# How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopædia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

## Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ö, ł, or ñ) and foreign letters without parallels in English (such as ayin [ʿ] and hamza [ʾ]) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as **1812, War of**, are alphabetized as if the numbers were written out (**Eighteen-twelve, War of**).

Alphabetization proceeds according to the "word-by-word" principle. Thus, **Mount Vernon** precedes **mountain**; any **John** entry precedes **John Henry**, which in turn precedes **Johne's disease**. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, **De Broglie** precedes **debenture**, and **jack-o'-lantern** precedes **jackal**. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (*e.g.,* William) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (**William I, William II**, etc.). Nobility or peers of the same titled name (*e.g.,* **Essex, EARLS OF**) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

## Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions.

Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal, Bay of**; the Bank of England as **England, Bank of**; the Tower of London as **London, Tower of**; the Siege of Vienna as **Vienna, Siege of**; and the balance of power as **power, balance of.** If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland, Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry **March, Patrick Dunbar, 2nd Earl of**, is read "Patrick Dunbar, 2nd Earl of March"; the entry **Orléans, Louis, duc d'**, is read "Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (*e.g.,* **Tōjō Hideki, Deng Xiaoping, Nguyen Cao Ky**).

## Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by *see, see also, see under, q.v.* (*quod vide,* "which see"), or *qq.v.* (*quae vide,* "which see," plural).

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (*e.g.,* **igneous rock**) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (*e.g.,* **music**) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

## Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

## Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power.

**Solovyov, Sergey Mikhaylovich,** Solovyov also spelled SOLOVIEV (b. May 5 [May 17, New Style], 1820, Moscow, Russia—d. April 4 [April 16], 1879, Moscow), one of the greatest Russian historians.

The son of a clergyman, Solovyov graduated from Moscow University in 1842 and joined the faculty of that institution as an assistant professor of Russian history in 1845. He became a full professor in 1850 and served in that capacity until his retirement in 1877. In the course of his academic career Solovyov held several important administrative posts at Moscow University, published several works concerning Peter I the Great and Alexander I, and acted as tutor to the tsarevich Nikolay Aleksandrovich (1859) and to the future tsar Alexander III (1866). Solovyov's reputation as one of the greatest of all Russian historians rests on his monumental 29-volume *History of Russia From Ancient Times*, 28 volumes of which were published between 1851 and Solovyov's death in 1879. The *History* wove a vast body of data into a unified and orderly whole that provided an exceptionally powerful and vivid picture of Russia's political development over the centuries. The work inaugurated a new era in Russian scholarship with its depiction of Russia as evolving through organic and rational processes from a primitive, family-based society into a centralized, autocratic state. Solovyov's work greatly influenced virtually all later Russian historians.

**Solovyov, Vladimir Sergeyevich,** Solovyov also spelled SOLOVIEV (b. Jan. 16 [Jan. 28, New Style], 1853, Moscow, Russia—d. July 31 [Aug. 13], 1900, Uzkoye, near Moscow), Russian philosopher and mystic who, reacting to European rationalist thought, attempted a synthesis of religious philosophy, science, and ethics in the context of a universal Christianity uniting the Orthodox and Roman Catholic churches under papal leadership.

He was the son of the historian Sergey M. Solovyov. After a basic education in languages, history, and philosophy at his Orthodox home, he took his doctorate at Moscow University in 1874 with the dissertation "The Crisis of Western Philosophy: Against the Positivists." After travels in the West, he wrote a second thesis, a critique of abstract principles, and accepted a teaching post at the University of St. Petersburg, where he delivered his celebrated lectures on *Godmanhood* (1880). This appointment was later rescinded because of Solovyov's clemency appeal for the March 1881 assassins of Tsar Alexander II. He also encountered official opposition to his writings and to his activity in promoting the union of Eastern Orthodoxy with the Roman Catholic church.

Solovyov criticized Western empiricist and idealist philosophy for attributing absolute significance to partial insights and abstract principles. Drawing on the writings of Benedict de Spinoza and G.W.F. Hegel, he regarded life as a dialectical process, involving the interaction of knowledge and reality through conflicting tensions. Assuming the ultimate unity of Absolute Being, termed God in the Judeo-Christian tradition, Solovyov proposed that the world's multiplicity, which had originated in a single creative source, was undergoing a process of reintegration with that source. Solovyov asserted, by his concept of Godmanhood, that the unique intermediary between the world and God could only be man, who alone is the highest part of nature capable of knowing and expressing the divine idea of "absolute unitotality" in the chaotic multiplicity of real experience. Consequently, the perfect revelation of God is Christ's incarnation in human nature.

For Solovyov, ethics became a dialectical problem of basing the morality of human acts and decisions on the extent of their contribution to the world's integration with ultimate divine unity, a theory expressed in his *The Meaning of Love* (1894).

**Solow, Robert Merton** (b. Aug. 23, 1924, Brooklyn, New York, N.Y., U.S.), American economist who was awarded the 1987 Nobel Prize for Economics for his important contributions to the theory of economic growth.

Solow received his B.A. (1947), M.A. (1949), and Ph.D. (1951) degrees from Harvard University. He began teaching economics at the Massachusetts Institute of Technology in 1949 and became a full professor there in 1958. He served on the Council of Economic Advisers in 1961–62 and was a consultant to that body from 1962 to 1968.

In the 1950s Solow developed a mathematical model that could show the relative contributions of various factors to producing sustained national economic growth. Contrary to traditional economic thinking, he showed that the rate of technological progress is actually more important than capital accumulation and increases in labour in achieving such growth. The greater efficiency and productivity that result from qualitative improvements such as new machines and improved human skills are thus more important than strictly quantitative investments that result in a greater number of machines and factories. From the 1960s on, Solow's studies were influential in persuading governments to channel their funds into technological research and development in order to spur economic growth.

**Solstad, Dag** (b. July 16, 1941, Sandefjord, Nor.), novelist, short-story writer, and dramatist, one of the most significant Norwegian writers to emerge during the 1960s.

Solstad began his career as a writer of short experimental fictions that investigated the themes of identity and alienation: *Spiraler* (1965; "Spirals") and *Svingstol* (1967; "Swing Chair"). His novel *Ir/ Grønt!* (1969; "Patina! Green!") described the efforts of a peasant student to escape his limited background. Solstad's fiction took a more directly political turn with the novel *Arild Asnes, 1970* (1971), which traced the development of a young man to the point at which he perceived that political revolution was necessary and must be brought about by conflict. In *25 September Plassen* (1974; "September 25th Square") he showed the growing political awareness on the part of factory workers in the period following World War II. *Svik. Forkrigsår* (1977; "Betrayal: Prewar Years") and *Krig. 1940* (1978; "War: 1940") were the first two in a series of novels that gave a minutely documented account of Norway in World War II.

**solstice,** either of the two moments in the year when the Sun's apparent path is farthest north or south from the Earth's Equator. In the Northern Hemisphere the summer solstice occurs on June 21 or 22 and the winter solstice on December 21 or 22. The situation is exactly the opposite in the Southern Hemisphere, where the seasons are reversed. The term solstice also is used in reference to either of the two points of greatest deviation of the ecliptic (the Sun's apparent annual path) from the celestial equator.

At the time of the summer solstice in the Northern Hemisphere, the North Pole is tilted 23.45° (23°27′) toward the Sun. Because the Sun's rays are shifted northward by the same amount, the vertical noon rays are directly overhead at the Tropic of Cancer (23°27′ N). Six months later, the south polar end of the Earth is inclined 23.45° toward the Sun. On this day of the summer solstice in the Southern Hemisphere, the Sun's vertical overhead rays progress to their southernmost position, the Tropic of Capricorn (23°27′ S). *Compare* equinox; *see also* season.

**Solti, Sir Georg,** original name GYÖRGY SOLTI (b. Oct. 21, 1912, Budapest, Hung.—d. Sept. 5, 1997, Antibes, France), Hungarian-born British conductor and pianist, one of the most highly regarded conductors of the second half of the 20th century.

Solti studied at the Liszt Academy in Budapest with Béla Bartók and Zoltán Kodály. At 18 he joined the coaching staff of the Budapest Opera and made his conducting debut there in 1938. A Jew, he found safety in Zürich during World War II, but his alien status prevented him from conducting professionally. He won the Geneva International Piano Competition in 1942. After the war, he became musical director of the Bavarian State Opera in Munich (1946–52), the Frankfurt Opera (1952–60), and Covent Garden (1961–71). He was knighted in 1971 and assumed British citizenship in 1972.

From 1969 to 1991 he was musical director of the Chicago Symphony Orchestra, reestablishing that orchestra's international reputation. He served in the same post for the Orchestra of Paris (1972–75) and acted as musical adviser to the Paris Opéra from 1971 to 1973. He was the principal conductor and artistic director of the London Philharmonic Orchestra from 1979 to 1983.

As a conductor Solti was best known for his dramatic and deeply felt interpretations of operas, symphonies, and other large-scale works by W.A. Mozart, Ludwig van Beethoven, Franz Schubert, Richard Wagner, Richard Strauss, and Gustav Mahler. He was particularly notable for his sharp attention to musical detail and his ability to evoke a wide range of tonal colours from an orchestra. He made many highly praised recordings from the late 1940s as both conductor and solo performer. In 1966 Solti made the highly acclaimed first complete recording of Richard Wagner's opera cycle, *The Ring of the Nibelung* (*Der Ring des Nibelungen*).

**solution,** in chemistry, homogenous mixture of two or more substances in relative amounts that can be varied continuously up to what is called the limit of solubility. The term solution is commonly applied to the liquid state of matter, but solutions of gases and solids are possible. Air, for example, is a solution consisting chiefly of oxygen and nitrogen with trace amounts of several other gases, and brass is a solution composed of copper and zinc.

A brief treatment of solutions follows. For full treatment, *see* MACROPAEDIA: Matter.

Life processes depend in large part on solutions. Oxygen from the lungs goes into solution in the blood plasma, unites chemically with the hemoglobin in the red blood cells, and is released to the body tissues. The products of digestion also are carried in solution to the different parts of the body. The ability of liquids to dissolve other fluids or solids has many practical applications. Chemists take advantage of differences in solubility to separate and purify materials and to carry out chemical analysis. Most chemical reactions occur in solution and are influenced by the solubilities of the reagents. Materials for chemical manufacturing equipment are selected to resist the solvent action of their contents.

The liquid in a solution is customarily designated the solvent, and the substance added is called the solute. If both components are liquids, the distinction loses significance; the one present in smaller concentration is likely to be called the solute. The concentration of any component in a solution may be expressed in units of weight or volume or in moles. These may be mixed—*e.g.*, moles per litre and moles per kilogram.

Crystals of some salts contain lattices of ions—*i.e.*, atoms or groups of atoms with alternating positive and negative charges. When such a crystal is to be dissolved, the attraction of the oppositely charged ions, which are

largely responsible for cohesion in the crystal, must be overcome by electric charges in the solvent. These may be provided by the ions of a fused salt or by electric dipoles in the molecules of the solvent. Such solvents include water, methyl alcohol, liquid ammonia, and hydrogen fluoride. The ions of the solute, surrounded by dipolar molecules of the solvent, are detached from each other and are free to migrate to charged electrodes. Such a solution can conduct electricity, and the solute is called an electrolyte.

The potential energy of attraction between simple, nonpolar molecules (nonelectrolytes) is of very short range; it decreases approximately as the seventh power of the distance between them. For electrolytes the energy of attraction and repulsion of charged ions drops only as the first power of the distance. Accordingly, their solutions have very different properties from those of nonelectrolytes.

It is generally presumed that all gases are completely miscible (mutually soluble in all proportions), but this is true only at normal pressures. At high pressures, pairs of chemically dissimilar gases may very well exhibit only limited miscibility. Many different metals are miscible in the liquid state, occasionally forming recognizable compounds. Some are sufficiently alike to form solid solutions (*see* alloy).

*Consult the* INDEX *first*

**Solutrean industry,** short-lived style of toolmaking that flourished approximately 17,000 to 21,000 years ago in southwestern France (*e.g.*, at Laugerie-Haute and La Solutré) and in nearby areas. The industry is of special interest because of its particularly fine workmanship. The Solutrean industry, like those of other late Paleolithic big-game hunters, contained a variety of tools such as burins (woodworking tools rather like chisels), scrapers, and borers; but blades that were formed in the shape of laurel or willow leaves and shouldered points are the implements that distinguish the Solutrean.

In the early Solutrean, unifacial points (flaked on only one side) are common. In the middle Solutrean, these are gradually replaced by laurel-leaf blades and bifacial points. Tiny blunt-backed flint blades and scrapers and single-shouldered points also occur. Bizarre implements, with notches or asymmetrical shapes, appear; these and laurel-leaf blades so fine as to have precluded their use as tools suggest the production of fine-flaked implements for purposes of luxury alone. In the late Solutrean, the willow-leaf blade (slim, with rounded ends and retouching on one side only) of extremely fine workmanship made its appearance. Bone needles with eyes occur and indicate the use of fitted clothing, useful in a near-glacial climate. There is much evidence of the use of ornament: bracelets, bead necklaces, pendants, bone pins, and coloured pigments must have been used for personal adornment. Stone friezes, bas-reliefs, and paintings on stone plaques and cave walls are known. Even tool stone was chosen for its beauty; coloured quartz, jasper, and handsome flints abound.

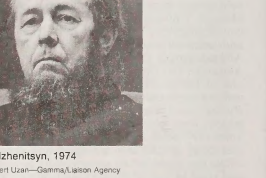
The origin of the Solutrean stoneworking technique is in some dispute. Most of the evidence indicates it was an invention indigenous to the Dordogne region of France, but some scholars attribute its swift appearance to the arrival of a new people and its equally swift disappearance to destruction of the Solutrean people by another group arriving with a different tool industry. The Solutrean follows the Perigordian and Aurignacian industries and is succeeded by the Magdalenian.

**Solvay, Ernest** (b. April 16, 1838, Rebecq-Rognon, near Brussels, Belg.—d. May 26, 1922, Brussels), Belgian industrial chemist, best known for his development of a commercially viable ammonia-soda process for producing soda ash (sodium carbonate), widely used in the manufacture of such products as glass and soap.

After attending local schools, Solvay entered his father's salt-making business. At the age of 21 he began working with an uncle at a gasworks near Brussels, and while there he began to develop the conversion method for which he is known.

Although the ammonia-soda process had been understood since 1811, a suitable and economical means of large-scale commercial production had evaded industrial chemists. Solvay, who was unaware that the reaction itself had been known for 50 years, solved the practical problems of large-scale production by his invention of the Solvay carbonating tower, in which an ammonia-salt solution could be mixed with carbon dioxide. In 1861 he and his brother Alfred founded their own company and in 1863 had a factory built. Production started in 1865, and by 1890 Solvay had established companies in several foreign countries. Solvay's method was gradually adopted throughout much of Europe and elsewhere and by the late 19th century had supplanted the Leblanc process, which had been chiefly used for converting common salt into sodium carbonate since the 1820s.

This success brought Solvay considerable wealth, which he used for various philanthropic purposes, including the founding of various international institutes of scientific research in chemistry, physics, and sociology. The Solvay conferences on physics were particularly noted for their role in the development of theories on quantum mechanics and atomic structure.



**Solvay process:** *see* ammonia-soda process.

**Solyman** (Turkish or Arabic personal name): *see under* Süleyman.

**Solzhenitsyn, Aleksandr (Isayevich)** (b. Dec. 11, 1918, Kislovodsk, Russia [U.S.S.R.]), Russian novelist and historian, who was awarded the Nobel Prize for Literature for 1970 and was exiled from the Soviet Union in 1974.

Solzhenitsyn was born into a family of Cossack intellectuals and brought up primarily by his mother (his father was killed in an accident before his birth). He attended the University of Rostov-na-Donu, graduating in mathematics, and took correspondence courses in literature at Moscow State University. He fought in World War II, achieving the rank of captain of artillery; in 1945, however, he was arrested for writing a letter in which he criticized Joseph Stalin and spent eight years in prisons and labour camps, after which he spent three more years in enforced exile. Rehabilitated in 1956, he was allowed to settle in Ryazan, in central Russia, where he became a mathematics teacher and began to write.

Encouraged by the loosening of government restraints on cultural life that was a hallmark of the de-Stalinizing policies of the early 1960s, Solzhenitsyn submitted his short novel *Odin den iz zhizni Ivana Denisovicha* (1962; *One Day in the Life of Ivan Denisovich*) to the leading Soviet literary periodical *Novy Mir* ("New World"). The novel quickly appeared in that journal's pages and met with immediate popularity, Solzhenitsyn becoming an instant celebrity. *Ivan Denisovich,* based on Solzhenitsyn's own experiences, described a typical day in the life of an inmate of a forced-labour camp during the Stalin era. The impression made on the public by the book's simple, direct language and by the obvious authority with which it treated the daily struggles and material hardships of camp life was magnified by its being one of the first Soviet literary works of the post-Stalin era to directly describe such a life. The book produced a political sensation both abroad and in the Soviet

Solzhenitsyn, 1974
Gilbert Uzan—Gamma/Liaison Agency

Union, where it inspired a number of other writers to produce accounts of their imprisonment under Stalin's regime.

Solzhenitsyn's period of official favour proved to be short-lived, however. Ideological strictures on cultural activity in the Soviet Union tightened with Nikita Khrushchev's fall from power in 1964, and Solzhenitsyn met first with increasing criticism and then with overt harassment from the authorities when he emerged as an eloquent opponent of repressive government policies. After the publication of a collection of his short stories in 1963, he was denied further official publication of his work, and he resorted to circulating them in the form of *samizdat* ("self-published") literature—*i.e.*, as illegal literature circulated clandestinely—as well as publishing them abroad.

The following years were marked by the foreign publication of several ambitious novels that secured Solzhenitsyn's international literary reputation. *V kruge pervom* (1968; *The First Circle*) was indirectly based on his years spent working in a prison research institute as a mathematician. The book traces the varying responses of scientists at work on research for the secret police as they must decide whether to cooperate with the authorities and thus remain within the research prison or to refuse their services and be thrust back into the brutal conditions of the labour camps. *Rakovy korpus* (1968; *Cancer Ward*) was based on Solzhenitsyn's hospitalization and successful treatment for terminally diagnosed cancer during his forced exile in Kazakhstan during the mid-1950s. The main character, like Solzhenitsyn himself, was a recently released inmate of the camps.

In 1970 Solzhenitsyn was awarded the Nobel Prize for Literature, but he declined to go to Stockholm to receive the prize for fear he would not be readmitted to the Soviet Union by the government upon his return. His next novel to be published outside the Soviet Union was *August 1914* (1971; *August 1914*), a historical novel treating Germany's crushing victory over Russia in their initial military engagement of World War I, the Battle of Tannenburg. The novel centred on several characters in the doomed 1st Army of the Russian general A.V. Samsonov and indirectly explored the weaknesses of the tsarist regime that eventually led to its downfall by revolution in 1917.

In December 1973 the first parts of *Arkhipelag Gulag* (*The Gulag Archipelago*) were published in Paris after a copy of the manuscript had been seized in the Soviet Union by the KGB. (*Gulag* is an acronym formed from the official Soviet designation of its system of prisons and labour camps.) *The Gulag Archipelago* is Solzhenitsyn's attempt

to compile a literary-historical record of the vast system of prisons and labour camps that came into being shortly after the Bolsheviks seized power in Russia (1917) and that underwent an enormous expansion during the rule of Stalin (1924–53). Various sections of the work describe the arrest, interrogation, conviction, transportation, and imprisonment of the Gulag's victims as practiced by Soviet authorities over four decades. The work mingles historical exposition and Solzhenitsyn's own autobiographical accounts with the voluminous personal testimony of other inmates.

Upon publication of the first volume of *The Gulag Archipelago,* Solzhenitsyn was immediately attacked in the Soviet press. Despite the intense interest in his fate that was shown in the West, he was arrested and charged with treason on Feb. 12, 1974. Solzhenitsyn was exiled from the Soviet Union on the following day, and in December he took possession of his Nobel Prize.

In 1975 a documentary novel, *Lenin v Tsyurikhe: glavy* (*Lenin in Zurich: Chapters*), appeared. Subsequently, Solzhenitsyn traveled to the United States, where he eventually settled. The second and third volumes of *The Gulag Archipelago* were published in 1974–75. Solzhenitsyn produced two books of nonfiction in 1980: *The Oak and the Calf,* which portrayed literary life in the Soviet Union, and the brief *The Mortal Danger,* which analyzed what he perceived to be the perils of American misconceptions about Russia. In 1983 an extensively expanded and revised version of *August 1914* appeared in Russian as the first part of a projected series, *Krasnoe koleso* (*The Red Wheel*); other volumes (or *uzly* ["knots"]) in the series were *Oktyabr 1916* ("October 1916"), *Mart 1917* ("March 1917"), and *Aprel 1917* ("April 1917").

In presenting alternatives to the Soviet regime, Solzhenitsyn tended to reject Western emphases on democracy and individual freedom and instead favoured the formation of a benevolent authoritarian regime that would draw upon the resources of Russia's traditional Christian values. The introduction of glasnost ("openness") in the late 1980s brought renewed access to Solzhenitsyn's work in the Soviet Union. In 1989 the Soviet literary magazine *Novy Mir* published the first officially approved excerpts from *The Gulag Archipelago.* Other works were also published, and Solzhenitsyn's Soviet citizenship was officially restored in 1990. He ended his exile and returned to Russia in 1994.

**soma,** in ancient Indian cult worship, an unidentified plant, the juice of which was a fundamental offering of the Vedic sacrifices. The stalks of the plant were pressed between stones, and the juice was filtered through sheep's wool and then mixed with water and milk. After first being offered as a libation to the gods, the remainder of the soma was consumed by the priests and the sacrificer. It was highly valued for its exhilarating, probably hallucinogenic, effect. The personified deity Soma was the "master of plants," the healer of disease, and the bestower of riches.

The soma cult exhibits a number of similarities to the corresponding haoma cult of the ancient Iranians and is suggestive of shared beliefs among the ancient Indo-Europeans in a kind of elixir of the gods. Like haoma, the soma plant grows in the mountains, but its true origin is believed to be heaven, whence it was brought to earth by an eagle. The pressing of soma was associated with the fertilizing rain, which makes possible all life and growth. In the post-Vedic classical period, soma is identified with the moon, which wanes when soma is drunk by the gods.

**soma,** in biology, all the living matter of an animal or a plant except the reproductive, or germ, cells. The distinction between the soma and the germ cells was propounded by the 19th-century German biologist August Weismann in the "germ plasm" theory that emphasized the role of the immortal, heredity-carrying genes and chromosomes, which are transmitted through successive generations of each species and determine the character of each individual in the propagative chain.

**Somadeva** (fl. 1070), Kashmiri Brahman of the Śaiva sect and Sanskrit writer who preserved much of India's ancient folklore in the form of a series of tales in verse.

The court poet to King Ananta of Kashmir, Somadeva apparently was commissioned to compose a cycle of stories to amuse and calm the queen Sūryamati during a political crisis. He borrowed from an earlier work, now lost, the *Bṛhat-katha* ("Great Tale") by the Sanskrit writer Guṇāḍhya, who probably had used Buddhist sources of an even earlier period. Somadeva's work *Kathā-saritsāgara* ("Ocean of Rivers of Stories") bears a strong resemblance to medieval European fairy tales: magic, demons, bloody orgies, vampires, love, and high adventure abound in the 124 sections, or chapters, known as *taraṅga* ("waves"). An English translation by Charles H. Tawney, titled *The Ocean of Story,* was published in 1924–28. Somadeva wrote his monumental work during the two periods of Ananta's interrupted rule, which ended in 1077.

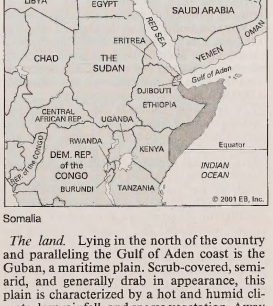
**Somali,** people of Africa occupying all of Somalia, a strip of Djibouti, the southern Ethiopian region of Ogaden, and part of northwestern Kenya. Except for the arid coastal area in the north, the Somalis occupy true nomad regions of plains, coarse grass, and streams. They speak a language of the Cushitic branch of the Afro-Asiatic (formerly Hamito-Semitic) family.

It is believed that in the 14th century the Somalis, converted to Islām by Arabs from across the Red Sea, began their expansion southward from the arid steppes to their present borders, which overflow what was traditionally known as Somaliland. Although three great divisions of Somalis exist, roughly corresponding to the northern, central, and southern parts of the region, the Somalis demonstrate considerable cultural unity.

The basis of Somali society is the *rēr,* or large, self-contained kinship group or clan, consisting of a number of families claiming common descent from a male ancestor. A Somali has obligations both to his *rēr* and to the loosely defined tribe of which his *rēr* is a part. Government of the *rēr* is markedly patriarchal, although the chief is chosen by a group of elders who counsel him.

The Somalis are primarily nomadic herders who, because of intense competition for scarce resources, have been extremely individualistic and frequently involved in blood feuds or wars with neighbouring tribes and peoples. Their conception of Islām is vague, and religious practices are dominated by the worship of ancestral saints.

A second category of Somalis are the townspeople and agriculturists of the urban centres, especially along the coast of the Horn of Africa, where intense and prolonged intimacy with the Islāmic tradition has rendered the culture highly organized and religiously orthodox and where geographic position has turned the townspeople into commercial middlemen between the Arab world and the nomadic tribes of the interior.



**Somali Basin,** submarine basin on the floor of the southwestern Arabian Sea, an arm of the Indian Ocean, east of Somalia. The Carlsberg Ridge separates it from the shallower Arabian Basin to the northeast. The Somali Basin also connects with the Mascarene and Madagascar basins to the south, with sill depths greater than 11,800 feet (3,600 m). Sill depths between the Somali and Arabian basins have been deduced from the minimum temperatures observed in the two areas.

**Somali Current,** surface current of the western Indian Ocean, caused during the northern summer months by the blowing of the southwest monsoon along the coast of East Africa, moving coastal waters northeastward along with it for about 950 miles (1,500 km). At longitude 6°–10° N (off Somalia), the northeastward Somali flow turns eastward as the Monsoon Current. With the monsoon's reversal to the northeast in September, the current begins to weaken until, in the winter, it disappears entirely to be replaced by a slow southwestward drift.

**Somalia,** Somali SOOMAALIYA, Arabic AṢ-ṢŪMĀL, country of northeastern Africa located in the Horn of Africa, the most easterly projection of the continent. Stretching from the Equator to the Red Sea, Somalia is bounded on the north by the Gulf of Aden, on the east by the Indian Ocean, on the west by Kenya and Ethiopia, and on the northwest by Djibouti. Its capital is Mogadishu. Area 246,000 square miles (637,000 square km). Pop. (2000 est.) 7,253,000.

A brief treatment of Somalia follows. For full treatment, *see* MACROPAEDIA: Eastern Africa: *Somalia.*

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Somalia

*The land.* Lying in the north of the country and paralleling the Gulf of Aden coast is the Guban, a maritime plain. Scrub-covered, semiarid, and generally drab in appearance, this plain is characterized by a hot and humid climate, low rainfall, and sparse vegetation. Away from the Gulf of Aden the plain rises to the precipitous north-facing cliffs of dissected highlands, which form rugged mountain ranges that extend from the northwestern border with Ethiopia eastward to the tip of the Horn. Along this range occur the highest elevations in the country, including Mount Surud Cad, reaching an elevation of 7,897 feet (2,407 m). To the south the mountains give way to the Hawd Plateau, which is cooler and drier. The extreme south consists mainly of flat plains. The two major rivers, the Jubba and the Shabeelle, rise in Ethiopia and flow southward across the country toward the Indian Ocean. Somalia lies within the tropical and subtropical zones. Mean daily maximum temperatures range from 86° to 107° F (30° to 42° C), while mean daily minimums range from about 65° to 80° F (18° to 27° C). Rainfall is usually higher in the south and northwest and varies from 4 to 24 inches (100 to 610 mm) over the country as a whole. Most of the northern areas of Somalia support scattered low trees and widely scattered patches of grass. In higher regions small forests are found. The country's animal life includes lion, elephant, hyena, fox, leopard, giraffe, zebra, and antelope. Only a small percent of Somalia's land area is arable, nearly half of which is cropped with cereals. More than half of the

land area, however, is available as pasture or rangeland.

*The people.* More than two-thirds of Somalia's populace are nomadic or seminomadic. During the dry season the nomads concentrate in villages near water sources; when the rains begin, they disperse with their herds. Traditionally, nomadism has been considered the most desirable lifestyle. Somalis constitute the vast majority of the population. Cultural divisions between pastoral nomads and sedentary cultivators and herdsmen have been weakened by large migrations from the countryside into towns, but most Somalis maintain a strong loyalty to one of many clans and subclans. The Somali language, spoken throughout the country, has been one of the nation's strongest unifying factors. Islām is the official religion and is practiced by most Somalis.

The largest concentrations of sedentary population are in the south and in the Jubba and Shabeelle valleys. Although the arid areas are sparsely populated, the urban population has increased rapidly since World War II and continues to grow. The cities of Somalia are not large. Mogadishu, the capital and largest city, was ravaged by civil war in the early 1990s.

Somalia's annual rate of population growth normally has been above average for sub-Saharan Africa, despite the country's high infant mortality rate and low life expectancy of 45 years for men and 48 years for women. In the 1970s and '80s Somalia had an influx of refugees numbering nearly 1,000,000—driven by war and drought from the Ogaden region of Ethiopia. During the early 1990s hundreds of thousands of Somalis died as a result of the violence, starvation, and disease that accompanied the drought and civil war. An estimated 1,000,000 refugees fled the country.

*The economy.* Somalia has a developing, mixed economy largely based on livestock and agriculture. It deteriorated rapidly after the outbreak of civil war in the early 1990s. The gross national product (GNP) per capita remains among the lowest in the world.

Agriculture traditionally has contributed about two-thirds of the gross domestic product (GDP) and has employed almost three-fourths of the workforce. The livestock industry expanded rapidly, beginning in the 1960s, and during the 1980s livestock products constituted in excess of the total exports. Bananas and other fruits are grown along the Jubba and Shabeelle rivers; other crops include sugarcane, cotton, corn (maize), and sorghum. During the 1970s and '80s government efforts to revitalize the Somalian fishing industry improved the size of catches.

Industry, accounting for a negligible portion of the GDP and employing much less than one-tenth of the workforce, is small-scale and consists mostly of meat and fish processing and textile and leather-goods production. Most of the enterprises have been state-owned, but the private sector is of increasing importance. Electricity is limited to the urban areas and is entirely generated by thermal sources.

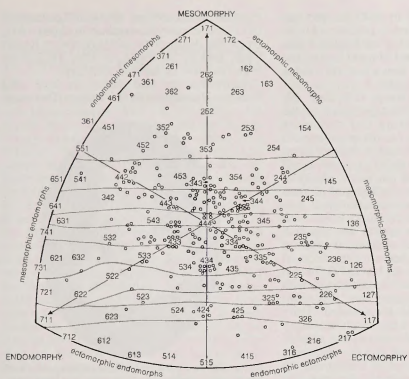
The national budget of Somalia normally has been divided into the ordinary budget, which was financed from internal sources, and the development budget, which was largely financed from overseas sources. Somalia is burdened by an increasing balance of payments deficit, and increasing amounts of foreign assistance have been required to offset deficits. Imports, composed largely of petroleum products, fertilizers and pesticides, basic manufactures, and foodstuffs, are supplied chiefly by western Europe. Italy, Saudi Arabia, and Yemen have been the chief markets for Somalia's exports of livestock, skins and hides, and bananas. The country has no railways, and internal transportation is by truck and bus. International and domestic air service is available, however, and there are several deep-water ports.

*Government and social conditions.* Since independence in 1960, Somalia has nominally been a republic. Its 1979 constitution vested executive power in the president and legislative authority in an elected People's Assembly, from which a central committee and cabinet were to be chosen. In reality, political parties as well as armed rebel groups have been based on loyalties to clan and region, and Somalia has never known stable, democratic rule. The central government collapsed in 1991, and control devolved into the hands of local clan leaders. In fact, no effective central government exists in the country. Much of Somalia's judicial system is based on Islāmic law, but an independent judiciary does not exist.

Health service in Somalia normally is provided through hospitals in the country's larger towns and cities, while a network of dispensaries serve the rural areas. Tuberculosis and leprosy are common diseases, but the major health problem is maternal and infant mortality. Doctors, however, are few, and medical supplies scarce; nurses and laboratory technicians are virtually unavailable. Social conditions are poor, and wages are at the subsistence level.

Education is officially compulsory at the primary level, but less than one-fifth of all primary-age children actually attend school. Secondary education is not compulsory. Somali National University (1954) at Mogadishu is the major institution of higher education. There are also vocational and teacher-training schools. Newspapers, printed in Arabic, Italian, or English, can be read only by a small educated elite. Radio Mogadishu and Radio Hargeysa broadcast daily in Somali.

*Cultural life.* Poetry is important in Somalia and deals with such subjects as war, peace, women, horses, and camels. Folk dancing is also a popular art. Somalis have a rich oral literature touching on subjects such as astronomy and astrology. The two principal cultural institutions in the country are the Garesa Museum and the National Theatre.



*History.* The northern and eastern Somali coasts probably formed part of Punt, mentioned in ancient Egyptian writings. Between the 7th and 10th century, immigrant Muslim Arabs and Persians developed trading posts along the Gulf of Aden and Indian Ocean coasts. By the 10th century the area inland from the Gulf of Aden was occupied by Somali nomads, and the south and west were inhabited by various groups of pastoral Oromo peoples. By this time Islām was firmly established in the trading centres of Mogadishu, Marka, Baraawe, Seylac, and Berbera. Intensive European exploration began after the British occupation of Aden in 1839. The British set up a protectorate in the north in 1884. In 1889 Italy acquired two protectorates in the northeast corner of Somalia, and in 1905 Italy assumed responsibility for another colony on the southern part of the Somali coast. In the early 1900s British rule of its dominions was hampered by Sayyid Maxamed Cabdulle Xasan, who rallied national Muslim solidarity against the British colonizers. In Italian Somaliland, however, Italian settlement was encouraged, and in 1936 Italian Somaliland was incorporated as a state in the Italian East African empire. During World War II the Italians invaded British Somaliland (1940); a year later British troops retook the area, and Britain administered the whole area until 1950, when Italian Somaliland became a United Nations trust territory, administered by Italy. In 1960 it was united with the former British Somaliland, and the two became the independent Republic of Somalia. In 1967 Cabdirashiid Cali Sherma'arke was elected president and Maxamed Xaaji Ibrahiim Cigaal became prime minister. Sherma'arke was assassinated in 1969, and the government of Prime Minister Cigaal fell to a military coup led by Major General Maxamed Siyaad Barre. Siyaad replaced the parliamentary regime with a Supreme Revolutionary Council consisting of military officers, formed the Somali Democratic Republic, and established strong relations with the Soviet Union. In 1977 Somalia invaded the Ogaden region of Ethiopia (inhabited almost entirely by ethnic Somalis) in an unsuccessful attempt to annex the territory. When the Soviet Union switched its support to Ethiopia, Siyaad's armies were pushed back into Somalia, and hundreds of thousands of refugees from the Ogaden region filled camps near the Ethiopian border. Siyaad was ousted in 1991 by an alliance of clan-based rebel groups. The country fragmented into a number of regions, each controlled by a clan or an alliance of clans. Fighting disrupted agricultural production, which was already suffering the effects of a prolonged drought; an estimated 1.5 million Somalis were threatened with starvation. Beginning in December 1992 a multinational force, led by the United States, intervened to secure food supplies but withdrew in the face of violent clan assaults in 1995. The country remained fragmented throughout the rest of the century, until May 2000 when a conference of national leaders established a charter for a transitional government. In August the transitional national assembly elected Abdiqassim Salad Hassan interim president.

**Somaliland,** historically, the area now comprising Somalia and Djibouti.

The region probably formed part of the "Land of Punt" known to the ancient Egyptians. Between the 7th and the 12th century AD, Muslim traders from Arabia and Iran settled on the coast, founding the cities of Seylac and Berbera on the Gulf of Aden, and Marka, Baraawe, and Mogadishu along the Indian Ocean. They exported precious gums, ostrich feathers, and slaves, waged war against the Christian Ethiopians of the interior, and organized themselves into sultanates (Adal, centred at Aybar, and Ajuran, centred at Mogadishu). The nomadic Somalis, who occupied the northern part of the country between the 10th and the 15th centuries, adopted Islām and served in the armies of the sultanates. Gradually the sultanates themselves came under Somali control, and the Somalis expanded southward toward Kenya.

When the European nations began to partition Africa among themselves in the late 19th century, France already possessed (from 1862) a station at Obock near the mouth of the Red Sea, other areas of the north coast were occupied by Egypt, and southern Somaliland recognized the overlordship of the sultan of Zanzibar. By the end of the 1880s France had expanded its holdings to the area of present Djibouti, Britain had established a protectorate over the north coast opposite its base at Aden, and Italy controlled the remainder of the country. In the north the Muslim leader Sayyid Maxamed Cabdulle Xasan began a war against the British in 1899 and maintained his hold over the interior until his death in 1920. The Italians acquired Jubaland in the extreme south after World War I, and in 1936 they united their Somali possessions with Ethiopia to form Italian East Africa. The British won control of the Italian zone during World War II. In 1960 British and Italian Somaliland were united to form the independent Republic of Somalia. French Somaliland (renamed the French Territory of the Afars and Issas in 1967) became independent as the Republic of Djibouti in 1977. An independent Republic of Somaliland that was declared following the collapse of central government in Somalia in the early 1990s failed to achieve international recognition.

**somatotype,** human body shape and physique type. The term somatotype is used in the sys-

Distribution of somatotypes of a group

tem of classification of human physical types developed by U.S. psychologist W.H. Sheldon. In Sheldon's system, human beings can be classified as to body build in terms of three extreme body types: endomorphic, or round, fat type; mesomorphic, or muscular type; and ectomorphic, or slim, linear type. A somatotype number of three digits is determined for an individual classified by the system, with the first digit referring to endomorphy, the second to mesomorphy, and the third to ectomorphy; each digit is on a scale of one to seven. Hence the extreme endomorph has the somatotype 711, the extreme mesomorph 171, and the extreme ectomorph 117. The classification numbers are negatively correlated, so that a high number in one class precludes high numbers in the others; in practice, extreme types (711, 171, 117) are rare or nonexistent, and the person of normal build has a somatotype approaching 444, evenly balanced between extremes. *See also* ectomorph; endomorph; mesomorph.

**Sombart, Werner** (b. Jan. 19, 1863, Ermsleben, Saxony, Prussia—d. May 18, 1941, Berlin), German historical economist who incorporated Marxist principles in his theories despite his attraction to Nazi theories.

Sombart, the son of a wealthy landowner and politician, was educated in Berlin, Pisa, and Rome, obtaining his Ph.D. at the University of Berlin in 1888. After teaching at Breslau he was appointed to an academic position in Berlin (1906), becoming a full professor in 1918.

Sombart was initially an enthusiastic supporter of Marxism but later became more conservative and strongly anti-Marxist. Nevertheless, his historical works on classes and the evolution of economic society, especially *Modern Capitalism* (1902), shows strongly the influence of Marx in his methodological approach. In this and later studies of capitalism Sombart propounded an evolutionary view of capitalism but not one that predicted its decay. He envisaged three stages in its evolution: the phase of the pre-Industrial Revolution merchant adventurer, the entrepreneurial phase, and the cooperative phase, with public ownership in the third one.

Although his work could be interpreted as supporting the economic views of National Socialism he was unsuccessful in playing a part in Nazi politics. In his *Die Juden und das Wirtschaftsleben* (1911) he was harshly critical of the role of Jews in the development of the modern market system. Sombart was widely recognized in his day despite his Nazi sympathies. Since his death, his name has fallen into obscurity.

**sombrero,** broad-brimmed, high-crowned hat made of felt or straw, worn especially in Spain, Mexico, and the southwestern United States. The sombrero, its name derived from the Spanish word *sombra,* meaning "shade," first appeared in the 15th century. Gentlemen often wore tan, white, or gray felt sombreros, while the peasants wore straw.

In Mexico the brim of the sombrero could be as much as two feet (60 centimetres) wide.

Mexican charro wearing a sombrero
Constantine Manos—Magnum

Adopted by ranchers and frontiersmen in the United States, the sombrero was modified into the cowboy hat.

**Somdet Chao Phraya Si Suriyawong:** *see* Si Suriyawong, Somdet Chao Phraya.

**Somers (of Evesham), John Somers, Baron** (b. March 4, 1651, Whiteladies, Claines, near Worcester, Worcestershire, Eng.—d. April 26, 1716, Brookmans, near Mimms North, Hertfordshire), English statesman, the chief minister to King William III of England from 1696 to 1700, and the leader of the group of influential Whigs known as the Junto from 1696 to 1716.

Admitted to the bar in 1676, he made his reputation by assisting in the successful defense (1688) of the seven Anglican bishops who were brought to trial for sedition by the Roman Catholic king James II. After James was deposed by William of Orange (later King William III), Somers was elected to Parliament (1689), and he became chairman of the committee that drew up the Bill of Rights. William appointed him attorney general (1692) and lord keeper of the great seal (1693); by 1696 he had become the King's leading adviser and the spokesman for Whig opinion. He became lord high chancellor and was elevated to the peerage in 1697, but the Tory majority in the House of Commons attacked him so vigorously that William asked for his resignation in 1700. In 1701 he was impeached by the House of Commons for abuse of ministerial power and his role in the Partition Treaties, but the House of Lords acquitted him. Although Queen Anne (ruled 1702–14) made him lord president of the Privy Council in 1708, Somers fell from power when the Tories won control of the government in 1710. In 1714 he became a member of George I's privy council. He died two years later without issue, and the barony became extinct. See W.L. Sachse, *Lord Somers* (1975).

**Somerset,** county of southwestern England, bordered on the northwest by the Bristol Channel. It covers 1,322 sq mi (3,451 sq km) and has five administrative districts: Mendip and Sedgemoor in the north, Yeovil and Taunton Deane further south, and West Somerset. The county consists of a low-lying basin, called Sedgemoor, near the coast, bounded on the northeast by the Mendip Hills and on the west by Exmoor and the Quantock Hills. The Mendips and the Quantock Hills are designated Areas of Outstanding Natural Beauty, and a large part of West Somerset is made up of Exmoor National Park. Long scenic stretches of the county's coastline have been selected for conservation.

Prehistoric settlement occurred chiefly on the relatively open uplands, particularly the Mendip Hills, but a prehistoric lake village has been excavated at Glastonbury. The Romans mined lead and built villas. From the 7th century Somerset formed the westernmost part of the Kingdom of Wessex, and castles such as those at Dunster and Taunton were built after the Norman Conquest.

Somerset is mainly an agricultural county. Dairy farming and stock rearing are important, and there is some market gardening. The county is traditionally associated with cider production, and the village of Cheddar, in the Mendip Hills, has given its name to the cheese.

Limestone and sandstone are quarried in the upland areas of the county, and elsewhere sand and gravel are worked. Peat extraction is important on Sedgemoor. In 1965 a nuclear power station was completed on the coast at Hinkley Point. Tourists, very important to the economy, are drawn by the Bristol Channel resorts such as Minehead and Burnham and by a number of National Trust properties and other historic mansions open to the public. The M5 motorway, passing Bridgwater and Taunton, connects Somerset with England's heavily urbanized areas and acts as a ma-

jor artery in bringing summer visitors to the county. Pop. (1983 est.) 435,700.

**Somerset,** EARLS AND DUKES OF, titled English nobility of three creations, in the families Beaufort, Carr, and Seymour, grouped below chronologically and indicated by the symbol •.

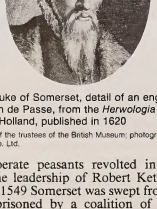
**• Somerset, Edmund Beaufort, 1st duke of,** 1ST EARL OF DORSET, also called (1444–48) 4TH EARL OF SOMERSET (b. *c.* 1406—d. May 22, 1455, St. Albans, Hertfordshire, Eng.), English nobleman and Lancastrian leader whose quarrel with Richard, duke of York, helped precipitate the Wars of the Roses (1455–85) between the houses of Lancaster and York.

He was a member of the Beaufort family, which in the 1430s obtained control—with William de la Pole, duke of Suffolk—of the government of the weak king Henry VI (ruled 1422–61 and 1470–71). He was created earl of Dorset in 1441 and inherited the earldom of Somerset from his brother in 1444. A veteran of the English campaigns in France, Beaufort was appointed captain general in France in 1447, and in the following year he was created duke of Somerset.

His poor leadership was largely responsible for the reconquest of Normandy by the French in 1449–50. Public indignation over this disaster brought about the fall of Suffolk, but Somerset survived the storm and became Henry's chief minister. His unrelenting enemy was the powerful Richard, duke of York. Following Henry's mental collapse in July 1453, Parliament imprisoned Somerset (*c.* December 1453) and appointed York lord protector of the realm. The King recovered in December 1454, however, and shortly thereafter Somerset was restored to his former role in government. York then resorted to arms, and in May 1455 Somerset was killed by York's troops at the Battle of St. Albans.

**• Somerset, Henry Beaufort, 2nd duke of,** 2ND EARL OF DORSET (b. 1436—d. May 15, 1464, Hexham, Northumberland, Eng.), leading Lancastrian in the English Wars of the Roses.

He was the eldest son of Edmund Beaufort, the 2nd duke; and, as duke of Somerset, marquess of Dorset, and titular count of Mortain, he was the victorious Lancastrian commander at the battles of Wakefield (1460) and of St. Albans (1461). But he fled to Scotland after the disaster of Towton (1461) and was then attainted and condemned to forfeiture. Failing to get French help, he deserted to the Yorkists in 1463 and was restored to his position; but a further equivocation brought his attainder, forfeiture, and execution on the day of his defeat and capture as Lancastrian commander at the Battle of Hexham.



When his brother Edmund, "duke of Somerset" to the Lancastrians alone, was captured and beheaded at the Battle of Tewkesbury (May 6, 1471), the male line of Beauforts ended.

**• Somerset, Edward Seymour, 1st duke of,** BARON SEYMOUR OF HACHE, byname THE PROTECTOR, also called (1523–36) SIR EDWARD SEYMOUR, or (1536–37) VISCOUNT BEAUCHAMP OF HACHE, or (1537–47) EARL OF HERTFORD (b. *c.* 1500/06—d. Jan. 22, 1552, London), the Protector of England during part of the minority of King Edward VI (reigned 1547–53). While admiring Somerset's personal qualities and motives, scholars have generally blamed his lack of political acumen for the failure of his policies.

After the marriage of his sister, Jane Seymour, to King Henry VIII in 1536, he rose rapidly in royal favour. He became earl of Hertford in 1537, and in 1542 he was appointed lord high admiral, a post he soon relinquished. He commanded the English forces that invaded Scotland in 1544 and sacked Edinburgh; a year later he won a brilliant victory over the French at Boulogne.

After the death of Henry VIII (Jan. 28, 1547), Hertford was named protector by the regency council that Henry had nominated to run the government for the nine-year-old king Edward. He soon became duke of Somerset (Feb. 16, 1547) and for two and a half years acted as king in all but name. His chief rival for power was John Dudley, earl of Warwick. Somerset tried, unsuccessfully, to persuade the Scots to join a voluntary union with England, but, when his appeal was rejected, he destroyed all chances of reconciliation by invading Scotland and defeating the Scots at the Battle of Pinkie (Sept. 10, 1547). In domestic affairs, the Protector proceeded with moderation in consolidating the Protestant Reformation in England. He repealed Henry VIII's heresy laws, which had made it treason to attack the king's leadership of the church; the first *Book of Common Prayer,* which was imposed (1549) by an Act of Uniformity by Somerset, offered a compromise between Roman Catholic and Protestant learning. Nevertheless, these and other apparently moderate measures stirred up antagonisms that resulted in Catholic uprisings in western England in 1549.

Somerset attempted to aid the rural poor by forbidding enclosures—that is, the taking of arable common land by the propertied classes to use as pasturage—and this action led to his downfall. The landowners foiled his efforts;

The 1st Duke of Somerset, detail of an engraving by Willem van de Passe, from the *Herwologia Anglica,* by Henry Holland, published in 1620

the desperate peasants revolted in Norfolk under the leadership of Robert Kett; and in October 1549 Somerset was swept from power and imprisoned by a coalition of Warwick and the propertied classes. When the coalition broke down, he was released in February 1550 and ostensibly reconciled with his rival. But in October 1551, the Duke of Northumberland (as Warwick was then called) had Somerset imprisoned on a trumped-up charge of treason. Four months later he was executed. A.F. Pollard's biography, *England Under Protector Somerset* (1900), presents a favourable picture of the Protector, but he is severely judged by M.L. Bush in *The Government Policy of Protector Somerset* (1975).

**• Somerset, Robert Carr, earl of,** Carr also spelled KER, also called (1607–11) SIR ROBERT CARR, or (1611–13) VISCOUNT ROCHESTER (b. *c.* 1590—d. July 1645), favourite of King James I of England from 1607 to 1615. His influence on governmental policy was slight, but he brought discredit on James's court by his involvement in a scandal.

Son of a Scottish nobleman, the handsome Carr first attracted James's interest in 1607. The King soon made him a gentleman of the bedchamber, and thereafter he rose rapidly in royal favour, becoming Viscount Rochester in 1611 and a privy councillor in April 1612. Upon the death of the chief minister, Robert Cecil, earl of Salisbury, in May 1612, Carr began to serve as James's secretary.

Meanwhile, he had fallen in love with Frances Howard, wife of Robert Devereux,

Robert Carr, earl of Somerset, oil painting after a portrait by J. Hoskins, *c.* 1620–25; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

3rd earl of Essex. He persuaded James to have a commission annul Frances' marriage, and during these proceedings Frances, probably with Carr's assistance, secretly poisoned Carr's former friend and mentor Sir Thomas Overbury (died Sept. 15, 1613), who had opposed the annulment. Carr and Frances were married in December 1613, shortly after Carr had been made earl of Somerset and treasurer of Scotland. He became lord chamberlain in 1614, but in the following year the circumstances of Overbury's death were made public. Somerset and Frances were found guilty of murder; they were imprisoned until 1621 and pardoned fully in 1624. Carr died 21 years later in obscurity.

**• Somerset, Charles Seymour, 6th duke of,** BARON SEYMOUR OF TROWBRIDGE (b. Aug. 12, 1662—d. Dec. 2, 1748, Petworth, Sussex, Eng.), British statesman during the reign of Queen Anne, who helped to secure the accession of George I of Hanover.

His brother, Francis Seymour, inherited the dukedom on the death of a cousin (the 4th duke) but was shot in 1678 at the age of 20 by a Genoese gentleman named Horatio Botti, whose wife Somerset was said to have insulted. Charles, who thus inherited the barony of Seymour of Trowbridge along with the dukedom of Somerset, was educated at Trinity College, Cambridge; and in 1682 he married a great heiress, Elizabeth, daughter of Joceline Percy, earl of Northumberland, who brought him immense estates, including Alnwick Castle, Petworth, Syon House, and Northumberland House in London. In 1683 Somerset received an appointment in the King's household, and two years later a colonelcy of dragoons; but at the Revolution of 1688 he bore arms for William of Orange.

Having befriended Princess Anne in 1692, he became a great favourite with her after her accession to the throne, receiving the post of master of the horse in 1702. Finding himself neglected by Marlborough, he made friends with the Tories and succeeded in retaining the Queen's confidence, while his wife replaced the Duchess of Marlborough as mistress of the robes in 1711. In the memorable crisis when Anne was at the point of death, Somerset acted with Argyll, Shrewsbury, and other Whig nobles who, by insisting on their right to be present in the privy council, secured the Hanoverian succession to the crown. He retained the office of master of the horse under George I until 1716, when he was dismissed and retired into private life.

**Somerset, Edward:** *see* Worcester, Edward Somerset, 2nd Marquess of.

**Somerset, FitzRoy James Henry:** *see* Raglan, FitzRoy James Henry Somerset, 1st Baron.

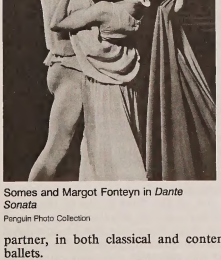
**Somerville,** city, Middlesex county, eastern Massachusetts, U.S. It lies along the Mystic River and is surrounded by Boston (Charlestown), Cambridge, Arlington, and Medford. Settled in 1630, it was originally known as the Cow Commons and was entirely fenced in until 1685. In the city stands the Old Powder House (*c.* 1704), from which the British general Thomas Gage seized gunpowder in 1774. Somerville was the last of the Mystic valley towns to separate (1842) from the early Charlestown colony. Its name is said to honour Captain Richard Somers, hero of the Tripolitan-American War. After the American Revolution, brickmaking became important, and the opening of the Middlesex Canal (1802), which passed through Somerville, added to its desirability as an industrial site. By 1835 the town was a regular stop on the new Boston and Lowell Railroad. Its greatest growth in population and industrial activity occurred after 1900, when slaughtering and meatpacking developed as the principal economic activities.

The city has become a residential and industrial suburb of Boston with some importance as a distribution centre. Inc. town, 1842; city, 1871. Pop. (1993 est.) 72,532.

**Somerville,** borough, seat (1784) of Somerset county, north-central New Jersey, U.S. It lies along the Raritan River. Settled by Dutch farmers in the late 17th century, it took its present name in 1801. The Wallace House (a state historic site) was headquarters for General George Washington during the winter of 1778–79. Somerville's growth was stimulated by the opening of the Delaware and Raritan Canal in 1834 and by the completion of the Elizabethtown and Somerville Railroad (later Jersey Central) in 1842. The borough is now a trade centre for nearby farm and industrial areas. Its light manufactures include drugs and electronic equipment.

The Old Dutch Parsonage (1751), a state historic site, was where Rutgers University (now in New Brunswick, a few miles southeast) and the New Brunswick Theological Seminary were first established. The Duke estate, established by tobacco magnate James B. Duke, is a research and exhibition centre for the New York Horticultural Society. The Knox-Porter Resolution ending the state of war between the United States and Germany was signed (July 2, 1921) by President Warren G. Harding at the Somerville estate of Joseph Frelinghuysen. Somerset County College (1968) is in the borough. Inc. town, 1863; borough, 1909. Pop. (1993 est.) 11,943.

**Somerville, William,** Somerville also spelled SOMERVILE (b. Sept. 2, 1675, Colwich, Staffordshire, Eng.—d. July 17, 1742, Henley-in-Arden, Warwickshire), British writer who, after studies directed toward a career at law, lived the life of a country gentleman, indulging in the field sports that were to make up the subject matter of his best-known poems, especially *The Chace* (1735). That poem traces the history of hunting up to the Norman Conquest of England (1066) and gives incidental information on kennel design, hare hunting, stag hunting, otter hunting, the breeding and training of dogs, and dog diseases and bites. Among the many digressions is one on Oriental hunting.



**Somerville and Ross,** also called E.Œ. SOMERVILLE AND MARTIN ROSS, pseudonyms of EDITH ANNA OENONE SOMERVILLE and VIOLET FLORENCE MARTIN (respectively b. May 2, 1858, Corfu, Greece—d. Oct. 8, 1949, Castlehaven, County Cork, Ire.; b. June 11, 1862, Ross House, County Galway, Ire.—d. Dec. 21, 1915, Cork, County Cork), Irish cousins and writers who collaborated on a series of novels and short stories that wittily and sympathetically portrayed Irish society in the late 19th century. Edith Somerville continued to use their joint pseudonym after her cousin's death, claiming that she was still inspired by her.

Violet Martin grew up in a genteel Protestant literary family living on a country estate, Ross House, in somewhat straitened finances. After her father's death in 1872, the family lived in Dublin, where she attended Alexandra College. Edith Somerville's father was a British army lieutenant colonel serving in Corfu who retired a year after her birth and returned the family to Drishane House in rural County Cork, where Somerville spent all her childhood. She studied briefly at Alexandra College and studied painting at studios in London, Düsseldorf, and Paris.

The 27-year-old Somerville and the 23-year-old Martin first met on Jan. 17, 1886, and began a literary partnership that resulted three years later in their first book, *An Irish Cousin* (1889). By the time that Martin died in 1915 they had cowritten 14 books, including a powerful novel called *The Real Charlotte* (1894) and a collection of short stories, *Some Experiences of an Irish R.M.* (1899), which, with its sequels, is their most popular work. After 1915 the Somerville and Ross name appeared on such Somerville works as *Irish Memories* (1917), *Mount Music* (1919), and *The Big House of Inver* (1925).

During their life together, the cousins resided at Ross House and Drishane House but traveled frequently, abroad and at home. Both were excellent horse riders to the fox and hounds, and Martin suffered a serious hunting accident in 1898, from which she never fully recovered. In later years Somerville often traveled, visiting Denmark and France and joining her friend the English composer, author, and feminist Dame Ethel Mary Smyth in trips to Italy and the United States.

**Somes, Michael,** in full MICHAEL GEORGE SOMES (b. Sept. 28, 1917, Horsely, Gloucestershire, Eng.—d. Nov. 18, 1994, London), English dancer, premier danseur and assistant director of the Royal (formerly Sadler's Wells) Ballet. His extensive repertoire included leading roles, frequently as Margot Fonteyn's

Somes and Margot Fonteyn in *Dante Sonata*
Penguin Photo Collection

partner, in both classical and contemporary ballets.

In 1934 Somes received the first scholarship given to a male by the Sadler's Wells School, and in 1935 he joined the ballet company. By 1937 he was appearing in solo parts; his first major creation was in Frederick Ashton's *Horoscope* (1938). After serving in World War II, he returned to create additional important roles in ballets choreographed by Ashton, including *Symphonic Variations* (1946), *Cinderella* (1948), *Daphnis and Chloë* (1951), *Tiresias* (1951), and *Ondine* (1958). He also performed in such classical ballets as *Swan Lake, Giselle,* and *The Sleeping Beauty.*

In 1950 Somes succeeded Robert Helpmann as Margot Fonteyn's official partner, and in 1959 he was made a Commander of the Order of the British Empire. After retiring as premier danseur (1961), he became assistant director of the Royal Ballet in 1963 and appeared in pantomime roles such as the Father in *Marguerite and Armand* (1963). Leaving his assistant directorship in 1970, he remained with the Royal Ballet as its principal teacher until 1984.

**Someş River,** Hungarian SZAMOS, river, one of the most important in Transylvania, northwestern Romania. It has two headstreams: the Great Someş, which rises in the Rodnei Mountains and flows southwest, and the Little Someş, which rises in the Apuseni Mountains as the Someşu Cald and Someşu Rece and flows northeast. The two headstreams flow rapidly out of the mountains to meet at the town of Dej in the Transylvanian Basin. From there the river follows a zigzag course toward the northwest to enter the Tisza (Tisa) River in Hungary after a course of about 250 miles (400 km), including either headstream. Between Dej and the Tisza, the Someş is joined by several tributaries. The city of Satu Mare is located on the Someş.

**somite,** in embryology, one of a longitudinal series of blocklike segments into which the mesoderm, the middle layer of tissue, on either side of the embryonic spine becomes divided. Collectively, the somites constitute the vertebral plate. Out of the somites arise the sclerotome, forerunner of the bodies and neural arches of the vertebrae; the dermatome, precursor of the connective tissue of the skin; and the myotome, or primitive muscle, from which the major muscles of vertebrates are derived. The term somite is also used more generally to refer to a body segment, or metamere, of a segmented animal.

**Somme,** *département,* Picardie *région,* northern France. Somme fronts the English Channel for about 30 miles (48 km) and embraces the valley of the river that bears its name. With an area of 2,382 square miles (6,170 square km), it was created from a large part of the historic province of Picardy, or Picardie, and also from a small portion of the neighbouring province of Artois. The estuary of the Somme River and the Bay of Somme occupy a large part of the low-lying coast.

The Somme River flows generally from the east to the northwest along its marshy valley through Péronne, Amiens (capital of the Somme *département*), and Abbeville. The Bresle River, to the south, and the Authie, to the north, flow parallel to the Somme along the borders of the *département.*

The climate is mainly oceanic, with frequent showers. The land is extremely fertile in the southwest where the cliffs rise above the English Channel. The estuaries of the Somme and the Authie have silted up, creating marshlands beyond the cliffs. Sand dunes have formed along the shore, which is dotted with harbours and small seaside resorts. Cattle and market gardens flourish in the reclaimed marshland and along the river valleys. Cereals, fodder, and sugar beets are grown and cattle are raised on the rolling chalk plateau of Picardie, which extends over most of the *département.* There are some industries (tex-

tiles, food processing, metals, chemicals, and rubber) in the vicinity of Amiens, Abbeville, Vimeu, and other towns; but the region is predominantly rural. Many cemeteries mark the Somme valley battlefields of World War I, located in a region over which armies have fought throughout French history. The *département* has four *arrondissements:* Amiens, Abbeville, Jimeu, Montdidier, and Péronne. It is in the educational division of Amiens. Pop. (1990) 547,825.

**Somme, First Battle of the** (July 1–Nov. 13, 1916), costly and largely unsuccessful Allied offensive on the Western Front during World War I.

The Germans were securely entrenched and strategically located when the British and French launched their frontal attack on a 21-mile (34-kilometre) front north of the Somme River. A week-long artillery bombardment preceded the British infantry's "going over the top," but the latter were nevertheless mown down as they assaulted the virtually impregnable German positions. The British sustained nearly 60,000 casualties (20,000 dead) on the first day of the attack. In September the British introduced their new weapon, the tank, into the war for the first time, but with little effect on the battle. The Somme offensive gradually deteriorated into a battle of attrition. In October torrential rains turned the battlefield into an impassable sea of mud, and by mid-November the Allies had advanced only 5 miles (8 km).

Although the figures have been much disputed, the casualties from the First Battle of the Somme perhaps amounted to roughly 650,000 German, 195,000 French, and 420,000 British. The Battle of the Somme became a metaphor for futile and indiscriminate slaughter. By taking the offensive in the Somme, the Allies did manage to relieve the German pressure on Verdun, however.

**Somme, Second Battle of the,** also called BATTLE OF SAINT-QUENTIN (March 21–April 5, 1918), partially successful German offensive against Allied forces on the Western Front during the later part of World War I.

The German commander, General Erich Ludendorff, believed that it was essential for Germany to use the troops freed from the Eastern Front by the collapse of Russia to achieve a victory on the Western Front in the spring of 1918, before American troops arrived in sufficient numbers to effectively reinforce the warweary Allies. His first offensive was directed against the rather weak British armies north of the Somme River, between Arras and La Fère. The British trenches were shelled and gassed before a massive morning attack in dense fog, which took the British by surprise. Their first and second lines quickly fell, and by March 22 the shattered British 5th Army was in retreat and had lost contact with the French to the south. The Germans moved rapidly forward, hoping to drive a permanent wedge between the French and the British, but by March 28, the Allies had quickly assembled new troops that checked the German advance east of Amiens. The German offensive had obtained the single largest territorial gain on the Western Front since the early months of the war in late 1914. The Germans had advanced almost 40 miles (64 km) and had taken about 70,000 prisoners, but in spite of these gains the Allied lines were only bent, not broken.

**Somme River,** river, northern France. It rises in the hills at Fonsommes, near Saint-Quentin in the Aisne *département,* and flows generally westward for 152 miles (245 km) to the English Channel, crossing Somme *département* and the ancient province of Picardy. From Amiens, near which its headstreams (including the Ancre and Avre) converge, the Somme follows the floor of a trench across the chalk country. Its valley is a marshy belt; and its line, an important barrier in the approaches from Flanders toward Paris, was of great strategic importance during World War I. The name Somme is derived from the Celtic *samara,* meaning "tranquil." The upper basin of the Somme was the scene of heavy fighting during World War I, particularly the First Battle of the Somme (July–November 1916). The valley was occupied by the Germans in May–June 1940 in World War II and was recovered by the Allies in August 1944.

The basin of the Somme River occupies about 2,300 square miles (6,000 square km). Below Abbeville the Somme enters a sand-encumbered estuary, which requires constant dredging, with the port of Saint-Valéry-sur-Somme situated at its mouth. From the river's upper valley there are canals to the Oise and the Escaut, or Scheldt, rivers, connecting it with the navigable waterways that link Paris and Flanders.

**Sommeiller, Germain** (b. March 15, 1815, Saint-Jeoire, Fr.—d. July 11, 1871, Saint-Jeoire), French engineer who built the Mount Cenis (Fréjus) Tunnel in the Alps, the world's first important mountain tunnel.

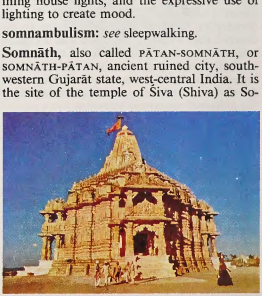
While working at the University of Turin on the construction of a compressed-air ram to supply extra power to locomotives on steep grades, Sommeiller conceived the idea of adapting the machine to rock drilling, for which steam power was not suited because of the difficulty of transmitting it over distances. Commissioned to drive the 7-mile (12-kilometre) tunnel under Mount Cenis, between France and Switzerland, Sommeiller introduced his new drill, which he perfected by trial and error, and a little later, dynamite, just invented by Alfred Nobel. The tunnel was completed in December 1870.

**Sommer, Ferdinand** (b. May 4, 1875, Trier, Ger.—d. April 3, 1962, Munich), German historical linguist known primarily for his scholarship concerning Hittite and the classical languages.

During his academic career, Sommer held professorships at the universities of Basel (1902–09), Rostock (1909–13), Jena (1913–24), Bonn (1924–26), and Munich (1926–51). His most important works include *Handbuch der lateinischen Laut- und Formenlehre* (1902; "Handbook of Latin Phonology and Morphology"); *Zur Geschichte der griechischen Nominalkomposita* (1948; "Contributions to a History of the Greek Nominal Compounds"); and a number of significant contributions to Hittite studies, including *Die Ahhijava-Urkunden* (1932; "The Ahhiyawa Documents") and *Hethiter und Hethitisch* (1947; "Hittites and the Hittite Language").

**Sommerfeld, Arnold (Johannes Wilhelm)** (b. Dec. 5, 1868, Königsberg, Prussia [now Kaliningrad, Russia]—d. April 26, 1951, Munich), German physicist whose atomic model permitted the explanation of fine-structure spectral lines.

After studying mathematics and science at Königsberg University, Sommerfeld became an assistant at the University of Göttingen and then taught mathematics at Clausthal (1897) and Aachen (1900).



As professor of theoretical physics at Munich (1906–31), he did his most important work. His investigations of atomic spectra led him to suggest that, in the Bohr model of the atom, the electrons move in elliptical orbits as well as circular ones. From this idea he postulated the azimuthal quantum number. He later introduced the magnetic quantum number as well. Sommerfeld also did detailed work on wave mechanics, and his theory of electrons in metals proved valuable in the study of thermoelectricity and metallic conduction.

**Sommo, Judah Leone ben Isaac,** also called LEONE DE SOMMI PORTALEONE, original name YEHUDA SOMMO (b. 1527, Mantua [Italy]—d. 1592, Mantua), Italian author whose writings are a primary source of information about 16th-century theatrical production in Italy.

Sommo wrote the first known Hebrew drama, *Tzaḥut hediḥuta de-qiddushin* (1550; "An Eloquent Comedy of a Marriage"), in which characters such as the pining lover, the comic servant, and the crafty lawyer reflect the influence of the Italian commedia dell'arte. Sommo's experience as a playwright and producer of dramas for various noble patrons was the basis for his *Dialoghi in materia di rappresentazioni sceniche* (c. 1565; *Dialogues on the Art of the Stage*), a summation of contemporary theatre practice containing one of the earliest extant discussions of stage lighting. It gives directions on the use of small reflectors to intensify lighting, the importance of dimming house lights, and the expressive use of lighting to create mood.

**somnambulism:** *see* sleepwalking.

**Somnāth,** also called PĀTAN-SOMNĀTH, or SOMNĀTH-PĀTAN, ancient ruined city, southwestern Gujarāt state, west-central India. It is the site of the temple of Śiva (Shiva) as So-

Temple of Śiva at Somnāth, Gujarāt, India
Baldev—Shostal Assoc.

manātha (which means "lord of the *soma,*" a sacred intoxicating drink, and, by extension, "lord of the Moon"). The temple was sacked by the Turkic Muslim invader Maḥmud of Ghazna in AD 1024–25. Reconstructed in 1169, it was destroyed again in the final Muslim invasions of the late 13th century. Subsequently rebuilt and destroyed on several occasions, it was reconstructed again beginning in 1951. According to an ancient tradition in the Indian epic *Mahābhārata,* Somnāth was the scene of the internecine massacre of the Yādava clan and of the subsequent death of Krishna, the eighth incarnation of Vishnu. Recent excavations there have revealed a settlement dating from about 1500 BC.

Pātan, a port on the old city site, is now overshadowed by the adjacent port of Verāval.

**Somnus** (Greco-Roman god): *see* Hypnos.

**Somogy,** *megye* (county), southwestern Hungary. It extends from the southern shore of Lake Balaton to the Yugoslav frontier with an area of 2,331 square miles (6,036 square km). Once known for its combination of great landed estates and poverty-stricken peasants, it initiated the development of cooperative farms in the 20th century. The main crops are now rye, potatoes, sugar beets, and tobacco. Pigs and sheep are raised, and the swineherds and shepherds developed an art of intricate wood carving for which Somogy is nationally famous. The Lake Balaton shoreline is a recreation area, with Siófok the local focus. Kaposvár (*q.v.*), the *megye* seat, is the principal market town. In the Völgység district the population is mixed Magyar and German with migrants from Transylvania, Bukovina, and the Great Alföld. There is a small petroleum and natural-gas field in southern Somogy, around Babócsa. Pop. (1990 prelim.) 344,925.

**Somolu** (Nigeria): *see* Shomolu.

**Somoza** FAMILY, family that maintained political control of Nicaragua for 44 years.

The founder of the dynasty, Anastasio Somoza García (b. Feb. 1, 1896, San Marcos, Nicaragua—d. Sept. 29, 1956, Ancón, Panama Canal Zone [now Panama]), was the son of a wealthy coffee planter and was educated in Nicaragua and the United States. By marrying the daughter of a prominent Nicaraguan family, he ensured himself a secure political career. He rose quickly through the political ranks to become head of Nicaragua's army, the National Guard, in 1933. With the army at his disposal, he three years later deposed the elected president, Juan Bautista Sacasa; Somoza assumed the office on Jan. 1, 1937. Although he was officially not president from 1947 to 1950, his position as commander in chief guaranteed his continuous, firm rule; his authority was again made official by his election to a presidential term beginning in 1951.

Somoza's administration fostered reforms and made Nicaragua less dependent on banana income. At the same time, however, Somoza amassed a considerable personal fortune, exiled most of his political opponents, and took over the ownership of large areas of land and many businesses.

