounding the same subject matter or at least to be dealing with the same general field of phenomena.

Mathematics and metaphysics bear on the distinction between philosophy and science in a different way. If, for example, we take experimentation or empirical research to be characteristic of science in distinction from philosophy, then mathematics would seem to resemble philosophy rather than science. On no understanding of the nature of mathematical knowledge is mathematics ever divided into two kinds which are capable of being described as empirical and rational. The possibility of metaphysical knowledge may be challenged, but no one has ever proposed an experimental metaphysics to challenge the metaphysics of the philosophers.

But physics seems to permit both an experimental and a philosophical treatment. Whether they are to be regarded as in conflict with one another depends on whether they are attacking

the same problems by different methods or whether they represent something like a division of labor. In the latter view, each would deal, according to its method, with different problems and tend to supplement rather than to exclude the other. Psychology is another subject matter which seems to receive a dual treatment—philosophical and experimental—in the tradition of the great books. It raises issues similar to those just mentioned. They are considered in the chapter on MAN.

As the chapters on PHILOSOPHY and on SCIENCE indicate, the discussion of their difference from and relation to one another is complicated by the double use of both terms. The word "science," for example, is used for both the philosophical and the experimental sciences throughout the greater part of the tradition. Similarly, until quite recently, the name of philosopher is taken by those who experiment as well as by those who do not.

It is impossible, therefore, to speak without confusion of a scientific and a philosophical physics unless the verbal ambiguities are resolved by some convention, such as the understanding that when the context indicates that the words "science" and "philosophy" are being used as opposites rather than as synonyms, then "science" shall signify the experimental and "philosophy" the non-experimental mode of treatment. Beyond this, it is necessary to proceed as if the chapters on PHILOSOPHY and SCIENCE formed a background for some of the matters to be discussed here. Otherwise the consideration of natural philosophy and natural science would tend to become a general discussion of philosophy and science.

THE GREAT BOOKS of experimental physics seem to have three characteristics in common. First, and most naturally, they insist upon experimentation as either the indispensable source or the ultimate test of scientific formulations. Second, they tend to rely upon mathematics as much as upon experiment, both for the formulation of nature's laws and for the demonstration of the consequences or corollaries of the primary laws. Third, though experiments and observations multiply as science develops, they seek to bring all the phenomena of nature under the smallest number of generalizations, which have the utmost simplicity in mathematical statement.

On the second and third points, Newton's declarations seem to be most explicit. "Nature," he says, "is pleased with simplicity and affects not the pomp of superflous causes." Accordingly, Newton directs his efforts toward the simplest statement of the laws of motion, and these he seeks to give the universality requisite for covering every type of natural phenomenon. At the opening of the third book of the *Mathematical Principles of Natural Philosophy*, he explains that in the preceding books, he has "laid down the principles of philosophy, principles not philosophical but mathematical; such, namely, as we may build our reasonings upon in philosophical inquiries. These principles are the laws and conditions of certain motions, and powers or forces." From these same principles, he will now undertake to "demonstrate the frame of the System of the World."

In the Preface to the first edition of this work, Newton describes the third book as one in which he derives "from the celestial phenomena the forces of gravity with which bodies tend to the sun and the several planets. Then from these forces, by other propositions which are also mathematical," he goes on, "I deduce the motions of the planets, the comets, the moon, the sea." But he does not consider his work to have attained the goal of physics—the comprehension of all natural phenomena by a few simple mathematical formulae.

His confession of failure may also be read as a prognostication of what an experimental physics based on mathematical principles might some day be able to achieve. "I wish we could derive the rest of the phenomena of nature by the same kind of reasoning," he writes, "for I am induced by many reasons to suspect that they may all depend upon certain forces by which the particles of bodies, by some causes hitherto unknown, are either mutually impelled towards one another, and cohere in regular figures, or are repelled and recede from one another." Einstein's unified field equations, covering both gravitational phenomena on the astronomical scale and the electrical attractions and repulsions of sub-atomic particles, seem to realize, or at least closely to approximate, the ideal Newton has in mind.

Midway between Newton and Einstein, Fourier also bears testimony to the ideal of physics as a science at once simple in its principles and universal in the scope of their application. The successors of Newton and Galileo, he writes, "have extended their theories and given them an admirable perfection; they have taught us that the most diverse phenomena are subject to a small number of universal laws which are reproduced in all the acts of nature. It is recognized that the same principles regulate all the movements of the stars, their form, the inequalities of their courses, the equilibrium and the oscillations of the seas, the harmonic vibrations of air and sonorous bodies, the transmission of light, capillary actions, the undulations of fluids, in fine the most complex effects of all natural forces. Thus has the thought of Newton been confirmed," he concludes, referring to Newton's praise of geometry, whose glory it is that the few mathematical principles it provided for use in physics should have been "able to produce so many things."

On the experimental side, the great works of physical science seem to contain diverse notions of the purposes served by experimentation, accompanied by a fairly uniform recognition of the dependence of natural science upon experiment. In the field of magnetism, for example, Gilbert sets aside as unscientific all those authors who "have written about amber and jet as attracting chaff . . . but with never a proof from experiments. . . . These writers deal only in words. . . . Such philosophy bears no fruit." The fruitfulness of experiments on the vacuum, the equilibrium of fluids, and the weight of air leads Pascal to conclude that the secrets of nature remain hidden until "the experiments which supply us with knowledge about it" can be performed and multiplied.

"We ought never to search for truth but by the natural road of experiment and observation," writes Lavoisier; and Faraday describes himself as "an experimentalist" who feels "bound to let experiment guide me into any train of thought which it may justify." The science of electricity, he finds, "is in that state in which every part of it requires experimental investigation, not merely for the discovery of new effects," but ultimately for "the more accurate determination of the first principles of action of the most extraordinary and universal power in nature."

Methods of experimentation necessarily differ in different fields of physical research. Newton's optical experiments with mirrors and prisms were adapted to the phenomena of light, as Galileo's experiment with the inclined plane, Pascal's experiment on the equilibrium of fluids, or Faraday's experiments with induction coils were adapted to the phenomena of dynamics, hydrostatics, and electricity. The materials employed, the apparatus or instruments devised, the factors controlled or isolated from irrelevant circumstances, and the units of measurement in which the results are recorded, naturally vary with the phenomena under observation. Yet one thing is common to the variety of experiments described in the great books of physical science. They all involve the construction of an artificial physical system which permits more accurate and refined observation than does nature uncontrolled or untampered with.

The student of nature must observe in any case, no matter whether he is a philosopher or a scientist. To say that philosophical physics is non-experimental does not mean for Aristotle that knowledge of nature is possible without observation or induction from experience. But the experimentalists insist upon the distinction between the kind of observations which men normally make in the course of everyday experience and the kind which involve the special experience enjoyed only by those who observe and, in addition, measure the results of specially contrived experiments.

This point of distinction seems to be strikingly illustrated by a passage in Galileo's *Two New Sciences*. One of the persons in the dialogue, Simplicio, declares "everyday experience to show the propagation of light to be instantaneous." He explains that "when we see a piece of artillery fired at a great distance, the flash reaches our eyes without lapse of time; but the sound reaches the ear only after a noticeable interval." Sagredo replies that this familiar bit of experience permits him to infer only that "sound, in reaching our ear, travels more slowly than light." It does not inform us, he says, "whether the coming of light is instanta-

neous or whether, although extremely rapid, it still occupies time." The choice between these alternatives could not be determined by ordinary experience. An experiment had to be constructed in order to measure the velocity of light.

Recourse to experimentation to find by observation and measurement the answers which ordinary experience fails to yield does not exhaust the uses of experiment. The great experimental physicists indicate at least three distinct uses to which experiments can be put in addition to a merely exploratory use for "the discovery of new effects."

In natural philosophy as in mathematics, writes Newton, "the method of analysis ought ever to precede the method of composition" or synthesis. In physics, the method of analysis "consists in making experiments and observations, and in drawing conclusions from them by induction." In contrast, the synthetic method begins with the principles *assumed*, therefrom "explaining the phenomena . . . and proving the explanations."

Here experiments perform a probative rather than an inductive function. As Huygens observes, proof in physics does not have the certitude of mathematical demonstration, but it can have an extremely high degree of probability —"very often scarcely less than complete proof"—as a result of the experimental confirmation of a conclusion deduced from the assumed principles. This occurs "when things which have been demonstrated by the principles that have been assumed, correspond perfectly to the phenomena which experiment has brought under observation, especially when there are a great number of them." A single crucial experiment, so perfect in construction that all relevant factors have been controlled, makes unnecessary the multiplication of experiments to establish the conclusion.

A third use of experiment is illustrated by Galileo when he measures the velocity of a ball rolling down an inclined plane, in order to decide whether a certain mathematical definition of uniformly accelerated motion describes the acceleration "which one meets in nature in the case of falling bodies." The persons in the dialogue seem to be satisfied with some mathematical reasoning which shows that the velocity increases with the units of time elapsed rather than with the intervals of space traversed. But when Simplicio asks for an experiment to show that the mathematical conclusion has physical reality, in the sense of describing observable phenomena, Salviati replies that this request "is a very reasonable one, for this is the custom —and properly so—in those sciences where mathematical demonstrations are applied to natural phenomena" and "where the principles once established by well-chosen experiments become the foundations of the entire superstructure." Here experiment does not confirm conclusions. It establishes principles, not by inductive generalization but by comparing actual measurements with mathematical expectations.

WITHOUT EXPERIMENT but not without inductions from experience, without measurements but not without recourse to observation, Aristotle's *Physics*—and with it such physical treatises as his works *On the Heavens* and *On Generation and Corruption*—represents a philosophy of nature. In Aristotle's meaning of the term 'science,' these treatises expound sciences, but they also constitute one part of philosophy, to be distinguished from mathematics and from what Aristotle regards as the first or highest part of philosophy, *i.e.*, the science of metaphysics.

Aristotle's tripartite division of the theoretic sciences or speculative philosophy into physics, mathematics, and metaphysics raises a question concerning his numerous biological works, and perhaps also his treatise *On the Soul*. Are these to be classified as physical sciences or parts of natural philosophy? The fact that Aristotle distinguishes between the forms and properties of living and non-living matter does not seem to affect the answer. By his criteria of physical inquiry—namely, that it investigates what neither exists nor can be conceived apart from matter and motion, and that it is concerned with every type of change—all these works belong to the domain of physics. Accordingly even such apparently psychological studies as those dealing with sensation, memory, dreams, justify the title under which they have been traditionally grouped—*Parva Naturalia*, *i.e.*, short physical treatises.

For all these more specialized considerations of natural phenomena the *Physics* seems to serve as a general introduction, as well as being in its own right an exposition of the most fundamental science in the sphere of natural philosophy. It tries to define change and to state the principles underlying every type of change. It tries to classify the types of change, separating coming to be and passing away simply (or generation and corruption), from coming to be in a special respect (or change in quality, quantity, and place) which Aristotle usually calls "motion" in distinction from "becoming" or "generation." It undertakes to analyze the conditions or causes of change or motion, to distinguish what happens by chance from what happens of necessity, to discriminate between natural and unnatural or violent motions, to treat the relation of mover and moved, to deal with the continuity and divisibility of motions, to consider place and time as conditions or aspects of motion, and to ask about the infinity of body and of change, and about the eternity of motion or the whole order of becoming, the natural world of things in motion.

Aristotle's physics thus seems to stand in sharp contrast to the physics of the experimentalists, not merely in method, but in the questions it tries to answer and in the principles to which it appeals. The effort to define change in general and to state the principles and causes operative in every type of change might appear to correspond to the search for formulae of maximum generality to cover all natural phenomena. But where Newton and Fourier hope thereby to reduce nature's variety to the simplest terms—a few laws of motion comprehending the whole framework of nature—Aristotle tends on the contrary to insist upon an irreducible variety of types of motion, kinds of matter, and causes of change.

Furthermore, the principles to which Aristotle appeals are not mathematical. He criticizes the discussion of becoming which takes place in Plato's *Timaeus*, on the ground that it tries to substitute mathematical for physical terms in the analysis of change. "Physical bodies contain surfaces and volumes, lines and points," he writes, "and these are the subject matter of mathematics"; but the mathematician is not concerned with these things as the attributes of physical bodies, but only as separated, in thought at least, from matter and motion. There are sciences which represent mixtures of mathematics and physics, such as optics and harmonics, but the existence of these mixed sciences—the equivalent of what is later called "mathematical physics"—seems to Aristotle to imply rather than deny the separation of purely physical science from pure mathematics.

Where Newton (who can be taken as the exemplary author of a physics which is at once mathematical and experimental) goes to mathematics for the principles of natural philosophy, Aristotle seems to think that physics has its own proper principles. If any deeper understanding of these principles is sought, it is not to be found in mathematics, but in metaphysics, or what Aristotle calls "the first philosophy."

For example, matter, form and privation, are proposed by Aristotle as the basic physical principles. In such terms he is able to state his insight that all change involves a substratum (or *that which* changes) and contraries (or that *from which* and that *to which* the change occurs). But the analysis of matter and form in terms of potentiality and actuality as modes of being, and the consideration of form and privation in terms of being and non-being, belong to metaphysics rather than physics.

Furthermore, Aristotle as a physicist deals with bodies in motion and with the difference between the generation of bodies and their alteration, increase and decrease, or change of place. But he leaves to metaphysics—to the books which come after the books on physics—the discussion of physical bodies as substances composite of matter and form, and the distinction of substance and accident which bears on the difference between substantial and accidental change (*i.e.*, generation and corruption as opposed to the change in quality, quantity, or place).

Though for Aristotle physics is as separate from metaphysics as it is from mathematics in subject matter, physics depends upon metaphysics, as it does not upon mathematics, for the establishment as well as the elucidation of its principles. It is in this sense that metaphysics is logically prior to physics. But there may also be a sense in which philosophical physics is

logically prior to experimental natural science. To the extent that the experimentalist employs physical as opposed to mathematical principles, he may have to derive these from a philosophy of nature. Galileo, for example, investigates the properties of natural and violent motions in the Third and Fourth Day of his *Two New Sciences* (*i.e.*, the motions of freely falling bodies and of projectiles). The problem of establishing the reality of this distinction and of defining the natural and the non-natural types of motion seems to be a matter of philosophical analysis rather than of experimental investigation.

BACON AND KANT appear to agree with Aristotle about the separation of physics from mathematics. Rational (or pure, as opposed to empirical) physics is, according to Kant, "entirely separate from mathematics." It is not to be confused with "what is commonly called *physica generalis*, which is mathematics rather than a philosophy of nature." Criticizing the natural philosophy of the ancients because it is corrupted by logic in the school of Aristotle and by mathematics in the school of Plato, Bacon says that mathematics should "terminate natural philosophy rather than generate or create it. We may hope for better results," he adds, "from pure and unmixed natural philosophy."

Bacon elsewhere observes that "the investigation of nature is best conducted when mathematics are applied to physics." He does not deny "the great use of mathematics in physics," but rather insists that mathematics be regarded as "an appendage or auxiliary" of natural philosophy, not its master. He is writing against the mathematicians "who would have their science preside over physics."

But to whatever extent Aristotle, Bacon, and Kant are in agreement concerning the relation of physics and mathematics, their theories of the scope and subject matter of physics seem to be at variance. For Bacon, physics is only one of the theoretic parts of natural philosophy; the other is metaphysics. Both are sciences of nature or the physical world, though one investigates material and efficient, the other formal and final causes. Both studies, moreover, can be conducted experimentally and can yield practical fruits (in mechanics and what Bacon calls "magic") through the production of effects by the application of a knowledge of causes.

For Kant, the whole body of theoretical knowledge which is rational and *a priori*, not empirical and *a posteriori*, is the metaphysic of nature, of which one part is rational physics, and the other rational psychology. "The metaphysic of corporeal nature," he writes, "is called *physic*, or, because it must contain the principles of an *a priori* knowledge of nature only, *rational physic*." Here physics and metaphysics do not have distinct objects as they do for Aristotle; nor does Kant's conception of physics as purely *a priori* knowledge of nature seem to agree with Aristotle's conception of physics as inductive and empirical, if not experimental.

These issues concerning the relation of physics to mathematics and metaphysics have significance for the experimental as well as the philosophical study of nature. If, for example, following the position taken by Hume, metaphysical inquiry is dismissed as incapable of yielding knowledge, and mathematical knowledge is restricted to the realm of ideal entities, then natural science, which for Hume consists in experimental reasoning about matters of fact, becomes the only knowledge of reality. Even though Hume looks upon the conclusions of experimental reasoning as at best probable, it remains the case that questions about nature which cannot be answered by physics cannot be answered scientifically.

The effect is the same as that achieved by Hobbes, who makes physics the primary science of reality on the ground that nothing exists except bodies in motion. The assertion of the primacy of physics, in short, may be due *either* to the denial that immaterial objects can be known by us, *or* to the denial that such objects have any real existence. Of quite opposite tenor is the view that only immaterial and eternal things can be scientifically known, and that the sensible world of things which come to be, pass away, and are forever undergoing change, belongs to the realm of probability and opinion, not knowledge.

For Plato, mathematics and dialectic can be, respectively, science and wisdom because they study the intelligible reality of being in its im-

mutable forms. But the physicists who try to give an account of becoming in all its changing sensible appearances can do no better than "adduce probabilities as likely as any others." On such matters, Timaeus says, "we ought to accept a tale which is probable and inquire no further." After discoursing at length of physical matters, Timaeus apologizes for the merely conjectural character of his account of natural phenomena, saying that "a man may sometimes set aside meditations about eternal things, and for recreation turn to consider the truths of becoming which are probable only; he will thus gain a pleasure not to be repented of, and secure for himself a wise and moderate pastime."

This view goes further than Hume's in depreciating physics by contrasting its probability with the certitude of mathematics. It praises mathematics and dialectic, as Hume's theory does not, for something more than their certitude—for their being knowledge of reality rather than of appearances.

Furthermore, Hume, unlike Plato, does not think the probability of physics detracts from its utility, the sort of utility which Bacon magnifies more eloquently than Hume—the invention of machines and the technical applications of physics whereby man extends his dominion over nature. In the traditional discussion of the dignity and value of physics, Plato and Bacon seem to represent attitudes as far apart as are the theories of Aristotle and Newton in the discussion of the subject matter and method of physics.

OUTLINE OF TOPICS

PAGE

1. Physics as the general theory of becoming and the order of nature or change: philosophical physics, the philosophy of nature, pure or rational physics 371

1*a*. The relation of the philosophy of nature to metaphysics and dialectic

1*b*. The relation of the philosophy of nature to mathematics: mathematical method and mathematical principles in natural philosophy 372

2. Experimental physics and the empirical natural sciences: the relation of experimental and philosophical physics

2*a*. The derivation of definitions, distinctions, and principles from the philosophy of nature: the metaphysics of the scientist

2*b*. The treatment of causes in philosophical and empirical physics: description and explanation, theory and prediction 373

3. The role of mathematics in the natural sciences: observation and measurement in relation to mathematical formulations

4. The experimental method in the study of nature 374

4*a*. The distinction between simple observation and experimentation: the art of creating ideal or isolated physical systems

4*b*. Experimental discovery: inductive generalization from experiment; the role of theory or hypothesis in experimentation

4*c*. Experimental testing and verification: the crucial experiment

4*d*. Experimental measurement: the application of mathematical formulae 375

5. The utility of physics: the invention of machines; the techniques of engineering; the mastery of nature

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265-283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265-283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a *(D)*, follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—*(D) II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the works or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 68: PLEASURE AND PAIN

INTRODUCTION

PLEASURE and pain, writes Locke, "like other simple ideas, cannot be described, nor their names defined; the way of knowing them is . . . only by experience." That pleasure and pain are elementary experiences, attributed to animals as well as enjoyed or suffered by men, is attested by poets and physiologists alike, by economists and theologians, by historians and moralists. Yet in the tradition of western thought, few of the great writers are content to leave the nature or meaning of pleasure and pain to the intuitions of experience alone.

Conflicting definitions are proposed. Psychologists disagree about the conditions under which the feelings of pleasure and pain occur, their causes and consequences, their relation to sensation, to desire and emotion, to thought, volition, and action. Moralists dispute whether pleasure is the only good and pain the only evil, whether pleasure is only one good among others to be assessed according to its worth in the scale of goods, whether pleasure and pain are morally indifferent, whether some pleasures are good, others bad, or all are intrinsically evil.

Not only in the theory of good and evil, but also in the theories of beauty and truth, pleasure and pain are fundamental terms. They are affected by all the difficulties which belong to these great themes; and also with the difficulties attendant on the ideas of virtue, sin, and punishment, of duty and happiness, into the consideration of which pleasure and pain traditionally enter.

The traditional use of the words "pleasure" and "pain" is complicated by more than the variety of definitions which have been given. Other words are frequently substituted for them, sometimes as synonyms and sometimes to express only one part or aspect of their meaning. Locke, for example, uses "pleasure" or "delight," "pain" or "uneasiness," and he observes that "whether we call it satisfaction, delight, pleasure, happiness, etc., on the one side, or uneasiness, trouble, pain, torment, anguish, misery, etc., on the other, they are still but different degrees of the same thing." Other writers use "joy" and "sorrow" or "grief" as synonyms for "pleasure" and "pain."

The words "pleasure" and "pain" are closely associated in meaning with "pleasant" and "unpleasant," though Freud sometimes uses "unpleasure" (*unlust*) to signify an opposite of pleasure which is not the same as ordinary pain (*schmerz*). The pleasant is often called "agreeable," "enjoyable," or "satisfying." In the language of Shakespeare, the words "like" and "dislike" have currency as the equivalents of "please" and "displease." A person who is displeased by something says of it that "it likes me not."

THE PROBLEM OF what pleasure and pain are seems logically to precede the ethical consideration of their relation to good and evil, happiness and misery, virtue and duty. But in the tradition of the great books, the psychological questions about pleasure and pain are usually raised in moral or political treatises, and sometimes in connection with discussions of rhetoric. What pleasure is, how it is caused, and the effects it produces are seldom considered apart from whether pleasures should be sought or avoided, whether some pleasures should be preferred to others, and whether pleasure is the sole criterion of the good. Sometimes, as with Marcus Aurelius and Epictetus, the ethical point—that pleasure and pain are in one sense morally indifferent—is made without any psychological account of the nature and origin of these experiences. More frequently, as in Plato's *Philebus* and Aristotle's *Ethics*, or in the

writings of Hobbes, Spinoza, Locke, and Mill, the psychological discussion is imbedded in an ethical or political context.

Even Lucretius and William James do not seem to be complete exceptions. James' theory that the feeling of pleasure accompanies activity which is unimpeded, whereas pain attends arrested activity, seems to be a purely psychological observation, and one which can be readily divorced from moral considerations on the ground that it makes no difference to the occurrence of pleasure and pain whether the activity in question is ethically good or bad. Yet James makes this observation the basis for arguing against those whom he calls "the pleasure-philosophers"—those who make pleasure the only motive or goal of conduct. They confuse, he thinks, the pursuit of pleasure itself with the pleasure which accompanies the successful achievement of other things which may be the goals of activity.

"A *pleasant act*," he writes, "and an act *pursuing a pleasure* are in themselves two perfectly distinct conceptions, though they coalesce in one concrete phenomenon whenever a pleasure is deliberately pursued . . . Because a pleasure of achievement *can* become a pursued pleasure upon occasion, it does not follow that everywhere and always that pleasure must be pursued." One might as well suppose that "because no steamer can go to sea without incidentally consuming coal, and because some steamers may occasionally go to sea to *try* their coal, that therefore no steamer *can* go to sea for any other motive than that of coal-consumption."

Psychological observations of this sort have an obvious relevance to Aristotle's theory of good and bad pleasures, as well as to Locke's and Mill's position that pleasure is the only good or the only object of desire. They reveal an ethical strain even in the psychologist's view of pleasure and pain. The same point can be made with regard to James' observation that "pleasures are generally associated with beneficial, pains with detrimental, experiences."

Lucretius appears to give a purely physiological account of pleasure and pain in terms of the effect upon the sense-organs of various atomic configurations. "Those things which can touch the senses pleasantly are made of smooth and round bodies, but those which seem to be bitter and harsh are made up of particles more hooked, and for this reason are wont to tear a way into our senses . . . Hot fires and cold frost have particles fanged in different ways to prick the senses." But Lucretius is concerned to point out not only the basis of pain in the atomic nature of things, but also the natural tendency of all sensible things to avoid pain as the one besetting evil. "Nature cries aloud for nothing else but that pain may be kept far sundered from the body, and that, withdrawn from care and fear, she may enjoy in mind the sense of pleasure."

Without giving any psychological explanation of the pleasures of the mind, Lucretius sets them above the pleasures of the body because the latter—as his diatribe against love makes clear—seem to be inevitably followed by bodily torments or even to be admixed with them. The first maxim of nature, then, is not to seek pleasure, but to avoid pain; and among pleasures to seek only the unmixed or pure, the pleasures of knowledge and truth. The distinction between different qualities of pleasure (pleasures of the body and of the mind, mixed and pure pleasures), which is made by Plato and Mill as well as by Lucretius, inevitably tends to have at once both moral and psychological significance.

If, in the great books, there is any purely psychological theory of pleasure and pain, divorced from moral considerations, it is probably to be found in Freud. The pleasure-principle, according to him, automatically regulates the operation of the mental apparatus. "Our entire psychical activity," he writes, "is bent upon *procuring pleasure* and *avoiding pain*." Though pleasure and pain are for him primary elements of mental life, Freud admits the difficulty they present for psychological analysis. "We should like to know," he writes, "what are the conditions giving rise to pleasure and pain, but that is just where we fall short. We may only venture to say that pleasure is *in some way* connected with lessening, lowering, or extinguishing the amount of stimulation in the mental apparatus; and that pain involves a heightening of the latter. Consideration of the most intense pleasure of which man is capable, the pleasure in the performance of the sexual act, leaves little doubt upon this point."

Yet for Freud the pleasure-principle is not the only regulator of mental life. In addition to the sexual instincts, which aim at gratification and pleasure, there are the ego-instincts which, "under the influence of necessity, their mistress, soon learn to replace the pleasure-principle by a modification of it. The task of avoiding pain becomes for them almost equal in importance to that of gaining pleasure; the ego learns that it must inevitably go without immediate satisfaction, postpone gratification, learn to endure a degree of pain, and altogether renounce certain sources of pleasure. Thus trained, the ego becomes 'reasonable,' is no longer controlled by the pleasure-principle, but follows the reality-principle, which at bottom also seeks pleasure—although a delayed and diminished pleasure, one which is assured by its realization of fact, its relation to reality."

This recognition of a conflict between pleasure and reality, with a consequent attenuation or redirection of the pleasure-principle, is not amplified by Freud into a moral doctrine. It does, however, bear a striking resemblance to the theories of moralists like Kant who oppose duty to pleasure; and also to the teachings of those who, like Aristotle and Aquinas, conceive virtue as the foregoing of certain pleasures and the endurance of certain pains, through a reasonable and habitual moderation of these passions.

IF PLEASURE AND pain were simply sensations, like sensations of color or sound, they would pose a problem for the physiological psychologist no different from the problems which arise in the fields of vision and audition. Modern physiological research claims to have discovered differentiated nerve-endings for pain which, together with the specific sense-organs for pressure, heat, and cold, make up the cutaneous senses. But whether there are special cells for the reception of pain stimuli or whether cutaneous pain results from the too intense stimulation of the pressure and thermal nerve-endings, there seems to be no evidence of organs sensitized to pleasure as, for example, the nerve cells of the retina are sensitized to light. The feeling of pleasure, it would seem to follow, is not a sensation. This seems to be confirmed by the traditional observation that every type of sensation, including the sensation of pain, can be pleasant.

Even if pain, unlike pleasure, is found to be a specific mode of sensation with a special sense-organ of its own, all other types of sensation—visual, auditory, olfactory, etc.—might still have painfulness or a feeling of unpleasantness as an attribute. That such is the case seems to be a matter of traditional observation. Locke, for example, says that "delight or uneasiness, one or the other of them, join themselves to almost all our ideas of sensation and reflection: there is scarce any affection of our senses from without . . . which is not able to produce in us pleasure or pain." So understood, pleasure and pain —or the pleasant and the unpleasant—are not opposite sensations, as are hot and cold, but contrary attributes with which every sort of sensation *can* be affected. All *need* not be. Some sensations may be neutral with respect to what psychologists call "affective tone" or "affective quality."

The kind of pleasure and pain which is called "bodily" or "sensuous" would thus be sensuous because it is an attribute of sensations, and bodily because sensations involve bodily organs. But in almost every great discussion of pleasure and pain, other types are recognized: intellectual delights, the pleasures and pains of learning, aesthetic pleasure in contemplating beauty with the mind as well as with the senses, and the pain of loss, the grief accompanying deprivation, which is so different from the torment of a painful affliction of the senses. The human suffering with which the great poems deal is much more often a torment of the spirit than of the flesh.

To cover these other types of pleasure and pain, we must go beyond sensation to two other terms traditionally connected with the psychological analysis of pleasure and pain. One is emotion, the other desire, the latter to be understood broadly as including both the sensitive and the rational appetites—both the passions and the will. Aquinas, for example, treats joy and sorrow as specific emotions which represent the appetite in a state of satisfaction or frustration. So, too, the will as an appetite can come to rest in the attainment of its object and, with fruition, be in a state of joy.

As conditions of the appetite, pleasure and

pain (or joy and sorrow) can be either passions and, like all other emotions, bodily states; or they can be acts of the will and, according to Aquinas at least, spiritual states. But either way pleasure and pain seem to represent the satisfaction or frustration of desire rather than objects desired or averted. To be pleased by the attainment of an object desired, such as food and drink or knowledge, is not the same as to desire pleasure itself, as, for example, the pleasant sensations which may be involved in eating or drinking.

Aquinas talks about the desire for pleasure and the aversion to pain, as well as the pleasure and pain of satisfied and unsatisfied desires. Since the same words are almost always used to express both meanings, the two senses of pleasure and displeasure may go unnoticed unless by context or by explicit mention the author refers to pleasure as an object of desire or identifies it with the satisfaction of any desire, whether for pleasure or for some other object. As a passage already quoted from James indicates, and as we shall presently see more fully, the distinction between these two senses of pleasure has a critical bearing on the dispute between those who think that pleasure is the only good, and those who think that pleasure is one good among others.

The generally recognized difference between two kinds of pain—the pain of sense and the pain of loss or deprivation—parallels the distinction which most writers acknowledge between sensuous pleasure and the pleasure of possession or satisfaction. Plato's example of the pleasure involved in the relief of itching by scratching seems to catch both meanings, and, in addition, to show that bodily pleasures may be either sensual *objects* or sensual *satisfactions.* In contrast, the pleasures of the mind are satisfactions of intellectual desire, as in the contemplation of beauty or the knowledge of truth.

Aristotle deals with pleasure and pain as *objects* when he defines temperance as a moderate pursuit of bodily pleasures, and courage as controlling the fear of pain and its avoidance. But he also conceives pleasure as that which completes any activity, whether of the senses and the body or of thought and the mind. "Without activity," he writes, "pleasure does not arise, and every activity is completed by the attendant pleasure." This meaning of pleasure seems to be analogous to, if not identical with, pleasure as satisfaction, at least insofar as the satisfaction of a desire is that which completes the activity springing therefrom. There can be as many different kinds of pleasure as there are kinds of activity; the quality of the pleasure is determined by the character of the activity it accompanies.

Though Mill refers to pleasure and freedom from pain as "the only things desirable as ends," he admits many other objects of desire, in the attainment of which men find pleasure or satisfaction. It is wrong to suppose that human beings, he writes, are "capable of no pleasures except those of which swine are capable." Precisely because "human beings have faculties more elevated than the animal appetites," they have sources of pleasure or gratification not open to swine. Here as before two meanings of pleasure seem to be involved. In pointing out that "money, in many cases, is desired in and for itself," Mill is naming an object of desire which, like health, knowledge, power, or fame, is not pleasure, yet which, through being desired, is a source of pleasure (*i.e.*, satisfaction) when achieved. Like other objects of desire, sensual or bodily pleasures may also be sources of satisfaction.

THESE TWO MEANINGS of pleasure are most in need of clear distinction when the relation of pleasure to happiness is being discussed. If happiness, as Aristotle and Mill seem to say, consists in having all desires satisfied, then the content of the happy life can be described either in terms of the goods which the happy man possesses—the objects of desires fulfilled—or in terms of the pleasures which accompany the goods possessed, that is, the pleasures which are satisfactions of desire. If pleasure in the other meaning, especially sensual or bodily pleasure, is only one object of normal desire, then lack or deficiency of pleasure may, like loss of health or fortune, impair a man's happiness. But the pursuit of pleasure in this sense cannot be identified with the pursuit of happiness. A life including every sort of bodily pleasure and free from every sort of bodily pain, if it lacked other things men normally desire, would be marred by many dissatisfactions inconsistent with happiness.

Talking to Don Quixote of the island he would like to govern, Sancho Panza says: "The first thing I would do in my government, I would have nobody to control me, I would be absolute . . . Now he that's absolute, can do what he likes; he that can do what he likes, can take his pleasure; he that can take his pleasure, can be content, and he that can be content, has no more to desire." Here, it would seem, Sancho conceives happiness as the sum of pleasures in the sense of satisfactions—all desires come to rest through the possession of their objects.

Dr. Johnson seems to make the opposite point about pleasure and happiness. Boswell asks him whether abstention from wine would be "a great deduction from life." "It is a diminution of pleasure to be sure," Johnson replies, "but I do not say a diminution of happiness." But, Boswell asks, "if we could have pleasure always, should we not be happy?" Johnson explains his negative answer by saying that "when we talk of pleasure, we mean sensual pleasure. When a man says, he had pleasure with a woman, he does not mean conversation, but something of a different nature. Philosophers tell you that pleasure is contrary to happiness."

This last observation does not seem to describe the position taken by those philosophers who make happiness the greatest good or ultimate end of human striving. Both Aristotle and Mill distinguish the life of pleasure, the bestial or swinish life, from one which employs the higher faculties peculiar to man. In this sense, perhaps, the life of pleasure can be regarded as contrary or opposed to what Johnson, along with Aristotle and Mill, calls "the rational life." But pleasure itself, far from being inimical to happiness, either represents the state of satisfaction which is identical with happiness, or one of the things a man desires and hence a constituent of the happy life.

Hobbes and Locke seem to go further in the direction of identifying pleasure with happiness or the good. "Pleasure," writes Hobbes, "is the appearance or sense of Good . . . and Displeasure, the appearance or sense of Evil." Similarly, Locke says that "things are good or evil only in reference to pleasure or pain. That we call *good* which is apt to cause or increase pleasure or to diminish pain in us . . . And, on the contrary, we name that *evil* which is apt to produce or increase any pain, or diminish any pleasure in us." As for happiness, it is, according to Locke, "the utmost pleasure we are capable of, and misery the utmost pain; and the lowest degree of what can be called happiness is so much ease from all pain, and so much present pleasure, as without which anyone cannot be content."

In which sense of the term is Locke identifying pleasure with happiness? Not sensual pleasure, nor even pleasure as an object of desire, it would seem, for he says: "Let one man place his satisfaction in sensual pleasure, another in the delight of knowledge; though each of them cannot but confess there is great pleasure in what the other pursues, yet neither of them making the other's delight a part of *his* happiness, their desires are not moved, but each is satisfied without what the other enjoys." Yet his understanding of happiness as consisting in the pleasures or satisfactions accompanying the possession of things desired leads him to criticize "the philosophers of old" who "did in vain inquire whether the *summum bonum* consisted in riches, or bodily delights, or virtue, or contemplation; they might have as reasonably disputed whether the best relish were to be found in apples, plums, or nuts, and have divided themselves into sects upon it. For as pleasant tastes depend not on the things themselves, but on their agreeableness to this or that particular palate, wherein there is great variety; so the greatest happiness consists in the having those things which produce the greatest pleasure . . . These, to different men, are very different things."

The difference between Locke's position and that of Mill seems, therefore, not to lie in a different conception of the relation of pleasure—as object or as satisfaction of desire—to happiness, but rather in Locke's conception of degrees of happiness as being determined only by larger and smaller quantities of pleasure, whereas Mill insists upon diverse qualities of pleasure, and upon the possibility of ordering pleasures as higher and lower. In consequence, Mill can say what Locke would seem unable to approve, namely, that "it is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied."

Locke's denial that happiness is the same

for all men explicitly takes issue with Aristotle's contrary view. It also involves an issue about pleasure. For Locke, as apparently for Hobbes and Mill, the good and the pleasant are inseparable. Nothing which satisfies a desire can be evil. Whether, as in Locke's view, one satisfaction is as good as another, and the only thing which matters is the amount or number of satisfactions; or whether, as in Mill's view one pleasure may be better than another, in no case is a pleasure bad so long as some one desires it, or desires the thing which produces satisfaction when possessed.

But, for Aristotle, desires themselves can be good or bad, and consequently there can be good and bad pleasures, as well as pleasures which vary in quality and in degree of goodness. "Since activities differ in respect of goodness and badness, and some are worthy to be chosen, others to be avoided, and others neutral, so, too," Aristotle writes, "are the pleasures; for to each activity there is a proper pleasure. The pleasure proper to a worthy activity is good, and that proper to an unworthy activity bad; just as the appetites for noble objects are laudable, those for base objects culpable."

Pleasure and pain, in Aristotle's judgment, are measured by virtue, not what is good and evil by pleasure and pain. Pleasure and pain are elements common to the good life and the bad, but only the pleasures which the good man enjoys, and the pains he willingly suffers, can be called good. That is why "in educating the young we steer them by the rudders of pleasure and pain . . . for to enjoy the things we ought and to hate the things we ought has the greatest bearing on virtue or character." Virtue is possessed only by those who habitually take pleasure in the right things.

As indicated in the chapters on Happiness and Duty, the moralists who make duty rather than virtue the spring of right conduct, and who make the goodness of anything depend upon its rightness according to the moral law, see little difference among the various theories of pleasure and happiness as the ultimate good and the standard of conduct.

The most eloquent tribute which Kant can pay to the idea of duty is that it "embraces nothing charming or insinuating." Reason, he says, "will never let itself be brought around" to the view that "there is any intrinsic worth in the real existence of a man who merely lives for enjoyment . . . even when in so doing he serves others." Admitting that "the greatest aggregate of the pleasures of life, taking duration as well as number into account," would appear to merit "the name of a true, nay, even of the highest good," Kant adds that "reason sets its face against this, too." The line of duty is always set against the seductions of pleasure or any calculations of utility, whether in terms of the means to achieving happiness or the ways of augmenting life's satisfactions.

According to Stoics like Marcus Aurelius, "pleasure is neither good nor useful," nor is pain an evil, for when we are "pained by any external thing," we should remember that "it is not this thing which disturbs us, but our own judgment about it." Pleasure and pain are morally indifferent, for like death and life, honor and dishonor, pain and pleasure are things which "happen equally to good men and bad" and therefore "make us neither better nor worse . . . and are neither good nor evil."

From the same observation, that pleasure is enjoyed by good and bad men, Aristotle and Plato seem to draw the conclusion, not that it is morally indifferent, but, as we have seen, that there are good and bad pleasures. Plato uses pleasure and wisdom to typify fundamentally different kinds of good. Wisdom is always true and good, but like opinion, which can be either true or false, there are true and false pleasures, good and evil pleasures. Furthermore, wisdom or knowledge represents the kind of good which is definite or intrinsically measured, whereas pleasure, like wealth, is an indefinite good, requiring something external to itself, something like wisdom, to measure it and limit its quantity.