Following the assassination of Somoza, the presidency passed to his elder son, Luis Somoza Debayle (b. Nov. 18, 1922, León, Nicaragua—d. April 13, 1967, Managua). He won election to his own term of office (1957–63), during which he extended the family's business interests and, by most accounts, ruled more gently than had his father. After he refused to run for a second term, the presidency was held until 1967 by politicians favourable to the Somoza family.

His younger brother, Anastasio Somoza Debayle (b. Dec. 5, 1925, León, Nicaragua—d. Sept. 17, 1980, Asunción, Paraguay), then won the presidency in a general election. He ruled aggressively in the manner of his father, and he continued to expand the family's fortune. He relinquished his office in 1972 but in 1974 returned to the presidency under a new constitution that permitted him to rule until 1981. Violent insurrection against the alleged oppression of Somoza's rule, as well as foreign accusations of violations of human rights, led to his resignation in 1979, and he was assassinated while in exile.

**son et lumière,** English SOUND-AND-LIGHT SHOW, nighttime entertainment conceived by Paul Robert-Houdin, curator of the Château de Chambord on the Cosson River, France, where the first one was presented in 1952. Multicoloured lights of changing intensity are directed against the facade of a historic building or ruin. The changes of light are synchronized with a sound track (relayed through loudspeakers) carrying music and the dramatized story of the site. Usually, no live participants appear. Live effects such as smoke bombs or fireworks are occasionally used.

The medium rapidly became popular in France, where, by the late 20th century, about 50 annual productions took place, notably in the Loire River valley, Versailles, and Invalides. European productions outside France included those in Rome (the Forum) and Athens (the Parthenon). The first British performance was produced in 1957 (Greenwich Palace) and the first U.S. presentation in 1962 (Independence Hall, Philadelphia). The first African production took place at Cairo, Egypt (the Pyramids of Giza), in 1961; the first Asian production was at Delhi, India (the Red Fort), in 1965. *Son et lumière* is also produced at the ruins of Teotihuacán, near Mexico City, and elsewhere.

**Son La,** town, northwestern Vietnam, about 190 miles (310 km) northwest of Hanoi. Son La is a market centre for an agricultural area specializing in corn (maize) and tea but also producing rice, cotton, and livestock. The population of the region is made up predominantly of the Tai Dam (Black Thai), but there are also Meo, Tai Khao (White Thai), and Muong peoples. There is an airport at nearby Na San. Pop. (2001 est.) 18,400.

**Son Pyŏng-hi** (b. 1861—d. 1922), third leader of the apocalyptic, antiforeign Tonghak religious sect in Korea.

Born the illegitimate son of a low-echelon government official, Son grew up in poverty, suffering much discrimination. In 1897 he was elected to the leadership of Tonghak, succeeding Ch'oe Si-hyŏng, and he successfully reconstructed the sect, which had been hurt by the failure of its uprising in 1894.

Branded a political criminal by the state, he went into exile in Japan. When Korea lost its sovereignty to Japan in 1905, he renamed the Tonghak sect the Ch'ŏndogyo (*q.v.*; literally "Religion of the Heavenly Way") and set about reorganizing it as a genuine religion. He undertook educational and cultural projects, running or supporting schools, conducting enlightenment programs for Ch'ŏndogyo followers, and leading campaigns for constructive living. In 1919 he led the nationwide movement for Korean independence.

**Son River,** also spelled SONE, principal southern tributary of the Ganges River, rising in Madhya Pradesh state, central India. It flows north past Manpur and then turns northeast. The river cuts through the Kaimur Range and joins the Ganges above Patna, after a 487-mile (784-kilometre) course. The Son valley is geologically almost a continuation of that of the Narmada River to the southwest. Largely forested, it is sparsely populated. The valley is bordered by the Kaimur Range (north) and the Chota Nāgpur plateau (south). The river's flow is seasonal, and the Son is unimportant for navigation. Dams have been constructed on some of its tributaries, and at Dehri, Uttar Pradesh state, are the headworks of the Son Canal system.

**sonar** (from "*so*und *na*vigation *r*anging"), technique for detecting and determining the distance and direction of underwater objects by acoustic means. Sound waves emitted by or reflected from the object are detected by sonar apparatus and analyzed for the information they contain.

Sonar systems may be divided into three categories. In active sonar systems an acoustic projector generates a sound wave that spreads outward and is reflected back by a target object. A receiver picks up and analyzes the reflected signal and may determine the range, bearing, and relative motion of the target. Passive systems consist simply of receiving sensors that pick up the noise produced by the target (such as a ship, submarine, or torpedo). Waveforms thus detected may be analyzed for identifying characteristics as well as direction and distance. The third category of sonar devices is acoustic communication systems, which require a projector and receiver at both ends of the acoustic path.

Sonar was first proposed as a means of detecting icebergs. Interest in sonar was heightened by the threat posed by submarine warfare in World War I. An early passive system, consisting of towed lines of microphones, was used to detect submarines by 1916, and by 1918 an operational active system had been built by British and U.S. scientists. Subsequent developments included the echo sounder, or depth detector, rapid-scanning sonar, side-scan sonar, and WPESS (within-pulse electronic-sector-scanning) sonar.

The uses of sonar are now many. In the military field are a large number of systems that detect, identify, and locate submarines. Sonar is also used in acoustic homing torpedoes, in acoustic mines, and in mine detection. Nonmilitary uses of sonar include fish finding, depth sounding, mapping of the sea bottom, Doppler navigation, and acoustic locating for divers.

A major step in the development of sonar systems was the invention of the acoustic transducer and the design of efficient acoustic projectors. These utilize piezoelectric crystals (*e.g.*, quartz or tourmaline), magnetostrictive materials (*e.g.*, iron or nickel), or electrostrictive crystals (*e.g.*, barium titanate). These materials change shape when subjected to electric or magnetic fields, thus converting electrical energy to acoustic energy. Suitably mounted in an oil-filled housing, they produce beams of acoustic energy over a wide range of frequencies.

In active systems the projector may be deployed from an air-launched sonobuoy, hull-mounted on a vessel, or suspended in the sea from a helicopter. Usually the receiving and transmitting transducers are the same. Passive systems are usually hull-mounted, deployed from sonobuoys, or towed behind a ship. Some passive systems are placed on the seabed, often in large arrays, to provide continuous surveillance.

**sonata,** form of musical composition for one or more instruments, usually consisting of three or four movements that are contrasted in rhythm and mood but related in tonality.

A brief treatment of the sonata follows. For full treatment, *see* MACROPAEDIA: Musical Forms and Genres.

The use of the word sonata is associated with the rise of instrumental music: its derivation from the Italian *sonare* implies something sounded, as opposed to cantata, something sung. The term first appeared in the 13th century and became widespread toward the end of the 16th century, when instrumental music began to be written in much greater quantities. At that stage its meaning was quite general: Giovanni Gabrieli wrote sonatas for several groups of instruments, to be performed in a church, as well as ones for more modest ensembles.

During the 17th century more precise definitions began to emerge, and the sonata took on its association with small groups of instruments, the names sinfonia, symphony, and concerto being introduced for larger ensembles. At the same time, it became common practice for sonatas to be written in several separate sections, or movements, contrasting in speed, and to be scored for one or two soloists with harmonic support, usually supplied by a keyboard and a bass instrument such as the viola da gamba (a stringed instrument of the period); the two-soloist type is normally called the trio sonata, and it became the central form of chamber music for Baroque composers from Arcangelo Corelli and Henry Purcell to Johann Sebastian Bach and George Frideric Handel. Another development of the period was the distinction between the *sonata da chiesa* (church sonata) and the *sonata da camera* (chamber sonata), a distinction that cut across that between the solo and trio sonata. Church sonatas usually had four movements in a slow-fast-slow-fast pattern; the genre survived until the end of the 18th century. Chamber sonatas were less standardized, sometimes having sequences of dances, as did suites, or the fast-slow-fast pattern that became usual in the Classical period.

Around the middle of the 18th century the trio sonata began to disappear, and with the rise of keyboard virtuosity the sonata for solo harpsichord increased in importance. Domenico Scarlatti wrote more than 500 such sonatas in single-movement form. As Joseph Haydn and Wolfgang Amadeus Mozart understood the sonata, it was in essence a keyboard

solo, perhaps with one other instrument taking a subsidiary part. Both composers adopted the three-movement fast–slow–fast pattern as standard. Beethoven also adhered to this convention in his 32 piano sonatas, though with significant deviations: his last sonata, for instance, has only two movements. He did not, however, accept the dominance of the piano in sonatas with other instruments, and in his violin and cello sonatas the string player becomes an equal partner.

To the next generation of composers the sonata seemed an old-fashioned and constricted form. Robert Schumann and Frédéric Chopin felt more at ease in genres of their own devising; Franz Liszt incorporated a literary program in his *Après une lecture de Dante* and combined the normally successive movements of the sonata into a single span in his Sonata in B Minor. The duo sonata fell into a decline until near the end of the 19th century and the appearance of the late works of Johannes Brahms and César Franck.

In the 20th century the use of the term sonata has become as confused as it was in the Renaissance. Piano sonatas have been composed with explicit reference to the works of Beethoven, including the sonatas of Sir Michael Tippett and Pierre Boulez, but otherwise the form and instrumentation of sonatas has become much freer.

The term sonata form denotes both the organization of tonal material within a movement and the relationship between movements. The main divisions within a movement in sonata form are the exposition, the development, and the recapitulation.

In the exposition the two-part tonal material has an inherent element of contrast. Its themes, though not necessarily two in number, present a conflict of mood. The tension between these parts is heightened by a conflict of key: the opening material is in the tonic key; the contrasting material is in a second key, normally in a close relationship to the tonic but sufficiently distinct to mark a certain distance from the starting point.

In the development any portion of the preceding material and in many cases new, or seemingly new, material may appear in any order and in any combination. Frequently the material is broken down into its constituent fragments, and these fragments are themselves combined and developed. Opposing moods are illustrated and made to interact. Toward the end of the development section a sense of premonition is introduced that is fulfilled by a return of the tonic key and, with it, the original opening material.

In the recapitulation both of the opposites that set up their contrasting tonalities and moods in the exposition are heard again and in the same order. Instead of appearing in a key or keys contrasted with the tonic key, the opposing material now appears in the same, or mainly in the same, key as the opening material. The tension of the opposites is not so much relaxed as brought into balance. A coda may then follow, sometimes of such elaborate proportions as to simulate further development; but a sonata-form movement is complete only if it ends with reconciliation.

**sonata da camera** (Italian: "chamber sonata"), a type of trio sonata (*q.v.*) intended for secular performance.

**sonata da chiesa** (Italian: "church sonata"), a type of trio sonata (*q.v.*).

**sonatina,** in music, curtailed form of the sonata, usually in three short movements, or independent sections. The first movement normally follows the sonata form with respect to the exposition and recapitulation of the musical materials but not necessarily the development section, which is either quite perfunctory or lacking altogether. The sonatina form without development is also found in certain slow movements of full-fledged 18th-century sonatas and in opera overtures (*e.g.*, Mozart's *Marriage of Figaro*).

Early piano sonatinas, including those of Muzio Clementi (1752–1832) and Friedrich Kuhlau (1786–1832), were often intended for pedagogical purposes. Later piano sonatinas, on the other hand, including those of Maurice Ravel (1875–1937) and Ferruccio Busoni (1866–1924), require considerable technical proficiency. Less common are sonatinas for instruments other than piano, such as that for violin, viola, and cello by Darius Milhaud (1892–1974).

**Sønderborg,** port and seaside resort, Sønderjyllands *amtskommune* (county), Denmark, on the southwestern coast of Als Island. It was founded in the mid-13th century around Sønderborg Castle and chartered in 1461. King Christian II was a prisoner at the castle 1532–49. The city was razed in 1864 during a Prussian assault on Danish trenches near Dybbøl nearby Dybbøl Mill, site of heroic Danish resistance, became a symbol of national unity. It passed to Germany and, as a part of the North Slesvig region, was restored to Denmark by a plebiscite in 1920. Sønderborg Castle now houses a museum. The city's chief products are textiles, machinery, furniture, chemicals, margarine, and beer. Pop. (1981) city, 26,885; (1982 est.) mun., 27,867.

**Sonderbund** (German: Separatist League), formally SCHUTZVEREINIGUNG (Defense Union), league formed on Dec. 11, 1845, by the seven Catholic Swiss cantons (Luzern, Uri, Schwyz, Unterwalden, Zug, Fribourg, and Valais) to oppose anti-Catholic measures by Protestant liberal cantons. The term Sonderbund also refers to the civil war that resulted from this conflict.

In 1841 the government of the Aargau canton decreed the dissolution of the Catholic monasteries in its territory, despite the fact that the Federal Pact (constitution of 1815) had guaranteed the monasteries' property. The seven Catholic cantons in 1843–44 agreed that they would dissociate themselves from any canton disloyal to the Federal Pact, and in 1844 the Jesuits, whom 19th-century liberals detested, were invited to take charge of religious education in Luzern. This cantonal act, although constitutionally permissible, provoked widespread popular indignation, and a Bernese staff officer led bands of volunteers from Protestant cantons in an unsuccessful expedition against Luzern in the spring of 1845. The Catholic cantons' subsequent formation of the so-called Sonderbund was even more vehemently denounced by the liberal and radical cantons.

In the summer of 1847, a reformist majority in the Swiss Diet voted for the dissolution of the Sonderbund, for the drafting of a new Federal Pact, and for the expulsion of the Jesuits. The Sonderbund, led politically by Konstantin Siegwart-Müller of Luzern, took up arms in November 1847 and appealed for help from abroad, but neither its military organization, commanded by Johann Ulrich von Salis-Soglio, nor its appeal were satisfactorily effective. The forces of the majority, ably led by Henri Dufour, took Fribourg on November 14 and Zug on November 21; they won a decisive victory at Gislikon on November 23, entered Luzern itself, the nucleus of the Sonderbund, on November 24, and subdued Valais on Nov. 28, 1847. The peace settlement of 1848 required the former members of the Sonderbund to pay 6,000,000 francs for the cost of the war and charged the cantons of Appenzell Inner-Rhoden and Neuchâtel 15,000 and 300,000 francs, respectively, as fines for having been neutral; a new constitution for Switzerland also was adopted. In 1852 the unpaid balance of the war costs was written off.

**Sønderjyllands,** *amtskommune* (county), southern Jutland, Denmark, created in 1970 from the former counties of Tønder, Abenrå-Sønderborg, and Haderslev, with an area of 1,517 sq mi (3,929 sq km). Bounded by the North Sea, the Little Belt, and Germany, the county comprises the historical region of North Slesvig, which passed to Germany in 1864 and was returned to Denmark after a plebiscite in 1920. While the western portion is sometimes marshy, the eastern section has fertile clay loams, and agriculture, livestock raising, and dairying are carried on throughout the county. The administrative centre is at Abenrå (*q.v.*). Christiansfeld in the north was laid out in 1773 by the Moravians, whose famous honey-cake bakery, museum, and cemetery remain. Pop. (1982 est.) 250,409.

**Sondheim, Stephen (Joshua)** (b. March 22, 1930, New York City), U.S. composer and lyricist whose brilliance in matching words and music in dramatic situations broke new ground for Broadway musical theatre.

Precocious as a child, he early showed musical aptitude among other wide-ranging interests. He studied piano and organ, and at 15 wrote a musical at the George School in Bucks County, Pa. Under the tutelage of a family friend, Oscar Hammerstein II, he studied musical theatre. He also studied music at Williams College, Williamstown, Mass., and wrote college shows there. When he graduated in 1950, he received the Hutchinson Prize for composition, a fellowship. He then studied further in New York with the composer Milton Babbitt.

In the early 1950s he wrote scripts in Hollywood for the "Topper" television series. Returning to New York, he wrote incidental music for *The Girls of Summer* (1956). He made his first mark on Broadway as the lyricist for Leonard Bernstein's *West Side Story*, which opened Sept. 26, 1957, in New York City. He was also lyricist for *Gypsy* (1959; music by Jule Styne).

*A Funny Thing Happened on the Way to the Forum*—based on comedies by the Roman playwright Plautus—opened in New York City on May 8, 1962, with music and lyrics by Sondheim. It ran for 964 performances. Two years later, his *Anyone Can Whistle,* closed after only nine performances in April 1964.

Sondheim later won Tony awards for a number of Broadway productions of shows with his music and lyrics—*Company* (1970), on marriage and bachelorhood; *Follies* (1971), which includes many pastiche songs; *A Little Night Music* (1973), based on Ingmar Bergman's *Smiles of a Summer Night* (1955); and *Sweeney Todd: The Demon Barber of Fleet Street* (1979). Harold Prince, producer of the first three shows, also produced *Pacific Overtures* (1976), in which Sondheim looked to Kabuki for stylized effects.

He later collaborated as composer–lyricist with playwright–director James Lapine to create *Sunday in the Park With George,* which opened on Broadway May 2, 1984, after a lengthy preparation. This musical was inspired by the painting "Sunday Afternoon on the Island of la Grande Jatte" by the pointillist Georges Seurat.

Sondheim's acerbic lyrics hit responsive chords with many. Most critics agree that his work marked a break from more traditional and sentimental musical comedies of the earlier decades of the century. "Sondheim: A Musical Tribute" was staged in New York City, March 11, 1973.

*The Last of Sheila* (1973) is a nonmusical film mystery that Sondheim, an enthusiast for games and puzzles (featured in the film), wrote with Anthony Perkins.

*Sondheim & Co.* (1974), by Craig Zadan, is a lively history of Sondheim's work with quota-

tions from him and his associates. Appendixes cover Broadway and other stage productions, original-cast recordings, and motion-picture sound-track recordings.

**Søndre Strømfjord,** inlet, southwestern Greenland, located just north of the Arctic Circle and 60 miles (95 km) southeast of Holsteinsborg. About 120 miles (190 km) long and 1–5 miles (1.5–8 km) wide, the inlet extends northeastward from Davis Strait to the edge of the inland ice cap, where its arms are fed by several glaciers. Near the head of the inlet is Bluie West 8 (BW 8), a U.S. World War II air base, which now serves as a transpolar intermediate stop between Scandinavia and North America.

*Consult the* INDEX *first*

**Sondrio,** city, capital of Sondrio *provincia,* Lombardia (Lombardy) *regione,* northern Italy; it is the chief town of the Valtellina (the upper Adda River valley), near the mouth of the Mallero River, and lies at an elevation of 1,017 feet (310 m), north of Bergamo. It has an archaeological museum, and its old castle, Castello Masegra, is now a barrack. The city, well-known for its wines (notably Sassella), is an agricultural and commercial centre and has cotton and silk textile industries. Sondrio is also a tourist base linked by cableways with nearby Alpine resorts, including Bormio and Santa Caterina Valfurva. It is connected by rail and road with Switzerland via Tirano and the Bernina Pass and by road with the Stelvio Pass and with Bolzano. Pop. (1991 prelim.) mun., 22,817.

**Sone River** (India): *see* Son River.

**sone,** unit of loudness. Loudness is a subjective characteristic of a sound (as opposed to the sound-pressure level in decibels, which is objective and directly measurable). Consequently, the sone scale of loudness is based on data obtained from subjects who were asked to judge the loudness of pure tones and noise. One sone is arbitrarily set equal to the loudness of a 1,000-hertz tone at a sound level of 40 decibels above the standard reference level (*i.e.,* the minimum audible threshold). A sound with a loudness of four sones is one that listeners perceive to be four times as loud as the reference sound.

**Sonepat,** city, east-central Haryāna state, northern India, 27 miles (43 km) north of New Delhi. The city was probably founded by early Aryan settlers about 1500 BC and flourished on the banks of the Yamuna River, which now has receded 9 miles (14 km) to the east. Mentioned in the Hindu epic the *Mahābhārata* as Śonaprastha, the city is in the region known as the Kurukṣetra ("Land of Kurus"), the scene of the epic war between the Kauravas and the Pāṇḍavas. It is one of the largest cities in Haryāna state, and its proximity to New Delhi as a source of raw materials and power has helped its industrial development. Sonepat is one of the major bicycle-manufacturing centres in the country; other products include sewing-machine parts, automobile parts, rolled steel, hosiery, and textiles. Carpets, handloomed textiles, and brass and copper ware are among the handicrafts. The mosque of Abdullah Nāṣer ud-Dīn (built in 1272), tombs of Khwāja Khiżr, and the ruins of the old fort wall are in the city. Pop. (1991 prelim.) 142,992.

**song,** piece of music performed by a single voice, with or without instrumental accompaniment. Works for several voices are called duets, trios, etc.; larger ensembles sing choral music. Speech and music have been combined from the earliest times; music heightens the effect of words, allowing them to be rendered with a projection and passion lacking in speech alone. Singing style differs among cultures, reflecting such variables as social structure, level of literacy, language, and even sexual mores. Wordy solo songs predominate in technologically advanced, highly centralized societies, whereas primitive cultures often stress ensemble singing, with less attention to careful enunciation and a more relaxed vocal quality than is found in, for example, Oriental solo singing.

In Western music, folk song is customarily distinguished from art song. Folk songs are usually sung unaccompanied or with simple accompaniment—*e.g.,* by guitar or dulcimer. They are usually learned by ear and are infrequently written down; hence they are susceptible to changes of notes and words through generations of oral transmission. Composers of most folk songs are unknown.

Art songs are intended for performance by professional, or at least carefully taught, singers, generally accompanied by piano or instrumental ensemble. The notes are written down, and notes and words are thereafter resistant to casual alteration. Popular songs stand midway between folk and art songs with regard to technical difficulty, sophistication, and resistance to change.

Folk songs often accompany activities such as religious ceremonies, dancing, labour, or courting. Other folk songs tell stories; chief among these are narrative ballads and lyrics. Anglo-American ballads are action-oriented, often dealing with a tragic episode. Lyric songs are more emotion-oriented, more sentimental. Both types display relatively simple melodies, usually with only one or a few notes per syllable. The language tends to follow certain conventions and is often repetitive. Music and words are easily understandable.

Art songs in the European tradition are rarely connected with extramusical activities. Their texts tend to be sophisticated, their melodies often wide-ranging and complex, demanding repeated hearings for full comprehension. Art song, like "classical" music, is essentially an urban phenomenon, with origins in the medieval courts, colleges, cities, and churches. Twelfth-century trouvères and troubadours left a large corpus of melodies and sung verse; they were imitated throughout Europe. Melodies and poems are subtle and highly organized, the products of an aristocratic society. Manuscripts indicate no accompaniment; presumably it was improvised.

With the growth of polyphonic music in Europe in the 13th and 14th centuries, composers learned to assign the principal melody to a solo singer, with subsidiary melodies played on instruments. The technique of having one melody imitate a preceding one led by the 15th century to elaborate textures wherein the vocal line's primacy was threatened; there followed a reaction in songs with the simplest possible accompaniment, merely a few chords. These became widely popular, and by the 16th century careful declamation and audibility of text became again a central concern.

Seventeenth-century dramatic music saw further refinement of song style. Distinctions arose between recitative and aria, the former entirely word-oriented and free, with simple chordal accompaniment, the latter more virtuosic and melodically elaborate, with varied accompaniment. Being musically more interesting, arias came to dominate opera, cantata, and oratorio, and in the 18th century relatively little attention was paid to solo song outside these genres. The songs of W.A. Mozart and Joseph Haydn, for example, are not considered among their best works. Only in popular music did simple strophic (stanzaic) songs with keyboard accompaniment flourish.

In the early 19th century Franz Schubert's songs excelled in dramatic realization and musical quality. Robert Schumann, Johannes Brahms, and the other leading Romantic songwriters learned from Schubert not only the art of varying a strophic melody but also the potential significance of the accompaniment. In French song the works of composers such as Gabriel Fauré and Claude Debussy characteristically possess shifting, kaleidoscopic harmonies, influenced in part by the fluid accentual patterns of the language. Twentieth-century composers continued to explore the relation of voice to accompaniment and to expand the singer's range of expression and technique, sometimes treating the voice instrumentally. *See also* chanson; lied.

**Song** DYNASTY (China): *see* Sung dynasty.

**song-babbler,** any of about 140 bird species of the babbler family Timaliidae (order Passeriformes). Also called laughing-thrushes, from a major subgroup, song-babblers are found in tropical Africa and Asia. They include all the brightly coloured timaliids. About 10 to 30

Pied babbler (*Turdoides bicolor*)
Painting by John P. O'Neill

cm (4 to 12 inches) long, they have strong bills and some have rather long tails. They stay under cover but are detected by their songs of quick phrases. Typical song-babblers are the 26 species of the genus *Turdoides.* The common babbler (*T. caudatus*), found from Iraq eastward across India, is 23 cm (9 inches) long, brown, and long-tailed; small parties feed on the ground in scrublands, uttering low warbling sounds. The pied babbler (*T. bicolor*), 21 cm (8 inches) long, of southwestern Africa, is white, with black wings and tail; it is very inquisitive. *See also* laughing thrush.

**Song Jiaoren** (Chinese leader): *see* Sung Chiao-jen.

**Song of Hildebrand** (German ballad): *see* Hildebrandslied.

**Song of Roland, The** (epic poem): *see* Chanson de Roland, La.

**Song of Solomon** (biblical literature): *see* Solomon, Song of.

**Song Qingling** (Mme Sun Yat-sen): *see* Soong Ch'ing-ling.

**songbird,** also called PASSERINE, any member of the suborder Passeres (or Oscines), of the order Passeriformes, including about 4,000 species—nearly half the world's birds—in 35 to 55 families. Most cage birds belong to this group. Songbirds are alike in having the vocal organ highly developed, though not all use it to melodious effect. Classification in this suborder is much disputed. Alaudidae (larks) and Hirundinidae (swallows) are the most distinctive families.

Songbirds range in size from tiny kinglets and sunbirds to comparatively large crows. They are mainly land birds that live in a wide variety of situations, from open grassland to forest. Although songbirds include some of the best songsters, such as thrushes, some have

harsh voices like crows, and some do little or no singing. Songbirds are distinguished from other perching birds by certain anatomical characteristics, especially the more complicated vocal organ, or syrinx.

The syrinx—as the voice-producing structure, or song box, is called—is located at the point where the windpipe divides into two bronchial tubes to go to the lungs. The syrinx is an intricately constructed organ with a firm bony framework and filmlike vibrating internal membranes over which the air, during exhalation, passes rapidly, producing all the many utterances of the bird. A variable number of syringeal muscles and their controlling nerves adjust the tension on the membranes. The song box reaches its greatest complexity in the true songbirds. (But it is not a complicated syrinx alone that determines singing ability, for some true songbirds hardly sing at all). In some birds the windpipe is elongated and elaborately coiled. Sometimes this elongation is enclosed within the breast bone, or sternum. In certain of the birds-of-paradise known as manucodes, the elongated windpipe is coiled on the breast between the skin and the flesh. Presumably this lengthening of the windpipe gives resonance to the voice.

Vocalization in birds includes a wide variety of calls besides the song proper and provides a means of social communication. Bird song is best considered the vocalization that is used in courtship and breeding, chiefly by the male, to advertise that he is ready to mate, to attract the female and perhaps stimulate her sexually, to keep the pair together, and to inform rival males that he has established a territory from which they will be excluded. The male's calls are also part of a threat display that takes the place of actual combat in repelling intruding rivals. However, similar song is sometimes given spontaneously when there is no obvious use for it. Occasionally females sing, and especially in tropical species pairs may duet, again perhaps as a method of reinforcing the bond between the pair. Often the song is delivered from a series of regularly used perches. Some species, especially those that live in grasslands, have flight songs.

Bird song need not be pleasing to the human ear. The hooting of the owl, the monotonously repeated phrases of the North American whip-poorwill, the crazed, repeated whistle of a Malayan cuckoo that has given it the name of the brain-fever bird, and the African tinkerbird's repeated notes, which, from their resemblance to hammering on metal, have given the bird its name—all must be called songs.

Which birds are the best songsters is a question that is subjective. The nightingale of Europe (*Luscinia megarhynchos*), a small thrush, perhaps heads the list of famous songsters of European literature. Also a favourite of the poets was the European skylark (*Alaudia arvensis*). In North America the mockingbird (*Mimus polyglottos*) is a wonderful performer with a rich, melodious, long-continued song. In Australia the lyrebirds, which are not true songbirds, have songs that are superlative in variety and intensity and have a dramatic quality. Though the best songsters may be true songbirds, some birds of other groups have pleasing or musical utterances, like the quavering trill of the screech owl and the cheery whistle of the bobwhite quail.

**Sŏnggyun'guan,** original name KUKHAK, national university of Korea under the Koryŏ (935–1392) and Yi, or Chosŏn (1392–1910), dynasties. Named the Kukhak ("National Academy") during the Koryŏ dynasty, it was renamed the Sŏnggyun'guan and served as the sole highest institute for training government officials during the Yi dynasty.

The national university at first had 200 students, but the number was later reduced to 126. The students were selected from four groups: the official candidates who had passed the lower civil-service examinations and thus qualified for the *saengwon* or *chinsa* degrees; graduates of the four secondary public schools in Seoul; sons of merit subjects; and lower officials.

The university, located in Seoul, had two residential halls, a lecture hall, and a shrine where rites were held regularly in spring and in autumn in honour of Confucius and eminent Confucian scholars. It also offered two programs of study: readings in Confucian classics and literary composition in Chinese.

Upon the Japanese annexation of Korea in 1910, the institute became a centre of Korean Confucianism. After Korea's liberation in 1945, it was reorganized as Sŏnggyun'guan University and equipped with modern educational facilities. Rites honouring Confucius are still held in spring and autumn in the shrine within the compound of the university.

*A list of the abbreviations used in the* MICROPAEDIA *will be found at the end of this volume*

**Songhai,** also spelled SONGHAY, also called SONRHAI, ethnolinguistic group inhabiting the area of the great bend in the Niger River in Mali, extending from Lake Debo to the mouth of the Sokoto River in Nigeria. The Songhai are a Negroid people of probable Caucasoid admixture. They are composed of many related groups, the most important of which are the Zerma. Their language, also called Songhai, is of independent stock.

Songhai society traditionally was highly structured, comprising a nobility, free commoners, artisans, *griots* (bards and chroniclers), and, formerly, slaves. Marriage could be polygynous, cousins being preferred partners. Descent and succession are patrilineal. Cultivation, largely of cereals, is practiced intensively only during the rainy season, from June to November. Cattle are raised on a small scale, and fishing is of some importance. Each craft of workers in iron, wood, pottery, leather, or cotton belongs exclusively to one particular caste. As a result of their advantageous location at the crossroads of western and central Africa, the Songhai have traditionally prospered from caravan trade. Many young Songhai have left home for the coast, especially Ghana.

**Songhai empire,** also spelled SONGHAY, great trading state of West Africa (fl. 15th–16th century), centred on the middle reaches of the Niger River in what is now central Mali and eventually extending west to the Atlantic coast and east into Niger and Nigeria.

Though the Songhai people are said to have established themselves in the city of Gao about AD 800, they did not regard it as their capital until the beginning of the 11th century during the reign of the *dia* (king) Kossoi, a Songhai convert to Islām. Gao so prospered and expanded during the next 300 years that from 1325 to 1375 the rulers of Mali added it to their empire. In about 1335 the *dia* line of rulers gave way to the *sunni*, or *shi*, one of whom, Sulaiman-Mar, is said to have won back Gao's independence. The century or so of vicissitudes that followed was ended by the accession in about 1464 of Sonni 'Alī, also known as 'Alī Ber (d. 1492). By repulsing a Mossi attack on Timbuktu, the second most important city of Songhai, and by defeating the Dogon and Fulani in the hills of Bandiagara, he had by 1468 rid the empire of any immediate danger. He later evicted the Tuareg from Timbuktu, which they had occupied since 1433, and, after a siege of seven years, took Jenne (Djenné) in 1473 and by 1476 had dominated the lakes region of the middle Niger to the west of Timbuktu. He repulsed a Mossi attack on Walata to the northwest in 1480 and subsequently discouraged raiding by all the inhabitants of the Niger valley's southern periphery. The civil policy of Sonni 'Alī was to conciliate the interests of his pagan pastoralist subjects with those of the Muslim city dwellers, on whose wealth and scholarship the Songhai empire depended. His son Sonni Baru (reigned 1493), who sided completely with the pastoralists, was deposed by the rebel Muḥammad ibn Abī Bakr Ture, also known as Muḥammad I Askia (reigned 1493–1528), who welded the central region of the western Sudan into a single empire. He too fought the Mossi of Yatenga, tackled Borgu, in what is now northwestern Nigeria (1505)—albeit with little success—and mounted successful campaigns against the Diara (1512), against the kingdom of Fouta-Toro in Senegal, and to the east against the Hausa states. In order to win control of the principal caravan markets to the north, he ordered his armies to found a colony in and around Agadez in Aïr. He was deposed by his eldest son, Musa, in 1528. Throughout the dynastic squabbles of successive reigns (Askia Musa, 1528–31; Bengan Korei, also known as Askia Muḥammad II, 1531–37; Askia Ismail, 1537–39; Askia Issihak I, 1539–49), the Muslims in the towns continued to act as middlemen in the profitable gold trade with the states of Akan in central Guinea. The peace and prosperity of Askia Dawūd's reign (1549–82) was followed by a raid imitated by Sultan Aḥmad al-Manṣūr of Morocco on the salt deposits of Taghaza. The situation, which continued to worsen under Muḥammad Bāni (1586–88), culminated disastrously for Songhai under Issihak II (1588–91) when Moroccan forces, using firearms, advanced into the Songhai empire to rout his forces, first at Tondibi and then at Timbuktu and Gao. Retaliatory guerrilla action of the pastoral Songhai failed to restore the empire, the economic and administrative centres of which remained in Moroccan hands.

**Songhua Jiang** (China): *see* Sungari River.

**Songjiang** (China): *see* Sung-chiang.

**Sŏngjin** (North Korea): *see* Kimch'aek.

**Songkhla,** also called SINGORA, city, southern Thailand, located on the eastern coast of peninsular Thailand. Songkhla is a port at the outlet of Luang Lagoon. It is a regional centre for the Gulf of Thailand coastal area and is commercially oriented to Malaysia and Singapore. Rubber, tin, coconuts, peanuts (groundnuts), edible birds' nests, and forest and fish products are exported from its roadstead harbour. On a rail spur from Hat Yai, Songkhla is also served by an airport. Educational facilities include the Prince of Songkla University (1964) and the Southern Technical Institute. The city is a popular tourist centre, with beaches and parks. Pop. (1986 est.) 84,738.

**songlark,** either of the two species of the Australian genus *Cinclorhamphus*, of the songbird family Maluridae (order Passeriformes) or the subfamily Orthonychinae (*see* Muscicapidae). Both are drab and vaguely larklike; males of both species are much larger than females. The rufous songlark (*C. mathewsi*), 20 cm (8 inches) long, lives in open forests and has a lively song; the 30-centimetre (12-inch) brown, or black-breasted, songlark (*C. cruralis*) lives in open country, utters creaky chuckling notes, and has a flight song, as larks do.

**Sŏngnam,** city, Kyŏnggi *do* (province), northwestern South Korea, 12 miles (19 km) southeast of Seoul. Given the status of a municipality in 1973, it developed rapidly as a satellite city of Seoul, absorbing some of the capital's population and light industries. From 1970 to 1975 alone, Sŏngnam's popula-

tion increased nearly fivefold to more than a quarter of a million persons, the highest rate of growth in the country. The government has continued to encourage the movement of industry from Seoul to Sŏngnam. Pop. (1984 est.) 434,078.

**Songnim,** city, southwestern North Korea. It is North Korea's largest iron and steel centre, as well as a river port on the banks of the Taedong-gang (river). During the Japanese occupation (1910–45) it was named Kyŏmip'o. Formerly, it was a poor riverside village, but after the establishment of an iron foundry in 1916 it developed rapidly. During the Korean War it was destroyed by bombing, but it has been rebuilt. A plant located there processes pig iron, steel, and rolled steel. The city is served by rail and highway and also uses the Taedong and Chaeryŏng rivers to transport raw materials and finished products. The river port accommodates ships of 4,000 tons. Pop. (latest est.) 53,035.

**songshrike,** any of several birds of the family Cracticidae (order Passeriformes) including the bell-magpie, butcherbird, and currawong (*qq.v.*).

**sonic boom,** shock wave that is produced by an aircraft or other object flying at a speed equal to or exceeding the speed of sound and that is heard on the ground as a sound like a clap of thunder.

When an aircraft travels at subsonic speed, the pressure disturbances, or sounds, that it generates extend in all directions. Because this disturbance is transmitted earthward continuously to every point along the path, there are no sharp disturbances or changes of pressure. At supersonic speeds, however, the pressure field is confined to a region extending mostly to the rear and extending from the craft in a restricted widening cone (called a Mach cone). As the aircraft proceeds, the trailing parabolic edge of that cone of disturbance intercepts the earth, producing on earth a sound of a sharp bang or boom—with silence before and after. When such an aircraft flies at a low altitude, the shock wave may be of sufficient intensity to cause glass breakage and other damage. The intensity of the sonic boom is determined not only by the distance between the craft and the ground but also by the size and shape of the aircraft, the types of maneuvers that it makes, and the atmospheric pressure, temperature, and winds. If the aircraft is especially long, double sonic booms might be detected, one emanating from the leading edge of the plane and one from the trailing edge.

**Soninke,** also called SARAKOLE, SERACULEH, or SERAHULI, a people located in Senegal near Bakel on the Sénégal River and in neighbouring areas of West Africa. They speak a Mande language of the Niger-Congo family. Some Senegalese Soninke have migrated to Dakar, but the population in the Bakel area remain farmers whose chief crop is millet. The Soninke were the founders of the ancient empire of Ghana, which was destroyed after the invasions of Muslim conquerors in the 10th century. Their social structure and organization are typical of the Mande (*q.v.*) peoples.

**Sonneberg,** city, Thuringia *Land* (state), eastern Germany, on the southern slope of the Thüringer Wald (forest), southeast of Suhl city, near the border with Bavaria *Land*. Mentioned in 1207, it was chartered in 1349 and belonged to the Duchy of Saxe-Meiningen from 1735 to 1918. A rail junction, it is the centre of the Thuringian toy-making industry, based in the nearby villages, and has a toy museum. Pop. (1998 est.) 25,151.

**Sonneck, Oscar (George Theodore)** (b. Oct. 6, 1873, Jersey City, N.J., U.S.—d. Oct. 30, 1928, New York City), American musicologist, librarian, and editor.

Sonneck was mainly educated in Germany and attended the universities of Heidelberg and Munich, studying philosophy, composition, conducting, and, especially, musicology.

A significant portion of his studies on American musical life before 1800—an area of study that remained his lifelong interest—was carried out at the new Library of Congress in Washington, D.C. In 1902 he was appointed the first head of the library's music division, in which capacity he organized and developed one of the finest and most comprehensive collections of music, manuscripts, and books on music in the world.

In 1917 he resigned from the library and accepted the post of director of the publication department of G. Schirmer, Inc. (New York City), whose *Musical Quarterly* he had edited since its first issue in 1915. After his appointment as vice-president of the company (1921), he actively supported American composers and directed the publication of new music by Ernest Bloch, John Alden Carpenter, Charles Tomlinson Griffes, Rubin Goldmark, Charles Martin Loeffler, and others.

Sonneck's writings laid the foundation for the scientific study of music in the United States. His elaborate catalogs (issued by the Library of Congress) and his work on opera librettos remain the outstanding reference works in their field, and the system he devised for the classification of music collections is an invaluable contribution to music bibliography.

**sonnet,** lyric poem of 14 lines having a formal rhyme scheme; it is unique among poetic forms in Western literature in that it has retained its appeal for major poets for five centuries. The sonnet seems to have originated in the 13th century among the Sicilian school of court poets, who were influenced by the love poetry of Provençal troubadours. From there it spread to Tuscany, where it reached its highest expression in the 14th century in the poems of Petrarch. His *Canzoniere,* a sequence of poems including 317 sonnets, addressed to his idealized beloved, Laura, established and perfected the Italian (or Petrarchan) sonnet, which remains one of the two principal sonnet forms, as well as the one most widely used. The other major form is the English (or Shakespearean) sonnet.

The Italian sonnet characteristically treats its theme in two moods. The first eight lines, the octave, state a problem, ask a question, or express an emotional tension. The last six lines, the sestet, resolve the problem, answer the question, or relieve the tension. The octave is rhymed *abbaabba.* The rhyme scheme of the sestet varies; it may be *cdecde, cdccde,* or *cdedce.* The Petrarchan sonnet became a major influence on European poetry. It soon became naturalized in Spain, Portugal, and France and was introduced to Poland, whence it spread to other Slavic literatures. In most cases the form was adapted to the staple metre of the language—*e.g.,* the Alexandrine (12-syllable iambic line) in France and iambic pentameter in English.

The sonnet was introduced to England, along with other Italian verse forms, by Sir Thomas Wyat and Henry Howard, earl of Surrey, in the 16th century. The new forms precipitated the great Elizabethan flowering of lyric poetry, and the period marks the peak of the sonnet's English popularity. In the course of adapting the Italian form to a language less rich in rhymes, the Elizabethans gradually arrived at the distinctive English sonnet, which is composed of three quatrains, each having an independent rhyme scheme, and is ended with a rhymed couplet.

The rhyme scheme of the English sonnet is *abab cdcd efef gg.* Its greater number of rhymes makes it a less demanding form than the Italian sonnet, but this is offset by the difficulty presented by the couplet, which must summarize the impact of the preceding quatrains with the compressed force of a Greek epigram. Even Shakespeare sometimes failed at it.

The typical Elizabethan use of the sonnet was in a sequence of love poems in the manner of Petrarch. Although each sonnet was an independent poem, partly conventional in content and partly self-revelatory, the sequence had the added interest of providing something of a narrative development. Among the notable Elizabethan sequences are Sir Philip Sidney's *Astrophel and Stella* (1591), Samuel Daniel's *Delia* (1592), Michael Drayton's *Idea's Mirrour* (1594), and Edmund Spenser's *Amoretti* (1591). The last-named work uses a common variant of the sonnet (known as Spenserian), which follows the English quatrain and couplet pattern, but resembles the Italian in using a linked rhyme scheme: *abab bcbc cdcd ee.* Perhaps the greatest of all sonnet sequences is Shakespeare's, addressed to a young man and a "dark lady." In these sonnets the supposed love story is of less interest than the underlying reflections on time and art, growth and decay, and fame and fortune.

In its subsequent development, the sonnet was to depart even further from themes of love. By the time John Donne wrote his religious sonnets (*c.* 1610) and Milton wrote sonnets on political and religious subjects or on personal themes such as his blindness (*i.e.,* "When I consider how my light is spent"), the sonnet had been extended to embrace nearly all the subjects of poetry.

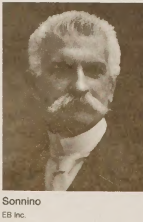
It is the virtue of this short form that it can range from "light conceits of lovers" to considerations of man, time, death, and eternity, without doing injustice to any of them. Even during the Romantic era, in spite of the emphasis on freedom and spontaneity, the arbitrary Italian and English sonnet forms continued to challenge major poets. The sonnets of Wordsworth (*e.g.,* "It Is a Beauteous Evening; Calm and Free" and "The World Is Too Much With Us") and those of Keats (*e.g.,* "When I Have Fears That I May Cease To Be" and "Bright Star, Would I Were Steadfast as Thou Art") are among the finest and best known in English.

In the later 19th century the love sonnet sequence was revived by Elizabeth Barrett Browning in *Sonnets from the Portuguese* (1850) and by Dante Gabriel Rossetti in *The House of Life* (1876). The most distinguished 20th-century work of the kind is Rainer Maria Rilke's *Sonnette an Orpheus* (1922).

**Sonni 'Alī,** Sonni also spelled SUNNI, also called SONNI 'ALI BER (Arabic: 'Alī the Great) (d. 1492), West African monarch who initiated the imperial expansion of the Western Sudanese kingdom of Songhai. His conquest of the leading Sudanese trading cities established the basis for Songhai's future prosperity and expansion.

When Sonni 'Alī ascended the Songhai throne *c.* 1464, the kingdom comprised only a small area in the upper Niger valley around its capital, the prosperous trading city of Gao. Although the Songhai people had managed to throw off the domination of the Mali Empire, they also hoped to obtain territorial benefits, like other West African peoples, from the disintegration of Mali. Sonni 'Alī saw an excellent opportunity to oblige in 1468, when Muslim leaders of the city of Timbuktu (Tombouctou), formerly one of the chief cities in the empire of Mali, asked his aid in overthrowing the Tuareg, the nomadic desert Berbers who had conquered the city when Mali control declined. After Sonni 'Alī conquered Timbuktu and drove out the Tuareg, he plundered the city and murdered many of its inhabitants, presumably in retaliation for the Muslim leader's failure to provide him with promised transport across the Niger River.

Sonni 'Ali's sack of Timbuktu established his reputation in the history of The Sudan as a cruel and capricious tyrant, alternately generous and savage. The 16th-century Muslim Sudanese historian 'Abd ar-Rahman as-Sadi, in the historical chronicle *Tar'ikh as-Sudan* ("History of the Sudan"), related several instances of Sonni 'Ali's summary executions of friend and foe alike. The antipathy of Muslim scholars toward Sonni 'Ali may be attributed in part to what they regarded as his rather unorthodox observance of Islam. He apparently combined the performance of Muslim rites with those of the traditional Songhai religion.



Aware of the benefits of controlling Sudanese commerce, Sonni 'Ali turned to the conquest of the wealthy trading city of Jenne (now Djenné) on the Bani River near its confluence with the Niger. His seven-year siege of the city resulted in its conquest in 1473. Sonni 'Ali spent most of his reign in the field repulsing attacks on his empire, these coming especially from the Mossi, the Fulani of the Dendi region, and the Tuareg. His fine strategic sense and his effective use of cavalry enabled him to cripple the striking power of the Mossi (although he could not annex their territory), to conquer and assimilate the Dendi area, and to discourage Tuareg raiding.

Little is known about the actual administration of Songhai during Sonni 'Ali's time except that he divided conquered territories into provinces and appointed trusted lieutenants to govern them. He died while returning from a campaign against Fulani peoples who lived west of Songhai.

**Sonnino, Sidney, Baron** (Barone) (b. March 11, 1847, Pisa [now in Italy]—d. Nov. 24, 1922, Rome, Italy), Italian statesman who as foreign minister promoted his country's entrance into World War I. He was also prime minister in 1906 and 1909–10.

Joining the diplomatic service in the 1860s shortly after the formation of a united Italy, Sonnino left it to devote time to political, social, and economic studies of Italian life. These studies led in 1876 to an important work on conditions in Sicily (*La Sicilia nel 1876* [1877]) and in 1878 to his founding of a weekly economic review, *La Rassegna Settimanale,* that he later converted into a political daily. When he was elected deputy in 1880, his knowledge of Italian economic affairs brought him first the post of under secretary of the treasury and later, in the midst of a financial crisis in 1893, that of finance minister. His energetic measures, including imposition of taxes by decree, averted possible national bankruptcy, but the military disaster of Adowa in Ethiopia brought the fall of the cabinet, and for many years he was a leader of the conservative parliamentary opposition. For brief periods in 1906 and 1909–10 he served as prime minister, in which role he proved to be unable to conciliate parliament.

In November 1914 Sonnino became foreign minister in the cabinet of Antonio Salandra. He plunged into negotiations aimed at completing Italian unification by the acquisition of territories still held by Austria-Hungary. When he found that Austria would not meet Italian aspirations, he switched to negotiating with the Allies, and, on their acceptance of his demands, he successfully urged his government to declare war, even though parliament was not in session. Sonnino remained at the Foreign Office throughout the war, despite changing ministries. In the closing months of the war and at the Versailles Peace Conference he was dismayed by the failure of the Allies, notably of the United States, to grant all of Italy's aims and by the cost of the war, which had exceeded his expectations. On the fall of the Orlando cabinet in June 1919 he retired to private life.

**Sonntag, Gertrud Walpurgis** (singer): *see* Sontag, Henriette.

**Sonoma,** city, Sonoma county, western California, U.S., 21 miles (34 km) southeast of Santa Rosa, in the Sonoma Valley (made famous by Jack London as the "Valley of the Moon"). It was founded in 1835 by General Mariano Guadalupe Vallejo (who had been sent to investigate the Russian outpost at Fort Ross, 50 miles north-northwest) at the site of the Mission San Francisco Solano, the last (1823) and most northerly of the 21 Franciscan California missions. The name Sonoma comes from a Wintun Indian word for "nose," probably derived from a local Indian chief and tribe. Vallejo's home (1850) and the restored mission now form the main part of Sonoma State Historic Park. On June 14, 1846, a small band of American settlers invaded Sonoma and captured Vallejo and his Mexican military garrison. They raised an improvised Bear Flag of California (designed by William Todd, nephew of Mary Todd Lincoln) and declared a republic, which lasted until July 9. In the 1850s Hungarian count Agoston Haraszthy planted thousands of cuttings from European grape vines around his Buena Vista vineyard (east of the town) and laid the basis for the vast California wine industry.

Wine-making and diversified farming are the city's economic mainstays. Inc. 1900. Pop. (1990) 8,121.

**Sonora,** *estado* ("state"), northwestern Mexico, bounded on the north by the United States, on the east by Chihuahua, on the south by Sinaloa, and on the west by Baja California and the Gulf of California. The name (meaning "sonorous") is from local deposits of marble, which when struck emit a bell-like sound. Explored by Spaniards in the 1530s, Sonora became an important colonial copper-, gold-, and silver-mining district. Generally arid and semiarid climatic conditions necessitate irrigation, with which winter vegetables, cereals, cotton, tobacco, and corn (maize) can be cultivated. Sonora became a state in 1830, but the Yaqui Indian tribes were not finally subdued until the 20th century. The population is clustered around Heroica Nogales, at the Arizona border; Hermosillo, the state capital; Guaymas, a gulf port and deep-sea fishing resort; and Ciudad Obregón, in the Yaqui valley. Since the 1940s, these and other communities have flourished, their cotton-growing hinterlands developed by irrigation projects. Major highways and railroads from Mexicali and Heroica Nogales to Mexico City traverse the state. Airports are situated in the major cities. Area 70,291 square miles (182,052 square km). Pop. (1990) 1,823,606.

**Sonora, José Gálvez, Marqués de la** (Marquess of): *see* Gálvez, José.

**Sonora River,** river in Sonora state, northwestern Mexico. It rises south of Cananea, near the U.S. border, and flows southward and then southwestward through the western flanks of the Sierra Madre Occidental. Below Hermosillo, the state capital, the river crosses the coastal lowlands and empties into the Gulf of California opposite Tiburón Island. Its total course is some 250 miles (400 km) long. Many settlements, including Arizpe, Moctezuma, Ures, and Hermosillo, lie along the river, and, although it reaches the gulf only in years of heavy rainfall, it is used for irrigation, especially near Hermosillo.

**Sonoran Desert,** arid region covering 120,000 square miles (310,000 square km) in southwestern Arizona and southeastern California, U.S., and including much of the Mexican state of Baja California Norte and the western half of the state of Sonora. Subdivisions of the hot, dry region include the Colorado and Yuma deserts. Irrigation has produced many fertile agricultural areas, notably the Coachella and Imperial valleys; the warm winters attract tourists to resorts, including Palm Springs, Calif., and Tucson and Phoenix, Ariz. Indian reservations (particularly Papago and Pima) are scattered across the desert.

Oasis in the Sonoran Desert near the Santa Rosa Mountains, California
David Muench

**sonorant,** in phonetics, any of the nasal, liquid, and glide consonants that are marked by a continuing resonant sound. Sonorants have more acoustic energy than other consonants. In English the sonorants are *y, w, l, r, m, n,* and *ng. See also* nasal; liquid.

**Sonrhai** (people): *see* Songhai.

**Sons of Liberty:** *see* Liberty, Sons of.

**Sonsonate,** city, western El Salvador, on the Río Grande de Sonsonate. Founded in 1524, it served as the provisional national capital in 1833–34. During the Spanish colonial period, it conducted a thriving cacao trade. Linked by road and rail with the Pacific port of Acajutla, 12 miles (19 km) southwest, it deals in livestock products, tropical fruit, coffee, and sugarcane and exports skins and hides. Pop. (1985 est.) mun., 48,436.

**Sontag, Henriette,** original name GERTRUD WALPURGIS SONNTAG (b. Jan. 3, 1806, Koblenz, Fr. [now in Germany]—d. June 17, 1854, Mexico City, Mex.), German operatic and concert soprano who enjoyed great acclaim both before and after a 19-year hiatus in her career.

The child of actor Franz Sonntag and singer Franziska Martloff Sonntag, she received early theatrical training and played juvenile roles in both stage plays and operas in Germany and in Prague, where her mother moved after her father's death. For several years she studied at the Conservatory there, making her adult operatic debut in 1821 as the princess in François-Adrien Boieldieu's *Jean de Paris.* After hearing her perform in Gioacchino Rossini's *La donna del lago* in Vienna in 1823, Carl Maria von Weber asked her to create the title role in his *Euryanthe.* The premiere performance later that year was a triumph for both singer and composer. In 1824 she sang the premieres of Ludwig van Beethoven's *Ninth Symphony* and *Missa Solemnis* in Vienna and for the next few years toured Berlin, Paris, London, and most of the other major European centres.

In 1828 Sontag was secretly married to Count Carlo Rossi of Sardinia, whose diplomatic career as ambassador to The Hague was jeopardized by the marriage until a patent of nobility was bestowed on her by the King of Prussia. After the marriage was publicly acknowledged in 1830, she yielded to pressure from her husband's colleagues and renounced the stage. For 19 years she appeared only rarely in private and charity concerts. In 1849, however, political upheaval in Sardinia ended both her husband's diplomatic career and Sontag's retirement. She accepted a six-month contract to sing at Her Majesty's Theatre, London, and then toured Great Britain and France. In 1850 she created the role of Miranda in Fromental Halévy's *La tempesta* in London, and, after a triumphal tour of Germany, she went in 1852 to the United States. She made her last appearance, as Lucrezia Borgia in the Gaetano Donizetti opera, during a tour of Mexico, where she succumbed to cholera during an epidemic.

**Sontag, Susan** (b. Jan. 16, 1933, New York, N.Y., U.S.), American intellectual and writer best known for her essays on modern culture.

Sontag was reared in Tucson, Ariz., and in Los Angeles. She attended the University of California at Berkeley for one year and then transferred to the University of Chicago, from which she graduated in 1951. She studied English literature (M.A., 1954) and philosophy (M.A., 1955) at Harvard University, teaching philosophy at several colleges and universities before the publication of her first novel, *The Benefactor* (1963). During the early 1960s she also wrote a number of essays and reviews, most of which were published in such periodicals as *The New York Review of Books, Commentary,* and *Partisan Review.* Some of these short pieces were collected in *Against Interpretation and Other Essays* (1968). Her second novel, *Death Kit* (1967), was followed by another collection of essays, *Styles of Radical Will* (1969). Her later critical works included *On Photography* (1977), *Illness as Metaphor* (1979), *Under the Sign of Saturn* (1980), and *AIDS and Its Metaphors* (1988).

Sontag's essays are characterized by a serious philosophical approach to various aspects and personalities of modern culture. She first came to national attention in 1964 with an essay entitled "Notes on 'Camp'," in which she discussed the attributes of taste within a particular segment of society. She has written on such subjects as theatre and film and such figures as Nathalie Sarraute, Robert Bresson, and Francis Bacon. In addition to criticism and fiction, she has written screenplays and edited selected writings of Roland Barthes and Antonin Artaud.

**Sony Corporation,** Japanese SONY KK, major Japanese manufacturer of consumer electronics products. Headquarters are in Tokyo.

The company was incorporated in 1946 as Tokyo Telecommunications Engineering Corporation. Its founders were Ibuka Masaru, whose Japan Precision Instruments Company had supplied electronic devices during World War II, and Morita Akio, an applied sciences instructor. The venture, which was funded by Morita's father, was formed to apply the advanced technology developed during the war to the manufacture of consumer products. The company's present name was adopted in 1958.

Initially the company made voltmeters, electrically heated cushions, resonator sound generators, and similar devices. The first major consumer item it produced was an audio tape recorder, introduced in Japan in 1950. Since then the company, which markets its products worldwide under the Sony trademark, has continued to pioneer new technology for consumer products. In 1957 Sony introduced the world's first pocket-sized, all-transistor radio. In 1960 Sony introduced an 8-inch (20-centimetre) transistorized television set, creating a new market for television; and in 1968 it brought out colour television sets equipped with the simplified Trinitron picture tube.

The company was one of the first to recognize the potential of the consumer videotape market, and in 1969 it introduced a colour video cassette recorder for both industrial and consumer use. In 1972 it formed an affiliate to market its Betamax colour videocassette system.

Sony spearheaded Japan's drive to become the world's dominant consumer electronics manufacturer in the late 20th century. In 1987–88 Sony purchased the CBS Records Group from CBS Inc., thus acquiring the world's largest record company. It followed that purchase with the purchase in 1989 of Columbia Pictures Entertainment Inc.

**Soochow** (China): *see* Su-chou.

**Soong** FAMILY, Soong also spelled SUNG, Pinyin SONG, influential Chinese family that was heavily involved in the political fortunes of China during the 20th century. Among its best-known members were Charlie, the founder of the family, and his children T.V. Soong, financier and politician; Soong Mei-ling, who became Madame Chiang Kai-shek; and Soong Ch'ing-ling (*qq.v.*), who married Sun Yat-sen.

Charlie Soong (1866–1918), also called Charles Jones Soon, was born Han Chiao-shun and was reared until he was nine in Wench'ang, a port on the eastern coast of the island of Hainan. After a three-year apprenticeship in the East Indies, he spent eight years in the United States. He was educated and trained by the Methodists for missionary work among the Chinese. In 1886 he returned to China. He married in 1887; the following year he joined a secret society dedicated to the overthrow of the Manchu dynasty. He nevertheless continued his missionary work until 1892. About this time he became a publisher—a career he had started with the printing of inexpensive, vernacular Chinese Bibles—and, with the aid of Julian Carr, a wealthy American patron, soon became a wealthy, influential industrialist involved in a number of businesses. In 1894 Soong met Sun Yat-sen, who helped to transform him into a revolutionary. In 1906 he was officially appointed Treasurer of the Revolutionary Alliance and was responsible for financing the Nationalist Party (Kuomintang) revolution.

Soong had all of his children educated in the United States. After her return to China, his eldest child, Ai-ling (1890–1973), acted as a secretary to Sun until her marriage to banker and businessman H.H. K'ung in 1914. Ch'ing-ling, Soong's second child, replaced Ai-ling as secretary and in 1914 married Sun Yat-sen, who was 26 years her senior. Both H.H. K'ung and Charlie Soong's third child, T.V. Soong, were financially significant forces in the advancement of Sun Yat-sen and the Nationalist cause in China and the United States. After Sun's death in 1925, the Nationalist Party split into factions. The group led by Sun's widow, Ch'ing-ling, was eventually overshadowed by the faction led by Chiang Kai-shek, who in 1927 married Mei-ling Soong. Charlie Soong's fourth child. (The two youngest of Soong's children, T.L. and T.A., became bankers.) T.V. Soong became an influential member of Chiang's Nationalist government and, with his sister Mei-ling, was extremely important in Chinese foreign relations. Ch'ing-ling remained opposed to Chiang's government; when the Communists established the People's Republic in 1949, they granted Ch'ing-ling high, though largely symbolic, status. The power of the Soong family began to dissipate after this period.

**Soong, T.V.,** in full SOONG TZU-WEN, Soong also spelled SUNG (b. Dec. 4, 1894, Shanghai, China—d. April 24, 1971, San Francisco, Calif., U.S.), financier and official of the Chinese Nationalist government between 1927 and 1949, once reputed to have been the richest man in the world.

The son of a prominent industrialist, Soong was educated in the United States at Harvard University. He returned to China in 1917 and soon became active in banking and financial circles. After 1923 he began to fill the role his father had had, that of financing the Nationalist Party (Kuomintang). At the request of Sun Yat-sen, to whom his sister Ch'ing-ling was married, T.V. established at Canton in 1924 the Central Bank of China, reorganized four years later as a central bank of issue and a government treasury.

In 1925 Soong became finance minister in the new Nationalist government. After 1927 he cooperated with Chiang Kai-shek, who had become head of the Nationalists, and to whom another of the Soong sisters, Mei-ling, was married. As finance minister Soong reformed the taxation system, abolished the likin, or internal transit tariff, and readjusted foreign and domestic debts. Moreover, between 1928 and 1930 he returned tariff autonomy to China by negotiating a series of agreements with foreign powers, thus restoring China's right to set tariff rates and supervise their collection, a privilege that had been forcibly taken from China in the 19th century by the Western nations. He resigned as finance minister in 1931 though his influence—largely due to his wealth and his growing international prestige—remained great. In 1936 he rejoined the government, and, during the Sino-Japanese War, he served China in its negotiations with the foreign powers. He became minister of foreign affairs in 1942.

The following year Soong negotiated the end of extraterritoriality rights; *i.e.,* the end of the rights of foreigners to govern themselves while on Chinese soil. In 1945 he negotiated a treaty of friendship between the Nationalist government and the Soviet Union. When the Communists captured the mainland in 1949,

however, Soong moved to the United States, where he was active in business and banking.

**Soong Ch'ing-ling,** Soong also spelled SUNG, Pinyin SONG QINGLING (b. Jan. 27, 1892, Shanghai, China—d. May 29, 1981, Peking), second wife of the Chinese revolutionary leader Sun Yat-sen. She became an influential Chinese political figure after Sun's death.

Educated in the United States, Soong Ch'ing-ling married Sun Yat-sen, 26 years her senior, in 1914. After his death (1925) Soong Ch'ing-ling assumed an active role in politics, supporting the left wing of the Nationalist Party (Kuomintang, which had been founded by Sun Yat-sen) when it split with the right wing of the party, later headed by Chiang Kai-shek. In 1927, when the left-wing Nationalists purged their communist members and reunited with the right-wing Nationalists, she denounced the organization as having betrayed the ideals of Sun Yat-sen. She then left China for the Soviet Union, where she remained for two years.

After the outbreak of the Sino-Japanese War in 1937, Soong organized the China Defense League, which did medical relief and child welfare work, especially in the communist-controlled areas of the country. During this period she also briefly reunited with her sister Soong Mei-ling (the wife of Chiang Kai-shek) and her brother T.V. Soong, one of China's leading industrialists and a powerful official in the Nationalist government.

In 1948 she became honorary chairman of the Kuomintang Revolutionary Committee, a splinter group organized in Hong Kong to oppose Chiang Kai-shek's Kuomintang. After the establishment of the People's Republic of China in 1949, Soong Ch'ing-ling remained on the mainland, where she was held in great deference by the communists because she symbolized a link between the People's Republic and the older revolutionary movement of Sun Yat-sen. She became an important official within the new government, and in 1951 she was awarded the Stalin Peace Prize for her work on welfare and peace committees. In 1966 during the Cultural Revolution she was criticized by the Red Guards, but she retained her position. In 1981 she was named honorary Chairman of the People's Republic.

**Soong Mei-ling,** Soong also spelled SUNG, Mei-ling also spelled MAYLING, also called MADAME CHIANG KAI-SHEK or CHIANG MEI-LING (b. March 5, 1897, Shanghai, China—d. Oct. 23, 2003, New York, N.Y., U.S.), second wife of the Nationalist Chinese president Chiang Kai-shek. Her sister Soong Ch'ing-ling was the wife of Sun Yat-sen, and her brother T.V. Soong was a prominent industrialist and official of the Nationalist Chinese government.

Soong Mei-ling was educated in the United States from 1908 to 1917 and was thoroughly Americanized. In 1927 she married Chiang Kai-shek, and she helped introduce him to Western culture and ideas and worked to publicize his cause in the West. During World War II she wrote many articles on China for American journals, and in 1943, during a visit to the United States, she became the first Chinese and the second woman to address a joint session of the U.S. Congress. Her efforts resulted in much financial aid, and she so impressed the American public that until 1967 her name appeared annually on the U.S. list of the 10 most admired women in the world.

When Chiang Kai-shek's forces were defeated in 1949, Soong Mei-ling and her family moved to Taiwan, where her husband established his government. Still highly influential, she helped sway the U.S. government's policy toward China and Taiwan. After Chiang Kai-shek's death in 1975, Soong Mei-ling moved to New York, where she lived until her death. Her published works include *This Is Our China* (1940), *The Sure Victory* (1955), and two volumes of selected speeches.

**sooty mold,** also called BLOTCH, or BLACK MOLD, plant disease characterized by splotchy black stain or coating on leaves, stems, and fruit, composed of dark fungal threads (*Capnodium, Fumago,* and *Scorias* species) that grow in flowing sap or on honeydew excreted by aphids and other sucking insects. The condition is unsightly but usually not harmful. Control includes spraying or dusting for sucking insects, washing off sticky coatings of sap or honeydew on plant surfaces, and avoiding the wounding of plants.

**Sophar** (Old Testament): *see* Zophar.

**sopher** (Judaism): *see* sofer.

**Sophia,** also called SOPHIA OF THE PALATINATE, German SOPHIE VON DER PFALZ (b. Oct. 14, 1630, The Hague—d. June 8, 1714, Herrenhausen, Hanover), electress of Hanover and heir to the British throne, whose son became George I of Great Britain.

Sophia was the 12th child of Frederick V, elector Palatine of the Rhine, by his wife Elizabeth, a daughter of the English king James I. Residing after 1649 at Heidelberg with her brother, the restored elector Palatine, Charles Louis, she married in 1658 Ernest Augustus, who became elector of Brunswick-Lüneburg (Hanover) in 1692.

Sophia became a widow in 1698, but before then her name had been mentioned in connection with the English throne. When considering the Bill of Rights in 1689 the House of Commons refused to place her in the succession, and the matter rested until 1700, when the state of affairs in England was more serious. William III was ill and childless; William, duke of Gloucester, the only surviving child of the princess Anne, had just died. The princess was the nearest Protestant heir. Accordingly, by the Act of Settlement of 1701 the English crown, in default of issue from either William or Anne, was settled upon "the most excellent princess Sophia, electress and duchess-dowager of Hanover" and "the heirs of her body, being Protestant." Sophia watched affairs in England during the reign of Queen Anne with great interest, although her son, the elector George Louis, objected to any interference in that country, and Anne disliked all mention of her successor. An angry letter from Anne possibly hastened Sophia's death in June 1714; less than two months later her son became George I of Great Britain and Ireland, on the death of Anne.

**Sophia,** Russian in full SOFYA ALEKSEYEVNA (b. Sept. 27 [Sept. 17, Old Style], 1657, Moscow—d. July 14 [July 3, Old Style], 1704, Moscow), regent of Russia from 1682 to 1689.

The eldest daughter of Tsar Alexis (ruled 1645–76) and his first wife, Mariya Miloslavskaya, Sophia was tutored by the monk Simeon Polotsky, from whom she received an outstanding education. When her brother Fyodor III died (May 7 [April 27, Old Style], 1682), her half brother Peter, son of Alexis and his second wife, Natalya Naryshkina, was proclaimed tsar. Sophia, as leader of the Miloslavsky family, however, objected to a government dominated by the Naryshkins and incited the discontented *streltsy* (household troops) to riot. After several members of the Naryshkin family were murdered, Sophia calmed the *streltsy* by arranging for her younger brother Ivan V to be proclaimed coruler with Peter; she assumed the role of regent (June 8 [May 29, Old Style], 1682).

Ruling under the guidance of her chief adviser and lover, Prince Vasily V. Golitsyn, Sophia consolidated her regime. To prevent the unreliable *streltsy* from reversing their position and removing her, she replaced their commander (who was executed for treason) with one of her favourites. In addition, she transferred 12 of the 19 Moscow regiments from the city to guard the frontier and revoked many of the privileges she had granted the troops when she seized power.

Sophia, engraving by A. Bloteling
Novosti Press Agency

Sophia also promoted the development of industry and encouraged foreign craftsmen to settle in Russia. Despite Golitsyn's numerous plans for domestic reform, however, the regent failed to meet discontent among the peasants and religious dissidents. She also overruled several of her advisers and approved Golitsyn's plan to conclude a permanent peace with Poland (1686; which confirmed a truce of 1667), by which Russia obtained Kiev and the territory east of the Dnieper River in exchange for a promise to join a European coalition against the Turks. In 1687 and 1689 she sponsored two disastrous military campaigns, led by Golitsyn, against the vassals of the Turks, the Crimean Tatars. Although her government also concluded the favourable Treaty of Nerchinsk with China (1689), setting Russia's eastern border at the Amur River, Golitsyn's failures reinforced the increasing dissatisfaction among both the Naryshkins and the general population with her rule. Recognizing this and hoping to eliminate Peter, the figurehead of her rivals, Sophia tried once more to incite the *streltsy* against the Naryshkins (August 1689); many of the *streltsy* colonels, however, supported Peter, who overthrew Sophia and forced her to enter the Novodevichy Convent in Moscow (September 1689). In 1698 her supporters among the *streltsy* made an unsuccessful attempt to restore her to the throne; although Sophia did not initiate the plot, she was afterward tried by a special tribunal and compelled to take the veil (October 1698).

**Sophia Dorothea,** German SOPHIE DOROTHEA (b. Sept. 13, 1666—d. Nov. 23, 1726, Schloss Ahlden, Lower Saxony), wife of George Louis, elector of Hanover (George I of Great Britain), who accused her of infidelity and imprisoned her for 32 years.

The only child of George William, duke of Brunswick-Lüneburg-Celle, by a Huguenot lady named Eleanore d'Olbreuze, she was married, for dynastic reasons, to her cousin George Louis in 1682. The union was unhappy: her mother-in-law, the electress Sophia, hated her, a feeling soon shared by the prince himself. Under these circumstances Sophia Dorothea made the acquaintance of Count Philipp Christoph von Königsmark, who assisted her in futile attempts to escape from Hanover and was regarded as her lover.

In 1694 the count was assassinated, and the princess was divorced and imprisoned in the castle of Ahlden, remaining in captivity until her death. Sophia Dorothea is sometimes referred to as the "princess of Ahlden." Her two children were the English king George II and Sophia Dorothea, wife of Frederick William I and mother of Frederick the Great.

**Sophist,** in philosophy, a member of a group of itinerant professional teachers, lecturers, and writers prominent in Greece in the latter half of the 5th century BC and continuing, although declining, into the 4th. A later movement, known as the Second Sophistic school, existed in the 2nd century AD, but it consisted of Greek prose writers characterized more by nostalgia than by originality or profundity of thought.

A brief treatment of the Sophists follows. For full treatment, *see* MACROPAEDIA: Philosophical Schools and Doctrines, Western.

The name Sophist derives from the Greek *sophistes,* itself derived from *sophos,* meaning "wise," "clever," or "expert," and, in a general sense, the epithet was applied to craftsmen as well as to poets and sages and to such figures as the Athenian statesman Solon (late 6th and early 5th century BC), Pythagoras, Socrates, and Plato.

The first and most eminent representative of the so-called Sophistic school was Protagoras (*c.* 485–*c.* 410 BC). Other notable Sophists, all working in the late 5th century, include Gorgias of Leontini, Prodicus, Hippias, Antiphon, and Thrasymachus; Critias is often considered a Sophist, although he was an amateur whose main career lay in politics.