If wisdom be allowed to choose among pleasures, Socrates suggests in the *Philebus*, it will choose those associated with itself in the activities of the mind, not the bodily pleasures which are always mixed with pain. So far as pleasure belongs to the realm of change or becoming, it is, again like opinion, inferior to knowledge and wisdom, which draw their goodness from the realm of immutable being. Yet Plato does not seem to think that knowledge

and wisdom are the only goods. The argument against those who think so seems to be as conclusive as against those who think that pleasure is the only good.

Each of the simple lives—the life of pleasure or the life of wisdom—is deficient. Only the mixed life, the life which combines both pleasure and wisdom, is the complete life. Like the happy life in Aristotle's view, it includes every kind of good; and the difficult problem, for Plato as for Aristotle, seems to be finding the principle which determines the goodness of the mixture or the right order and proportion in which the variety of goods should be combined.

THE MORAL ISSUES which have been raised here with respect to pleasure and pain are more broadly considered in the chapters on GOOD AND EVIL and on VIRTUE, TEMPERANCE, and SIN, as well as in the chapters on HAPPINESS and DUTY. Other issues are reserved entirely for discussion elsewhere, such as the role of pleasure in the perception of beauty and in judgments of taste (the chapter on BEAUTY), or the role of pain in relation to the government of men (the chapter on PUNISHMENT).

Two special problems which involve pleasure and pain remain to be briefly mentioned. The first concerns the contrast between asceticism and self-indulgence or even profligacy.

In the tradition of western thought and culture, and in the ancient as well as in the modern world, those who worship pleasure, though perhaps only as a minor deity to be celebrated in bacchic revels, stand opposed to those who turn away from pleasure, as from the world, the flesh, and the devil, even mortifying the flesh and sanctifying themselves with pain. In their less extreme forms these contrasting attitudes generate the traditional issue concerning the place of worldly recreations in man's life and in the state. Is the pleasure of play a necessary and proper relief from the pain of work, or is it always an indulgence which provides occasions for sin? Are the enjoyment of the theatre, of music and poetry, the gaiety of public festivals, and the diversions of games or sports things to be promoted or prohibited by the state?

Man's avidity for amusements and diversions of all sorts leads Pascal to say, "How hollow and full of ribaldry is the heart of man!" The fact that "men spend their time in following a ball or a hare" and that "it is the pleasure even of kings," indicates to him how deep is the misery from which men try to escape through play and pleasure. "If man were happy," Pascal suggests, "he would be the more so, the less he was diverted." But "so wretched is man that he would weary, even without any cause of weariness, from the peculiar state of his disposition; and so frivolous is he, that, though full of a thousand reasons for weariness, the least thing, such as playing billiards or hitting a ball, is sufficient to amuse him." Men need such diversions in order to "prevent them from thinking of themselves."

Men indulge in pastimes for another reason, according to Aristotle. They "need relaxation because they cannot work continuously" and "amusement is a sort of relaxation." But "happiness does not lie in amusement. It would, indeed, be strange," he says, "if the end were amusement, and one were to take trouble and suffer hardship all one's life in order to amuse one's self." It is true that "pleasant amusements" resemble happiness in having the nature of an end, because we engage in playful activity "not for the sake of other things," whereas we do serious work for some end beyond itself. But in Aristotle's opinion "a virtuous life requires exertion" and since "the happy life is thought to be virtuous," it follows that "serious things are better than laughable things and those connected with amusement."

These reflections on work and play, and the pains and pleasures they involve, lead us to the second of the two problems mentioned above. That concerns pleasure and pain in the life of learning. Here there seems to be no fundamental issue, for the tradition speaks with an almost unanimous voice of the pleasure all men find in knowing and the pain none can avoid in the process of seeking the truth. The problem is rather a practical and personal one which the great books put to their readers, to solve in their individual lives. Their invitation to learning should not be accepted, nor their promise of pleasure relied upon, by those unwilling to take the pains which, however great initially, gradually diminish as the mind, in the very process of learning, learns how to learn.

2. The causes of pleasure and pain

3. The effects or concomitants of pleasure and pain 386

4. The kinds of pleasure and pain: different qualities of pleasure

   4*a*. The pleasant and unpleasant in the sphere of emotion: joy and sorrow, delight and grief 387

   4*b*. Sensuous pleasure: the affective quality of sensations

   4*c*. Intellectual pleasure: the pleasures of reflection and contemplation 388

      (1) Pleasure in the beauty of nature or art: disinterested pleasure

      (2) The pleasure and pain of learning and knowledge 389

   4*d*. The pleasures of play and diversion

   4*e*. The kinds of pain: the pain of sense and the pain of loss or deprivation 390

5. The quantity of pleasure: the weighing of pleasures; the limits of pleasure 391

6. Pleasure and the good

   6*a*. Pleasure as the only good or as the measure of goodness in all other things

   6*b*. Pleasure as one good among many: pleasure as one object of desire

   6*c*. Good and bad pleasures: higher and lower pleasures 392

   6*d*. Pleasure as the accompaniment of goods possessed: the satisfaction of desire

   6*e*. Pleasure as intrinsically evil or morally indifferent

7. Pleasure and happiness: their distinction and relation 393

   7*a*. Pleasure and pain in relation to love and friendship

   7*b*. The life of pleasure contrasted with other modes of life: the ascetic life 394

8. The discipline of pleasure 395

   8*a*. Pleasure and pain in relation to virtue: the restraints of temperance and the endurance of courage

   8*b*. The conflict between pleasure and duty, or the obligations of justice: the pleasure principle and the reality principle 396

   8*c*. Perversions or degradations in the sphere of pleasure and pain: sadism and masochism

9. The regulation of pleasures by law 397

10. The social utility of pleasure and pain

   10*a*. The employment of pleasure and pain by parent or teacher in moral and mental training

   10*b*. The use of pleasure and pain by orator or statesman in persuasion and government

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature of pleasure and pain

Chapter 69: POETRY

INTRODUCTION

THE spirit in which the great poets have read their predecessors differs remarkably from the attitude toward the past which prevails in other fields. The philosophers and scientists frequently feel assured that they can improve upon their predecessors. The poets, for the most part, wish only to do as well. Virgil's admiration for Homer; Dante's accolade to Virgil; Milton's praise of Aeschylus, Sophocles, and Euripides as "the three tragic poets unequall'd yet by any"; the tributes which Cervantes and Fielding pay to the poets of antiquity—these testify that there is no battle between the modern and the ancient books of poetry.

Contemporary novelists and dramatists—especially those who are proud of their innovations in the forms or materials of poetry—may constitute an exception. But they would still be the exception to a rule which can be verified for almost all the great books of poetry. Part of the reason for such unusual accord may be that, in the tradition of the great books, one book enjoys the unique distinction of having founded the science of poetry. More than that, it seems to have gained from the poets a large measure of approval, and even adherence to its principles, during a period of more than 2000 years.

Not that Aristotle's *Poetics* is without sources. They exist in Plato's comments on the kinds of poetry; in Aristophanes' critical weighing of Aeschylus and Euripides; and, of course, in the original inventions of Homer and the great dramatic poets, both tragic and comic. Not that the acceptance of Aristotle's theory of poetry is unaccompanied by some dissent, as, for example, in Fielding's quarrel with the rules about the unities of time and place. But Fielding, like Cervantes who is another close student of the *Poetics*, more frequently adopts than rejects Aristotle's basic insights. His most rebellious protest—that the originality of creative genius cannot be bound by the laws of art or held accountable to any established critical standards—would certainly receive sympathetic consideration from the man who formulated the rules of poetry and its measures of excellence by the study of the productions of Greek genius.

One way in which later poets have expressed their disagreement with the *Poetics* confirms Fielding's insight. Those who have violated its rules and yet produced great poems have been men of exceptional genius. Where the genius has been lacking to create new forms, the violation of the rules has usually resulted in formlessness. But it is not only in the creative work of the poets that Aristotle's principles have been put to use and tested. His influence also appears in the comments which the poets make on the nature and purpose of poetry. The terms and distinctions of the *Poetics* are reflected in the writings of Dante, Chaucer, Shakespeare, Milton, Goethe, and Melville, as well as in many essays in criticism from Horace and Demetrius to Boccaccio, Boileau, Dryden, and Pope.

Socrates once complained of the wisdom of the poets. Those whom he asked about their poetry were tongue-tied. They finally resorted to the mystery of inspiration or the inscrutability of genius. "There is hardly a person present," he tells his judges in the *Apology*, "who would not have talked better about their poetry than they did themselves." The poets of a later age were, through benefit of Aristotle, better able to discourse analytically of their art.

IF WE TURN FROM the poets themselves, or rather from their poems, to the analysis of poetry—by poets or others—we find a number of major issues. On what poetry is and on the end it serves, the tradition does not seem to be either unified or harmonious. Basic disagreements begin with the ancients.

On the question, for example, whether the poets have the same obligation to speak the truth—and the same kind of truth—as do philosophers or scientists, Plato and Aristotle seem to be opposed. On the question whether the art of poetry lies in its use of language or is primarily the craft of fiction, Aristotle's *Poetics* and Horace's *Art of Poetry* represent the opposite answers which have been points of departure for divergent discussions of poetry throughout the whole tradition of western thought.

With regard to the second of these two questions, it may be wondered whether we are in the presence of the sort of disagreement which requires us to take one side rather than the other. The fact that Aristotle, in his *Rhetoric*, writes about poetry in a vein contrary to the theory he advances in his *Poetics*, would suggest the possibility of different but not inconsistent points of view about poetry. Unless Aristotle unwittingly contradicts himself, the rhetorical consideration of poetry is simply a different way of conceiving what is poetic.

In the *Advancement of Learning*, Bacon records this difference in the meaning of poetry, which had become traditional by his time. He treats it, moreover, as the sort of difference which does not require the rejection of either alternative as incorrect. Poetry, he writes, can be "taken in two senses: in respect of words or matter. In the first sense it is but a character of style, and belongeth to the arts of speech, and is not pertinent for the present. In the latter it is (as hath been said) one of the principal portions of learning, and is nothing else but feigned history, which may be styled as well in prose as in verse."

When Bacon says that the conception of poetry as a literary style—as an art of writing in verse rather than prose— "is not pertinent for the present," he does not reject that alternative entirely. He merely postpones it for the later section of his work in which he treats of grammar and rhetoric. The other alternative —poetry as "feigned history"—is germane to his present consideration of the kinds of learning. Just as Aristotle does not set his *Rhetoric* against his *Poetics* on the nature of poetry, so Bacon does not exclude one of these conceptions in favor of the other when he observes how different are the principles and considerations appropriate to each.

These two points of view about the nature of poetry are not always treated in this way. Sometimes one or the other is taken as the primary or even the only way of approaching the subject, and then a genuine issue ensues—either with those who take the excluded point of view or with those who find it possible to embrace both. The Alexandrian and Roman critics seem to create such an issue by considering poetry largely in terms of style. Modern criticism, especially since the beginning of the 19th century, goes even further in the direction of identifying poetry with verse.

When Wordsworth discusses the art of poetry in his preface to *Lyrical Ballads*, he is concerned largely with its language. His definition of poetry as "emotion recollected in tranquility" indicates his emphasis upon the lyrical aspect of even narrative poetry. When Edgar Allen Poe writes his *Poetic Principle* and Matthew Arnold his *Essays in Criticism*, each is concerned almost exclusively with lyric poetry, with that kind of poetry which is written in verse rather than prose. The poet tends to become more and more a composer of verses—so much so that the free-verse movement can appear to be a great revolution in poetry. In the *Brothers Karamazov*, Smerdyakov says, "Poetry is rubbish." At Maria's protest that she is very fond of poetry, he adds: "So far as it's poetry, it's essentially rubbish. Consider yourself, whoever talks in rhyme?"

Just as the word "art" has come in popular usage to mean only painting and sculpture, so its sister-word "poetry" has also narrowed in significance. Contemporary readers who are accustomed to think of poems as lyrics and of poetry as verse may be surprised to learn that according to the significance of its Greek root, the word "poetry" can cover all the forms of art or human productivity; they are just as likely to be surprised by the reference to novels and plays, written in prose, as poems. Yet, in the tradition of the great books, novelists like Cervantes, Fielding, and Melville call themselves poets. The great books consider poetry primarily as narrative rather than lyrical, as story rather than song.

This does not mean that they exclude the

other consideration of poetry. Fielding, for example, says in one place that "poetry . . . demands numbers or something like numbers" (*i.e.*, metre), but for the most part he insists that the art of the novelist or romancer lies mainly in the invention of good stories, not in the mastery of rules of prosody which apply only to poems of the lyric sort, written in verse. Speaking of "the sweet influence which melody and rhythm by nature have," Plato may observe "what a poor appearance the tales of the poets make when stripped of the colors which music puts upon them and recited in simple prose"; but for Plato as for Aristotle the poet is a teller of tales, either in prose or in verse.

Aristotle does not ignore the devices of language. In the third book of the *Rhetoric*, where he considers problems of style in all sorts of compositions, he distinguishes "poetic" from "prosaic" writing; and in the *Poetics* also he devotes a few chapters to style. But when in the latter case he deals with the language of poetry, he is not concerned with the style of any sort of composition, but only of dramatic and epic narratives. Except for a brief mention of the form of verse known as the "dithyramb," Aristotle does not discuss the isolated lyric as a kind of poetry. He treats song and spectacle merely as embellishments of the drama. In the *Poetics* his emphasis is not upon the devices of language or the sentiments of the poet, but upon the construction of plot, the development of character, the diction and thought of the characters—in short, upon the subject matter of the poem rather than upon the feelings of the poet and the eloquence with which he expresses them.

Because he regards plot as the "soul of tragedy"—and, by extension, the primary principle of all narrative poetry— Aristotle insists that "the poet or 'maker' should be the maker of plots rather than of verses." He is therefore led to criticize the confusion—apparently prevalent in his day as in ours—which he thinks results from identifying the art of poetry with skill in writing verse. "Even when a treatise on medicine or natural science is brought out in verse," he writes, "the name of poet is given by custom to the author; and yet Homer and Empedocles have nothing in common except the metre, so that it would be better to call the one poet, the other physicist rather than poet." Just as Bacon later remarks that "a true narrative may be delivered in verse and a feigned one in prose," so Aristotle says that "the poet and the historian differ not by writing in verse or in prose. The work of Herodotus might be put into verse, and it would still be a species of history, with metre no less than without it."

That the difference between prose and verse may affect the style of writing but not the essence of storytelling is a point which has wide acceptance among writers who call themselves poets. In the Prologue to Melibeus, Chaucer's host commands him to leave off rhyming and "tell a tale in prose—you might do worse—wherein there's mirth or doctrine good and plain." Thinking of his *History of Don Quixote* as a species of epic poetry, Cervantes declares that "epics may be as well written in prose as in verse."

The use, by Cervantes and Fielding, of the word "history" in the title of their novels indicates the acceptance of the other point in the conception of poetry by reference to its subject matter rather than to its linguistic style. The great poets recognize that, as narratives, their works resemble histories, but they also know that the stories poets tell are, in the words of Bacon, "imaginary history." Just as Fielding writes at length in mock justification of himself as an historian, so Melville touches upon "the plain facts, historical and otherwise," of whale fishery, lest someone "scout at Moby Dick as a monstrous fable, or still worse and more detestable, a hideous and intolerable allegory." In his chapter on the Leviathan's tail, he says, "Other poets have warbled the praise of the soft eye of the antelope, and the lovely plumage of the bird that never alights; less celestial, I celebrate a tail."

The conception of poetry as feigned or imaginary history seems to have a direct bearing on the question of the poet's obligation to speak the truth. We shall return subsequently to other aspects of the comparison of poetry with history and philosophy. For the present we are concerned with the issue in the theory of poetry which arises from applying the standards of knowledge to the inventions of the poet.

Bacon, like Aristotle, denies that such standards are applicable. Though he treats poetry as

"a part of learning," he holds that it is only restrained "in measure of words"; "in all other points," it is "extremely licensed, and doth truly refer to the imagination; which, being not tied to the laws of matter, may at pleasure join that which nature hath severed, and sever that which nature hath joined." Kant, on the other hand, like Plato, judges poetry in terms of its contribution to knowledge. A thing of the imagination, poetry, he maintains, serves the understanding, for it conducts "a free play of the imagination as if it were a serious business of the understanding."

Though "the *poet* promises merely an entertaining *play* with ideas," Kant continues, "yet for the understanding there enures as much as if the promotion of its business had been his one intention." He achieves a certain "combination and harmony of the two faculties of cognition, sensibility and understanding, which, though doubtless indispensable to one another, do not readily permit of being united without compulsion and reciprocal abatement." In so doing, the poet, in Kant's opinion, "accomplishes something worthy of being made a serious business, namely, the using of play to provide food for the understanding, and the giving of life to its concepts by means of the imagination."

Yet Kant and Plato do not agree in their judgment of the poet. Regarding "the poet's promise" as "a modest one"—"a mere play with ideas is all he holds out to us"—Kant praises him for achieving more in actual performance than he promises. Plato, on the contrary, seems to think the poet promises more and achieves less. He seems to regard the poet not as assisting, but as competing with the philosopher. The reason why the poet must fail in this attempt is that he tries to do on the level of the imagination what the philosopher is better able to do on the level of reason.

Both are engaged in a process of imitation—for all knowledge is imitation—but whereas the notions of the philosopher imitate the reality of the Ideas, the images of the poet imitate sensible appearances, which are themselves imitations of the Ideas or eternal Forms. Even when it is accurate or truthful, poetry must, therefore, be an inferior form of knowledge. In Plato's terms, it is on the level of opinion, along with fancy and belief. In any case, it must submit to being judged by the same standards of accuracy as anything else which claims to be knowledge or right opinion. "Imitations," he writes, "are not to be judged of by pleasure and false opinion. . . . They are to be judged of by the standard of truth, and by no other whatever." The competent judge of poetry must, therefore, "possess three things: he must know, in the first place, of what the imitation is; secondly, he must know that it is true; and thirdly, that it has been well executed in words and melodies and rhythms."

The issue concerning poetry and truth can be most sharply drawn between Plato and Aristotle, precisely because Aristotle thinks that poetry is a form of imitation, but that knowledge does not have the character of imitation at all. Since poetry is not a kind of knowledge, the same standards do not apply to both. "There is not the same kind of correctness," he insists, "in poetry as in politics"—or "in medicine or any other special science." The poet's art is at fault if he "meant to describe the thing correctly but failed through lack of power of expression." But if a technical error in physiology enters into his description because he meant to describe the thing "in some incorrect way (*e.g.*, to make the horse in movement have both right legs thrown forward)," then, according to Aristotle, "his error in that case is not in the essentials of the poetic art." The poet's obligation is not to be truthful in such particulars but to make his whole story seem plausible. Aristotle summarizes his position in the statement of his famous rule concerning the probable and the possible. "For the purposes of poetry," he says, "a convincing impossibility is preferable to an unconvincing possibility."

Connected with this issue concerning the kind of truth to be expected from the poet is the controversy over the purpose of poetry—to instruct or to delight, or to do both. This in turn relates to the moral problem of the influence poetry can have on human character or virtue; and to the political problem of the regulation of poetry by the state or the right of poetry to be free from such censorship. It is not surprising that Plato, conceiving poetry as he does, should banish poets from the ideal state described in the *Republic*; or that he should lay

down specific regulations for the content of poetry in the *Laws*.

At the opposite extreme are those who, like Milton and Mill, attack the principle of censorship itself—as applied to poetry as well as to other forms of communication. But the traditional defense of poetry, in essays bearing that title from the pen of Sidney and Shelley or in the writings of Chaucer, Montaigne, and Cervantes, usually tries to answer Plato by praising poetry as an instrument of moral instruction as well as of delight. Waiving the question of its effect upon morals, some, like Adam Smith, answer the sort of criticism Augustine levels against pagan poetry and theatrical presentations by holding the theatre to be a legitimate, a lawful, even a necessary means of recreation.

Some of these issues touch on considerations dealt with in other chapters. The problem of censorship is discussed in the chapters on Art and Liberty; and the theory of imitation as applied to the arts in general, useful as well as fine, is discussed in the chapter on Art. Here we are concerned with the bearing of that theory upon the nature of poetry. The difference we have observed between Plato and Aristotle concerning imitation itself does not seem to affect their use of this notion in treating works of fine art, and more particularly poetry. What Hamlet tells the players is the purpose of their play—"to hold, as 'twere, the mirror up to nature"—Aristotle says is the aim of such arts as poetry, sculpture, painting, music, and the dance, which give both instruction and delight through imitation.

Within the sphere of the fine arts, the distinction of poetry from the others is usually made in terms of the medium of imitation. Poetry, according to Aristotle, imitates through the medium of language; painting and sculpture through lines, planes, colors, and shapes; music through rhythm and harmony. Whether Aristotle's statement that "the objects of imitation are men in action" applies to poetry alone or to all the fine arts, is a question of interpretation to which opposite answers have been given. Some commentators seem to think that human action as the object of imitation specifically defines poetry, whereas music and sculpture have distinct objects as well as distinct mediums of imitation. Others hold that human action is the object of imitation common to all the arts.

However this issue is resolved, the differentiation of the kinds of poetry can be made neither in terms of the object nor the medium of imitation, but only in terms of the manner. "The medium being the same and the object the same," Aristotle writes, "the poet may imitate by narration—in which case he can either take another personality as Homer does, or speak in his own person, unchanged—or he may present all his characters as living and moving before us."

Plato makes the same distinction, pointing out that the Homeric type of poetry combines both the discourse of the poet and the discourse of his characters in dialogue. He calls stage plays pure imitations in the sense that the author never speaks directly, but tells his story entirely through the actions and speeches of the characters; whereas the type of poetry which he calls narrative as opposed to imitative may combine both methods of storytelling or may, in some extreme instances, never resort to dialogue at all.

Since all storytelling is narration, and since all poetry is imitation, it seems slightly confusing to call the two major types of poetry "narration" and "imitation," as Plato sometimes does, or "narrative" and "dramatic," as Aristotle sometimes does. Bacon also speaks of "narrative" and "dramatic" or "representative" poetry. He defines narrative poetry as "such an exact imitation of history as to deceive, did it not often carry things beyond probability," and dramatic poetry as "a kind of visible history, giving the images of things as if they were present, whilst history represents them as past."

The difficulties of language seem to be removed by other terms which both Plato and Aristotle use to express the main distinction. The manner of storytelling, exemplified by Homer, which either employs direct narration without dialogue or combines both, is *epic* poetry. That which uses dialogue alone, is *dramatic*.

These words—"epic" and "dramatic"—may have their difficulties, too, especially for the contemporary reader, unless a number of things are remembered. First, epics and dramas may

be written either in prose or verse. Second, the arts of theatrical representation are auxiliary to the art of the dramatic poet. The writing of a play is completely independent of its acting, "the production of spectacular effects depending," as Aristotle says, "more on the art of the stage machinist than on that of the poet." Third, epic poetry differs from dramatic poetry in other respects than the use of indirect discourse as well as dialogue.

On this last point, Aristotle observes that all the elements of epic poetry are found in drama, whereas the dramatic form may include the embellishments of song and spectacle in addition to plot, character, thought, and diction. Even more important is his distinction of the two in terms of the unities of time, place, and action. Because it need not be limited at all in time and place, epic narration may have a much more complicated plot structure or even, as Aristotle says, "a multiplicity of plots."

With this understanding of the distinction between the two major types of storytelling, we can see why the great novels of Cervantes, Melville, Tolstoy, and Dostoevsky should be classified as epic poems, and were apparently so conceived by their authors, at least in the cases of Cervantes and Melville. As measured by the magnitude of its plot—its reach in time, and its scene the whole universe "from Heaven, through the world, to Hell"—Goethe's *Faust*, even though dramatic in manner, seems to be no less epic in its structure and proportions than the poems of Homer, Virgil, Dante, and Milton. The story of a single white whale can be epic in its immensity if the storyteller, like Melville, makes it "include the whole circle of the sciences, and all the generations of whales, and men, and mastodons, past, present, and to come, with all the revolving panoramas of empire on earth, and throughout the whole universe, not excluding its suburbs."

ANOTHER TRADITIONAL division in the kinds of poetry is that between the tragic and the comic. This distinction is variously expressed. Fielding sees the difference in terms of the misery or happiness to which the poet brings his principal characters in the end. Speaking of tragedy alone, Milton says that it has ever been held "the gravest, moralest, and most profitable of all other poems." In similar vein, Marcus Aurelius praises tragedy "for reminding men of the things which happen to them and that it is according to nature for things to happen so." He does not admit comedy to be of equal worth, though he does look with some favor upon the older forms of comedy which were "useful in reminding men to beware of insolence."

According to Aristotle, "comedy represents men as worse, tragedy as better than in actual life." He describes the action which tragic poetry imitates as serious, adding that tragedies "through pity and fear effect the proper purgation of these emotions." Whether comedies also arouse and purge certain emotions Aristotle does not say, for his promise to speak more fully of comic poetry is not fulfilled in the *Poetics*. Concerning the meaning of the tragic catharsis, there are questions enough.

Augustine asks: "How is it that a man wants to be made sad by the sight of tragic sufferings that he could not bear in his own person? . . . The more a man feels such sufferings in himself, the more he is moved by the sight of them on the stage. Now when a man suffers himself, it is called misery; when he suffers in the suffering of another, it is called pity. But how can the unreal sufferings of the stage possibly move pity?"

Boswell begs Dr. Johnson to explain Aristotle's doctrine of the purging of the passions as the purpose of tragedy. "Why, Sir," Johnson replies, "you are to consider what is the meaning of purging in the original sense. It is to expel impurities from the body. The mind is subject to the same imperfections. The passions are the great movers of human actions; but they are mixed with such impurities, that it is necessary they should be purged or refined by means of terror and pity. For instance, ambition is a noble passion; but by seeing upon the stage, that a man who is so excessively ambitious as to raise himself by injustice is punished, we are terrified by the fatal consequences of such a passion. In the same manner a certain degree of resentment is necessary; but if we see that a man carries it too far, we pity the object of it, and are taught to moderate that passion." Johnson's interpretation seems to be more specific than Milton's notion that to purge the passions by tragedy is "to temper and reduce

them to just measure with a kind of delight, stirr'd up by reading or seeing those passions well imitated."

It may be arguable whether the difference between tragedy and comedy is well defined by reference to the nobility or vulgarity of the leading characters; by the contrast between the pride of the tragic and the wit of the comic hero; by the seriousness or lightness of the tragic and comic themes and by the passions appropriate to each. In any case it seems clear that this division of poetry crosses the other division into epic and dramatic writing. The plays of Sophocles and the *Iliad* of Homer, Aristotle observes, are tragic poetry, yet dramatic and epic respectively in manner; but from another point of view, Sophocles is to be compared with Aristophanes, for though the one writes tragedies and the other comedies, both are dramatists. In the tradition of the great books, there are comic as well as tragic epics—Chaucer's *Troilus and Cressida*, Rabelais' *Gargantua and Pantagruel*, Cervantes' *Don Quixote*, Sterne's *Tristram Shandy*, and Fielding's *Tom Jones*—just as there are tragic and comic plays. The examination of these suggests that talk rather than action is the essence of comedy.

The chief thing which Aristodemus remembers of Socrates' discourse the morning after the banquet, in Plato's *Symposium*, is Socrates' success in compelling Aristophanes and Agathon "to acknowledge that the genius of comedy was the same as that of tragedy, and that the true artist in tragedy was an artist in comedy also. To this they were constrained to assent, being drowsy, and not quite following the argument." Precisely what they assented to has never been entirely clear. On one interpretation of Socrates' remark, examples of his point are difficult to find in the great books—except, perhaps, for the plays of Shakespeare which, in the sphere of dramatic poetry, seem to represent an equal genius for tragic and comic writing. In the sphere of epic poetry, we have only Aristotle's reference to a lost poem of Homer's —the *Margites*—which he says "bears the same relation to comedy that the *Iliad* and *Odyssey* do to tragedy."

According to another interpretation the insight of Socrates is that the totality of the great tragic vision tends to approximate the totality of the great comic vision. The same poem may be both tragic and comic because the poet has been able to see far enough into the nature of things to reveal a world which is at once dreadful and ridiculous. In this sense *Moby Dick* may be both a tragedy and a comedy. "Though in many of its aspects," Melville writes, "this visible world seems formed in love, the invisible spheres were formed in fright"; but he also remarks that "there are certain queer times and occasions . . . when a man takes this whole universe for a vast practical joke."

In the science of poetics, certain principles or rules seem to apply to all the major forms of poetry, where others relate specifically to epic or dramatic writing, or to tragedy or comedy. Aristotle implies that his most general formulations hold not only for long poems, but for dithyrambic poetry as well. If that is so, they should be capable of extension to other forms of lyric poetry, such as, for example, the sonnets of Shakespeare and Milton, and Milton's odes and elegies. Yet the two principal elements in Aristotle's analysis of poetry—plot and character—seem, superficially at least, to belong peculiarly to narrative poems, long or short. Whether they are present in any comparable manner in the structure of a lyric, or whether the form and content of lyric poetry requires an analysis peculiar to itself, are among the most difficult questions in the theory of poetry.

In the tradition of the great books, there seems to be, as already observed, general agreement about the basic rules for writing narrative poetry. Since these rules aim to direct the artist toward the achievement of excellence, they are also the basic principles of criticism. The science of poetics is at once an organon of production and a canon of criticism.

The simple rules such as those of plot construction afford an example. A well constructed plot must have a beginning, middle, and end. It must observe certain unities (at least of action, if not of time and place). Certain effects, it is held, can best be produced by the use of recognition scenes and reversals of fortune. Whether the events narrated are possible or impossible, the poet must at least invest them with plausibility or verisimilitude. Such rules, formulated by Aristotle and discussed by Cer-

vantes, Fielding, and others, provide standards for judging whether a poem is skillfully made, as well as give directions for the attainment of skill by the poet.

It may be held, of course, that the great poet works by inspiration, by a divine madness rather than by rule; that, as Theseus says in *A Midsummer-Night's Dream*, "the lunatic, the lover, and the poet are of imagination all compact . . . The poet's eye, in a fine frenzy rolling, doth glance from heaven to earth, from earth to heaven; and as imagination bodies forth the forms of things unknown, the poet's pen turns them to shapes, and gives to airy nothing a local habitation and a name." But if there is an art of poetry, then like any other art it is a thing of rules, whether or not genius needs their guidance or can be regulated by them.

The pivotal question here is, Which takes precedence, the creative or the critical faculty? Does Aristotle's rule concerning the primacy of plot derive from the greatest poems of antiquity in which he found this principle observed? Does it set up an infallible measure of excellence in narration or, on the other hand, do certain modern novels have an impeccable greatness despite their violation of this rule by the emphasis they place on the development of character rather than on the action in which the characters are involved? The rule of probability and necessity may, on the other hand, be inviolable. Not even the most original genius may be able to tell a good story without giving it poetic truth, according to the necessities of the characters he has created and the probabilities of the situations in which he places them.

ON THE SIDE of language, poetic theory seems to draw much from the art of rhetoric. The relation of rhetoric to poetics, the nature of rhetorical devices such as metaphor and simile, the choice among existing words or the invention of new ones, are matters dealt with in the chapter on RHETORIC as well as here. Aristotle's treatment of these problems both in his *Rhetoric* and his *Poetics* lays the foundation for the traditional association of these two disciplines. In both, for example, he discusses the various modes of metaphor and their utility in achieving an expansion of meaning combined with a contraction of speech.

This, in turn, relates to his general maxim of style which directs the writer "to be clear without being ordinary. The clearest style," he says, "is that which uses only current or proper words," but in order to avoid being commonplace or ordinary, it must be admixed with lofty diction—"raised above the commonplace by the employment of unusual words. . . . Nothing contributes more to produce a clearness of diction that is remote from commonness than the lengthening, contraction, and alteration of words. . . . Phrases which are not part of current idiom give distinction to style. . . . But the greatest thing by far is to have a command of metaphor. This alone cannot be imparted by another; it is the mark of genius for to make good metaphors implies an eye for resemblances."

One part of Aristotle's theory of style seems to be amplified by Pascal's observation that a certain perfection is achieved by the use of those words which, if altered, would spoil the discourse. In these terms, prosaic as opposed to poetic writing does not result from the lack of a fixed metre but rather from commonplaceness or lack of distinction in language. This standard of style does not apply to poetry alone; for just as history and philosophy may be written in prose or verse, so also may they be written poetically or prosaically.

Dr. Johnson's point that poetry cannot be translated, that "the beauties of poetry cannot be preserved in any language except that in which it was originally written," may be capable of the widest generalization. It may be extended to mean that writing which is poetic cannot be translated into any other form of words, even in the same language. A poetic sentence in English is untranslatable in this absolute sense when no alternative English phrasing is truly its equivalent. For example, it seems impossible to re-state, without loss or ruin, Shakespeare's "Life is a tale told by an idiot, full of sound and fury, signifying nothing" or Hobbes' "Life in a state of nature is solitary, poor, nasty, brutish, and short."

The other part of Aristotle's theory of style, that concerning metaphors, seems to be converted by William James into a general distinction between poetic and philosophic thought, or what he calls "the splendid and the analytic"

types of intellect. Poetic thought tends to develop the implications of an analogy without giving an explication of its grounds. This, in James' view, explains "the abrupt transitions in Shakespeare's thought," which "astonish the reader by their unexpectedness, no less than delight him by their fitness." Quoting a passage from Homer, unfathomably rich in metaphor, he says that "a man in whom all the accidents of an analogy rise up as vividly as this, may be excused for not attending to the ground of the analogy." The two types of intellect are rarely found in conjunction—Plato, according to James, being one of the few exceptions "whose strangeness proves the rule."

On the level of thought and knowledge, as opposed to that of language, poetry is traditionally contrasted to philosophy and history. As indicated in the chapter on History, historians like Herodotus, Thucydides, and Plutarch emphasize the difference rather than the similarity; the historian is a reporter of fact, the poet a creator of fables or fictions. The one gains credence by his display of evidence and reasons; the other, by the intrinsic plausibility of his tale. "In a good poem," writes Hobbes, "whether it be epic or dramatic . . . both judgment and fancy are required, but the fancy must be more eminent . . . In a good history, the judgment must be eminent, because the goodness consists in the method, in the truth . . . Fancy has no place but only in adorning the style."

Bacon associates poetry most intimately with history, both being concerned with "individuals, circumscribed by time and place," and differing only as one employs the imagination, the other the memory. Aristotle, on the other hand, finds poetry and philosophy more alike, at least to the extent that poetry, unlike history, "tends to express the universal," by which he means "how a person of a certain type will on occasion speak or act, according to the law of probability or necessity." Even if the poet "chances to take an historical subject, he is none the less a poet; for there is no reason why some events that have actually happened should not conform to the law of the probable and possible, and in virtue of that quality in them he is their poet or maker." In this sense the historian also may turn poet. Referring to the speeches in his history, Thucydides tells us that it was his habit "to make the speakers say what was in my opinion demanded of them by the various occasions, of course adhering as closely as possible to the general sense of what they really said."

Some of the great poems, notably the *Divine Comedy*, *Paradise Lost*, and *Faust*, are frequently called philosophical for what appear to be other reasons: either because the discourse of their characters is weighted with doctrine, or because the poet himself is expressing a doctrine, not in particular speeches, nor by argument, but in the symbolism of the poem as a whole. By these criteria, Lucretius' *On the Nature of Things* is a philosophical work, but not a philosophical poem. It is argumentative throughout, not narrative at all; it aims to be a literal rather than an allegorical statement of the truth. Bacon's definition of allegorical poetry—as that "which represents intellectual things to the senses"—seems to characterize both the poetic aspect of philosophy and a distinctively philosophical type of poetry.

Yet Aristotle's point, that poetry and philosophy are alike, may remain valid. All poetry, certainly all the great narrative poems, the great epics and dramas, novels and plays, deal with the abiding problems of human action and the perennial themes of human thought. It is not this moral or metaphysical content, however, which makes poetry more philosophical than history. It is the poet's treatment of such matters. In the persons and events of his story he succeeds in giving the universal a concrete embodiment. Precisely because these are only imaginary, not real particulars, they permit the abstract universal to be readily disengaged.

Poets like Chaucer and Cervantes, who insist that their function is to instruct as well as to delight, do not assume the role of pedagogues or preachers. They teach, not dogmatically, but as experience does, by affording the mind the materials or occasions for insight and inference. As an artistic imitation, poetry may be better than the experience it represents. It may improve upon experience as a teacher, because, born of the poet's mind, it is already impregnated with ideas.

OUTLINE OF TOPICS

PAGE

1. The nature of poetry: its distinction from other arts 410
   1*a*. The theory of poetry as imitation: the enjoyment of imitation
   1*b*. The object, medium, and manner of imitation in poetry and other arts 411
2. The origin and development of poetry: the materials of myth and legend
3. The inspiration or genius of the poet: the influence of the poetic tradition
4. The major kinds of poetry: their comparative excellence 412
   4*a*. Epic and dramatic poetry
   4*b*. Tragedy and comedy
5. Poetry in relation to knowledge
   5*a*. The aim of poetry to instruct as well as to delight: the pretensions or deceptions of the poet as teacher 413
   5*b*. Poetry contrasted with history and philosophy: the dispraise and defense of the poet
6. Poetry and emotion 414
   6*a*. The expression of emotion in poetry
   6*b*. The arousal and purgation of the emotions by poetry: the catharsis of pity and fear
7. The elements of poetic narrative
   7*a*. Plot: its primacy; its construction
   7*b*. The role of character: its relation to plot
   7*c*. Thought and diction as elements of poetry 415
   7*d*. Spectacle and song in drama
8. The science of poetics: rules of art and principles of criticism
   8*a*. Critical standards and artistic rules with respect to narrative structure
      (1) The poetic unities: comparison of epic and dramatic unity
      (2) Poetic truth: verisimilitude or plausibility; the possible, the probable, and the necessary
      (3) The significance of recognitions and reversals in the development of plot 416
   8*b*. Critical standards and artistic rules with respect to the language of poetry: the distinction between prose and verse; the measure of excellence in style
   8*c*. The interpretation of poetry
9. The moral and political significance of poetry 417
   9*a*. The influence of poetry on mind and character: its role in education
   9*b*. The issue concerning the censorship of poetry

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature of poetry: its distinction from other arts

Chapter 70: PRINCIPLE

INTRODUCTION

OF the three ways in which principles are considered in the tradition of the great books, the most familiar sense of the word is the one in which we speak of moral principles, principles of action, or political principles. The connotation of the word in this usage seems to be twofold. We think of principles as rules of conduct and we think of them as standards by which to measure and judge human acts or political events. Either conception attributes a certain generality to principles. Just as rules apply to an indefinite number of particular cases, so any principle we appeal to in order to decide a practical problem or to weigh the merits of an action undertaken, can be applied again and again in other circumstances.

In addition to this characteristic of generality, principles seem to have the quality of *underlying* or being the *source of* other things. In jurisprudence the search for principles consists in the attempt to discover those few most fundamental precepts from which the more detailed rules of law can be derived. The constitution of a state provides the principles which underlie its particular laws and sets the standards by which their legality is to be measured. Governments are judged by the principles they attempt to apply as well as by their success in putting these principles into practice. To say of a government that its acts are *unprincipled* is not to condemn the particular acts as wrong, but to accuse the government of having no uniform policy to serve as a foundation for its acts.