The Sophist movement arose at a time when there was much questioning of the absolute nature of familiar values and ways of life. It was recognized that while different societies expressed radically different outlooks on fundamental questions, all people everywhere—Greeks of one's own as well as of other cities, Greeks and non-Greeks, men and women, masters and slaves—shared a common human nature. An antithesis arose between nature and custom, tradition, or law. Custom could be regarded either as artificial trammels on the freedom of the natural state or as a beneficial and civilizing restraint upon natural anarchy. Both views were represented among the Sophists, although the former was the more common.

The Sophists worked independently of each other, primarily on ethical, political, and social questions. They drew their audiences partly from people with a general intellectual curiosity, but also from those seeking practical training in the arts of persuasion as preparation for political and legal careers. This led certain Sophists to specialize in logic and rhetoric and to ask questions, both theoretical and practical, about the nature of language; a common sport developed in the form of so-called dialectic, a kind of intellectual jousting subject to elaborate rules of procedure. Other Sophists lectured or wrote on subjects ranging from mathematics to wrestling.

The early Sophists enjoyed great prestige, but as challengers to orthodoxy they soon incurred unpopularity. In Athens those citizens who had the money and leisure to attend the lectures of the Sophists came from the aristocratic class, and they were constantly suspected of trying to subvert the popular democracy in the interests of the traditional enemy, Sparta. On the other hand the Sophist teachers were also regarded by some critics—most significantly, Plato—as catering to popular opinion in order to attract a larger group of pupils, and teaching those pupils to do likewise in order to advance politically.

Only fragments of the Sophists' writings have survived, and it is from Plato that they are mainly known. Plato gives a vivid picture of an assembly of Sophists in his dialogue *Protagoras,* and in another dialogue, the *Sophist,* he discusses more formally what he takes to be the essence of their thought. His attitude is generally hostile, though he does allow a tenuous intellectual link between them and his master, Socrates. But it is clear that the Sophists had an immense influence, largely via Plato himself, on a number of spheres, including the growth of logic, the philosophy of language, and epistemology, as well as on ethical and political theory.

After their decline, the reputation of the Sophists remained generally low into the 19th century, when they were defended by the English historian of Greece, George Grote. Still more recently, they have attained through some evaluations a modest esteem.

**Sophocles** (b. *c.* 496 BC, Colonus, near Athens [Greece]—d. 406, Athens), with Aeschylus and Euripides, one of classical Athens' three great tragic playwrights. The best known of his 123 dramas is *Oedipus the King.*

A brief treatment of Sophocles follows. For full treatment, *see* MACROPAEDIA: Greek Dramatists, Classical.

Sophocles' father, Sophillus, was a wealthy manufacturer of armour who gave his son a good education. It is not known when Sophocles first competed in dramatic festivals; he gained his first victory in 468, defeating Aeschylus. This began a career of unparalleled success and productivity. He wrote 123 dramas for the major dramatic competition, won perhaps as many as 24 victories, and never received less than second place at the competitions he entered.

He also distinguished himself in the public life of Athens. In 442 he was one of the treasurers responsible for receiving and managing the tribute from Athens' subject-allies in the Delian League. In 440 he was elected one of 10 strategi (military and naval commanders); his senior colleague was Pericles. All the ancient biographical sources depict Sophocles as a gracious and well-loved public figure who participated actively in his community and exercised outstanding artistic talents. Outliving Euripides by a few months, he died just before the end of the Peloponnesian War.

Only seven of Sophocles' tragedies—*Ajax, Antigone, Trachinian Women, Oedipus the King, Electra, Philoctetes,* and *Oedipus at Colonus*—survive in their entirety; all are works of his maturity. He is credited with several dramatic innovations, including some type of "scene paintings" or pictorial prop, an increase in the number of members in the chorus, and the addition of a third actor onstage. He also is noted for his supple language and superb artistry. His plays centre on the collision of defective personal judgment with an unkind fate that leads to human loss and disaster. The formal perfection and vivid characterizations in his plays make them the epitome of classical Greek drama.

**Sophonias** (Israelite prophet): *see* Zephaniah.

**Sophron** OF SYRACUSE (fl. *c.* 430 BC), author of rhythmical prose mimes in the Doric dialect. Although the mimes survive mostly in fragments of only a few words, it can be seen from their titles—*e.g., The Tunny-fisher, The Sempstress,* etc.—that they depicted scenes from daily life. One longer fragment deals with a magical ceremony. Plato thought highly of Sophron, who had some influence on Theocritus and also on Herodas.

**Sophronius** (b. *c.* 560, Damascus [Syria]—d. March 11, 638, Jerusalem), patriarch of Jerusalem, monk, and theologian who was the chief protagonist for orthodox teaching in the doctrinal controversy on the essential nature of Christ and his volitional acts.

A teacher of rhetoric, Sophronius became an ascetic in Egypt about 580 and then entered the monastery of St. Theodosius in Jerusalem. Journeying to monastic centres in Asia Minor, Egypt, and Rome, he accompanied the Byzantine chronicler John Moschus, who dedicated to him his celebrated tract on the religious life, *Leimōn ho Leimōnon* (Greek: "The Spiritual Meadow"). On the death of Moschus in Rome (619), Sophronius accompanied the body back to Jerusalem for monastic burial. He traveled to Alexandria, Egypt, and to Constantinople during 633 to persuade the respective patriarchs to renounce Monothelitism, a heterodox teaching that posited a single, divine will in Christ to the exclusion of a human capacity for choice. Sophronius' extensive writings on this question are all lost.

Although unsuccessful in this mission, Sophronius was elected patriarch of Jerusalem in 634. Soon after his enthronement he forwarded his noted synodical letter to Pope Honorius I and to the Eastern patriarchs, explaining the orthodox belief in the two natures (human and divine) of Christ, as opposed to Monothelitism, which he viewed as a subtle form of heretical Monophysitism (which posited a single [divine] nature for Christ). Moreover, he composed a *Florilegium* ("Anthology") of some 600 texts from the Greek Church Fathers in favour of the orthodox tenet of Dyotheletism (positing both human and divine wills in Christ). This document also is lost.

Sophronius noted the Saracen menace to Palestine in his Christmas sermon of 634, in which he commented that the Arabs already controlled Bethlehem. The fall of Jerusalem to 'Umar I's Saracen forces in 637 probably hastened Sophronius' death after he had negotiated the recognition of civil and religious liberty for Christians in exchange for tribute.

Beside polemics, Sophronius' writings included an encomium on the Alexandrian martyrs Cyrus and John in gratitude for an extraordinary cure of his failing vision. He also wrote 23 Anacreontic (classical metre) odes on such themes as the Saracen siege of Jerusalem and on various liturgical celebrations.

**Sophuza** (African kings): *see under* Sobhuza.

**Sopiha** FAMILY: *see* Sapieha family.

**Sopot,** German ZOPPOT, town and port, Gdańsk *województwo* (province), northern Poland. It lies on the Gulf of Gdańsk between Gdańsk (Danzig) and Gdynia. One of Poland's largest and most popular seaside and health resorts, a role it has filled since the 16th century, Sopot is situated in an area of wooded hills. There is some shipping and good road and rail connections to Gdynia and Gdańsk, with which Sopot is linked economically.

First settled in the 13th century, it was annexed to the free city of Danzig under Napoleon in 1807; it received municipal rights in 1901. It was again incorporated into Danzig in 1919 and returned to Poland in 1945. Pop. (1989 est.) 47,800.

**soprano,** the highest human vocal register, extending approximately from middle C to the second A above. A voice with a range approximately from the A below middle C to the second F or G above is termed a mezzo-soprano. Soprano generally refers to female voices, although it is also applied to boy sopranos (also called trebles) and to male castrati singers of the 16th, 17th, and 18th centuries. In music written in four parts, the soprano part is the highest part. Soprano can also designate a high-pitched member of an instrument family (*e.g.,* soprano saxophone). The term derives from Italian *sopra* ("above") and corresponds to the earlier Latin term *superius,* which in the polyphonic (multipart) music of the 13th–16th century referred to the highest part.

Soprano voices are often classified according to their colour or agility: a dramatic soprano has a rich, powerful quality; a lyric soprano, a lighter, singing tone; and a coloratura soprano possesses a high range (to the second C above middle C and higher) and extreme agility.

**Sopron,** German ÖDENBURG, town, Győr-Sopron *megye* (county), western Hungary. Occupying a salient projecting into the Burgenland of Austria, it is in the foothills of the Austrian Alps near Lake Fertő, west of

Budapest. Artifacts from the area indicate Neolithic, Bronze Age, Illyrian, and Celtic settlements prior to the town's becoming the Roman municipium of Scarabantia. It is a long-established mercantile centre at the intersection of major trade routes. The medieval inner town is oval-shaped and is surrounded by the old city walls, which largely remain intact. Many old houses with courtyards, a remarkable City Tower, and several old churches are of historical and architectural interest. After World War I the Burgenland was allotted to Austria, but in 1921 Sopron voted to remain in Hungary. Because most of Sopron's trade was in the Vienna Basin, the division of Austria-Hungary caused the town to lose much of its importance as a commercial centre. The town has some industry, including fruit preserving, sugar refining, and the manufacture of cotton goods. Sopron's architectural attractions make it a major tourist centre. The University of Forestry and Wood Sciences (1808) is in Sopron. Pop. (1994 est.) 56,324.

**Sopwith, Sir Thomas Octave Murdoch** (b. Jan. 18, 1888, London, Eng.—d. Jan. 27, 1989, Compton Manor, Kings Somborne, near Winchester, Hampshire), British aircraft designer whose firm was famous for such British World War I military aircraft as the Sopwith Camel and Triplane.

Sopwith, 1954
BBC Hulton Picture Library

Sopwith taught himself to fly in 1910 and in that year won the de Forest prize for the longest flight to the European continent. Two years later he founded Sopwith Aviation Company, Ltd., and won the first aerial derby flying a Blériot monoplane.

During World War I his firm produced many military aircraft, including the Pup, Camel, 1½-Strutter, and Triplane. Sopwith was chairman of the Society of British Aircraft Constructors from 1925 to 1927. He was chairman of the Hawker Siddeley Group, Ltd., from 1935 to 1963. During World War II this company built the Hurricane fighter and the Lancaster bomber. Sopwith's yachts *Endeavour* (1934) and *Endeavour II* (1937) were unsuccessful British challengers for the America's Cup. He was knighted in 1953.

**Sør-Trøndelag**, *fylke* (county), central Norway. It extends from the Swedish border (east) to the coast of the Norwegian Sea (west). The mouth of the deeply indented Trondheim Fjord lies in the northern part of the *fylke;* parts of the Dovre Mountains are in the south. Adjacent to the Norwegian Sea coast are the large islands of Hitra and Frøya. The *fylke*'s economy is based on fishing and agriculture in the rural areas, while shipping and manufacturing are predominant in and around Trondheim (*q.v.*), the county seat and one of Norway's principal cities. Area 7,271 square miles (18,831 square km). Pop. (1996 est.) 257,079.

**Sora** (people): *see* Savara.

**Sora,** town, Frosinone *provincia,* Lazio (Latium) *regione,* south-central Italy. In ancient times the town was the scene of fighting between the Romans and the Samnites (a warlike Italic tribe) and experienced a turbulent history during the numerous wars that ravaged the Italian peninsula before Rome's rise to dominance. The town was damaged several times by earthquakes, including one in 1915. In later times it has developed as a mountain vacation resort that also has textile, paper, and other manufacturing industries. Pop. (1993 est.) mun., 26,363.

**Sorabji, Kaikhosru Shapurji,** original name LEON DUDLEY (b. Aug. 14, 1892, Chingford, near London, Eng.—d. Oct. 15, 1988, Dorchester, Dorset), eccentric English composer known for his complex musical works combining free rhythms, elements of Asiatic melodic construction, and European polyphonic structures.

Dudley was of Parsi, Sicilian, and Spanish descent and spent most of his life in England. As a young man he became interested in his father's Parsi heritage and changed his name accordingly. He began his career as a masterly concert pianist, but he abandoned concert performing in the early 1920s. In the 1920s and '30s he was an outspoken music critic and essayist, displaying biting wit and sarcasm in his critical evaluations. He then took up composition.

Sorabji's most famous composition is *Opus Clavicembalisticum* (1930). It consists of one movement lasting nearly 5 hours and is the longest nonrepetitive piano composition ever published. He wrote several symphonies, including the "Jami" Symphony (1942–51), which was nearly 1,000 pages long. From 1940 to 1976 Sorabji prohibited the performance or further publication of his works, making them available only in his own private recordings. In 1976 he permitted only Michael Habermann and Yonty Solomon to perform his works. His books include *Around Music* (1932) and *Mi Contra Fa: The Immoralisings of a Machiavellian Musician* (1947).

**Soranus,** in Roman religion, the underworld deity worshiped on Mount Soracte in southern Etruria. As priests, the *hirpi Sorani* celebrated a rite in which they marched barefoot over burning coals. Soranus was identified with Dis, the Roman god of the underworld, or with Apollo, a Greek god adopted by the Romans, and had a female partner, Feronia, a goddess of uncertain attributes.

**Soranus** OF EPHESUS (near modern Selçuk, Turkey; fl. 2nd century AD, Alexandria and Rome), Greek gynecologist, obstetrician, and pediatrician, chief representative of the methodist school of medicine (emphasizing simple rules of practice, based on a theory that attributed all disease to an adverse state of "internal pores"). His writings set medical opinion concerning women's diseases, pregnancy, and infant care for nearly 1,500 years.

Soranus' remarkable work, *On Midwifery and the Diseases of Women,* includes numerous descriptions of contraceptive measures; he also describes the obstetric chair and podalic version (delivery of the fetus feet first)—hailed as new discoveries during the 15th century—and renders a recognizable account of rickets. His *On Acute and Chronic Diseases* contains an excellent chapter on nervous disorders, with suggested treatments resembling aspects of modern psychotherapy. A keen observer and a practitioner of unusual competence, Soranus also wrote the oldest known biography of Hippocrates and a treatise on fractures.

**Sorb,** German SORBEN, any member of a Slavic minority living in eastern Germany. The Sorbs are concentrated in the Spree River valley, in the area of Bautzen (Budyšin) and Cottbus. This area was part of the traditional region of Lusatia (*q.v.*), whose history is intimately bound up with the Sorbs. The Sorbs are descendants of two small Slavic tribes, the Lužičí and the Milčani, who were subgroups of the major tribe known as Sorbs. The latter were one of a number of Slavic tribes collectively known as Wends, who lived in the area between the Elbe and Oder rivers for centuries until they were subdued and assimilated by the Germans in the late Middle Ages. Though surrounded by Germans for centuries, the present-day Sorbs have managed to preserve their own ethnic identity, language, literature, and customs. The Sorbs are mostly Roman Catholic and use an alphabet of Latin origin. They numbered some 75,000 in the late 20th century. *See also* Wend.

**Sorbian languages,** also called LUSATIAN, or WENDISH, closely related West Slavic languages or dialects; their small number of speakers in eastern Germany are the survivors of a more extensive medieval language group. The centre of the Upper Sorbian speech area is Bautzen, near the border with the Czech Republic, while Cottbus, near Poland, is the centre for Lower Sorbian. The oldest written record of Sorbian dates from the 15th century, although the languages, differing mostly in their sound systems, are known to have begun to diverge around the 13th century. Upper Sorbian enjoyed a considerable amount of prestige in Saxony, while the kingdom of Prussia attempted to suppress Lower Sorbian. Although all Sorbs today also speak German, both Upper and Lower Sorbian have been taught in the schools of the Sorbian areas since 1948.

**Sorbon, Robert de** (b. Oct. 9, 1201, Sorbon, near Rethels, France—d. Aug. 15, 1274, Paris), French theologian, confessor to King Louis IX, and founder of the Sorbonne, a collegiate building that became identified with the University of Paris.

Born into a poor rural family, Sorbon was educated in Reims and in Paris, where his piety and diligence drew the patronage of the comte d'Artois and King Louis IX. In 1251 he became canon of Cambrai. His importance and influence with the king grew until 1258, when he was appointed canon of Paris and chaplain to the court.

Sorbon began to teach about 1253, and in 1257 he obtained property upon which, with the aid of the king, he founded the Maison de Sorbonne, a theological college for poor students. The Sorbonne received official sanction from the pope in 1259 and rapidly grew into a major European centre of learning and the core of the University of Paris. Sorbon himself was chancellor of the university from 1258 and continued to advocate widespread access to higher education and to write numerous religious tracts and commentaries.

**Sorby, Henry Clifton** (b. May 10, 1826, Woodbourne, near Sheffield, Yorkshire, Eng.—d. March 9, 1908, Sheffield), English geologist whose microscopic studies of thin slices of rock earned him the title "father of microscopical petrography."

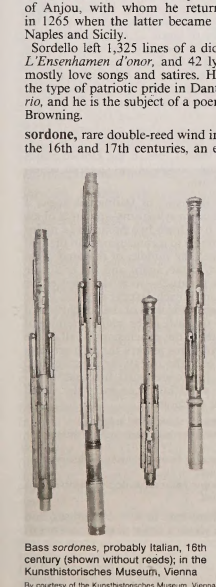
Sorby's early investigations were concerned with agricultural chemistry, but his interests soon turned to geology. He published works dealing with the physical geography of geologic periods, rock denudation and deposition, and the formation of river terraces.

Convinced of the value of the microscope as a tool in all sciences, Sorby began to prepare thin sections of rocks (about 0.025 millimetre, or 1/1000 inch thick) for microscopic study in 1849. His subsequent findings demonstrated the value of petrography, the descriptive branch of the study of rocks. In his memoir "On the Microscopical Structure of Crystals," in the *Quarterly Journal of the Geological Society of London* (1858), he championed the use of microscopic techniques in geology.

In 1865 Sorby announced a new type of

spectrum microscope for analyzing the light of organic pigments, especially minute bloodstains. His research on meteoric geology led to studies of iron and steel, and he concluded that steel is a crystallized igneous rock. His later studies included the origin of stratified rocks, weathering, and marine biology.

**sorcery,** the use of power gained from the assistance or control of evil spirits. Sorcery is distinguished by some writers from witchcraft (*q.v.*) in that it may be practiced by anyone with the appropriate knowledge, using charms, spells, potions, and the like; whereas witchcraft is considered to result from an inherent mystical power and to be practiced by invisible means. Sorcery can be protective—for example, as a guard of property against theft. A practitioner of sorcery is called a sorcerer, or a wizard. The distinction between sorcery and witchcraft is not consistently or universally maintained. During the witch-hunts of the 16th and 17th centuries, courts frequently regarded witches and sorcerers alike as candidates for burning.



**Sordello** (b. *c.* 1200, Goito, near Mantua [Italy]—d. before 1269), most renowned Provençal troubadour of Italian birth, whose *planh*, or lament, on the death of his patron Blacatz (Blacas), in which he invites all Christian princes to feed on the heart of the hero so that they might absorb his virtues, is one of the masterpieces of Provençal poetry.

Sordello became famous when, in 1224, at the court of Richard of Bonifacio at Verona, he abducted his master's wife at the instigation of her brother. After this act (which was primarily political), he went to Treviso, married, and crossed the Alps, pursued by the hatred of several families.

He traveled as a troubadour through Spain and southern France and settled at the court of Raymond Berengar IV of Provence about 1237. He later became a companion of Charles of Anjou, with whom he returned to Italy in 1265 when the latter became Charles I of Naples and Sicily.

Sordello left 1,325 lines of a didactic poem, *L'Ensenhamen d'onor*, and 42 lyrical pieces, mostly love songs and satires. He was made the type of patriotic pride in Dante's *Purgatorio*, and he is the subject of a poem by Robert Browning.

**sordone,** rare double-reed wind instrument of the 16th and 17th centuries, an early precursor of the bassoon. It differs from the curtal, the bassoon's direct predecessor, in having a cylindrical bore (a bassoon bore is conical). The bore, cut into a single piece of wood, doubled in a narrow U-shape and emerged in a lateral hole. Finger holes were cut in the instrument wall. The *sordone* produced a muted sound and had a compass of a 13th.

Bass *sordones*, probably Italian, 16th century (shown without reeds); in the Kunsthistorisches Museum, Vienna
By courtesy of the Kunsthistorisches Museum, Vienna

**Sore, Martin:** *see* Agricola, Martin.

**sore mouth,** also called DOBY MOUTH, PUSTULAR DERMATITIS, OF CONTAGIOUS ECTHYMA (CE), viral disease of sheep and goats. Blisters, pustules, ulcers, and scabs form on the lips especially but also on the face and ears. In severe cases sores form inside the mouth. Infections occur in the spring and summer and heal in about a month. Humans who work around the sheep sometimes become infected.

*Articles are alphabetized word by word, not letter by letter*

**Sorel,** city, Montérégie region, southern Quebec province, Canada. It lies at the mouth of the Richelieu River, on the south bank of the St. Lawrence River. Fort-Richelieu (marked by a monument) was erected on the site in 1642. In 1672 a land grant was obtained by the fort commandant, Pierre de Saurel (or Sorel), for whom the settlement was named. A parish was established in 1721. In 1787 the community was renamed William Henry after the son (later William IV) of George III, but it reverted to its original name in 1845. A service centre for a farming area, Sorel is also a seaport and a wintering port for river steamships, dredges, and other craft. Steelmaking, titanium smelting, ship repairing, and the manufacture of plastics, synthetic fibres, clothing, and furniture are the chief industries. During World War II, Sorel became an important armament and shipbuilding centre. The city has a college, historical museum, two cathedrals (St. Peter's and Notre Dame), and the Gothic-style Christ Church (1842). Inc. 1848. Pop. (1991) 18,786.

**Sorel, Agnès** (b. *c.* 1422, Fromenteau, France—d. Feb. 9, 1450, Anneville), mistress (1444–50) of King Charles VII of France, sometimes known as "Dame de Beauté" from the estate at Beauté-sur-Marne, which he gave her.

Born of a family of the lesser nobility at Fromenteau in Touraine, Sorel was attached at an early age to the service of Isabel of Lorraine, queen of Sicily and wife of René of Anjou, who was the brother-in-law of Charles VII. From 1444 until her death in 1450 she was the acknowledged mistress of the king, the first woman to hold that semiofficial position which was to be of so great importance in the subsequent history of the old regime. Her ascendancy dated from the festivals at Nancy in 1444, the first brilliant court of Charles VII. There her great beauty captivated the king, whose love for her remained constant until her death. He gave her wealth, castles, and lands and secured for her the state and distinction of a queen. This first public recognition of his mistress by a king of France scandalized people and awakened jealousy and intrigue. Her sudden death from dysentery, shortly after the birth of her fourth child, was accordingly attributed to poison. Burgundian historians even openly accused the dauphin, afterward Louis XI, of her death, and later the enemies of Jacques Coeur, in their search for crimes to be brought against him, used this rumour to charge him with the one crime most likely to turn the king against him.

Legend has made an entirely different character of this first official mistress of the French kings. The date of her birth was placed at about 1409, her liaison with the king dated from 1433. Then, so the story ran, she drew him from his indolence, continuing the work of Joan of Arc, both by nerving the king to warlike enterprises—she did apparently induce him to take part personally in the conquest of Normandy—and by surrounding him with that band of wise advisers who really administered France during her ascendancy. Later investigation exploded this romantic story by simply showing that Charles VII had not met her until 10 years later than the time of the legend.

**Sorel, Georges (-Eugène)** (b. Nov. 2, 1847, Cherbourg, France—d. Aug. 30, 1922, Boulogne-sur-Seine), French Socialist and revolutionary syndicalist who developed an original and provocative theory on the positive, even creative, role of myth and violence in the historical process.

Sorel was born of a middle-class family and trained as a civil engineer. Not until he reached age 40 did he become interested in social and economic questions. In 1892 he retired from his civil-service engineering post and devoted himself to a life of meditation and study. In 1893 he discovered Marxism and began writing the analytical critiques that constitute his most original and valuable achievement.

Georges Sorel
H. Roger-Viollet

In 1897 Sorel was a passionate defender of Alfred Dreyfus, the Jewish army officer who was wrongly convicted of treason, but he became disgusted with the way the parties of the left exploited "the Affair" for their own political advancement. By 1902 he was denouncing the Socialist and Radical parties for advocating democracy and constitutionalism as a road to Socialism. Instead, he enthusiastically supported revolutionary syndicalism, a movement with anarchistic leanings that stressed the spontaneity of the class struggle. His best known work, *Réflexions sur la violence* (1908; *Reflections on Violence*), first appeared as a series of articles in *Le Mouvement Socialiste* early in 1906 and has been widely translated. Here Sorel developed his notions of myth (modeled on the syndicalist vision of the general strike) and of violence. Violence for Sorel was the revolutionary denial of the existing social order, and force was the state's power of coercion. (His theory was later perverted and utilized by the Italian Fascist dictator Benito Mussolini.)

Throughout Sorel's thought there runs a moralistic hatred of social decadence and resignation. He attacked the idea of inevitable progress, as developed by 18th-century philosophers, in his work *Les Illusions du progrès* (1908; "Illusions of Progress") and believed that the future was what men chose to make it. Departing from the intellectual tradition of European Socialism, Sorel held that human nature was not innately good; he therefore concluded that a satisfactory social order was not likely to evolve but would have to be brought about by revolutionary action. After 1909 Sorel became disenchanted with the syndicalist movement, and, with some hesitation,

he adhered, not without embarrassment and hesitation, to the monarchist movement—Action Française—which sought to reestablish a homogeneous and traditional moral order. With the outbreak of the Russian Revolution in 1917, Sorel declared himself for the Bolsheviks, who he thought might be capable of precipitating the moral regeneration of mankind.

Sorel wrote on an extraordinarily broad range of topics, including the Bible, Aristotle, and the decline of Rome, in addition to his writings on Socialism. Among his chief works are *L'Avenir socialiste des syndicats* (1898; "The Socialist Future of the Syndicalists"), *Les Illusions du progrès* (1908; "Illusions of Progress"), and *La Révolution dreyfusienne* (1909; "The Dreyfusard Revolution").

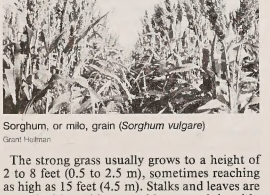
**Sørensen, Rasmus Møller** (b. March 8, 1799, Jelling, Den.—d. May 23, 1865, Copenhagen), teacher and politician who was a leading agitator for agrarian reform and for the establishment of representative government in Denmark.

In the 1820s and 1830s Sørensen, serving as tutor on the estates of several progressive landowners, developed his ideas of peasant reform. He championed the opening of folk high schools for practical secular education, the breaking up of large estates in favour of smallholders, tenant proprietorship aided by government funds, and increased political representation. In the early 1840s he founded and edited the journal *Almuevennen* ("Friend of the Common People") with J.A. Hansen, another leading peasant agitator. Leaving his teaching position, he organized the circulation of petitions calling for agrarian reform, equality of taxation, universal conscription, and political equality. With the achievement of constitutional government, Sørensen was elected to parliament (1849–52).

**Sørensen, Villy** (b. Jan. 13, 1929, Copenhagen, Den.—d. Dec. 16, 2001, Copenhagen), influential writer of modernist short stories and also a leading literary critic in Denmark after World War II.

His first collection of short stories, *Saere historier* (*Tiger in the Kitchen and Other Strange Stories*) appeared in 1953, followed in 1955 by *Ufarlige historier* ("Harmless Stories") and in 1964 by the important collection *Formynderfortaellinger* ("Guardian Stories"). His short stories are experimental and often draw their material from the Bible, legends, ballads, and world history in general. Sørensen employed the naive manner of Hans Christian Andersen and allegorical tales like those of Isak Dinesen to describe the absurdity that threatens human existence. He often treated the themes of the divided self and the loneliness of the individual in society.

Sørensen's fiction manifests in artistic form the theories of his philosophical writings, *Digtere og daemoner* (1959; "Poets and Demons") and *Hverken-eller* (1961; "Neither-Nor"). He was strongly influenced in his thinking by German existentialism, in particular the writings of Martin Heidegger. Sørensen served as an editor of the literary periodical *Vindrosen* (1959–63).



**Sorge, Richard** (b. Oct. 4, 1895, Baku, Russia [now in Azerbaijan]—d. Nov. 7, 1944, Tokyo), German press correspondent who headed a successful Soviet espionage ring in Tokyo during World War II.

After service in the German Army during World War I, he earned a doctorate in political science at the University of Hamburg, Germany, joining the Communist Party of Germany in 1919. He went to Moscow in 1924, and about five years later the Communist International sent him to China to organize a spy ring. While in China, Sorge built a reputation as an able journalist and loyal German, and in 1933 he joined the Nazi Party. The Comintern then sent him to Japan, where he became political adviser to the German ambassador, Major General Eugen Ott.

On May 12, 1941, Sorge reported to the Russians that 170 German divisions would attack along the Soviet frontier on June 20 (the attack came on June 22), proceeding in the direction of Moscow. In August 1941 Sorge reported that the Japanese Army was planning to advance southward against Pacific targets rather than northward against the U.S.S.R.; this information freed Soviet troops along the Manchurian border for service in the west.

On Oct. 18, 1941, Sorge was arrested by the Japanese, and he and Ozaki Hotsumi, another agent of Russia, were executed. In 1964 Sorge was declared a Hero of the Soviet Union.

**sorghum,** cereal grain plant of the family Gramineae (Poaceae), probably originating in Africa, and its edible starchy seeds. All types raised chiefly for grain belong to the species *Sorghum vulgare,* which includes varieties of grain sorghums and grass sorghums, grown for hay and fodder, and broomcorn, used in making brooms and brushes. Grain sorghums include durra, milo, shallu, kafir corn, Egyptian corn, great millet, and Indian millet. In India sorghum is known as jowar, cholam, or jonna; in West Africa as Guinea corn; and in China as kaoliang. Sorghum is especially valued in hot and arid regions for its resistance to drought and heat.

Sorghum, or milo, grain (*Sorghum vulgare*)
Grant Heilman

The strong grass usually grows to a height of 2 to 8 feet (0.5 to 2.5 m), sometimes reaching as high as 15 feet (4.5 m). Stalks and leaves are coated with a white waxy bloom, and the pith, or central portion, of the stalks of certain varieties is juicy and sweet. The leaves are about 2 inches (5 cm) broad and 2½ feet (0.75 m) long, and the panicles, or flower clusters, range from loose to dense, bearing 800–3,000 kernels. The seeds vary widely among different types in colour, shape, and size, but they are smaller than those of the wheat plant.

Sorghum is of a lower feed quality than corn (maize). It is high in carbohydrates, with 10 percent protein and 3.4 percent fat, and contains calcium and small amounts of iron, vitamin $B_1$, and nicotinic acid. The grain is usually ground into a meal that is made into porridge, flatbreads, and cakes. The characteristic strong flavour can be reduced by processing. The grain is also used in making edible oil, starch, dextrose (a sugar), paste, and alcoholic beverages. The stalks are used as fodder and building materials. Sweet sorghums, or sorgos, are grown mainly in the United States and southern Africa for forage and for syrup manufacture. In some countries the sweet stalks are chewed.

Sorghum, one of Africa's major cereal grains, is also cultivated in the United States, India, Pakistan, and northern and northeastern China. Substantial quantities are grown in Iran, the Arabian Peninsula, Argentina, Australia, and southern Europe.

**Soria,** province, in the *comunidad autónoma* ("autonomous community") of Castile-León, north-central Spain. Formed from part of Old Castile in 1833, it has an area of 3,972 square miles (10.287 square km). The terrain is varied: to the north are the Moncayo and Urbión mountain ranges; in the centre, around Soria city, the provincial capital, is a flat plain watered by the Duero (Portuguese: Douro) River; and in the south, this same plain gives way to rolling hills. Cereals and grapes are grown in areas irrigated by the Duero, and timbering and sheep grazing are carried on. Pop. (2000 est.) 90,911.

**Soria,** town, capital of Soria province, in the Castile-León *comunidad autónoma* ("autonomous community"), north-central Spain, on the western bank of the Duero (Portuguese: Douro) River, about 110 miles (175 km) northeast of Madrid. Restored by Alfonso I the Warrior of Aragon after the Moorish invasion, the city was later given to Alfonso VII of Castile. Medieval Soria was ruled by the unique Doce Linajes (12 noble families that governed in turn). The churches of Santo Domingo and San Nicolás, the Colegiata (collegiate church) de San Pedro, the cloister of the Convent of San Juan del Duero, and other ecclesiastical buildings are fine specimens of Romanesque architecture.

Commercial activities include food processing, sawmilling, and the manufacture of cement, soap, and tiles. Pop. (2001 est.) 36,640.

**Sorin, Edward Frederick** (b. Feb. 6, 1814, Ahuillé, Fr.—d. Oct. 31, 1893, South Bend, Ind., U.S.), Roman Catholic priest and educator, founder and first president of the University of Notre Dame.

Sorin was ordained a priest in 1838, and two years later he joined the Congregation of Holy Cross, a group of priests and brothers organized at Le Mans, Fr. Sorin and six brothers went to Vincennes, Ind., in 1841 at the invitation of Bishop Célestine Hailandière. Offered land near South Bend by the bishop, Sorin in 1843 estab-lished a community of French Sisters of Holy Cross at nearby Bertrand, Mich. The following year he obtained a charter for the University of Notre Dame, an institution of higher learning for men, where he served as president until 1865. Sorin acquired a site adjacent to Notre Dame in 1854 for the French sisters, who founded St. Mary's College there, a small liberal arts college for women and the motherhouse of the Sisters of Holy Cross. He began publishing *Ave Maria* magazine in 1865 and served as provincial superior of the Congregation of Holy Cross in the United States until 1868, after which he was superior general until his death.

**sorites,** in syllogistic, or traditional, logic, a chain of successive syllogisms—or units of argument that pass from two premises (a major and then a minor) to a conclusion—in the first figure (*i.e.*, with the middle, or repeated, term as the subject of the major and the predicate of the minor premise)—so related that either the conclusion of each (except the last) is the minor premise of the next or the conclusion of each (except the last) is the major premise of the next. If, then, the conclusions of all of the successive syllogisms (except the last) are suppressed and only the remaining premises and the final conclusion are stated, the resulting argument is a valid inference from the stated premises. For example:

> Some enthusiasts show poor judgment.
> All who show poor judgment make frequent mistakes.
> None who makes frequent mistakes deserves implicit trust.
> Therefore, some enthusiasts do not deserve implicit trust.

In general, there may be $n + 1$ premises, and analysis then yields a chain of $n$ successive syllogisms.

**Sørlandet,** geographical region, southern Norway. Occupying some 6,368 square miles

(16,493 square km), it embraces the *fylker* (counties) of Aust-Agder and Vest-Agder. Its base runs along the southern coast of Norway, and it extends inland to the Bykle Hills. Like most of Norway, Sørlandet has a strip of lowland along its coast that quickly rises into interior mountains and plateaus. These highlands are cut by deep valleys and rivers, the most important being the Setes valley containing the Otra River, which bisects the region from north to south.

Most of the population lives on the coastal lowlands. Kristiansand and Arendal, the administrative centres of Vest-Agder and Aust-Agder, respectively, are the main industrial centres and seaports in the region. The rural economy is based on farming and dairying, while fishing and the fish-processing industry are important along the coast. The southernmost point of mainland Norway is marked by the Lindesnes lighthouse in the southwest. Because of Sørlandet's southern location, the coastal areas have the warmest climate in Norway as well as fine bathing beaches, and the region is a major tourist centre. Pop. (1992 est.) 243,782.

**Sorø,** city, seat of Vestsjælland *amtskommune* (county commune), Sjælland (Zealand), Denmark. It is the home of Sorø Academy, a well-known Danish boys' school, resembling an English public (*i.e.,* "private") school. The academy was founded by Frederick II in 1586 in a former Cistercian abbey (dating from the 12th century). Its alumni include many Danish kings and princes. The magnificent abbey church, built by Bishop Absalon later in the 12th century, contains the bishop's tomb and those of two 14th-century kings. The city was chartered in 1638. Its economic mainstays are wood and meat products and machinery. Pop. (1999 est.) city, 6,728; (1995 est.) mun., 14,668.

**Sorocaba,** city, east-central São Paulo *estado* ("state"), Brazil. It lies along the Sorocaba River, a tributary of the Tietê River, at 1,804 feet (550 m) above sea level. Given town status in 1661 and made the seat of a municipality in 1842, Sorocaba is now one of the nation's major industrial centres. Manufactures include cotton and silk textiles, cement, fertilizers, lumber, aluminum products, shoes, hats, alcohol, and wines. The city is the headquarters of the electric Sorocaba Railway (arrived *c.* 1875) and of its maintenance shops. Goods from Sorocaba reach São Paulo city, 80 miles (130 km) east, and other markets by rail, road, and air. Pop. (2000 prelim.) 487,907.

**Sorokin, Pitirim Alexandrovitch** (b. Jan. 21, 1889, Turya, Russia—d. Feb. 10, 1968, Winchester, Mass., U.S.), Russian-American sociologist who founded the department of sociology at Harvard University in 1930. In the history of sociological theory, he is important for distinguishing two kinds of sociocultural systems: "sensate" (empirical, dependent on and encouraging natural sciences) and "ideational" (mystical, anti-intellectual, dependent on authority and faith).

The first professor of sociology at the University of Petrograd (1919–22; St. Petersburg), Sorokin was expelled from the Soviet Union for his anti-Bolshevism. Before going to Harvard, he was on the faculty of the University of Minnesota, Minneapolis, where he specialized in rural sociology (1924–30). Among his writings are *A Systematic Source Book in Rural Sociology,* 3 vol. (1930–32); *Social and Cultural Dynamics,* 4 vol. (1937–41); *Man and Society in Calamity* (1942); *Altruistic Love* (1950); and an autobiography, *A Long Journey* (1963).

Sorokin believed that the postmedieval Western sensate culture was in its last stages and that the study of nonsexual altruistic love as a science was needed to avert worldwide chaos. In his view, this necessity followed from his principle of polarization, according to which the moral indifference prevailing under ordinary circumstances is supplanted, for the duration of a crisis, by the extremes of selfishness and altruism.

**Sorokino** (Ukraine): *see* Krasnodon.

**Sorolla y Bastida, Joaquín** (b. Feb. 27, 1863, Valencia, Spain—d. Aug. 10/11, 1923, Cercedilla), Spanish painter. The style of his later works has been called a conservative, personal variant of Impressionism.

Sorolla began training at the Royal Academy of San Carlos in Valencia at age 15; he later studied in Rome and Paris. His works include historical and genre paintings, portraits, and landscapes. He is best known for scenes of the beach, such as "Beaching the Boat" (1903), marked by dramatic composition, sharp contrasts of light and shade, brilliant colour, and vigorous brushstrokes.

**Soromenho, Fernando Monteiro de Castro** (b. Jan. 31, 1910, Chinde, Mozambique—d. June 18, 1968, São Paulo, Brazil), white Angolan novelist writing in Portuguese who depicted African life in the interior of the country and condemned the Portuguese colonial administration there. He is known as the "father of the Angolan novel."

Soromenho was taken to Angola by his parents in 1911, was sent to school in Portugal at the age of six, and returned to Angola from 1925 until 1937. His first job, as a recruiter of African contract labour for a mining company in northeastern Angola, gave him a chance to know and respect traditional African life. He then became a journalist, first in Luanda and later in Lisbon, where in 1937 he edited the weekly *Humanidade.* In 1943 he started his own publishing house, Sociedade de Intercâmbio Luso-Brasileiro.

Soromenho's published work consists of five novels, four volumes of stories, and several sociological studies and travel books. *Nhári: O Drama da Gente Negra* (1938; "Nhari: The Drama of Black People"), his first work, contains stories about traditional African societies. In later books, such as the novel *Terra Morta* (1949; "Dead Land"), he concentrates on the conflict produced by European intrusion on the life of Africans in Luanda province. *Terra Morta,* published in Brazil, was banned by Portuguese authorities. The government subsequently prevented the distribution of other books published by Soromenho. In 1960, to escape arrest in Portugal, he fled abroad and lived in France, the United States, and Brazil.

Soromenho's other novels include *Noite de Angústia* (1939; "Night of Anguish"), *Homens sem Caminho* (1941; "Men without Direction"), *A Viragem* (1957; "Turnabout"), and *A Chaga* (1970; "The Wound").

**sororate,** marriage of a man to his wife's sister, whether in the lifetime of the first wife or after her death. The term was introduced by the British anthropologist Sir James George Frazer. Though related in principle, the levirate (marriage with a deceased husband's brother) and sororate are usually but not invariably associated and appear to be the most common of preferential secondary marriages. Either may be permissive rather than obligatory. The Maricopa Indians of Arizona traditionally insisted on a widow's marrying a husband's relative, whereas the replacement of a deceased wife by a kinswoman of hers was customary but not compulsory.

Though successive and simultaneous marriages of two or more sisters fall under the same principle, some peoples favour one while tabooing the other practice. Hence it has become necessary to distinguish between sororal polygyny and sororate. The typical rule for sororal polygyny is that the husband of the eldest girl in a family marries her juniors as they come of age; this was a practice in at least 40 North American Indian tribes during the 19th century. More recently, Navajo men often were simultaneously married to two sisters, occasionally to three. Australian Aborigines recognized the same preemptive claim, but in many tribes the husband contented himself with the two oldest girls, conveying his claims on their younger sisters to his junior brother. With remarkable unanimity Aborigines explained that in sororal polygyny sisters are unlikely to quarrel as cowives.

**sorority:** *see* fraternity and sorority.

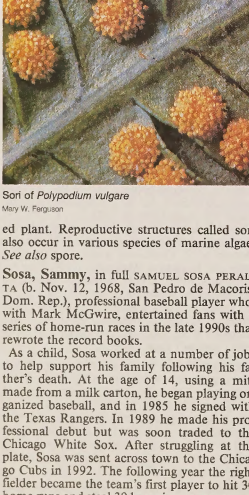
**sorosilicate,** formerly called PYROSILICATE, any member of a group of compounds with structures that have two silicate tetrahedrons (a central silicon atom surrounded by four oxygen atoms at the corners of a tetrahedron) linked together. Because one oxygen atom is shared by two tetrahedrons, the chemical formula contains $Si_2O_7$, as in melilite or hemimorphite.

**sorrel** (tree): *see* sourwood.

**sorrel,** any of several hardy perennial herbs of the Polygonaceae, or buckwheat, family that are widely distributed in temperate regions. Sheep sorrel (*Rumex acetosella*) is a weed that is native to Europe and has become widespread in North America. It is an attractive but troublesome invader that occurs in lawns and gardens as well as meadows and grassy slopes. It sprouts from spreading rootstocks and has acid-tasting, slender triangular leaves and tiny yellow or reddish flowers. Sheep sorrel's pungent, sour leaves are used as a vegetable, as a flavouring in omelets and sauces, and as the chief ingredient of creamed sorrel soup. The young leaves are used in salads. Two related species are garden sorrel (*R. acetosa*) and French sorrel (*R. scutatus*); both are hardy perennials distributed throughout Europe and Asia. Garden sorrel, like sheep sorrel, has become naturalized in North America. The name wood sorrel (*q.v.*) is given to plants belonging to the genus *Oxalis.*

**Sorrento,** Latin SURRENTUM, town and archiepiscopal see, Napoli *provincia,* Campania *regione,* southern Italy. It lies on a peninsula separating the Bay of Naples, which it faces, from the Gulf of Salerno, south-southeast of Naples. The backbone of the peninsula is formed by the Lattari Mountains, which culminate in Mount Sant'Angelo (4,734 feet [1,443 m]). Probably of Greek origin, the town was the ancient Surrentum, a Roman resort. The seat of an autonomous duchy in the 7th century, Sorrento became part of the Norman kingdom of Sicily in 1137. The poet Torquato Tasso was born there in 1544.

Notable landmarks in the town include the frequently rebuilt cathedral, the 14th-century cloister of St. Francis of Assisi, and the Correale di Terranova Museum, containing an important collection of Campanian decorative art, medieval sculpture, paintings, and classical remains. Long popular as a resort for its climate and scenic location, Sorrento is also noted for wine, olive oil, and citrus fruit. Pop. (1991 prelim.) mun., 17,015.



**Sorsogon,** town, southeastern Luzon, Philippines, near the southernmost tip of the Bicol Peninsula. The town of Sorsogon is a port on the northeastern shore of Sorsogon Bay. The adjacent hinterland consists of volcanic cones interspersed with broad, level farmlands that produce abaca, coconuts, rice, and sweet potatoes. Sorsogon has processing facilities for abaca and copra. Pop. (1990) 72,871.

**sortition,** election by lot, a method of choosing public officials in some ancient Greek city-states. It was used especially in the Athenian democracy, from which most information about the practice is derived. With few exceptions, all magistrates were chosen by lot,

beginning with the archons in 487–486 BC; likewise the Boule (council) of 500 and the juries of the law courts were chosen by lot. The practice of sortition obviated electoral races and provided for the regular turnover of officeholders. The operations of government were thus not in the hands of experts, but, through the system of sortition, the Athenian democracy provided at least some practical political education for its citizens.

The rationale of sortition was the equality of all citizens. Only those who had presented themselves as candidates were chosen by lot to fill public offices. Military officers (including the 10 *stratōgoi*) and some financial officials were selected by voting rather than by sortition. But for the most part executive functions were broken down into small tasks, of which each was entrusted to an annual board of 10 members chosen by lot.

**sorus,** plural SORI, in botany, brownish or yellowish cluster of spore-producing structures (sporangia) on the lower surfaces of fern leaves. A sorus may be protected during development by a scale or film of tissue called an indusium. In rust and smut fungi, a sorus is a spore mass produced on the leaf of an infected plant. Reproductive structures called sori also occur in various species of marine algae. *See also* spore.

Sori of *Polypodium vulgare*
Mary W. Ferguson

**Sosa, Sammy,** in full SAMUEL SOSA PERALTA (b. Nov. 12, 1968, San Pedro de Macoris, Dom. Rep.), professional baseball player who, with Mark McGwire, entertained fans with a series of home-run races in the late 1990s that rewrote the record books.

As a child, Sosa worked at a number of jobs to help support his family following his father's death. At the age of 14, using a mitt made from a milk carton, he began playing organized baseball, and in 1985 he signed with the Texas Rangers. In 1989 he made his professional debut but was soon traded to the Chicago White Sox. After struggling at the plate, Sosa was sent across town to the Chicago Cubs in 1992. The following year the right fielder became the team's first player to hit 30 home runs and steal 30 bases in one season, an achievement he repeated in 1994. Though Sosa was a powerful hitter, he was also undisciplined—his strikeouts (174) outnumbered his hits (161) that year.

The 1998 season, however, marked a turnaround for Sosa as he became more patient at the plate. After a slow start, he hit 20 home runs in June to set a major league record for the most homers in a single month. Though not expected to threaten Roger Maris's single-season home-run record (61), he was soon battling McGwire for a place in the record books. On September 13, five days after McGwire had passed Maris, Sosa hit his 61st and 62nd homers. He finished the year with a .308 batting average and 66 home runs. On Sept. 18, 1999, Sosa became the first player to hit 60 homers twice; he finished the year with 63.

**Sosigenes** OF ALEXANDRIA (fl. 1st century BC), astronomer and mathematician employed by Julius Caesar to devise the Julian calendar. He is sometimes confused with Sosigenes the Peripatetic (fl. 2nd century AD), an Egyptian philosopher and tutor of the Greek philosopher Alexander of Aphrodisias.

At the conclusion of the Roman civil war (49–45 BC), Caesar set out to replace the multitude of inaccurate and diverse calendars of the Roman commonwealth with a single official calendar. At the suggestion of Sosigenes, on Jan. 1, 45 BC, he adopted the Julian calendar, with a 365-day year and an extra day every fourth year (leap year). With minor modifications this calendar is the same as the modern Gregorian calendar.

Sosigenes' astronomical writings, including *Revolving Spheres,* have all been lost, except for isolated fragments. One notable fragment mentions Sosigenes' belief that Mercury revolved around the Sun.

**Sosnowiec,** town, Katowice *województwo* (province), southern Poland. It lies along the Czarna Przemsza River, which is a tributary of the Vistula. A rail junction in the Silesian Upland, Sosnowiec has numerous heavy-industrial plants, coal mines, textile mills, and glassworks.

A castle was built in Sosnowiec in the 17th century. The town was rebuilt after a disastrous fire in 1830 and began to prosper with the building of the Warsaw-Vienna rail line in 1845. It had become an industrial centre by the end of the 19th century. Town rights were acquired in 1902. Pop. (1993 est.) 251,300.

**Soso** (people): *see* Susu.

**Šostka** (Ukraine): *see* Shostka.

**Sōtatsu,** in full TAWARAYA SŌTATSU (fl. 1600–30s), Japanese artist of the Tokugawa period (1603–1867) who combined the traditional themes of the indigenous school of Japanese narrative scroll painting, known as Yamato-e, with the bold, decorative designs of the great screen painters of the Azuchi-Momoyama period (1574–1600). He pioneered the use of such painting techniques as defining shapes and forms with colour rather than with ink outlines and applying multiple layers of paint or ink on to a still-wet first layer. His use of colour, especially gold and silver, and his treatment of space also influenced later artists, notably Ogata Kōrin.

The only established facts about Sōtatsu's life are that he came from a well-to-do merchant's family and that he was active in Kyōto from approximately 1600 to the 1630s. It is further known that he was given the rank of *hokkyō,* an honorary title conferred on distinguished artists. Only a few documents and references to Sōtatsu or his work have been found. These consist largely of three letters and a colophon, or inscription, on one of his scrolls.

Based on Sōtatsu's few dated works, it generally is believed he was born about 1570 and emerged as a prominent artist by the beginning of the 17th century. Because he sometimes called himself Tawaraya Sōtatsu, it is conjectured that he was associated in Kyōto with the Tawaraya weaving factory, which is famed for its Chinese-style textiles. Probably he worked in the Tawaraya factory during the early years of his career, and only after receiving the rank of *hokkyō* did he sign his works simply Sōtatsu. A diary and a popular novel of the time refer to "Tawaraya pictures" and "Tawaraya fans," suggesting that the pictorial compositions produced by this factory enjoyed great popularity. This would explain why so many of Sōtatsu's works are fan pictures.

"Genji monogatari: 'Miotsukushi,'" centre detail of left screen of a pair of sixfold screens by Sōtatsu, colour on gold-leafed paper; in the Seikado Bunko Art Museum, Tokyo
The Seikado Bunko Art Museum, Tokyo

His style is clearly derived from the native Japanese tradition of colourful, decorative painting rather than ink painting (*sumi-e*) in the Chinese style, although he did work in monochrome, as well as colour.

Since none of Sōtatsu's art was dated, it is impossible to establish a chronology. A group of paintings, however, that he executed for the sliding doors of the Yōgen Temple in Kyōto (rebuilt in 1621 for the wife of the Tokugawa shogun, the military ruler of Japan) indicates that he was already famous at that time, and it has been suggested that he may have been given the title of *hokkyō* in connection with this commission. With the Yōgen Temple doors Sōtatsu must certainly have attained his artistic maturity and independence, and it is likely that he produced most of the works that he is celebrated for during the succeeding decade.

Among the works attributed to him, the most outstanding are a pair of sixfold screens depicting episodes from *The Tale of Genji,* the great 11th-century novel by Murasaki Shikibu. Now in the Seikado Bunko Art Museum in Tokyo, they originally came, along with several other of his most famous works, from the Sambō Temple in Kyōto. Other works of note are the twofold screen showing bugaku dancers in the Sambō Temple and the pair of twofold screens with the god of thunder and the god of wind in the Kennin Temple, also in Kyōto. (H.MA./Ed.)

BIBLIOGRAPHY. William Watson (ed.), *Sōtatsu* (1959); Elise Grilli, *Tawaraya Sotatsu, . . .* (1956); and Judith Burling and Arthur Hart Burling, *Sōtatsu* (1962), are brief introductions to the work of Sōtatsu by Western scholars. Fuller treatments are provided by Bernard Leach, *Kenzan and His Tradition: The Lives and Times of Koetsu, Sotatsu, Korin, and Kenzan* (1966); and Hiroshi Mizuo, *Edo Painting: Sotatsu and Korin* (1972).

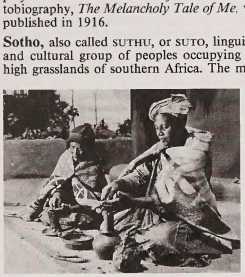
**Soteria** (from Greek: "deliverance"), in Hellenistic religions, any sacrifice or series of sacrifices performed either in commemoration or in expectation of deliverance from a crisis; in

a specific sense the word was often used in reference to large-scale commemorative festivals held at planned intervals. Sixteen Soteria festivals are known; the most famous was that at Delphi, which celebrated the defeat of the Celts in 279–278 BC.

**Sotheby's,** in full SOTHEBY'S HOLDINGS, INC., also called (1864–1924) SOTHEBY, WILKINSON AND HODGE, or (from 1924) SOTHEBY AND COMPANY, art auction firm founded in London in 1744 and American-owned since 1983. Its main offices are in New York City and London, supplemented by other sales offices and auction rooms worldwide.

The founder, Samuel Baker (d. 1778), a London bookseller, held his first auction (under his own name) early in 1744, selling an estate library of 457 books. Establishing the firm in York Street and handling further libraries over the years, he went into partnership with George Leigh in 1767. Upon Baker's death, his estate was divided between Leigh and a nephew, John Sotheby (1778–1807), whose successors were to move the business to 13 Wellington Street in 1818 and were to lead the company for more than 80 years—until 1861, when the last Sotheby died. The company continued to prosper under a series of partners and in 1917 moved to the present London quarters at 34–35 New Bond Street. Throughout the 19th and early 20th centuries, Sotheby's concentrated chiefly on auctioning books, manuscripts, and prints; and, though other collectibles were occasionally offered for sale, paintings and other works of art did not begin to dominate Sotheby's sales until after World War I. After World War II, principally under the leadership (1958–80) of its chairman Peter C. Wilson, Sotheby's became established in New York City and, in 1964, acquired Parke-Bernet Galleries, the premier American auction house (founded 1883).



Throughout its history, Sotheby's has handled some of the most important manuscripts and library collections that have come up for sale. In the 20th century it acquired a number of estates and was noted for its 19th- and 20th-century paintings, especially by the Impressionists. Sotheby's aggressive sale of the Goldschmidt collection in 1958, which elicited (for that time) amazingly high prices, has been cited as the event heralding the late 20th-century boom in fine-art selling. One of the most spectacular auctions came three years later (1961), when Rembrandt's "Aristotle Contemplating the Bust of Homer" was purchased by New York's Metropolitan Museum of Art for $2.3 million.

In 1983 Sotheby's was purchased by A. Alfred Taubman, a shopping mall developer who led the company through an era of enormous growth but was convicted in April 2002 of organizing a price-fixing scheme with rival auction house Christie's. With offices and auction halls around the world, Sotheby's also owns businesses involved in real estate, appraisals, restoration, and repairs.

**Sothern, Edward Hugh** (b. Dec. 6, 1859, New Orleans, La., U.S.—d. Oct. 28, 1933, New York, N.Y.), American actor who was widely popular for his roles in romantic comedy and was noted as well for his performances in Shakespearean plays.

The son of the English comedian Edward Askew Sothern, he made his first stage appearance with his father's company in New York City in 1879. He toured England in 1882 and 1883 and became leading comedian in John McCullough's company. Under Daniel Frohman he was leading man at the Lyceum Theatre in New York and in 1899 formed his own company. In 1900 Sothern appeared in the title role of *Hamlet,* in 1901 in that of *Richard Lovelace,* and in 1902–03 as Villon in *If I Were King,* three of his greatest roles. In 1904 he played opposite Julia Marlowe in *Romeo and Juliet* in Chicago. Thereafter, except for 1907–09, they appeared together on the stage almost continuously until their retirement in 1924. They were married in 1911. Sothern had a repertory of over 125 parts, but he was best known as the romantic hero in plays such as *The Prisoner of Zenda.* His autobiography, *The Melancholy Tale of Me,* was published in 1916.

**Sotho,** also called SUTHU, or SUTO, linguistic and cultural group of peoples occupying the high grasslands of southern Africa. The main

Sotho women potters

groups are customarily classified as the Transvaal, or northern, Sotho (Pedi, Lovedu, and others); the western Sotho, or Tswana (*q.v.*); and the southern Sotho (often called Basuto) of Lesotho and adjoining areas.

Traditionally, most Sotho groups relied both on cultivation and on animal husbandry. Corn (maize) was a staple, and millet, beans, sweet potatoes, and a variety of other crops are also of importance. In modern times, a large proportion of Sotho men are often absent from home as migrant labourers.

The typical settlement pattern was characterized by scattered hamlets of circular huts with mud and wattle or stone walls surmounted by a conical, thatched roof. Towns of considerable size occur among some groups, particularly the Tswana, and among groups organized into Bantu townships in South Africa.

Polygyny was traditionally permitted, and a substantial bridewealth in cattle was paid. Descent, succession, and inheritance were patrilineal, except in the case of one group among whom descent was traced through both the male and female lines.

The advent of Christianity, urbanization, and detribalization have resulted in a progressive breakdown of the Sotho's traditional culture patterns.

**sotie,** also spelled SOTTIE, short satirical play popular in France in the 15th and early 16th centuries, in which a company of *sots* ("fools") exchanged badinage on contemporary persons and events. The *sots,* wearing the traditional short jacket, tights, bells, and dunce cap of the fool, also introduced acrobatics and farcical humour into the sketches. At first the sotie was used as an introductory piece to mystery and morality plays. Developing into an independent form, sotie were created and staged by the Clercs de la Basoche, an association of law clerks; the Enfants sans Souci, a group of nobles; and other, more permanent companies. Pierre Gringore became the preeminent sotie dramatist. The sotie was openly satirical and was used as a weapon in political battles. It was forbidden in the 16th century and replaced by more general forms of satire.

**Sōtō,** largest of the Zen Buddhist sects in Japan. It follows the method of quiet sitting and meditation (*zazen*) as a means of obtaining enlightenment.

The sect was founded in China in the 9th century by Liang-chieh and Pen-chi, where it was known as Ts'ao-tung (after its monastic centres on the mountains Ts'ao and Tung). It was transmitted to Japan by Dōgen, who founded the Eihei Temple in 1244 in what is now Fukui prefecture, and further popularized in the 13th–14th century by Keizan.

The headquarters of the sect are at the Eihei Temple and the Sōji Temple (founded in 1321 in what is now Ishikawa prefecture and in 1911 moved to Yokohama). *Compare* Rinzai.

**Soto, Hernando de,** Hernando also spelled FERNANDO (b. *c.* 1496/97, Jerez de los Caballeros, Badajoz, Spain—d. May 21, 1542, along Mississippi River [in modern Louisiana, U.S.]), Spanish explorer and conquistador who participated in the conquests of Central America and Peru and, in the course of exploring what was to become the southeastern United States, discovered the Mississippi River.

*Early years.* De Soto spent his youth in the family manor house at Jerez de los Caballeros. His parents intended him to be a lawyer, but in 1514, while still in his teens, he told his father of his desire to go to the Indies, and he left for Seville. Despite his youth, de Soto's zeal and his prowess as a horseman helped gain him a place on the 1514 expedition of Pedro Arias Dávila to the West Indies. In Panama, de Soto quickly made his mark as a trader and expeditioner, reaping high profits by his skill and daring. By 1520 he had accumulated considerable capital through his slave trading in

De Soto, engraving from *Historia general de las Indias Occidentales* by Antonio de Herrera y Tordesillas
By courtesy of the Library of Congress, Washington D.C.

Nicaragua and on the Isthmus of Panama, after successful partnerships with Hernán Ponce de León and Francisco Campañón. In 1524–27 de Soto defeated his archrival, Gil González de Ávila, in a struggle for control of Nicaragua, and he subsequently expanded his trade in Indian slaves.

In 1530 de Soto lent Francisco Pizarro two ships to investigate reports of gold located south of Darién on the Pacific coast (now in northwestern Colombia). After de Soto's patron, Dávila, died in 1531 and Pizarro's expedition confirmed the reports of gold, de Soto joined the new enterprise. In return for the use of his ships, Pizarro named de Soto his chief lieutenant, and the conquest of Peru began the next year (1532). De Soto, as the expedition's captain of horse, was the driving force in the Spaniards' defeat of the Incas at Cajamarca, and he was the first European to make contact with the Inca emperor Atahuallpa.

Following the Spaniards' capture of Atahuallpa, de Soto seized Cuzco, the Inca capital. For political reasons, he became the emperor's friend and protector, but Pizarro, fearing Atahuallpa's influence over his Inca subjects, had the emperor executed even though the latter's

subjects had raised an enormous ransom in gold in order to ensure his release. Dissatisfied with Pizarro's leadership and coveting a governorship of his own, de Soto returned to Spain in 1536. The shares that he had accumulated in the sack of Peru, though less than half of Pizarro's, made him one of the wealthiest of the returning conquistadors.

In Spain de Soto married Isabel de Bobadillo, daughter of Dávila, and was accepted into the prestigious Order of Santiago. He grew restless in Spain, however, and in 1537 he sought special permission to conquer Ecuador, with special rights to the Amazon River basin. Instead, he was commissioned by the Spanish crown to conquer what is now Florida. In addition, he was made governor of Cuba.

*Exploration of southern North America.* In April 1538 de Soto embarked from the port of Sanlúcar de Barrameda in command of 10 ships and 700 men. After a brief stop in Cuba, the expedition landed in May 1539 on the coast of Florida, at a point somewhere between his successor, led the expedition's remnants (half the original party) down the Mississippi on rafts, and they reached Mexico in 1543.

BIBLIOGRAPHY. Miguel Albornoz, *Hernando de Soto: Knight of the Americas* (1986), is an informative biography. Narratives of de Soto's Florida expedition are found in modern translations of the original conquistador histories, such as John Grier Varner and Jeannette Johnson Varner (eds.), *The Florida of the Inca* (1951, reissued 1980), after Garcilaso de la Vega; James Alexander Robertson (ed.), *True Relation of the Hardships Suffered by Governor Fernando de Soto* (1932); and Edward Gaylord Bourne (ed.), *Narratives of the Career of Hernando de Soto in the Conquest of Florida,* 2 vol. (1904, reissued 1974). Miscellaneous documents and essays, with an attempt to trace de Soto's North American route, are presented in John R. Swanton (ed.), *Final Report of the United States De Soto Expedition Commission* (1939, reprinted 1985).

**sottie** (satirical play): *see* sotie.

**sotto in su** (Italian: "from below to above"), in drawing and painting, extreme foreshortening of figures painted on a ceiling or other high surface so as to give the illusion that the figures are suspended in air above the viewer. It is an approach that was especially favoured by Baroque and Rococo painters, particularly in Italy, in the 17th and 18th centuries. Andrea Mantegna, Giulio Romano, Correggio, and Giovanni Battista Tiepolo were outstanding exponents of the technique.

"Aurora," ceiling fresco painted *sotto in su* by Guercino, 1621–23, in the Casino Ludovisi, Rome

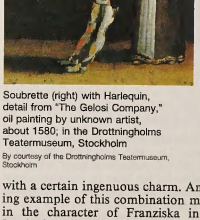
**souari nut,** souari also spelled SWARRI, also called BUTTERNUT, or PEKEA NUT, any of the seeds borne in large, clustered fruits of trees of the genus *Caryocar* (family Caryocaraceae). *C. nuciferum,* from northern South America, is typical. Its coconut-sized fruit has four nuts, surrounded by edible flesh. The warty, red, hard-shelled, kidney-shaped nuts have a rich flavour and contain a fatty oil that is extracted and used in cooking.

**Soubirous, Marie-Bernarde:** *see* Bernadette of Lourdes, Saint.

**Soubise, Benjamin de Rohan, seigneur de** (lord of) (b. 1583, La Rochelle, France—d. Oct. 9, 1642, London, Eng.), French Huguenot leader, younger brother of Henri, duc de Rohan.



Soubise apprenticed as a soldier under Prince Maurice of Orange-Nassau in the Low Countries. In the Huguenot rebellions that rocked France in the 1620s, his elder brother chiefly commanded the Huguenots' forces on land and in the south, while Soubise commanded those in the west and along the seacoast. His exploits in the conflict have been sympathetically related by his brother, who, if he was not quite an impartial witness, was one of the best military critics of the time. Soubise's most impressive exploit was a singularly bold and well-conducted attack (in 1625) on the Royalist fleet in the River Blavet and the occupation of Oléron. He commanded the Huguenots' defense of La Rochelle during the Royalists' famous siege. When surrender became inevitable, he fled to England, which he had previously visited in quest of succour.

**Soubise, Charles de Rohan, prince de** (b. 1715, Paris, France—d. July 4, 1787, Paris), peer and marshal of France, favourite of Louis XV and Mme de Pompadour.

Soubise accompanied Louis XV in the campaign of 1744–48 and attained high military rank, which he owed more to his courtiership than to his generalship. Soon after the beginning of the Seven Years' War, through the influence of Mme de Pompadour, he was put in command of a corps of 24,000 men, and in November 1757 he sustained the crushing defeat of Rossbach at the hands of Frederick II the Great of Prussia. He was more fortunate, however, in his later military career, winning victories at the battles of Sonderhausen and Lützelburg (1758), and continued in the service until the general peace of 1763, after which he lived the life of an ordinary courtier and man of fashion in Paris.

**soubrette,** in theatre, comic female character usually in the role of a chambermaid. The soubrette role originated in French comedy, one of the earliest examples being Suzanne in Pierre-Augustin de Beaumarchais' *Le Mariage de Figaro* (1784). Still earlier, Molière's plays *Tartuffe* (1664) and *Le Bourgeois gentilhomme* (1670) contained versions of the character in the roles of Dorine and Nicole.

Most often of an independent nature, the soubrette demonstrated a nonconformist attitude coupled with a down-to-earth approach and native humour. Quick-witted and subtle, as in the character Lisette in Pierre Marivaux's *Le Jeu de l'amour et du hasard* (1730; *The Game of Love and Chance*), the soubrette developed greater popularity and recognition in comic opera and the operetta. During this period in the 18th century she became fixed as a type. The most successful soubrettes coupled the personality traits of Molière's characters with a certain ingenuous charm. An outstanding example of this combination may be seen in the character of Franziska in Gotthold Lessing's *Minna von Barnhelm* (1767).

**Souei language,** also called SOUI, KUAY, or KUY, language of northeastern Thailand, northern Cambodia, and parts of southern Laos. It belongs to the Katuic branch of the Mon-Khmer language family, itself a part of the Austroasiatic stock. Spoken by some 630,000 people, Souei is—after Vietnamese, Khmer, and Mon—one of the most important Mon-Khmer languages because of its number of speakers, its geographic spread, and its historical role.

modern Tampa Bay and Charlotte Harbor. After spending the winter at the small Indian village of Apalache (near present-day Tallahassee, Fla.), de Soto moved northward and through present-day Georgia and then westward through the Carolinas and Tennessee, led by native guides whom he abducted along the way. Though he didn't find the gold he was looking for, he did collect a valuable assortment of pearls at a place called Cofitachequi, in present-day eastern Georgia. Near Lookout Mountain, in southeastern Tennessee, de Soto and his men turned southward into Alabama and headed toward Mobile Bay where they expected to rendezvous with their ships. But at the fortified Indian town of Mauvila (near present-day Mobile), a confederation of Indians attacked the Spaniards in October 1540. The natives were decimated, but the Spanish were also severely crippled, losing most of their equipment and all their pearls.

After a month's rest, de Soto decided to turn north once again and head inland in search of treasure. This was a fateful decision that was to have disastrous results. Moving northwest through Alabama and then west through Mississippi, de Soto's party was attacked relentlessly by Indians. On May 21, 1541, the Spaniards saw for the first time the Mississippi River, the "Father of the Water" south of what is now Memphis, Tenn. They crossed the river and made their way through Arkansas and Louisiana. Then, early in 1542, de Soto turned back to the Mississippi River. Overcome by fever, he died in Louisiana, and his comrades buried his body in the Mississippi. Luis de Moscoso, whom de Soto had named

**Soufflot, Jacques-Germain** (b. July 22, 1713, Irancy, France—d. Aug. 29, 1780, Paris), French architect, a leader in the development of Neoclassical architecture and the designer of the Church of Sainte-Geneviève (the Panthéon) in Paris.

Claiming to be self-taught, Soufflot made several sojourns in Rome during the 1730s and '50s and studied the classical monuments there. In 1738 he returned to Lyon to practice as an architect. The simplicity, spaciousness, and archaeologically accurate classical details of the principal works of his Lyon period, the extension of the Hôtel-Dieu (begun 1741) and the Loge des Changes (1751–52), presaged the movement of French taste away from the Rococo and toward Neoclassicism.

Soufflot was entrusted in 1755 with the design of Sainte-Geneviève, which was intended to be the principal church of Paris. His aim in this project was to combine the strict regularity and monumentality of Roman arched ceiling vaults with the lightness of slender supporting piers and freestanding Corinthian columns. The plan was essentially a Greek cross, the facade an enormous temple front. The freestanding columns proved inadequate to support the building's dome, which eventually had to be buttressed. Because of the predominantly classical origins of the design, it became a simple matter, when the Revolution abolished religion, for the church to be secularized and renamed the Panthéon. Unfortunately, the side windows were at that time walled up and much decoration removed. The effect of a light interior space was destroyed, resulting in the somewhat gloomy monument that the Panthéon is today.

*Consult the* INDEX *first*

**Soufrière,** also called LA SOUFRIÈRE (French: "Sulfur Mine"), active volcano on southern Basse-Terre island, Guadeloupe, in the Caribbean Sea. It rises to 4,813 feet (1,467 m) and is the highest point of Guadeloupe. It erupted in August 1976 but caused no loss of life because some 72,000 people had been evacuated from the area; other, weaker eruptions occurred in January 1977.

**Soufrière,** town on St. Lucia island in the eastern Caribbean Sea. It is situated on a bay of the island's west coast, southwest of Castries, the capital. The town is exceptionally picturesque. It is a fishing port and the centre of a coconut- and lime-producing district and is 2 miles (3 km) northwest of the boiling sulfur springs from which Soufrière takes its name. The springs and the nearby Terre Blanche and Petit Peak were born of the ancient Qualibou Caldera. Pop. (1992 est.) 7,963.

**Soufrière, Mount,** active volcano on the island of St. Vincent in the Lesser Antilles in the Caribbean Sea. It is a geometrically shaped volcano rising to peaks of 3,864 feet (1,178 m) and 4,048 feet (1,234 m) north of the crater. The volcano erupted violently in 1812 and again in 1902, when it devastated half the island and killed 2,000 people. A series of mild eruptions in 1971 caused no damage, but eruptions in April 1979 forced authorities to evacuate two-thirds of the island. There was no loss of life, but agriculture suffered considerably. The mountain's name (French: "Sulfur Mine") reflects the sulfurous odour accompanying its eruptions.

**Souk el-Arba** (Tunisia): *see* Jundūbah.

**soul,** in religion and philosophy, the immaterial aspect or essence of a human being, that which confers individuality and humanity, often considered to be synonymous with the mind or the self. In theology, the soul is further defined as that part of the individual which partakes of divinity and often is considered to survive the death of the body.

Many cultures have recognized some incorporeal principle of human life or existence corresponding to the soul, and many have attributed souls to all living things. There is evidence even among prehistoric peoples of a belief in an aspect distinct from the body and residing in it. Despite widespread and longstanding belief in the existence of a soul, however, different religions and philosophers have developed a variety of theories as to its nature, its relationship to the body, and its origin and mortality.

Among ancient peoples, both the Egyptians and the Chinese conceived of a dual soul. The Egyptian *ka* (breath) survived death but remained near the body, while the spiritual *ba* proceeded to the region of the dead. The Chinese distinguished between a lower, sensitive soul, which disappears with death, and a rational principle, the *hun,* which survives the grave and is the object of ancestor worship.

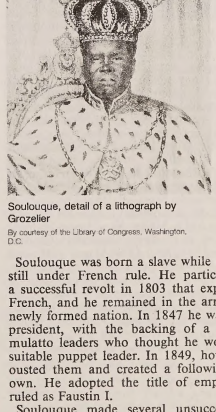
The early Hebrews apparently had a concept of the soul but did not separate it from the body, although later Jewish writers developed the idea of the soul further. Old Testament references to the soul are related to the concept of breath and establish no distinction between the ethereal soul and the corporeal body. Christian concepts of a body-soul dichotomy originated with the ancient Greeks and were introduced into Christian theology at an early date by St. Gregory of Nyssa and by St. Augustine.

Ancient Greek concepts of the soul varied considerably according to the particular era and philosophical school. The Epicureans considered the soul to be made up of atoms like the rest of the body. For the Platonists, the soul was an immaterial and incorporeal substance, akin to the gods yet part of the world of change and becoming. Aristotle's conception of the soul was obscure, though he did state that it was a form inseparable from the body.

In Christian theology, St. Augustine spoke of the soul as a "rider" on the body, making clear the split between the material and the immaterial, with the soul representing the "true" person. However, although body and soul were separate, it was not possible to conceive of a soul without its body. In the European Middle Ages, St. Thomas Aquinas returned to the Greek philosophers' concept of the soul as a motivating principle of the body, independent but requiring the substance of the body to make an individual.

From the Middle Ages onward, the existence and nature of the soul and its relationship to the body continued to be disputed in Western philosophy. To René Descartes, man was a union of the body and the soul, each a distinct substance acting on the other; the soul was equivalent to the mind. To Benedict de Spinoza, body and soul formed two aspects of a single reality. Immanuel Kant concluded that the soul was not demonstrable through reason, although the mind inevitably must reach the conclusion that the soul exists because such a conclusion was necessary for the development of ethics and religion. To William James at the beginning of the 20th century, the soul as such did not exist at all but was merely a collection of psychic phenomena.

Just as there have been different concepts of the relation of the soul to the body, there have been numerous ideas about when the soul comes into existence and when and if it dies. Ancient Greek beliefs were varied and evolved over time. Pythagoras held that the soul was of divine origin and existed before and after death. Plato and Socrates also accepted the immortality of the soul, while Aristotle considered only part of the soul, the *noûs,* or intellect, to have that quality. Epicurus believed that both body and soul ended at death. The early Christian philosophers adopted the Greek concept of the soul's immortality and thought of the soul as being created by God and infused into the body at conception.



In the Hindu religion, each atman ("breath," or "soul") is considered to have been created at the beginning of time and imprisoned in an earthly body at birth. At the death of the body, the atman passes into a new body, its position in the Chain of Being determined by karma, or the cumulative consequences of actions. The cycle of death and rebirth (samsara) is eternal according to some Hindus but others say it persists only until the soul has attained karmic perfection, thus merging with the Absolute. Buddhism negates the concept of atman, asserting that any sense of the individual soul or self is illusory.

The Muslim concept, like that of the Christian, holds that the soul comes into existence at the same time as the body; thereafter, it has a life of its own, its union with the body being a temporary condition.

**Sŏul** (Korea): *see* Seoul.

**soul music,** form of popular music sung and performed primarily by black musicians, having its roots in black American gospel singing and rhythm and blues. The term was first used in the 1960s to describe music that combined rhythm and blues, gospel, jazz, and rock and that was characterized by intensity of feeling and earthiness. In its earliest stages, soul music was found most commonly in the South, but many of the young black singers who were to popularize soul migrated north to urban areas. The founding of Motown Records in Detroit and Stax-Volt in Memphis did much to encourage the form. Its most popular performers included James Brown, Ray Charles, Sam Cooke, and Aretha Franklin.

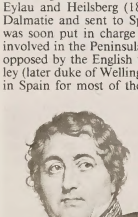
**Soulouque, Faustin-Élie,** Soulouque also spelled SOLOUQUE (b. 1782?, Petit-Goâve, Haiti—d. Aug. 6, 1867), Haitian slave, president, and later emperor of Haiti, who represented the black majority of the country against the mulatto elite.

Soulouque, detail of a lithograph by Grozelier

By courtesy of the Library of Congress, Washington, D.C.

Soulouque was born a slave while Haiti was still under French rule. He participated in a successful revolt in 1803 that expelled the French, and he remained in the army of the newly formed nation. In 1847 he was named president, with the backing of a group of mulatto leaders who thought he would be a suitable puppet leader. In 1849, however, he ousted them and created a following of his own. He adopted the title of emperor and ruled as Faustin I.

Soulouque made several unsuccessful attempts to conquer the neighbouring Domini-



can Republic; on one occasion the United States, France, and Great Britain acted in concert to pressure him to desist. In 1859 the mulattoes rallied under the chief of the general staff and deposed him. Soulouque escaped and went into exile, where he died.

**souls, multiple:** *see* multiple souls.

**Soult, Nicolas-Jean de Dieu,** DUC (duke) DE DALMATIE (b. March 29, 1769, Saint-Amans-la-Bastide, later Saint-Amans-Soult, Fr.—d. Nov. 26, 1851, Saint-Amans-Soult), French military leader and political figure who was noted for his courage in battle and his opportunism in politics.

Upon the death of his father in 1785, Soult enlisted in the infantry. At the outbreak of the French Revolution (1789–92), he was a sergeant at Strasbourg. He served under several commanders and was made a general by François-Joseph Lefebvre for his conduct in the Battle of Fleurus (June 1794). In March 1799 he replaced the wounded Lefebvre at the Battle of Stokach.

Soult built a reputation for vigour, boldness, and method. Under Napoleon he was put in charge of the southern part of the Kingdom of Naples (1800–02) and in 1804 was made a marshal of France. His reputation was further enhanced by his significant role in French victories at Ulm, Austerlitz, and Jena in 1805–06, though he was less successful in Poland at Eylau and Heilsberg (1807). Created duc de Dalmatie and sent to Spain late in 1808, he was soon put in charge of all French armies involved in the Peninsular War, where he was opposed by the English under Arthur Wellesley (later duke of Wellington). Soult remained in Spain for most of the next five years, but

Soult, engraving by P.-L. Grévedon, 1825, after a lithograph by F.-S. Delpech

By courtesy of the Bibliotheque Nationale, Paris

eventually Wellesley forced his outnumbered troops to retreat and defeated him at Toulouse (April 1814), four days after Napoleon had abdicated.

During the First Restoration (1814) Soult declared himself a royalist, but during Napoleon's Hundred Days (1815) he again supported Bonaparte, acting as his chief of staff at Waterloo. Soult was exiled at the start of the Second Restoration (1815–30) but was recalled in 1819. Under King Louis-Philippe he presided over three ministries (October 1832–July 1834, May 1839–March 1840, and October 1840–September 1847) and was usually minister of war as well as president of the council; he was responsible for the French conquest of Algeria during the 1840s. In 1848, when Louis-Philippe was overthrown, Soult declared himself a republican. His *Mémoires* appeared in three volumes in 1854.

**Soumak,** method of brocading handmade flat-woven rugs and similar fabrics. It is one of the oldest known techniques, identified among charred 7th-century-BC fragments excavated at Gordion, near Ankara in Anatolia.

Soumak carpet from the Caucasus, 19th century; in the collection of the National Rugs and Textile Foundation, Washington, D.C.

By courtesy of the National Rugs and Textile Foundation, Washington, D.C., gift of W. Russell Pickering; photograph, Otto E. Nelson—EB Inc.

In recent times, it has been most prevalent in the Caucasus, but it is also used in various parts of Iran. In this technique, brocaded yarns, which form the pattern, lie at slight angles from the horizontal, and herringbone effects are often created by changing the angle of alternate rows. Loose ends of the pattern yarns are allowed to hang free at the back of the rug, providing a padding. For so slight an excuse as this, Soumak rugs for a long time were confusingly sold as "Cashmeres."

Many Caucasian and Persian saddlebags for use on donkeys have been Soumak-woven, as have floor-size carpets, which usually have a central repeat of large diamond- or star-shaped medallions. Soumak rugs ordinarily have borders as elaborate as those of pile rugs made in the same areas. Particular Soumak patterns are characterized as Silé and Verné.

**sound,** a mechanical disturbance from a state of equilibrium that propagates through an elastic material medium. A purely subjective definition of sound is also possible, as that which is perceived by the ear, but it is not particularly illuminating and is unduly restrictive, for it is useful to speak of sounds that cannot be heard by the human ear, such as those that are produced by dog whistles or by sonar equipment.

Sound is treated in a number of articles in the MACROPAEDIA. For the physics of sound generation, propagation, and detection, *see* Sound. For a more general discussion of vibration and wave motion, *see* Mechanics. For a discussion of biological mechanisms of sound production and reception, *see* Speech; Sensory Reception. For a discussion of musical sounds, *see* Music, Art of; Musical Instruments. For techniques of sound recording and reproduction, *see* Sound: Sound Recording and Reproduction. For a discussion of the use of acoustical waves as a tool of research, *see* Earthquakes.

For a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part One, Division II.

Most solids, liquids, and gases of ordinary experience can serve as media for sound. A mechanical disturbance may be produced in any number of ways but will consist of a sudden increase in pressure at some point. Since the material is elastic, the compression is not permanent; once the disturbing influence is removed, the compressed region will rebound, but in doing so it will compress an adjacent region. The result of this cycle repeating itself is the generation of a compression wave, followed by a rarefaction wave as each region of elastic material rebounds. These waves are longitudinal, *i.e.*, the displacement of a particle of the medium is in the direction of wave motion (note, however, that there is no net transport of material). The waves thus generated travel through the medium at a speed that is a function of the equilibrium pressure and density of the material and, to various extents, of the specific heat (for a gas), the elasticity (for liquids and solids), and the temperature of the medium and of the frequency of the wave. In dry air (at 0° C [32° F] and a sea-level pressure of 14.7 pounds per square inch [1013.25 millibars]) the speed of sound is 331.29 m per second (741.1 miles per hour). (This calculation, made in 1986, corrected an earlier calculation made about 1942.) The speed of sound in seawater is 1,490 m (4,889 feet) per second and in steel 5,000 m (16,405 feet) per second.

A great many of the sounds encountered in daily life are periodic, that is, the sound waves associated with them occur in patterns that repeat with regularity over time. Such sounds are characterized by a dominant frequency, or pitch, which may be defined as the number of waves that pass a fixed point per unit time. The simplest form of sound wave, called a pure tone, can be represented by a sine wave; more complex but still relatively simple forms, such as notes played on various musical instruments, can be represented by more complex harmonic curves, with numbers of harmonic tones or overtones superimposed on the fundamental tone. The complexity of a sound wave can become so great that no particular pitch can be discerned; white noise, so called by analogy with white light (a mixture of all frequencies, or colours, of visible light), is an example.

Another parameter of sound, in addition to velocity and frequency, is intensity, which is defined as the average flow of energy per unit time through a unit area of the medium. Intensity is usually measured in watts per square centimetre. The standard usually used for the quietest sound audible to the human ear has an intensity of $10^{-16}$ watt per square centimetre. Closely related to the intensity of a sound is the sound pressure, or pressure excess over equilibrium caused by a sound wave. Sound pressure is measured in dynes per square centimetre or, in the SI system of units, in pascals. The sound pressure of the human voice at ordinary conversational level, measured directly in front of the mouth, is about 0.1 pascal, which may be compared with the standard pressure of the atmosphere of about $10^5$ pascals. Also related to sound intensity, although not simply, is loudness. Loudness is a subjective phenomenon and can be measured only comparatively, by means of a standard reference sound under specified conditions.

Sound waves behave in many ways as light waves do, and optical analogies are frequently useful in describing acoustical phenomena. Thus, sound waves can be reflected, refracted, diffracted, and scattered, and many of the differences in behaviour between sound and light waves reflect simply the very great difference in wavelengths ordinarily dealt with.

**Sound, The,** Danish ØRESUND, Swedish ÖRESUND strait between Sjælland, or Zealand (Denmark), and Skåne (Sweden), connecting the Kattegat Strait (northwest) with the Baltic Sea (south). Its extreme length, between

Kullen and Falsterbo (Sweden), is 70 mi (110 km). The most landlocked portion, between Helsingør (Elsinore)–Hälsingborg in the north (width 3 mi) and Copenhagen–Malmö in the south (width 9 mi), is 33 mi long. The strait has a minimum depth of 23 ft (7 m) and a surface current of up to 3 to 4 mi per hour toward the Kattegat. Ice in the almost tideless strait may impede navigation in severe winters. Three large islands lie in The Sound: Amager (partly embraced by Copenhagen), Ven, and Saltholme. These divide the waters into the channels of Drögden (west) and Flinterenden (east). Copenhagen and Helsingør are the principal ports on the Danish side, Malmö and Hälsingborg on the Swedish side.

In the past, political control of The Sound, the shortest route from the Kattegat to the Baltic, conferred great commercial benefits. Between 1429 and 1657, Denmark controlled both shores and exacted tolls from all shipping passing through. Even after Skåne was annexed by Sweden in 1658, the great Danish coastal fortress of Kronborg at Helsingør continued to levy The Sound toll until 1857. The Sound is one of the busiest sea lanes in the world.

**sound barrier,** sharp rise in aerodynamic drag that occurs as an aircraft approaches the speed of sound and that was formerly an obstacle to supersonic flight. If an aircraft flies at somewhat less than sonic speed, the pressure waves (sound waves) it creates outspeed their sources and spread out ahead of it. Once the aircraft reaches sonic speed the waves are unable to get out of its way. Strong local shock waves form on the wings and body; airflow around the craft becomes unsteady, and severe buffeting may result, with serious stability difficulties and loss of control over flight characteristics. Generally, aircraft properly designed for supersonic flight have little difficulty in passing through the sound barrier, but the effect upon those designed for efficient operation at subsonic speeds may become extremely dangerous. *See also* sonic boom.

**sound effect,** any artificial reproduction of sound or sounds intended to accompany action and supply realism in the theatre, radio, television, and motion pictures. Sound effects have traditionally been of great importance in the theatre, where many effects, too vast in scope, too dangerous, or simply too expensive to be presented on stage, must be represented as taking place behind the scenes. An offstage battle, for instance, can be simulated by such sounds as trumpet blasts, shouts, shots, clashing weapons, and horses' hooves. Certain dangerous effects, such as explosions, crashes, and the smashing of wood or glass, must also take place offstage. Sound effects must often be coordinated with actions on stage; when the hero pretends to punch the villain on the jaw, a sound technician backstage must provide a realistic "smack!"

Many ingenious methods have been devised for the faithful reproduction of various sounds; wind sounds, from a breeze to a hurricane, can be simulated when a piece of canvas is rubbed by wooden slats mounted on a revolving cylinder; thunder is imitated by shaking a large sheet of metal; rain sounds are produced by rattling dried peas in a wooden box; horses' hooves can be imitated by clattering coconut shells or suction cups against a hard surface; gunshots can be produced by slapping boards together or by firing blank cartridges.

Today most sound effects are recorded on records or tapes, which provide greater realism and allow for the production of an almost limitless range of effects with no need of bulky sound-producing devices.

**sound intensity,** amount of energy flowing per unit time through a unit area that is perpendicular to the direction in which the sound waves are travelling. Sound intensity may be measured in units of energy or work—*e.g.,* microjoules ($10^{-6}$ joule) per second per square centimetre—or in units of power, as microwatts ($10^{-6}$ watt) per square centimetre. Unlike loudness, sound intensity is objective and can be measured by auditory equipment independent of an observer's hearing.

The intensity of one sound can be compared to that of another of the same frequency by taking the ratio of their powers. When this ratio is 10, the difference in intensity of the sounds is said to be one bel, a unit named in honour of the United States inventor Alexander Graham Bell. Accordingly, the relative intensities of two sounds in bels is equal to the logarithm of the intensity ratio—*i.e.,* if $I$ is the intensity of one sound and $I_0$ is that of another, then the intensity ratio $B$ in bels is $B = \log_{10}(I/I_0)$. The unit in general use is the decibel (abbreviated db), equal to 0.1 bel. Thus the equation for relative intensities $b$ in decibels may be written $b = 10 \log_{10}(I/I_0)$. It may be calculated from this equation that one decibel corresponds to a 26 percent change in intensity. If $I_0$ is taken as a reference standard intensity equal to $10^{-16}$ watt per square centimetre, the intensity of the faintest sound that can be heard, then the intensity, or level, of any sound can be measured in decibels. Thus speech of intensity $10^{-12}$ watt per square centimetre has a sound level of $b = 10 \log_{10}(10^{-12}/10^{-16}) = 40$ decibels.

**sound-level meter,** device for measuring the intensity of noise, music, and other sounds. A typical meter consists of a microphone (*q.v.*) for picking up the sound and converting it into an electrical signal, followed by electronic circuitry for operating on this signal so that the desired characteristics can be measured. The indicating device is usually a meter calibrated to read the sound level in decibels (db), a logarithmic unit used to measure the sound intensity (*q.v.*). Threshold of hearing is about zero decibels for the average young listener, and threshold of pain (extremely loud sounds) is around 120 decibels, representing a power 1,000,000,000,000 (or $10^{12}$) times greater than zero decibels.

The electronic circuitry can be adjusted, usually by an external switch, to register the integrated level of all frequencies in the sound being measured or the intensity of selected bands of frequencies. A time lag is usually incorporated to slow down meter response and thus permit rapidly varying sounds to be averaged. The amount of time lag may vary somewhat among instruments, depending on the purpose for which the instrument was designed.

In the early 1970s, as concern about noise pollution increased, accurate, versatile, portable noise-measuring instruments were developed.

Sound level is a measure of loudness, but actual loudness is a subjective factor and depends on the characteristics of the ear of the listener. In an attempt to overcome this problem, scales have been developed to correlate loudness with objective measurements of sound. The Fletcher–Munson curve, for example, shows the relationship between loudness in decibels and subjectively judged loudness. Other variables have also been studied.

**sound production,** in animals, the initiation of sound as a means of information transmission. Sounds are termed vocal when produced in the respiratory system and mechanical when produced by mutual contact of body parts or by contact with some element in the environment. Vocal sounds are restricted to vertebrate animals; nonvocal sounds are produced by many invertebrates and by some members of all vertebrate classes.

Many animals possess special structures for producing mechanical sounds. Crickets and grasshoppers produce sound by rubbing together rasplike structures on their wings. Cicadas, which emit the loudest sounds known from insects, do so by means of a pair of membranous organs (timbal organs) at the base of the abdomen. A special muscle deadens the hearing apparatus of the insect when it is calling.

In the vertebrates many means of mechanical sound production exist. A number of birds, of widely divergent families, have feathers modified for producing sound in flight. The specially modified tail tip of the rattlesnake is another familiar example. Many animals, especially among the mammals, produce sounds with parts of the body that are specialized for other purposes; stamping or drumming on the ground with the feet is seen in many species, and slapping the water with the tail is a common means employed by aquatic mammals to warn others of danger.

Many fishes produce sounds by moving bones or teeth against each other, sometimes with the swim bladder acting as a resonating cavity. Among amphibians, the sirens (order Trachystomata), salamanders (Caudata), and caecilians (Gymnophiona) are silent or nearly so, but the frogs (Anura) are highly vocal, producing species-specific sounds by moving air between the mouth and lungs past vocal chords in the windpipe (trachea). Among reptiles, crocodilians and some turtles produce low-pitched sounds; lizards (except geckos) and snakes are usually silent, except for hissing sounds uttered under stress. Vocal sounds of birds are produced by the syrinx, a specialized region at the lower (posterior) end of the trachea. Mammalian vocalizations, on the other hand, originate in the larynx, a modification of the upper (anterior) end of the trachea. Members of both groups may use the mouth for resonating or filtering sound or may possess special outpouchings of the trachea or esophagus that serve as resonating cavities.

**sound reception,** the response of an aural mechanism, the ear, to a specific form of energy change, or sound waves. Sound waves can be transmitted through gases, liquids, or solids, but the hearing function of each species is particularly (though not exclusively) sensitive to stimuli from one medium.

A brief treatment of sound reception follows. For full treatment, *see* MACROPAEDIA: Sensory Reception.

In spiders, certain insects, and some fishes, sound reception is based on detection of a vibration's velocity, while in most animals, hearing is caused by pressure on an obstacle in a vibration's path. Members of two animal groups are capable of sound reception: arthropods (*e.g.,* insects and crabs) and vertebrates (*e.g.,* reptiles, birds, and mammals). In more primitive species, hearing can enable an animal to sense danger, locate food, and find mates, and in more complex creatures it is important for communication and emotional expression.

*Hearing in invertebrates.* Hearing organs in insects are usually located in the thorax (middle portion) or abdomen. In the mosquito, however, the sensory units, or scolophores, for auditory response are attached at one end to the base of the antenna. Inside each mosquito scolophore is a chain consisting of a base cell, a ganglion cell, a sheath cell, an extracellular cap, and a terminal cell. Out of the ganglion cell projects a hair (cilium) containing the axon, or nerve fibre, which connects with the central nervous system. Sound waves cause the shaft of the antenna to vibrate, resulting in relative motion between the ends of the scolophore and stimulation of the axon. The velocity of the sound wave determines the strength of the nerve impulse.

Another velocity type of sound receptor, the cercal organ, can be found in the abdomen of

cockroaches and crickets. It contains several hundred cilia connected to a nerve trunk and is sensitive to sound frequencies in the range of 100 to 3,000 hertz (cycles per second).

The tympanal organ is a pressure type of ear found in moths, grasshoppers, and one variety of cicada. A number of scolophores are attached both to a tympanic membrane and to an immobile part of the insect's thorax. When sound waves cause the tympanic membrane to move, pressure is exerted on the axons projecting from the scolophores, which then transmit impulses to the central nervous system.

*Hearing in vertebrates.* All vertebrates have two ears composed of a complex system of labyrinths. The labyrinths consist of three semicircular canals, which regulate equilibrium or sense of balance, attached to the upper of two connected sacs, the utricle. The derivatives of the lower sac, or saccule, are the sensory organs for hearing, which vary among and within the vertebrate classes.

The hearing mechanism in teleosts (bony fishes) consists of a lagena—a curved structure that contains a macula—which is attached to the saccule. The macula contains hair cells with their projecting cilia, which contain the ends of nerve fibres. The cilia are also connected to an otolith, a dense, calcareous structure. When sound vibrations travel through the water, most tissues vibrate in a uniform manner except for the massive otolith, thus creating relative motion between the cilia and the otolith, stimulating the auditory hair cells. In some teleosts, the efficiency of hair-cell stimulation is vastly increased by the presence of air sacs adjacent to the labyrinth. One group of fishes, the Ostariophysi, do not have air sacs but do have a connection between the swim bladder and fluid chambers adjacent to the labyrinth. A chain of tiny bones, called Weberian ossicles, lies between the air-filled swim bladder and the atrium, which connects with the labyrinths. The ear's sensitivity is heightened by discontinuity between solids (her otolith or Weberian ossicles) and gases (air sac or swim bladder).

Little is known about sound reception in most amphibians except for certain species of frog. In most frogs, a skin-covered disk of cartilage serves as an eardrum, and a thin column (columella) of bone extends through an air-filled cavity to the otic capsule, the bony case of the inner ear. The two sections are connected by an oval window and a round window. When movement is conducted from the eardrum, the end of the columella, called the stapes, moves against the oval window. Vibrations travel through the fluid within the inner ear and stimulate a tectorial membrane. The two types of auditory hair cells found in the inner ear are the amphibian papillae (found in all amphibians) and basilar papillae (found in some amphibians). These sensory hair cells are stimulated by the tectorial membrane.

There is a great diversity in reptilian ears regarding structure and level of complexity. Lizards, for the most part, have a middle ear consisting of a two-element ossicular chain extending from the tympanic membrane to the otic capsule. The auditory section of the labyrinth, the cochlea, includes a basilar membrane that, in many species, contains a thickened middle portion, or fundus. On the fundus are auditory hair cells and supporting cells. These cells are stimulated by some intermediate structure that connects to the tectorial membrane.

Auditory structure is similar to that of reptiles in most bird species. The meatus, a short external passage, leads to an eardrum, which often consists of two membranes, the outer one apparently for protection. The ossicular chain, consisting of the columella and extracolumella, leads to the otic capsule. Within the cochlea lies the basilar membrane.

The mammalian ear is a remarkably well-differentiated structure. The outer ear consists of the pinna, which is attached to the outside of the head and often serves to collect and reflect sound waves. In the middle ear, three auditory ossicles (malleus, incus, and stapes) cross an air-filled cavity between the tympanic membrane and the otic capsule. The auditory portion of the labyrinth is the cochlea, often snail-shaped, inside of which is the basilar membrane bearing the organ of Corti. The organ of Corti consists of hair cells and supporting cells that are arranged so that sound waves of different frequencies stimulate different nerve endings, thus allowing for highly specialized auditory messages to be transmitted to the central nervous system. The size of and spatial arrangement within the organ of Corti differ between mammalian species, resulting in varying degrees of specialization.

Bats have an extremely well-developed sense of hearing. One highly specialized adaptation of bats is their use of echolocation. By emitting high-frequency sound waves that are then reflected from an object, bats can gauge distance, note obstructions, and locate prey in the dark with amazing accuracy.

**sound recording,** transcription of vibrations in air that are perceptible as sound onto a storage medium, such as a phonograph disc. In sound reproduction the process is reversed so that the variations stored on the medium are converted back into sound waves. The three principal media that have been developed for sound recording and reproduction are the mechanical (phonograph disc), magnetic (recorded tape), and optical (motion-picture sound tracks and digital compact discs) systems.

The American inventor Thomas A. Edison developed the "talking machine," which could both record and reproduce sound, in 1877. The original Edison cylinder recordings used indentations embossed into a sheet of tinfoil by a vibrating stylus attached to a diaphragm. Emil Berliner, the German-born American inventor of the Gramophone, introduced the flat disc, as well as the practice of using electroforming to make a negative of the master, which then could serve to mold copies.

Early sound recording and reproduction relied entirely on acoustical means. In the early 1920s the vacuum-tube amplifier, invented by the American Lee De Forest, came into use, marking the transition from acoustical to electrical recording. Microphones replaced acoustical horns, and soon there was developed the modern electric phonograph—consisting of an amplifier, a motor-driven turntable (that often incorporated a record-changing device), a cartridge, and loudspeakers. The 78-rpm (revolutions per minute) record, originally made of shellac and later of synthetic thermoplastic resins and with a playing time of about 4½ minutes, became standard.

The long-playing (LP) record, first introduced in 1948, was designed to be played at a speed of 33⅓ rpm; it used "microgrooves," allowing up to 30 minutes of playing time per side. The 45-rpm disc, playing up to eight minutes per side, was introduced in 1949. Stereophonic recordings, with two separate channels of sound recorded in the same groove, were introduced in 1958. Quadraphonic discs, with the two additional channels often used to reproduce ambient sound, became available in the early 1970s but were not successful commercially.

Magnetic systems of recording sound date to the 1890s, when the Danish engineer Valdemar Poulsen invented a device that stored electrical information by magnetizing particles on a steel wire. American and German scientists had developed magnetic tape by the 1920s, and during the following decade recorders were further refined, but not until after World War II did the tape recorder begin to have widespread application in recording music.

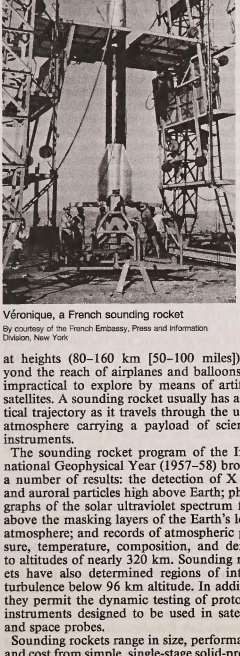
In tape recording, the electrical signal to be recorded is usually applied to the tape by means of a "head," consisting of a coil wound around a core of magnetic iron, that has a gap at the point where the tape moves across its surface. The current in the coil produces a magnetomotive force across the gap, magnetizing the particles on the tape. In reproduction the tape is passed over the playback head, and the magnetized portions of the tape cause the magnetic flux in the core to change, generating a voltage. Recording tapes consist of a plastic-base film coated with a magnetic material, usually iron oxide, although chromium dioxide and pure metal particles also are used.

The principal tape-recording formats are the open-reel and the cassette. Open-reel recorders, which were the first to be developed, are now used most commonly for professional recording. They operate at several speeds and have great flexibility, including the ability to record up to 24 separate tracks. A cassette consists of a feed reel of tape and a take-up hub enclosed in a sealed rectangular package. Although the cassette is less flexible and generally has lower fidelity than the open-reel format, it became more popular, largely because of its ease of operation.

The first optical system was invented by De Forest, who by 1923 had developed techniques for transcribing sound waves into impulses of light that could be photographed on a strip of film. When the developed film was then passed between a light source and a photoelectric cell in the motion-picture projector, the images were transformed back into electrical voltages that could be converted into sound through a loudspeaker system.

A second type of optical recording is the digital compact disc (CD). Unlike all other methods of recording and reproduction, which create "analogies" of the original sound and thus are called analogue methods, digital recording samples the sound at specified intervals and converts the samples into binary (base-2) numbers that are then recorded on tape as a series of pulses. Digitally mastered tapes converted into conventional phonograph discs first appeared in the 1970s, and fully digital compact discs, which are read, or "played," by a laser, became available in the early 1980s and became the most popular mode by the beginning of the 1990s. Other digital modes being introduced were the digital audio tape (DAT) and the digital compact cassette (DCC).

**sound track,** in motion-picture technology, narrow band, usually along the margin of the film, that carries the photographic or magnetic sound record. In optical recording systems, sound waves modulate a beam of light; the sound track, which may be of variable density or of variable width, is a photographic record of the varying light. For sound reproduction, a beam of light is passed through the sound track onto a photocell connected, through an amplifier, to a loudspeaker. This optical system is the basic plan of sound reproduction in sound motion pictures. In stereophonic sound recording, a number of such bands may be used on the same film.



In magnetic recording systems, the narrow band of the film is coated with a magnetizable material; for the recording and reproduction of sound by this method, *see* magnetic recording.

**soundboard,** also called BELLY, a thin plate of wood or a stretched membrane lying directly under the strings of a stringed musical instrument. It vibrates in response to the vibrations of the strings (transmitted to it by the bridge, an elastic piece of wood held under pressure or tension between the strings and

soundboard), amplifying the faint sound produced by the string alone.

The soundboard's size, shape, and material have an effect on the instrument's tone quality. Low notes, for example, may suffer if a soundboard is too small.

**sounding rocket,** also called PROBE ROCKET, any unmanned rocket that is designed to probe atmospheric conditions and structure

Véronique, a French sounding rocket
By courtesy of the French Embassy, Press and Information Division, New York

at heights (80–160 km [50–100 miles]) beyond the reach of airplanes and balloons but impractical to explore by means of artificial satellites. A sounding rocket usually has a vertical trajectory as it travels through the upper atmosphere carrying a payload of scientific instruments.

The sounding rocket program of the International Geophysical Year (1957–58) brought a number of results: the detection of X rays and auroral particles high above Earth; photographs of the solar ultraviolet spectrum from above the masking layers of the Earth's lower atmosphere; and records of atmospheric pressure, temperature, composition, and density to altitudes of nearly 320 km. Sounding rockets have also determined regions of intense turbulence below 96 km altitude. In addition, they permit the dynamic testing of prototype instruments designed to be used in satellites and space probes.

Sounding rockets range in size, performance, and cost from simple, single-stage solid-propellant rockets that can lift a 5.4-kilogram (12-pound) meteorologic payload 60 km to two-stage solid-propellant vehicles capable of lifting a 22-kilogram payload to 3,000 km.

**soup,** liquid food prepared by cooking meat, poultry, fish, legumes, or vegetables with seasonings in water, stock, milk, or some other liquid medium. The cooking of soup is as ancient as the devising of vessels to hold liquid; before the development of pots that could withstand the direct heat of a fire, soups were cooked by dropping hot stones into the liquid. The long cooking of soup enabled nourishment to be drawn from meagre quantities of fish and meat too bony or tough to be otherwise utilized.

In the West lighter soups are usually served as a first course, while thicker, heartier soups constitute the entrée for informal meals. A notable exception are the fruit soups favoured in northern and eastern Europe, which are often served for dessert. In China a thin soup is consumed throughout the meal as a beverage, and elaborate soups such as the celebrated bird's nest and shark's fin may be interspersed with other courses or served near the end of the meal.

Many soups are eaten cold. French vichyssoise (potatoes and leeks), Spanish gazpacho (tomatoes and other vegetables), Polish *chłodnik* (beets, sour cream, pickles, and shellfish), Jewish *schav* (sorrel), and Danish *kærnemaelkskoldskaal* (buttermilk) are classic cold soups. Consommé can be served cold, in which case it takes the form of a jelly as a result of the natural gelatin present in the bony meats from which it is prepared.

The basis of many soups is stock, or broth, a rich liquid obtained by boiling fish, meat, poultry, game, or vegetables. Clear broths can be garnished with separately cooked vegetables, pasta or rice, quenelles or dumplings, poached eggs, or other ingredients. Chinese egg-drop and Italian *stracciatella* are enriched with beaten eggs stirred in the hot broth.

Thick soups may achieve their texture by means of a flour- or egg-thickened sauce or a puree of vegetables with or without butter or cream. Bisques and chowders are creamy soups usually made with shellfish or fish, sometimes with meat or vegetables, and cream or milk. Gumbos are spicy soups originating in the Creole cooking of Louisiana that combine African, European, and American Indian elements. Substantial stewlike soups are found in rural cuisines worldwide. They often combine root vegetables, legumes, and smoked or fresh meats. Well-known examples are Italian minestrone, French *garbure,* Swedish *ärter med flask* (yellow peas and pork), and Dutch *erwtensoep* (split green peas).

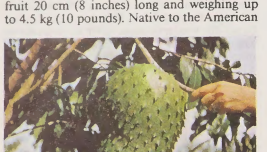
**Soupault, Philippe** (b. Aug. 2, 1897, Chaville, France—d. March 11, 1990, Paris), French poet and novelist who was instrumental in founding the Surrealist movement.

Soupault's earliest verse collection, *Aquarium* (1917), was published with the help of Guillaume Apollinaire, who introduced Soupault to André Breton. In 1919 Soupault, Breton, and Louis Aragon cofounded the review *Littérature.* Originally drawn to the antirationalism of the Dada movement, Soupault soon rejected its nihilism, and he and Breton experimented with other revolutionary techniques. One result of their experimentation was the "automatic writing" of the jointly authored *Les Champs magnétiques* (1920; *The Magnetic Fields*), known as the first major Surrealist work. Soupault soon abandoned automatic writing to produce carefully crafted verses such as those in *Westwego* (1922) and *Georgia* (1926). As the Surrealist movement became increasingly dogmatic and political, Soupault grew dissatisfied with it and eventually broke with it and Breton.

After the mid-1920s Soupault devoted himself primarily to writing novels and essays and to journalism. His novels—which include *Les Frères Durandeau* (1924; "The Durandeau Brothers"), *Le Nègre* (1927; "The Negro"), and *Les Mortsnuls* (1934; "The Dying")—centre on the concepts of freedom and revolt. *Le Temps des assassins* (1945; *Age of Assassins*), a memoir, details Soupault's six-month imprisonment by the Vichy government in Tunis, Tunisia, where he worked as a journalist and as director of Radio Tunis. A second autobiography, *Mémoires de l'oubli* ("Memoirs of Oblivion"), was published in 1981. Soupault also wrote a number of biographies, plays, and critical essays. He was awarded the Grand Prix de Poésie of the French Academy in 1972.

**soupfin shark,** North American Pacific shark species of the family Carcharhinidae. *See* carcharhinid.

**Souphanouvong** (b. July 13, 1909, Luang Prabang, Laos—d. Jan. 9, 1995, Laos), leader of the revolutionary Pathet Lao movement and first president of Communist-governed Laos.



Souphanouvong, half brother of the Lao premier Souvanna Phouma, was born a prince, a son of Viceroy Boun Khong of Luang Prabang. He was trained in civil engineering in France, and, under the French Indochina administration, he built bridges and roads in Vietnam (1938–45). After World War II he opposed the reimposition of French rule in Laos and joined the nationalist provisional government in Vientiane as defense minister. After a period as foreign minister of the Free Lao government-in-exile in Bangkok (1947–48), he broke with it to ally with the Viet Minh, with whose aid he formed the Communist-oriented Pathet Lao in 1950. After more than a decade in opposition, he joined the coalition government set up by Souvanna Phouma in 1962. When it collapsed a year later, he escaped to northern provinces administered by the Pathet Lao and its political wing, the Neo Lao Hak Xat, and resumed the Laotian civil war. As the Pathet Lao was establishing control over the whole of Laos in 1974–75, Souphanouvong returned to Vientiane to head the National Political Council; and, when a republic was proclaimed in late 1975, he became president (ceremonial head of state) and served on the Politburo of the Laotian Communist Party. He resigned from the presidency for reasons of health in 1986.

**Souris,** town, southwestern Manitoba, Canada. It lies at the confluence of Plum Creek and the Souris River, 20 miles (32 km) southwest of Brandon. Settled about 1880, it developed as a retailing and service centre for a grain-growing district. Souris (French for "mouse" or "mice") also became a divisional point on the Canadian Pacific Railway, and railroad shops are a main source of employment. The town is known for its Gravel Pits (a popular rock-collecting site with an abundance of petrified wood, jasper, agates, and dendrite) and for its swinging footbridge (one of Canada's longest, 582 feet [177 m]) across the Souris River. Inc. 1904. Pop. (1991) 1,662.

**Souris,** town, Kings county, eastern Prince Edward Island, Canada. It is situated along Colville Bay, an inlet of the Gulf of St. Lawrence, at the mouth of the Souris River, 48 miles (77 km) northeast of Charlottetown. Originally settled by French Acadians in 1748, the town was named via the river for the *souris* ("mice") that once plagued crops in the area. Souris is a regional service centre noted for its beaches and trout fishing. One of the province's main commercial-fishing centres, it has a large deepwater harbour with steamer connections to the Magdalen Islands, 70 miles (113 km) north. Inc. 1910. Pop. (1991) 1,333.

**Souris River,** tributary of the Assiniboine River, in Saskatchewan and Manitoba (Canada) and North Dakota (U.S.). Rising in southeastern Saskatchewan, it receives drainage from Moose Mountain and Coteau du Missouri and flows southeastward into North Dakota. It then bends northward to reenter Canada and finally joins the Assiniboine near Brandon in Manitoba, after a course of 600 miles (966 km), which is only partly navigable. Much of its drainage basin of 22,000 square miles (57,000 square km) is floored with silt and clay deposited on the bottom of what was once glacial Lake Souris; this fertile soil forms the basis of a productive agricultural area known for its hard, red spring wheat. The Souris (French: "mouse") flows through a region that is also rich in minerals. Coal is mined near Estevan and Bienfait (Saskatchewan) and Minot (North Dakota), while oil is extracted from the vicinity of Midale (Saskatchewan) and Virden (Manitoba).

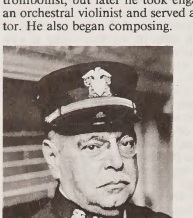
**soursop,** also called GUANABANA (species *Annona muricata*), tree of the family Annonaceae (order Magnoliales) that produces an edible fruit 20 cm (8 inches) long and weighing up to 4.5 kg (10 pounds). Native to the American

Soursop (*Annona muricata*)
W.H. Hodge

tropics, the tree has been widely introduced in the Old World tropics. Reaching about 8 m (26 feet), it has broad-ended, oval evergreen leaves about 12.7 cm long. The fruits are oval, spiny, green-skinned, and aromatic. The fibrous white flesh, which combines the flavours of mango and pineapple, is strained to make custards, ice creams, and drinks. *See also* custard apple.

**sourwood,** also called SORREL (species *Oxydendrum arboreum*), ornamental tree, of the heath family (Ericaceae), native to southeastern North America. It grows to about 23 m (75 feet) in height. The bitter-tasting leaves

Sourwood (*Oxydendrum arboreum*)
A to Z Botanical Collection—EB Inc



are alternate, stalked, rather oblong, and 12–20 cm (5–8 inches) long. In the autumn the leaves turn a brilliant red. The fragrant white flowers, about 1 cm long, grow in clusters 20–25 cm in length.

**Sous, Wadi,** river of southern Morocco, rising from several headstreams in the Haut (High) Atlas mountains and flowing westward for 112 miles (180 km) to the Atlantic Ocean south of Agadir. Its alluvial basin, protected from the Sahara by the Anti-Atlas mountains, is one of Morocco's most fertile regions. Fruits, cotton, vegetables, sugar, and olives are grown, much of them for export. Chief towns are Taroudant, a market centre, and Agadir, a fishing base and commercial port.

**Sousa** (Tunisia): *see* Hadrumetum; Sūsah.

**Sousa, John Philip,** byname THE MARCH KING (b. Nov. 6, 1854, Washington, D.C., U.S.—d. March 6, 1932, Reading, Pa.), American bandmaster and composer of military marches.

The son of an immigrant Portuguese father and a German mother, Sousa grew up in Washington, D.C., where from the age of six he learned to play the violin and later various band instruments and studied harmony and musical theory first with John Esputa and then with George Felix Benkert. In 1867 he began to follow the career of his father as a trombonist, but later he took engagements as an orchestral violinist and served as a conductor. He also began composing.

John Philip Sousa
By courtesy of RCA Records

In 1868 he enlisted in the U.S. Marine Corps as an apprentice in the Marine Band. He began building his formidable reputation as a bandmaster of great precision through his leadership (1880–92) of this group, which he raised to the highest standard of performance. In 1892 he formed his own band, a carefully selected group capable of equal virtuosity in both military and symphonic music; with it he toured the United States and Europe (1900–05) and finally made a world tour (1910–11).

Sousa composed 136 military marches, remarkable for their rhythmic and instrumental effects. They include the famous "Semper Fidelis" (1888), which became the official march of the U.S. Marine Corps, "The Washington Post" (1889), "The Liberty Bell" (1893), and "The Stars and Stripes Forever" (1897).

Between 1879 and 1915 he wrote 11 operettas, of which *El Capitan* (1896), *The Bride Elect* (1897), and *The Free Lance* (1906) were particularly successful. He wrote at least 70 songs, 11 waltzes, 12 other dance pieces, 11 suites, 14 humoresques, and 27 fantasies. In the 1890s he also redeveloped a type of bass tuba called the helicon (*q.v.*), made to his specifications and eventually called the sousaphone.

During World War I he enlisted in the U.S. Navy and took charge of the band-training centre at Great Lakes Naval Base, in Illinois. For the U.S. Department of the Navy he compiled *National, Patriotic and Typical Airs of All Lands* (1890). He wrote three novels, an instruction book for trumpet and drum, and an autobiography, *Marching Along* (1928).

**Sousa, Luís de,** original name MANOEL DE SOUSA COUTINHO (b. 1555, Santarém, Port.—d. May 5, 1632, Bemfica, near Lisbon), monastic historian whose prose style in his chronicle of the Dominican order earned him an important position in the history of Portuguese literature.

Sousa may have studied law at the University of Coimbra. About 1576 he became a novice in the Knights of Malta but did not continue his religious affiliation at that time. Between 1584 and 1586 he married Madalena de Vilhena, widow of a Portuguese military hero.

In 1613, however, Sousa and Madalena decided to take religious vows and thereby separate for the rest of their lives. According to some, they were motivated by grief over the death of their young daughter; according to others, it was the discovery, or at least the rumour, that Madalena's first husband was still alive. Sousa entered the Dominican monastery at Benfica, where he spent the rest of his life, changing his name to Friar (Frei) Luís de Sousa and taking vows in 1614.

Sousa soon took over the order's chronicle begun by Friar Luís Cácegas, the *História de São Domingos,* 3 vol. (1623, 1662, 1678; "History of Santo Domingo"). Its publication brought him immediate recognition as a master stylist of Portuguese prose. In addition, he completed the *Vida do Arcebispo D. Frei Bartolomeu dos Mártires* (1619; "Life of Archbishop D[ominican] Friar Bartholomeu dos Mártires"), a biography of a 16th-century Portuguese Dominican friar who became archbishop of the see of Braga, Port. The biography is considered a literary masterpiece, as well as a valuable historical record.

Nevertheless, Sousa might have remained an obscure monastic chronicler known only to scholars had his own life not been dramatized and popularized by the 19th-century Portuguese writer João Baptista de Almeida Garrett. Garrett's romantic play *Frei Luís de Sousa* (1843), emphasizing the personal struggles of the man, made Sousa a legendary and heroic figure in Portuguese history.

**Sousa, Martim Afonso de** (b. *c.* 1500, Vila Viçosa, Port.—d. July 21, 1564, Lisbon), Portuguese admiral who commanded the first colonizing expedition to Brazil (1530–33).

After destroying a French trading post in the territory of Pernambuco, Sousa founded the first two permanent Portuguese settlements in Brazil in 1532. One was São Vicente, near the present port of Santos, and the other was Piratininga, now São Paulo. He set up a municipal government and legal and economic systems, thereby laying the basis for future colonial social organization. He also established friendly relations with the Indians and obtained information from a group of shipwrecked Spanish sailors about the location of gold and silver in the interior of Brazil. Sousa was later governor of the Portuguese colony in Goa, India.

**Sousa, Tomé de,** also spelled THOMÉ DE SOUZA (b. *c.* 1515—d. 1573), Portuguese nobleman and soldier who became the first governor-general (1549–53) of the Portuguese colony of Brazil.

After military service in Africa and India, Sousa led a 1,000-man expedition to Brazil, where he built the fortified capital of Salvador. He assisted the Jesuits in converting the native population and helped to reestablish the king's authority throughout the colony. In 1552 he recommended Rio de Janeiro as a site for settlement and fortification. Sousa returned to Portugal in 1553 and spent his remaining years as the king's adviser on Brazilian affairs.

**sousaphone** (musical instrument): *see* helicon.

**Sousse** (Tunisia): *see* Hadrumetum; Sūsah.

**Soussou** (people): *see* Susu.

**Soustelle, Jacques (-Émile)** (b. Feb. 3, 1912, Montpellier, Fr.—d. Aug. 7, 1990, Neuilly-sur-Seine), French anthropologist and politician who was instrumental in the return to power of General Charles de Gaulle in 1958 but afterward broke with de Gaulle over the issue of Algeria.

The son of a railway worker, Soustelle studied at the École Normale Supérieure and received his doctorate from the Sorbonne in 1937. He took part in several anthropological missions to Mexico (1932–39), became assistant director of the Museum of Man in Paris (1937–39), and was a professor at the Collège de France and the Colonial School (1938–39).

Beginning as a strong leftist, Soustelle in 1938 became secretary-general of the Vigi-

lance Committee of Antifascist Intellectuals. After the fall of France to Germany in 1940, he joined the Free French forces of General de Gaulle in London. He was Free French commissioner of information (1942) and directed intelligence operations in Algiers (1943–44).

A member of the Constituent Assembly of 1945–46, Soustelle was successively minister of information and minister of colonies during 1945 in the government headed by de Gaulle. As secretary-general (1947–52) of de Gaulle's Rally of the French People, he led the party in the National Assembly after his election in 1951. In 1955 he was appointed governor-general of Algeria. Initially viewed with suspicion by the Algerian French community, Soustelle soon came to be regarded as its principal spokesman. He was recalled in February 1956 by the Guy Mollet government.

As the leader of the Gaullist group in the National Assembly in 1956–58, Soustelle became known as the "destroyer of ministries"; his intensive attacks on their Algerian policies led to the downfall of three governments. He returned to Algeria in May 1958 and became a leader of the rebel Committee of Public Safety. In company with the Algerian French rebels, the mutinous army, and other sectors of French society, he helped force the May 28 resignation of Premier Pierre Pflimlin and his replacement by de Gaulle. He was appointed minister of information on July 7, 1958, and, after de Gaulle's election to the presidency, he became minister for Sahara and atomic affairs in January 1959. In February 1960 he left the government, increasingly in disagreement with de Gaulle's policies toward Algeria, and went into exile in 1961. In December 1962 a warrant was placed for his arrest on grounds of plotting against the state. Following a general amnesty in 1968, he returned to France and became director of studies at the École Pratique des Hautes Études. He was elected to the National Assembly (1973–78) and served on the city council of Lyon (1971–77). In 1973 he served as the French representative to the Council of Europe. He was elected to the French Academy in 1983.

Soustelle's publications include *La Vie quotidienne des Aztèques* (1955; "The Daily Life of the Aztecs"), *Aimée et souffrante Algérie* (1956; "Beloved and Suffering Algeria"), *L'Art du Mexique ancien* (1966; *Arts of Ancient Mexico*), *Vingt-huit ans de Gaullisme* (1968; "Twenty-eight Years of Gaullism"), *La Longue Marche d'Israël* (1968; *The Long March of Israel*), *Lettre ouverte aux victimes de la décolonisation* (1973; "Open Letter to the Victims of Decolonization"), *Archéologie et anthropologie* (1976; "Archaeology and Anthropology"), *L'Universe des Aztèques* (1979; "The Universe of the Aztecs"), *Les Olmèques, la plus ancienne civilisation du Mexique* (1979; "The Olmecs, the Most Ancient Civilization of Mexico"), and *Les Maya* (1982; "The Mayans").

**Soutar, William** (b. April 28, 1898, Perth, Perthshire, Scot.—d. Oct. 15, 1943, Perth), Scottish poet, second in importance to Hugh MacDiarmid among the writers of the Scottish Renaissance movement.

Soutar was educated at Perth Academy and the University of Edinburgh. During World War I he served for two years in the navy and contracted osteoarthritis, from which he suffered thereafter. From October 1923 he was a semi-invalid, and, after the failure of an operation in May 1930, he was bedridden. He was saved from apathy and despair by his delight in the variety of nature and his devotion to the craft of letters. His "bairn-rhymes" in Scots, *Seeds in the Wind* (1933), are beast fables that express a mature insight into the life of things viewed with the "innocent eye" of childhood. In *Poems in Scots* (1935) he developed the ballad style toward the objective expression of individual lyricism. During his last 10 years his principal output in Scots consisted of "whigmaleeries," humorous poems full of comic exaggeration, interweaving the fantastic and the familiar. He was fond of miniatures, publishing *Riddles in Scots* (1937), while as a poet in English he was at his best in the pointed epigrams of *Brief Words* (1935) and the short nature lyrics of *The Expectant Silence* (1944).

**Souter, David Hackett** (b. Sept. 17, 1939, Melrose, Mass., U.S.), associate justice of the U.S. Supreme Court from 1990.

Souter spent his early childhood in a Boston suburb before his family moved to rural East Weare, N.H., in 1950. He attended Harvard University, from which he graduated magna cum laude in 1961. He then spent two years at Magdalen College, Oxford, on a Rhodes scholarship. Upon his return to the United States in 1963, he entered Harvard Law School, receiving his law degree in 1966.

After graduation, Souter spent two years in private practice in Concord, N.H., before joining the state attorney general's office. He was appointed state attorney general in 1976 and associate justice of the state Superior Court two years later. In 1983 Souter was elevated to the state Supreme Court. He was considered tough on crime, favouring prosecutors and resisting reversals of criminal convictions.

In February 1990 Pres. George Bush nominated Souter to the U.S. Court of Appeals for the First Circuit in Boston. In July he was nominated by Bush to the U.S. Supreme Court, easily winning confirmation (90–9). Souter's judicial record indicated that he would be ideologically compatible with the conservative justices appointed by Bush's predecessor, Ronald Reagan. From his early tenure on the court, however, Souter gradually emerged as a moderate liberal, routinely aligning himself with the court's more liberal members. Although Souter was expected to favour the overturning of *Roe* v. *Wade*, the 1973 ruling that established the legal right to abortion, he instead supported in 1992 a new "undue burden" standard that restricted abortion rights but did not eliminate them. Souter also adopted left-of-centre positions in cases involving school desegregation and race-conscious electoral districting. By the late 1990s, Souter was recognized for his intellectual leadership among the court's moderate members and for his skill at building consensus.

(B.P.S.)

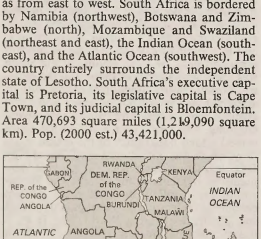
**South, the,** region, southeastern United States, generally, though not exclusively, considered to be south of the Mason and Dixon Line, the Ohio River, and the 36°30′ parallel. It includes, as defined by the U.S. federal government, Alabama, Arkansas, Delaware, the District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The South was historically set apart from other sections of the country by a complex of factors: a long growing season, its staple-crop patterns, the plantation system, and black agricultural labour, whether slave or free. White racial domination of blacks characterized Southern politics and economics from the 17th century and began to yield only after World War II.

The warm climate of the South affords a period of 200–290 frost-free days per year, enabling such profitable crops as tobacco, rice, sugarcane, and cotton to grow. This climate, coupled with abundant rainfall, offered 17th- and 18th-century European settlers a superb opportunity to raise crops for export if an adequate permanent labour supply could be found. The source proved to be African slaves, made available for purchase through the international slave trade. From this unique situation of supply and demand arose the system of plantation slavery, which above all other factors distinguished the South from other U.S. regions. By 1790 blacks constituted about one-third of the Southern population and almost the entire work force on the plantations. At the beginning of the American Civil War (1861), more than four million blacks remained in bondage, though less than one-sixth of the white population actually owned slaves.

Economically the antebellum and cotton-oriented South looked to the British textile industry for its market and opposed the growing politico-economic power of the industrializing North. The Southern social philosophy presented a sharp contrast with that of the North, for it stressed a genteel, aristocratic life-style rather than one based on the earnest accumulation of money.

In the period between the American Revolution (1775–83) and about 1830, the North, spurred by the abolitionists, passed from mild opposition to strong condemnation of slavery. In response, the white South rose to an unqualified defense of its "peculiar institution," supporting it on the grounds of biblical sanction, economic justification, the supposed racial inferiority of blacks, and the necessity for a well-ordered society. Southern separatism in defense of slavery and states' rights culminated in 1860–61, when 11 Southern states (South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Arkansas, North Carolina, Virginia, and Tennessee) seceded from the Union and formed the Confederate States of America. The ensuing Civil War (1861–65) wrought immense destruction on much of the South, which emerged the loser in the conflict. In many areas cropland was ruined, livestock lost, railroads destroyed, and billions of dollars in slave-related investments wiped out. Recovering slowly from this destruction, much of the South continued to rely largely on a one-crop economy—cotton, tobacco, or rice—and to cultivate the crops with the labour of black freedmen. The white-dominated South's continuing insistence on the inferiority and subordination of African Americans through a system of legalized racial-control measures known as Jim Crow laws resulted, after Reconstruction ended (1877), in the replacement of slavery with three institutions: the economic system of sharecropping (tenant farming), the political system of one-party politics (Democratic), and the social system of racial segregation, supported by law and custom.

Until 1932 the South remained an impoverished and undiversified region. The growth of a textile industry in the Carolinas and the movement to develop a "New South" after the Civil War had not seriously qualified the region's commitment to cotton, to agriculture, and to a rural way of life. African Americans remained poor, and the income of the South was less than half that of the rest of the country. Chronic overproduction of cotton, with its attendant low prices, forced more and more farmers, both black and white, into sharecropping. The Great Depression of the 1930s caused a total bankruptcy of the cotton economy, which was not relieved until federal New Deal legislation intervened to provide payments for reducing cotton acreage and for unemployment relief. Both of these devices encouraged migration to the cities, a trend that was accelerated during World War II by a heavy influx of Southern blacks to Northern industrial centres.



The New Deal, however, was ultimately to benefit the South. The cotton acreage quota system led to improvements in productivity and to diversification of the agricultural base. The Tennessee Valley Authority, a vast river-development scheme created in 1933, brought electricity to many rural families, further increased farmland productivity through flood control and improved soil management, and laid the groundwork for new industry.

After World War II the South began to experience sustained growth and industrialization, particularly in the lumber, paper, petrochemical, and aerospace industries. The cultivation of citrus and other fruits, peanuts (groundnuts), and soybeans eradicated the Deep South's historic dependence on cotton, which fell below livestock, poultry, and textiles in production value. By the 21st century, manufacturing had become the largest sector of the economy in most Southern states.

During the second half of the 20th century the population of the South boomed, exceeding 100 million by the end of the century, when the increasingly urban region contained two-fifths of the nation's 50 largest metropolitan areas. By the 2000 census, Texas surpassed New York as the second most populous state. Moreover, Florida's population more than doubled in the final three decades of the 20th century. As the demographic balance of the country shifted southward, the South consistently gained Congressional representation. Meanwhile, the region's political profile changed dramatically. A split in the Democratic Party in response to its postwar civil rights platform led to the ascendancy of George Wallace (*q.v.*) and caused many segregationist Southern conservatives to flee to the Republican Party. This split was so exacerbated by the growing Civil Rights Movement (*q.v.*) of the 1960s that by the 1980s the Democratic monopoly of the South was fully broken. Ever wealthier, the South played an increasing role in national politics beginning in the final quarter of the 20th century. Democrats Jimmy Carter of Georgia and Bill Clinton of Arkansas, as well as Republicans George Bush and George W. Bush of Texas, were elected president, and Southern patronage became pivotal to successful presidential campaigns. The controversial continued use of the Confederate Battle Flag by some Southern states remains a hotly debated political issue.

Culturally, the South boasts a literary tradition stretching from Sidney Lanier and Kate Chopin in the 19th century to William Faulkner, James Agee, and Eudora Welty in the 20th. It also has been the crucible of jazz, blues, rock, and country and western music.

**South Africa,** officially REPUBLIC OF SOUTH AFRICA, formerly UNION OF SOUTH AFRICA, the southernmost country on the African continent. The country extends for about 1,000 miles (1,600 km) from north to south, as well as from east to west. South Africa is bordered by Namibia (northwest), Botswana and Zimbabwe (north), Mozambique and Swaziland (northeast and east), the Indian Ocean (southeast), and the Atlantic Ocean (southwest). The country entirely surrounds the independent state of Lesotho. South Africa's executive capital is Pretoria, its legislative capital is Cape Town, and its judicial capital is Bloemfontein. Area 470,693 square miles (1,219,090 square km). Pop. (2000 est.) 43,421,000.

South Africa

A brief treatment of South Africa follows. For full treatment, *see* MACROPAEDIA: Southern Africa.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

*The land.* South Africa can be divided into three major physiographic zones: the broad interior plateau; the surrounding mountainous, semicircular Great Escarpment; and a narrow belt of coastal plain. The plateau, ranging in elevation from 2,000 feet (610 m) above sea level in the west to 8,000 feet (2,440 m) in the east, consists of undulating to flat landscapes. The Great Escarpment, ranging in elevation from 5,000 to nearly 11,000 feet (1,500 to 3,350 m), is known by a variety of names, such as Transvaal Drakensberg in the far northeast and Roggeveld Mountains in the southwest. The fertile region of the narrow, up to 50-mile- (80-kilometre-) wide coastal plain lies in the west, south, and east. The Orange and the Limpopo are the principal rivers.

South Africa has a temperate subtropical climate. The average daytime temperatures are between 70° and 90° F (21° and 32° C) in summer (December–February) and between 50° and 70° F (10° and 21° C) in winter (June–August). Mean annual rainfall varies from less than 8 inches (200 mm) in the arid northwest to more than 40 inches (1,000 mm) along the KwaZulu/Natal coast in the southeast. Natural vegetation varies from Mediterranean shrub type in the Cape of Good Hope region to the drought-resistant bush type of the semidesert western part of the country; some temperate forests are found along the Cape coast east of George, and grassland (veld) covers the rest of the republic. The Kruger National Park is one of a number of wildlife reserves that protect species such as lions, elephants, rhinoceroses, and antelopes.

South Africa is richly endowed with mineral resources such as coal, asbestos, copper, manganese, gold, chromite, uranium, platinum, iron ore, diamonds, and natural gas.

*The people.* Black Africans make up three-fourths of the country's total population, whites about one-eighth, and people of mixed race (including Cape Malay) and of Indian descent most of the remainder. The black population is composed of four main linguistic groups, all of whom speak Bantu languages belonging to the Benue-Congo subgroup of the Niger-Congo language family. The Nguni group is the largest and includes various Xhosa, Zulu, Swazi, and Ndebele peoples, who together constitute more than half of the total black population. The Sotho-Tswana group includes numerous Sotho, Pedi, and Tswana peoples. The Tsonga and Venda constitute the other two major linguistic groupings. The country's whites are either Afrikaans or English speakers and are mostly descended, respectively, from Dutch settlers or from later British immigrants. Afrikaans and English, together with nine Bantu languages, hold official status. South Africa's major religious groups include African Christian, Dutch Reformed, Roman Catholic, Hindu, and Muslim.

Almost half of South Africa's population is urban. Population density varies from 5 persons per square mile (2 persons per square km) in the arid western part of the country to 239 persons per square mile (92 persons per square km) on the eastern coast around Durban. The population growth rate is higher for blacks and persons of mixed race than it is for whites. Infant mortality, although it is declining, continues to be high among blacks and moderate among whites. Life expectancy in South Africa is 52 years for males and 54 years for females, but it is highest for the white population and lowest for the black.

*The economy.* South Africa has a market economy, with state participation in a number of ways, that is based largely on services, manufacturing, and mining. Economic policy has been aimed primarily at sustaining economic growth and achieving a measure of industrial self-sufficiency. The gross national product (GNP) is the largest in Africa.

Agriculture accounts for about 5 percent of the gross domestic product (GDP) and employs nearly one-tenth of the workforce. Arable land is limited to about one-tenth of the total land area, and productivity is low. Droughts are frequent, and annual harvests of corn (maize), the chief staple and chief farm export, fluctuate sharply. Irrigation is inadequate, though the Orange River Project was initiated in 1962 to greatly expand the land under irrigation. Other major crops include sugarcane, wheat, potatoes, peanuts (groundnuts), citrus fruits, grapes, and tobacco. Pastures cover two-thirds of the land and support sheep, cattle, and other livestock.

Forests cover less than 7 percent of the land; removals of roundwood meet nearly all of domestic demand. There are rich fisheries off the coast, and annual landings include anchovy, stockfish (Cape hake), and herring.

Mining, once the mainstay of South Africa's economy, now accounts for only about 5 percent of the GDP. South Africa remains the world's largest producer of gold, although the importance of gold in the nation's total mineral output has declined significantly since 1946. Coal is widely mined, and large quantities are exported. South Africa must import petroleum, and the South African Coal, Oil and Gas Corporation (SASOL) produces some oil from coal. Significant quantities of uranium are mined and subsequently enriched. A nuclear power station began operating at Koeberg near Cape Town in 1984.

South Africa is also a leading producer and exporter of chromite, gem diamonds, platinum, and vanadium. Antimony, industrial diamonds, fluorite, manganese, and vermiculite are also produced in large quantities.

Manufacturing accounts for one-fifth of the GDP and employs one-tenth of the workforce. Principal manufactures include metal products, chemicals, food and beverages, electrical machinery, motor vehicles, textiles, and printing and publishing. Electricity is generated mostly from domestic coal.

The most important trade union federation is the Congress of South African Trade Unions, a nonracial but mainly black body that includes the country's largest unions.

South Africa's chief import sources are Germany, the United States, the United Kingdom, and Japan. Machinery, transport equipment, chemicals, and foodstuffs are the major imports. Switzerland, the United Kingdom, the United States, Japan, and Germany are the chief markets for South African exports. Gold, the country's largest export commodity, is followed by gem diamonds and other minerals.

*Government and social conditions.* From 1948 to 1993–94 South Africa's political and social structure was based on apartheid, a system of legalized discrimination that maintained the political and economic dominance of the white minority and legally enshrined the complete segregation of whites, Coloureds (persons of mixed race), Asians (mostly Indians), and Africans (blacks). Under apartheid the government established 10 Bantu (African) national homelands to which it assigned specific tribal groups, and in 1970 all blacks were made citizens of one or another of these small polities. The black majority was thus effectively stripped of South African citizenship.

A new constitution adopted in 1983 granted limited political rights to the country's Coloured and Asian minorities while continuing to exclude blacks from the franchise; there was no parliamentary representation for the country's black majority. The 1983 constitution also increased the powers of South Africa's chief executive, the state president. The dominant white party during the

apartheid era was the National Party. The principal black political organization was the African National Congress (ANC), although at that time it was illegal in South Africa.

Under the leadership of President F.W. de Klerk, the South African government in 1990 began to dismantle the apartheid system by releasing the ANC leader Nelson Mandela from prison and lifting the ban against the ANC and other antiapartheid political groups. From 1991 the government undertook negotiations with the ANC and other groups on the establishment of a constitution that would enfranchise the country's nonwhite majority. The government also systematically dismantled the legal basis of apartheid by repealing a large body of racially discriminatory legislation. In 1993 the government and the black opposition agreed on the mechanisms for a transition to democratic government in South Africa. The interim constitution of 1993 called for a bicameral parliament consisting of a National Assembly elected by proportional party representation and a Senate elected by the provincial legislatures.

All-race elections for the new parliament were held in April 1994. Upon the start of the elections (April 26) the interim constitution went into effect, the country's four historic provinces (Cape of Good Hope, Transvaal, Natal, and the Orange Free State) were replaced by nine new provinces, and the 10 black homelands were dissolved and reincorporated into South Africa. The elections were won by the ANC under the leadership of Mandela, who became South Africa's first black president. He promptly formed a government of national unity whose vice presidents and cabinet ministers were drawn from the ANC, the National Party, and other moderate political parties.

The constitution of 1996 provides for a bicameral legislature. The National Council of Provinces consists of nine delegations (of 10 delegates each) elected by the legislatures of the nine provinces. Members of the 350- to 400-seat National Assembly are elected by proportional party representation to five-year terms. The National Assembly chooses from among its members the president of the republic, who may serve no more than two five-year terms in that capacity. The judiciary is headed by the Constitutional Court and includes the Supreme Court of Appeal, the High Courts, and the Magistrates' Courts.

South Africa's social-welfare services include social pensions; family allowances; care for the elderly, handicapped, and children in need; and unemployment compensation. Urban areas have modern health facilities rarely found in rural areas. Hospitals located in the formerly segregated African areas tend to be overcrowded, and the incidence of infectious disease and malnutrition among nonwhites remains high. The proportion of the population infected with HIV, the virus that causes AIDS, increased sharply during the 1990s.

One consequence of the three separate educational systems built up under apartheid has been a disparity in literacy rates among races. Literacy rates range from nearly universal among the white population to about one-third among the black population. Education is compulsory for all children between the ages of 7 and 15. In the late 1990s the government began to develop a single nonracial educational system that aimed at overturning the educational disparities of the apartheid era.

Apartheid-driven censorship before 1990 has given way to a more open and free press. Although most television and radio stations remain state-owned, private ownership is becoming more common, and Internet access in South Africa is the highest in the continent.

*Cultural life.* The numerous languages spoken by the South African population reflect the country's cultural diversity. The largest group, the blacks, is the most eclectic, and, though many have adopted European customs, African traditions in music, dance, and the visual arts remain strong. South Africa's literary tradition consists of writings in English, Afrikaans, and various African languages, chief among them Zulu and Xhosa. Among the country's noted writers have been the poets N.P. van Wyk Louw and Breyten Breytenbach in Afrikaans; and the novelists Alan Paton, Nadine Gordimer, and J.M. Coetzee and the playwright Athol Fugard in English. (*See* South African literature.)

*History.* In the late Stone Age, about 10,000 years ago, the San and Khoikhoin roamed South Africa as hunters and gatherers, with the latter group developing a pastoralist culture by the time of European contact. Bantu-speaking peoples (to about the 15th century) migrated southward and developed more complex societies, gold- and copper-mining industries, and an active East African trade.

The Portuguese navigator Bartolomeu Dias sailed around the southern tip of the country in 1488. In 1652 the Dutchman Jan van Riebeeck established a colony at the Cape of Good Hope to serve as a stopping point for Dutch East India Company trading vessels. Dutch settlers became known as Boers and later as Afrikaners—named for their Afrikaans language, which had derived from the settlers' native Netherlandic (Dutch). Intermarriage among San, Khoikhoin, and Afrikaners produced an ethnic group known as Cape Coloureds. Afrikaners ventured inland from the Cape, becoming seminomadic pastoral farmers called trekboers. They encountered the populous and settled agricultural Xhosa people in the area of the Fish River. In the last quarter of the 18th century, minor cattle raids developed into frontier wars between the Afrikaners and Xhosa that were to last intermittently for almost 100 years.

In 1795 British forces captured the Cape; they relinquished control in 1802 and recaptured the colony in 1806. The British initiated a policy of subduing Bantu-speaking tribes along the frontier. In the 1830s began the "Great Trek," during which Afrikaners with their slaves migrated north in large numbers across the Orange and Vaal rivers to escape British rule. The Boer republics of the Orange Free State (1854) and the South African Republic (1838; later the Transvaal region) were established during that period. Both gained independence from British colonial rule in the 1850s.

The discovery of diamonds (1868) and gold (1886) caused the economy to boom during the late 19th century. The Boer republics resisted British attempts to include them in a South African confederation, leading to the South African (Boer) War between the republics and Britain beginning in 1899. By 1902 Boer resistance had been destroyed, and Britain had annexed the republics as new colonies.

In 1910 the South Africa Act (1909) unified the British colonies of Cape Colony, Transvaal, Natal, and Orange River into the new Union of South Africa. South Africa sided with Britain in World War I, and by 1915 its soldiers had defeated German troops occupying South West Africa (modern Namibia); in 1919 the League of Nations mandated the former German colony to South Africa.

Throughout the 20th century South African politics was dominated by the question of maintaining white supremacy over the country's black majority. In 1948 the new government of the white National Party introduced enforced segregation—apartheid—as a formal segregation policy; its built-in racial hierarchy fixed whites and blacks at opposite ends of the economic and political spectrum, with whites holding virtually all political power and owning most of the country's wealth. In the middle were the Asians and the Coloureds. Unrest among nonwhites increased from the 1950s, resulting in occasional violent conflicts with police over apartheid policy. These protests were frequently met with brutal suppression.