This aspect of the meaning of principle—as the source from which a set of consequences follows—seems to be more characteristic of the idea of principle than the aspect of generality. According to its Latin derivation and the equivalent root in Greek, "principle" means a beginning or a foundation. Sometimes it means that which comes first absolutely, in the sense of being before everything else; sometimes it means that which comes first only relatively, taking precedence over some things, but having others prior to itself. Since priority may be either absolute or relative—first without qualification or first only in a certain respect—the traditional phrase "first principle" does not have the redundancy of "first first" or "beginning beginning."

If there are absolutely first beginnings, to which nothing else can be prior, they can legitimately be called "first principles" to distinguish them from principles which come first only in a certain respect. Only if there are first principles can regression to infinity be avoided in the search for origins. The propositions which lie at the foundation of a science may, for example, constitute its principles, but they may also be derived in turn from some prior science. Only the principles of a science which is prior to or independent of all others can be truly first principles.

THE FOREGOING example brings us to the other meaning of principle that is popularly recognized. It is the sense in which men speak of principles in relation to conclusions, or of principles as the foundations of a science.

The priority which belongs to principles in the domain of thought need not be temporal. Principles may or may not be first in the order of learning. But if they are not first in the temporal order, they must be first logically, as premises are logically prior to a conclusion, or, as in Euclid's *Elements*, his principles—his definitions, postulates, and axioms—are logically prior to all the theorems he demonstrates by means of them.

It may be asked whether, among propositions related as premises and conclusions, the logical priority of one proposition to another

is sufficient to make the prior proposition a principle. Can a proposition be a principle if, even though it is used as a premise in reasoning, it lacks generality? For example, is the particular proposition—that this bottle contains poison—a principle underlying the practical conclusion that its contents should not be swallowed?

Aristotle answers affirmatively. In the order of practical thinking, he holds, we deliberate neither about the end to be sought nor about the particular facts on which a choice of the means depends. "The end cannot be a subject of deliberation," he writes, "but only the means; nor indeed can the particular facts be a subject of it, as whether this is bread or has been baked as it should; for these are matters of perception." The perceived particulars thus function as principles along with the most general of all practical propositions, namely, what the end should be. Calling the faculty which apprehends first principles "intuitive reason," Aristotle says that "the intuitive reason involved in practical reasonings grasps the last and variable fact, *i.e.*, the minor premise. For these variable facts are the starting-points for the apprehension of the end, since the universals are reached from the particulars; of these therefore we must have perception, and this perception is intuitive reason."

Perception, at least in the form of *sense*-perception, seems to be only one of the two ways in which we apprehend the particular facts which are principles in practical reasoning. Like Aristotle, Aquinas uses the judgment, that *this is bread or iron*, as an example of "facts received through the senses" which are "principles . . . accepted in the inquiry of counsel." But the moral quality inherent in particular acts does not seem to be perceptible by the senses alone; and such particular moral judgments are also involved in moral reasoning. Aristotle suggests that habit (*i.e.*, the moral habits or virtues) are the immediate source of such judgments, which can be called "perceptions of the particular" even though they are not simply sense-perceptions.

"Of first principles," Aristotle explains, "we see some by induction, some by perception, some by a certain habituation." By induction we see the general truths; by sense-perception, the sensible particulars; and by habituation, the moral particulars. Hence Aristotle insists that "anyone who is to listen intelligently to lectures about what is noble and just and, generally, about the subjects of political science must have been brought up in good habits. For the fact is the starting-point, and if this is sufficiently plain to him, he will not at the start need the reason as well; for the man who has been well brought up has or can easily get the starting-points."

The word "principle" is used by Kant in a much more restricted sense. He reserves the status of principle to the general propositions which serve as the major premises in reasoning. In both the theoretic and the practical sciences, principles express reason's understanding of universal and necessary relationships.

Kant differs from Aristotle in other respects. He differentiates between ordinary general propositions which merely serve as major premises in reasoning and the propositions he classifies as "synthetic judgements *a priori*." He regards the former as principles only in a relative sense and treats the latter alone as principles absolutely. He also distinguishes between those principles of the *understanding* which he thinks are "constitutive of experience," and those principles of the *reason* which should be used in what he calls a "regulative," not a constitutive manner. They determine the direction and goals of thought beyond experience. But such differences concerning the nature and kinds of principles do not affect the commonly accepted meaning of principle as that from which, in the temporal order of learning, knowledge develops or that upon which, in the logical order, knowledge rests.

THE THIRD AND relatively unfamiliar sense in which principles are discussed in the great books does not refer to the sources of man's moral decisions, political acts, or scientific conclusions. The discussion in question refers to reality apart from man. Just as men try to discover the elements of matter, or the causes of motion, so they try to discover the principles of existence and of change. The issues which arise from this concern with the principles of reality are discussed in such chapters as BEING, CAUSE, CHANGE, FORM, NATURE, and MATTER.

If the word "principle" always connotes a beginning, every special sense of principle should involve some kind of priority. As we have already observed, principles may be either prior in time or prior logically. But the principles of the universe or the principles of change are not usually thought to be prior in either of these ways. For them Aristotle specifies another kind of priority—priority in nature—to explain the primacy of those principles which constitute the nature of a thing. In his view, for example, matter and form are the principles of a physical substance. Since a substance composite of matter and form cannot exist until its matter and its form coexist, matter and form are not prior to the substance they compose. Their priority to substance consists only in the fact that that which has the nature of a composite substance *results* from the union of matter and form as its natural components. Because the substance is the *natural resultant*, matter and form can properly be called its *natural principles*.

This way of considering principles at once suggests a close relationship among principles, elements, and causes; and also indicates the connection between the present chapter and the chapters on CAUSE and ELEMENT. The ultimate parts into which a whole can be divided may be its principles as well as its elements. The form or matter of a substance may be, in Aristotle's theory, not only one of its principles, but also a cause—a formal or a material cause. Among the great authors Aristotle and Aquinas alone seem to dwell upon the relationship of these three terms. They give instances in which the same thing is principle, element, and cause, as well as instances in which a principle is neither a cause nor an element, *e.g.*, privation. In the sphere of human conduct, an end is both a principle and a final cause, but not an element. The last end is the highest final cause and the first principle—first in intention though last in attainment.

THE TRADITIONAL issues concerning this idea differ according to the general context in which the question of principles is raised. The main controversy, for example, with regard to principles in the order of reality is over their number and order.

Aristotle argues against an infinite number of principles as incompatible with the very notion of principle itself. In his analysis of change or motion, he tries to prove that no more than three principles are necessary, and no less will do. These are, as the chapter on CHANGE explains, matter, form, and privation. Considering the principles of the universe as a whole, Plotinus also enumerates three and tries to prove that none can be added or subtracted. But whereas Aristotle treats the three principles of change as coordinate, Plotinus places the cosmic principles in the absolute order of first, second, and third.

"We need not go seeking any other Principles," writes Plotinus. "This—the One and the Good—is our First, next to it follows the Intellectual Principle, the Primal Thinker, and upon this follows Soul. Such is the order in nature. The intellectual realm allows no more than these and no fewer. Those who hold to fewer Principles must hold the identity of either Intellectual Principle and Soul, or of Intellectual Principle and The First . . . To increase the Primals by making the Supreme Mind engender the Reason-Principle, and this again engender in the Soul a distinct power to act as mediator between Soul and the Supreme Mind, this is to deny intellection to the Soul, which would no longer derive its Reason from the Intellectual Principle, but from an intermediate. . . . Therefore, we must affirm no more than these three Primals."

In the sense in which Plotinus conceives the three primals, they are not only principles in the order of reality, but are themselves the ultimate grades or modes of reality. Similarly for Plato soul is not only the principle of life and thought in the universe, but it also has its own existence in the realm of being. For Aristotle, in contrast, the principles of change do not have existence in and of themselves. Matter, form, and privation are not substances, but aspects of substance. They are present in every changing substance and in every change, but they are only the principles *of* mutable being; they are not mutable beings in themselves.

Lucretius states two principles as the basic laws of nature. The first is that nothing comes into being out of nothing; the second, that nothing is ever completely reduced to nothing-

ness. The word "principle" is obviously not being used in the same sense here as when it designates The One for Plotinus, soul for Plato, matter for Aristotle, or the atoms which Lucretius calls the "first beginnings." Here it does not refer to an entity, or even to an aspect of some real being, but rather to a law—the statement of a universal and necessary condition which governs all that is or happens. It is in this sense that the proposition traditionally called "the law of contradiction"—that the same thing cannot both be and not be in the same respect at the same time—is said by Aristotle to be the first principle of being as well as of thought.

The conception of the law of contradiction and the related laws of identity and excluded middle as principles of thought raises problems about logical principles in general—whether they are axioms or postulates, whether they are merely rules of reasoning and demonstration or are themselves premises from which conclusions can be deduced. If, for example, the law of contradiction is *only* a rule of thought, which forbids the mind to affirm and deny the same proposition, then it is not a principle of knowledge in the sense in which the definitions and axioms of geometry function as premises in the demonstration of theorems. No conclusion can be drawn from it concerning the nature of things. But if, in addition to being a rule of thought, it is a metaphysical axiom, which states the most fundamental fact about existence, then like the axioms in geometry it may be the source of conclusions in metaphysics.

On this second point Locke seems to differ sharply from Aristotle and Aquinas. He denies that the laws of identity and contradiction are fruitful principles of knowledge. "These magnified maxims," he writes, "are not the principles and foundations of all our other knowledge." Nor have they been, he adds, "the foundations whereon any science hath been built. There is, I know, a great deal of talk, propagated from scholastic men, of sciences and the maxims on which they are built; but it has been my ill luck, never to meet with any such sciences, much less any one built upon these two maxims, 'what is, is' and 'it is impossible for the same thing to be and not to be.'"

WE SHALL PRESENTLY consider the issue concerning axioms or postulates—whether the principles of the sciences are self-evident truths or are only provisional assumptions. Those who are willing to admit the existence of axioms do not all agree, however, that such truths refer to reality. Hume, for example, limits the content of axioms to knowledge of the relations between our own ideas. They are not truths about real existence or matters of fact.

Locke also grants self-evidence only to perceptions of the agreement or disagreement between ideas. "Concerning the real existence of all other beings" except ourselves and God, we have, he writes, "not so much a demonstrative, much less a self-evident, knowledge; and therefore concerning these there are no maxims." But Locke does think that our demonstrative knowledge of God's existence depends upon an intuitive knowledge of our own existence; and in addition to knowing our own existence directly or without proof, he also thinks we have through our senses an equally direct knowledge of the existence of other things. Such intuitive and sensitive knowledge of particular existences is, like the truth of axioms, immediate—that is, something known directly or without proof, without any appeal to prior propositions. Hence Locke is not denying that we know some immediate truths about reality, but only that such truths consist exclusively of propositions about particular existences. Since axioms, or what Locke calls "maxims," are always general propositions, the self-evident truths which they express do not apply to reality.

William James uses the word "intuitive"—in a different sense from Locke—to characterize propositions that state "the necessary and eternal relations" which the mind "finds between certain of its ideal conceptions." Intuitive propositions are for him, therefore, what maxims are for Locke; and like Locke, James also denies that such axioms of reason hold for reality. "Only *hypothetically*," he says, "can we affirm intuitive truths of real things—by supposing, namely, that real things exist which correspond exactly with the ideal subject of the intuitive propositions . . . The intuitive propositions of Locke leave us as regards outer reality none the better for their possession. We

still have to 'go to our senses' to find what the reality is.

"The vindication of the intuitionist position," James continues, "is thus a barren victory. The eternal verities which the very structure of our mind lays hold of do not necessarily themselves lay hold on extramental being, nor have they, as Kant pretended later, a legislating character for all possible experience. They are primarily interesting only as subjective facts. They stand waiting in the mind, forming a beautiful ideal network; and the most we can say is that we *hope* to discover outer realities over which the network may be flung so that ideal and real may coincide."

The opposite view seems to be taken by Plato, Aristotle, Aquinas, Bacon, Descartes, Spinoza, and Kant. Though they are far from being in complete agreement concerning the principles of knowledge, the propositions which they call axiomatic, self-evident, intuitive, or *a priori* synthetic judgments, are not restricted by them to the mind's perception of the relations between *its own* ideas. There are self-evident or immediate truths in physics and metaphysics, as well as in mathematics and logic. Whether these are inductions from experience or innate possessions of the mind, whether they are intuitive apprehensions of intelligible being or *a priori* judgments having a transcendental origin, these propositions are held to describe the world of experience, or the nature and existence of things outside the human mind.

THERE SEEM TO BE two degrees of skepticism with regard to principles in the order of knowledge. Complete skepticism would consist in denying principles in every sense. That would be the same as denying any beginning or basis for even the opinions which men hold. No one seems to go that far.

The issue with respect to the foundations of knowledge or opinion is therefore not between those who affirm and those who deny principles, but between different views of what the starting points are. It is sometimes said, for example, that sensations are the principles or beginnings of all human learning. This view is shared both by those who think that all our ideas or concepts are abstracted from the materials provided by the senses and by those who account for all the other contents of the mind —its memories and imaginations, its complex formations—in terms of the simple impressions originally received by the senses.

Concepts, as distinct from sense-perceptions, are also sometimes regarded as principles of knowledge by those who think that concepts originate by abstraction from sensory materials, as well as by those who think that ideas are primary principles, *i.e.*, having no origin in any prior apprehensions. On either view, ideas or concepts function as principles insofar as they are the simples from which the more complex acts of the mind develop, such as the acts of judgment and reasoning. Just as on the level of language, words are the principles of all significant speech, out of which sentences and paragraphs are formed; just as, in the logical order, terms are said to be the principles of propositions and syllogisms; so concepts are the principles of judgments and reasonings. The definitions of Euclid, for example, state the notions of point, line, triangle, etc. which underlie his theorems and demonstrations.

One common characteristic of either sensations or concepts as principles of knowledge seems to be simplicity. Nothing more elementary, out of which they can be formed, is prior to them. Another characteristic is that they are principles of knowledge or opinion without being themselves acts of knowledge or opinion. This point is made by all who hold that only propositions—whether statements of opinion or of knowledge—can be true or false.

The terms which express the simple apprehensions of the mind—its sensations or concepts—cannot be true or false, because, unlike propositions, which are composed of terms, they do not assert anything. If sensations and concepts cannot be true or false in the sense in which propositions or judgments are, then they lack the distinctive property of knowledge or opinion. In contrast, propositions or judgments —which are supposed to be principles, whether axioms or assumptions—can be treated as themselves expressions of knowledge or opinion, not merely as its starting points or sources.

THE TWO DEGREES of skepticism previously mentioned apply only to those principles of

knowledge which are themselves capable of being regarded as knowledge or opinion and hence as either true or false.

We have already considered the skepticism of those who, admitting that the truth of some propositions can be immediately recognized by the mind, nevertheless deny that such self-evident truths describe reality. This may or may not be accompanied by a further depreciation of axioms on the ground that they are merely analytical propositions and hence trifling, uninstructive, or tautological.

The chapter on JUDGMENT considers the issue which revolves around the derogatory use of such words as "tautology" or "truism" to designate self-evident truths. Though the invidious connotation of the word "truism" does not make the truth to which this epithet is applied any less true, the dignity of a truth does seem to be affected by the refusal to regard it as a statement of reality. Furthermore, a certain degree of skepticism results from such refusal. Hume exemplifies this. He holds that self-evident truths are possible only in mathematics, which deals not with matters of fact, but with the relations between our own ideas. In consequence, he denies to the study of nature the certitude or demonstrative character which he finds in mathematical science. Since physics is concerned with real existences, no axioms or self-evident principles are available to it; and so, according to Hume, it cannot demonstrate its conclusions, but must advance them as probabilities.

A more thorough-going skepticism seems to consist in holding that there are absolutely no matters at all about which men have axiomatic knowledge. This appears to be the position of Montaigne. No truths are self-evident. None commands the universal assent of mankind; none belongs to the nature of the mind so that all men must agree to it. Montaigne almost holds it to be axiomatic that there are no axioms, for if there were, he says, "there would be some one thing to be found in the world . . . that would be believed by men with an universal consent; but this, that there is no one proposition that is not debated and controverted amongst us, or that may not be, makes it very manifest that our natural judgment does not very clearly comprehend what it embraces."

If it is objected that, in the absence of such principles, there is no starting point or foundation for science, Montaigne seems willing to accept the consequence. He does not flinch from an infinite regression of reasons. "No reason," he writes, "can be established but upon the foundation of another reason; and so run back to all infinity." To those who say that there is no disputing with persons who deny principles, he replies that "men can have no principles, if not revealed to them by the Divinity; of all the rest, the beginning, the middle, and the end are nothing but dream and vapor."

If, however, for practical purposes, a beginning must be made somewhere, Montaigne suggests that it can be done by taking things for granted and then getting others to grant our presuppositions. "It is very easy," he writes, "upon granted foundations to build whatever we please . . . By this way, we find our reason well-grounded and discourse at a venture; for our masters prepossess and gain beforehand as much room in our belief as is necessary for them towards concluding afterwards what they please, as geometers do by their postulates; the consent and approbation we allow them giving them power to draw us to the right and left, and to whirl us about at their own pleasure."

IF THE ONLY principles upon which reasoning can be based or from which conclusions can be drawn are assumptions, postulates, or hypotheses rather than axioms, then everything is a matter of opinion and probability; nothing can have the certitude of knowledge. As indicated in the chapters on KNOWLEDGE and OPINION, one theory of that distinction makes knowledge an act of the mind independent of our wishes or will and treats opinion as a judgment voluntarily accepted or rejected. Accordingly, assumptions or postulates are perfectly representative of opinion, and axioms express the very essence of knowledge. To assume or postulate anything is to take it for granted—voluntarily! A postulate neither compels assent, nor does it ever exclude the possibility of taking the opposite for granted. Where men make postulates, there dispute is possible. But to assert something as an axiom is to command assent on the ground that its opposite can be

immediately recognized as impossible. No proposition can be regarded as an axiom if its acceptance or rejection is in any way a matter of choice.

For Aristotle the area in which men can dispute with some reason on both sides belongs to what he calls "dialectic," whereas what he calls "science" is the area from which dispute is excluded by demonstrations which rest on self-evident truths. One is the area of probability and opinion; the other, of certainty and knowledge. Contrary assumptions are the starting point of dialectical argument, whereas science begins with axioms. These may be the first principles which Aristotle and Bacon call "common notions" because they are common to diverse sciences; or they may be the axioms peculiar to a single subject matter.

The word "dialectic" is used by Plato in a quite different sense. It names the highest science. Whereas the mathematical sciences start from hypotheses which require further support, dialectic—in the conception of Plato—rises to the first principles of all knowledge. In the hierarchical ordering of the sciences, Plato's dialectic, Aristotle's metaphysics, and Bacon's *philosophia prima* seem to occupy respectively the same primary position and to perform the same function in virtue of being the discipline which contemplates or considers the absolutely first or most universal principles. For Bacon, as for Aquinas, the only higher science is sacred theology, whose principles are articles of supernatural faith, not axioms of reason.

These matters are more fully discussed in the chapters on DIALECTIC, METAPHYSICS, and THEOLOGY; questions concerning different kinds of principles or the principles of different sciences are considered in HYPOTHESIS and LOGIC. The chapter on INDUCTION, furthermore, discusses the inductive origin of axioms, as well as the disagreement between Bacon and Aristotle on the point of whether the highest axioms or first principles are immediately intuited from the particulars of experience, or are reached only through intermediate stages of generalization.

Since axioms are indemonstrable, they cannot be derived by reasoning as conclusions from any truths prior to themselves. Their indemonstrability is regarded by Aristotle and Pascal as a virtue rather than a defect, for if they were demonstrable, they could not be the principles or starting points of demonstration. If there were no axioms, then nothing could be demonstrated, because everything in turn would require proof in an endless regression.

To the ancient counterparts of the skeptical Montaigne, Aristotle replies that unless the law of contradiction is an indisputable axiom, any form of reasoning, even probable reasoning from assumptions, is impossible. The principle which underlies all disputation cannot itself be disputed. To those who, with skeptical intent, insist upon having everything demonstrated before they will accept it, Aristotle offers an indirect defense of the law of contradiction by asking the questioner to try denying that self-evident principle without reducing himself to absurdity.

Those who acknowledge the existence of axioms generally agree that they are indemonstrable truths, but some, like Descartes and Kant, do not agree that they are inductions from experience. The alternatives seem to be that axioms are innate possessions of the intellect or that they are transcendental *a priori* principles of pure reason, independent of experience. Yet Locke, who denies innate ideas and principles, or anything prior to experience, does not treat what he calls self-evident maxims as inductions from experience. They are rather direct perceptions of agreement or disagreement among the ideas we have acquired through experience.

Aquinas, who, no less than Locke, denies innate ideas and insists upon sense-experience as the source of all human knowledge, refers to the assent we give first principles as a *natural habit* of the mind—the intellectual virtue he calls "understanding," equivalent to what Aristotle calls "intuitive reason." As the chapter on HABIT indicates, axioms are called "natural" truths, not in the sense of being innate, instinctive, or congenital, but only in the sense that if the human reason functions naturally or normally it will come to recognize these truths. Again, like Locke, Aquinas seems to be saying that the truth of axioms is perceived by the human understanding as soon as their terms are known, but he does not concur

with Locke in thinking that therefore such truths hold only for relations between our own ideas.

THE THEORY OF the possession of principles by natural habit has, for Aquinas, more than a verbal connection with the theory of natural law. Of the various meanings of the phrase "natural law" which are distinguished in the chapter on LAW, we are here concerned with what both Kant and Aquinas conceive as the moral law whose precepts are the fundamental principles of human conduct. Both also speak of the precepts of the natural law or the moral law as the first principles of man's practical reason.

For Aquinas, these principles are primary in the order of practical truth and the moral sciences, as metaphysical first principles are primary in the order of speculative truth and the theoretic sciences. "The precepts of the natural law," he writes, "are to the practical reason what the first principles of demonstration are to the speculative reason, because both are self-evident principles." As the proposition that "*the same thing cannot be affirmed and denied at the same time*" is the first principle of the speculative reason, so "the first precept of law, that *good is to be done, and evil is to be avoided*," is the first principle of the practical reason.

For Kant, the principles of the pure practical reason, which legislate *a priori* for the realm of freedom, play an analogous role to the principles of the pure speculative reason, which legislate *a priori* for the realm of nature or experience. It is this parallelism between the two sets of principles which Kant seems to have in mind when he conceives a *metaphysic of nature* and a *metaphysic of morals* as twin disciplines founded on the speculative and the practical employment of the transcendental principles of pure reason.

The same fundamental issues which we have considered in connection with the axioms of theoretic knowledge occur here in connection with the first principles of moral knowledge. Aquinas and Kant disagree, for example, about the way in which we come into possession of these principles. For Kant, the principles of mortality, like the principles of nature, belong to the transcendental structure of pure reason itself. For Aquinas, as already suggested, the precepts of the natural law are known in the same way as the axioms of the speculative reason. As the truth of the principle of contradiction is known when we understand the meaning of 'is' and 'not,' so the truth of the first command of natural law—'Seek the good'—is known when we understand the meaning of 'seek' and 'good.' We hold such truths by the natural habit of our minds, which in the case of the natural law is given the special name of *synderesis*.

Just as we find a certain skepticism with regard to the principle of contradiction and other axioms, so we find doubts about the existence of natural law, or about indisputable and universally acceptable principles of morality. Referring to those who think that there are some laws "first, perpetual, and immutable, which they call natural that are imprinted in mankind by the condition of their own proper being," Montaigne declares that "the only sign by which they can argue or infer some laws to be natural is the universality of approbation"; and he adds: "Let them produce me but one of this condition."

The consequences of skepticism are here the same as before. Without first principles, moral science either fails entirely or is reduced to systems of belief based upon one set of assumptions or another. In either case, moral judgments express, not knowledge, but opinion. As John Stuart Mill observes, the utilitarians must, despite all other differences, agree with Kant that if there is to be a science of ethics, "mortality must be deduced from principles," and ultimately from one first principle, for "if there be several, there should be a determinate order of precedence among them."

What Mill says concerning the self-evidence of the first principle of morality—which he formulates as a statement of the ultimate end of human conduct—closely resembles what Aristotle says about the self-evidence of the law of contradiction. "Questions of ultimate ends are not amenable to direct proof," Mill writes. "To be incapable of proof by reasoning is common to all first principles: to the first premises of our knowledge, as well as to those of our conduct."

OUTLINE OF TOPICS

PAGE

1. Principles in the order of reality 429

1*a*. The differentiation of principle, element, and cause

1*b*. The being, number, and kinds of principles in the order of reality

1*c*. The metaphysical significance of the principles of thought 430

2. The kinds of principles in the order of knowledge

2*a*. The origin of knowledge in simple apprehensions

(1) Sensations or ideas as principles

(2) Definitions as principles

(3) Indefinables as principles of definition 431

2*b*. Propositions or judgments as principles

(1) Immediate truths of perception: direct sensitive knowledge of appearances; evident particular facts

(2) Immediate truths of understanding: axioms or self-evident truths; *a priori* judgments as principles

(3) Constitutive and regulative principles: the maxims of reason

3. First principles or axioms in philosophy, science, dialectic 432

3*a*. Principles and demonstration

(1) The indemonstrability of axioms: natural habits of the mind

(2) The indirect defense of axioms

(3) The dependence of demonstration on axioms: the critical application of the principles of identity and contradiction

3*b*. Principles and induction: axioms as intuitive inductions from experience; stages of inductive generalization

3*c*. Axioms in relation to postulates, hypotheses, or assumptions

(1) The distinction between first principles in general, or common notions, and the principles of a particular subject matter or science

(2) The difference between axioms and assumptions, hypotheses and principles, as a basis for the distinction between knowledge and opinion, or science and dialectic 433

(3) The distinction and order of the sciences according to the character of their principles

4. First principles in the practical order: the principles of action or morality; the principles of the practical reason

4*a*. Ends as principles, and last ends as first principles: right appetite as a principle in the practical order 434

4*b*. The natural moral law and the categorical imperative

5. The skeptical denial of first principles or axioms: the denial that any propositions elicit the universal assent of mankind 435

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Principles in the order of reality

1*a*. The differentiation of principle, element, and cause

Chapter 71: PROGRESS

INTRODUCTION

LIKE the idea of evolution, with which it has some affinity, the idea of progress seems to be typically modern. Anticipations of it may be found in ancient and mediaeval thought, sometimes in the form of implicit denials of the idea. But in explicit formulation, in emphasis and importance, progress, like evolution, is almost a new idea in modern times. It is not merely more prominent in modern discussion; it affects the significance of many other ideas, and so gives a characteristic color or tendency to modern thought.

The idea of evolution affects our conceptions of nature and man. But the theory of evolution is itself affected by the idea of progress. Since it was a major theme at least two centuries before Darwin, progress does not depend for its significance upon the theory of biological evolution. The reverse relationship seems to obtain. The idea of evolution gets some of its moral, social, even cosmic significance from its implication that the general motion in the world of living things, perhaps in the universe, is a progress from lower to higher forms.

Darwin thinks "Von Baer has defined advancement or progress in the organic scale better than anyone else, as resting on the amount of differentiation and specialization of the several parts of a being"—to which Darwin adds the qualification that the organisms must be judged when they have arrived at maturity. "As organisms have become slowly adapted to diversified lines of life, their parts will have become more and more differentiated and specialized for various functions from the advantage gained by the division of physiological labor. The same part appears often to have been modified first for one purpose, and then long afterwards for some other and quite distinct purpose; and thus all the parts are rendered more and more complex. . . . In accordance with this view," Darwin writes, "it seems, if we turn to geological evidence, that organization on the whole has advanced throughout the world by slow and interrupted steps. In the kingdom of the Vertebrata it has culminated in man."

Whether strictly biological evolution has a single or uniform direction may be disputed in the light of evidences of regression and the multiplication of lower as well as higher forms. But Darwin seems to think that since "natural selection works solely by and for the good of each being, all corporeal and mental endowments will tend to progress toward perfection." Whatever the evidence may be, the popular notion of evolution, especially when applied by writers like Herbert Spencer to human society or civilization, connotes progress—the gradual yet steady march toward perfection.

APART FROM THIS APPLICATION of the idea of evolution to man's world, progress seems to be the central thesis in the modern philosophy of history. In the minds of some, the philosophy of history is so intimately connected with a theory of progress that the philosophy of history is itself regarded as a modern development. There seems to be some justification for this view in modern works on the tendency of history which have no ancient counterparts, such as the writings of Vico, Condorcet, Kant, Proudhon, Comte, J. S. Mill, Hegel, and Marx.

These writers do not all define or explain progress in the same way. Nor do they all subscribe to an inviolable and irresistible law of progress which has the character of a divine ordinance, replacing or transforming less optimistic views of providence. But for the most part the moderns are optimists. They either believe in man's perfectibility and in his approach to perfection through his own efforts freely

turned toward the realization of ideals; or they see in the forces of history—whether the manifestations of a world spirit or the pressure of material (*i.e.*, economic) conditions—an inevitable development from less to more advanced stages of civilization, according to a dialectical pattern of conflict and resolution, each resolution necessarily rising to a higher level.

As opposed to the optimism of expecting a continual improvement in all things or an irreversible ascent to new heights, the pessimistic view denies that progress is either the law or the hope of history. It believes rather that everything which goes up must come down. As indicated in the chapter on HISTORY, the theory of cycle after cycle of rise and decline—or even the notion that the golden age is past, that it is never to be regained, and that things are steadily getting worse—prevails more in the ancient than in the modern world.

The modern exceptions to optimism in the philosophy of history are notably Spengler and, to a much less extent, Toynbee. But modern pessimism never seems to reach the intensity of the Preacher's reiteration in Ecclesiastes that "there is no new thing under the sun" and that "all is vanity and vexation of spirit." Nor does the modern theory of cycles of civilization, even in Vico, seem to be as radical as that of the ancients. In his vision of cosmic cycles Lucretius sees the whole world crumbling into atomic dust to be reborn again. Herodotus does not relieve the gloom of his observation that, in the life of cities, prosperity "never continues long in one stay." The eternity of the world means for Aristotle that "probably each art and each science has often been developed as far as possible and has again perished."

LEAVING TO THE chapter on HISTORY the discussion of progress so far as it concerns an explicit philosophy of history, we shall here deal with considerations of progress as they occur in economics, in political theory, in the history of philosophy and the whole intellectual tradition of the arts and sciences.

In this last connection, the great books play a dual role. They provide the major evidence which, on different interpretations, points toward opposite answers to the question whether or not there has been progress in the tradition of western thought. Whatever their readers may think on this subject, the great authors, having read the works of their predecessors, offer their own interpretations of the intellectual tradition. In many cases, especially among the modern writers, their point of departure—even the conception they entertain of the originality and worth of their own contribution—stems from their concern with a deplorable lack of progress, for which they offer new methods as remedies.

Before we enter upon the discussion of economic, political, or intellectual progress, it seems useful to distinguish between the *fact* and the *idea* of progress. When men examine the fact of progress, they look to the past and find there evidence for or against the assertion that a change for the better has taken place in this or that respect. Two things are involved: a study of the changes which have occurred and the judgment—based on some standard of appraisal—that the changes have been for the better. But when men entertain the idea of progress, they turn from the past and present and look to the future. They regard the past merely as a basis for prophecy, and the present as an occasion for making plans to fulfill their prophecies or hopes. The fact of progress belongs to the record of achievement; the idea of progress sets a goal to be achieved.

This distinction seems to be exemplified by the difference between ancient and modern considerations of progress. The ancients observe the *fact* of progress in some particulars—almost never universally. Thucydides, for example, in the opening chapters of his *History*, contrasts the power and wealth of the modern city-states of Greece with "the weakness of ancient times." "Without commerce, without freedom of communication either by land or sea, cultivating no more of their territory than the exigencies of life required, destitute of capital, never planting their land (for they could not tell when an invader might not come and take it all away, and when he did come they had no walls to stop him), thinking that the necessities of daily sustenance could be supplied at one place as well as another, they cared little for shifting their habitation, and consequently neither built large cities nor attained to any other form of greatness."

But Thucydides does not seem to draw from these observations any general idea of progress. He does not concretely imagine a future excelling the Periclean age in the magnitude of its wars and the magnificence of its wealth, as that period dwarfs antiquity. He does not infer that whatever factors worked to cause the advance from past to present may continue to operate with similar results. It might almost be said that he does not think about the future; certainly he does not think of it as rich in promise. "Knowledge of the past." he writes, is "an aid to the interpretation of the future, which in the course of human things must resemble if it does not reflect it."

Adam Smith's thinking about economic progress represents the contrasting modern emphasis upon the future. In one sense, both Thucydides and Smith measure economic progress in the same way, though one writes of the wealth of cities, the other of the wealth of nations. Both Smith and Thucydides judge economic improvement in terms of increasing opulence, the growth of capital reserves, the expansion of commerce, and the enlarged power in war or peace which greater wealth bestows. But Smith, in the spirit of Francis Bacon, seeks to analyze the causes of prosperity in order to make them work for further progress. He is the promoter of progress, not merely the historian who witnesses the beneficial effect on productivity of an increasingly refined division of labor and of the multiplication of machinery.

To know how these things have operated to bring about the opulence of modern nations as compared with the miserable poverty of primitive tribes or even the limited property of ancient cities is to know how to formulate policies which shall still further expand the wealth of nations. For Smith the study of the means and methods by which economic progress has been made serves to determine the policy which is most likely to ensure even greater increments of progress in the future.

MARX APPEARS TO measure economic progress by a different standard. The transition from the slave economies of antiquity through feudal serfdom to what he calls the "wage-slavery" of the industrial proletariat may be accompanied by greater productivity and vaster accumulations of capital stock. But the essential point for him about these successive systems of production is their effect upon the status and conditions of labor. The *Communist Manifesto* notes respects in which, under the capitalist system, the supposedly free workingman is worse off than were his servile ancestors. But if economic progress is conceived as the historically determined approach to the final liberation of labor from its oppressors, then capitalism represents both an advance over feudalism and a stage in the march to communism.

Each successive economic revolution brings mankind nearer to the goal of the ideal or classless economy. Capitalism creates the proletariat—the revolutionary class which is to be that system's own undoing. The overthrow of the landed aristocracy by the bourgeoisie thus prepares the way for the dictatorship of the proletariat, as that in turn liquidates the obstacles to the realization of the perfect communist democracy.

We are not here concerned with the details of this history and prophecy but only with the theory of progress which it involves. In the first place, it seems to set an ultimate goal to progress, while at the same time it makes progress a necessary feature of what is for Marx, as it is for Hegel, the "dialectic of history." Those who think that the inevitability of progress ought to render progress as interminable as history itself, find some inconsistency in this tenet of dialectical materialism, as well as in Hegel's notion of the necessary dialectical stages by which the Absolute Idea reaches perfect realization in the German state. *Can progress be the inner law of history and yet reach its goal before the end of time?*

There may be some answer to this question in a second aspect of the theory of progress which goes with a dialectic of history. The progress which the successive stages of history represent resides in the quality of human institutions rather than in the nature of man. If more economic justice or greater political liberty is achieved, it is not because the later generations of men are born with a nature more disposed to goodness or virtue, but because better institutions have evolved from the conflict of historical forces. Furthermore, according to Marx, man's nature is only partly de-

termined at birth. Part remains to be determined by the social and economic circumstances of his life—by the system of production under which he lives. Hence though institutional progress may arrive at its historical goal with the establishment of the ideal economy, it may be possible for further progress to be made throughout the rest of time by the improvement of men themselves, when at last their natures can develop under ideal circumstances.

We have noted two great issues in the characteristically modern discussion of progress. Is the goal of progress definitely attainable, or is its goal an ideal progressively approximated but never realized? Is progress accomplished by the betterment of human institutions or by improvements in the nature of man?

The second question has a critical bearing on the first, especially for those who conceive man as infinitely perfectible. It also relates to the problem of the evolutionist: whether a higher form of life on earth will evolve from man or whether the future belongs to the progressive development of human nature—biologically or culturally. Darwin is unwilling to admit that "man alone is capable of progressive improvement," but he does affirm that man "is capable of incomparably greater and more rapid improvement than is any other animal."

Rousseau, on the other hand, claims that "the faculty of self-improvement" is one distinction between man and brute "which will admit of no dispute." But he also thinks that this faculty is the cause of human decline as well as progress. "A brute, at the end of a few months," he writes, "is all he will ever be during his whole life, and his species, at the end of a thousand years, exactly what it was the first year of that thousand . . . .While the brute, which has acquired nothing and has therefore nothing to lose, still retains the force of instinct, man, who loses, by age or accident, all that his *perfectibility* had enabled him to gain, falls by this means lower than the brutes themselves."

One other issue concerning progress remains to be stated. It raises the question of freedom or necessity in history. Is progress inevitable in the very nature of the case, or does it occur only when men plan wisely and choose well in their efforts to better themselves or the conditions of their lives?

In his *Idea of a Universal History* and his *Principle of Progress*, Kant finds the possibility of progress in man's potentialities for improvement. He regards the realization of this possibility as a work of freedom rather than a manifestation of historical necessity. Political progress may have an ultimate goal—the world republic or federation of states. But this, according to Kant's conclusion in the *Science of Right*, is an impracticable idea, and serves only the regulative purpose of "promoting a continuous *approximation* to Perpetual Peace." Hegel's theory of the progressive realization of the idea of the state in history seems to represent the contrary position on both points. Progress is an historical necessity, and it reaches an historic consummation.

The contrast between ancients and moderns with respect to political progress seems to be the same as that which we observed between Thucydides and Adam Smith with regard to wealth. The ancients assert the superiority of the present over the past, and even trace the stages by which advances have been made from primitive to civilized conditions. But they do not extend the motion they observe into the future. The moderns look to the future as to a fulfillment without which present political activity would be undirected.

According to Aristotle, for example, the state is the last stage in the development of social life which begins with the family. "When several families are united, and the association aims at something more than the supply of daily needs, the first society to be formed is the village." The village or tribal community, in turn, becomes the unit out of which a larger and more truly political community is formed. "When several villages are united in a single complete community, large enough to be nearly or quite self-sufficing, the state comes into existence."

Aristotle sees this development not merely as a progress from smaller and weaker societies to larger and more powerful ones, but also as an advance toward the realization of man's political nature. Absolute or despotic government by the eldest, natural to the family, still persists in the tribe. "This is the reason why the Hellenic

states were originally governed by kings; because the Hellenes were under royal rule before they came together, as the barbarians still are." Not until the domestic or tribal form of government is replaced by political or constitutional government—not until kings and subjects are replaced by statesmen and citizens—is the state or political community fully realized.

But Aristotle does not conceive the development he describes as one continuing into the future. He does not imagine a larger political unity than the city-state, as Kant is able to envisage a world state as the ultimate formation toward which the progressive political unification of mankind should tend. Though Aristotle recognizes that new institutions have been invented and old ones perfected, his political theory, unlike Mill's, does not seem to measure the goodness of the best existing institutions by their devotion to further progress.

Considering the criterion of a good form of government, Mill criticizes those who separate the maintenance of order, or the preservation of existing institutions, from the cultivation of progress. "Progress includes Order," he writes, "but Order does not include Progress." Order "is not an additional end to be reconciled with Progress, but a part and means of Progress itself. If a gain in one respect is purchased by a more than equivalent loss in the same or in any other, there is not Progress. Conduciveness to Progress, thus understood, includes the whole excellence of government."

Progress fails to define good government, Mill adds, unless we understand by the term not merely "the idea of moving onward," but "quite as much the prevention of falling back. The very same social causes . . . are as much required to prevent society from retrograding, as to produce a further advance. Were there no improvement to be hoped for, life would not be the less an unceasing struggle against causes of deterioration; as it even now is. Politics, as conceived by the ancients, consisted wholly in this . . . Though we no longer hold this opinion; though most men in the present age profess a contrary creed, believing that the tendency of things, on the whole, is toward improvement; we ought not to forget that there is an incessant and everflowing current of human affairs toward the worse."