In 1966 Lesotho (Basutoland) and Botswana (Bechuanaland) became independent. In 1968 South West Africa was renamed Namibia by the United Nations; it became independent in 1990. Meanwhile, the white government of South Africa, faced by worldwide condemnation, inaugurated policies to conciliate the black population and to eliminate the barriers of apartheid. Negotiations toward a new, nonracial constitution began between the white-dominated government and black political organizations in 1991. The apartheid system was dismantled, and the government and the leading black political party, the ANC, cooperated in a transition to majority rule signaled by the holding of all-race democratic elections in April 1994. The ANC won an outright majority of seats to the new Parliament in these elections, and the ANC leader Nelson Mandela became the country's first black president and promptly formed a government of national unity with the National Party. A much-heralded nonracial constitution was formally adopted in 1996, at which time the Nationalists resigned from the government. The ANC retained its majority in elections held in 1999, despite the retirement of Mandela.

**South Africa, Church of the Province of,** independent church that is part of the Anglican Communion. It developed from the work of British clergy among the British soldiers and settlers in the Cape of Good Hope in the late 18th and 19th centuries. The bishop of Calcutta, India, was at first responsible for the area, but in 1847 Robert Gray was consecrated the first bishop of Cape Town. Through his work the church grew, and additional dioceses were established. In 1853 he became metropolitan (archbishop) of South Africa.

Gray had been influenced by the Oxford Movement in the Church of England, which emphasized the Roman Catholic heritage of the church. Anglicanism in South Africa reflected this influence.

In modern times the church has attempted to minister to the country's black population. It actively opposed the government's policy of apartheid (racial segregation and disfranchisement) until the policy was abolished.

**South Africa Act** (1909), act that unified the British colonies of Cape Colony, Natal, Transvaal, and Orange River and thereby established the nation of South Africa. It was the work of white delegates to a national convention at Durban, Natal, in 1908, who represented white electorates, less than one-fifth of the population of South Africa.

The constitution agreed upon at Durban was largely the work of Jan Smuts, colonial secretary of the Transvaal (and of his English secretary, R.H. Brand), and was modeled on the Australian constitution of 1900. Most power was to be concentrated in the all-white union Parliament, effectively disfranchising blacks. Before the convention Smuts and John X. Merriman, prime minister of the Cape Colony, had agreed that a "colour-blind" franchise (*i.e.,* one not excluding nonwhites) should be confined to the Cape Province and, even there, should be subject to constitutional amendment. The amendment procedure—two-thirds majority of both houses sitting together—also applied to the clause guaranteeing equal status to whites of either English or Dutch descent. Cape African and Coloured (persons of mixed race) voters also lost their right (never exercised) of electing people of their own class to Parliament. The political colour bar was thus enshrined in the constitution. One of the political issues that most vexed the delegates was that of the capital of the new union; finally a compromise was reached, with Preto-

ria becoming the administrative, Cape Town the legislative, and Bloemfontein the judicial capital.

The draft constitution was passed as an act of the British Parliament in 1909, and the union was inaugurated on May 31, 1910, with Louis Botha as the first prime minister. Many British members of Parliament and some white South African politicians were aware of the discriminatory nature of the new act, but it was argued that the political and economic advantages of union would outweigh the disadvantages.

**South African literature,** the body of writings in either Afrikaans or English produced in what is now the Republic of South Africa. For writings in the African languages of the country's black majority, *see* African arts.

South Africa was colonized by Europeans against the resistance of Africans and was for some time afterward a battlefield between Briton and Boer. Although South Africa became independent in 1910, the nation's varied ethnic and racial constituents have not yet been unified in a harmonious whole, and the tension arising from the unequal relations between blacks and whites is the authentic note of much South African literature. Indigenous South African literature effectively began in the late 19th century and became fairly copious in the 20th century. Much of the work by persons born in South Africa was limited in its viewpoint; often these writers only dimly apprehended the aspirations, perceptions, and traditions of South Africans belonging to a race other than their own. English-speaking South African writers are mainly urban and cosmopolitan; their culture is English, and they often have a wider audience among English-speaking communities abroad. By contrast, Afrikaans writers belonged for many decades to a close-knit community—born of a defensive posture—with shared experiences (including rural roots), shared aspirations and religion, and a strong sense of nationhood. Only in the 1960s did a major break with this tradition become apparent.

The twin 20th-century phenomena of urbanization and the separation of the black and white races by government policy have greatly affected the psychological makeup and thus the literary expression of English- and Afrikaans-speaking whites, as well as of Africans. The moral and artistic challenges inherent in South Africa's situation stimulated writing up to a point, but the South African preoccupation with race problems may ultimately have proven inimical to the creation of an authentic national literature.

*In Afrikaans.* Although Afrikaans had diverged sufficiently from its parent Dutch by about 1750 to be considered a language on its own, the first Afrikaans texts were not published until more than a century later. In 1875 a group of nationally conscious men established the Association of True Afrikaners, which eventually published the first newspaper, the first magazine, and the first literary texts in Afrikaans. The leader of the so-called First Afrikaans Language Movement was S.J. du Toit, a Dutch Reformed pastor and a versatile and prolific author. The writings of the First Language Movement were propagandist, aiming to break down prejudice against the new language and to prove that it could be used effectively as a means of communication.

Out of the Boers' defeat in the South African War (1899–1902) came a new upsurge to establish Afrikaans as a national language. The Second Afrikaans Language Movement spread north from Cape Province, and Afrikaans gradually won ascendancy over Dutch, replacing Dutch as the medium of instruction in schools, as the language of the Dutch Reformed churches, and finally as an official language of the (then) Union of South Africa in 1925. Poets were the outstanding writers of the second movement, which spanned the first two decades of the 20th century. Chief among them were Eugène Marais, with his disillusioned and compassionate verse on human suffering; Jan F.E. Celliers, a pastoral poet; Jakob Daniel du Toit (Totius), who wrote some of the best elegiacs in Afrikaans; and C. Louis Leipoldt, whose poetry expressed the suffering inflicted by the South African War, and whose short lyric poems called *Slampamperliedjies* ("songs of a reveler") express a sensuous appreciation of nature.

Afrikaans prose writing made important strides in the 1920s and '30s. In the genre of local realism, two novelists achieved success with their delineations of the folk of farms and villages—Jochem van Bruggen and Jan van Melle. The two foremost Romantic novelists were D.F. Malherbe, who wrote numerous prolix narratives on Biblical themes and South African pioneering history; and C.M. van den Heever, whose work is based mostly on the Afrikaner's conflicts in the transition from a rural to an urban society and implies a natural bond between the farmer and the soil. Toon van den Heever was the outstanding new poet of the 1920s, and his anticonformist verse foreshadowed the great upsurge of "new" Afrikaans poetry in the 1930s.

The supreme event in Afrikaans literature was the appearance of a group of talented poets, the Dertigers ("Poets of the '30s"), begun by W.E.G. Louw with *Die ryke dwaas* (1934; "The Rich Fool"). This sensitive poet, with his searing conflicts between God and Eros, exemplified qualities soon to become the new generation's hallmark. He was followed by his elder brother, N.P. van Wyk Louw, the principal creative artist and theoretician of the new movement. Van Wyk Louw achieved mastery in every form, writing the finest odes, sonnets, modern ballads, and love lyrics in Afrikaans. His dramatic monologue "Die Hond van God" (1942; "The Hound of God") was unsurpassed in the Dutch literatures, his epic poem *Raka* (1941) became a classic, and in the poetry collection *Tristia* (1962) he mourned the exile of the individual searching for signs of God in earthly existence.

Another poet of the 1930s was Elisabeth Eybers, whose verse dealt initially with the intimate confessions of women but broadened out to a penetrating, objective approach to love, exile, old age, and the poetical craft. Besides writing vivid romantic poetry, Uys Krige was also a short-story writer and playwright and a fine translator from the Romance languages. The poet D.J. Opperman came into prominence in 1945. His technique superimposes different historical levels intermingled with a fascinating mosaic of themes, images, and allusions from both Africa and a common Western heritage. Ernst van Heerden, another major poet who emerged in the 1940s, veered from tightly structured, rather impersonal verse to freer forms expressive of human vulnerability. Of the poets writing in the vernacular of the Cape Coloureds, Adam Small was the most talented.

By mid-century Afrikaans was changing from an essentially pastoral language to an urban one, expressing the frustrations and stresses of the city dweller. Among the new writers were the poet Peter Blum and the short-story writer Jan Rabie. They were followed by the Sestigers ("Writers of the '60s"), a disparate group of writers loosely united by their interest in formal experimentation, their existential view of life, and their dissatisfaction with apartheid and the authoritarian character of Afrikaner society under the ruling National Party. The most important of the Sestigers were the novelists Etienne Leroux and André P. Brink and the poet Breyten Breytenbach. In a series of thematically linked novels published in the 1960s, Leroux explored the dilemma of modern Afrikaners in search of a myth, the inexhaustible fantasy and satire of his work making it unique in Afrikaans. In the 1970s Brink wrote a series of novels depicting the evils and injustices of apartheid. As the most important poet of the 1960s, Breytenbach combined surrealism and Zen Buddhism in free verse packed with original imagery. And finally, in the 1960s the short story emerged as an important genre in Afrikaans with the works of Chris Barnard, Abraham H. de Vries, and Hennie Aucamp.

The apartheid system and its tensions and moral failures continued to be explored in Afrikaans literature after the 1960s. Two impressive documentary novels were Elsa Joubert's *Die swerfjare van Poppie Nongena* (1978; "The Long Journey of Poppie Nongena"), which records the experiences of an Afrikaans-speaking black woman up to 1976; and John Miles's *Kroniek uit die doofpot* (1991; "Chronicle From the Wastepaper Basket"), a novel about a political assassination. Etienne van Heerden's *Toorberg* (1986; "The Magic Mountain") is at once a family novel, an exercise in magic realism, and an allegory of South African history. In Karel Schoeman's masterpiece, *'n Ander land* (1984; "Another Country"), the melancholy experience of individual desolation is combined with a probing depiction of South African political realities.

Afrikaans poets of note since the 1960s have been mostly women: Wilma Stockenström, who displays impressive technical abilities in bleak depictions of desolate landscapes and personal alienation; Sheila Cussons, who describes in her poetry the transcendence of human suffering through Roman Catholic mysticism; and Antjie Krog, whose search for an individual language within tradition is recorded in *Lady Anne* (1989).

Afrikaans drama lagged behind poetry and prose. In the 1960s and '80s there were upsurges of playwriting by younger authors, notably by Bartho Smit, André P. Brink, and Pieter Fourie, but the most impressive achievements in the genre probably remain N.P. van Wyk Louw's *Germanicus* (1956) and Opperman's *Periandros van Korinthe* (1954), both of which make use of classical themes.

*In English.* South African literature in English effectively began in the late 19th century in the states preceding the Republic of South Africa and became fairly copious in the 20th. During the early 1900s, Africans, largely cut off from tribal customs and values (including the oral literary tradition), began to write in English. In the middle decades many talented Africans served literary apprenticeships on popular English newspapers and periodicals, such as *Drum,* aimed at the African reader in his poverty-stricken but lively "township." At about that time, too, English-speaking writers, both black and white, began to mix on a limited scale, a cross-fertilization that may have had seminal value for literature. Regrettably, it was short-lived; from 1948, many African and white writers went into exile for political reasons.

Olive Schreiner, a liberal and a powerful writer on local and international affairs, composed the first great South African novel, *The Story of an African Farm* (1883). Other English writers include William Plomer, who pioneered race relations as material for fiction in the novel *Turbott Wolfe* (1925), and Pauline Smith, whose stories in *The Little Karoo* (1925) dealt sympathetically with rural Afrikaners. Laurens van der Post, in a novel, *In a Province* (1934), dealt with the African-coming-to-town theme.

Alan Paton and Nadine Gordimer both achieved international reputations with their novels and short stories. *Cry, the Beloved Country* (1948) established Paton as the most eloquent voice of South African liberal humanism, and his later writing, such as the

novel *Too Late the Phalarope* (1953) and the stories in *Debbie Go Home* (1961), further enhanced his reputation. Paton's work is characterized by rhythmic prose, a compassionate view of South Africa's tormented race relations, and irony. Gordimer made an impact abroad with her first novel, *The Lying Days* (1953). A meticulous observer of the physical world and of nuances in human relationships, she writes astringently and without sentimentality, her talent at its best perhaps in such short-story collections as *Not for Publication* (1965). In 1991 Gordimer became the first South African to receive the Nobel Prize for Literature.

The early novels of Dan Jacobson were also deservedly praised, providing as they did a peculiarly incisive view of racially divided South African society. Restraint and wry humour are characteristic of his best works, which include the short-story collection *Beggar My Neighbour* (1964) and the novel *The Beginners* (1965). Perhaps the most important novelist to emerge after Gordimer was J.M. Coetzee, whose books mark a decisive break with South African traditions of realism and naturalistic description. In such novels as *In the Heart of the Country* (1977), *Waiting for the Barbarians* (1980), and *Life and Times of Michael K* (1983), Coetzee uses allegory, black humour, and stream-of-consciousness narrative techniques to depict the brutality and injustice of unnamed but clearly exploitative modern societies.

Some of the finest works of black and Coloured writers in English are autobiographical depictions of the frustrations and deprivation experienced by young black intellectuals in South African society. Peter Abrahams was a prolific expatriate Coloured novelist who explored this vein in his novel *Tell Freedom: Memories of Africa* (1954). In his short stories and novellas (*e.g., A Walk in the Night* [1962]), Alex La Guma used a racy Coloured English vernacular that owes much to Afrikaans. His other writings include *And a Threefold Cord* (1964), *The Stone-Country* (1967), and *In the Fog of a Season's End* (1972). Other writers of protest include Lewis Nkosi, author of a collection of essays, *Home and Exile* (1965), and Ezekiel Mphahlele, whose autobiographical *Down Second Avenue* (1959) has become a South African classic. Nkosi and Mphahlele, both Africans, worked for *Drum* magazine, which provided an important forum for their ideas. The two went into exile.

Warm humour, rare in South African writing, is abundant in the work of H.C. Bosman, who deals affectionately with Afrikaners of the old school in *Mafeking Road* (1947) and *A Cask of Jerepigo* (1957). The only drama of note in English is that of Athol Fugard, particularly *The Blood Knot* (1963) and *Hello and Goodbye* (1966). Fugard's penetrating and pessimistic analyses of the South African situation in such later plays as *Boesman and Lena* (1969) and *Sizwe Bansi is Dead* (1972) secured his reputation as a dramatist of international importance.

Early South African poets writing in English tried to describe the African landscape within the romantic conventions of 19th-century English poetry. But in the 1920s came the work of major poets Roy Campbell and William Plomer. As satirists they debunked much of the shallowness and sentimentality that characterized South African verse of the period. Campbell wrote vigorously extroverted verse that often sounded a note of menace. His most famous work was his long symbolic poem *The Flaming Terrapin* (1924). The acutely observant Plomer wrote with more restraint and experimented with rhythm and diction in such works as *Notes for Poems* (1927) and *Visiting the Caves* (1936).

Campbell's work stimulated the emergence of a new generation of English poets in the decades after World War II. Guy Butler, in his fine poem "Home Thoughts" (1956), expressed a sense of the English being aliens as people as well as poets. F.C. Slater often evoked by image and rhythm a uniquely South African experience, as in "Lament for a Dead Cow" (*Collected Poems* [1957]). Sydney Clouts was another important poet who came to prominence after World War II, but it was Douglas Livingstone who became the leading English-language poet of the latter 20th century. He emerged in the 1960s with his powerful descriptions of African landscapes and animals, but his poetry subsequently broadened in scope to touch upon various aspects of modern society. An African poet of merit is O.M. Mtshali, whose *Sounds of a Cowhide Drum* (1971) received acclaim.

**South African Party,** former political party in South Africa, founded by Louis Botha in conjunction with the creation of the Union of South Africa in 1910. It strove to conciliate British South Africans and Boers within the framework of the British Commonwealth. The party was formed from the coalition that won control of the government in the elections of 1910, making Botha the first prime minister of the Union. Before long the party lost J.B.M. Hertzog, a member of Botha's first Cabinet, who in 1914 founded the opposition National Party to express a more stridently Afrikaner perspective. The South African Party, a strong supporter of the Allies in World War I, stayed in power for 14 years. Jan Smuts became prime minister after Botha died in 1919. The party, led by Smuts, was strengthened in 1920–21 with the addition of members from the defunct Unionist Party, the strongly pro-British party of Cecil Rhodes and Leander Jameson.

A crisis in the mining industry, with resultant discontent among white labourers, contributed to the South African Party's defeat in the elections of 1924. The victory went to the National Party; Hertzog became prime minister. The South African Party remained in opposition until 1933, when it formed a coalition with and then merged with the National Party—in difficulties because of economic depression—to form the United Party (in full, the United South African National Party).

**South African Republic,** either of two 19th-century Boer states in what is now South Africa. The first was established in the Potchefstroom area of the Transvaal, by Voortrekkers (Afrikaner migrants from the Cape) in 1838. In 1860 the name was applied to the amalgamated Boer republics in the area bounded by the Vaal, Hartz, and Limpopo rivers. Annexed by Britain in 1877, this South African Republic became the Crown Colony of the Transvaal. In December 1880 rebellious Boers in the Transvaal again proclaimed a South African Republic; and after its conquest by Britain in 1900 during the South African War, it once again became the Crown Colony (and after 1910, the Province) of the Transvaal.

**South African War,** also called BOER WAR, or ANGLO-BOER WAR (Oct. 11, 1899–May 31, 1902), war fought between Great Britain and the two Boer (Afrikaner) republics—the South African Republic (Transvaal) and the Orange Free State. Although it was the largest and most costly war in which the British engaged between the Napoleonic Wars and World War I, it was fought between wholly unequal protagonists. The total British military strength in South Africa reached nearly 500,000 men, whereas the Boers could muster no more than about 88,000. But the British were fighting in a hostile country over difficult terrain, with long lines of communications, while the Boers, mainly on the defensive, were able to use modern rifle fire to good effect, at a time when attacking forces had no means of overcoming it.

The war began on Oct. 11, 1899, following a Boer ultimatum directed against the reinforcement of the British garrison in South Africa. The crisis was caused by the refusal of the South African Republic, under President Paul Kruger, to grant political rights to the Uitlander (foreigners; *i.e.,* non-Dutch and primarily English) population of the mining areas of the Witwatersrand, and the aggressive attitudes of Alfred Milner, 1st Viscount Milner, the British high commissioner, and of Colonial Secretary Joseph Chamberlain, in response to this obduracy. An underlying cause of the war was the presence in the Transvaal of the largest gold-mining complex in the world, beyond direct British control, at a time when the world's monetary systems, preeminently the British, were increasingly dependent upon gold.

The course of the war can be divided into three periods. During the first phase, the British in South Africa were unprepared and militarily weak. Boer armies attacked on two fronts, into Natal from the Transvaal and into the northern Cape from the Orange Free State; the northern districts of the Cape Colony rebelled against the British and joined the Boer forces. In the course of Black Week (December 10–15) the Boers defeated the British in a number of major engagements and besieged the key towns of Ladysmith, Mafeking, and Kimberley; but large numbers of British reinforcements were being landed, and slowly the fortunes of war turned. Before the siege of Ladysmith could be relieved, however, the British suffered another reverse at Spion Kop (January 1900).

In the second phase, the British, under Lord Kitchener and Frederick Sleigh Roberts, 1st Earl Roberts, relieved the besieged towns, beat the Boer armies in the field, and rapidly advanced up the lines of rail transportation. Bloemfontein was occupied by the British in February 1900, and Johannesburg and Pretoria in May and June. Kruger left the Transvaal for Europe. But the war, which until then had been largely confined to military operations, was by no means at an end, and at the end of 1900 it entered upon its most destructive phase. For 15 months Boer commandos, under the brilliant leadership of generals such as Christiaan Rudolf de Wet and Jacobus Hercules De la Rey, harried the British army bases and communications; large rural areas of the Transvaal and the Orange Free State (which the British annexed as the Orange River Colony) remained out of British control.

Kitchener responded with barbed wire and blockhouses along the railways, but when these failed he retaliated with a scorched-earth policy. The farms of Boers and Africans alike were destroyed and the Boer inhabitants of the countryside were rounded up and held in segregated concentration camps. The plight of the Boer women and children in these camps became an international outrage—more than 20,000 died in the carelessly run, unhygienic camps. The commandos continued their attacks, many of them deep into the Cape Colony, General Jan Smuts leading his forces to within 50 miles (80 km) of Cape Town.

But Kitchener's drastic and brutal methods slowly paid off. The Boers had unsuccessfully sued for peace in March 1901; finally, they accepted the loss of their independence by the Peace of Vereeniging (*see* Vereeniging, Peace of) in May 1902.

**South America**, fourth largest continent and southernmost of the two main New World landmasses. It covers about one-eighth of Earth's land area. The continent, broad in the north and tapering to a point in the south at Tierra del Fuego, extends about 4,700 miles (7,600 km) from Point Gallinas, Colom., in the north to Cape Horn, Chile (and the nearby Diego Ramírez Islands), in the south. At its broadest point, near where it is crossed by the Equator, South America extends about 3,300 miles (5,300 km) from east to west; four-fifths of its landmass lies within the tropics. Bounded by the Caribbean Sea to the north-northwest, the Atlantic Ocean to the northeast, east, and southeast, and the Pacific Ocean to the west, the continent is separated from Antarctica by the Drake Passage. In the northeast it is joined to North America by the Isthmus of Panama, which forms a land bridge narrowing to about 50 miles (80 km) at one point. Area 6,878,000 square miles (17,814,000 square km). Pop. (1993 est.) 308,770,000.

A brief treatment of South America follows. For full treatment, *see* MACROPAEDIA: South America; American Peoples, Native; Pre-Columbian Civilizations.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

*The land.* The continent may be divided into three topographic sections: the geologically young mountain chains of the Andes in the west, the ancient, crystalline Guiana and Brazilian continental shields in the east and north-centre, and the sedimentary basins peripheral to the shields. The Andes Mountains stretch north-south for about 5,500 miles (8,800 km) and are second in average height only to the Himalayas of Asia. They border the Pacific Ocean for the entire length of the continent and rise in the Central Andes along the Chilean-Argentine border to Mount Aconcagua (22,831 feet [6,959 m]), the highest peak in the Western Hemisphere. The Andes region is seismically active and prone to earthquakes.

The continental-shield region in the east, which is separated into two unequal sections (the Guiana Highlands and the Brazilian Highlands) by the Amazon lowlands, contains the oldest rocks in South America. The smaller Guiana Highlands are a low, sparsely settled plateau constituting a considerable portion of present-day Venezuela and Guyana. The Brazilian Highlands, covering an area of 580,000 square miles (1,502,200 square km) and constituting virtually all of eastern and southern Brazil, slope gently down toward the Atlantic Ocean in the east; in the southeast they drop more abruptly, sometimes by as much as 2,600 feet (790 m) at the Serra do Mar. Patagonia, which is located in southern Argentina, consists of a succession of arid plateaus that rise terracelike from the Atlantic to the eastern slopes of the Andes.

Extending southward down the middle of the continent is a series of lowlands and river basins peripheral to the shields that separate the highlands and the Andes from one another. Prominent among these lowlands is the Amazon River basin, the world's largest drainage basin, having an enormous area of about 2,722,000 square miles (7,050,000 square km). The Pampas of eastern Argentina consists of an immense accumulation of loose sediment brought down from the Andes by rivers or by dust storms. Covering an area of about 300,000 square miles (777,000 square km), the Pampas and its fertile soils constitute one of South America's most productive agricultural areas.

South America's hydrology is dominated in the north by the Amazon River basin, which drains more than a third of the continent's land area into the Atlantic Ocean. Second in length after the Nile River, the Amazon has a discharge rate four times that of the Congo River in Africa. Three other important river systems, the Orinoco, the Paraná–Paraguay–Río de la Plata, and the São Francisco, also empty into the Atlantic Ocean; no rivers of similar size empty into the Pacific Ocean. Most of the lakes of South America are mountain lakes in the Andes or along their foothills. Lake Titicaca, lying at an elevation of about 12,500 feet (3,810 m) between Peru and Bolivia, is the highest freshwater lake in the world.

South America can be divided into four well-marked climatic regions: tropical, temperate, arid, and cold. The tropical climate zone is subdivided into two types: the tropical-rainy, or rain-forest, type occurs on the Pacific coast of Colombia, in the Amazon basin, on the coast of the Guianas, and on parts of the coast of Brazil; the tropical wet-dry, or savanna, type is found in drier areas peripheral to the tropical-rainy belt, in the Orinoco basin, on the Brazilian Highlands, and in part of western Ecuador. Temperate climates, characterized by greater temperature ranges and lower winter temperatures, are found in parts of Chile, Argentina, Paraguay, and southern Brazil. Arid climates are found principally in Patagonia east of the Andes, portions of the Pacific coast, and in northeastern Brazil. Cold climates, with average annual temperatures of less than 50° F (10° C), occur only in the southernmost parts of Argentina and Chile and in the high Andes. Over most of South America rainfall is plentiful, averaging between 40 and 80 inches (1,016 and 2,032 mm) per year, with heavier rainfalls in the Amazon basin. The largest arid area is in Patagonia, while the driest region is the Atacama Desert of northern coastal Chile.

About 7 percent of South America is arable; much of this is devoted to producing corn (maize), wheat, and rice. Roughly one-fourth of the continent is under permanent pasture. About half the total land area is covered by forest, principally the enormous but steadily diminishing Amazon Rain Forest. About 2,500 different species of trees grow in the rain forests of the Amazon alone. Almost one-fourth of all the world's known species of animals live in the rain forests, plateaus, rivers, and swamps of South America. They include such rare or indigenous forms as the llama, jaguar, alpaca, capybara, sloth, giant anteater, rhea, manatee, and piranha.

*The people.* Four main ethnic components have contributed to the present-day population of South America: American Indians, who were the continent's pre-Columbian inhabitants; the Iberians, Spanish and Portuguese who conquered and dominated the continent until the beginning of the 19th century; the Africans, imported as slaves by the colonizers; and, finally, the post-independence immigrants from overseas, mostly Germans and southern Europeans but also Lebanese, South Asians, and Japanese.

Spanish is the official language throughout South America except for Portuguese in Brazil, French in French Guiana, English in Guyana, and Dutch in Suriname. Less than 10 percent of South America's total population are speakers of Indian languages, and of these more than three-fourths are in the Central and Northern Andes. South America is predominantly Christian in religious affiliation (about 90 percent), and about 85 percent of these are Roman Catholic. Syncretic sects (combining Christian and pagan beliefs), Protestantism, and traditional indigenous practices account for most of the non-Catholics.

The population growth rate of tropical South America (the countries north of Argentina, Chile, and Uruguay), long one of the highest in the world, peaked at 3 percent annually in 1955–65, but has declined substantially since then. Brazil, with more than 150 million people, has nearly half of South America's total population.

Temperate South America has lower growth rates, mostly because of decreased fertility starting in the 1950s. Family-planning programs were introduced in most countries during the 1960s, and adherence to Roman Catholic church prohibitions against the use of artificial birth-control methods subsequently declined. Birth rates are lower in urban areas and among more educated women. In most South American countries, however, children younger than 15 years constitute more than one-third of the national population; the only exceptions are Argentina, Chile, and Uruguay.

South America is densely settled along the coast but has a relatively sparsely populated interior. The coastal areas have become highly urbanized in the 20th century. In Uruguay, Argentina, Chile, and Venezuela, more than 80 percent of the population lives in urban areas. Altogether more than 35 million people live in the huge metropolitan areas of only three cities (Rio de Janeiro, São Paulo, and Buenos Aires).

*The economy.* Brazil accounts for almost three-fifths of South America's economic output and is the dominant economic power of the continent, followed by Argentina, Venezuela, Colombia, and Chile. Industrialization is farthest advanced in Brazil, Argentina, and Uruguay. Income tends to be unevenly distributed in South America between large numbers of poor people and a small number of wealthy families, with the growing middle classes still a minority in most countries. Most countries have free market or mixed state and private enterprise economies.

South America possesses abundant reserves of several important minerals. Its deposits of iron, found mainly in Brazil and Venezuela, represent almost one-eighth of the world's total. Chile and Peru possess one-fourth of the world's copper reserves, while tin is found in major quantities in Bolivia and in Brazil's western Amazon basin. Significant deposits of columbium (niobium), molybdenum, bauxite, lead, and zinc are also located throughout the continent. The most important of the continent's reserves of petroleum and natural gas are located in Venezuela.

Agriculture employs less than one-third of the overall South American workforce. Despite the continent's reputation as a food producer, agricultural productivity is generally low, and land utilization is inefficient. Many countries are not self-sufficient in agricultural production, only just self-sufficient, with no useful surplus.

The Bolivian and Peruvian Andes and parts of Ecuador and Colombia are characterized by small-scale, subsistence farming of crops such as beans, corn (maize), and potatoes, interspersed with large haciendas (ranches) devoted to cattle and sheep production. In the tropical lowlands of Brazil, Paraguay, Peru, Colombia, and Venezuela, there is more commercial production of bananas, citrus fruits, and vegetables, as well as such staples as cassava, beans, and rice. Sugar, cocoa, and coffee are other major agricultural products. The natural grasslands of the Pampas in Argentina, Uruguay, and southern Brazil are used for a combination of cattle and grain farming. Patagonia is also an important region for livestock, producing sheep for wool and some meat. Chile and Peru have excellent fishing resources along their long coastlines and the total catch for each country is among the world's largest.

The concentration of land in large holdings is a continuing problem in South America, and land reform has been a recurrent promise of many governments. Land reforms have been undertaken most extensively in Chile, Bolivia, and Peru, while over the rest of the continent the rate of reform has been much slower. Despite its vast timber resources, the commercial exploitation of forest resources is difficult in South America, largely because tropical forests contain such a wide variety of species that exploitation of any one species is relatively uneconomical. The process of the destruction of habitats, in particular that of the Amazon Rain Forest, has continued to accelerate throughout the continent, where previously primeval conditions had remained stable for centuries.

Mineral production, primarily for export, is important in many regions of South America. Chile produces almost one-fifth of the world's copper; Brazil produces one-sixth of the world's tin and one-seventh of the world's iron ore. Brazil is also a leading producer of gold, manganese ore, chromite, and steel, while Peru is a leading producer of zinc, lead, and copper. Venezuela is South America's dominant producer of crude petroleum, ranking among the major world producers. Three-fourths of the continent's electrical power is generated from hydroelectric sources, two-thirds of which originates in Brazil.

In most South American countries the manufacturing sector is relatively underdeveloped and dominated by light industries or the processing of raw materials for export. The exceptions are Argentina and Brazil, which are industrialized with well-diversified manufacturing sectors producing iron and steel, refined petroleum, petrochemicals, and capital goods such as automobiles. Nearly all the continent's manufacturing is concentrated in the great metropolitan centres such as São Paulo, Rio de Janeiro, and Buenos Aires. Many South American countries have nationalized major, formerly foreign-owned, industries.

South America suffers from an inadequate transportation network throughout much of the interior, as roads and railroads are concentrated primarily along the peripheries of the continent. Except for the Orinoco River, the continent's principal rivers are not readily navigable by large vessels. Most important long-distance movement has been by sea, and the ports remain the chief centres of population and trade, supplemented by air service and some newer highways.

South America's imports substantially outweigh exports, and many countries suffer chronic balance-of-trade deficits. Most export trade is with the United States and members of the European Community (EC); imports are largely supplied by the United States, the EC, and Middle Eastern countries. Intra-regional trade within the continent is slowly increasing.

*Social conditions.* Large populations in Bolivia, Ecuador, Peru, and Colombia suffer from poverty and poor nutrition. These countries also had lower life expectancy rates and higher infant mortality rates than the rest of the continent.

Guyana, Argentina, Uruguay, Suriname, and Chile have the highest literacy rates in South America. Females are generally less literate than males in most South American countries. Elementary school enrollment is gradually becoming more evenly distributed between the sexes, however. Freedom of the press has been fragile. Censorship of the news media, either imposed by a military government or self-imposed in order to avoid closure or other sanctions by a military regime, has been easing only slowly.

*Cultural life.* The cultural life of South America is based on a fusion of Iberian values and Indian and African folklore, music, and oral traditions. The Indian influence is especially strong in the Andes and Amazon basin; the African influence is strong in Brazil. Cultural life is also admixed with German and Italian immigrant traditions and with aspects of more recent Western (particularly U.S.) popular culture. The basic European cultural orientation of Argentina, Uruguay, Chile, and, to a lesser extent, Brazil is reflected in their art galleries, museums, and concert halls. The northern Andean countries have been more strongly influenced by their Indian and Spanish colonial heritages.

*History.* Archaeological discoveries indicate that people originally of Asiatic origins first arrived in South America at least 20,000 years ago. These early migrants were primarily hunters and gatherers. The growth of agriculture about 2600 BC initiated a period of rapid cultural evolution that attained varying levels in different parts of South America. The greatest cultural development occurred in the central Andes region and culminated with the Inca empire, which at its height encompassed about 1,000,000 square miles (2,600,000 square km) and had a population of about 6,000,000. The Chibcha in Colombia were probably the next most developed culture, and at the arrival of the Europeans at the beginning of the 16th century the others varied from Paleolithic to late Neolithic stages of development.

European exploration began when Christopher Columbus, on his third voyage to the New World in 1498, landed on the South American continent at the mouth of the Orinoco River, now in modern Venezuela. In 1499 Alonso de Ojeda, a Spanish lieutenant serving the Italian navigator Amerigo Vespucci (for whom the New World continents were named), landed on the northern coast called Guiana by the Indians. Spain officially took possession of the northern coast in 1593. By 1520 the Atlantic coast of South America had been substantially explored. The Treaty of Tordesillas (1494) divided South America between Portugal and Spain. Portugal received the eastern part of the continent to about 50° W longitude, while Spain received the rest.

Lured by rumours of great wealth, Spanish and Portuguese adventurers moved inland to explore the new lands. Francisco Pizarro conquered the Inca by about 1535. In 1538 Jiménez de Quesada subdued the Chibcha and founded Bogotá in Colombia. Settlers from Spain and Portugal began arriving in sizable numbers in the mid-16th century, and by the end of the century the foundations of cities had been laid.

Immense amounts of gold and silver were mined in South America in the 16th and 17th centuries by the Spanish to enrich their national treasury. In the 17th century all of Spain's territory in South America, except for Venezuela, was included in the Viceroyalty of Peru. In the 18th century other Spanish viceroyalties were created. In many cases the Indian populations, already decimated by European diseases, were reduced to a form of serfdom, serving as agricultural labourers on large plantations and working in the mines for their Spanish or Portuguese overlords. The Spanish colonies were governed from Spain by the Council of the Indies. The governors appointed by the council were landowners who had almost absolute authority.

The Napoleonic Wars in Europe set the stage for the revolt of the increasingly restive colonists against their Spanish- or Portuguese-appointed viceroys. In 1808 Napoleon I of France invaded Spain and Portugal. Spain, occupied with its own defense, left the colonies almost uncontrolled, allowing them to take the first steps toward independence. The colonies set up their own juntas. The Portuguese monarch John VI sailed for Brazil shortly before the French invasion of his country and transferred the Portuguese government to the colony. In 1811 Venezuela, under the leadership of Francisco de Miranda, declared its independence; other Spanish colonies soon followed. In 1812 the new republic under Miranda was overthrown by Spanish forces, and Miranda was sent in chains to Spain. In 1817 the revolution continued with the start of military campaigns by General Simón Bolívar, in the north, and General José Francisco de San Martín, in the south. Aided by General Bernardo O'Higgins, San Martín freed Chile from Spain by 1818 and liberated southern Peru by 1822. Bolívar freed Venezuela from Spain in 1821 and freed other Spanish colonies in the north. After the fall of Callao, Peru, in 1826, the Spanish presence in South America was at an end. Brazil declared independence from Portugal in 1822 and proclaimed Dom Pedro I, the Portuguese prince regent, its emperor. The South American continent was free of European rule, except for the Guianas, which were still occupied by England, France, and The Netherlands.

Argentina, Uruguay, Paraguay, and Bolivia arose out of the Viceroyalty of La Plata; and Colombia, Venezuela, and Ecuador were created out of the Viceroyalty of Peru. Most of the South American countries adopted a republican form of government with strong executive power. The semifeudal economic conditions of these countries caused antagonism between the conservative landowners and liberals who sought industrial progress and social reform; this situation gave rise to periodic revolutions. Vaguely defined national boundaries were often the subject of territorial disputes and eventually led to such major conflicts as the Paraguayan War (1864/65–70) and the War of the Pacific (1879–84). Brazil became a republic in 1889.

During World War I most of the South American countries broke off relations with Germany. After the war the South American countries joined the League of Nations. Among the territorial disputes in the interwar period was the Chaco War (1932–35) between Bolivia and Paraguay, which resulted in the loss of considerable Bolivian territory to Paraguay. Inter-American relations were strengthened between the wars particularly under the U.S. president Franklin D. Roosevelt's Good Neighbor Policy. In 1938 the Declaration of Lima was signed, which committed the governments of the Americas (north and south) to unite in defense against outside attacks on their countries.

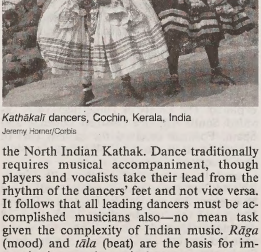
When the United States entered World War II all the South American countries except Argentina broke relations with the Axis powers. After the war all the South American countries joined the United Nations. In 1945 the Act of Chapultepec strengthened inter-American unity, cooperation, and defense against foreign aggression. This agreement was made a permanent treaty at a conference at Rio de Janeiro in 1947. In 1948 the Organization of American States (OAS) was established, which all South American countries but Guyana joined. In 1960 the Treaty of Montevideo established the Latin-American Free Trade Association (LAFTA) to which Argentina, Brazil, Chile, Mexico, Paraguay, Peru, and Uruguay were signatories. Later efforts at regional economic cooperation included the establishment of such organizations as the Andean Group (1969) and the Amazon Pact (1978). LAFTA was superseded in 1982, when the Latin-American Integration Association, established in 1980 to replace it, was fully ratified.

**South American fox,** also called SOUTH AMERICAN DOG, OF SOUTH AMERICAN JACKAL, any of several South American carnivores of the genus *Dusicyon,* family Canidae. One member of the genus, the small-toothed dog, is sometimes considered to comprise a dis-

tinct genus called *Lycalopex*. Although these canids are not actually foxes, they resemble true foxes. There are about 6 to 11 species, depending on the authority consulted. In general, South American foxes are long-haired, rather grayish animals growing about 0.5–1 m (1.6–3.3 feet) in length, excluding the bushy tail, which is 30–35 cm (12–14 inches) long. They are found in open and forested areas, depending on species; they feed on small animals, birds, fruit and other plant material, and insects. They are generally nocturnal and live in abandoned burrows or in dens among rocks or trees. Both parents care for the litters of three to six young. South American foxes can attack domestic livestock. They are, however, helpful in controlling rodent and bird populations. The Antarctic, or Falkland Island, wolf (*D. australis*) was hunted to extinction in the late 1800s.

**South Arabic language,** Semitic language of southern Arabia and the island of Socotra. South Arabic belongs to the Southern Peripheral group of Semitic languages, along with Ge'ez, Amharic, Tigré, Tigrinya, and the other Semitic languages of Ethiopia, Eritrea, and The Sudan. Modern dialects of the language include Mahrī, Shaḥrī (or Eḥkalī), Ḥarsūsī, and Baṭḥarī on the Arabian shore of the Indian Ocean and Suquṭrī on Socotra. Ḥarsūsī has been influenced by Arabic to a greater extent than have the other dialects.

Minaean, Sabaean, Qatabanian, and Ḥaḍramawtian were the four known South Arabic dialects of ancient times. The earliest South Arabic inscriptions, dating from the 8th century BC, are in the Minaean dialect. Sabaean is the dialect of the majority of South Arabic inscriptions; the latest inscriptions are from the 6th century AD. The type of Semitic alphabet in which the ancient inscriptions are written has 29 consonant signs but does not indicate vowels.



**South Asian arts,** the literary, performing, and visual arts of India, Pakistan, Bangladesh, and Sri Lanka. Despite a history of ethnic, linguistic, and political fragmentation, the Hindu majority population of the Indian subcontinent share a cultural tradition of great antiquity. The coexistence of a sophisticated courtly culture alongside relatively uncorrupted folk and tribal tradition, and the interaction between the two, has given rise to the complexity and fascination of South Asian arts.

A brief treatment of South Asian arts follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

The encyclopaedic quality of Hindu scriptures has ensured that virtually every aspect of Indian life is pervaded by religious assumptions; this is nowhere more obvious than in the arts. Myths of the popular gods, Vishnu and Śiva, in the *Purāṇas* (ancient tales) and the *Mahābhārata* and *Rāmāyaṇa* epics supply material for representational and dramatic arts.

*Literature.* The *Rāmāyaṇa* is often considered the first *kāvya,* a poetic style best illustrated in the works of Kālidāsa. *Rasa* is the outstanding feature of classical Sanskrit culture. In *kavya* compositions the poet must convey different *rasa* (sentiments) and also induce the appropriate *rasa* in his audience. The Dravidian languages of the south, including Tamil and Telegu, provided some enduring works, particularly the devotional poems of the Tamil Alvars and Nayannars from the 7th through the 9th century. *Bhakti* (devotion) was a great stimulus to vernacular poetry in the north also: the *Rāmcarita* of Tulsidas is an outstanding example of the late medieval style. The introduction of Persian by Muslim conquerors led to the development of Urdu. Urdu poets follow the Persian tradition, particularly favouring the *ghazal,* a love poem of great metric and rhythmic subtlety. The Urdu poet Muḥammad Iqbal and the Bengali poet, playwright, and philosopher Rabindranath Tagore attained the status of national poets in Pakistan and India, respectively.

*Music.* The *Nāṭya-śāstra* established the rules for classical dance and drama, the most popular form of which was the *nāṭaka,* or heroic tale. From the 14th century onward the *nāṭaka* lost ground to popular folk theatre, such as the *Rāmlīla* of Varanasi, but elements of classical drama persist, particularly in the notion of *rasa;* dancers and actors test their ability against audience response, and enthusiastic onlookers often demand, and receive, encores in mid-performance. Dance is of two types: *tāṇḍava,* or fierce, following the destructive *tāṇḍava* dance of Śiva Naṭarāja, patron deity of dance, and *lasya,* or gentle, generally performed by women in emulation of Śiva's consort, Pārvatī, and exemplified by classical *Bhārata Nāṭyam* preserved in Tamil Nadu. The Keralan *kathākalī* is *tāṇḍava,* as is

*Kathākalī* dancers, Cochin, Kerala, India
Jeremy Horner/Corbis

the North Indian Kathak. Dance traditionally requires musical accompaniment, though players and vocalists take their lead from the rhythm of the dancers' feet and not vice versa. It follows that all leading dancers must be accomplished musicians also—no mean task given the complexity of Indian music. *Rāga* (mood) and *tāla* (beat) are the basis for improvisation, and musical arrangements are rare. The classical music and dance tradition is passed down from *guru* (teacher) to pupil, accounting for the high standards observable today. Unfortunately the same cannot be said of the folk tradition, though the extravagant theatrical expression of regional "folk operas" has influenced the Indian cinema.

*Visual arts.* The South Asian architectural tradition begins with the Buddhist cave temples of eastern and western India, notable for the persistence of wooden construction forms in stone, but the first free-standing temple dates from the Gupta period. A major distinction can be made between the northern temple, where the towering *śikhara* ("mountain peak") dominates the shrine, and the evolved southern temple, where the *gopuras* (gateways) tower over the central *śikhara.* Both represent Mount Meru, the mythical centre of the universe. Sculptures and bas-reliefs are carved in profusion on the exterior, and manifold themes underline their cosmic significance.

The carved railings of Sāñcī, Bhārhūt, and Amarāvatī are good examples of naturalistic styles of early Indian sculpture, as are the later Mathurā and Gandhāra Buddhist schools. Indian sculpture has its own aesthetic standards, which, again, hinge on *rasa*—the sentiment evoked by the visual arts should be spiritual elevation. Realism and anatomical veracity had little value for an artistic tradition that evolved in response to philosophical complexities played out through the mythology of an ever-expanding pantheon. Moreover, realism was deliberately eschewed in the Gupta period—often considered the classical era of Indian art—with the application of iconometry to the plastic arts. Figures were constructed according to a series of standard measurements intended to produce a regularity of composition typical of the sublime appearance of supramundane beings. Tantra stimulated the intricate Pāla bronzes of northeastern India.

Excepting the frescoes of Ajanta and Ellora, little early painting survives. Painting flourished under the Mughals, and contemporary Rajput schools were influenced by the Perso-Mughal style, though the Mewar, Kotah, and Bundi schools were more original. They were far outclassed by the 17th-century Basohli school, characterized by bold colouring, vigour of outline, and a naive expression of emotion. The Basohli gave way to the 18th-century Kangra school, in which the colours are softer and the style more lyrical. Though the Delhi sultanate and the provincial sultanates of Gujarat, Malwa, and the Deccan utilized some indigenous motifs in their fine mosques, usually from ransacked Hindu temples, it was only under the Mughals that Islāmic architecture transcended its Persian origins. The marble and sandstone tomb of Humayun in Delhi is the first real expression of this synthesis of Persian and Indian styles; its sombre magnificence heralded the sublime composition of the Tāj Mahal. Akbar's Agra fort and the city of Fatehpur Sikri are the best examples of the harmonious principles of Mughal secular architecture.

*Sri Lanka.* The arts of Buddhist Sri Lanka follow the trends of the mainland. The beautiful 6th-century frescoes of Sigiriya echo the naturalism of contemporary Indian painting while the Kandyan dance-drama is courtly in the *kathak* tradition. There are noteworthy divergences, however. Pre-Buddhist traditions remained strong and are evident in Sri Lankan devil dances. Indian artistic genres often persisted long after their decline in India, as revealed in the stupas at Anurādhapura and Polonnaruwa. The bell-shaped stupa, or *dagoba,* is a singularly Sri Lankan adaptation of an Indian Buddhist construction.

**South Asian Association for Regional Cooperation** (SAARC), organization of South Asian nations, founded in 1985 and dedicated to economic, technological, social, and cultural development emphasizing collective self-reliance. Its seven founding members are Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan, and Sri Lanka. Meetings of heads of state are usually scheduled annually; meetings of foreign secretaries, twice annually. Headquarters are in Kathmandu, Nepal.

The 11 stated areas of cooperation are education, culture, and sports; health, population, and child welfare; environment and meteorology; rural development (including the SAARC Youth Volunteers Program); tourism; transport; science and technology; communications; women in development; and the prevention of drug-trafficking and drug abuse. The charter stipulates that decisions are to be unanimous and that "bilateral and contentious issues" are to be avoided.

**South Australia,** state of south-central Australia, occupying one of the dryest, most barren parts of the continent.

A brief treatment of South Australia follows. For full treatment, *see* MACROPAEDIA: Australia.

South Australia is bounded by Western Australia on the west, the Northern Territory on the north, Queensland to the north and east, and New South Wales and Victoria on the east. On the south it fronts the Great Australian Bight of the Antarctic Ocean. Two-

thirds of the vast interior receives too little rainfall to support significant human or animal population. Yet in the northeast is a portion of the Great Artesian Basin, the world's largest region of natural springs.

More than four-fifths of the land lies at elevations below 1,000 feet (300 m) above sea level. The coastline is indented by two large navigable gulfs: the Gulf St. Vincent is about 100 miles (160 km) in length, and the state capital, Adelaide, is on its eastern shore; Spencer Gulf, twice as long, has near its northern limits the industrial towns of Port Pirie, Port Augusta, and Whyalla.

No vegetation at all grows in the stretches of sand and pebble desert, and only scrub grasses and saltbush are hardy enough to survive in the dry regions of the north and west. Eucalyptus and native pines are scattered in the Flinders Ranges. The Mount Lofty Ranges near Adelaide are more heavily wooded, mainly with eucalyptus. In the southeastern part of the state, many thousands of acres of manmade forest, most of it softwood, have been created since the late 19th century to assure forest preserves.

Most Australian faunal species are represented in the state, and some species are unique to it. Their populations are sparse, however, in comparison with the eastern states because of the climate and the use of better land for farming. Some species have become extinct. The kangaroo and wallaby are still common, as are the wombat and bush rat. There are many kinds of birds, lizards, and snakes. The coastal sea has a rich variety of fish, but few are found in inland waters except in the Murray River.

Maintaining and transporting fresh water are important in South Australia. The need to ensure a regular flow of high-quality water in the Murray River basin led in 1970 to disputes between South Australia and its partners in the River Murray Agreement—the national government, New South Wales, and Victoria—over the location of additional dams.

South Australia's rate of economic growth was uneven during the late 20th century, but the standard of living is on a par with the rest of Australia. Less than one-tenth of the state's work force is engaged in primary production, including mining and quarrying. The Middleback Ranges produce a large part of Australia's iron ore; some of this is processed at the Whyalla blast furnaces. The state is a major world source of opals. It also produces most of the nation's salt and gypsum. Pipelines connect large natural-gas fields in the north with Adelaide and population centres in New South Wales.

Motor-vehicle manufacture is a large component of secondary industry and employs one-fifth of the state's labour force. Consumer durable goods, metal pipes and tubes, chemicals, and textiles are produced in or near Adelaide. A soda-ash plant near Port Adelaide is the major producer in the Australian alkali industry. Whyalla has the country's largest shipyards. Sawmills and factories producing particleboard and paper are located near the softwood plantations in the southeast.

South Australia is a major producer of wheat and barley for export abroad, and it also excels in its vineyards, producing most of the wine and brandy consumed in the nation. Coastal fishing of tuna and crayfish is for export both to other states and abroad.

More than three-fourths of South Australia's population was born in Australia (of British or continental European descent), and nearly all the others were born in the British Isles or continental Europe. About 1 percent have some Aborigine ancestry.

The main social matters under state authority are education, hospitals, housing, police and prisons, and railways and roads. The two primary political parties are the Australian Labor Party (ALP) and the Liberal Party of Australia (LP). The ALP usually receives a majority of the votes and usually seats a majority in the House of Assembly.

Education is compulsory and free from ages 6 to 15. Apprenticeships are controlled by a state commission. The institutions of higher learning include the University of Adelaide (founded 1876), Flinders University of South Australia (opened 1966), and the University of South Australia (1991).

The state provides facilities for its citizens to participate in the arts. The Art Gallery of South Australia has a collection of Australian, European, and Asian art. A professional symphony orchestra is maintained by the Australian Broadcasting Commission, and several theatres provide amateur and professional drama. Every second year an Adelaide Festival of arts is held. Area 379,900 square miles (984,000 square km). Pop. (1998 est.) 1,487,300.

**South Ayrshire,** council area, southwestern Scotland. It stretches along the shores of the Firth of Clyde and includes the steep rock of Ailsa Craig at its mouth. In the south it includes a section of the hilly Southern Uplands. South Ayrshire lies entirely within the historic county of Ayrshire.

Cattle are raised on the Kyle plain in the north, and cattle and sheep on the Carrick uplands in the south, which are also extensively forested. The mild climate favours market gardening of vegetables. Ayr, Prestwick, and Troon are seaside resorts and are known for their golf courses. The three towns form a contiguous urban area in the northwest that houses most of South Ayrshire's population. Their industries include electronics, food processing, aircraft construction, and services. Prestwick is the site of Scotland's international airport. Robert Burns, Scotland's national poet, was born at Alloway, just south of Ayr. Prestwick and Ayr are the administrative centres. Area 464 square miles (1,202 square km). Pop. (1999 est.) 114,250.

**South Bedfordshire,** district, administrative county of Bedfordshire, south-central England. The district lies within the historic county of Bedfordshire, except for the town of Linslade, which is part of the historic county of Buckinghamshire. It nearly encircles the unitary authority of Luton in the east. South Bedfordshire district is an area of low, rolling terrain at the headwaters of several river systems. It extends across the northernmost scarps of the Chiltern Hills (nearly 800 feet [245 m] in elevation) in the south. Its varied geologic composition includes the chalk of the Chilterns, greensand in the west near Leighton Buzzard (the district seat), and clay beds in the northeast. Sand, used in brick production and glassmaking, is extensively extracted at Leighton Buzzard. Chalk quarries around Houghton Regis and Dunstable supply cement manufacturers outside the region. Mixed farming is practiced, with an emphasis on dairy products. Dunstable, in the centre of the district, has industrial works associated with motor vehicle manufacturing at nearby Luton.

The district was an area of ancient settlement. Defensive works and barrows were built by various peoples of the Neolithic and Iron ages. Whipsnade (opened 1931), the large open-air display area of the Zoological Society of London, is located in the Chiltern Hills south of Dunstable. Area 82 square miles (213 square km). Pop. (1998 est.) 110,100.

**South Bend,** city, seat (1831) of St. Joseph county, northern Indiana, U.S. It lies along the St. Joseph River, adjacent to Mishawaka (east) and 94 miles (151 km) east-southeast of Chicago. René-Robert Cavelier, sieur de La Salle, the French explorer, visited the locality in 1679, and under the old Council Oak Tree (still standing in Highland Cemetery) he parleyed in 1681 with the chiefs of the Miami and Illinois Indian confederation. In 1820 Pierre Freischütz Navarre, an agent of the American Fur Company, established a trading post at the site (his cabin has been restored). Three years later the post was bought by Alexis Coquillard and his business partner, Francis Comparet; Coquillard named the place Big St. Joseph Station and promoted European settlement. In 1828 the Michigan Road, the state's first north-south highway, was built nearby, and the next year the settlement became known as Southold. The community was subsequently renamed (1830) for the great bend in the St. Joseph River.

The Hesburgh Memorial Library, University of Notre Dame, South Bend, Ind.
Mit and Joan Mann from CameraMann

Former (pioneer) industries of South Bend were the Studebaker Brothers Manufacturing Company (1852, later auto plant), the Oliver Chilled Plow Works (1855), and the Singer Sewing Machine Company cabinet works (1868). Despite the closure of these companies in the 1950s, '60s, and '70s, South Bend's economy remained highly industrialized. As the centre of trade and finance for the southern Michigan and northern Indiana region, the metropolitan area is known as Michiana.

The University of Notre Dame (1842) is situated just outside South Bend. Also near South Bend are St. Mary's College (1844), Indiana University South Bend (1933), and Holy Cross (junior) College (1966). Inc. town, 1835; city, 1865. Pop. (2000) city, 107,789; South Bend MSA, 265,559.

**South Bucks,** district, administrative and historic county of Buckinghamshire, England. The River Misbourne drains the district's northeastern part. South Bucks's boundary with Greater London in the east follows roughly the Grand Union Canal, and the River Thames separates it from the county of Berkshire in the south. The district also borders the unitary authority of Slough to the south.

South Bucks has scenic areas, with beech woods on gentle chalk hills, including Burnham Beeches and Stoke Park. The district contains a mix of rural landscapes, modern residential development, and historic villages. Beaconsfield in the north is a main tourist attraction with the Bekonscot model village, the timber-framed Lloyds Bank, the five-bay mid-18th-century Rectory and the Wycombe House, the parish church where Edmund Burke is buried, and Hall Barn (1660), which was the home of the poet Edmund Waller. Area 56 square miles (144 square km). Pop. (1998 est.) 63,700.

**South Cambridgeshire,** district, administrative county of Cambridgeshire, east-central England. The district lies almost entirely within the historic county of Cambridgeshire, except for the area around Great Chishill, which belongs to the historic county of Essex. It encircles the administratively independent city of Cambridge. South Cambridgeshire lies generally within the drainage basins of the Cam and Granta rivers and is an area of low, rolling terrain that extends into the Fens, an extensive region of reclaimed marshland northeast of Cambridge. The villages and small towns of the district base their economic livelihood on the cultivation of cereals, sugar beets, and fruits, although many residents commute to work in Cambridge. Jams and leather products are manufactured respectively at Histon and Sawston. Girton, a women's college of the University of Cambridge, is located in South Cambridgeshire. Cambridge is the district seat. Area 349 square miles (904 square km). Pop. (1998 est.) 132,500.

**South Carolina,** constituent state of the United States of America, lying in the South Atlantic region of the country.

A brief treatment of South Carolina follows. For full treatment, *see* MACROPAEDIA: United States of America: *South Carolina.*

Roughly triangular in shape, South Carolina faces the Atlantic Ocean along the southeast and is bounded by North Carolina on the north and northeast and by Georgia on the southwest. The capital is Columbia. The state extends about 225 miles (362 km) from north to south and 285 miles (459 km) from east to west.

At the time of initial European settlement, South Carolina was inhabited by Yamasee Indians. Spanish and French settlements were established and abandoned along the coast in the 16th century. A 1629 land grant by Charles I of England was settled, and in 1663 Charles II rechartered it to a group of eight proprietors. The first permanent European settlement was made in 1670 by 143 whites and 5 black slaves at Charles Town on the Ashley River. The settlers moved their town to the present site of Charleston in 1680. The colony reverted to British crown rule in 1729. In spite of constant threats from the Spanish, French, pirates, and Indians, the settlements thrived from a trade in pelts, rice, and indigo. Charleston became the commercial and cultural centre of the southeastern coast.

During the American Revolution there were several military campaigns in the state, notably the British defeats at Kings Mountain and Cowpens. In 1788 South Carolina was the eighth state to ratify the Constitution.

Even before the Revolution, a fundamental rivalry had developed between the wealthy plantation aristocrats of the coastal lowlands and the more numerous frontier settlers inland. As a compromise the capital was moved inland to Columbia in 1786. With the invention of the cotton gin, slavery also moved inland, and up-country people grew wealthy raising cotton. In spite of lingering cultural differences, the state's white population was unified by proslavery sentiments, and a strong states' rights movement developed out of objection to high federal tariffs that were harmful to Southern commerce. South Carolina was the first Southern state to secede from the Union (Dec. 20, 1860), and the engagement with federal troops at Fort Sumter in Charleston harbour in April 1861 led the nation into the Civil War. The state's readmission to the Union occurred in 1868. After black participation in government during a severely administered Reconstruction period, white South Carolinians in 1876 regained control of the government. Constitutional revisions in 1895 disenfranchised almost all the state's blacks, and a rigid policy of racial segregation developed that rendered blacks almost powerless until the mid-1960s. At the turn of the 21st century controversy arose over the flying of the Confederate flag at the state capitol.

Physiographically, South Carolina can be divided into two main regions: the broad Coastal Plain and the rolling Piedmont farther inland. Along the coast is a fringe of sandy islands separated from the mainland by marshes and lagoons. The state drains generally southeastward through parallel river systems, the largest of which are the Pee Dee, Santee, Cooper, Edisto, and Savannah.

The South Carolina climate is subtropical with long, hot, humid summers and mild winters. Average January temperatures range from 38° to 50° F (3° to 10° C). Mean July temperatures vary from 71° to 81° F (22° to 27° C). Most of the state receives about 49 inches (1,245 mm) of rain per year. The growing season varies from 200 days inland to 300 days on some coastal islands. Soils are well-suited for agriculture, but forests cover about two-thirds of the land.

The early white settlement of South Carolina was primarily by English-speaking peoples. Immigrants from southern and central Europe largely bypassed the state. The black population exceeded the white population between 1810 and the 1920s. By 1980, however, the percentage of blacks had declined to about 30. The state was mostly rural until the 1970s, but by 1980 more than half of the population lived in urban areas. The population is generally clustered in small portions of the state, leaving vast areas almost uninhabited.

South Carolina is a leader in American textile manufacturing. Cotton fabrics make up much of the output, but synthetics and wool are also important. Chemicals, clothing, and paper and allied products are other leading manufactures. Nearly all the giant industrial firms in the country have plants in South Carolina, and it has been among the most successful in the nation in encouraging foreign investments. Tourism is the state's second largest industry. Agriculture contributes significantly to the economic base, with the main crops being tobacco, soybeans, cotton, peaches, peanuts (groundnuts), and watermelons; poultry and cattle are also important. Clays, cement, stone, and sand and gravel are the most valuable mining products. Reforestation and other forest-management programs have caused a rapid increase in the state's supply of timber. Shrimp, crabs, and oysters are the main products of the coastal commercial-fishing industry. The state is easily accessible to the nation's highway and railroad systems, airways, and sea-lanes.

Charleston is notable for its atmosphere and architecture, reflecting the antebellum heritage that pervades many parts of the state. Beaufort, Georgetown, and Columbia also provide examples of early American architectural design. The University of South Carolina, Clemson University, and The Citadel are noted institutions of higher learning. Area 31,117 square miles (80,593 square km). Pop. (2000) 4,012,012.

**South Caucasian languages:** *see* Kartvelian languages.

**South Celebes** (Indonesia): *see* Sulawesi Selatan.

**South Charleston,** city, Kanawha county, western West Virginia, U.S. It lies across the Kanawha River from Charleston. South Charleston was founded in 1916, and its development began with the establishment of several chemical companies and a U.S. naval ordnance plant (1917). The ordnance plant was shut down after World War II and sold in 1961 to the Food Machinery Chemical Corporation; the area was more recently converted into an industrial park. The manufacture of chemicals remains the city's economic mainstay, although there is also a plant that produces automobile parts. The graduate college (1958) of Marshall University is in South Charleston. An earthen mound built by the Adena people, 33 feet (10 m) high and 550 feet (168 m) in circumference, and Little Creek Park are within the city limits. Kanawha State Forest lies just to the south. Inc. 1917. Pop. (2000) 13,390.

**South China Sea,** Chinese NAN HAI, arm of the Pacific Ocean and part of the China Sea. Extending for about 1,800 miles (2,900 km) north to south and for 600 miles (950 km) east to west, it is bounded by the Malay Peninsula and the Southeast Asian mainland (west through north) and by the islands of Taiwan (northeast), the Philippines (east), and Borneo (south). The total area is 1,300,000 square miles (3,400,000 square km). Its Chinese name means "Southern Sea."

**South Chölla** (South Korea): *see* Chöllanam.

**South Ch'ungch'ŏng** (South Korea): *see* Ch'ungch'ŏng-nam.

**South Dakota,** constituent state of the United States of America, lying in the western north-central region of the country. The capital is Pierre.

A brief treatment of South Dakota follows. For full treatment, *see* MACROPAEDIA: United States of America: *South Dakota.*

South Dakota is bounded by North Dakota on the north, Minnesota and Iowa on the east, Nebraska on the south, and Wyoming and Montana on the west. Roughly rectangular in shape, the state extends about 380 miles (610 km) from east to west and 245 miles (395 km) from north to south.

The state's name is derived from the Dakota, or Sioux, Indians who roamed the plains before the arrival of Europeans. A lead plate discovered at Fort Pierre records the earliest-known presence of French explorers in the area in 1742–43. South Dakota was acquired by the United States as part of the Louisiana Purchase from France in 1803. The Lewis and Clark expedition spent about seven weeks in South Dakota on its way to the Pacific Northwest in 1804, but trappers and fur traders were virtually the only Europeans in the area until the mid-1850s, when Fort Randall was built on the Missouri River. The Dakota Territory was created in 1861, but settlement was confined to the extreme southeast until the Black Hills gold rush of 1875–76 swelled the population. South Dakota was admitted to the Union as the 40th state in 1889.

Physiographically South Dakota can be divided into three main regions: (1) the eastern smoothed-out glaciated Prairie Plains; (2) the western unglaciated Great Plains, characterized by high buttes, high canyons, and level tablelands and containing the Badlands; and (3) the Black Hills, an eroded dome-shaped uplift in the state's western part that rises to 7,242 feet (2,207 m) above sea level at Harney Peak. The Missouri River bisects the state from north to south. In the east-river area the principal tributaries of the Missouri—the Big Sioux, Vermillion, and James—flow southward into valleys formed by glaciation. The main rivers of the unglaciated west-river region, the Grand, Moreau, Cheyenne, Bad, and White, flow eastward.

The South Dakota climate is temperate but continental, exhibiting great extremes between summer and winter temperatures. The climate is also marked by persistent winds, low precipitation, and low humidity. The mean annual temperature for the entire state is about 45° F (7° C). At Rapid City in the Black Hills, average January and July temperatures are 24° F (−5° C) and 72° F (22° C), respective-

ly. At Sioux Falls on the state's eastern border, the respective average temperatures are 14° F (−10° C) and 74° F (23° C). Annual precipitation, which averages from 14 inches (356 mm) or less in the northwest to about 24 inches (610 mm) along the eastern border, falls primarily as rain during the spring and summer months.

Early white settlement of South Dakota was primarily by farmers in the east-river area and primarily by cattle ranchers and miners in the west-river area. Immigrants came mainly from Norway, Sweden, Denmark, Germany, and Russia. Indians, mainly descendants of the original Dakota, now comprise about 7 percent of the state's population and are the largest nonwhite group. Today most of the land is used for farming and ranching, and more than half of the population lives in areas classified as rural. Sioux Falls is the largest city. Because of insufficient economic opportunities, South Dakota loses a considerable number of its young people to other states.

The economy of South Dakota is based largely on farming, which provides the basis for related manufacturing, trade, and service industries. Cash income from livestock and meat processing is several times that from crops. The state is among the leaders in cattle and hog production, and the main crops are wheat, corn (maize), rye, flaxseed, and alfalfa (lucerne) seed. The Homestake Mine near Lead in the Black Hills was long a leading producer of gold in the United States. Tourism, largely focused on the scenic attractions, mining and frontier traditions, and recreational opportunities of the Black Hills, accounts for a large portion of retail sales and service income.

South Dakota is served by several railways that provide freight transportation and by two federal interstate highways. The Missouri River, dammed at four locations in the state, is a major source of electric power.

Traditions of pioneer life pervade the art and culture of South Dakota. Education was given high priority by the early farmers, and the state supports a number of public institutions of higher learning and vocational schools. Summer theatres in the Black Hills are known worldwide. The National Park Service administers Mount Rushmore, Wind Cave, and Badlands national parks and Jewel Cave National Monument. Area 77,121 square miles (199,743 square km). Pop. (2000) 754,844.

**South Derbyshire,** district, administrative and historic county of Derbyshire, England. Undulating arable land is interspersed with meadowland in the valleys of the Rivers Derwent, Dove, and Trent, although the Trent valley also has electric-power stations and gravel-extraction sites. Swadlincote is the principal town in the district; using local coal and clay, it manufactures stoneware pipes, pottery, and bricks. The village of Repton is known for its public school and its medieval church. Area 127 square miles (330 square km). Pop. (1998 est.) 80,700.

**South-Eastern** (state, Nigeria): *see* Cross River.

**South Georgia,** mountainous, barren island in the South Atlantic Ocean, 800 miles (1,300 km) east of the British Falkland Islands, of which it is a dependency. It has an area of 1,450 square miles (3,756 square km), is 100 miles (160 km) long by 20 miles (32 km) wide, and rises to Mount Paget (9,625 feet [2,934 m]). The island's bleak Antarctic climate, with perpetual snow covering three-fourths of the island, supports only hardy grasses and other tundra plants. Reindeer were introduced on to the island shortly after 1900 and have survived. Marine life is abundant offshore, and there are a number of species of penguins and seals. Whaling ceased in the area in 1965. About 20 scientists and support personnel maintain the British Antarctic Survey station at Grytviken on King Edward Point.

Captain James Cook visited and claimed South Georgia for Britain in 1775. Sir Ernest Shackleton first crossed it in 1916 while in search of aid for his ill-fated trans-Antarctic expedition. He died later on the island and was buried there. It was not until 1964–65 that the island's interior was further explored, including the first ascent of Mount Paget. The island was the site of military occupation during Argentina's unsuccessful attempt to annex the Falkland Islands and their dependencies in 1982.

**South Glamorgan,** former county (1974–96) of South Wales. The region is now incorporated in the unitary council areas of Cardiff and Vale of Glamorgan (*qq.v.*).

St. Donat's Castle, Glamorganshire, Wales
Barry Webb © Celtic Picture Agency

**South Hadley,** town (township), Hampshire county, south-central Massachusetts, U.S. It lies along the Connecticut River. Settled in 1684 as part of Hadley, it was recognized as a separate precinct in 1732, incorporated as a district in 1753, and reincorporated as a town in 1775. South Hadley prospered briefly as a manufacturing centre (producing textiles, paper, buttons, and leather) during the 1830s, but it is now primarily a residential locality with a service-based economy. The town is best known as the seat of Mount Holyoke College, founded by Mary Lyon in 1837 as one of the first institutions of higher learning for American women. Pop. (2000) 17,296.

**South Hams,** southernmost district in the administrative and historic county of Devon, England. It extends from Dartmoor in the north to the English Channel in the south. Its scenery and rural character attract holiday visitors, retired people, and purchasers of second homes (especially in Stokenham, Salcombe, and Marlborough).

Part of Dartmoor National Park extends into the northern portion of South Hams. The moor is mainly heathland used extensively for the grazing of sheep, cattle, and ponies. The moor's common grazing land is fringed by irregular fields that have extended up the main river valleys from the ancient peripheral villages. Dartmoor's formerly drier, warmer climate brought considerable settlement during the Bronze Age, and old hut circles, enclosures, field boundaries, and stone monuments still remain.

The land falls from Dartmoor toward the coast in a series of steps, deeply incised by rivers flowing south from the moor. The steep sides of the valleys are generally wooded, and the floors form rich meadows. In the hedged fields between the rivers, dairying predominates, and Totnes is a centre for collecting, processing, and distributing milk products. Barley is the main crop; fruit, vegetables, and flowers are also cultivated.

The coastline extends for 51 miles (82 km) of picturesque headlands, cliffs, estuaries, and bays, forming the South Devon Area of Outstanding Natural Beauty. Ports have grown up on the sheltered river mouths. Dartmouth, a historic port on the River Dart, is a yachting centre with marine and light engineering. Area 342 square miles (887 square km). Pop. (1998 est.) 80,200.

**South Herefordshire,** former district (1974–98) of the former county of Hereford and Worcester, western England. The region is now incorporated in the unitary council area and historic county of Herefordshire (*q.v.*).

**South Holland,** district, administrative and historic county of Lincolnshire, east-central England, occupying an area of reclaimed marshland within the Fens. It borders the Wash, a shallow bay of the North Sea, to the northeast. The dry flatlands in the north along the Wash were formed as islands of silt interspersed with marshes when large stretches of silt penned in by glaciers of the Pleistocene Epoch piled up on the shores of a shallow inland sea. Flat plains of peat farther inland were formed as plants decayed on the shallow sea bottom. Throughout the Middle Ages piecemeal encroachment upon the edges of the silt land took place for agricultural use, but the whole expanse of peat land remained virtually undrained until the mid-17th century. Spalding, an ancient market town and now the administrative centre of the district, is a headquarters for the elaborate drainage and flood-control system of the Fens.

This very fertile area grows fruit trees, cereals (mainly wheat and barley), potatoes, and market-garden produce. The largest bulb-growing area in England, specializing in tulips, is in the vicinity of Spalding. Agricultural implements, tractors, and canned food are produced at Spalding. Area 286 square miles (742 square km). Pop. (1998 est.) 73,400.

**South Holland** (The Netherlands): *see* Zuidholland.

**South Holland,** village, southern suburb of Chicago, Cook county, northeastern Illinois, U.S. Founded in 1847 by Dutch farmers, it was first called de Laage Prairie ("the Low Prairie"); it was renamed South Holland in 1870. The community developed after 1853, when the Illinois Central Railroad came through. Originally a truck-farming community, noted especially for its onion sets, South Holland has become mainly residential but also has meatpacking facilities and manufactures window blinds, hardware, and packaging. The area was the setting for Edna Ferber's novel *So Big* (1924). South Holland was the first Northern community against which federal action was brought under the 1964 Civil Rights Act to force desegregation of the public schools. South Suburban College (1927) is located in the town. Inc. village, 1894. Pop. (2000) 22,147.

**South Hwanghae Province** (North Korea): *see* Hwanghae-namdo.

**South India, Church of,** Christian denomination formed in 1947 by merger of part of the Anglican Church of India, Burma (Myanmar), and Ceylon (Sri Lanka); the South India province of Methodism; and the South India United Church, itself a 1908 merger of Presbyterian, Dutch Reformed, and Congregationalist groups. Other smaller groups joined later. By the end of the 20th century membership was almost 4,000,000.

The Church of South India was the first union since the Reformation between episcopal and non-episcopal churches, and this aroused passionate and continuing controversy. Conversations with Baptists aimed at extending the union lapsed, but agreement was reached with Lutherans on doctrinal points, though not on all questions of organization. The church is in full communion with the non-episcopal bodies from which in part it sprang but not with all Anglicans.

The union was based on the acceptance of the Holy Scriptures as the supreme authority in faith and life, of the Nicene Creed as the authorized summary of the faith, of the sacraments of Baptism and Holy Communion, and of the historic episcopate as the basis for church government. Provision was made for a 30-year period of growing together, in the course of which it was hoped that the union would become complete. On the day of the merger, nine new bishops, drawn from all the traditions, were consecrated to serve with the five Anglican bishops already in office.

No attempt was made to impose uniformity at once on all the local churches, which were to continue to use their accustomed liturgical forms until genuinely Indian forms of worship could be worked out. The church later issued orders for Holy Communion, Baptism, and other services. These were not mandatory, but use of them expanded steadily.

**South Indian bronze,** any of the cult images of Hindu divinities that rank among the finest achievements of Indian visual art. The images were produced in large number from the 8th to the 16th century, principally in the Thanjāvūr and Tiruchchirāppalli districts of modern Tamil Nadu, and maintained a high standard of excellence for almost 1,000 years.

During the Pallava period, metal sculpture closely followed the canons of contemporary stone sculpture, and the images were almost invariably frontal, though modelled fully in the round, with arms held symmetrically to either side. A greater fluidity of movement is apparent in images of the early Cōla period (10th–11th century AD), and the movements and hand gestures of dance are frequently employed. The Cōla images are unsurpassed in their elegance, sensitive modelling, and balanced tension. During the Vijayanagar period (1336–1565) the ornamentation tended to become more elaborate, interfering with the smooth rhythm of the body, and the postures became more rigid.

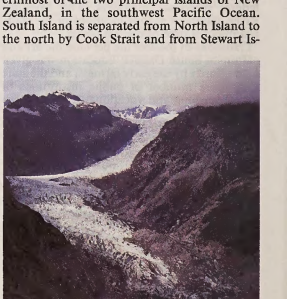
The god Śiva in the garb of a mendicant, South Indian bronze from Tiruvengādu, Tamil Nadu, early 11th century; in the Thanjāvūr Museum and Art Gallery, Tamil Nadu

P. Chandra

The icons range from small household images to almost life-size sculptures intended to be carried in temple processions. A few Buddhist and Jaina images were produced, but the figures mostly represent Hindu divinities, especially various iconographic forms of the god Śiva and Lord Vishnu, together with their consorts and attendants. Also of outstanding quality are the many images of Śiva and Vaiṣṇava saints (the Āḻvārs).

The images are cast by the cire-perdue (*q.v.*), or "lost wax," process. Final sculptural touches are added to the image after it is cast, with the result that the images are "carved" as well as "modelled." Important collections of South Indian bronzes are housed in the Thanjāvūr Museum and Art Gallery, in Tamil Nadu, and at the Government Museum in Madras, but the largest number of fine images are in the various temples of southern India.

**South Indian temple architecture,** also called DRĀVIḌA STYLE, architecture invariably employed for Hindu temples in modern Tamil Nadu from the 7th to the 18th century, characterized by its pyramidal, or *kūṭina*-type, tower. Variant forms are found in Karnataka (formerly Mysore) and Andhra Pradesh states. The South Indian temple consists essentially of a square-chambered sanctuary topped by a superstructure, tower, or spire and an attached pillared porch or hall (*maṇḍapa,* or *maṇṭapam*), enclosed by a peristyle of cells within a rectangular court. The external walls of the temple are segmented by pilasters and carry niches housing sculpture. The superstructure or tower above the sanctuary is of the *kūṭina* type and consists of an arrangement of gradually receding stories in a pyramidal shape. Each story is delineated by a parapet of miniature shrines, square at the corners and rectangular with barrel-vault roofs at the centre. The tower is topped by a dome-shaped cupola and a crowning pot and finial.



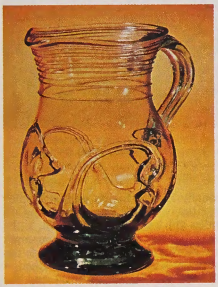
Coliśvara temple at Kilaiyūr, Tamil Nadu, India, late 9th century AD

P. Chandra

The origins of the Drāvida style can be observed in the Gupta period. The earliest extant examples of the developed style are the 7th-century rock-cut shrines at Mahābalipuram and a developed structural temple, the Shore Temple (*c.* 700), at the same site.

The South Indian style is most fully realized in the splendid Bṛhadīśvara temple at Thanjāvūr, built about 1003–10 by Rājarāja the Great, and the great temple at Gaṅgaikoṇḍacōḷapuram, built about 1025 by his son Rājendra Cōla. Subsequently, the style became increasingly elaborate—the complex of temple buildings enclosed by the court became larger, and a number of successive enclosures, each with its own gateway (*gopura*), were added. By the Vijayanagar period (1336–1565) the *gopuras* had increased in size so that they dominated the much smaller temples inside the enclosures.

**South Island,** island, the larger and southernmost of the two principal islands of New Zealand, in the southwest Pacific Ocean. South Island is separated from North Island to the north by Cook Strait and from Stewart Island to the south by Foveaux Strait. Mountainous terrain occupies almost three-quarters of South Island, with a central mountain chain, the Southern Alps, trending southwest to northeast and culminating at Mount Cook (12,349 feet [3,764 m]). The Southern Alps separate the narrow coastal strip of the Westland Plain (west) from the broad Canterbury Plains (east). Fiordland in the southwest is a distinctive area with its numerous coastal



Terminus of Fox Glacier on the western slopes of the Southern Alps, South Island, New Zealand

G.R. Roberts, Nelson, New Zealand

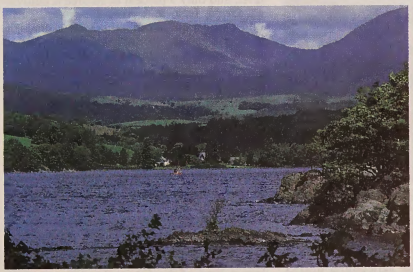
fjords (inlets) and high lakes. The island was sighted by the Dutch navigator Abel Tasman in 1642. Although South Island has several large urban areas, including Christchurch, Dunedin, and Invercargill, all coastal, its population grew less rapidly than that of North Island in the 20th century. Area 58,384 square miles (151,215 square km). Pop. (1998 est.) 925,000.

**South Jersey glass,** glass made at American factories in southern New Jersey, New England, and New York state from about 1781 to about 1870, following the example of Caspar Wistar. Though Wistar's factory had closed in 1780, it had provided the impetus for the "South Jersey tradition." The workmen were descendants of Wistar's own German and Polish workers or new immigrants from Europe,

Lily-pad pitcher, South Jersey glass, c. 1800–25; in the Toledo Museum of Art, Ohio

By courtesy of the Toledo Museum of Art, Toledo, Ohio, gift of Edward Drummond Libbey

and their style had its roots in the glass made for centuries in central Europe. Tableware, such as jugs and sugar bowls, was made in bottle and window glass, these latter being the staple products of most factories. The use of this glass dictated the range of natural colours: green and amber for bottle glass and aquamarine for window glass, though other colours were sometimes added. Decoration was of a kind long established in European glass: applied blobs of glass, variously fashioned, and "threads" of molten glass drawn around and around the vessel. Another technique, with no European ancestry and peculiar to South Jersey, was the "lily pad" ornament, in which an extra coating of molten glass was given to the bottom of the vessel and worked with a tool into a series of points up its sides, giving an effect that was at once artless and controlled. The best period of South Jersey was between 1820 and 1850; after that, the increasing mechanization of the American glass industry and other factors caused a decline in individual glassblowing.



**South Kesteven,** district, administrative and historic county of Lincolnshire, east-central England, lying in the southwestern part of the county. There are fertile pasturelands on the western border with Nottinghamshire, but the bulk of South Kesteven district is a limestone plateau oriented north-south. Lying at an elevation of 200 to 400 feet (60 to 120 m), the plateau has a steep western scarp and descends gradually eastward, crossing a treeless expanse before touching the outer limits of the Fens, an extensive area of reclaimed marshland near sea level that produces wheat, barley, and sugar beets and other root crops. Bourne and, especially, Stamford are well-preserved ancient market towns at the edge of the Fens and have textile, footwear, and stone-trade industries. Agricultural implements and machinery are manufactured at Grantham, the district's administrative centre, in the northwest; sheep are pastured in the nearby limestone uplands. The adjacent parishes (towns) of Market Deeping and Deeping St. James are expanding agricultural communities within the Fens. Sir Isaac Newton and Margaret Thatcher, the first woman to be prime minister of the United Kingdom, spent their formative years around Grantham. Area 364 square miles (943 square km). Pop. (1998 est.) 122,700.

**South Kingstown,** town (township), Washington county, southern Rhode Island, U.S. It lies west of Point Judith Pond and extends northward from Block Island Sound. The area was settled in 1641 and incorporated in 1674 as Kings Towne. Called Rochester in 1686–89, it was divided in 1722–23 into North Kingstown and South Kingstown. The township includes the villages of Kingston, West Kingston, Peace Dale, Wakefield (administrative centre), Matunuck, Green Hill, Perryville, and Tuckertown. The Great Swamp in western South Kingstown was the scene (December 1675) of the Narraganset Indians' final defeat by the colonists in King Philip's (Indian) War. The University of Rhode Island, founded in 1892 near the village of Kingston, plays a major role in the economic and cultural life of the town. Diversified small manufacturing has replaced the textile industry, which was formerly the economic mainstay; summer tourism also is significant. Pop. (2000) 27,921.

**South Kyŏngsang** (South Korea): *see* Kyŏngsang-nam.

**South Lakeland,** district, administrative county of Cumbria, northwestern England, in the southern part of the county, bordering the shallow Morecambe Bay of the Irish Sea to the south. The western part of the district, west of the River Winster and the northern Windermere (lake), is in the historic county of Lancashire. The eastern part of the district, including the Pennine uplands, Garsdale, Dentdale, and the area around Sedbergh, forms part of the Yorkshire Dales in the historic county of Yorkshire. The central part of the district, including Kendal, the administrative centre and largest town, is in the historic county of Westmorland.

South Lakeland is generally an upland district that is a popular vacation area. Central South Lakeland has lower hills and dales of the fertile Kent and Lune river valleys. The western and eastern uplands encompass parts of the Lake District and Yorkshire Dales national parks, respectively, and rise to elevations of 1,500 to 3,000 feet (450 to 900 m). One of the narrow, lake-filled valleys contains Windermere, England's largest freshwater lake. The Yorkshire Dales are rolling uplands of bleak moors. The rough grazing of sheep predominates in all the uplands, and dairy cattle as well as oats and fodder crops are raised in the valleys. Kendal, the district seat, and Ulverston are local agricultural and light industrial centres. Grasmere, Windermere, and Coniston are resorts in the Lake District. The Romantic poet William Wordsworth and the children's writer Beatrix Potter found creative inspiration through observation of the district's landscape. Area 599 square miles (1,551 square km). Pop. (1998 est.) 103,200.

Coniston Water in the Lake District, South Lakeland district, Cumbria, England

David Endersbee from TSW—CLICK/Chicago

**South Lanarkshire,** council area, south-central Scotland, encompassing Clydesdale—the valley of the River Clyde—and the surrounding lowlands and uplands. South Lanarkshire extends from the heavily urbanized southern periphery of the Glasgow metropolitan area, where most of the population live, to the extensive agricultural countryside of the south, which accounts for most of the area. It lies entirely within the historic county of Lanarkshire.

Clydesdale supports intensive cultivation of fruits and vegetables for the Glasgow market and soft fruits for the jam-making industries of Carluke. Other important crops include barley, turnips, and fodder for the considerable numbers of beef and dairy cattle, sheep, and pigs that are raised in the surrounding valleys and uplands. Lanark is a market centre for this large agricultural hinterland. During the 19th century Hamilton developed as an industrial town based initially on lace and textile manufacture and later on coal mining, but these industries have since shut down, and it is now primarily a commercial centre and a residential suburb of Glasgow. East Kilbride houses the National Engineering Laboratory and several electronics firms. East Kilbride, Hamilton, and Lanark are the administrative centres. Area 686 square miles (1,777 square km). Pop. (1999 est.) 307,520.

**South Manchurian Railway,** railway line connecting the South Manchurian sea towns of Lü-shun (Port Arthur) and Lü-ta (Dairen) with the Chinese Eastern Railway, which runs across Manchuria (Northeast provinces) from Chita in Siberia to the Russian port of Vladivostok. The line has been a source of friction between the Chinese, Japanese, and Russians throughout the 20th century.

In March 1898 the Russians forced China to give them control of the Liaotung Peninsula, in southern Manchuria; shortly after that, they began construction of the South Manchurian Railway. Following the Russian defeat in the Russo-Japanese War (1904–05), the Liaotung Peninsula was transferred to Japan. In 1906 the Japanese made the South Manchurian

Railway Company their chief instrument for the economic exploitation of Manchuria, and the company developed the enormous open-pit Fu-shun coal mine and the An-shan steelworks. Lower-echelon Japanese employees harboured ultranationalistic feelings, which encouraged the Japanese to invade Manchuria in 1931 and rule it as the puppet state of Manchukuo.

At the Yalta Conference in 1945, U.S. President Franklin D. Roosevelt agreed to restore the railway to the Soviet Union as a partial reward for Joseph Stalin's agreement to enter the war against Japan. A treaty between the Chinese Nationalists and the Soviet Union on August 14 of the same year gave China and the Soviet Union joint control over the South Manchurian Railway for 30 years. When the Chinese Communists came to power in 1949, the Soviets were obliged to return the railway to full Chinese control.

**South Mountain,** northernmost section of the Blue Ridge in the Appalachian Mountains, extending southwestward for 65 miles (105 km) from southern Pennsylvania to northern Virginia, U.S. Quirauk Mountain (2,145 feet [654 m]) in Maryland is the highest point. It is crossed by the Appalachian Trail (for hikers). The American Civil War Battle of South Mountain took place near Burkittsville, Md., on Sept. 14, 1862.

**South Norfolk,** district, administrative and historic county of Norfolk, eastern England, occupying an area directly south of the city of Norwich. South Norfolk is principally an agricultural district extending across low-lying open countryside. Soils are generally fertile, and the old market centres (including Wymondham, Diss, Harleston, and Loddon) have small populations. A wide variety of crops, including barley, wheat, sugar beets, oats, and vegetables, are grown. Dairy cattle, pigs, and poultry are raised. Several parishes (towns) and villages have imposing churches ranging in date from the Norman to the Perpendicular Gothic periods (11th to late 15th century). The district's southern boundary, the River Waveney, is popular with anglers. Freshwater marshlands abounding in waterfowl are commonplace in the northeast. Long Stratton is the district seat. Area 350 square miles (907 square km). Pop. (1998 est.) 107,700.

**South Northamptonshire,** district, administrative and historic county of Northamptonshire, south-central England, characterized by

Sulgrave Manor, in the village of Sulgrave, South Northamptonshire district, Northamptonshire, England
Barry Hicks—Britain on View (BTA/ETB)

rolling hills in the west of the county. In the north this predominantly agricultural district is bordered by the upper reaches of the River Nene and the town of Northampton and is crossed by the (disused) Grand Union Canal. Clay uplands at elevations of 300 to 500 feet (60 to 90 m) in the centre and south ascend to above 700 feet (210 m) in the extreme west. Covered by fertile glacial drift, the land is predominantly used for pasture, but cereals (wheat and barley) are also grown.

The old market town of Towcester, in the centre of the district, is the administrative headquarters, and Brackley, in the extreme south, is the largest town; both have expanding light industrial bases. Conspicuous village churches, stone and thatched cottages, and distinctive country manors typify the architecture of the district. The latter are perhaps best exemplified by the Baroque Easton Neston House (1700), designed by Nicholas Hawksmoor, and Sulgrave Manor, an Elizabethan building completed about 1560 by Lawrence Washington, a direct ancestor of George Washington. The Talbot Inn in Towcester was immortalized in Charles Dickens's novel *The Pickwick Papers.* Area 244 square miles (632 square km). Pop. (1998 est.) 77,300.

**South Orange Village,** also called SOUTH ORANGE, township (town), Essex county, northeastern New Jersey, U.S., immediately west of Newark. Following the American Civil War, many residents of New York City were attracted by the natural beauty of the open, rolling country and moved into the area. It was originally the Orange Dale section of Orange township, but it separated from Orange and was incorporated in 1869. Seton Hall University (1856) is located there. Although the township is largely a residential suburb, it also has some light manufacturing. Pop. (2000) 16,964.

**South Orkney Islands,** island group lying between the Scotia Sea to the north and the Weddell Sea to the south in the South Atlantic Ocean. It is composed of two large islands (Coronation and Laurie) and a number of smaller islands and rocky islets and forms part of the British Antarctic Territory. The islands (total area about 240 square miles [620 square km]) are barren and uninhabited, but Signy Island is used as a base for Antarctic exploration. George Powell (British) and Nathaniel Palmer (American), both sealers, sighted and charted the islands in December 1821.

**South Ossetia,** Russian YUZHNAYA OSETIYA, region, north-central Georgia, on the southern slopes of the Greater Caucasus mountains. The region is populated largely (about two-thirds) by the Ossetes, a Caucasian people (many Ossetes live in the neighbouring republic of North Ossetia [Severnaya Osetiya] in Russia as well); most of the remainder are Georgians. The area is deeply intersected by rivers, which are harnessed for hydroelectric power. About 90 percent of the region lies more than 3,300 feet (1,000 m) above sea level, and only 9 percent of its area is cultivated. Grain, fruit, and vines are grown, partly under irrigation. Sheep are raised on the higher slopes, and the considerable forest wealth is exploited. The major city is Tskhinvali.

**South Oxfordshire,** district, administrative county of Oxfordshire, south-central England, occupying an area in the southeastern part of the county between the cities of Oxford (northwest) and Reading (south). Most of the district lies within the historic county of Oxfordshire, but the areas to the west of the Thames, including Wallingford, form part of the historic county of Berkshire. The district is generally a clay valley drained by the River Thames and is dominated by the beech-forested Chiltern Hills in the southeast. South Oxfordshire's economy is largely agricultural, primarily based on corn (maize), potatoes, cereals, and dairy cattle. Henley-on-Thames, the largest town of the district (located east of the Chilterns in its southeastern corner), has iron foundries and malt breweries and has become

Henley Royal Regatta on the River Thames at Henley-on-Thames, South Oxfordshire district, Oxfordshire, England
Britain on View (BTA/ETB)

internationally known for its annual Henley Royal Regatta (rowing). The village of Culham, 7 miles (11 km) south of Oxford, is the site of an important atomic-energy research laboratory. Nearby Dorchester was founded as a Roman town; later it became the cathedral city of Wessex (in the 7th century) and the cathedral city of Mercia (from the late 9th to the late 11th century). District offices are located at Crowmarsh Gifford, a settlement across the Thames from Wallingford. Area 259 square miles (671 square km). Pop. (1998 est.) 127,400.

**South Pacific Commission,** also called (from 1998) SECRETARIAT OF THE PACIFIC COMMUNITY (SPC), organization founded in 1947 by the governments of Australia, France, New Zealand, The Netherlands, Great Britain, and the United States to advise them on economic, social, and health matters affecting the South Pacific island territories they administered. It is the oldest regional organization in the Pacific and is headquartered in Nouméa, New Caledonia. Guam and the Trust Territory of the Pacific Islands joined the SPC in 1951, extending the organization's membership to the North Pacific, but The Netherlands withdrew after it transferred administration of Netherlands New Guinea (Irian Jaya) to Indonesia in 1962. Britain withdrew its membership in 1996 but rejoined two years later. By 2000 the SPC had 27 members. As most of the territories gained independence, the organization was transformed into an agency for providing technical advice, assistance, training, and research to address economic, biological, medical, educational, and social problems.

Originally, all founding members of the SPC were entitled to one vote each. However, with the admission of the newly independent Western Samoa in 1965, voting rules were changed to give Australia five votes; France, Britain, New Zealand, and the United States four; and Western Samoa one. Membership rules also were altered to allow other independent states, as well as nonindependent territories, to apply for membership, resulting in the admission of Nauru in 1969 and Fiji in 1971. The SPC revised its rules again in 1983, granting each member—regardless of its status—equal voting rights. The annual South Pacific Conference, attended by two delegates from each member country, approves the organization's budget and determines its Work Programme

of technical assistance through local and regional seminars and workshops. About nine-tenths of the SPC's budget is contributed by Australia, France, Britain, New Zealand, and the United States.

**South Pacific Forum,** also called (from 2000) PACIFIC ISLANDS FORUM, organization established in 1971 to provide a setting for heads of government to discuss common issues and problems facing the independent and self-governing states of the South Pacific. Headquartered in Suva, Fiji, the forum includes Australia, the Cook Islands, the Federated States of Micronesia, Fiji, Kiribati, Nauru, New Zealand, Niue, Palau, Papua New Guinea, the Solomon Islands, the Republic of the Marshall Islands, Tonga, Tuvalu, Vanuatu, and Western Samoa.

At its first meeting, senior officials of the forum recommended that a permanent bureau be established to deal with economic matters. The measure was approved the following year. The resulting group, the South Pacific Bureau for Economic Co-operation, was established in April 1973 and worked to facilitate member cooperation on trade, tourism, transportation, and economic development.

The forum holds an annual meeting of heads of government, which is followed by ministerial discussions with the forum's 10 dialogue partners: Canada, China, the European Union, France, Great Britain, Japan, South Korea, Malaysia, the Philippines, and the United States.

**South Pasadena,** city, Los Angeles county, Calif., U.S., about 2 miles (3.2 km) south of Pasadena and 10 miles (16 km) northeast of the centre of the city of Los Angeles via the Pasadena Freeway. It is principally a residential community, but it has some light manufacturing, chiefly in electronics. The city was incorporated in 1888. Pop. (2000) 24,292.

**South Pembrokeshire,** former district (1974–96) of the former county of Dyfed,

Ruins of the Norman castle at Pembroke, Pembrokeshire, Wales
Britain on View (BTA/ETB)

southwestern Wales, now incorporated in the county of Pembrokeshire (*q.v.*).

**South Platte River,** one of the two main arms of the Platte River (*q.v.*), rising in the Mosquito Range of central Colorado, U.S., and flowing southeast. West of Divide, Colo., the river turns sharply northeast, flows through the Front Range via the Platte River Canyon, and emerges on the flatland of the Colorado Piedmont southeast of Denver. Continuing its northeastern course, it flows through Denver to Greeley, Colo., where it bends eastward via Sterling to North Platte, Neb. There it joins the North Platte River to form the Platte River, after a course of 442 miles (711 km). From Greeley east, the South Platte Valley is 2 to 10 miles (3 to 16 km) wide. Reservoirs and dams, notably around Denver, include Cheesman, Cherry Creek, Eleven Mile Canyon, and Antero; all are part of the Missouri River Basin project for flood control, irrigation, and power. Chief tributaries of the South Platte are Clear Creek and Boulder Creek and the Big Thompson, St. Vrain, and Cache La Poudre rivers.

**South Pole,** southern end of the Earth's axis, lying in Antarctica, about 300 miles (480 km) south of the Ross Ice Shelf. This geographic South Pole does not coincide with the magnetic South Pole, from which magnetic compasses point and which lies on the Adélie Coast (at about 66°00′ S, 139°06′ E; the magnetic pole moves about 8 miles [13 km] to the northwest each year). Nor does it coincide with the geomagnetic South Pole, the southern end of the Earth's geomagnetic field (this pole also moves; during the early 1990s it was located about 79°13′ S, 108°44′ E). The geographic pole, at an elevation of some 9,300 feet (2,830 m; the elevation also changes constantly) above sea level, has six months of complete daylight and six months of total darkness each year. Ice thickness is 8,850 feet (2,700 m). First reached by the Norwegian explorer Roald Amundsen on Dec. 14, 1911, the pole was reached the following year by the British explorer Robert F. Scott and in 1929 by the American explorer Richard E. Byrd. In the early 1970s the South Pole was the site of a U.S. station and landing strip (Amundsen-Scott); owing to the movement of the polar ice cap, the station now lies west of the pole.

**South Ribble,** borough (district), administrative and historic county of Lancashire, northwestern England, occupying an area south of the borough of Preston. The borough is part of the Lancashire coastal plain bordering the Pennine uplands to the east. It was covered by glacial moraine deposited by the Irish Sea ice sheet, which has given the eastern part of the borough a rolling, occasionally drumlin-like landscape. The River Ribble forms the northern boundary.

Most industry is associated with the BL Public Limited Company (formerly British Leyland Ltd.), the motor-vehicle-manufacturing enterprise established at the town of Leyland in 1896 and now headquartered in London. Leyland is the administrative centre, and the borough also includes part of the town of Preston. Other light industrial centres include Walton-Le-Dale, Bamber Bridge, and Farington. Reclaimed peat fens in the west are intensively cultivated, and dairy cattle are grazed. Area 44 square miles (113 square km). Pop. (1998 est.) 103,600.

**South Saint Paul,** city, Dakota county, southeastern Minnesota, U.S., on the Mississippi River, adjacent to the city of St. Paul. It was settled in the 1850s on the site of a Sioux Indian village (Kaposia, 1826–53). Until 1889 the South St. Paul area included West St. Paul. The St. Paul Union Stockyards opened in 1886, bringing large numbers of primarily Central and Eastern European immigrants to the city to work in the yards and associated meatpacking plants. During the 1970s, however, most of the large plants closed and the stockyard decreased dramatically in size. During the 1990s the former site of a major plant was turned into an industrial park. Inver Hills Community College is located in Inver Grove Heights. The eastern section of South St. Paul is part of the Mississippi National River and Recreation Area. Inc. 1887. Pop. (2000) 20,167.

**South San Francisco,** city, San Mateo county, Calif., U.S., about 3 miles (5 km) south of San Francisco on U.S. Highway 101 Bypass. Situated at the southern base of San Bruno Mountain, South San Francisco is heavily industrialized, with meat-packing, steel and other metal fabrication, chemical processing, and other manufacturing. The city also has an attractive residential section with a view of San Francisco Bay. San Francisco International Airport lies just to the south. Pop. (2000) 60,552.

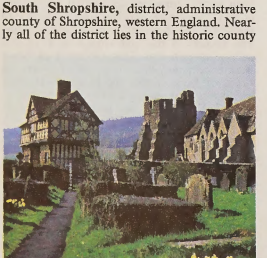
**South Sandwich Islands,** group of actively volcanic islets in the South Atlantic Ocean, north of the Weddell Sea and 470 miles (760 km) southeast of the island of South Georgia. They extend for 190 miles (305 km), occupy 120 square miles (310 square km), and are covered with glaciers. They are included within the British Falkland Islands as a dependency. In 1775 Captain James Cook, the British explorer, sighted the islands, which were uninhabited until 1976, when Argentine personnel, despite protests from the British government, occupied the Southern Thule group of islands. The Argentine personnel were removed by British forces in June 1982.

**South Sea Bubble,** the speculation mania that ruined many British investors in 1720. The bubble, or hoax, centred on the fortunes of the South Sea Company, founded in 1711 to trade (mainly in slaves) with Spanish America, on the assumption that the War of the Spanish Succession, then drawing to a close, would end with a treaty permitting such trade. The company's stock, with a guaranteed interest of 6 percent, sold well, but the relevant peace treaty, the Treaty of Utrecht made with Spain in 1713, was less favourable than had been hoped, imposing an annual tax on imported slaves and allowing the company to send only one ship each year for general trade. The success of the first voyage in 1717 was only moderate, but King George I of Great Britain became governor of the company in 1718, creating confidence in the enterprise, which was soon paying 100 percent interest.

In 1720 there was an incredible boom in South Sea stock, as a result of the company's proposal, accepted by Parliament, to take over the national debt. The company expected to recoup itself from expanding trade, but chiefly from the foreseen rise in the value of its shares. These did, indeed, rise dramatically, from 128½ in January 1720 to more than 1,000 in August. Those unable to buy South Sea stock were inveigled by overly optimistic company promoters or downright swindlers into unwise investments. By September the market had collapsed, and by December South Sea shares were down to 124, dragging other, including government, stock with them. Many investors were ruined, and the House of Commons ordered an inquiry, which showed that at least three ministers had accepted bribes and speculated. Many of the company's directors were disgraced, but the company itself survived until 1853, having sold most of its rights to the Spanish government in 1750.

**South Semitic alphabet,** any of a group of minor scripts originating in the Arabian Peninsula about 1000 BC, possibly related to the writing system used in the Sinaitic inscriptions. These scripts, most of which were used only in the Arabian Peninsula, are of note because of their great age and because of the lack of any clear link between them and the North Semitic alphabet, which dates from about 1100 BC and is probably ancestral to all subsequent alphabetic scripts except the South Semitic group. South Semitic alphabets generally have 28 letters, all representing consonants, and were usually written from right to left. Seven (possibly eight) of the letters resemble North Semitic letters of the same phonetic value.

Of nine distinct scripts, only Safaitic, Sabaean, and Ethiopic occur outside the Arabian Peninsula; the Ethiopic alphabet, developed from Sabaean in Ethiopia, is the only one still in use. Its modern form is sometimes called Amharic. *Compare* North Semitic alphabet.



**South Seymour Island** (Galápagos Islands): *see* Baltra Island.

**South Shetland Islands,** island group forming part of the British Antarctic Territory in the Drake Passage of the South Atlantic Ocean. Lying 90 miles (150 km) north of the Antarctic Peninsula, Antarctica, the islands extend for 320 miles (510 km) and have a total area of 1,800 square miles (4,700 square km). Their main use has been for whaling and sealing activities (1906–31) and for Antarctic exploration bases (notably on Deception Island). Barren and snow-covered, the islands were sighted by the sealer William Smith in 1819 and are uninhabited.

**South Shields,** town and North Sea port, South Tyneside district, metropolitan county of Tyne and Wear, historic county of Durham, northeastern England. It lies on the south side of the mouth of the River Tyne near the site of a Roman fort. The town, founded by the Convent of Durham in the 13th century, was a centre of the salt and glass industries in the 17th and 18th centuries. The first British self-righting lifeboat (for aiding ships in distress in the region) was launched there in 1790. Shipbuilding and coal mining fueled the town's growth during the 19th century, but by the late 20th century these traditional industries had given way to services and newer manufacturing sectors, such as electronics. Pop. (2001) 82,854.

**South Shropshire,** district, administrative county of Shropshire, western England. Nearly all of the district lies in the historic county of Shropshire, but a small area south of Ludlow is part of the historic county of Herefordshire. Wales borders the mostly rural district to the west. The Shropshire Hills, a series of ridges oriented southwest to northeast, including the Stiperstones, Long Mynd, and Clee Hills, rise to elevations of 1,600 to 1,700 feet (475 to 500 m) and are separated by deep valleys; they occupy most of the district. Officially designated an Area of Outstanding Beauty, the ridges contain forests at their summits, except the Long Mynd, which is heather-covered.

The development of castle building is well illustrated in South Shropshire through extensive remains at Ludlow in the southeast and nearer the Welsh border at Clun, Hopton, and Stokesay. Ludlow, the administrative centre and largest town, is known for its many half-timbered 14th- and 15th-century homes. Cattle, cereals, and fodder crops are raised in the valleys, and sheep are grazed at higher elevations. Area 397 square miles (1,028 square km). Pop. (2001) 40,389.

(Left) Elizabethan half-timbered gatehouse and (right) 13th-century tower and great hall of Stokesay Castle, South Shropshire district, Shropshire, Eng.

Martin Page from TSW—CLICK/Chicago

**South Somerset,** district, administrative county of Somerset, England, encompassing the southeastern part of the county. It lies almost entirely within the historic county of Somerset, except for a few small areas along its southern border that belong to the historic counties of Dorset or Devon. The district is predominantly rural and has many villages scattered over an agricultural landscape. The district's largest town and administrative centre is Yeovil. Its rapidly developing industries include food processing, light engineering, and the manufacture of helicopters and aircraft equipment, in addition to its traditional glovemaking and leather-dressing trades. Area 370 square miles (959 square km). Pop. (2001) 150,974.

**South Spitsbergen National Park,** Norwegian SØR-SPITSBERGEN NASJONALPARK, national park and bird sanctuary established by Norway in 1973 in the southern corner of the island of Spitsbergen, in the Svalbard archipelago in the Arctic Ocean. With an area of 1,804 square miles (4,673 square km), the park has four separate bird sanctuaries located off the southern and western coasts: Sørkapp, Dunøyane, Isøyane, and Olsholmen.

**South Staffordshire,** district, administrative and historic county of Staffordshire, central England, immediately west of the West Midlands metropolitan area centred on Birmingham. A greenbelt area of rolling terrain, South Staffordshire contains both rich agricultural farmland and residential suburbs housing commuters working in the West Midlands metropolitan area. The district is a source of sand and gravel for the heavy industries of the West Midlands, and modern industrial estates are dispersed throughout. Codsall is the administrative centre. Area 158 square miles (409 square km). Pop. (2001) 105,896.

**South Tyneside,** metropolitan borough, metropolitan county of Tyne and Wear, northeastern England. It lies just southeast of the city of Newcastle upon Tyne and is bordered by the River Tyne to the north and the North Sea to the east. South Tyneside's towns—South Shields, Jarrow, Hebburn, and Boldon—have played a prominent role in the industrial development of the Tyne and Wear (or Tyneside) metropolitan area. Light industries were established after World War II in an attempt to mitigate the area's reliance on heavy industries such as shipbuilding and repairing, coal mining, and iron and steel production. While ship repair continues in Jarrow, coal mining has ceased, and heavy industry has nearly disappeared. The borough's economy now depends mainly on services and light industry. Stretches of scenic grassland and beach are found along the North Sea coast south of South Shields, the administrative centre, at the mouth of the Tyne. A metro rapid-transit system connects South Shields and Jarrow with Newcastle upon Tyne and North Tyneside. Area 25 square miles (64 square km). Pop. (2001) 152,785.

**South Uist,** island of the Outer Hebrides, Western Isles council area, historic county of Inverness-shire, Scotland. It lies west of the island of Skye, from which it is separated by about 25 miles (40 km) of water. The island is 20 miles (30 km) north to south and 7 miles (11 km) wide and is connected by road bridges northward to the islands of Benbecula and North Uist. The east side of South Uist is mountainous—Beinn Mhor reaches an elevation of 2,033 feet (620 m)—and much indented. It has poor soil with peat bogs and heather. The western side, however, has a belt of arable land derived from shell sand. Stock raising is the chief occupation, but islanders also engage in crofting (small-scale tenant farming, mainly for subsistence), fishing, and seaweed processing. Tweeds are woven on the island. Lochboisdale, on the east coast, is the main village. About four-fifths of the people speak Scottish Gaelic.

**South West Africa People's Organization** (SWAPO), party in Namibia (formerly South West Africa) that advocated immediate Namibian independence from South Africa and became the country's leading party following independence in 1990.

It was founded in 1960, and, after South Africa refused a United Nations order to withdraw from the trust territory in 1966, SWAPO turned to armed struggle. SWAPO's greatest political strength lay among the Ovambo people in the northern part of the territory. Led by Sam Nujoma and backed by the Angolan ruling party, the Popular Movement for the Liberation of Angola, and the Soviet Union, SWAPO used Angola as a base for guerrilla warfare on Namibian soil; operations were carried out by SWAPO's guerrilla force, the People's Liberation Army of Namibia (PLAN). Beginning in 1978, South Africa made periodic retaliatory strikes into Angola. Herman Toivo ja Toivo, the founder of SWAPO, was imprisoned in South Africa for a 20-year term in 1968 but was released in 1984.

In 1978 the UN recognized SWAPO as the sole representative of the people of Namibia. Both SWAPO and South Africa agreed to a UN plan for a cease-fire, withdrawal of South African troops, and free elections to be guaranteed by UN security forces. After years of diplomatic maneuvering, South Africa finally accepted a UN resolution to that effect in December 1988. Sporadic fighting continued. In 1989 Nujoma was elected president and took office the following year. SWAPO continued to dominate the political scene into the 21st century, transforming itself from a liberation movement into a governing party.

**South-West National Park,** national park in southwestern Tasmania, Australia. The initial park was created in 1968 out of the amalgamation of the Lake Pedder National Park (created in 1955) and the Huon Serpentine Impoundment, which had inundated Lake Pedder owing to hydroelectric construction. In 1976 the park was almost doubled when the Port Davey Foreshore Preserve and the Precipitous Bluff were both added to it. In 1981 it was enlarged again, with lands about the headwaters of the Davey River. The park now covers 1,092,700 acres (442,200 hectares). The park, together with the adjacent Franklin-Lower Gordon Wild Rivers National Park (proclaimed in 1981), is perhaps the best-known wilderness area in Australia.

Situated in an area of rugged terrain and cold, wet climate, the park consists of several parallel highland ranges, divided by wide valleys marked by rivers and lakes. The flora is a combination of rainforest, sedgeland, and eu-

calyptus. Fauna is limited compared with eastern Tasmania, but the Maatsuyker group of islands, forming part of the park, is rich in seabirds and seals.

**South Wight,** former district (1974–95) of the former county of Isle of Wight, England. The region is now part of the unitary authority of Isle of Wight, historic county of Hampshire (*qq.v.*).

**South Yorkshire,** metropolitan county in north-central England. It comprises four metropolitan boroughs: Barnsley, Doncaster, Rotherham, and the city of Sheffield. South Yorkshire lies within the historic county of Yorkshire, except for three areas. In the metropolitan borough of Doncaster, the parish of Finningley and the area west of Bawtry are part of the historic county of Nottinghamshire, and in the city of Sheffield the area around Beighton and Mosborough belongs to the historic county of Derbyshire. From 1974 to 1986 South Yorkshire was an administrative unit. In 1986 the metropolitan county lost its administrative powers, and its constituent boroughs became autonomous administrative units, or unitary authorities. South Yorkshire is now a geographic and ceremonial county without administrative authority.

South Yorkshire's physical geography is diverse. In the west the high Pennine moorlands, composed of limestone and millstone grit, descend to the valleys of the Rivers Don and Dearne, which flow into a lowland around Doncaster in the east. Much of the lowland, including the marshes of Hatfield, Thorne, and Humberhead, has been drained. The Don rises in the Pennines and flows eastward through the Rivers Aire and Ouse to the River Humber.

In the 19th century the proximity to coal supplies and the arrival of railways stimulated the region's industrial growth. The Don valley became the focus of a belt of ironworks and steelworks extending eastward from Sheffield. Today South Yorkshire includes most of England's main coalfield, but mining declined dramatically in the late 20th century. A few highly mechanized mines still operate around Doncaster, the headquarters of Britain's remaining coal industry. The iron and steel industry, based in Sheffield and Rotherham, also declined during the late 20th century, but Sheffield, located in the Pennine foothills, is still known for its production of special steels and cutlery. Light manufactures, research and development, food processing, and services have compensated somewhat for the loss of employment in mining and heavy industry. Sheffield is South Yorkshire's largest city and main service centre and the site of the University of Sheffield. The metropolitan county encompasses areas of open countryside and part of the Peak District National Park. Area 612 square miles (1,585 square km). Pop. (1998 est.) 1,304,100.

**Southampton,** city and English Channel port, a unitary authority in the historic county of Hampshire, England. It lies near the head of Southampton Water, on a peninsula between the estuaries of the Rivers Test and Itchen.

In AD 43 there was a Roman settlement, Clausentum, on the east bank of the Itchen, and inscribed stones, coins, pottery, and other artifacts have been found. Southampton (Suhamptun) superseded the Saxon Hamtun and was a royal borough before 1086. The earliest town charter was given by King Henry II, probably in 1154–55, but the borough was not incorporated until 1445. Henry VI, in 1447, created Southampton a county in itself. A charter that remained in force until 1835 was granted by Charles I in 1640.

In the European Middle Ages Southampton became one of England's major ports, exporting wool and hides from the hinterland and importing wine from Bordeaux. For the Norman and Plantagenet kings, it was the chief link with their domains across the Channel in France. Remnants of the city's medieval prosperity include St. Michael's Church (11th century and later); King John's Palace (12th century), one of England's oldest domestic buildings; and parts of the city walls, built of Caen limestone from Normandy and featuring the guildhall over the archway of Bargate, the north gate.

The port and city declined in the 17th and 18th centuries but revived in the 19th with the introduction of railways, especially the London-Southampton railway of 1840. New dock development took advantage of the spacious harbour and the prolonged high-water period, which results from a double tide caused by the presence of the Isle of Wight off the coast. A major oil-tanker terminal and refinery were established on the western shore in 1951 and began to use North Sea oil in 1978. By 1980 Southampton had become Britain's second largest port. The city centre was rebuilt after it incurred extensive damage during World War II. New manufactures—aircraft, automobiles, cables, electrical-engineering products, and petrochemicals—have joined the port's traditional industries of shipbuilding and repairing, grain milling, and tobacco processing. Construction of major new commercial and industrial development took place in the late 20th century. The university (1862) is in the northern suburbs. Pop. (1998 est.) city and unitary authority, 216,000; (1991) Southampton Urban Area, 276,752.

**Southampton,** village and town (township), Suffolk county, southeastern New York, U.S., lying along the south shore of eastern Long Island. Settlers from Lynn, Mass., landed at Conscience Point in 1640, founding the first English community in New York. The original Shinnecock Indian land deed (Dec. 13, 1640) is preserved. Many colonial buildings in Southampton town have been restored, including the Halsey Homestead (1648; the state's oldest English saltbox house) and the Old Water Mill (1644). Within the town is the Shinnecock Indian Reservation (1703) and Sag Harbor, once a whaling port. The Southampton campus of Long Island University was founded in 1963. The Parrish Art Museum is in Southampton village. Pop. (2000) village, 3,965; town, 54,712.

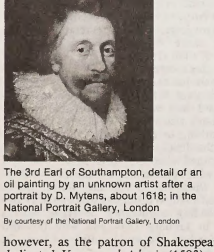
**Southampton,** EARLS, COUNTESS, AND DUKES OF, titled English nobility of multiple creations, grouped below chronologically and indicated by the symbol •.

**•Southampton, William Fitzwilliam, Earl of** (b. *c.* 1490—d. October 1542, Newcastle upon Tyne, Northumberland, Eng.), English admiral during the reign of Henry VIII.

A son of Sir William Fitzwilliam of Aldwarke, near Rotherham, Fitzwilliam was a companion in boyhood of Henry VIII and was knighted for his services at the siege of Tournai in 1513. Later he was treasurer of Thomas, Cardinal Wolsey's household and was sent several times to France on diplomatic business. As vice admiral he commanded a fleet when England and France were at war in 1523. He was comptroller of the royal household, chancellor of the duchy of Lancaster, and keeper of the privy seal. In 1537 he became lord high admiral and Earl of Southampton. He went to Calais to conduct Anne of Cleves to England and wrote in flattering terms to Henry about his bride. He died while marching with the English army into Scotland. He left no sons, and his title became extinct.

**•Southampton, Thomas Wriothesley, 1st Earl of,** BARON WRIOTHESLEY OF TITCHFIELD (b. Dec. 21, 1505, London, Eng.—d. July 30, 1550, London), influential minister of state during the last years of the reign of King Henry VIII of England.

The son of one herald, William Writh, or Wriothesley, and nephew and cousin to two others, Thomas Wriothesley was well-placed for a career in the royal service. He was educated at the University of Cambridge, where he made the acquaintance of Stephen Gardiner, later master of Trinity Hall, bishop of Winchester, and a leading councillor to Henry VIII. Wriothesley subsequently married Gardiner's niece Jane Cheyne. Gardiner appointed him a clerk of the signet in 1530, but, when Thomas Cromwell rose to power (1532–33) as Henry VIII's chief minister, Wriothesley transferred to his service, finally becoming Cromwell's chief clerk and personal secretary. His promising connections not only got him possession of extensive monastic properties in Hampshire and elsewhere but also moved him upward in the king's service. In 1538 he went on embassy to the Netherlands; in 1539 he sat in Parliament as one of the knights for Hampshire; in April 1540 he succeeded Cromwell as one of two joint principal secretaries of state. In the same month, he was knighted. Cromwell's fall (June 1540) did not interrupt Wriothesley's career; indeed, even before the final crisis he had almost certainly reestablished contact with Cromwell's enemy Gardiner and had worked against his master. Wriothesley was a true Henrician who would have nothing to do with the pope and welcomed the dissolution of the monasteries, but he remained a conservative in religion and viewed with apprehension Cromwell's negotiations with the Lutheran states. After Cromwell's fall, Wriothesley was one of Henry VIII's leading councillors, rewarded with a barony in January 1544 and with the lord chancellorship, the senior office of state, in April that year.



Very ambitious, he hoped to profit from the accession of the minor Edward VI after Henry VIII's death (January 1547), but the ensuing political struggles proved that he should have remained the senior civil servant that the discerning Cromwell had meant him to be. In February 1547 the Protector, Lord Somerset, bought his support with the earldom of Southampton; a month later, ready to promote the Reformation in England, Somerset deprived him of the chancellorship. Naturally, therefore, Wriothesley supported the conspiracy that Somerset's rival, John Dudley, Earl of Warwick (later Duke of Northumberland), led against Somerset in October 1549. But once again he was outmaneuvered: so far from restoring Roman Catholicism and the fallen minister, Warwick proved more Protestant still and in February 1550 excluded Wriothesley from the Council. The earl died in London five months later.

**•Southampton, Henry Wriothesley, 2nd Earl of,** BARON WRIOTHESLEY OF TITCHFIELD (baptized April 24, 1545—d. Oct. 4, 1581, Itchel Manor, near Farnham, Hampshire, Eng.), one of the Roman Catholic English nobles who conspired for the release of Mary, Queen of Scots.

Henry Wriothesley was the third and only surviving son of the 1st Earl of Southampton and was born into great privilege (King Henry VIII himself was one of the sponsors at his baptism). During the reign of the Protestant Elizabeth I, however, he gained a reputation as a zealous Roman Catholic. In June 1570, at age 25, he was arrested for alleged complicity in the proposed marriage of Thomas Howard, 4th Duke of Norfolk, to Mary, Queen of Scots, and was imprisoned from July to November 1570 and from October 1571 to May 1573—during the latter period, in the Tower of London. Thereafter, he held a minor post in the county of Southampton and apparently withdrew from politicking.

**•Southampton, Henry Wriothesley, 3rd Earl of,** BARON WRIOTHESLEY OF TITCHFIELD (b. Oct. 6, 1573, Cowdray, Sussex, Eng.—d. Nov. 10, 1624, Bergen op Zoom, Neth.), English nobleman and William Shakespeare's patron.

Henry Wriothesley succeeded to his father's earldom in 1581 and became a royal ward under the care of Lord Burghley. Educated at the University of Cambridge and at Gray's Inn, London, he was 17 when he was presented at court, where he was favoured by Queen Elizabeth I and befriended by Robert Devereux, 2nd Earl of Essex. Southampton became a munificent patron of writers, including Barnabe Barnes, Thomas Nashe, and Gervase Markham. Southampton is best known,

The 3rd Earl of Southampton, detail of an oil painting by an unknown artist after a portrait by D. Mytens, about 1618; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

however, as the patron of Shakespeare, who dedicated *Venus and Adonis* (1593) and *The Rape of Lucrece* (1594) to him. It has also been argued, albeit inconclusively, that the sonnets were addressed to him. If so, the earlier sonnets, urging marriage, must have been written before the beginning (in 1595) of Southampton's intrigue with Elizabeth Vernon, one of the queen's waiting women, which culminated with their hasty marriage in 1598, incurring the queen's wrath and leading to their brief imprisonment.

In 1596 and 1597 Southampton accompanied Essex on his expeditions to Cádiz and to the Azores. In 1599 he went to Ireland with Essex, but the queen insisted that Southampton return to London. He was deeply involved in the Essex rebellion (February 1601), on the eve of which he induced players at the Globe Theatre to revive *Richard II*, a play dealing with the deposition of a king, in order to stir up the populace. He was tried for treason on Feb. 19, 1601; his titles were forfeited and he was condemned to death, but his sentence was commuted to life imprisonment through the intervention of Sir Robert Cecil.

On the accession of James I, Southampton resumed his place at court. He was made a Knight of the Garter and captain of the Isle of Wight in 1603 and was restored to the peerage by act of Parliament. In 1603 he entertained Queen Anne with a performance of *Love's Labour's Lost* by Richard Burbage and his company, to which Shakespeare belonged.

Southampton was an active member of the Virginia and East India companies. He was a volunteer in support of German Protestants in 1614 and in 1617 proposed fitting out an expedition against the Barbary pirates. He became a privy councillor in 1619 but fell into disgrace through his determined opposition to the royal favourite, the Duke of Buckingham. In 1624 he and his elder son volunteered to fight for the United Provinces against Spain, but on landing in the Netherlands they were attacked with fever, and Southampton died a few days after the death of his son.

BIBLIOGRAPHY. A.L. Rowse, *Shakespeare's Southampton* (1965), is a biography.

**•Southampton, Thomas Wriothesley, 4th Earl of,** BARON WRIOTHESLEY OF TITCHFIELD (b. 1607—d. May 16, 1667, London, Eng.), major supporter of both Charles I and Charles II of England.

The only surviving son of the 3rd Earl, Thomas attended St. John's College, Cambridge. When the dispute began between Charles I and Parliament, he took the side of the latter, but soon the violence of its leaders drove him to support Charles, one of whose most loyal advisers he remained thereafter. He was, however, eager for peace and negotiated with the representatives of Parliament in 1643 and again at Uxbridge in 1645. Having paid more than £6,000 to the state, Southampton was allowed to live unmolested in England during the Commonwealth period, and on the restoration of Charles II he was made lord high treasurer. As treasurer he was remarkable for his freedom from any taint of corruption and for his efforts in the interests of economy and financial order. He died without surviving sons, and his titles became extinct. The name of the 4th Earl is perpetuated in London in Southampton Row and Southampton Street, Holborn, where his London residence stood.

**•Southampton, Barbara Villiers, Countess of:** *see* Cleveland, Barbara Villiers, Duchess of.

**•Southampton, Charles Fitzroy, 1st Duke of,** DUKE OF CLEVELAND, EARL OF SOUTHAMPTON, EARL OF CHICHESTER, BARON NONSUCH OF NONSUCH PARK, BARON NEWBURY, original name CHARLES PALMER, LORD LIMERICK (baptized June 18, 1662—d. Sept. 9, 1730), the natural son of Charles II by Barbara Villiers, Countess of Castlemaine. When his mother became Duchess of Cleveland and Countess of Southampton in 1670, he was allowed to assume the name of Fitzroy and the courtesy title of Earl of Southampton. In 1675 he was created Duke of Southampton and Earl of Chichester in his own right and became Duke of Cleveland on his mother's death in 1709, succeeding to her titles.

His life was fairly uneventful, but he was suspected of intriguing to restore James II to the throne in 1691. From 1710 he sat in the House of Lords—but infrequently. Upon his death, the titles went to his eldest son, William Fitzroy, who died without surviving issue in 1774; the titles then became extinct.

**Southampton Island,** island in Keewatin region, Northwest Territories, Canada. It lies at the entrance to Hudson Bay and is separated from the mainland by Roes Welcome Sound. Roughly triangular, it is about 210 miles (340 km) long and 220 miles (355 km) wide and has an area of 15,913 square miles (41,214 square km). The terrain consists of a plateau about 2,000 feet (600 m) high in the northeast (with 1,000-foot [300-metre] coastal cliffs), gradually sloping to lowlands in the south. In the interior, swift streams cut through deep gorges. Coral Harbour, at the head of South Bay, is the only trading post, but a Royal Canadian Mounted Police base and an airfield and meteorologic station are at Munn Bay, 5 miles (8 km) northwest. The coastal waters are noted for Arctic char fishing. The island was discovered in 1613 by Thomas Button and was named after the 3rd Earl of Southampton.

**Southdown,** breed of medium-wool, dark-faced, hornless sheep originating in the Sussex hills of England. The oldest of all British breeds of sheep, it has an ideal body conformation for meat production. Its fleece is close and is the finest of the British breeds; but, though white and of good quality, the wool is short and the fleeces relatively light in weight. The colour of its face and legs is brown to light brown or gray. Southdowns are popular in many parts of the world, especially in The Commonwealth and the United States.

**Southeast Asia,** region of Asia lying roughly between the Indian and the Pacific oceans and between the Asian landmass and Australia. It consists of two portions: mainland, or peninsular, Southeast Asia, comprising Myanmar (Burma), Thailand, Cambodia, Laos, Vietnam, and Singapore, and insular, or archipelagic, Southeast Asia, comprising Indonesia, Brunei, and the Philippines; Malaysia lies on both mainland (the southern portion of the Malay Peninsula) and insular (the northern part of Borneo) Southeast Asia. Although Indonesia and the Philippines are discussed in this article in their regional context, these two countries are treated separately in *Encyclopædia Britannica*. Area (land and sea) 5,000,000 square miles (13,000,000 square km), of which about 1,736,000 square miles (4,496,000 square km) is land. Pop. (1993 est.) 462,000,000.

A brief treatment of Southeast Asia follows. For full treatment, *see* MACROPAEDIA: Southeast Asia.

*The land.* Southeast Asia stretches some 4,000 miles (6,400 km) at its farthest extent (northwest to southeast). The region lies mostly between the Tropic of Cancer and 10° S latitude and is almost wholly within the humid tropics. The mainland is broken up topographically by an intricate and often rugged relief, where ridges typically attain heights of 6,000–9,800 feet (1,800–3,000 m). The pattern of relief is usually a continuation of larger continental landforms. An abundance of rainfall has added an elaborate network of rivers, in whose great deltas extensive regions of cultivable land exist, some of them major granaries of the peninsula. These natural features have influenced the human geography of the mainland. The difficulty of entry from the north has restricted overland human migration in the region, which is one of the reasons why, despite China's presence to the north, mainland Southeast Asia as a whole is relatively underpopulated.

Insular Southeast Asia's topography is typified by numerous volcanoes and short, swift-flowing rivers. Proximity to the sea has facilitated considerable waterbourne communication, although rugged interior areas are highly isolated.

The outlines of the region have been shaped geologically by recent flooding of the continental shelves, and wide estuaries were formed by the drowning of river mouths. The process of drowning led to an increase in rates of sedimentation, and, along many of the shallower and less-disturbed shores, vast belts of swamps were built up, such as in the deltas of the Red, Mekong, Irrawaddy, and Chao Phraya rivers.

Except in northern Vietnam and northern Myanmar, annual average sea-level temperatures in Southeast Asia are remarkably close to 80° F (27° C), and the degree of seasonal variation depends upon proximity to the sea and elevation. Snow falls only in extreme northern Myanmar. Most of the region receives more than 60 inches (1,500 mm) of rainfall annually, and considerable areas receive two to three times this amount.

In general, weather patterns are dictated by the monsoons. The southwest monsoon (May to September) accounts for most of the mainland's precipitation. The northeast monsoon (November to March) is a period of relatively cool and dry air for the mainland. Cyclonic disturbances occur during the intermonsoonal periods, and some of them grow into mature tropical-cyclonic storms, bringing torrential rain and destruction to the areas over which they pass.

The region is remarkable for the richness of its animal, vegetational, and microorganic life, which thrives in its hot, humid climate. The equatorial lowlands and much of the wet-

ter tropical zone to the north contain tropical evergreen rain forest. Palms of many kinds extend over wide areas behind the mangrove zone along the coasts of much of Malaysia. On nonsedimenting and exposed shores are found stretches of sandy beach, with various salt-tolerant plants, such as the grass *Spinitex squarrosus*. More common still is the coconut palm, which thrives in dense coastal margins. The rain forests in general support a lighter animal population than do the more open monsoon forests. Tigers and rhinoceroses are endemic in many parts, though their numbers are dwindling. The elephant and the water buffalo, the latter indigenous to Southeast Asia, are found in all parts of the region. There is also a tremendous profusion and diversity of birds and insects throughout the region.

*People.* The earliest-known inhabitants of mainland Southeast Asia were from the Asian continental interior and were displaced by successive waves of migrants from the north; insular Southeast Asia contains a mixture of descendants of Proto-Malay (Nesoit) and Pareoean peoples, influenced by Malayo-Polynesian and other groups. The ethnic pattern was complicated during the era of European dominance by the influx of Chinese and, to a lesser extent, of Indians and Arabs, which resulted in considerable intermixture.

The region has a comparatively low level of urbanization, excluding Singapore and Brunei. Immigration, however, has played a major role in the population increase of such cities as Singapore, Bangkok, and Jakarta, where the rate of increase is often double the national growth rate.

Elements of most earlier religious influences are found in varying degrees throughout the region. Animism has survived in many of the more isolated areas. The dominant Buddhist and Hindu religions suffered from the encroachment of Islām in much of Indonesia and Malaysia, while the limited adoption of Christianity in the region dates from the later stages of the spread of Islām.

*Economy.* Agriculture continues to dominate the economy of much of Southeast Asia. A great number of people are farmers or are engaged in extraction industries. The principal crops include rice, cassava, corn (maize), tobacco, sugarcane, rubber, coffee, tea, fruits, spices, peanuts (groundnuts), and soybeans. The region as a whole is self-sufficient in cereals. Animals raised include water buffalo, cattle, goats, sheep, and pigs. Fisheries are important, particularly in Malaysia, Indonesia, and Thailand.

Manufacturing has come to contribute an increasing share of the region's economic output, especially in the countries of the Association of Southeast Asian Nations (ASEAN). Industries having mainly rural locations include rubber and palm-oil processing, small-scale rice milling, and brick- and tileworks. The range of urban industries, which is much wider, includes large-scale rice milling, rubber remilling, tin smelting, spinning and weaving, the assembly of motor cars and electronic components, the processing of tobacco and dairy products, canning, petroleum refining, and heavy-metal fabrication. International transportation systems in the region are relatively well developed, but most national systems are predominantly local and often discontinuous. The well-developed road network of the western part of peninsular Malaysia is an exception. Internal air routes are generally focused on one or two major cities from which branches radiate.

*History.* The history of Southeast Asia is remarkable for the succession of outside influences that shaped its course. The Dong Son culture passed into Southeast Asia from China as early as 1000 BC. In the period that followed, Hinduism and Buddhism from India penetrated the region and had great cultural and political impact upon the imperial powers, such as the Śrīvijaya, Ava, and Majapahit, that rose and fell there. The Khmer kingdom was founded in the late 8th century, and from the 10th through the 12th century it flourished at Angkor. The exposed position of Cambodia between Siam (Thailand) and Vietnam, however, eventually led to its destruction. Theravāda Buddhism spread through the area between the 11th and the 15th century, leading to the establishment of Theravāda Buddhist monarchies in Pagan, Myanmar, and in Ayutthaya (or Ayudhya), north of present-day Bangkok. Islām became a dominant force in the 15th century, which also was when the Portuguese, Dutch, English, French, and Spanish arrived. The Islāmic states gradually came under the sway of these powers, and within a span of 300 years these foreigners colonized nearly the entire region. Only Siam remained free of colonial occupation. In the late 19th and early 20th centuries there was a growth of nationalist movements, which received further impetus during World War II, when much of the region was under Japanese occupation. Independence came to most of the countries in the region by the 1950s. Despite independence, political stability has eluded the region as a whole, mainly because of ethnic strife, socioeconomic inequities, and a plethora of economic difficulties. Many countries, such as Cambodia, Vietnam, and Laos, were plagued by open conflicts between various communist and noncommunist factions. The establishment of ASEAN in 1967 was an attempt to advance the economic and political integration of the region.

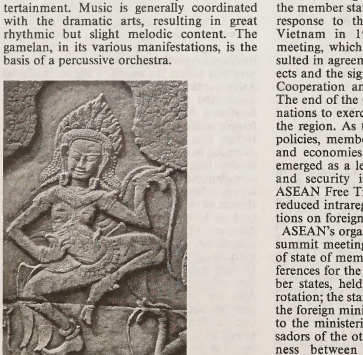
**Southeast Asia Treaty Organization** (SEATO), regional-defense organization from 1955 to 1977, created by the Southeast Asia Collective Defence Treaty, signed at Manila on Sept. 8, 1954, by the representatives of Australia, France, New Zealand, Pakistan, the Philippines, Thailand, the United Kingdom, and the United States. The treaty came into force on Feb. 19, 1955. Pakistan withdrew in 1968, and France suspended financial support in 1975. The organization held its final exercise on Feb. 20, 1976, and formally ended on June 30, 1977.

The formation of SEATO was a response to the demand that the Southeast Asian area be protected against communist expansionism, especially as manifested through military aggression in Korea and Indochina and through subversion backed by organized armed forces in Malaysia and the Philippines. Vietnam, Cambodia, and Laos (the successor states of Indochina) were not considered for membership in SEATO for reasons that related to the Geneva agreements of 1954 on Vietnam. These states were, however, accorded military protection by a protocol. Other nations of South and Southeast Asia preferred to retain their foreign policies of nonalignment.

The treaty defined its purposes as defensive only and included provisions for self-help and mutual aid in preventing and countering subversive activities from without and cooperation in promoting economic and social progress. SEATO had no standing forces but relied on the mobile striking power of its member states, which engaged in combined military exercises.

**Southeast Asian arts,** the literary, performing, and visual arts of Myanmar (Burma), Thailand, Laos, Cambodia, Vietnam, Malaysia, Singapore, and the Philippines. Though the cultural development of Southeast Asia was dominated by Indian influence, some prehistoric cohesive traits predate "Indianization." Wet-rice (or *padi*) agriculture, metallurgy, navigation, ancestor cults, and worship associated with mountains were indigenous and widespread; nor were *batik* textiles, *gamelan* orchestras, or *wayang* puppet theatre—three art forms still popular throughout the region—derived from India.

A brief treatment of Southeast Asian arts follows. For full treatment, *see* MACROPAEDIA: Southeast Asian Arts.



The 3rd-century-BC Dong Son culture of Vietnam produced bronze artifacts of technical and decorative sophistication. The navigational skills of the Dong Son people are evinced by their representations of large boats and the wide dispersal area of their beautifully crafted drums. Southeast Asian archaeological and historical studies are still in their infancy; excavation may yet reveal similar Metal Age sites associated with bronze drums found in Malaysia and Indonesia. Dong Son motifs recur at a later date in the architectural ornamentation of Old Java and the ancient Cambodian kingdom of Champa and are echoed in the decorative arts of the present-day Dyak of Borneo. Hinduism and Buddhism were transplanted to Southeast Asia from India but were transformed in conformity with the archaic beliefs and religious practices of Southeast Asia. Indian architectural and decorative motifs were similarly reworked to suit Southeast Asian requirements, a process to which local traditions contributed. Purely derivative styles generally reflect the earliest stage of Southeast Asian contact with India; indigenous elements dominated the late phases of Hindu art in Southeast Asia. In the final phase of Hindu temple construction in East Java, for example, Indian and local mythological themes were executed in a style taken from the indigenous shadow theatre. These *wayang* relief panels are complemented at Caṇḍi Sukuh by a terraced layout echoing the ancient megalithic terrace-shrines of the Yang Plateau. Sinicized regions such as Vietnam are generally the product of conquest. Chinese literature (and written characters), art, and ideas were imposed on Vietnam along with Han-dynasty administration. Despite commercial and diplomatic contact, few artistic elements elsewhere in Southeast Asia are overtly Chinese, yet Chinese ideas possibly had a formative influence—assumptions underlying the emperor cult have many points of comparison with the regal symbolism that pervades the visual arts of Southeast Asia.

Trade with South Asia existed long before Hinduism and Buddhism were adopted in Southeast Asia. It seems unlikely, however, that small mercantile colonies were the centres for dissemination of Indian ideas and art forms. On the contrary, Southeast Asian princes certainly took the initiative by inviting to court Brahman priests, some of whom had already brought their Sanskrit language and culture to the coastal areas of both insular and mainland Southeast Asia. Indian art forms flourished because these potentates found in the highly evolved ritual, mythology, and theology of India a means of legitimating and extending their rule. In a sense, they were importing a superior magic—displayed in the monumental architecture and colourful ceremonial so prominent in Southeast Asian societies.

Religious art and architecture did not simply further temporal power; the two were intimately connected. The Khmer temple-cities of Angkor Wat and Angkor Thom were centres of a royal cult. Aligned along the cardinal points and dominated by "temple-mountains," they were microcosms of both the universe and the kingdom. The unearthly faces of the bodhisattva Lokeśvara crowning the Bayon were equally representative of the all-seeing eye of the emperor. Regal narcissism was widespread in Southeast Asia, and many sculptures of divinities were in fact royal portrait statues giving a sophisticated and novel veneer to archaic notions of power and spiritual potency. In Java the *caṇḍi* combined temple and royal mausoleum. The complex symbolism of

Borobudur marries Buddhist cosmology to an ancestral cult of kings. Temple reliefs illustrate excerpts from Indian texts, mostly *Mahābhārata* and *Rāmāyaṇa* epic episodes and *Jātaka* tales of the Buddha's previous lives.

The *Mahābhārata*, *Rāmāyaṇa*, *Jātakas*, and local legendary tales—the Pandji cycle of stories of Java and the Thai king Abhai, among many others—are also expounded in the performing arts of the region. *Bhārata-nāṭya* is the model for a distinct dance technique that has minimized the mudras (gestures) of Indian classicism to emphasize grace of movement over theme. Regional variations of temple and court dance vie with local developments; Bali, a living museum of popular idiosyncratic Hinduism, sports the *barong* and *legong*. Numerous theatrical forms are vehicles for social criticism; most remarkable is wayang, or shadow play, in which puppetry has been fused with dance and drama in a unique form of entertainment. Music is generally coordinated with the dramatic arts, resulting in great rhythmic but slight melodic content. The gamelan, in its various manifestations, is the basis of a percussive orchestra.

Bas-relief of an *apsara* (celestial dancer) from an ancient Khmer temple in Angkor, Cambodia
Wolfgang Kaehler—Corbis

Myanmar and Thailand share the common performance tradition of Southeast Asia, but their adoption of Theravāda Buddhism forged strong ties with Sri Lanka, evident in their visual arts (the Thai *cheddi* [or *chedi*] and Myanmar pagoda are versions of the Sri Lankan bell stupa). Thai sculpture and architecture were often highly derivative of Indian and Khmer forms, though the walking Buddhas of Sukhothai are innovative. The temples of Pagan (Myanmar) are distinctive, and the outstanding Borobudur complex in central Java, though influenced by Indian art, provides a unique and impressive example of architectural adaptation.

Islām made no impact on these kingdoms, and elsewhere it tended to contribute little more than a Muslim veneer to evolved art traditions. Similarly, the cultural influence of Europe was minimal outside the Philippines, yet nationalist agitation against colonial rule gave impetus to the development of vernacular literatures, which had been slow to develop because of the regional hegemony of Sanskrit. Chronicle, epic, and romantic compositions rarely predate the 15th century.

**Southeast Asian Nations, Association of** (ASEAN), international organization established by the governments of Indonesia, Malaysia, the Philippines, Singapore, and Thailand on Aug. 8, 1967, to accelerate economic growth, social progress, and cultural development and to promote peace and security in the Southeast Asia region. Brunei became a member in 1984, and Vietnam was admitted in 1995. Laos and Myanmar (Burma) became members of ASEAN in 1997, and Cambodia was admitted to full membership in 1999. ASEAN replaced the Association of South East Asia (ASA), which had been formed by the Philippines, Thailand, and the Federation of Malaya (now part of Malaysia) in 1961. ASEAN's chief projects involve economic cooperation, promotion of trade both among ASEAN nations and between ASEAN nations and the rest of the world, and programs for joint research and technical cooperation between member nations.

Held together somewhat tenuously in its early years, ASEAN achieved a new cohesion in the mid-1970s in the face of the changed power balance in Southeast Asia following the end of the Vietnam War. Greater self-confidence was also a factor, born of the dynamic economic growth experienced by the member nations during the 1970s. Thus, for example, the member states were able to make a unified response to the takeover of Cambodia by Vietnam in 1979. ASEAN's first summit meeting, which was held in Bali in 1976, resulted in agreement on several industrial projects and the signing of a Treaty of Amity and Cooperation and a Declaration of Concord. The end of the Cold War allowed the ASEAN nations to exercise greater political latitude in the region. As they began to implement new policies, member nations saw their influence and economies grow. In the 1990s ASEAN emerged as a leading voice on regional trade and security issues. Members created the ASEAN Free Trade Area (AFTA), a pact that reduced intraregional tariffs and eased restrictions on foreign investment, in 1992.

ASEAN's organizational structure consists of summit meetings, which bring together heads of state of member countries; ministerial conferences for the foreign ministers of the member states, held annually in each country in rotation; the standing committee, consisting of the foreign minister of the country that is host to the ministerial conference and the ambassadors of the other five, which conducts business between ministerial conferences; a permanent secretariat in Jakarta, Indonesia, headed by a secretary-general (which position rotates among member nations every three years); and a number of other committees, subcommittees, and ad hoc groups. The organization publishes an annual report, as well as the semimonthly *ASEAN Newsletter*.

**Southeast Celebes** (Indonesia): *see* Sulawesi Tenggara.

**Southeast Svalbard Nature Reservation,** Norwegian SØRAUST-SVALBARD NATURRESERVAT, nature reserve established in 1973 by Norway. One of several protected areas in the Svalbard archipelago, it is bordered on the east by Olga Strait and on the west by Stor Fjord. With an area of 2,463 square miles (6,380 square km), the reserve encompasses the islands of Barents and Edge and has a number of small glacial caps that extend across a substantial portion of each island. Animal life on the reserve includes the Svalbard reindeer, which feeds on the sparse vegetation of the area.