According to Mill, the ideally best polity is representative government on democratic principles. By a just distribution of political rights and by the fullest grant of liberties, it serves better than any other form of government "to promote the virtue and intelligence of the people themselves." This is the ultimate end of political progress. Inferior forms of government, such as despotic monarchy, may be justified for people as yet unfit for self-government, but only if they also work for progress, *i.e.*, "if they carry those communities through the intermediate stages which they must traverse before they can become fit for the best form of government."

The whole theory of good government is thus for Mill a theory of progress in which we must take "into account, not only the next step, but all the steps which society has yet to make; both those which can be foreseen and the far wider indefinite range which is at present out of sight." We must judge the merits of diverse forms of government by that ideal form "which, if the necessary conditions existed for giving effect to its beneficial tendencies, would, more than all others, favour and promote not some one improvement, but all forms and degrees of it."

IN THE FIELD OF THE ARTS and sciences or culture generally, the modern emphasis upon progress seems to be even more pronounced than in the spheres of economics and politics. Lack of progress in a science is taken to indicate that it has not yet been established on the right foundations or that the right method for discovering the truth has not yet been found. Lack of agreement in a particular field is the chief symptom of these defects.

The fact that philosophy "has been cultivated for many centuries by the best minds that have ever lived, and that nevertheless no single thing is to be found in it which is not a subject of dispute, and in consequence which is not dubious," leads Descartes to propose his new method. He hopes this may ensure progress in philosophy, of the same sort which the new method has, in his view, accomplished in mathematics. The *Novum Organum* of Bacon seems to be dedicated to the same end of progressively augmenting knowledge in all those

fields in which, according to the inventory made in the *Advancement of Learning* of the present state of the sciences, no or little progress has been made since antiquity. Similarly, Locke, Hume, and Kant insist that a study of the human mind should precede all other studies in order to save men from fruitless disputes concerning matters beyond their capacities for knowledge; they hope thereby to encourage research in areas where progress can be made.

The comparison of different disciplines or subject matters with respect to their progress leads to the condemnation of those which lag behind. The great scientific advances of the 17th century tend to intensify the complaint about philosophy, especially metaphysics. The progress which has been made from the beginning in mathematics and more recently in physics means to Kant that each of these disciplines has found the "safe way" or the "secure path" of a science. By comparison, metaphysics has not yet even made a beginning. A hundred years later, William James is still to say that, by comparison with the progress of knowledge in the natural sciences, metaphysics belongs to the future.

The notion that any field of learning has attained its full maturity seems to Bacon to be the presumption of those philosophers who, seeking "to acquire the reputation of perfection for their own art," try to instill the "belief that whatever has not yet been invented and understood can never be so hereafter." Whenever such belief prevails, learning languishes. "By far the greatest obstacle to the advancement of the sciences, and the undertaking of any new attempt or departure, is to be found in men's despair and the idea of impossibility."

Though the ancients do not evidence this presumption of perfection in their arts and sciences, neither do they fret about lack of progress. Nor does the disagreement of minds seem to them to signify an unhealthy condition which requires new and special methods to cure.

"The investigation of the truth is in one way hard, in another easy," writes Aristotle. "An indication of this is found in the fact that no one is able to attain the truth adequately, while, on the other hand, we do not collectively fail, but everyone says something true about the nature of things, and while individually we contribute little or nothing to the truth, by the union of all a considerable amount is amassed." Aristotle puts the intellectual tradition to use by adopting the policy of calling "into council the views of those of our predecessors who have declared any opinion" on whatever subject is being considered, "in order that we may profit by whatever is sound in their suggestions and avoid their errors."

But, in the opinion of the moderns, the intellectual tradition can also be the greatest impediment to the advancement of learning if it is received uncritically and with undue reverence for the authority of the ancients. "The respect in which antiquity is held today," Pascal says, "has reached such extremes in those matters in which it should have the least preponderance, that one can no longer present innovations without danger." This is the common complaint of Hobbes, Bacon, Descartes, and Harvey. "The reverence for antiquity and the authority of men who have been esteemed great in philosophy have," according to Bacon, "retarded men from advancing in science, and almost enchanted them."

Harvey agrees with Bacon that philosophers or scientists should not "swear such fealty to their mistress Antiquity, that they openly, and even in sight of all, deny and desert their friend Truth." Harvey has a much higher opinion than Bacon of the achievements of antiquity. "The ancient philosophers," he writes, "whose industry even we admire, went a different way to work, and by their unwearied labor and variety of experiments, searching into the nature of things, have left us no doubtful light to guide us in our studies. In this way it is that almost everything we yet possess of note or credit in philosophy, has been transmitted to us through the industry of ancient Greece."

His admiration for the ancients does not, however, lead Harvey to rest on their achievements. "When we acquiesce in the discoveries of the ancients, and believe (which we are apt to do through indolence) that nothing farther remains to be known," then, in his opinion, "we suffer the edge of our ingenuity to be taken off, and the lamp which they delivered us to be

extinguished. No one of a surety," he continues, "will allow that all truth was engrossed by the ancients, unless he be utterly ignorant (to pass by other arts for the present) of the many remarkable discoveries that have lately been made in anatomy."

In his own anatomical researches, Harvey adopts an attitude toward the work of his predecessors, both ancient and recent, which remarkably resembles the attitude expressed by Aristotle toward his scientific forebears. "As we are about to discuss the motion, action, and use of the heart and arteries, it is imperative on us," Harvey declares, "first to state what has been thought of these things by others in their writings, and what has been held by the vulgar and by tradition, in order that what is true may be confirmed, and what is false set right by dissection, multiplied experience, and accurate observation." It is precisely this attitude which Bacon expressly condemns.

Bacon sees no genuine method of science, but merely a cultivation of opinion, in those who prepare themselves for discovery by first obtaining "a full account of all that has been said on the subject by others." Those who begin in this way, it is the judgment of Descartes, seldom go further. Particularly the followers of Aristotle "would think themselves happy," he says, "if they had as much knowledge of nature as he had, even if this were on the condition that they should never attain to any more. They are like the ivy that never tries to mount above the trees which give it support, and which often even descends again after it has reached the summit; for it appears to me that such men also sink again—that is to say, somehow render themselves more ingnorant than they would have been had they abstained from study altogether. For, not content with knowing all that is intelligibly explained in their author, they wish in addition to find in him the solution of many difficulties of which he says nothing, and in regard to which he possibly had no thought at all."

Pascal takes a more moderate view. We can profit, he thinks, from a limited respect for the ancients. "Just as they made use of those discoveries which have been handed down to them only as a means for making new ones and this happy audacity opened the road to great things, so," Pascal suggests, "must we accept those which they found for us and follow their example by making them the means and not the end of our study, and thus try to surpass them by imitating them. For what would be more wrong than to treat the ancients with more caution than they did those who preceded them, and to have for them this inviolable respect which they only deserve from us because they did not feel a similar respect for those who had the same advantage over them?"

MODERN WRITERS SEEM to conceive the law of intellectual progress by an analogy between the mind of the race and the individual mind. Where Aquinas says merely that "it seems natural to human reason to advance gradually from the imperfect to the perfect," adding, in the past tense, that hence the imperfect teaching of early philosophers "was afterwards perfected by those who succeeded them," Pascal generalizes the insight and gives it future significance. "Not only does each man progress from day to day in the sciences, but all men combined make constant progress as the universe ages, because the same thing happens in the succeeding generations of men as in the different ages of each particular man. So that the whole succession of men, in the course of so many centuries, should be regarded as the same man who exists always and learns continually."

At this point Pascal applies his metaphor to effect a reversal of the relation between the moderns and the ancients. "Since old age is the time of life most distant from childhood, who does not realize that old age in this universal man should not be sought in the times closest to his birth, but in those which are farthest away from it? Those whom we call ancients were really novices in all things, and actually belonged to the childhood of man; and as we have added to their knowledge the experience of the centuries which followed them, it is in ourselves that may be found this antiquity which we revere in others."

Whether by accident or borrowing, this characteristically modern view of the advantage progress confers upon modernity is expressed in similar language by Hobbes and Bacon. "Though I reverence those men of ancient times," writes Hobbes, "who either have

written truth perspicuously or have set us in a better way to find it out for ourselves; yet to the antiquity itself I think nothing due; for if we will reverence age, the present is the oldest." "Antiquity, as we call it," writes Bacon, "is the young state of the world; for those times are ancient when the world is ancient; and not those we vulgarly account ancient by computing backwards; so that the present time is the real antiquity."

To secure a sound, not specious, progress in all things of the mind, Bacon recommends the avoidance of two extremes, the affectations of antiquity and novelty, for "antiquity envies new improvements, and novelty is not content to add without defacing." Since "antiquity deserves that men should stand awhile upon it, to view around which is the best way," the great books of the past can lay the foundations for progress, but only if they are properly read. "Let great authors, therefore, have their due," Bacon declares, "but so as not to defraud time, which is the author of authors, and the parent of truth."

OUTLINE OF TOPICS

PAGE

1. The idea of progress in the philosophy of history 445
   - 1*a*. Providence and necessity in the theory of progress: the dialectical development of Spirit or matter; conflict as a source of progress
   - 1*b*. Optimism or meliorism: the doctrine of human perfectibility
   - 1*c*. Skeptical or pessimistic denials of progress: the golden age as past; the cyclical motion of history 446
2. The idea of progress in the theory of biological evolution
3. Economic progress
   - 3*a*. The increase of opulence: the division of labor as a factor in progress
   - 3*b*. The improvement of the status and conditions of labor: the goals of revolution and reform
   - 3*c*. Man's progressive conquest of the forces of nature through science and invention 447
4. Progress in politics
   - 4*a*. The invention and improvement of political institutions: the maintenance of political order in relation to progress
   - 4*b*. The progressive realization of the idea of the state 448
   - 4*c*. The growth of political freedom: the achievement of citizenship and civil rights
5. Forces operating against social progress: emotional opposition to change or novelty; political conservatism
6. Intellectual or cultural progress: its sources and impediments 449
   - 6*a*. Progress in the arts
   - 6*b*. Progress in philosophy and in the sciences 450
   - 6*c*. The use and criticism of the intellectual tradition: the sifting of truth from error; the reaction against the authority of the past
   - 6*d*. Plans for the advancement of learning and the improvement of method in the arts and sciences 451
   - 6*e*. Freedom of expression and discussion as indispensable to the progressive discovery of the truth 452

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a *(D)*, follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—*(D) II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The idea of progress in the philosophy of history

1*a*. Providence and necessity in the theory of progress: the dialectical development of Spirit or matter; conflict as a source of progress

5 AESCHYLUS: *Prometheus Bound* [436–525] 44c-45b
7 PLATO: *Protagoras*, 44a-45a
18 AUGUSTINE: *Confessions*, BK XIII, par 49–51 124a-d / *City of God*, BK X, CH 14 307c-308a; BK XV–XVIII 397b,d-507a,c esp BK XV, CH 1–4 397b,d-400a, BK XVI, CH 3 423d-425b, CH 12 431b-c, BK XVII, CH 1–2 449a-450c, BK XVIII, CH 1 472b,d, CH 54, 506d-507a,c; BK XXII, CH 30, 618c-d
38 ROUSSEAU: *Inequality*, 338c-339b
43 MILL: *Representative Government*, 376a-c; 387c-d
46 HEGEL: *Philosophy of Right*, INTRO, par 32–33 20a-d; PART III, par 340–360 110b-114a,c esp par 342 110c-d; ADDITIONS, 36 122b-c / *Philosophy of History* 153a-369a,c esp INTRO, 156d-190b, 203a-206a,c, PART IV, 368d-369a,c
49 DARWIN: *Descent of Man*, 320d; 321c; 322d-323a; 328b-c; 596c
50 MARX: *Capital*, 6c-7d; 10a-11d esp 11b-d
50 MARX-ENGELS: *Communist Manifesto*, 419b,d-425b
51 TOLSTOY: *War and Peace*, EPILOGUE I, 645a-650c esp 646b-c; EPILOGUE II, 675b-d; 676d-677b; 679b-680b
54 FREUD: *Beyond the Pleasure Principle*, 654a-c / *Civilization and Its Discontents*, 801d-802a,c / *New Introductory Lectures*, 882b-883c

1*b*. Optimism or meliorism: the doctrine of human perfectibility

38 ROUSSEAU: *Inequality*, 338b-c; 347d-348a / *Social Contract*, BK III, 420a-b
40 GIBBON: *Decline and Fall*, 633c-634a,c
42 KANT: *Judgement*, 586a-587a
43 FEDERALIST: NUMBER 6, 41a; NUMBER 55, 174c-d
43 MILL: *Liberty*, 287d / *Representative Government*, 335d-336a / *Utilitarianism*, 452a-b; 460a-461b
46 HEGEL: *Philosophy of Right*, PART III, par 343 110d-111a / *Philosophy of History*, INTRO, 178a-179c

(1. *The idea of progress in the philosophy of history.* 1b. *Optimism or meliorism: the doctrine of human perfectibility.*)

47 GOETHE: *Faust*, PART I [570–573] 16a

Chapter 72: PROPHECY

INTRODUCTION

THE name of prophet signifies, throughout a great part of the western tradition, an eminence and dignity not shared by the scientist, the philosopher, the statesman, or even the sage. The soothsayer and the seer in pagan antiquity and the prophet of the Lord in Israel do not claim to speak from a merely human wisdom or to declare truths they have learned by inquiry or reflection. Nor are their utterances concerned with the nature of things. The prophet claims to know what men cannot know by any exercise of human powers. He enjoys special gifts. He is divinely inspired. He is instructed by God or has in some way been admitted to the secrets of the gods. His knowledge is not only of supernatural origin; it deals with supernatural matters.

Prophecy is more than a prediction of the future. It unveils what Fate holds in store for men; it foretells the course of providence. In most cases, the future predicted has deep moral significance, expressing the pleasure or displeasure of the gods with individuals or nations, or manifesting God's justice in the rewards promised those who keep His commandments, and the punishments awaiting those who break them. The prophet's foresight discerns more than the future; it discovers what men can hope for or must fear according to their merits, not in the eyes of men but in the sight of God.

This understanding of prophecy seems to be involved in the major issues which the great books raise about prophets. For example, the problem of distinguishing between true and false prophets goes beyond the mere truth or falsity of a prophet's utterances to the validity of his claim to special sources of knowledge or a supernaturally inspired understanding of dreams and visions, omens and portents. The false prophet is not like the mistaken scientist or philosopher—just a person in error. He is either a deceiving impostor or a self-deceived victim of his own pathology.

Similarly, the Christian theologians who criticize the pagan cult of oracles and all forms of divination which seek to pry into divine mysteries, seem to imply that the seers and soothsayers of Greece and Rome, unlike the Hebrew prophets, did not have the gift of prophecy. The acceptance or rejection of prophets and of ways of foreseeing what has been planned in Heaven cannot, it seems, be separated from a whole system of religious beliefs. In this respect, prophets are like miracles. Without faith, both are incredible. "There be two marks," writes Hobbes, "by which together, not asunder, a true Prophet is to be known. One is the doing of miracles; the other is the not teaching any other religion than that which is already established." In Hobbes' view, that there be a religion already established among a people is the one indispensable condition for their reception of prophets or their experience of miracles.

Issues concerning prophecy may, therefore, occur within a single religious community, or be relative to differences between religious communities, as, for example, the opposition between the Jewish and Christian interpretation of the messianic prophecies in the Old Testament. Necessarily, then, there is an issue between the unbelievers and the religious of any faith. Those who deny the existence of God or the gods, or divine agency in the temporal affairs of men, and certainly those who deny the credentials of revelation, cannot but regard prophets as misled and misleading and those who accept prophecy as gullible or superstitious. In the pagan tradition, a philosopher like Aristotle may, however, be critical of divination, and an historian like Thucydides may cast doubt on oracles, without discredit-

ing all other religious beliefs or being themselves atheists.

Some who reject religious prophecy do not concede that man's natural desire to peer into the future need be completely balked. But the secular substitutes for religious prophecy appear to alter the meaning of prophecy. Scientific predictions of the future of the world or of life on this planet (as, for example, those which occur in the writings of Lucretius or Darwin) may be accompanied by attributions of moral qualities to Nature, but usually they connote Nature's sublime indifference to man's welfare. They are seldom, if ever, read as promises or threats of what man deserves to have befall him.

Similarly, historians turned prophets, or philosophers of history who, like Spengler, prophesy decline and doom, do not exhort men to avert disaster, as do the prophets of the Old Testament. Nor do those who, like Hegel and Marx, foresee the ultimate goal toward which events inevitably march, urge men to prepare themselves for it as do the prophecies of the New Testament, which speak of the second coming of Christ. Secular prophecies which bespeak the inevitable operation of necessary causes are, in this respect, like pagan previsions of Fate. At most, they leave man only the illusion of free choice. Jewish and Christian prophecy, in contrast, addresses man as a responsible agent, who, even when he knows something of God's will, remains free to will good or evil for himself. If, according to the theologians, divine providence or predestination does not abolish human freedom, neither does prophetic knowledge of the divine plan.

These matters are discussed elsewhere—secular prophecy in the chapters on HISTORY and PROGRESS, and the problem of foreknowledge and freedom in the chapters on FATE and NECESSITY AND CONTINGENCY.

IN PAGAN ANTIQUITY, prophecy does not seem to be confined to men especially appointed by the gods. The gods themselves foretell the future to men. When people wish to know the future, they go or send emissaries to the temple at Delphi over which a goddess, the Pythoness, presides. The institution of the oracles, of which Delphi is perhaps the most illustrious example, leaves foresight in the hands of the gods; for, as most of the anecdotes in Herodotus and Thucydides show, only the Pythoness herself knows unequivocally the meaning of her oracular utterances.

To men is left the task of interpreting what the oracle means. The pagan unlike the Hebrew prophet seems to be a man of skill in penetrating the secrets of the gods—a skill which may itself be divinely bestowed—but he is not a man to whom the gods have spoken plainly, so that he may in turn unerringly advise others. "No man, when in his wits," according to Plato, "attains prophetic truth and inspiration."

There are passages in the Greek poets and historians which seem to suggest that the gods begrudge men too clear a vision of the future, and may even on occasion mislead them or at least permit them to be misled. In Aeschylus' play, Prometheus declares that "because he gave to men gifts claimed by the gods," he is "bound in durance here." He gave them radiant fire, the mechanical arts; he "took from men the expectancy of Death"; he gave them medicines and healing drugs. Last in his own enumeration and in a sense most significant, he endowed men with the divine gift of foresight.

"I drew clear lines for divination," Prometheus says, "and discerned (before all others) what from dreams is sure to come to pass in waking. I disclosed the mysteries of omen-bringing words, and pathway tokens, and made plain the flight of taloned birds, both of good augury and adverse . . . I cleared the way for mortals to an art hard of discernment, and made bright and clear fire-auguries, heretofore obscure and blind." The chorus questions whether "the power of creatures creeping for an hour" shall by wisdom overpass the bounds set for their little lives by "the mind of Zeus." Does the wisdom of foreknowledge, gained through the arts of divination, give men strength to resist the will of the gods or to struggle against them?

Prometheus himself is the answer to the question. The power he wields over Zeus, which Zeus tries to wrest from him by bribes and threats and by the infliction of titanic pain, is the foreknowledge which Prometheus possesses of the doom to befall the son of Kronos. No threat of Zeus will get him to divulge it,

Prometheus says, because "nought can surprise me who foreknow . . . Nought in his power shall bend me to reveal whom Fate prepares to work his overthrow."

A myth which Socrates relates in the *Gorgias* appears to contain a sequel to the legend as told by Aeschylus. It also seems to confirm the point that foresight is a divine privilege in which men should not share, lest they become too god-like. According to the myth, Zeus, in order to prevent men from evading the divine judgment, says: "In the first place, I will deprive men of the foreknowledge of death; this power which they have, Prometheus has already received my orders to take from them."