**Southeastern Conference,** American collegiate athletic association that grew out of the Southern Conference. Members are the University of Alabama, the University of Arkansas (Fayetteville), Auburn University, the University of Florida, the University of Georgia, the University of Kentucky, Louisiana State University, the University of Mississippi, Mississippi State University, the University of South Carolina, the University of Tennessee, and Vanderbilt University. The University of the South in Sewanee, Tenn., an original member, dropped out of the conference in 1940, and both the Georgia Institute of Technology and Tulane University left in the 1960s. The conference was formed in 1932 when its members left the 11-year-old Southern Conference, believing that it had grown too large for competitive balance. In 1990 Arkansas and South Carolina joined the conference.

**Southend-on-Sea,** unitary authority, England. It lies on the Thames estuary and the North Sea. The nearest seaside resort to London, 40 miles (64 km) away, it attracts millions of visitors, and there are many resident commuters. It is noted for its pier (1.5 miles [2 km] long) as well as its beaches, gardens, yachting, open-air theatre, carnival celebration, and seafront illuminations. The parish of Prittlewell, now a part of Southend, has a 12th-century priory that houses a museum. Southend became fashionable as a seaside resort when visited in 1801 by Princess Charlotte of Wales and by her mother, Princess Caroline, in 1803. Area 16 square miles (42 square km). Pop. (1998 est.) 176,000.

**southern Africa,** southern region of the African continent, comprising the countries of Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe. The island nation of Madagascar is excluded from this region because of its distinct language and cultural heritage. Area 2,316,000 square miles (5,999,000 square km). Pop. (2000 est.) 110,555,000.

A brief treatment of southern Africa follows. For full treatment, *see* MACROPAEDIA: Southern Africa.

The interior of the region consists of a series of undulating plateaus, which extend from western South Africa and central Angola to Zambia, Zimbabwe, and western Mozambique. The plateau region is divided altitudinally from east to west into three subregions: the Highveld, lying above 4,000 feet (about 1,200 m); the Middleveld, averaging between 2,000 and 4,000 feet (600 to 1,200 m); and the Lowveld, below 2,000 feet (600 m). The Kalahari basin is the central depression of the plateau region. It is flanked by the Great Escarpment, a series of mountain ranges that run in an almost unbroken arc southward from the Zambezi River and around the Cape of Good Hope before turning north toward Angola. These ranges characterize the coastal margins throughout much of the region, though coastal plains lie along the Indian Ocean in Mozambique and on the Atlantic in parts of Angola and Namibia.

Southern African climates range from temperate to tropical. Its temperatures are somewhat lower than those of equatorial Africa, Fahrenheit temperatures in the 70s and 80s (20s Celsius) being the norm. Most of southern Africa receives a moderate annual rainfall of about 30 to 50 inches (760 to 1,270 mm). Much of southern Angola, Namibia, Botswana, and western South Africa have a more arid climate and higher mean temperatures, however; these are especially marked in the Namib and Kalahari deserts. Most of southern Africa is covered with either savannas or subdesert scrublands. Wooded grasslands are somewhat more common to the east.

The indigenous inhabitants of southern Africa can be conventionally classed into two major divisions, based primarily on linguistic distinctions: the Khoisan-speaking peoples, including the San and the Khoikhoin (formerly known, derogatorily, as Bushmen and Hottentots, respectively), and Bantu-speaking peoples. The San are now found primarily in the Kalahari and in surrounding areas. The Khoikhoin are located in the southern half of Namibia. The far more numerous and widespread Bantu constitute the vast majority of the people living in southern Africa. Among the larger ethnic groups of the Bantu are the Xhosa, Tembu, and Zulu peoples of South

Africa; the Ndebele of Zimbabwe; the Tsonga of Mozambique; the Tswana of Botswana; the Shona peoples of Zimbabwe and Mozambique; and the Herero and Ambo of Namibia.

Culturally the history of most of the peoples of the region is comparatively recent. The oldest inhabitants are probably the San and Khoi peoples, who have occupied parts of the area since Paleolithic times. They were succeeded (and often displaced) by the arrival of Bantu-speaking peoples from the north and east beginning sometime during the first half of the 1st millennium AD. The Bantu-speaking peoples' Iron Age cultures were based primarily on the keeping and milking of cattle, although there was some scattered farming using iron implements.

By the 8th century AD Arab traders had begun to visit the region's inhabitants, who traded ivory, copper, and gold for the Arabs' wares. In the 14th and 15th centuries there arose a stone-building culture represented in the present day by the walled ruins of Great Zimbabwe in Zimbabwe. This and several other cultures before and after it were based on great wealth in cattle, which in turn gave them preferential access to the coastal trade with the Arabs. However, the arrival of Portuguese traders and colonizers on the coast in the 16th century led to the economic and cultural decline of the African cultures in the region. The Portuguese pushed inland during the 17th century, establishing themselves in the Zambezi River valley and into present-day Mozambique and Angola.

The second half of the 17th century saw increasing numbers of Dutch colonists arriving at the Cape of Good Hope (in present-day South Africa). The immediate consequences of Dutch settlement were the decimation of the indigenous Khoi peoples of the Cape area. During the first half of the 19th century, much of southern Africa underwent great political and economic dislocations. These were due partly to the pressures of Dutch settlement as it spread northward from the Cape, but a more important cause was the rise to power in the 1820s of the Zulu kingdom under Shaka. He created a highly centralized military kingdom in what is now southeastern South Africa, and his armies pushed many other neighbouring peoples northward into Zimbabwe, Botswana, and Mozambique. The resulting migrations of peoples largely determined the current ethnic geography of the eastern half of southern Africa, with its patchwork of different Bantu subgroups.

The imposition in the early 19th century of British rule over the Dutch at the Cape had far-reaching consequences; the white settlement of the area expanded rapidly thereafter; many descendants of the Dutch, called Boers, migrated northward to escape British rule; and the British during the late 19th and early 20th centuries established a number of protectorates, territories, and colonies that came to constitute virtually all of southern Africa north of the Union (later the Republic) of South Africa. These British possessions were flanked on the east and west by the Portuguese colonies of Mozambique and Angola, respectively, and by German-held South West Africa (now Namibia) on the southwest. Out of the remaining British colonies in southern Africa there eventually emerged in the 1960s the independent African nations of Zambia, Malawi, Botswana, Lesotho, and Swaziland. Zimbabwe came under the rule of its black African majority in 1980. Mozambique and Angola achieved independence from Portuguese colonial rule in the 1970s. In 1988 South Africa accepted a UN resolution granting free elections in Namibia and the withdrawal of South African troops; the country officially gained its independence in 1990. In 1994 democratic elections in South Africa resulted in the ascendancy of the country's black majority. Pop. (1996 est.) 108,300,000.

**Southern African Development Community** (SADC), originally (1979–92) SOUTHERN AFRICAN DEVELOPMENT COORDINATION CONFERENCE, regional organization of southern African countries that works to promote economic cooperation and integration among the member states and to preserve their economic independence. The member states are Angola, Botswana, Lesotho, Malawi, Mauritius, Mozambique, Namibia, South Africa, Swaziland, Tanzania, Zambia, and Zimbabwe. The first conference was held in 1979, on the eve of Zimbabwe's (Rhodesia's) independence under black majority rule. The SADC's activities are coordinated at annual conferences of the heads of government and of a council of ministers from all the member states. The SADC plans, coordinates, and finances various projects in agriculture and animal husbandry, energy, mining, disease control, telecommunications, and regional trade.

Among the SADC's earliest priorities were projects to improve the existing rail and road networks between the member states so they could reduce their dependence on South African ports and transport routes for the shipment of their imports and exports. These projects greatly improved the region's transportation infrastructure. With the advent of majority black rule in South Africa and that country's membership in the SADC (1994), however, the focus of the organization shifted toward greater regional economic integration.

**Southern Alps,** mountain range on South Island, New Zealand. It is the highest range in Australasia. Making up the loftiest portion of the mountains that extend the length of the island, the Alps extend from Haast Pass, at the head of Wanaka Lake, northeastward to Arthur's Pass. They vary in elevation from

Southern Alps, New Zealand
Werner Stoy from Camera Hawaii

3,000 feet (900 m) to 16 peaks above 10,000 feet (3,050 m) and culminate in Mount Cook (12,349 feet [3,764 m]). Glaciers descend from the permanently snow-clad top of the range, and major rivers, including the Rakaia, Rangitata, and Waitaki, drain eastward across the Canterbury Plains. The Alps divide the island climatically, the forested western slopes and narrow coastal plain of Westland being much wetter than the eastern slopes and the wide Canterbury Plains. The Southern Alps have great hydroelectric potential, and, since the 1930s, power stations have been built on the Waitaki River and its tributaries and at Lake Coleridge. The Alps are crossed by a rail line passing through the Otira Tunnel (5.3 miles [8.6 km] long) at Arthur's Pass. Sighted by the Dutch navigator Abel Tasman in 1642, the Alps' first European traversal (1857) was accomplished by Leonard Harper.

**Southern Baptist Convention,** largest Baptist group in the United States, organized at Augusta, Ga., in 1845 by Southern Baptists who disagreed with the antislavery attitudes and activities of Northern Baptists.

Like Baptists in the North, Baptists in the South trace their history back to the Baptist churches established in the American colonies in the 17th century. The number of Baptist churches increased and spread throughout the colonies in the 18th century, primarily because of the missionary work of the Philadelphia Baptist Association, which was organized in 1707 by five Baptist churches in Pennsylvania, New Jersey, and Delaware. Early associations of Baptist churches in the South included the Charleston Association (1751) in South Carolina, the Ketochton Association (1765) in Virginia, and the Kehukee Association (1765) in North Carolina.

In the 19th century, the Baptist churches and associations in the North and South cooperated in organizing national organizations concerned with foreign and home missions and religious publications. The slavery question, however, soon caused disagreements between Southern and Northern Baptists, and in 1845 the Southern Baptists set up their own organization. About 300 churches joined the new group.

From its beginnings the Southern Baptist Convention was a more centralized denominational organization than had been usual among the Baptists. It developed its own missions, publications, and educational and other boards that functioned under the direction of the convention. The centralized organization has been credited with aiding the amazing growth of the convention following a period of recovery after the devastation of the American Civil War (1861–65).

Generally considered more conservative than the American Baptist Churches in the U.S.A., the Southern Baptist Convention has not taken an active part in ecumenical activities. Though joining in the Baptist World Alliance, it has not joined the National Council of the Churches of Christ in the U.S.A. or the World Council of Churches. In a historic reversal, the convention adopted a resolution in 1995 denouncing racism and repudiating its past defense of slavery and opposition to the civil rights movement. The Southern Baptist Convention has become a national rather than a regional church, and it has long been by far the largest American Protestant body and one of the most rapidly growing. Its membership, more than 15 million in the late 20th century, now includes a substantial fraction of ethnic minorities. There are state conventions, and a general convention is held annually. Headquarters are in Nashville, Tenn.

**Southern Bihār Plains,** southern part of the Middle Ganges Plain, Bihār state, eastern India. Bounded by the Chota Nāgpur plateau on the south, the Ganges River and the North Bihār Plains on the north, the Ayodhya (Oudh) Plains on the west, and the Bengal Basin on the east, the Southern Bihār Plains extend across central Bihār state and have an area of about 17,330 square miles (44,900 square km).

The plains are a segment of the flat Indo-Ganges trough, with an elevation gradually decreasing from 500 feet (150 m) in the south to 100 feet (30 m) in the north. The Ganges is the major river in the plains and is the recipient of other rivers crisscrossing the region; the Son River divides the plains into two physiocultural units comprising the Ganges-Son Divide in the west and the Magadha-Anga Plain in the east. Historically, the rivers have shifted

their courses several times. Soils are alluvial, and dense forests of sal (*Shorea*), teak, Java plum, mahua, and jujube are found on the plains. Agriculture dominates the economy; rice, wheat, and oilseeds are the chief crops. Irrigation, principally from the Ganges River, plays an important role in farming operations. Copper, apatite, kyanite, and other minerals are mined. Cottage industries produce textiles, sugar, paper, and vegetable oil.

Patna and Gaya are educational centres. Monghyr (Munger) has a cigarette factory, and Jamālpur has the country's major railway-engineering workshops. Bhāgalpur is noted for its production of tussah silk. The region has a well-developed network of roads, railways, and inland waterways.

**Southern Buh,** Ukrainian PIVDENNYY BUH, Russian YUZHNY BUG, Yuzhny also spelled IUZHNYI, or JUŽNYJ, river, southwestern and south-central Ukraine. The Southern Buh is 492 miles (792 km) long and drains a basin of 24,610 square miles (63,740 square km). It rises in the Volyn-Podilsk Upland and flows east and southeast, first through a narrow valley with rapids and then across rolling steppe (largely under cultivation), to enter the Black Sea by a winding estuary 29 miles (47 km) long. The flow of the river shows great seasonal variation. The Southern Buh is navigable to Voznesensk, and on its estuary is the port of Mykolayiv.

**Southern Carpathians** (Romania): *see* Transylvanian Alps.

**Southern Christian Leadership Conference** (SCLC), American nonsectarian agency with headquarters in Atlanta, Ga., established by the Reverend Martin Luther King, Jr., and his followers in 1957 to coordinate and assist local organizations working for the full equality of blacks in all aspects of American life. The organization worked primarily in the South and some border states, conducting leadership-training programs, citizen-education projects, and voter-registration drives. The SCLC played a major part in the civil-rights march on Washington, D.C., in 1963 and in anti-discrimination and voter-registration drives, notably at Albany, Ga., and Birmingham and Selma, Ala., in the early 1960s—campaigns that spurred passage of the federal Civil Rights Act of 1964 and the Voting Rights Act of 1965.

After King's assassination in April 1968, his place as president was taken by the Reverend Ralph David Abernathy. While the SCLC maintained its philosophy of nonviolent social change, it soon ceased to mount giant demonstrations and confined itself to smaller campaigns, predominantly in the South. The organization was further weakened by several schisms, including the departure in 1972 of civil-rights leader Jesse L. Jackson and his followers who had staffed Operation Breadbasket in Chicago, which was directed at economic goals.

**Southern Cross, The** (constellation): *see* Crux.

**Southern Dynasties,** Chinese (Wade-Giles) NAN-CH'AO, or (Pinyin) NAN CHAO (AD 420–589), four succeeding short-lived dynasties based at Chien-k'ang (now Nanking), which ruled over a large part of China south of the Yangtze River during much of the period of the Six Dynasties (*q.v.*). The four dynasties were the Liu-Sung (420–479), the Nan (Southern) Ch'i (479–502), the Nan Liang (502–557), and the Nan Ch'en (557–589). Although it was a time of comparative political weakness, Chinese culture flourished during this period.

**Southern Karoo** (South Africa): *see* Little Karoo.

**southern lights,** also called AURORA AUSTRALIS, luminous atmospheric display visible in the Southern Hemisphere. *See* aurora.

**Southern Ocean:** *see* Antarctic Ocean.

**Southern Overland Mail Company,** organization awarded (1858) the U.S. government contract to deliver mail to the Pacific coast. The company operated a 25-day, semiweekly stagecoach run along a route from St. Louis, Mo., through El Paso, Texas, and Tucson, New Mexico Territory, to San Francisco.

With the outbreak of the American Civil War in 1861, the southern route was abandoned, and the government contract was awarded to the Central Overland California and Pikes Peak Express, which operated through Salt Lake City, Utah. The Central Overland was purchased in 1862 by Ben Holladay, and the Holladay Overland Stage Company was sold to Wells, Fargo and Company in 1866. The company's stagecoach operations were maintained until the completion of the first transcontinental railroad in 1869.

**Southern Pacific Railroad,** one of the great American railroad systems, established in 1861 by the "big four" of western railroad building—Collis P. Huntington, Leland Stanford, Mark Hopkins, and Charles Crocker. After completing the Central Pacific from California to Utah in 1869, they started the Southern Pacific as a branch line into southern California. It reached the Arizona border in 1877, and in 1883 it was joined to other railroads built west from New Orleans across Texas and New Mexico. These lines were collectively known as the Central Pacific system. In 1884 the Southern Pacific Company was incorporated, and the railroads making up the Central Pacific system were leased to it a year later. The Central Pacific thus became the nucleus from which the Southern Pacific system developed.

The Southern Pacific serves 15 states in the West and Southwest, including the Pacific and Gulf coasts, with the network dipping south from northwestern Oregon to swing in a wide arc up into Illinois. The railroad served 35 international points of entry. About half the railroad's freight revenues came from food products, lumber, chemicals, and motor vehicles.

In 1971, along with many other railroads, the Southern Pacific gave up operating intercity passenger trains of its own account, although it continued to operate several long-distance trains for the federally sponsored National Railroad Passenger Corporation (Amtrak). It also continued a commuter service between San Francisco and San Jose, Calif.

The Southern Pacific Transportation Company, a holding company for the railroad, was incorporated in 1969. In 1983 the Southern Pacific Transportation Company agreed to merge with Santa Fe Industries, but in 1987 the Interstate Commerce Commission rejected the proposed merger, and the Southern Pacific was sold to Rio Grande Industries, owner and operator of the Denver and Rio Grande Western Railroad system, in 1988. The Southern Pacific was acquired by the Union Pacific Corporation in 1996. The merged firm was the largest railroad company in the United States and controlled most of the rail-based shipping in the western two-thirds of the country.

**Southern painting** (Japanese painting style): *see* Nan-ga.

**Southern Railway Company,** railroad system in the southern United States incorporating almost 150 prior railroads. It was organized in 1894 by the financier J.P. Morgan to take over a number of other railroads, including the Richmond and Danville, formed in 1847, and the East Tennessee, Virginia, and Georgia, formed in 1887.

The company's earliest antecedent, the South Carolina Canal and Railroad Company, was chartered in 1827 and operated the country's first regularly scheduled passenger train, on Christmas Day, 1830. In three years the line became the world's longest railway. Many of the predecessor lines played a strategic role in the American Civil War, although a number of them suffered destruction by Northern troops. The current system grew out of the reorganization following the war.

The company acquired a number of other railroads over the years until by the 1970s it served all the states south of the Ohio and Potomac rivers and east of the Mississippi except West Virginia. It extended from Washington, D.C., and St. Louis, Mo., to Brunswick, Ga., and Jacksonville, Fla., on the Atlantic, and to Mobile, Ala., and New Orleans, La., on the Gulf of Mexico.

From the 1940s, the Southern followed a policy of simplifying its organization until by the late 20th century the system included a number of separately operated subsidiaries that operated over 10,000 miles (16,100 km) of track. Much of their freight revenue came from coal, pulp and paper, and chemicals. In 1982 the Southern was merged with the Norfolk and Western Railway Company and thereafter was operated by Norfolk Southern Corporation, a holding company.

**Southerne, Thomas** (b. 1660, Oxmantown, Dublin, Ire.—d. May 26, 1746, London, Eng.), Irish dramatist, long famous for two sentimental tragedies that were acted until well into the 19th century—*The Fatal Marriage* (performed 1694; adapted 1757 by the actor-manager David Garrick as *Isabella, or the Fatal Marriage*) and *Oroonoko* (performed 1695).

Southerne was educated at Trinity College, Dublin, but spent his life after about 1680 in London, where he began to study law. His

Southerne, stipple engraving after a portrait by J. Worsdale

BBC Hulton Picture Library

first play, *The Loyal Brother,* was produced at London's Drury Lane Theatre in 1682. From 1685 to 1688 he was soldiering, but he wrote several other plays and contributed prologues and epilogues to John Dryden's plays.

Both of Southerne's principal works were based on novels by Aphra Behn, a popular 17th-century novelist and poet. In their mingling of pathos with a sometimes flaccid rhetoric, they owed much to the 17th-century dramatist Thomas Otway, as well. *The Fatal Marriage* anticipated 18th-century domestic tragedy, and *Oroonoko* showed affiliations with the earlier heroic plays of Dryden. The role of Isabella, which was first played by the great English actress Elizabeth Barry, gave Sarah Siddons one of her major successes a century later. The character of Oroonoko, an African prince enslaved in the English colony of Surinam, marked one of the first literary appearances of the "noble savage," and the play was a notably early English condemnation of the slave trade. As well as writing several other plays—lively comedies of manners and frigid tragedies in Roman settings—Southerne also revised and finished Dryden's tragedy *Cleomenes* (1692).

**Southey, Robert** (b. Aug. 12, 1774, Bristol, Gloucestershire, Eng.—d. March 21, 1843, Keswick, Cumberland), English poet and writer of miscellaneous prose who is chiefly remembered for his association with Samuel Taylor Coleridge and William Wordsworth, both of whom were leaders of the early Romantic movement.

Southey, detail of a pencil and watercolour portrait by R. Hancock, 1796; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

The son of a linen draper, Southey spent much of his childhood at Bath in the care of his aunt, Elizabeth Tyler. He began to write while attending Westminster School in London, from which he was expelled for criticizing in a school magazine the practice of excessive whipping. His expulsion roused the rebellious side of his nature and confirmed his enthusiasm for the ideals of the French Revolution. When he entered Balliol College, Oxford, in 1792, soon after his father's bankruptcy and death, Southey expressed his ardent sympathy for the revolution in the long poem *Joan of Arc* (published 1796). He first met Coleridge, who shared his views, in 1794, and together they wrote a verse drama, *The Fall of Robespierre* (1794). After leaving Oxford without a degree, Southey planned to carry out Coleridge's project for a pantisocracy, or utopian agricultural community, to be located on the banks of the Susquehanna River, in the United States. But his interest in pantisocracy faded, causing a temporary breach with Coleridge.

In 1795 he secretly married Edith Fricker, whose sister, Sara, Coleridge was soon to marry. Southey's marriage created an irreparable breach between himself and his aunt, and late in 1795 he went to Portugal with his uncle, who was the British chaplain in Lisbon. While in Portugal he wrote the letters published as *Letters Written During a Short Residence in Spain and Portugal* (1797), studied the literature of those two countries, and learned to "thank God [he was] an Englishman." So began the change from revolutionary to Tory. He also began to study law but found himself unsuited for it. In 1797 he began to receive an annuity of £160 that was paid to him for nine years by an old Westminster school friend, Charles Wynn. In 1797–99 he published a second volume of his collected *Poems*.

Southey by this time had decided to earn his living as a writer. In these years he composed many of his best short poems and ballads, and he became a regular contributor to newspapers and reviews. Southey also did translations, edited the works of Thomas Chatterton, and worked on the epic poem *Madoc* (1805) and completed the epic *Thalaba the Destroyer* (1801).

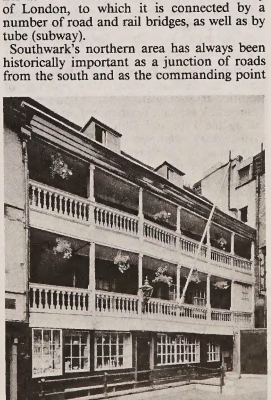
In 1803 the Southeys visited the Coleridges, then living at Greta Hall, Keswick. The Southeys remained at Greta Hall for life, partly so that Sara and Edith could be together. Southey's friendship with Wordsworth, then at nearby Grasmere, dates from this time. The Southeys had seven children of their own, and, after Coleridge left his family for Malta, the whole household was economically dependent on Southey for a time. He was forced to produce unremittingly—poetry, criticism, history, biography, journalism, translations, and editions of earlier writers. During 1809–38 he wrote, for the Tory *Quarterly Review*, 95 political articles, for each of which he received £100. Of most interest today are those articles urging the state provision of "social services." He also worked on a projected history of Portugal that he was destined never to finish; only his *History of Brazil*, 3 vol. (1810–19), was published.

In 1813 Southey was appointed poet laureate through the influence of Sir Walter Scott, and in 1835 his government pension of £160, which had been secured for him by Wynn in 1807, was increased to £300 in recognition of his services to literature. He thus gained economic security, but the unauthorized publication (1817) of *Wat Tyler*, an early verse drama reflecting his youthful political opinions, enabled his enemies to remind the public of his youthful republicanism. About this time he became involved in a literary imbroglio with Lord Byron, who disliked him. Byron had already attacked Southey in *English Bards and Scotch Reviewers* (1809) and had dedicated to him (1819) the first cantos of *Don Juan*, a satire on hypocrisy. In his introduction to *A Vision of Judgement* (1821), Southey continued the quarrel by denouncing Byron as belonging to a "Satanic school" of poetry, and Byron replied by producing a masterful parody of Southey's own poem under the title *The Vision of Judgment* (1822). Southey's last years were clouded by his wife's insanity, by family quarrels resulting from his second marriage after her death (1837), and by his own failing mental and physical health.

Except for a few lyrics, ballads, and comic-grotesque poems—*e.g.*, "My days among the Dead are past," "After Blenheim," and "The Inchcape Rock" (considered a masterpiece of comic invention)—Southey's poetry is little read, but his prose style has been long regarded as masterly in its ease and clarity. These qualities are best seen in his *Life of Nelson* (1813), still a classic; in the *Life of Wesley; and the Rise and Progress of Methodism* (1820); in the lively *Letters from England: By Don Manuel Alvarez Espriella,* the observations of a fictitious Spaniard (1807); and in the anonymously published *The Doctor*, 7 vol. (1834–47), a fantastic, rambling miscellany packed with comment, quotations, and anecdotes (including the well-known children's classic "The Story of the Three Bears"). His less successful epic poems are verse romances having a mythological or legendary subject matter set in the past and in distant places. In his prose works and in his voluminous correspondence, which gives a detailed picture of his literary surroundings and friends, Southey's effortless mastery of prose is clearly evident, a fact attested to by such eminent contemporaries as William Hazlitt and Scott and even by such an enemy as Byron.

**Southington,** town (township), Hartford county, west-central Connecticut, U.S., on the Quinnipiac River. It originated as the South Society of Farmington (1726) and was incorporated as a separate town in 1779. The Borough of Southington (incorporated 1889), the town's central community, was consolidated with the town in 1947. Since the early 19th century Southington has been both an agricultural and a manufacturing community. Pop. (1992 est.) 38,445.

**Southland,** local government region, southwestern South Island, New Zealand. Bordering the Tasman Sea to the west, the Southland region stretches for 120 miles (190 km) from the vicinity of Milford Sound in the northwest to Preservation Inlet in the south; eastward it includes Gore and the city of Invercargill. Fiordland National Park, one of the world's largest national parks, with a total land area of more than 3,000,000 acres (1,200,000 hectares), makes up the western part of Southland region.



The region, which includes Stewart Island to the south, is known for its coastal inlets, or fjords, in the west; these are U-shaped valleys, often with several branches and excavated by glaciers, that have become flooded by the sea to a distance of 10–20 miles (16–32 km) inland. The valley's steep walls plunge almost vertically below the water to reach great marine depths. On the nearby highlands, which rise some 3,600 feet (1,100 m) above sea level, glaciers also carved many large valleys that, dammed by morainal (glacial) debris, have become flooded to form lakes. The largest of these lakes are Te Anau, Manapouri, Monowai, Hauroko, and Poteriteri. The highland part of the region receives as much as 250 inches (6,350 mm) of rain annually and is densely forested. Stewart Island is an offshore outlier of Southland. Invercargill, which is located across the Foveaux Strait from Stewart Island, is the centre of a sheep- and dairy-farming area.

The region was sighted by the Dutch navigator Abel Tasman in 1642 and by Captain James Cook in 1770 but was not explored until the 1850s. The rugged western landscape, basically untouched, is accessible via the Homer Tunnel road (1954). Pop. (1991) 103,442.

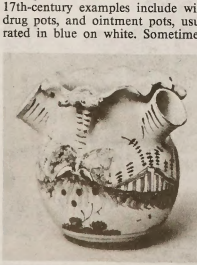
**Southport,** locality in Sefton district, metropolitan area of Merseyside, England. It is a residential community and Irish Sea coastal resort about 20 miles (32 km) north of the major port of Liverpool. It grew rapidly in the 19th century on coastal dunes, with spacious gardens and golf courses, including Royal Birkdale. These amenities lie along the seafront and the shopping thoroughfare, Lord Street. Pop. (1981) 90,962.

**Southwark,** inner borough, metropolitan area of Greater London, with an area of 11 square miles (29 square km) and extending south from the River Thames to Sydenham Hill. It was formed in 1965 by the amalgamation of three former metropolitan boroughs, Bermondsey, Camberwell, and Southwark. It lies across the Thames from the central City of London, to which it is connected by a number of road and rail bridges, as well as by tube (subway).

Southwark's northern area has always been historically important as a junction of roads from the south and as the commanding point

The George Inn, Southwark, London

A.F. Kersting



to the approach to London Bridge. Southwark itself dates from the Roman construction of a bridge across the Thames, from which main Roman roads (now the A2 and A3 highways) radiated. The crossroads, known as the Elephant and Castle (the name of an inn), is a major traffic approach for the four road bridges.

Because of its position, Southwark has long been a busy commercial area. Commercial activities in the borough include food processing and newspaper publishing and printing. Bankside was formerly the location of houses of the bishop of Winchester and other ecclesiastics. Among the borough's educational and cultural institutions are Dulwich College (founded 1619) and the Imperial War Museum. Where not of post-World War II date, Southwark's architecture is predominantly Victorian; wartime destruction and large-scale redevelopment schemes have completely changed parts of the borough, notably the Elephant and Castle area.

Old Southwark, known traditionally as "The Borough," was from 1295 to 1547 the only town besides the City in the present Greater London area to be represented in Parliament. Southwark was granted to the citizens of London in 1327 by Edward III, and it became known as the "Bridge Ward Without." From the 15th century on, Southwark was known for its many inns, theatres, spas, country resorts, and other places of entertainment and recreation. The Canterbury pilgrims, as imagined by the poet Geoffrey Chaucer, started from the Tabard Inn in Borough High Street. The George, now owned by the National Trust, is the last surviving galleried inn in London. Many of William Shakespeare's plays were first produced at the Globe Theatre on Bankside.

After the Reformation, the Augustinian priory of St. Overie, by the southern end of London Bridge, became the parish church of St. Saviour Southwark. Since 1905 it has been the cathedral church of the Southwark diocese. Guy's Hospital, one of London's major teaching hospitals, was opened nearby in 1725. Two former Southwark landmarks have given rise to popular phrases: to be "in the clink" (*i.e.,* imprisoned), derived from the prison in Clinke Street; and a state of "bedlam" (*i.e.,* animated confusion), derived from the disorder at Bethlehem Royal Hospital for the mentally ill. Pop. (1992 est.) 227,400.

**Southwark and Lambeth delftware,** tin-glazed earthenware made at a number of factories at Southwark, London, and nearby Lambeth, Vauxhall, Bermondsey, and Aldgate during the 17th and 18th centuries. Typical 17th-century examples include wine bottles, drug pots, and ointment pots, usually decorated in blue on white. Sometimes the decoration consists of bold horizontal lines and freehand lettering, sometimes of arms, shells, masks, or cupids. Large dishes in blue, green, yellow, orange, and purplish black, with biblical and other scenes, belong to this period.

Lambeth delftware flowerpot painted with a manganese tin glaze, about 1680; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

In the 18th century several new styles arose; the plates of this period show sketchy scenes in the Chinese manner, with figures, trees, and architectural details executed sometimes in blue only (on a white ground) but often in various combinations of the colours mentioned. The keynote of the style was free and almost slapdash brushwork: effects were achieved by hatching and bold horizontal or vertical brushstrokes. Abstract rather than naturalistic floral festoons, bunches, and sprays were similarly rendered.

**Southwell, Robert** (b. 1561, Horsham St. Faith, Norfolk, Eng.—d. March 4, 1595, London), English poet and martyr remembered for his saintly life as a Jesuit priest and missionary during a time of Protestant persecution and for his religious poetry.

Southwell was educated at Jesuit colleges in France and in Rome. In 1585 he was ordained priest and made prefect of studies at the English College at Rome. He returned to England as a missionary in 1586, when he became chaplain to Anne Howard and spiritual adviser to her husband, the 1st Earl of Arundel, a recusant imprisoned in the Tower of London. Southwell lived in concealment at Arundel House, writing letters of consolation to persecuted Roman Catholics and making pastoral journeys. His *An Epistle of Comfort* was printed secretly in 1587; other letters circulated in manuscript.

Southwell was arrested in 1592 while celebrating mass. He was tortured in an attempt to make him reveal the whereabouts of his fellow priests and imprisoned in the Tower of London in solitary confinement. In 1595 he was tried for treason under the anti-Catholic penal laws of 1585 and executed. Southwell's devotional lyrics and prose treatises and epistles reflect the ardent piety of his life. His best works achieve an unusual directness and simplicity, and his use of paradox and striking imagery is akin to that of the later Metaphysical poets. He is the foremost representative of Roman Catholic letters in Elizabethan England.

**Southwest,** region, southwestern United States, historically denoting several geographic areas in turn and changing over the years as the nation expanded. After the War of 1812, the Southwest generally meant Missouri, Arkansas, and Louisiana; after Texas was annexed, it, too, was included. In the wake of the war with Mexico, the Southwest embraced most, but not all, of the territory that was acquired under the Treaty of Guadalupe Hidalgo (1848), including land often considered part of the "West"—*i.e.,* New Mexico, Arizona, and all or parts of Oklahoma, Colorado, Utah, and Nevada, as suited the convenience of the user of the term. It ordinarily excludes California.

The common denominator of the modern Southwest is aridity. The high, dry plains of Texas extend westward to the Pecos valley of New Mexico. Although the southern spurs of the Rocky Mountains beyond the Pecos River are cool and are dotted with evergreens, farther west are vast highly coloured sandstone deposits. Occasional mesas or buttes rise above the peneplain through which the Colorado River has cut such spectacular gorges as the Grand Canyon. Stretching westward from Arizona are the true deserts with their growth of cacti and gaunt, parallel chains of mountains almost devoid of vegetation.

Most crops can be grown in the Southwest only with irrigation, the water for which is taken mostly from the Colorado River and the Rio Grande. Prior to the Reclamation Act of 1902 and the subsequent building of Theodore Roosevelt Dam (completed 1911) near Phoenix, Ariz., Hoover Dam (1936) on the Colorado River, and the Glen Canyon Dam (1966) upriver from Hoover, the dryness of the land enforced a pastoral economy. During the period of Spanish ascendancy in the early 1800s, sheep ranches grew to great size. The Pueblo Indians even began to use wool instead of native cotton in their weaving. Although the importance of sheep ranching has declined in the 20th century, cattle raising has increased and is economically important in New Mexico, Arizona, Oklahoma, and Texas; the latter leads all other states in the raising of beef cattle as well as sheep. Long-staple cotton, alfalfa, citrus fruit, grain, and sorghum are the Southwest's main crops.

Copper mining, particularly in Arizona, where open-pit operations account for about two-thirds of the nation's total annual production, has been important since the 19th century. The discovery of petroleum and natural-gas deposits in the early 20th century in Oklahoma and Texas resulted in oases of prosperity from local oil booms. Along the Gulf Coast a flourishing industrial region developed around Houston and other Gulf of Mexico ports, largely based on petrochemical industries. Also, since World War II and particularly in Arizona and Texas, manufacturing has become important, notably in the electrical, communications, aeronautical, automobile-assembly, and aluminum industries. The growth of population and industry in the region also brought water shortages and, following the building of dams, disputes between states over the allocation of water resources, such as the diversion of water from the Colorado River.

Although the Southwest's dry, crisp climate and scenic landscapes were a curse to agriculture, they have been a boon to businesses catering to tourists and health seekers. These visitors had a lively interest in the Indian and Spanish-American cultures, including the native architecture, Indian dances, Spanish fiestas, and rodeos. The Southwest has also become a popular retirement area.

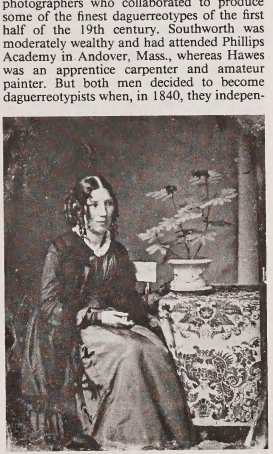
**Southwest Airlines Co.,** American airline incorporated in 1967 as Air Southwest Company. The current name was adopted in 1971. The company features low-fare, no-frills air service with frequent flights of mostly short routes. Costs are kept down by the exclusive use of Boeing 737 aircraft, which allows for low maintenance costs and quicker turnaround times for flights, and by an emphasis on ticketless travel. Headquarters are in Dallas, Texas.

It was founded in 1966 and envisioned as a commuter air service between Dallas, Houston, and San Antonio. The airline was incorporated the following year but, owing to several lengthy legal battles, was unable to begin commercial flights until 1971. Expansion began in 1975 with new routes to cities throughout Texas. The airline expanded conservatively into new markets following the federal deregulation of the airline industry in 1978, at first stretching its operations only into neighbouring southwestern states. In the 1990s Southwest added service to California, the Midwest, and the East and Southeast.

**Southwest Indian,** any American Indian who inhabits what is now the southwestern United States, including the southern portion of Colorado, most of Utah, Arizona, and New Mexico, and northwestern Mexico. Though highly diversified culturally and linguistically, the Southwest Indians divide roughly into four groupings: the Yuman tribes (Yuma, Mohave, Havasupai, Hualapai, Cocopa, Maricopa, and Yavapai); the Pima and Papago; the Pueblo (Hopi, Hano, Zuni, Acoma, Laguna, Jemez, Santa Ana, Zia, Cochiti, Santo Domingo, San Felipe, San Juan, Santa Clara, San Ildefonso, Nambe, Tesuque, Taos, Picuris, Isleta, and

Sandia); and the Navajo and Apache. They speak Yuman, Aztec-Tanoan, and Athabascan languages.

A brief treatment of Southwest Indians follows. For full treatment, *see* MACROPAEDIA: American Peoples, Native.



The best known of the Southwest Indians are the Pueblo Indians (*q.v.*), whose ancestors built great cliff villages now seen in ruins and equally remarkable multiple apartment houses of adobe and stone masonry. Some of the latter are still occupied, and the Pueblo Indian inhabitants speak languages and observe ceremonies that are at least pre-Spanish in origin. The Hopi and Zuni are among the largest groups of Pueblo Indians.

Whether the Navajo (*q.v.*) and Apache (*q.v.*) entered the area as a disruptive force or as peaceful neighbours is not definitely known. It is possible that hostility characterized their early relations, but in time the Pueblos and their Navajo-Apache neighbours accommodated to each other. The Navajo evidently joined the Pueblos in driving the Spanish out of New Mexico in 1680; and, following that, some Rio Grande Pueblo families joined the Navajo and were incorporated into the tribe. It is believed that the Navajo and Apache, who speak languages belonging to the Athabascan family, came down from the north, possibly from as far as Canada, where the bulk of the Athabascan linguistic stock was still located in the 20th century. They were already in the Southwest when Francisco Vásquez de Coronado entered the region in 1540, and the assumption is that the original immigration occurred at the close of the 13th century, coincidental with the abandonment of the great Pueblo communities in the San Juan River area. When they reached the Southwest, the Navajo were nomadic hunters and food gatherers, but in time they adopted agriculture from the Pueblos and made some pottery. By the beginning of the 18th century agriculture was the basic economy, and livestock raising (sheep and goats) had become established. Weaving of woolen blankets had also begun by that time. The Apache bands, with the exception of the Jicarilla and the Western Apache, seem to have borrowed less from the sedentary peoples of the Southwest and more from the Plains Indians.

On the Colorado River a group of tribes belonging to the Yuman language family combined agriculture with wild-seed gathering and hunting. Three of these tribes were in the vicinity of the Grand Canyon: Yavapai, Havasupai, and Hualapai. The tribes at the lower end of the Colorado River, the Cocopa, Yuma, Mohave, and Maricopa, were primarily agriculturists, utilizing flood irrigation. Their excellent pottery was derived from Pueblan types.

Although some progress has been made in recent years in alleviating the conditions facing most Southwest American Indians, many problems remain. Unemployment is high among the tribes, in some cases reaching 10 times the U.S. national average, and alcoholism has also been cited as one of the more serious problems. Because most of the tribes are not economically self-sufficient, they are, in greater or lesser degree, dependent on outside help. The U.S. federal government has tried to supply that help. Roads, schools, and hospitals have been built, and assistance has been given not only by the government but by private industry to develop such natural resources as coal, uranium, and oil, which have been found on tribal lands. Indian tribal councils have fostered Indian language schools and Indian-owned businesses, and scholarships have been formed to help train Indian professionals. Beliefs and traditions have been revived in an attempt to develop a viable Indian cultural identity, and Indian arts and crafts have found a ready market among tourists and collectors.

**Southworth, Albert Sands; and Hawes, Josiah Johnson** (respectively b. March 12, 1811, West Fairlee, Vt., U.S.—d. March 3, 1894, Charlestown, Mass.; b. Feb. 20, 1808, East Sudbury, now Wayland, Mass.—d. Aug. 7, 1901, Crawford's Notch, N.H.), American photographers who collaborated to produce some of the finest daguerreotypes of the first half of the 19th century. Southworth was moderately wealthy and had attended Phillips Academy in Andover, Mass., whereas Hawes was an apprentice carpenter and amateur painter. But both men decided to become daguerreotypists when, in 1840, they independently viewed the first daguerreotype brought to the United States. They learned the process from the U.S. agent of Jacques Daguerre, the inventor, and in 1841 opened a portrait studio together in Boston.

Daguerreotype portrait of Harriet Beecher Stowe, about 1856, by Southworth and Hawes

By courtesy of the Metropolitan Museum of Art, New York, gift of I.N. Phelps Stokes, Edward S. Hawes, Alice Mary Hawes, Marian Augusta Hawes, 1937

Unlike most portrait daguerreotypists of the mid-19th century—who were often more concerned with the quantity of their sales than with the quality of their portraits—Southworth and Hawes avoided contrived poses and painted backdrops. Instead, they gave each customer personal attention, making spontaneous portraits that revealed the personality of the sitter. Lemuel Shaw, then chief justice of the Massachusetts Supreme Court, was portrayed, for example, in a pose he happened to assume in a shaft of light that brought out the rugged features expressive of his character. The high quality of the work of Southworth and Hawes attracted many of the most prominent Americans of the day to their studio, including Senators Daniel Webster and Henry Clay and the writer Harriet Beecher Stowe.

The two men also made daguerreotypes of landscapes, cityscapes, and scenes such as hospital operating rooms that were not then accepted as proper subjects of photography.

In 1849 Southworth went to California in a futile attempt to find gold. When he returned to Boston, his failing health prevented him from working actively. In 1861 he ended his partnership with Hawes, who continued to photograph until his death.

**Southworth, Emma,** *née* EMMA DOROTHY ELIZA NEVITTE, also called MRS. E.D.E.N. SOUTHWORTH (b. Dec. 26, 1819, Washington, D.C., U.S.—d. June 30, 1899, Georgetown, Washington, D.C.), one of the most popular of the 19th-century American sentimental novelists. For more than 50 years, her sentimental domestic novels reached a wide audience in the United States and Europe.

After teaching school for five years, Emma Nevitte married Frederick Southworth, an itinerant inventor. When the couple separated in 1844, she turned to writing to support her family. Her first novel, *Retribution* (1849), sold 200,000 copies. Southworth went on to write 66 more novels, many of them first published serially in such magazines as the *Saturday Evening Post* and the *New York Ledger*. Her stories contributed two new character types to American fiction: the self-made man and the independent woman; her works also relied on sentimental plots of the Gothic genre that reflected prevailing values of piety and domesticity.

Emma Southworth's *Ishmael* (1876) and its sequel, *Self-Raised* (1876), were both huge successes. Among her other successful novels were *The Curse of Clifton* (1852), *The Hidden Hand* (1859), and *The Fatal Marriage* (1863).

**Soutine, Chaim** (b. 1893/94?, Smilovichi, near Minsk, Russian Empire [now in Belarus]—d. Aug. 9, 1943, Paris, Fr.), Russian-born French painter whose highly individualistic style, characterized by the use of thick impasto, agitated brushwork, convulsive compositional rhythms, and the presence of disturbing psychological content, is closely related to early 20th-century Expressionism.

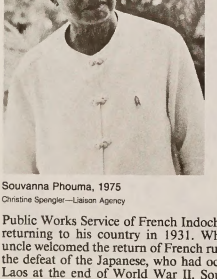
Soutine was born the 10th child of a poor Jewish tailor in Belorussia. At age 16 he went to Vilna (now Vilnius) in Lithuania, where a friendly doctor helped him attend the school of fine arts for three years. In 1913 he emigrated to Paris, where he met Marc Chagall, Amedeo Modigliani, and Jacques Lipchitz, and attended the École des Beaux-Arts. Modigliani introduced Soutine to the art dealer Leopold Zborowski, who enabled him to spend three years (1919–22) painting at Céret in the south of France. The feverish, visionary landscapes Soutine painted there marked the emergence of his mature style. Soutine spent most of the remainder of his life in Paris. He exhibited little during his lifetime and relentlessly reworked or destroyed old canvases, but his paintings nevertheless found their way into French and American private collections and museums. Soutine died in France in 1943 during the wartime German occupation.

"Side of Beef," oil on canvas by Chaim Soutine, *c.* 1925; in the Albright-Knox Art Gallery, Buffalo

By courtesy of the Albright-Knox Art Gallery, Buffalo, Room of Contemporary Art Fund; photograph, Sandak, Inc.

Soutine is most popularly associated with his studies of choirboys and cooks and his series of

pageboys (*e.g.*, "Page Boy at Maxim's," 1927; Albright-Knox Art Gallery, Buffalo). Also well known are his paintings of hung poultry and carcasses of beef, which convey the colour and luminosity of putrescence. He obtained these effects by painting in as many as 40 different hues with as many brushes.



Soutine's portraits from the 1920s, distinguished by their subjects' twisted faces and distorted limbs and by the emphasis in each canvas on one brilliant colour, frequently red, are among his most expressive works.

**Soútsos, Aléxandros** (b. 1803, Constantinople—d. 1863), Greek poet who founded the Greek Romantic school of poetry.

Soútsos studied in Chíos (Khíos) and later in Paris, where he was influenced by the French Romantics and by liberal political opinion. His verse satires are his liveliest writings and inspired the early development of modern political liberalism in Greece. His dramas and one long prose work, the *Exóristos* ("The Exile"), were considered cold and artificial, but his numerous lyrics were admired by his contemporaries in spite of their lack of originality and their rhetorical exuberance. Lord Byron's *Childe Harold* was the model for his longest poem, *Periplanoménos* ("The Wanderer"). His collected works were published in 1916.

**Souvanna Phouma** (b. Oct. 7, 1901, Luang Prabang, Laos—d. Jan. 10, 1984, Vientiane), premier of Laos known for having sought, throughout several terms in office, to maintain Laotian neutrality in Southeast Asian affairs.

Souvanna was the nephew of King Sisavangvong of Laos. He studied architectural engineering in France and then entered the

Souvanna Phouma, 1975
Christine Spengler—Liaison Agency

Public Works Service of French Indochina on returning to his country in 1931. When his uncle welcomed the return of French rule after the defeat of the Japanese, who had occupied Laos at the end of World War II, Souvanna and his half brother Souphanouvong joined the Lao Issara (Free Laos) movement and its provisional Vientiane government (1945–46). When the French reoccupied Laos, Souvanna fled to exile in Bangkok, but returned to Laos in 1949 as France began conceding autonomy to Laos. In 1951 he was elected premier and held that office until 1954.

He returned to the premiership in 1956 as the head of a coalition government that included both rightist representatives and members of the Communist Pathet Lao, which Souphanouvong headed. The coalition collapsed in 1958, and civil war broke out between the two groups. Souvanna served briefly as premier in 1960 and again returned during a brief truce in 1962. During the 1960s and early 1970s Souvanna struggled to retain a neutral position; with the proximity of the war in Vietnam, his efforts were in vain, and he came to depend upon U.S. military assistance. After the United States began to withdraw from that struggle, however, the Vientiane government and the Pathet Lao agreed on a cease-fire (February 1973), and in April 1974 a coalition government was formed. Souvanna retained the premiership until December 1975, when the People's Democratic Republic of Laos was established. He remained an adviser to the government until his death.

**Sovereign Council,** governmental body established by France in April 1663 for administering New France, its colony centred in what is now the St. Lawrence Valley of Canada.

The council's power included the naming of judges and minor officials, control of public funds and commerce with France, regulation of the fur trade with the Indians, and the right to issue policy decrees on colonial affairs. The powers of the council, however, were not absolute. It could order military expenditures, for example, only with the authority of the governor; moreover, its decisions were subject to the governor's veto. As originally established, the council consisted of the governor, the bishop (or, in his absence, the senior ecclesiastic), five councillors, an attorney general, and a clerk. The governor and the bishop, acting "jointly and in agreement," appointed the other members, who, at the end of a year, could be changed or continued in office.

In 1664 some of the council's powers were transferred to the Company of the West Indies; that company, however, did not exercise them fully, and the council continued to be the dominant force in the colony. The company was permitted to name the council members, but it did not do so until 1674, a year before its own dissolution.

In June 1675 a royal edict increased the number of councillors to seven, with vacancies to be filled by the king. After 1685 the intendant, a French administrative official, gradually took over many of the council's functions. In 1702 the Sovereign Council was renamed the Superior Council.

**sovereignty,** in political theory, the ultimate overseer, or authority, in the decision-making process of the state and in the maintenance of order. The concept of sovereignty, one of the most controversial ideas in political science and international law, is closely related to the difficult concepts of state and government, of independence and democracy. Originally, as derived from the Latin term *superanus* through the French term *souveraineté*, sovereignty was meant to be the equivalent of supreme power. It has departed, however, quite often from this traditional meaning.

*History.* In 16th-century France, Jean Bodin used the new concept of sovereignty to bolster the power of the French king over the rebellious feudal lords; the transition from feudalism to nationalism was thus facilitated. The theories of John Locke at the end of the 17th century and of Jean-Jacques Rousseau in the 18th century, that the state is based upon a compact of its citizens, through which they entrust such powers to a government as may be necessary for common protection, led to the development of the doctrine of popular sovereignty that found expression in the U.S. Declaration of Independence in 1776. Another twist was given to this concept by the statement in the French constitution of 1791 that "Sovereignty is one, indivisible, unalienable and imprescriptible; it belongs to the Nation; no group can attribute sovereignty to itself nor can an individual arrogate it to himself." The idea of popular sovereignty exercised primarily by the people became thus combined with the idea of national sovereignty exercised not by an unorganized people in the state of nature, but by a nation embodied in an organized state. Going one step further and investigating who in the name of the people or of the state exercises sovereignty, the English jurist John Austin came to the conclusion that sovereignty was vested in a nation's parliament. This was the supreme organ that enacted laws binding upon everybody else but that was not itself bound by the laws and could change these laws at will. This particular description again fitted only a particular system of government, such as prevailed in Great Britain in the 19th century.

When this idea of legislative sovereignty crossed the Atlantic Ocean, it did not really fit the American situation. The Constitution of the United States, being the fundamental law of a federal union, did not endow the national legislature with supreme power but imposed important restrictions upon it. A further complication was added when the Supreme Court of the United States asserted successfully its right to declare laws unconstitutional. While this development did not lead to a concept of judicial sovereignty, it seemed to vest the sovereign power in the fundamental document itself, the Constitution. This system of constitutional sovereignty was made more complex by the fact that the authority to propose changes in the Constitution and to approve them was vested not only in Congress but also in the several states and special conventions called for that purpose. It could be argued, therefore, that sovereignty continued to reside in the states or in the people, who, under the terms of the 10th Amendment to the Constitution, retained all powers not delegated to the United States by the Constitution or expressly prohibited by it. Consequently, the claims by the states' rights advocates that states continued to be sovereign were bolstered by the difficulty of finding a sole repository of sovereignty in a complex federal structure; and the concept of dual sovereignty of both the union and the component units found a theoretical basis. Even if the competing theory of popular sovereignty were accepted, vesting sovereignty in the people of the United States, it still might be argued that this sovereignty need not be exercised on behalf of the people solely by the national government, but could be divided on a functional basis between the federal and state authorities.

Another assault from within on the doctrine of state sovereignty was made in the 20th century by those political scientists (*e.g.*, Léon Duguit, Hugo Krabbe, and Harold J. Laski) who developed the theory of pluralistic sovereignty exercised by various political, economic, social, and religious groups that dominate the government of each state. According to this doctrine, sovereignty in each society does not reside in any particular place but shifts constantly from one group (or alliance of groups) to another. This pluralistic theory went even so far as to contend that the state is but one of many examples of social solidarity and possesses no special authority in comparison with other components of society.

*Sovereignty and international law.* While the doctrine of sovereignty has had an important impact on developments within states, its greatest influence has been in the relations between states. The difficulties here can be traced back to Bodin's statement in 1576 that the sovereign who makes the laws cannot be bound by the laws he makes (*majestas est summa in cives ac subditos legibusque soluta potestas*). This statement has been often interpreted as meaning that a sovereign is not responsible to anybody and is not bound by any laws whatever. But closer reading of Bodin's writings does not support this interpretation. He emphasizes that even with respect to his own citizens a sovereign is bound to observe certain basic rules derived from the divine law, the law of nature or reason, and the law that is common to all nations (*jus gentium*)—as well as the fundamental laws of the state that

determine who is the sovereign, who succeeds to sovereignty, and what limits the sovereign power. Thus, Bodin's sovereign was restricted by the constitutional law of the state and by the higher law that was considered as binding upon every human being. In fact, Bodin discussed as binding upon states many of those rules that were later woven into the fabric of international law. Nevertheless, his theories have been used as justifying absolutism in the internal political order and irresponsible anarchy in the international sphere.

This interpretation was developed to its logical conclusion by Thomas Hobbes in the *Leviathan* (1651), in which the sovereign was identified with might rather than law. Law is what the sovereign commands, and it cannot limit his power; sovereign power is as absolute as men can make it. In the international sphere this condition led to a perpetual state of war, one sovereign trying to impose his will by force on all other sovereigns. This situation changed but little over the next two centuries; and sovereign states have continued to claim the right to be judges in their own controversies, to enforce by war their own conception of their rights, to treat their own citizens in any way that suited them, and to regulate their economic life with complete disregard for possible repercussions in other states.

During the 20th century important restrictions on the freedom of action of states started to appear. The Hague Conferences of 1899 and 1907 established detailed rules governing the conduct of wars on land and at sea. The Covenant of the League of Nations restricted the right to wage war, and the Briand-Kellogg Pact of 1928 condemned recourse to war for the solution of international controversies and its use as an instrument of national policy. They were followed by the Charter of the United Nations (Article 2), which imposed the duty on member states to "settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered" and supplemented it with the injunction that all members "shall refrain in their international relations from the threat or use of force. . . ." However, the Charter listed as one of the basic principles of the UN "the principle of sovereign equality of all its Members."

In consequence of such developments, sovereignty ceased to be considered as synonymous with unrestricted power. States have accepted a considerable body of law limiting their sovereign right of acting as they please. Those restrictions on sovereignty are usually explained as deriving from consent or autolimitation, but it can be easily demonstrated that in some cases states have been considered as bound by certain rules of international law despite the lack of satisfactory proof that these rules were expressly or implicitly accepted by them. On the other hand, new rules cannot ordinarily be imposed upon a state, without its consent, by the will of other states. In this way a balance has been achieved between the needs of the international society and the desire of states to protect their sovereignty to the maximum possible extent.

*Nonsovereign states.* The 19th-century distinction between fully sovereign states and several categories of less sovereign units lost its importance under the law of the United Nations. Emphasis was placed not on legal differences among colonies, protected states, protectorates, and states under the suzerainty of another state, but on the practical distinction between self-governing and non-self-governing territories. Non-self-governing territories became under the charter of the UN "a sacred trust," and the states administering them promised to develop them toward self-government. Some of these territories were placed under a UN trusteeship that resulted in a closer supervision of their administration by the UN and in their speedier progress toward self-government or independence. Once a territory achieved self-government, as defined in resolutions of the General Assembly, supervision by the UN ceased, even though independent status was not reached.

*Divided sovereignty.* The concept of absolute, unlimited sovereignty did not last long after its adoption, either domestically or internationally. The growth of the democratic form of government imposed important limitations upon the power of the sovereign and of the ruling classes. The increase in the interdependence of states restricted the principle that might is right in international affairs. The peoples of the world have recognized that there can be no peace without law and that there can be no law without some limitations on sovereignty. They have started, therefore, to pool their sovereignties to the extent needed to maintain peace, and sovereignty is being increasingly exercised on behalf of the peoples of the world not only by national governments but also by organs of the world community. Thus, the theory of divided sovereignty, first developed in federal states, has become applicable also in the international sphere.

**Sovetsk,** formerly (until 1946) TILSIT, river port, Kaliningrad *oblast* (province), western Russia, on the Neman River. The city was founded by the Teutonic Knights in 1288 and was the site of the treaty negotiated between Napoleon and Tsar Alexander I in 1807. Until 1945 the city belonged to Prussia. Today it has wood and food industries and teacher-training and handicraft schools. Pop. (1991 est.) 42,300.

**Sovetskaya Gavan,** seaport, Khabarovsk *kray* (region), eastern Russia. Situated on the southeastern shore of a deep, narrow gulf of the Tatar Strait, the port has one of the best natural harbours of far-eastern Russia. Its development began only on the eve of World War I, and city status was achieved in 1941. Its principal economic activities include woodworking and fishery industries. The city received a great impetus when it became the terminus of a railway from Komsomolsk-na-Amure. Further growth followed the completion in 1980 of the BAM (Baikal–Amur Magistral) railroad because of Sovetskaya Gavan's location near its Pacific terminus. Pop. (1991 est.) 35,400.

**soviet,** council that was the primary unit of government in the Union of Soviet Socialist Republics and that officially performed both legislative and executive functions at the all-union, republic, province, city, district, and village levels.

The soviet first appeared during the St. Petersburg disorders of 1905, when representatives of striking workers acting under socialist leadership formed the Soviet of Workers' Deputies to coordinate revolutionary activities. It was suppressed by the government. Shortly before the abdication of Tsar Nicholas II in March 1917 and the creation of a Provisional Government, socialist leaders established the Petrograd Soviet of Workers' and Soldiers' Deputies, composed of one deputy for every 1,000 workers and one for each military company. A majority of the 2,500 deputies were Socialist Revolutionary Party members, claiming to represent peasant interests. This Petrograd Soviet stood as a "second government" opposite the Provisional Government and often challenged the latter's authority. Soviets sprang up in cities and towns across the Russian Empire. Much of their authority and legitimacy in the public eye came from the soviets' role as accurate reflectors of popular will: delegates had no set terms of office, and frequent by-elections gave ample opportunity for quick exertion of influence by the voters.

In June 1917 the first All-Russian Congress of Soviets, composed of delegations from local soviets, convened in Petrograd (now St. Petersburg). It elected a central executive committee to be in permanent session, with this committee's presidium at the head of the congress. The second congress met right after the radical Bolshevik faction of the Petrograd Soviet, having gained a majority in this body, had engineered the overthrow of the Provisional Government by the Red Guards and some supporting troops. In protest of this coup (the Russian Revolution of October 1917), most of the non-Bolshevik members of the congress walked out, leaving the Bolsheviks in control; an all-Bolshevik Council of People's Commissars was established as Russia's new government. Soviets across the empire assumed local power, though it took some time for the Bolsheviks to achieve a dominant position in every soviet.

At the fifth All-Russian Congress of Soviets, in 1918, a constitution was drawn up that established the soviet as the formal unit of local and regional government and affirmed the All-Russian Congress of Soviets as the highest body of the state. Later, the 1936 constitution provided for the direct election of a two-chamber Supreme Soviet—the Soviet of the Union, in which membership was based on population, and the Soviet of Nationalities, in which members were elected on a regional basis. Nominally, the deputies and presiding officers of the soviets at all levels were elected by the citizenry, but there was only one candidate for any office in these elections, and the selection of candidates was controlled by the Communist Party.

**Soviet Encyclopedia, Great:** *see* Bolshaya Sovetskaya Entsiklopediya.

**Soviet-German Nonaggression Pact** (1939): *see* German-Soviet Nonaggression Pact.

**Soviet law,** also called SOCIALIST LAW, the law that developed in the Soviet Union after the Russian Revolution of October 1917 and which, after World War II, was assimilated by other communist states. Although it had many of the characteristics of civil-law systems, including similar rules of procedure and legal methodologies, socialist law was distinguished from other legal systems by the influence of state ownership of the means of production, the pervasive influence of the Communist Party, the ties between the legal system and national economic planning, the denial of a distinction between public and private law, and the underlying conception of the law as a force for restructuring society and advancing the nation toward communism.

The legal system of the Soviet Union was the principal model followed by other members of the socialist family of legal systems (*e.g.*, Mongolia, China, eastern Europe, Cuba, Vietnam). Developed after the Russian Revolution of 1917, the origins of the legal system date back to the 10th century in Kievan Rus and reflect the influence of Byzantine secular and canon law and of Roman law via the civil-law tradition of western Europe.

The Soviet authorities formally repealed all tsarist legislation in 1918 and undertook thereafter to establish a social system leading toward communism. Socialist law was based on the writings of Karl Marx and Friedrich Engels, who proposed several general guidelines that were adopted by the founders of the new socialist legal system. First, the new legal system should eliminate the political power of the bourgeoisie (property-owning middle class); second, law should be the instrument of the state, not a limitation upon those who make policy; third, law should establish rules of public order that facilitate the transition of the state to socialism and eventually to the ideal of communism; and fourth, law should

educate citizens on how they can help achieve the communist social order.

Legislation was the principal source of law in the socialist legal system; custom was relied upon only in isolated commercial situations. Leading court decisions were published, but they constituted merely a guide to the application of law rather than a set of precedents. The basic law was the U.S.S.R. constitution—the latest constitution being that of 1977, augmented in 1978 by constitutions of the 15 union republics and 20 autonomous republics. Under the U.S.S.R. constitution, certain matters were reserved exclusively for federal, or "all-union," jurisdiction, and others were left to the union republics. In the principal branches of law, the all-union authorities enacted sets of "fundamental principles" of legislation binding throughout the land; these were then elaborated in codes of statutes by each respective union republic, which adapted the fundamental principles to its special circumstances. The principal republic codes included the criminal, civil, criminal procedure, civil procedure, family, labour, forestry, water, land, and correctional-labour codes. The Air Code and the Merchant Shipping Code were all-union codes exclusively.

In 1922 the Russian republic established a three-tiered system of civil and criminal courts that remained basically unchanged throughout the history of the Soviet Union. The courts of first instance in the Soviet Union were the people's courts, which heard 95 percent of all civil and criminal cases. In all cases heard at first instance, at whatever level, the judge had to sit with two laymen, called people's assessors, elected for 2½-year terms. The assessors served two weeks per year and had equal rights with the judge. Cases were decided by majority vote. Appeals were handled by provincial courts headed by professional judges, and the highest level of court, the Supreme Court of the republic, coordinated policy in all of the provinces. Soviet courts did not have the power of judicial review over the constitutionality of Supreme Soviet enactments. A separate system of military tribunals heard cases involving servicemen.

A legal agency of exceptional importance was the Procuracy of the U.S.S.R. The Procuracy was a highly centralized institution, dating conceptually back to Tsar Peter I the Great in the early 18th century. The U.S.S.R. procurator-general was appointed by and accountable only to the U.S.S.R. Supreme Soviet. In turn, the procurator appointed subordinate procurators. The Procuracy had responsibility for overseeing the investigation of most criminal cases, for prosecuting on behalf of the state, and for exercising sweeping powers of supervision over judicial decisions and over the legality of administrative actions and draft normative acts. The Procuracy also supervised the administration of correctional-labour institutions.

The socialist legal system produced many novel institutions. Because private ownership of most productive wealth had been abolished in many socialist states, legal codes tended to reflect the importance of state-owned property by imposing more severe penalties for theft of state-owned property than that of private, nonproductive property. While laws pertaining to sales, contracts, and property damage of consumer goods followed civil-law traditions, new laws were developed to govern transactions involving state property.

In the U.S.S.R. a vast category of offenses did not come within the purview of the criminal law or the courts at all. These were administrative offenses, punishable summarily by a fine, disciplinary sanction, or, in some instances, administrative detention for up to 15 days. Fines frequently were imposed on the spot by the apprehending official or inspector. Other aspects of the legal system demonstrated how socialist law endorsed the intervention of the state in social relationships. Employers were compelled to follow strict guidelines in executing labour contracts; property owners were subjected to numerous restrictions on the use of their land, farms, or dwellings, which, in some countries, could be confiscated if they were not thought to be used productively; and marriage and divorce were secularized in nearly all socialist law countries in order to reduce the power of religion and to consolidate control of marital relationships within the purview of the state.

**Soviet Union:** *see* Union of Soviet Socialist Republics.

**sovkhoz,** abbreviation of Russian SOVETSKOE KHOZYAYSTVO ("soviet farm"), plural SOVKHOZY, or SOVKHOZES, state-operated agricultural estate in the U.S.S.R. organized according to industrial principles for specialized large-scale production. Workers were paid wages but might also cultivate personal garden plots. Its form developed from the few private estates taken over in their entirety by the state in the original Soviet expropriations. The number of sovkhozy increased during the period of collectivization beginning in 1929 and spurted again during the 1950s when a number of kolkhozy, or collective farms, the more prevalent form of agricultural enterprise, were converted to sovkhozy. The Virgin and Idle Lands Campaign initiated in 1953 relied mainly on the sovkhozy. In 1973 the total area of sovkhozy was greater than that of kolkhozy for the first time. In 1990 the Russian government began encouraging the gradual conversion of sovkhozy to private farms.

**Sovremennik** (1836–66; "The Contemporary"), Russian literary and political journal founded in 1836 by the poet Aleksandr Pushkin. In its first year, the journal established its literary prestige by publishing Pushkin's novel *Kapitanskaya dochka* (1836; *The Captain's Daughter*) and Nikolay Gogol's story "Nos" (1836; "The Nose"). Pyotr Pletnev was editor from 1837 to 1847. Nikolay Nekrasov, editor from 1847 to 1866, published works by Ivan Turgenev and Leo Tolstoy and guided the journal into radical politics. Between 1857 and 1860 it was a leading voice in the movement to abolish serfdom. The journal's open criticism of the ruling class led to its suppression by tsarist authorities in 1866.

**sow bug,** any of certain small, terrestrial crustaceans of the order Isopoda, especially members of the genus *Oniscus.* Like the related pill bug, it is sometimes called the wood

Sow bug (*Oniscus asellus*)
Hugh Spencer

louse. *O. asellus,* which grows to a length of 18 mm (0.7 inch), is widely distributed in Europe and has also been introduced into North America. The oval, gray body, which is rather flattened and arched, is covered with broad, armourlike plates. Two elbowed antennae extend about half the length of the body, and there are seven pairs of limbs. This species is found under stones, in moist leaf litter, and in cellars.

**Sower, Christopher,** Sower also spelled SAUR, or SAUER (b. 1693, Ladenburg Palatinate of the Rhine [Germany]—d. Sept. 25, 1758, Germantown, Pa. [U.S.]), German-born American printer and Pietist leader of the Pennsylvania Germans.

Sower migrated with his wife and son Christopher to Germantown, Pa., in 1724. He was an artisan skilled in many crafts, was profoundly religious, and found his true career in 1738 as the first successful printer to the numerous Germans in colonial America. The output from his large and prolific press included a newspaper, *Der Hoch-Deutsch Pensylvanische Geschicht-Schreiber,* retitled *Pensylvanische Berichte* in 1748; an almanac, *Der Hoch-Deutsch Americanische Calender;* and more than 150 other imprints, mostly religious and in German, from broadsides to the first European-language colonial Bible (1743).

Sower's Pietism was evident in all his activities. He urged the politically apathetic Pennsylvania Germans to go to the polls to maintain pacifist and oath-denying Quakers in power. He worked for legislation to stop mistreatment of immigrants, dissemination of medical knowledge, building of hospitals, and maintenance of the German culture. He opposed defense measures, compulsory Anglicization of Germans, slavery, higher education, and traditional religions, with their forms, sectarianism, and professional clergy. Both his press and his principles were continued by his son Christopher (1721–84) after his death.

**Sowerby, Leo** (b. May 1, 1895, Grand Rapids, Mich., U.S.—d. July 7, 1968, Port Clinton, Ohio), American composer, organist, and teacher, whose organ and choral works provide a transition between 19th- and 20th-century American church-music styles.

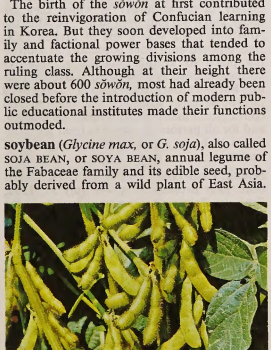
Sowerby
By courtesy of the Cathedral of St. James (Episcopal), Chicago

Sowerby studied in Chicago and in Rome as the first American winner of the Prix de Rome. He taught composition and theory at the American Conservatory of Music in Chicago (1925–62) and was organist at St. James Church (now Cathedral) there from 1927 to 1962. He became director in 1962 of the College of Church Musicians in Washington, D.C., where he also was associated with the National Cathedral (Episcopal).

Sowerby combined a fine melodic talent with a use of modern harmonies. His *Canticle of the Sun* for chorus and orchestra, based on Matthew Arnold's translation of a canticle by St. Francis, won the Pulitzer Prize in 1946. In *Syncopata* (1924) and *Monotony* he experimented with jazz. His orchestral works include tone poems, notably *Prairie* (1929), and four symphonies. He also wrote chamber music, concerti for piano, cello, and organ, and extensive choral and organ works.

**Soweto,** urban complex in Gauteng province, South Africa. It was originally set aside by the South African white government for residence by blacks. It adjoins Johannesburg on the southwest, its name being an acronym derived from *South-Western Townships.* It is the country's largest black urban complex.

The townships constituting Soweto grew out of shantytowns and slums that arose with the arrival of black labourers from rural areas, in particular in the period between World Wars I and II. Slum clearance and permanent-housing programs began in 1948, and local as well as national authority was established.



The population comprises a number of black ethnic groups, and Soweto residents have been in the forefront of demands for the development of black equality. In 1976 Soweto was the site of a massive uprising known as the Soweto Rebellion, which began as a political protest against the government's insistence that the Afrikaans language be used as the medium of instruction in Soweto's high schools.

In 1978 the first Community Council of black residents was elected to administer municipal affairs. Considered a powerless institution by most residents of Soweto, the Community Council was nominally responsible for development of transport, roads, water supply, sewerage, electricity, and housing. Under the postapartheid 1994 South African constitution, these municipal services came under the jurisdiction of the Greater Johannesburg Metropolitan Board (an elective body that includes representatives from Soweto and other black townships) or are provided by various provincial or national authorities. There is little industrial development, and most of Soweto's residents commute to Johannesburg for employment. Pop. (1985) 521,948.

**sŏwŏn,** private Confucian academies of the Korean Yi dynasty (1392–1910), founded by the members of the ruling class who did not hold official posts; their purpose was the educating of local *yangban,* or aristocratic youth. *Sŏwŏn* were usually built on sites associated with famous Confucian scholars of the past. They had their origin in the Paekundong Sŏwŏn, established in 1543 by Chu Sebung, a county magistrate in Kyŏngsang province, in honour of the Korean scholar An Yu.