The oracles never make the future so plain that men can act with a foreknowledge equal to that possessed by the gods, but sometimes oracular utterances seem to be contrived not merely to veil the future, but to lead men astray. Herodotus tells the story of Miltiades who, on the advice of Timo, a priestess of the goddesses of the underworld, acted in a way which brought him to grief. When the Parians sent to Delphi to ask whether Timo should be punished for this, the Pythoness forbade them, saying, "Timo was not at fault; 'twas decreed that Miltiades should come to an unhappy end; and she was sent to lure him to his destruction."

There is also the story, told by Thucydides, of Cyclon who, inquiring at Delphi, was told to seize the Acropolis of Athens on the grand festival of Zeus. This, too, turned into a disastrous misadventure, apparently because, as Thucydides observes, "whether the grand festival that was meant was in Attica or elsewhere was a question he never thought of, and which the oracle did not offer to solve."

For the most part, however, the calamities which befall men who seek guidance from the oracle seem to be due to their own misinterpretation of the Delphic deliverance, itself always admittedly difficult to understand. Herodotus and Thucydides abound with such stories, and also with instances in which the same oracular statement is given conflicting interpretations, one of which must be wrong. Nevertheless, Herodotus declares himself unwilling "to say that there is no truth in prophecies," and he is certainly not willing to question "those which speak with clearness." Giving an example of a clear prediction, he adds, "When I look to this, and perceive how clearly Bacis spoke, I neither venture myself to say anything against prophecies, nor do I approve of others impugning them."

Thucydides appears to take a contrary view. He singles out one example as "an instance of faith in oracles being for once justified by the event." He puts into the speech of the Athenians at the Melian Conference the warning not to "be like the vulgar, who, abandoning such security as human means may still afford, when visible hopes fail them in extremity, turn to invisible, to prophecies and oracles, and other such inventions that delude men with hopes to their destruction."

The problem of the reliability of prophecies, and of the faith or credulity of those who rely upon them, applies not only to oracles, but also to dreams or visions, and to omens and portents of all sorts. Two stories about Croesus, told by Herodotus, show that oracles and dreams can be equally ambiguous and are equally liable to misinterpretation. Croesus dreamed that his son Atys would die by the blow of an iron weapon. Subsequently when Atys wished to go boar hunting with Adrastus, he persuaded Croesus that the dream could not have been a warning against this undertaking because a boar does not have hands to strike with, nor does it wield iron weapons. But during the hunt Atys was killed by the spear which Adrastus intended for the boar.

On another occasion, Croesus inquired of Delphi how long his kingdom would last. The Pythoness answered, in effect, until "a mule is monarch in Media." This not only pleased him because "it seemed incredible to him that a mule should ever become king of the Medes," but also gave him confidence when he engaged in war with the Medes and Persians, led by Cyrus. The war ended in his defeat and capture but, according to Herodotus, he had no right to complain of the oracle because "he had misunderstood the answer which had been given him about the mule. Cyrus was that mule; for the parents of Cyrus were of different races and of different kinds"—his mother a Median princess, his father a Persian subject.

The attitude of the ancients toward these

various instruments of prophecy or divination does not seem to be consistent or constant. Herodotus reports at one place how Xerxes, "despising the omens," carried out his plans against their forebodings; and at another how an eclipse of the moon, being interpreted as of good omen, rejoiced Xerxes who, "thus instructed, proceeded on his way with great gladness of heart." And again, when Xerxes reports to Artabanus the advice—concerning his war against the Greeks—which he received from a dream apparition, Artabanus scoffs, saying, "Such things, my son, have of truth nothing divine in them . . . Whatever a man has been thinking of during the day, is wont to hover round him in the visions of his dreams at night." But when Artabanus himself experiences the same apparition which had occurred to Xerxes in his dream and, in addition to giving the same advice, the vision threatens him, Artabanus changes his mind about dreams and reverses his policy with regard to the expedition against Greece.

"As to the divination which takes place in sleep, and is said to be based on dreams," Aristotle writes, "we cannot lightly either dismiss it with contempt or give it implicit confidence." Nevertheless, he himself seems to conclude that most so-called prophetic dreams are "to be classed as mere coincidences"; and that "dreams are not sent by God, nor are they designed for this purpose," *i.e.*, foretelling the future. One proof that they are not sent by God is, in his opinion, the fact that the persons having them "are not the best and wisest but merely commonplace persons." The fact that "the power of foreseeing the future and of having vivid dreams is found in persons of inferior type implies that God does not send them."

THE CHRISTIAN THEOLOGIANS, distinguishing between prophecy and divination, condemn the latter as a kind of presumption or impiety. Though their criticism seems to be directed especially against astrology, it applies to the interpretation of terrestrial as well as celestial signs. Augustine refers to "the lying divinations and impious dotages of the astrologers," and Aquinas explains how the astrologers are able to foretell things in a general way without attributing to them any genuinely prophetic power.

In his consideration of the difference between true and false religion, Hobbes goes further than the theologians in condemning "the innumerable other superstitious ways of divination," such as "the ambiguous or senseless answers of the priests at Delphi, Delos, Ammon, and other famous oracles," or "the prediction of witches that pretended conference with the dead, which is called necromancy, conjuring, and witchcraft, and is but juggling and confederate knavery," or, in general, the recourse to omens, portents, and dreams for purposes of prognostication.

That the things Hobbes calls superstitious are not confined to pagan antiquity is manifest in Shakespeare's *Macbeth*. The witches and the omens there are like the soothsayers and the portents in *Julius Caesar;* and Macbeth's misunderstanding of "'til Birnam Forest come to Dunsinane" is as fatal as Croesus' reliance on "until a mule is monarch in Media."

In one other respect, pagan and Christian cultures seem to exhibit a certain parallelism with regard to the belief in supernatural foreknowledge. The spirits of the departed, in the *Odyssey* and the *Aeneid*, are able to inform the visitor to the underworld of coming events on earth. They speak plainly and with perfect prescience. The veil which hides the future from mortal eyes has been lifted. So, too, the damned souls and the blessed foretell future things to Dante, no less accurately though less extensively than, in *Paradise Lost*, the archangel Michael unfolds to Adam the whole future history of mankind.

But so far as the foreknowledge of mortal men is concerned, the Hebrew prophets seem to be unique. Unlike pagan diviners or soothsayers, they do not probe the future in order to help men anticipate the turns of fortune or the lines of fate. They do not have to employ arts or devices for penetrating divine secrets. God speaks to them directly and, through them, to the Chosen People. For the most part their prophetic speeches, unlike those of the oracles, seem to be unambiguous. At least the intention seems to be to reveal, not to conceal, God's plan on such matters as He Himself wishes men to foresee the course of providence.

Where pagan prognosticators may claim to be divinely inspired in the sense of having special powers of interpretation, the Hebrew prophets speak from a different kind of supernatural inspiration. They are the vessels through which the Lord Himself speaks. They are interpreters only in that they make known to others what God has made known to them.

The content of the divine communication is seldom exclusively a foretelling of the future. It is often accompanied by instruction concerning the actions to be performed by the Jewish people—the direction of their conduct toward the Promised Land or the rebuilding of the Temple. Sometimes when the prophecy is one of doom rather than of hope, as in the case of the destruction of Jerusalem, the Babylonian captivity, or the dispersion of Israel, the prediction of the future is accompanied by moral instruction of another sort—the lessons of the Law which the Jews have forsaken, meriting thereby the punishments the prophets foresee.

Mere prognostication does not seem to be the chief purpose of Hebrew prophecy. Just as the Covenant which God makes with Abraham, Isaac, and Jacob consecrates the Jewish people to a special mission; just as the Law which God hands down through Moses sets them apart from the Gentiles and prescribes for them the way of righteousness and sanctity; so the revelations of God's providence through the prophets tend to remind the Chosen People of the meaning of the Covenant and the Law as well as to disclose their destiny as a nation.

The prophets speak not only of the future, but of the present and the past. They are divinely appointed teachers, no less than the patriarchs and Moses. Yet they may rank below Moses (who is sometimes also regarded as a prophet) by reason of the manner in which they are addressed by God. As Hobbes points out, "God himself in express words declareth that to other prophets he spake in dreams and visions, but to his servant Moses, in such manner as a man speaketh to his friend"—face to face.

The content of Hebrew prophecy, in short, seems to be continuous with the rest of God's revelation of Himself to His Chosen People. The difference between the prophets as the instruments of God's teaching and the pagan philosophers as merely human teachers seems to Augustine plainly shown by the agreement of the prophets with one another and by their continuity with Moses and the patriarchs; whereas Augustine can find nothing but disagreement and dissension among even the best teachers of the pagans. Among them, false teachers or prophets seem to be accorded the same recognition and to attract the same following as true.

"But that nation," Augustine writes, "that people, that city, that republic, these Israelites, to whom the oracles of God were entrusted, by no means confounded with similar license false prophets with the true prophets; but, agreeing together, and differing in nothing, acknowledged and upheld the authentic authors of their sacred books. These were their philosophers, these were their sages, divines, prophets, and teachers of probity and piety. Whoever was wise and lived according to them was wise and lived, not according to men, but according to God who hath spoken to them."

Hobbes also conceives the prophets of the Old Testament as more than foretellers of the future. "The name of prophet," he writes, "signifies in Scripture sometimes *prolocutor*; that is, he that speaketh from God to man, or from man to God; and sometimes *predictor*, or a foreteller of things to come." In addition to their being divinely appointed teachers, the prophets, according to Hobbes, seem to perform a political function. They check the power of the kings, or seek to awaken their consciences to the dictates of justice and mercy. "Through the whole history of the kings, as well of Judah as of Israel, there were prophets that always controlled the kings for transgressing the religion; and sometimes also for errors of state."

A secular view of the Hebrew prophets seems to give prominence to their political role in the theocratic community of the Jews. Comparing the Jewish state with other sacerdotal societies, Mill observes that "neither their kings nor their priests ever obtained, as in those other countries, the exclusive moulding of their character. Their religion . . . gave existence to an inestimably precious unorganized institution—the Order (if it may be so termed) of the Prophets. Under the protection, generally though not always effectual, of their sacred character, the Prophets were a power in the nation, often

more than a match for kings and priests, and kept up, in that little corner of the earth, the antagonism of influences which is the only real security for continued progress."

AS THERE IS A BODY of prophetic doctrine in the Old Testament, so the religion of the Gospels contains a number of prophetic beliefs peculiar to Christian doctrine. Such, for example, is the prophecy of the second coming of Christ, the prophecy of the Last Judgment on that occasion, and the prophecy of a final conflagration to cleanse the world, which will precede the resurrection of the body as that in turn precedes the general judgment of souls.

Aquinas discusses the various signs which will foretell the imminence of these events. He also raises the question whether the time of the end of the world and of the resurrection can be known exactly. On this he agrees with Augustine that "that time is hidden from men." It cannot be calculated by natural reason, nor is it revealed. "Of that day and hour," it is written in Matthew, "no one knoweth, no, not the angels of heaven." When the apostles asked Christ about His second coming, He answered, according to Saint Paul, "It is not for you to know the times or moments which the Father hath put in His own power."

What Christ refused to tell the apostles, Aquinas adds, "He will not reveal to others. Wherefore all those who have been misled to reckon the aforesaid time have so far proved to be untruthful; for some, as Augustine says, stated from our Lord's ascension to His last coming 400 years would elapse, others 500, others 1,000. The falseness of these calculators is evident, as will likewise be the falseness of those who even now cease not to calculate."

The single greatest prophecy in the Judaeo-Christian tradition is, perhaps, the messianic prophecy—the foretelling of a Messiah or of a messianic age. The prediction of a Messiah or Saviour, who shall be born of the house of David and shall be king of the Jews, runs throughout the prophetic books of the Old Testament, though with different degrees of explicitness and varying imagery in Daniel and Jeremiah, in Isaiah and Ezekiel.

"The Lord himself shall give you a sign," says Isaiah. "Behold a virgin shall conceive and bear a son, and shall call his name Immanuel. . . . For unto us a child is born, unto us a son is given," Isaiah goes on, "and the government shall be upon his shoulder, and his name shall be called Wonderful, Counsellor, The mighty God, The Everlasting Father, The Prince of Peace. Of the increase of his government and peace, there shall be no end, upon the throne of David and upon his kingdom, to order it and to establish it with justice from henceforth even for ever." And Jeremiah tells his people, "Behold the days come, saith the Lord, that I will raise unto David a righteous Branch and a King shall reign and prosper and shall execute judgment and justice in the earth. In his days, Judah shall be saved, and Israel shall dwell safely."

Two of the great issues between the Jewish and Christian faiths concern these messianic prophecies in the Old Testament. One arises from opposite interpretations of the event predicted—a messianic age in which the kingdom of the Jews will be established on earth in perpetual righteousness and glory, or the coming to earth of God's only begotten son, incarnate in human form, for the salvation of all mankind. The other arises from opposite answers to the question whether the prediction—on either interpretation—has been fulfilled.

It is, of course, the Christian view that the prophets foretold the coming of Christ and that their prophecy has been fulfilled. But more than that, Christian apologists and theologians seem to make the fulfillment of Hebrew prophecies, interpreted as foreshadowing the truths of the Christian religion, a source of verification for these truths.

The difference between Jesus Christ and Mahomet, according to Pascal, is that "Mahomet was not foretold; Jesus Christ was foretold. I see many contradictory religions, and consequently all false save one," he writes. "Each wants to be believed on its own authority, and threatens unbelievers. I do not therefore believe them. Everyone can say this; everyone can call himself a prophet. But I see the Christian religion wherein prophecies are fulfilled; and that is what everyone cannot do."

And in another place Pascal declares that "the prophecies are the strongest proof of Jesus Christ. . . . If one man alone had made a book of predictions about Jesus Christ, as to the time

and manner, and Jesus Christ had come in conformity to these prophecies, this fact would have infinite weight. But there is much more here. Here is a succession of men during four thousand years, who, consequently and without variation, come, one after another, to foretell this same event."

Centuries earlier Augustine writes in a similar vein. The Hebrew people as a whole are chosen to perform this prophetic function—to foretell, "sometimes through men who understood what they spake, and sometimes through men who understood not, all that has transpired since the advent of Christ until now, and all that will transpire." Not only the explicit "prophecies which are contained in words," but all the rituals and ceremonies, the offices and institutions, of the Jewish religion prefigure Christianity, signifying and fore-announcing "those things which we who believe in Jesus Christ unto eternal life believe to have been fulfilled, or behold in process of fulfillment, or confidently believe shall yet be fulfilled."

OUTLINE OF TOPICS

PAGE

1. The nature and power of prophecy 461

1*a*. Prophecy as the reading of fate, the foretelling of fortune, the beholding of the future

1*b*. Prophecy as supernaturally inspired foresight into the course of providence 462

1*c*. Prophecy as the instrument of providence: prophets as moral teachers and political reformers

1*d*. The religious significance of the fulfillment of prophecy 463

2. The vocation of prophecy: the possession of foreknowledge

2*a*. The foreknowledge possessed by the spirits in the afterworld

2*b*. The political office of prophecy: priests, soothsayers, oracles 464

2*c*. The Hebraic conception of the prophetic vocation: the law and the prophets; Christ as prophet

3. The varieties of prophecy and the instruments of divination 465

3*a*. The institution of oracles: the interpretation of oracular or prophetic utterances

3*b*. Omens and portents: celestial and terrestrial signs; signs as confirmations of prophecy

3*c*. Dreams, visions, visitations 466

3*d*. Prophecy by the direct word of God 467

4. Particular prophecies of hope and doom 468

4*a*. The Covenant and the Promised Land

4*b*. The destruction of Jerusalem and the dispersion of Israel: the restoration of Israel and the rebuilding of the Temple

4*c*. The coming of a Messiah: Hebraic and Christian readings of messianic prophecy

4*d*. The second coming of the Lord: the Day of Judgment, the end of the world, and the millenium 469

5. The criticism and rejection of prophecy: the distinction between true and false prophecy; the condemnation of astrology and divination as impiety or superstition

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265–283] **12d**, the number **4** is the number of the volume in the set; the number **12d** indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters **a** and **b** refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, **116a-119b**, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters **a** and **b** refer to the upper and lower halves of the left-hand side of the page, the letters **c** and **d** to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, **163b-164c**, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; *e.g.*, *Iliad*, BK II [265–283] **12d**.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (*D*), follows; *e.g.*, OLD TESTAMENT: *Nehemiah*, 7:45—(*D*) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature and power of prophecy

1*a*. Prophecy as the reading of fate, the foretelling of fortune, the beholding of the future

4 HOMER: *Iliad*, BK XVI [843–861] **121c**; BK XVIII [94–137] **131a-c**; BK XXII [355–366] **159a** / *Odyssey*, BK X [487–540] **241a-c**; BK XI [90–137] **244a-c**; BK XIV [321–336] **263b-c**; BK XIX [291–307] **292b**

5 AESCHYLUS: *Persians* [739–842] **23a-24b** / *Seven Against Thebes* [1–38] **27a-c** / *Prometheus Bound* [88–114] **41a-b**; [907–940] **49d-50a** / *Agamemnon* [104–159] **53a-d**; [248–254] **54d**; [1072–1342] **63c-66b**

5 SOPHOCLES: *Oedipus the King* [300–512] **102a-103d** / *Oedipus at Colonus* [1348–1555] **126c-128b** / *Antigone* [988–1114] **139c-140c** / *Ajax* [745–783] **149c-d** / *Trachiniae* [155–177] **171c**; [821–830] **177b** / *Philoctetes* [604–619] **187c**; [1326–1347] **194a**; [1408–1444] **194d-195a,c**

5 EURIPIDES: *Trojan Women* [308–461] **272d-274a** / *Electra* [1233–1359] **338b-339a,c** / *Phoenician Maidens* [834–1018] **385c-387b** / *Iphigenia Among the Tauri* [1234–1283] **422b-c**

6 HERODOTUS: *History*, BK I, **12b-d**; BK II, **77a-b**; BK VI, **189a-b**; **190c-d**; **199d-201a**; **201d-202c**; **204b-c**; BK VII, **223b-c**; **227a**; **239c-240d**; **248b-c**; **255c-d**; BK VIII, **263b-c**; **268b-d**; **270c-271a**; **273b-c**; **276d-277a**; BK IX, **308a-c**

7 PLATO: *Phaedrus*, **123b-d** / *Symposium*, **153a-b**; **156d-157a** / *Apology*, **210d-211a** / *Gorgias*, **292b-d** / *Timaeus*, **466d-467c**

9 ARISTOTLE: *Rhetoric*, BK I, CH 15 [$1375^{b}35$–$1376^{a}2$] **620c**

12 EPICTETUS: *Discourses*, BK I, CH 17, **123b-124a**

13 VIRGIL: *Eclogues*, IV **14a-15b** / *Aeneid*, BK I [223–304] **109a-111a**; BK VIII [608–731] **275a-278b**

14 PLUTARCH: *Romulus*, **20b-c** / *Numa Pompilius*, **52b-c** / *Poplicola*, **82a-b** / *Pericles*, **123c-124a** / *Fabius*, **141d-142a** / *Marcellus*, **259c-260c** / *Sulla*, **371d-372c** / *Lucullus*, **404d-405a** / *Caesar*, **601c-602a** / *Tiberius Gracchus*, **679a-680b** / *Demosthenes*, **698b-699a**

18 AUGUSTINE: *City of God*, BK XIX, CH 22 **525b-c**

23 HOBBES: *Leviathan*, PART III, **183b-d**

27 SHAKESPEARE: *Macbeth*, ACT I, SC III **285b-287b**; ACT IV, SC I **300b-302b**; ACT V, SC VIII [9–22] **310a-b** / *Cymbeline*, ACT V, SC V [426–475] **488b-d**

40 GIBBON: *Decline and Fall*, **56b**