The birth of the *sŏwŏn* at first contributed to the reinvigoration of Confucian learning in Korea. But they soon developed into family and factional power bases that tended to accentuate the growing divisions among the ruling class. Although at their height there were about 600 *sŏwŏn,* most had already been closed before the introduction of modern public educational institutes made their functions outmoded.

**soybean** (*Glycine max,* or *G. soja*), also called SOJA BEAN, or SOYA BEAN, annual legume of the Fabaceae family and its edible seed, probably derived from a wild plant of East Asia.

Soybeans (*Glycine max*)
J.C. Allen and Son

The soybean is economically the most important bean in the world, providing vegetable protein for millions of people and ingredients for hundreds of chemical products.

The origins of the soybean plant are obscure, but many botanists believe it to have derived from *Glycine ussuriensis,* a legume native to central China. The soybean has been used in China for 5,000 years as a food and a component of medicines. Soybeans were introduced into the United States in 1804 and became particularly important in the South and Midwest in the mid-20th century.

The most nutritious and most easily digested food of the bean family, the soybean is one of the richest and cheapest sources of protein. It is a staple in the diet of people and animals in numerous parts of the world today. The seed contains 17 percent oil and 63 percent meal, 50 percent of which is protein. Because soybeans contain no starch, they are a good source of protein for diabetics. In East Asia the bean is extensively consumed in the forms of soybean milk, a whitish liquid suspension, and tofu (*q.v.*), a curd somewhat resembling cottage cheese. Soybeans are also sprouted for use as a salad ingredient or as a vegetable and may be eaten roasted as a snack food. Soy sauce, a salty brown liquid, is produced from crushed soybeans and wheat that undergo yeast fermentation in salt water for six months to a year or more; it is a ubiquitous ingredient in Asian cooking.

The soybean is an erect, branching plant ranging in height from several centimetres to more than 2 m (6.5 feet). The self-fertilizing flowers are white or a shade of purple. Seeds can be yellow, green, brown, black, or bicoloured. In the United States, commercial varieties have brown or tan seeds, with one to four seeds per pod. The soybean may be cultivated in most types of soil, but it thrives in warm, fertile, well-drained, sandy loam. The crop is planted after all danger of frost is past. Maturing during September and October, soybeans are usually harvested mechanically in the United States, after the leaves have fallen off the plant and the moisture content of the seed has dropped to 13 percent, permitting safe storage.

In the 1980s the United States was the world's principal producer, followed by Brazil and China. Illinois is the leading producer among U.S. states. Ninety-eight percent of the U.S. crop is used for livestock feed.

Modern research has led to a remarkable variety of uses for the soybean. Its oil can be processed into margarine, shortening, and vegetarian cheeses. Industrially, the oil is used as an ingredient in paints, adhesives, fertilizers, sizing for cloth, linoleum backing, insect sprays, and fire extinguisher fluids, among other products. Soybean meal serves as a high-protein meat substitute in many food products, including baby foods, and can be imparted with a meatlike texture for increasing the cooked yield of such products as ground meat and bologna. In the late 20th century, the versatile, nutritious soybean, widely cultivable and readily exportable, played an integral role in attempts to alleviate world hunger.

**Soyinka, Wole,** in full AKINWANDE OLUWOLE SOYINKA (b. July 13, 1934, Abeokuta, Nigeria), Nigerian playwright, poet, novelist, and critic who received the Nobel Prize for Literature for 1986. He wrote of modern West Africa in a satirical style and with a tragic sense of the obstacles to human progress.

A member of the Yoruba people, Soyinka attended Government College and University College in Ibadan before graduating in English in 1958 from the University of Leeds, in England. Upon his return to Nigeria he founded a national theatre, The 1960 Masks (later the Orisun Theatre), and wrote his first important play, *A Dance of the Forests* (produced 1960, published 1963), for the Nigerian independence celebrations. The play satirizes the fledgling nation by stripping it of romantic legend and by showing that the present is no more a golden age than was the past.

In plays of a lighter vein he made fun of pompous, Westernized schoolteachers, as in *The Lion and the Jewel* (first performed in Ibadan, 1959; published 1963), and he mocked the clever preachers of upstart prayer-churches who grow fat on the credulity of their parishioners, as in *The Trials of Brother Jero* (1960)

Soyinka
Vernon L. Smith

and *Jero's Metamorphosis* (1972). But his more serious plays, such as *The Strong Breed* (1963), *Kongi's Harvest* (1965; opened the first Festival of Negro Arts in Dakar, 1966), *The Road* (1965), and *From Zia, With Love* (1992), reveal his disillusionment with African authoritarian leadership and with Nigerian society as a whole.

Other notable plays include *Madmen and Specialists* (1971; later retitled *Madmen and Scientists*) and *Death and the King's Horseman* (1975), which examines the clash of the colonial authorities' mores with the more demanding ones of traditional Yoruba society. In these and Soyinka's other dramas, Western elements are skillfully fused with subject matter and dramatic techniques deeply rooted in Yoruba folklore and religion. Symbolism, flashback, and ingenious plotting contribute to a rich dramatic structure. His best works exhibit humour and fine poetic style as well as a gift for irony and satire and for accurately matching the language of his complex characters to their social position and moral qualities.

From 1960 to 1964 Soyinka was coeditor of *Black Orpheus,* an important literary journal. From 1960 onward he taught literature and drama and headed theatre groups at various Nigerian universities, including those of Ibadan, Ife, and Lagos.

Soyinka's novels are *The Interpreters* (1965), in which a group of young intellectuals function as artists in their talks with one another as they try to place themselves in the context of the world about them, and *Season of Anomy,* which appeared in 1973.

Soyinka's volumes of poetry include *Idanre and Other Poems* (1967), *Poems from Prison* (1969; republished as *A Shuttle in the Crypt,* 1972), and *Mandela's Earth and Other Poems* (1988). His verse is characterized by a precise command of language and a mastery of lyric, dramatic, and meditative poetic forms. He wrote a good deal of *Poems from Prison* while he was jailed in 1967–69 for allegedly conspiring to aid the attempted secession of Biafra from Nigeria. *The Man Died* (1972) is his prose account of his arrest and imprisonment. Soyinka's principal critical work is *Myth, Literature, and the African World* (1976), a collection of essays in which he examines the role of the artist in the light of Yoruba mythology and symbolism.

Soyinka was the first black African to be awarded the Nobel Prize for Literature. His autobiography, *Aké: The Years of Childhood,* was published in 1981 and a companion piece, *Isara: A Voyage Around Essay,* in 1989.

**Soyot** (people): *see* Tuvinian.

**Soyuz**, any of several versions of Soviet/Russian manned spacecraft launched since 1967 and the longest-serving manned spacecraft design in use. The Soyuz design was originally conceived in Sergey Korolyov's design bureau for the U.S.S.R.'s Moon-landing program, which was canceled in 1974. Comprising orbital and service modules and a reentry capsule, the craft has served mainly as a crew ferry to and from Earth-orbiting space stations, specifically the Salyut stations, Mir, and the International Space Station (ISS).

The first version of Soyuz accommodated three persons without pressure suits. After accidental depressurization of the reentry capsule killed the crew of Soyuz 11 (1971), the spacecraft was modified for a crew of two to make room for additional life-support equipment. Soyuz T, introduced in 1979, had advanced equipment and capabilities and restored the third crew seat. Soyuz TM, an upgrade featuring a variety of new systems, made its first manned flight in 1987 when it carried Mir's second crew to the then-embryonic station. The Soyuz TMA debuted in 2002 with a manned flight to the ISS; its design incorporated changes to meet certain NASA requirements as an ISS "lifeboat," including eased height and weight restrictions for crew members. After the in-flight explosion of the U.S. space shuttle *Columbia* in February 2003 and the consequent grounding of the shuttle fleet, Soyuz spacecraft for a time provided the only means for ISS crew exchanges.

**Sōzen, Yamana** (15th-century Japanese clan head): *see* Yamana Mochitoyo.

**Sozini, Fausto (Paolo),** Sozini also spelled SOZZINI: *see* Socinus, Faustus.

**Sozini, Lelio (Francesco Maria),** Sozini also spelled SOZZINI: *see* Socinus, Laelius.

**Sozomen,** Greek SALAMANES HERMEIOS SOZOMENOS (b. *c.* 400, Bethelea, near Gaza, Palestine—d. *c.* 450, Constantinople, Byzantine Empire [now Istanbul, Tur.]), Christian lawyer in Constantinople whose church history, distinguished for its classical literary style, its favouring of monasticism, and its greater use of western European sources, rivaled that of his elder contemporary Socrates Scholasticus.

Dedicating the project to the reigning Byzantine emperor, Theodosius II (408–450), Sozomen compiled his work in nine books to cover the period 324 to 439. The surviving text, however, ends at 425, raising the question of whether the final part was suppressed by the emperor or lost.

Sozomen possibly intended to recast Socrates' work in a superior literary style for an audience not only of ecclesiastics but also of the cultured laity. Although he demonstrated an inferior critical method and little theological comprehension, Sozomen's unique inclusion of certain sources makes his chronicles valuable; they are corrective of Socrates' text and with it provided the medieval church with most of its knowledge of early Christianity.

**Spa,** municipality, Liège *province,* eastern Belgium. It is situated in the wooded hills of the northern Ardennes, southeast of Liège. Its popular mineral springs, known locally as *pouhons,* have caused the name spa to be given to all such health resorts.

Known in Roman times and mentioned by Pliny the Elder, the springs were rediscovered in 1326 and have been frequented since the 16th century. Spa reached its zenith in the 18th century, when it was visited by European royalty. It was the general headquarters of the German army in 1918 and was the site of the

The Baths at Spa, Belg.
Authenticated News

Conference of the Allied Supreme Council in 1920.

Now the health centre of Belgian state medicine, it is also a winter sports centre and a tourist resort with amusement facilities, including horse and auto (Francorchamps) racing, and a small airport. There are some metallurgical industries and a soft-drink bottling plant. Landmarks include the Casino (1919–21; original building, 1763), the Baths (1866–68), and the Parc de Sept-Heures. Pop. (2004 est.) 10,491.

**spa,** spring or resort with thermal or mineral water used for drinking and bathing. The name was taken from a town near Liège, Belg., to which persons traveled for the reputed curative properties of its mineral springs.

The practice of "taking the waters" for therapeutic purposes reached its heyday in the 19th century, but springs have been considered places of healing at many times and in all parts of the world. The founding of Bath in England is attributed in legend to Bladud, son of Lud Hudibras and father of King Lear, who in 863 BC was cured of disease by immersion in the steaming swamps. Roman colonists developed a considerable spa there and also at Buxton, Derbyshire. After the departure of the Romans the baths seem to have been long neglected, but many churches were built on sites of ancient places of healing throughout Europe, and cures were attributed to immersion in fonts fed by the springs beneath the sanctuary. In the early 18th century some Roman baths were rebuilt, many new "watering places" were established, and spas became fashionable secular centres of resort for the upper classes at the most seasonable times of the year. For the ill and infirm many spas provided year-round treatment centres under varying degrees of medical supervision.

Spa therapy is based on both the drinking of and the bathing in certain waters containing properties believed to be of medicinal value. Mineral springs usually contain noticeable quantities of salts in solution—including carbonate and sulfate of lime, common salt, iron, and sulfur. Magnesia and many trace minerals, notably lithium, also constitute medicinal waters. In addition to solid constituents, gas is present in many waters in considerable quantities. There is a little oxygen and a good deal of nitrogen in some of them. The quantity of hydrosulfuric acid, even in strong sulfuric waters, is small, but the volume of carbonic acid present is often large, giving a noticeable effervescence. Thermal springs are derived from two sources: meteoric waters that rise from considerable depths along fissures of penetration; and volcanic waters, which reach the surface in the form of either geysers or hot springs. Most thermal water contains mineral substance in solution.

The spas of Europe and the United States with the greatest popularity were those with thermal springs. Bathing in warm water has an undoubted therapeutic effect as an aid to relaxation, although the skin does not absorb any of the salts or gases. Sulfurated waters such as those at Aachen, Ger., Baden, Austria, and White Sulphur Springs, W.Va., are used for some skin conditions. Drinking mineral waters may, at the least, provide a general washing out of the digestive system, and the alkaline waters of Vichy, Fr., Ischia, Italy, and Mariánské Lázně, Czech Republic, may act as purgative agents. The highly carbonated salt springs at Saratoga Springs, N.Y., and at Wiesbaden and Baden-Baden, Ger., have long been used for rheumatic and neuralgic conditions. Drinking mineral water, carbonated or not, has become so popular that a considerable business of bottling and exporting has grown up on both sides of the Atlantic; it has a practical importance in aiding digestion that is much greater than one would expect from its small mineral content.

It is likely, however, that most of the medicinal effects of spa therapy result from the environmental factors of the location and facilities of the spa. The beautiful town of Bath has the only thermal springs in England, which usually yield more than 500,000 gallons daily at a temperature of 120° F (49° C). The waters are drunk medicinally and used for hydrotherapy treatments, and the Georgian Pump Room, with its fountain, has long been a rendezvous for visitors who are "taking the waters." Many European spas are located in forested alpine settings such as Sankt Moritz, Switz., Évian-les-Bains, Fr., Badgastein, Austria, and Bormio, Italy. Japan has several thousand hot springs, many of which have been converted into spas or public baths.

An individual who goes to a spa usually finds a different climate, diet, and style of living than he is used to. In a new and probably cheerful society, a person is more relaxed and may take more exercise in the open air. For many persons the therapy of the waters is secondary to the company in which they are taken, and it has long been so at spas. After the American Civil War a spa at French Lick, Ind., enjoyed enormous popularity as a meeting place to arrange marriages. Saratoga Springs declined as a spa in the early 20th century but still attracts thousands of visitors to its racecourse each year. For the diseased and convalescent many spas offer medical therapy, and for all persons the spa has been and continues to be in a variety of ways a place of healing.

**Spaak, Paul-Henri** (b. Jan. 25, 1899, Schaerbeek, near Brussels, Belg.—d. July 31, 1972, Brussels), Belgium's foremost statesman in the decades following World War II and a leading advocate of European cooperation. He played

Spaak
Camera Press

a major role in forming the European Economic Community (EEC), the North Atlantic Treaty Organization (NATO), and Benelux, the customs union of Belgium, The Netherlands, and Luxembourg.

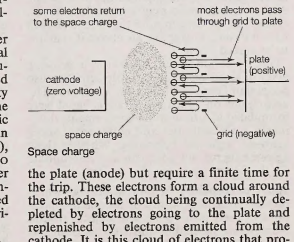
After practicing as a lawyer (1921–31), Spaak became a Socialist member of the Chamber of Deputies in 1932. As foreign minister (1936–38), he won acceptance by Great Britain and France of Belgium's independent foreign policy in the years before World War II. He became Belgium's first Socialist prime minister (1938–39) and again served as foreign minister (1939–45) in Hubert Pierlot's government, which was exiled in London (1940–44). In London in 1944 Spaak helped form the Benelux customs union, which took effect in 1948. He helped draft the United Nations Charter in 1945 and served as president of the organization's first General Assembly in 1946.

After a term as foreign minister (1945–47), Spaak became prime minister in the Social Christian–Socialist coalition government (1947–50) that introduced woman suffrage (1948) and brought the National Bank under state control. In 1948 he signed the Brussels Treaty establishing a regional defense alliance among Britain, France, and the Benelux countries, and he helped align those nations with the United States the following year to form NATO. Spaak's counsel was influential in persuading King Leopold III to abdicate the Belgian throne in 1951.

Between 1948 and 1952 Spaak presided over several organizations for European political and economic cooperation, including the European Coal and Steel Community. He played a leading role in the negotiation of the Treaty of Rome (March 1957), which created the Common Market and the European Atomic Energy Community (Euratom). After again serving as Belgian foreign minister (1954–57), Spaak became secretary general of NATO (1957–61) and then Belgian deputy premier and foreign minister in the coalition government of Théo Lefevre (1961–66). He retired from the Socialist Party in 1966 to work in private business.

**Spaatz, Carl,** byname TOOEY SPAATZ (b. June 28, 1891, Boyertown, Pa., U.S.—d. July 14, 1974, Washington, D.C.), the leading U.S. combat air commander in World War II and first chief of staff of the independent U.S. Air Force.

Spaatz
By courtesy of the U.S. Army



A graduate (1914) of the U.S. Military Academy at West Point, N.Y., Spaatz served as a combat pilot during World War I and then acquired extensive staff and command experience between 1919 and 1942. He went to England in 1940 to evaluate German military power, and, after the United States' entry into the war, in July 1942 he took command of the 8th Air Force in England. Spaatz initiated the U.S. daylight bombing offensive against German-occupied Europe in 1942. In January 1944 he became commander of the U.S. Strategic Air Forces in Europe and directed the daylight strategic bombing of Germany from both England and Italy until the end of the war in Europe.

Spaatz moved to the Pacific theatre in July 1945, and, though personally opposed to the use of atomic bombs against Japanese cities, he directed the final strategic bombing of Japan that included, under orders of Pres. Harry S. Truman, the dropping of atomic bombs on Hiroshima and Nagasaki. He became chief of staff of the newly independent U.S. Air Force (September 1947), but, not enjoying the administrative work, he retired in 1948.

**space,** a boundless, three-dimensional extent in which objects and events occur and have relative position and direction.

Space is treated in a number of articles in the MACROPAEDIA. For a philosophical consideration of the subject, *see* Metaphysics. For a discussion of the relativity of space and time, *see* Relativity. For a description of space as the region of the universe beyond the Earth and its atmosphere, *see* Cosmos. For coverage of the scientific investigation of this region, *see* Exploration.

**space charge,** electrical charge distributed through a three-dimensional region. In an electron tube, for example, a negative charge results because electrons that are emitted from the cathode do not travel instantaneously to

Space charge

the plate (anode) but require a finite time for the trip. These electrons form a cloud around the cathode, the cloud being continually depleted by electrons going to the plate and replenished by electrons emitted from the cathode. It is this cloud of electrons that produces the negative space charge.

**space contraction:** *see* Lorentz–FitzGerald contraction.

**space exploration,** the investigation of the reaches of the universe beyond Earth's atmosphere by means of manned and unmanned spacecraft.

A brief treatment of space exploration follows. For full treatment, *see* MACROPAEDIA: Exploration.

Scientific studies on the use of rockets for spaceflight appeared early in the 20th century. Most notable were the works of Konstantin Tsiolkovsky (1903), Robert Goddard (1919), and Hermann Oberth (1923). By the early 1930s Germany was conducting extensive research on rocket propulsion, which led to the development of the V-2 ballistic missile. After World War II the United States and the Soviet Union, with the aid of relocated German scientists, made substantial progress in high-altitude rocket technology. On Oct. 4, 1957, the U.S.S.R. launched the first artificial satellite, Sputnik 1, into orbit around Earth. Nearly four months later, on Jan. 31, 1958, the United States sent up its first satellite, Explorer 1. Over the next few years both countries launched a variety of unmanned spacecraft including scientific, reconnaissance, and communications satellites and lunar probes.

The next major step in space exploration was the launch of a manned space vehicle. This was first accomplished by the U.S.S.R. on April 12, 1961, when cosmonaut Yury Gagarin completed a single orbit around Earth in the space capsule Vostok 1. Less than a month later, on May 5, the United States launched its first manned spacecraft, a Mercury capsule in which astronaut Alan Shepard made a 15-minute suborbital flight. A succession of one-person Soviet and U.S. manned orbital missions of increasing duration and complexity soon followed. The U.S. Gemini and the Soviet Voskhod programs of the mid-1960s marked a great advance in their use of two- and three-person crews, in their development of in-orbit rendezvous and docking techniques, and in the first human excursions outside orbiting spacecraft (spacewalking, or extravehicular activity).

The succeeding U.S. Apollo program culminated in the first manned lunar landing in 1969. On July 20 of that year, astronauts Neil Armstrong and Edwin Aldrin exited the Apollo 11 Lunar Module to become the first humans to set foot on the Moon. A total of six successful Apollo lunar landing missions were carried out (1969–72), during which 12 astronauts explored the Moon, collected rock and soil samples, and performed a variety of experiments. Although the U.S.S.R. did not land humans on the Moon, it launched a series of robotic lunar probes (Luna and Zond) that returned important data and soil samples.

The Soviet space program in the 1970s and '80s concentrated on the development of a series of Earth-orbiting Salyut space stations equipped for extended missions of scientific research or military reconnaissance. The stations were launched vacant; Soyuz spacecraft then ferried up cosmonaut crews who remained aboard on space missions lasting weeks or months rather than a few days. In 1986 the Soviet Union launched the core element of a modular space station called Mir. This facility was expanded with five additional laboratory and life-support elements over the next 10 years, and it ultimately hosted more than 100 different people until it was abandoned in 2000. After the dissolution of the U.S.S.R. in 1991, its space program was continued by Russia, but on a much-reduced basis owing to economic constraints.

After the Apollo lunar landings, much of the U.S. space program was devoted to developing the space shuttle, a partially reusable transport system designed to lift off like a rocket and glide to a landing like a winged aircraft. First launched in 1981, the shuttle was used extensively as a launch vehicle for satellites and probes and as a space platform for repairing spacecraft in Earth orbit and conducting research in weightlessness for as long as two weeks. In 1998 a multinational consortium led by the United States, with Russia as a major partner, began the in-orbit construction of the International Space Station (ISS) using the shuttle and Russian expendable rockets to transport the facility's components and crews into space. The overall plan for the ISS included specialized laboratories supplied by the European Space Agency (ESA) and Japan.

Beginning in the 1960s, the U.S. and Soviet Union, followed by a number of other countries, carried out unmanned space science missions. Among significant accomplishments of early space-probe missions to the planets were the U.S. Viking landings on Mars in 1976, the U.S. Voyager flybys of Jupiter, Saturn, Uranus, and Neptune between 1979 and 1989, and the Soviet Venera explorations of the atmosphere and surface of Venus from the mid-1960s to the late 1970s. Some later planetary missions were designed for extended studies; the U.S. Galileo spacecraft, for example, went into orbit around Jupiter in late 1995, where it observed the planet and its moons into the early 21st century. Smaller solar system bodies were also targets of space probes. The ESA's Giotto spacecraft made a close flyby of Halley's Comet in 1986 and photographed its nucleus, and the U.S. Near Earth Asteroid Rendezvous (NEAR) spacecraft landed on Eros in 2001 after a year in orbit around the asteroid.

Crucial, too, in space science have been space-based astronomical observatories, which

permit observations of near and distant cosmic phenomena above the filtering and distorting effects of Earth's atmosphere. Developed by a number of countries, they ranged from large instruments such as the U.S. Hubble Space Telescope (launched 1990) and Chandra X-Ray Observatory (1999) to smaller, specialized spacecraft such as Japan's Yohkoh solar observatory (1991). Other satellites have allowed scientists to view Earth itself from the unique vantage of space.

Manned spacecraft also have been used to conduct scientific research. In 1973–74 astronauts aboard the U.S. Skylab space station made valuable observations of solar phenomena and served as both experimenters and subjects in studies of how the human body responds to extended periods of weightlessness. A variety of research, including astronomy, Earth observation, and biological and materials-sciences studies, was conducted on the Salyut stations and then on Mir. Plans called for early scientific work aboard the ISS to focus on life-sciences and materials-sciences research in the weightless environment.

**space group,** in crystallography, any of the ways in which the orientation of a crystal can be changed without seeming to change the position of its atoms. These changes may involve displacement of the whole structure along a crystallographic axis (translation), as well as the point group operations of rotation about an axis, reflection in a plane, inversion about a centre, or sequential rotary inversion. As demonstrated in the 1890s, only 230 distinct combinations of these changes are possible; these 230 combinations define the 230 space groups. A crystal can be assigned to one of these groups after the arrangement of its atoms is studied, as by X-ray crystallography. *See also* symmetry (in crystallography).

**space law,** the body of regulations that governs international conduct in and related to areas of space above Earth's lower atmosphere.

A brief treatment of space law follows. For full treatment, *see* MACROPAEDIA: International Law.

The evolution of space law began with U.S. Pres. Dwight D. Eisenhower's introduction of the concept into the United Nations in 1957, in connection with disarmament negotiations. Following the first successful satellite launches by the U.S.S.R. and the United States in 1957–58, both countries took an active interest in the development of international space policy. It was established that traditional laws of sovereignty that allow any nation to claim uninhabited and uncivilized lands are not viable in space territories and that countries cannot extend the boundaries of their dominion indefinitely into the space regions above them. In 1959 a permanent Outer Space Committee was formed to maintain the UN Charter and other international law in space, which opened the way for peaceful exploration. In 1963 the Nuclear Test Ban Treaty was signed, followed by an Outer Space Committee resolution to prohibit nuclear weapons testing in space. Later that same year a UN General Assembly declaration acknowledged a free international interest in space development and outlined rules assigning each nation individual responsibility for dealing with transgressions of international law and for any resulting destruction. International cooperation was recommended for the safeguarding of all astronauts in crisis situations.

In 1967 an Outer Space Treaty was ratified by 63 participants in the United Nations. This agreement reasserted all earlier guidelines for international space conduct. In addition, it banned certain military activities, such as the deployment of weapons of mass destruction in space and on celestial bodies; established each state's ownership of and responsibility for its space projectiles and components; urged common participation in the protection of space and terrestrial environments; and provided for the open observation and inspection of each state's activities and installations by others. This document, noted as a landmark in the development of international space law, remains effective today among participating countries. This treaty was followed in 1968 by an Agreement on the Rescue and Return of Astronauts and the Return of Objects Launched into Space, which reinforced international commitment to the safety of humans in space, assigned economic responsibility to each nation for the recovery of its equipment, and confirmed the control of each space power over the vehicles that it launches.

Although international diplomacy continues to play an active role in the codification of acceptable space conduct, several issues remain subjects of debate. Because nations are prohibited from laying claim to space territories, for instance, there is a need to establish regulations governing the apportionment of usable resources that space may eventually provide. A method for determining the extent of each nation's control over the air above it remains to be agreed upon.

The development of space for a growing array of government and private activities also poses significant challenges for space law. The agreements on which space law is based were formulated at a time when governments dominated space activities and commercial space ventures were just beginning. Whether these agreements remain adequate and appropriate for the 21st century requires review.

**space perception,** the process through which organisms become aware of the relative positions of their own bodies and objects around them. Space perception provides cues, such as depth and distance, that are important for locomotion and orientation to the environment.

A brief treatment of space perception follows. For full treatment, *see* MACROPAEDIA: Perception, Human.

Detailed understanding of space perception has only come in the last hundred years. In the 18th century the British philosopher George Berkeley proposed that since the image on the retina is two-dimensional, an individual must learn to interpret visual data so as to deduce the spatial relations between objects of sight. Psychologists now believe, however, that there are certain innate elements in the ability to perceive space. The current study of space perception is concerned with a variety of complex issues, including the ability to judge the full shape of objects of which only one side is visible, and how pilots can compensate for unusual perceptual cues while navigating airplanes or spacecraft.

Space perception is thought to serve the general purpose of orientation, *i.e.,* of aiding an individual to grasp his position in relation to the objects around him. Perceiving one's spatial relation to a given object is more important the more relevant the object is to one's needs. For example, organisms are particularly sensitive to stimuli that warn them of dangers along their paths. Thus, space perception involves, in a central role, the selection of relevant sense data. Sense data that do not bear on one's needs are excluded, so that the incoming flow of information is not overwhelming.

Another important feature of space perception is its ability to account for motion. When an object moves in relation to the perceiver, or vice versa, the stimuli presented to his senses are changed. However, he interprets the change in shape of an image on the retina, for example, not as a change in the shape of the given object, but as evidence that the object has changed its position in space, relative to the eye. That is, space perception relies on perceptual constancy (*q.v.*), without which the world would seem inconceivably chaotic.

The perception of space makes use of data from all five outer senses, as well as the inner senses of balance and of the arrangement of the body. Using the stimuli to which it responds, each of the outer senses, in a manner of speaking, constructs its own version of spatial arrangement around the perceiver. Under normal circumstances one's perception of space results from the interweaving of all these sensory "spaces" with each other, and with the data of the inner senses.

Nonetheless, the sense of sight plays a preeminent role in space perception because it is a so-called distance sense—it can receive stimuli from over a vast range of space. There are a variety of cues by which data from sight are converted into perceptions of distance. Some of these cues are not, in fact, visual—instead they are produced by the muscles that control the movements of the eyes. One learns to judge distances in part by learning to interpret the slight contractions of these muscles as they adjust the eyes to see objects that are nearer or farther away.

Purely visual cues to spatial relations are given by what is called the binocular disparity. Since a person's two eyes are in slightly different positions, the images of an object on the two retinas are not exactly the same. The brain combines the two retinal images and converts their difference into the experience of three-dimensionality—*i.e.,* the scene is perceived to have depth. Visual movement parallax is a similar visual cue, but it acts even on one eye alone. If a person changes position, the retinal images of objects in different positions move by different amounts, indicating their distance from the viewer. When vision is impaired or totally lacking (*e.g.,* in blindness), the sense of hearing commonly becomes a major means of space perception, and aural acuity is generally highly developed in the blind.

The sense of balance is also important in orienting oneself in space. Closely related are the kinesthetic sensations of the arrangement of one's own body; combined with sensations of touch, these help one to determine the spatial relationships of nearby objects. In fact, the senses of touch and sight interact quite closely as young children begin to develop their capacities for space perception.

**space shuttle,** partially reusable rocket-launched vehicle designed to go into Earth orbit, to transport people and cargo between Earth and orbiting spacecraft, and to glide to a runway landing on Earth. The first vehicle of this type was developed by the U.S. National Aeronautics and Space Administration (NASA). Formally called the Space Transportation System (STS), it lifted off into space for the first time on April 12, 1981.

The U.S. space shuttle consists of three major components: a winged orbiter that carries both crew and cargo; an external tank containing liquid hydrogen (fuel) and liquid oxygen (oxidizer) for the orbiter's three main rocket engines; and a pair of large, solid-propellant, strap-on booster rockets. At liftoff the entire system weighs two million kilograms (4.4 million pounds) and stands 56 metres (184 feet) high. During launch the boosters and the orbiter's main engines fire together, producing about 31,000 kilonewtons (7 million pounds) of thrust. The boosters are jettisoned about two minutes after liftoff and are returned to Earth by parachute for reuse. After attaining 99 percent of its orbital velocity, the orbiter has exhausted the propellants in the external tank. It releases the tank, which disintegrates on reentering the atmosphere. Although the orbiter lifts off vertically like an expendable rocket launcher, it makes an unpowered descent and landing similar to a glider.

The space shuttle can transport satellites and other craft in the orbiter's cargo bay for de-

ployment in space. It also can rendezvous with orbiting spacecraft to allow astronauts to service, resupply, or board them or to retrieve them for return to Earth. Moreover, the orbiter can serve as a space platform for conducting experiments and making observations of Earth and cosmic objects. On some missions it has carried a European-built pressurized facility called Spacelab, in which shuttle crew members have conducted research in weightless conditions.

Designed to be reflown as many as 100 times, the space shuttle had been expected to reduce the high cost of spaceflight into low Earth orbit. After the system became operational, however, the vehicle's operating costs and the time needed for refurbishment between flights proved to be significantly higher than early projections. Between 1981 and 1985 a fleet of four orbiters—*Columbia, Challenger, Discovery,* and *Atlantis*—was put into service. On Jan. 28, 1986, *Challenger,* carrying seven astronauts, exploded shortly after liftoff, killing all aboard including a private citizen, schoolteacher Christa McAuliffe. In 1992, *Endeavour,* a replacement orbiter for the destroyed *Challenger,* flew its first mission.

Between 1995 and 1998, NASA conducted a series of shuttle missions to the orbiting Russian space station Mir to give the agency experience in station operations in anticipation of the construction of the modular International Space Station (ISS). Beginning in 1998, the shuttle was used extensively to take components of the ISS into orbit for assembly and to ferry astronaut crews and supplies to and from the station. On Feb. 1, 2003, *Columbia* broke up catastrophically over north-central Texas at an altitude of about 60 km (40 miles) as it was returning from an orbital mission. All seven crew members died, including Ilan Ramon, the first Israeli astronaut to go into space. *See also* space exploration.

**space station,** an artificial structure placed in orbit and having the pressurized enclosure, power, supplies, and environmental systems necessary to support human habitation for extended periods. A space station can serve as a base for a variety of activities. They include astronomical observations, study of Earth's resources and environment, military reconnaissance, and investigations of the behaviour of materials and biological systems in a state of weightlessness. Small space stations are launched fully assembled, but larger stations are sent up in modules and assembled in orbit. Since 1971, nine space stations placed in a low orbit around Earth have been occupied for varying lengths of time.

The world's first space station, Salyut 1, was launched April 19, 1971, by the Soviet Union. Equipped for scientific studies, it had the form of a stepped cylinder 14.6 metres (48 feet) long, with its widest section 4.25 metres (13.9 feet) across. Between 1974 and 1982, five additional Salyuts—two outfitted for military reconnaissance—were successfully orbited and occupied. In February 1986, the U.S.S.R. launched the cylindrical core module of the Mir space station. Five modules carrying scientific equipment and expanding the living space were added over the next 10 years, and the complex supported human habitation between March 1986 and June 2000.

The United States orbited its first space station, called Skylab, on May 14, 1973. Occupied by three separate astronaut crews in 1973 and 1974, Skylab served as a solar observatory and a laboratory for studying the response of the human body to space conditions.

In 1998 Russia and the United States launched the first modules of the International Space Station (ISS), a multinational project involving the participation of 16 countries. Other elements were subsequently added, with the overall plan calling for the assembly of a large complex of laboratory and habitat modules. In 2000 the ISS received its first resident crew. *See also* space exploration.

**space-time,** in physical science, single concept that recognizes the union of space and time, posited by Albert Einstein in the theories of relativity (1905, 1915).

Common intuition previously supposed no connection between space and time. Physical space was held to be a flat, three-dimensional continuum—*i.e.,* an arrangement of all possible point locations—to which Euclidean postulates would apply. To such a spatial manifold, Cartesian coordinates seemed most naturally adapted, and straight lines could be conveniently accommodated. Time was viewed independent of space—as a separate, one-dimensional continuum, completely homogeneous along its infinite extent. Any "now" in time could be regarded as an origin from which to take duration past or future to any other time instant. Within a separately conceived space and time, from the possible states of motion one could not find an absolute state of rest. Uniformly moving spatial coordinate systems attached to uniform time continua represented all unaccelerated motions, the special class of so-called inertial reference frames. The universe according to this convention was called Newtonian.

By use of a four-dimensional space-time continuum, another well-defined flat geometry, the Minkowski universe (after Hermann Minkowski), can be constructed. In that universe, the time coordinate of one coordinate system depends on both the time and space coordinates of another relatively moving system, forming the essential alteration required for Einstein's special theory of relativity. The Minkowski universe, like its predecessor, contains a distinct class of inertial reference frames and is likewise not affected by the presence of matter (masses) within it. Every set of coordinates, or particular space-time event, in such a universe is described as a "here-now" or a world point. Apparent space and time intervals between events depend upon the velocity of the observer, which cannot, in any case, exceed the velocity of light. In every inertial reference frame, all physical laws remain unchanged.

A further alteration of this geometry, locally resembling the Minkowski universe, derives from the use of a four-dimensional continuum containing mass points. This continuum is also non-Euclidean, but it allows for the elimination of gravitation as a dynamical force and is used in Einstein's general theory of relativity (1915). In this theory, the continuum still consists of world points that may be identified, though non-uniquely, by coordinates. Corresponding to each world point is a coordinate system such that, within the small, local region containing it, the time of special relativity will be approximated. Any succession of these world points, denoting a particle trajectory or light ray path, is known as a world line, or geodesic. Maximum velocities relative to an observer are still defined as the world lines of light flashes, at the constant velocity *c.*

Whereas the geodesics of a Minkowski continuum (without mass-point accelerations) are straight lines, those of a general relativistic, or Riemannian, universe containing local concentrations of mass are curved; and gravitational fields can be interpreted as manifestations of the space-time curvature. However, one can always find coordinate systems in which, locally, the gravitational field strength is nonexistent. Such a reference frame, affixed to a selected world point, would naturally be in free-fall acceleration near a concentrated mass. Only in this region is the concept well defined—*i.e.,* in the neighbourhood of the world point, in a limited region of space, for a limited duration. Its free-fall toward the mass is due either to an externally produced gravitational field or to the equivalent, an intrinsic property of inertial reference frames. Mathematically, gravitational potentials in the Riemannian space can be evaluated by the procedures of tensor analysis to yield a solution of the Einstein gravitational field equations outside the mass points themselves, for any particular distribution of matter.

The first rigorous solution, for a single spherical mass, was carried out by a German astronomer, Karl Schwarzschild (1916). For so-called small masses, the solution does not differ appreciably from that afforded by Newton's gravitational law; but for "large" masses the radius of space-time curvature may approach or exceed that of the physical object, and the Schwarzschild solution predicts unusual properties. Astronomical observations of dwarf stars eventually led U.S. astrophysicists J.R. Oppenheimer and H. Snyder (1939) to postulate super-dense states of matter. These, and other hypothetical conditions of gravitational collapse, were borne out in later discoveries of pulsars and neutron stars. They also have a bearing on black holes thought to exist in interstellar space. Other implications of space-time are important cosmologically and to unified field theory.

**spacecraft,** vehicle designed to operate, with or without a crew, in a controlled flight pattern above Earth's lower atmosphere.

A brief treatment of spacecraft follows. For full treatment, *see* MACROPAEDIA: Exploration; Industries, Manufacturing.

The first spacecraft, the Soviet Union's Sputnik 1, was launched on Oct. 4, 1957; it weighed 83.6 kg (184 pounds). It was soon followed by other unmanned Soviet and U.S. spacecraft and, within four years (April 12, 1961), by the first manned spacecraft, Vostok 1, which carried the Soviet cosmonaut Yury Gagarin. Since then, numerous other manned and unmanned craft have been launched to increase scientific knowledge or provide important services in areas such as telecommunications and weather forecasting.

Most spacecraft are not self-propelled; they depend on the initial velocity provided by a launch vehicle, which separates from the spacecraft when its task is done. The spacecraft typically either is placed into an orbit around Earth or, if given sufficient velocity to escape Earth's gravity, continues toward another destination in space. The spacecraft itself often carries small rocket engines for maneuvering and orienting in space. The Lunar Module, the manned Moon-landing vehicle used in the Apollo program, had rocket engines that allowed it to soft-land on the Moon and then return its crew to the lunar-orbiting Command Module. The latter craft, in turn, carried sufficient rocket power in its attached Service Module to leave lunar orbit for the return journey to Earth. The space shuttle orbiter uses three on-board liquid-fuel engines supplied by a disposable external tank and a pair of solid-fuel boosters to reach space.

Spacecraft require an on-board source of electrical power to operate the equipment they carry. Those designed to remain in Earth orbit for extended periods generally use panels of solar cells, often in conjunction with storage batteries. The space shuttle, designed for stays in space of one to two weeks, uses hydrogen-oxygen fuel cells. Deep-space probes, such as the Cassini spacecraft launched to Saturn in 1997, are usually powered by small, long-lived radioisotope thermoelectric generators, which convert heat emitted by a radioactive element directly into electricity.

**spadebill,** any of six species of New World flycatchers (family Tyrannidae, order Passeriformes) whose triangular bill is very broad and flat. The white-throated, or stub-tailed, spadebill (*Platyrinchus mystaceus*), scarcely 10 centimetres (4 inches) long, is the most

White-throated spadebill (*Platyrinchus mystaceus*)
Painting by John P. O'Neill

widespread species; it inhabits forest undergrowth from southern Mexico to Argentina in southern South America.

**spadefish** (family Ephippidae), any of about 17 species of marine fishes (order Perciformes), predominantly tropical though also found in temperate regions. In appearance the spadefishes are deep-bodied and laterally compressed, with five or six vertical black bands on a silvery body. The vertical bars may disappear with age, the adults being solid white, black, or, more commonly, silver.

The Atlantic spadefish (*Chaetodipterus faber*) is a western Atlantic species that ranges from New England to Brazil. It feeds primarily on marine invertebrates, particularly crustaceans and ctenophores (comb jellies).

**spadefoot toad,** relatively smooth-skinned amphibian of either the Old World genus *Pelobates* or the North American *Scaphiopus,* both of the family Pelobatidae. Spadefoot

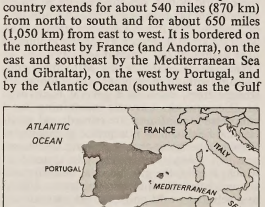
Couch's spadefoot toad (*Scaphiopus couchi*)
Ron Garrison—San Diego Zoo

toads have a broad, horny "spade" projecting from the inside of each hind foot and used by the animals in burrowing.

The European spadefoot (*Pelobates fuscus*) is found in Europe and Central Asia, usually in sandy regions. Some related species have more restricted ranges. It is about 6 to 7.5 cm (2 to 3 inches) long and spends the day underground.

At least seven species of spadefoots are found in regions of Canada, the United States, and Mexico, where soils are sandy. These animals are about 4 to 7.5 cm (1.5 to 3 inches) long and are also nocturnal burrow dwellers. In warm weather after a heavy rain, they emerge to breed in ponds. The young of the western, arid-country forms normally hatch quickly and transform into adults before the ponds dry up; those of the eastern spadefoot develop more slowly.

**Spagnolo, Lo** (Baroque painter): *see* Crespi, Giuseppe Maria.



**Spahn, Warren,** in full WARREN EDWARD SPAHN (b. April 23, 1921, Buffalo, N.Y., U.S.—d. Nov. 24, 2003, Broken Arrow, Okla.), American professional baseball player whose total of 363 major league victories established a record for left-handed pitchers. His feat of winning 20 or more games in each of 13 seasons also was a record for left-handers. He set still another mark by striking out at least 100 batters each year for 17 consecutive seasons (1947–63). At the time of his retirement, in 1965, his career total of 2,583 strikeouts was the third highest in baseball history.

Spahn, 1957
UPI

Spahn signed with the Boston Braves (later the Milwaukee Braves) of the National League (NL) in 1940 and pitched his first major league game in 1942. Drafted into the army the following year, he saw extensive combat service during World War II and received a Bronze Star and Purple Heart. In 1946 he returned to baseball, and his fluid, high-kick delivery and pinpoint accuracy established him as one of the game's leading pitchers. In 1957 he helped the Braves win the World Series. A finely conditioned athlete, Spahn pitched two no-hitters at ages 39 and 40. He was also one of the best hitters among pitchers, and his 35 career home runs set a record for pitchers in the NL. In 1965, his last season, he played for the New York Mets and the San Francisco Giants. A 14-time All-Star and recipient of the Cy Young Award (1957), Spahn was inducted into the Baseball Hall of Fame in 1973.

**Spain,** officially KINGDOM OF SPAIN, Spanish ESPAÑA, or REINO DE ESPÃNA, one of Europe's largest countries, located on the Iberian Peninsula at the southwestern corner of Europe. The country extends for about 540 miles (870 km) from north to south and for about 650 miles (1,050 km) from east to west. It is bordered on the northeast by France (and Andorra), on the east and southeast by the Mediterranean Sea (and Gibraltar), on the west by Portugal, and by the Atlantic Ocean (southwest as the Gulf

Spain

of Cádiz, northwest and north as the Bay of Biscay). The Balearic Islands off Spain's eastern coast and the Canary Islands off the coast of North Africa are also part of Spain, and the cities of Ceuta and Melilla in northern Morocco have belonged to Spain for several centuries. The capital of Spain is Madrid. Area 195,379 square miles (506,030 square km). Pop. (2003 est., including Balearic and Canary islands and Moroccan enclaves) 42,600,000.

A brief treatment of Spain follows. For full treatment, *see* MACROPAEDIA: Spain.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

*The land.* Spain's topography is dominated by the Meseta, a large central plateau having an average elevation of 2,600 feet (800 m) above sea level. The plateau is almost completely surrounded by mountain ranges: the Cantabrian Mountains (Cordillera Cantábrica) to the north, the Iberian System (Sistema Ibérico) to the northeast, the Sierra Morena to the south, and some lower mountains of the Portuguese frontier to the northwest. Five natural regions surround the central plateau: (1) the valley of the Ebro River in the northeast, (2) the mountainous region of Catalonia in the far northeast, (3) the Mediterranean coastal region of Valencia in the east, (4) the valley of the Guadalquivir River in the south, and (5) the mountainous region of northern Spain extending westward from the Pyrenees Range to the Atlantic. The highest point in mainland Spain is the peak of Mulhacén (11,411 feet [3,478 m]) in the Sierra Nevada in the south. The principal rivers are the Duero, the Tagus, the Ebro, and the Guadalquivir.

Three climatic zones predominate in mainland Spain. The northern and eastern coasts have a maritime climate with average temperatures of 48° F (9° C) in winter and 64° F (18° C) in summer and annual rainfall of 38 inches (965 mm). The central plateau has a continental climate with average temperatures of 40° F (4° C) in winter and 75° F (24° C) in summer and annual rainfall of less than 15 inches (380 mm). Areas having an elevation of more than 9,000 feet (2,750 m) have a mountain climate with average temperatures of less than 32° F (0° C) in winter and 52° F (11° C) in summer and annual rainfall of more than 45 inches (1,150 mm); the northern central plateau is snow-covered for parts of the winter. Deciduous forests and meadows cover most of the humid regions of northern Spain, and scrub forests (evergreen oak and other drought-resistant plants) predominate in the dry southern region; much of the central plateau has steppe vegetation. Wildlife includes deer, the rare Spanish ibex, bear, and wolf.

Some iron ore and zinc deposits are found in the Cantabrian Mountains, copper and lead in the Sierra Morena, and coal in the Asturias region in the northwest.

*The people.* The Spanish population is basically homogeneous in race and culture; the Roma (Gypsies) are perhaps the only true racial minority. Roman Catholicism is the principal religion. Modern standard Spanish, or Castilian, is spoken throughout Spain; the Catalan, Galician, and Basque languages are also spoken by large communities. More than three-fourths of the total population is urban. The birth and death rates are typical of those of a developed country.

*The economy.* Spain has a developed market economy that is largely based on services, light and heavy industries, and agriculture. The government has fostered the development of heavy industries through the National Institute of Industry, which plays a large role in the production of petroleum, steel, automobiles, and various other goods. The gross national product (GNP) is one of the highest in Europe and is growing much more rapidly than the population. The GNP per capita is also relatively high.

Agriculture accounts for 5 percent of the gross domestic product (GDP) and employs less than one-eighth of the work force. The chief crops include barley, rice, lucerne, sugar beets, grapes, wheat, and potatoes. Spain is also one of the world's major producers of wine. Large quantities of agricultural commodities are normally exported to the countries of the European Community (EC). Pastures cover more than one-fifth of the land and support sheep, pigs, cattle, and goats.

Forests cover nearly one-third of the land, and the roundwood removed is processed into pulpwood and sawn wood. Some 17,000 vessels belong to the Spanish fishing fleet, and landings are chiefly sardines, cod, and tuna. The total catch declined in the late 1980s.

Manufacturing industries (including mining and public utilities) account for almost one-third of the GDP and employ more than one-fifth of the work force. The principal minerals mined are iron ore, mercury, pyrite, potash, and coal. Petroleum is produced on a small scale. Major manufactures include chemicals, machine tools, and motors. Other leading industries produce textiles, toys, shoes, and electrical appliances. Production of iron, steel, and ships has slackened. Investments by European and American motor vehicle manufacturers have helped to establish Spain as a leading manufacturer of automobiles. Heavy industries are concentrated around Bilbao, Santander, and Oviedo; the manufacture of textiles and plastics centres around Barcelona. Electricity is largely generated from domestic and imported fuels; nuclear energy supplies about one-third of the country's electric power. Tourism is also a major industry.

The Constitution of 1978 recognized the right of labour unions to exist. The union movement is dominated by the General Union of Workers, affiliated with the Spanish Socialist Workers' Party, and by the Workers' Commissions, affiliated with the Spanish Communist Party (now under the United Left).

Imports ordinarily exceed exports, and the deficit is partially offset by remittances from Spaniards working abroad. Machinery, fuels, transportation equipment, and agricultural products dominate imports; transport equipment, agricultural products, and machinery lead among exports. Spain's chief suppliers include France, Germany, Italy, and Great Britain.

*Government and social conditions.* Spain is a constitutional monarchy. Its constitution, adopted in 1978, establishes the king as head of state and commander in chief of the armed forces. Legislative power is concentrated in the bicameral parliament, the Cortes Generales, with a Congress of Deputies (Lower House) and a Senate (Upper House). Executive power rests in the prime minister (president) of the government, who is named by the king upon the recommendation of the majority party. The prime minister is assisted by a cabinet. In response to the historically sensitive issue of regional autonomy, Spain developed a new system of local government. Autonomous regional communities were initially established in Catalonia (1979), the Basque Country (1979), and Galicia (1981); by 1983 the entire country had been divided into 17 autonomous communities.

Although it was essentially a dictatorship from 1939 to 1975 and was governed by a single party from 1977 to 1982, Spain has nevertheless developed a pluralistic political character, with a large number of registered parties. The independent judiciary is headed by the Supreme Court, which is made up of six branch courts.

Spain's social welfare system provides maternity and sickness benefits; hospital and medical cost assistance; and financial assistance for temporary disability, retirement, death, or unemployment. The steadily increasing number of health facilities, together with improving diets, has contributed to the control of most infectious diseases and to the overall health of the population. Particular emphasis is placed on the provision of perinatal care in a hospital setting. Life expectancy is 77 years. An urban housing shortage remains, despite government-subsidized housing construction.

The literacy rate is 96 percent for men and 90 percent for women. According to reforms introduced in 1970, the educational system includes preschool education; eight years of free and compulsory general basic education; *bachillerato,* a prerequisite for professional and preuniversity institutions; the universities; and professional training.

Press censorship laws of the administration of General Francisco Franco have been replaced by constitutional guarantee of freedom of the press. Until 1983 television was broadcast in Spanish by two government-operated stations. Since then, the Catalan and Basque autonomous governments established television stations that broadcast in the regional languages. In 1989 the socialist government introduced legislation permitting the establishment of privately owned stations.

Throughout history, Spaniards have contributed richly to the arts and humanities. In architecture the tradition begins before the unknown builders of such Gothic cathedrals as those in Burgos and Toledo and continues down to the 20th century with Pedro Muguruza, Felix Candela, Antoni Gaudí, and others. Among 20th-century sculptors are Juan de Avalos, Angel Ferrant, and Eduardo Chillida (noted for his work in metal). In painting the tradition extends from El Greco and Diego Velázquez to the major 20th-century figures of Pablo Picasso, Joan Miró,

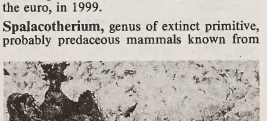
and Salvador Dalí. Spanish composers include Antonio de Cabezón and the Italian-born Domenico Scarlatti, who worked in Madrid, and the early 19th-century tenor and famous teacher Manuel García; later composers such as Manuel de Falla had such disciples as Joaquín Turina. Great performers included the cellist Pablo Casals, the guitarist Andrés Segovia, pianist Alicia de la Rocha, and the soprano Victoria de los Angeles.

Spanish literature first flowered with the work of the world-renowned Miguel de Cervantes, author of *Don Quixote.* The Nobel Prize winners José Echegaray y Eizaguirre, Jacinto Benavente y Martínez, Juan Ramón Jiménez, Vicente Aleixandre, and Camilo José Cela also had an international readership. Notable figures of the 20th century include Federico García Lorca, Ramón Pérez de Ayala, José Agustín Goytisolo, and Rafael Alberti.

*History. Homo sapiens sapiens* appeared in Spain after 35,000 BC. The most remarkable remains of their culture are the painted caves in the Cantabrian Mountains in northern Spain. These show polychrome representations of bison, horses, and other animals. Bronze Age settlements such as the El Argar farming culture emerged about 2000 BC, and advanced metallurgical techniques used in working with bronze, silver, and gold are in evidence. Celtic peoples began to migrate through the Pyrenees from central Europe in the 9th and 8th centuries BC. Beginning with the Second Punic War in 218 BC, Rome gradually extended its hegemony over the peninsula. The military conquest was completed during the reign of Augustus. In the 4th century AD Germanic tribes invaded, and the Visigoths emerged dominant, establishing a kingdom over most of the peninsula and accepting Roman Christianity by the early 7th century.



During the early 8th century Muslims invaded the peninsula from North Africa and conquered most of it. By the late 13th century the Christian kingdoms of Castile and Aragon had reconquered most of the Muslim-controlled territory. In 1479 the two kingdoms were joined in a personal union as a result of the marriage (1469) of Ferdinand II of Aragon and Isabella I of Castile, known as the Catholic Monarchs. They reconquered the last Muslim kingdom, Granada, in 1492. At the close of the century Spain became the first European colonial power in the Americas. In 1516 Charles I, Habsburg ruler of the Netherlands, succeeded Ferdinand as king, and he was elected Holy Roman emperor in 1519 as Charles V, then the most powerful ruler in Europe. He was succeeded by his son Philip II (1556–98). A religious fanatic, he resolved to defend the Roman Catholic faith and to stamp out Protestantism and thus involved Spain in many costly wars and military adventures (such as the Spanish Armada of 1588) that drained the country financially. Philip II was succeeded by three weak Habsburg kings who presided over the quick decline of Spain.

Habsburg rule ended in 1700, when Philip V became the first Bourbon king of Spain. Philip's accession to the throne caused the War of the Spanish Succession (1701–14), resulting in heavy territorial losses. In 1808 Napoleon Bonaparte installed his brother Joseph as king of Spain, but British and Spanish forces defeated Napoleon's troops and eventually restored the Bourbon monarchy (1814). Spain's weakness encouraged most of its American colonies to declare independence. In its war with the United States (1898) Spain lost its remaining overseas possessions.

Spain became a republic in 1931 when Alfonso XIII abdicated after election results showed overwhelming support for republicanism. A civil war erupted in 1936 as the Republicans opposed the Nationalists, who, led by General Francisco Franco, received arms from Nazi Germany and Fascist Italy. The Republicans, with domestic and foreign support from socialists, communists, and various liberal sympathizers, received arms only from the Soviet Union. After the Nationalist victory in 1939, Franco became chief of state, remaining in power until his death in 1975. In 1969 Franco designated Juan Carlos de Borbón y Borbón as his successor, and on Franco's death in 1975 Juan Carlos became king, restoring the monarchy and establishing a greater measure of democracy.

Elections were held in 1977, and the new Cortes (parliament) embarked upon a program of democratic reform, including the separation of church and state and the guaranteeing of free enterprise and human and civil rights. The elections of 1982 marked the final break with the Francoist legacy by installing a socialist government under the leadership of Felipe González Márquez, who continued market reforms. Spain, once relatively isolated, became more closely associated with western Europe, joining the European Community (now part of the European Union) in 1986. Spain enjoyed international prominence in 1992 as the host of a fair in Seville and the Olympics in Barcelona. In 1996 the conservative Popular Party ended 13 years of socialist government; their leader, José María Aznar López, became prime minister in 1996. The country experienced a remarkable economic boom during the 1990s and adopted the common European currency, the euro, in 1999.

**Spalacotherium,** genus of extinct primitive, probably predaceous mammals known from

*Spalacotherium* jawbone

fossils found in Late Jurassic deposits of Europe. The genus *Spalacotherium* is representative of the symmetrodonts, a group characterized by molar teeth with three cusps arranged in a triangle. The symmetrodonts are among the oldest known mammals and may in some way have played a role in the development of the higher mammalian forms.

**Spalatin, Georg,** original name GEORG BURKHARDT (b. Jan. 17, 1484, Spalt, Bavaria [Germany]—d. Jan. 16, 1545, Altenburg, Saxony), humanist friend of Martin Luther and prolific writer whose capacity for diplomacy helped advance and secure the Protestant Reformation in its early stages.

As a student Spalatin came in contact with various humanists, and he followed their custom in choosing a last name that reflected his birthplace. In 1505 he joined a circle of humanists led by the German scholar Mutianus Rufus and the same year began to teach in the monastery at Georgenthal. He was ordained priest and made tutor to the heir of Frederick III the Wise, elector of Saxony, in 1508. In 1511 he was made a preceptor to the elector's nephews, who were studying at Wittenberg, where Spalatin first met Luther. The following year Frederick appointed Spalatin his librarian, and in this position he gained increasing trust and respect at the elector's court.

Spalatin passed his admiration for Luther on to Frederick and in 1518 persuaded the elector to protect Luther during the controversy over indulgences. This action was crucial to the progress of the Reformation. Spalatin also helped Luther receive a favourable reception at the Diet of Worms (1521), at which Luther's opponents failed in their efforts to condemn him.

Spalatin similarly championed the Reformation through several successive diets and the tenure of two electors of Saxony, John and John Frederick. From 1526 he participated in the visitations of churches and schools that established the Reformation in Saxony. From 1530 he worked with Luther's associate, Philipp Melanchthon, in preparing the Augsburg Confession (1530), which legally established the Reformation in Germany, and in forming the Schmalkaldic League, a defensive alliance of German princes concluded in 1531. Also a translator of Luther's and Melanchthon's writings for Frederick, Spalatin wrote numerous historical works. Among them are *Annales Reformationis* (1718; "Annals of the Reformation") and "A Life of Frederick III," published in *Georg Spalatins historischer Nachlass und Briefe* (1851, ed. by C.G. Neudecker and L. Preller; "Georg Spalatin's Historical Literary Remains and Letters").

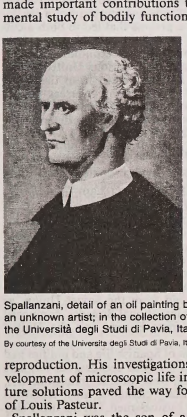
**Spalato** (Croatia): *see* Split.

**Spalding, A.G.,** byname AL SPALDING, in full ALBERT GOODWILL SPALDING (b. Sept. 2, 1850, Byron, Ill., U.S.—d. Sept. 9, 1915, Point Loma, Calif.), American professional baseball player and sporting-goods manufacturer, who contributed to the development of professional baseball and manufactured gear for many sports played in his day.

In his youth Spalding pitched and batted right-handed with such authority that the Forest City (Rockford, Ill.) team became well known. He pitched for the Boston Red Stockings in the National Association (1871–75) and pitched for and managed the Chicago National League Club, the White Stockings (1876–77). In 1876 he and his brother James founded in Chicopee, Mass., the sporting-goods manufacturing company that later became known as A.G. Spalding and Brothers. He remained with the Chicago club after his playing days as president (1882–91) and was a practical organizer in baseball until business took up most of his time in the 1890s. Spalding organized baseball tours abroad (to England and Ireland in 1874, around the world in 1889) and became an official ambassador of goodwill for baseball.

*Spalding's Official Baseball Guide*—begun in 1878 and issued annually after 1880 until the 1940s, when it was amalgamated with official major-league guides—was a sort of unofficial baseball guide. Spalding also wrote a history of baseball, *America's National Game* (1911), and he was elected to the Baseball Hall of Fame in 1939.

**Spalding, Albert** (b. Aug. 15, 1888, Chicago, Ill., U.S.—d. May 26, 1953, New York, N.Y.), American composer and one of the leading violinists of his day.



The son of a partner in the sporting-goods firm of A.G. Spalding and Brothers, he began to study the violin at the age of seven, making his debut in Paris in 1905 and in New York City in 1908. He served with the American Expeditionary Force in Europe during World War I. Spalding toured the United States and Europe many times, playing with the leading orchestras. His musical compositions include a suite for orchestra, two violin concerti, and a *String Quartet in E Minor.* He was the author of an autobiography, *Rise to Follow* (1943), and of a novel, *A Fiddle, a Sword, and a Lady* (1953).

**Spalding, Henry Harmon** (b. *c.* 1803—d. *c.* 1843), U.S. Presbyterian missionary who, with his wife, Eliza (*née* Hart), in 1836 established the Lapwai Mission (near present-day

Lewiston, Idaho) with the first white home, church, and school in what is now Idaho.

Spalding was educated at Plattsbury (N.Y.) Academy, Western Reserve College (Ohio), and Lane Theological Seminary (Cincinnati) and was ordained in the Presbyterian ministry in 1835. He was first appointed to the Osage Indian mission (western Missouri) and then went west with the party of Marcus Whitman (*q.v.*) in 1830. The printing press that Spalding and his wife brought in 1839 was the first in the Pacific Northwest. The Lapwai mission was closed in 1847 after the Whitman massacre, but in 1871 the Presbyterian Church resumed the work, which is still being carried on among the Nez Percé Indians.

**Spallanzani, Lazzaro** (b. Jan. 12, 1729, Modena, Duchy of Modena—d. 1799, Pavia, Cisalpine Republic), Italian physiologist who made important contributions to the experimental study of bodily functions and animal

Spallanzani, detail of an oil paintng by an unknown artist; in the collection of the Università degli Studi di Pavia, Italy

By courtesy of the Universita degli Studi di Pavia, Italy

reproduction. His investigations into the development of microscopic life in nutrient culture solutions paved the way for the research of Louis Pasteur.

Spallanzani was the son of a distinguished lawyer. He attended the Jesuit college at Reggio, where he received a sound education in the classics and philosophy. He was invited to join the order, but, although he was eventually ordained (in 1757), he declined this offer and went to Bologna to study law. Under the influence of his kinswoman Laura Bassi, a professor of mathematics, he became interested in science. In 1754 Spallanzani was appointed professor of logic, metaphysics, and Greek at Reggio College and in 1760 professor of physics at the University of Modena.

Although Spallanzani published in 1760 an article critical of a new translation of the *Iliad,* all of his leisure was being devoted to scientific research. In 1766 he published a monograph on the mechanics of stones that bounce when thrown obliquely across water. His first biological work, published in 1767, was an attack on the biological theory suggested by Georges Buffon and John Turberville Needham, who believed that all living things contain, in addition to inanimate matter, special "vital atoms" that are responsible for all physiological activities. They postulated that, after death, the "vital atoms" escape into the soil and are again taken up by plants. The two men claimed that the small moving objects seen in pond water and in infusions of plant and animal matter are not living organisms but merely "vital atoms" escaping from the organic material. Spallanzani studied various forms of microscopic life and confirmed the view of Antonie van Leeuwenhoek that such forms are living organisms. In a series of experiments he showed that gravy, when boiled, did not produce these forms if placed in phials that were immediately sealed by fusing the glass. As a result of this work, he concluded that the objects in pond water and other preparations were living organisms introduced from the air and that Buffon's views were without foundation.

The range of Spallanzani's experimental interest expanded. In 1768 he published the results of his regeneration and transplantation experiments. He studied regeneration in a wide range of animals including planarians, snails, and amphibians and reached a number of general conclusions: the lower animals have greater regenerative power than the higher; young individuals have a greater capacity for regeneration than the adults of the same species; and, except in the simplest animals, it is the superficial parts not the internal organs that can regenerate. His transplantation experiments showed great experimental skill and included the successful transplant of the head of one snail onto the body of another. In 1773 he investigated the circulation of the blood through the lungs and other organs and did an important series of experiments on digestion, in which he obtained evidence that digestive juice contains special chemicals that are suited to particular foods. At the request of his friend Charles Bonnet, Spallanzani investigated the male contribution to generation. Although the spermatozoa had first been seen in the 17th century, their function was not understood until some 30 years after the formulation of the cell theory in 1839. As a result of his earlier investigations into simple animals, Spallanzani supported the prevailing view that the spermatozoa were parasites within the semen. Both Bonnet and Spallanzani accepted the preformation theory. According to their version of this theory, the germs of all living things were created by God in the beginning and were encapsulated within the first female of each species. Thus, the new individual present in each egg was not formed *de novo* but developed as the result of an expansion of parts the delineation of which had been laid down within the germ by God at the creation. It was assumed that the semen provided a stimulus for this expansion, but it was not known if contact was essential nor if all the parts of the semen were required. Using amphibians, Spallanzani showed that actual contact between egg and semen is essential for the development of a new animal and that filtered semen becomes less and less effective as filtration becomes more and more complete. He noted that the residue on the filter paper retained all its original power if it were immediately added to the water containing the eggs. Spallanzani concluded that it was the solid parts of the secretion, proteinaceous and fatty substances that form the bulk of the semen, that were essential, and he continued to regard the spermatozoa as inessential parasites. Despite this error, Spallanzani performed some of the first successful artificial insemination experiments on lower animals and on a dog.

As Spallanzani's fame grew, he became a fellow of most of the scientific societies in Europe. In 1769 he accepted a chair at the University of Pavia, where, despite other offers, he remained for the rest of his life. He was popular with students and colleagues. Once a small group, jealous of his success, accused him of malpractice in association with the museum that he controlled, but he was soon vindicated. Spallanzani took every opportunity to travel, to study new phenomena, and to meet other scientists. The accounts of his journeys to Constantinople and Sicily still provide interesting reading. Toward the end of his life he conducted further research on microscopic animals and plants that he had started early in his career; he also began studies on the electric charge of the torpedo fish and sense organs in bats. In his last set of experiments, published posthumously, he attempted to show that the conversion of oxygen to carbon dioxide must occur in tissues, not in the lungs (as Antoine-Laurent Lavoisier had suggested in 1787). (E.B.G.)

BIBLIOGRAPHY. Most general histories of biology have a short section on Spallanzani. Two books by Elizabeth B. Gasking are *Investigations into Generation, 1651–1828* (1967), which discusses Spallanzani's researches into regeneration, infusions, and his experiments on fertilization, and *The Rise of Experimental Embryology* (1970), a general history, with an account of Spallanzani's experiments and comments on the preformation theory. Spallanzani's own works in translation are *Tracts on the Natural History of Animals and Vegetables,* trans. by J. Dalyell (1803); and *An Essay upon Animal Reproductions,* trans. by M. Maty (1769).

*Where the same name may denote a person, place, or thing, the articles will be found in that order*

**spallation,** high-energy nuclear reaction in which a target nucleus struck by an incident (bombarding) particle of energy greater than about 50 million electron volts (MeV) ejects numerous lighter particles and becomes a product nucleus correspondingly lighter than the original nucleus. The light ejected particles may be neutrons, protons, or various composite particles equivalent to nuclei of hydrogen, helium, or lithium isotopes. The product nucleus is occasionally much lighter than the target nucleus; chlorine-38, for example, has been produced along with an assortment of neutrons, protons, and alpha particles (helium nuclei) by bombarding copper-63 with protons accelerated to 70 MeV.

**Spandau,** district of Berlin, Germany, on the Havel River at the mouth of the Spree. Originally the site of a Sorbian (Wendish) fortress, Spandau became German *c.* 1230 and was granted civic rights in 1232. It was incorporated into Berlin in 1920. The citadel (1560–94, including the 12th-century Julius Tower) is one of the oldest well-preserved Italian-style Renaissance fortifications in northern Germany, and the 14th-century St. Nicholas' Church is the oldest Gothic church in Berlin. After 1946 the Spandau prison, on the Wilhelmstrasse, housed the Nazi war criminals sentenced by the Allies. Spandau is the chief industrial district of Berlin, with the electrotechnical firm of Siemens in the Siemensstadt section and an airport at Gatow. It also has a number of parks and forests, notably the large Spandauerforst, which makes it a favourite weekend resort for Berliners. Pop. (1986 est.) 192,895.

**spandrel,** also spelled SPANDRIL, the roughly triangular area above and on either side of an arch, bounded by a line running horizontally through the apex of the arch, a line rising vertically from the springing of the arch, and the curved extrados, or top of the arch. When arches adjoin, the entire area between their crowns and springing line is a spandrel. If it is filled in, as is ordinarily the case, the resulting structure is termed a spandrel wall. In medieval architecture it was usually ornamented.

In buildings of more than one story the spandrel is the area between the sill of a window and the head of the window below it. In steel or reinforced concrete structures there will sometimes be a spandrel beam extending horizontally from one column to another and supporting a section of wall. The more or less triangular area filling in the space below a stair string is also a form of spandrel.

**Spangenberg, August Gottlieb** (b. July 15, 1704, Klettenberg-Hohenstein, Saxony—

d. Sept. 18, 1792, Berthelsdorf), German bishop of the Unitas Fratrum, successor to its leader, Nikolaus Ludwig, graf von Zinzendorf, and founder of the Moravian Church in North America.

As a law student at Jena, Spangenberg was converted in 1722 to Pietism, a religious movement emphasizing biblical study, morality, and Christian living, and he began to study theology. In 1728, during Zinzendorf's visit to Jena, Spangenberg was drawn into his circle. In 1732 he was named to the theological faculty at Halle, but Pietists there opposed his association with Zinzendorf, and he was expelled the next year. As Zinzendorf's assistant, he went to the United States, first to Georgia and then to Pennsylvania, to supervise Moravian missionary work. Intending to make Philadelphia the centre of Moravian activity, he founded the North American branch of the Unitas Fratrum there (1740), and at Bethlehem, Pa., he established a community in which work was done and goods were held communally. Spangenberg organized another branch in England (1741–42), worked again in Germany, and returned to North America in 1744 after becoming a bishop of his church. After an interval in Europe (1749–51), he extended Moravian missionary work to North Carolina and in 1762 went back to Germany for the last time, assuming leadership of the Unitas Fratrum as a member of its governing body.

In addition to contributing in the mission field, Spangenberg also drafted the *Idea Fidei Fratrum* (1779; *Exposition of Christian Doctrine*, 1784), which became the accepted statement of Moravian beliefs. Through his moderation, internal differences were ameliorated, and the Moravian Church maintained friendly relations with the Lutheran Church. Among his works are a life of Zinzendorf (1772–75; abridged Eng. trans., 1838), some apologetic writings, and several hymns.

**spaniel,** any of several sporting dogs used by hunters to flush game from cover. The earliest spaniels apparently originated in Spain, hence the name, but most of the modern breeds were developed in Britain.

(Top) Cocker spaniel; (bottom) English springer spaniel

Sally Anne Thompson—EB Inc.

The cocker spaniel is a small dog standing 14 to 15 inches (36 to 39 centimetres) and weighing 22 to 29 pounds (10 to 13 kilograms). Compact and sturdily built, it has a rounded head, floppy ears, and a soft, flat or wavy coat. The coat may be either solid coloured or variegated; colours include black, reddish brown, buff, and black and white.

The English cocker spaniel is similar to the cocker spaniel but is larger and has longer legs and a longer muzzle. It has a medium-length silky coat in a variety of colours. The distinction between spaniel breeds originally was one of size, the larger spaniels being called springers and the smaller ones cockers—the latter apparently in reference to their use in flushing woodcocks.

There are two breeds known as springer spaniels. The English springer spaniel is a medium-sized, compact dog standing 19 to 20 inches (48 to 51 centimetres) and weighing 35 to 55 pounds (16 to 25 kilograms). Its glossy coat is flat or wavy and usually black and white or liver-coloured and white. The English springer spaniel is valued both as a companion and for its use in the field as a pheasant hunter. The Welsh springer spaniel is somewhat smaller than the English and is always red-brown and white. It is noted as both a pet and a capable hunting dog and retriever.

There are several other breeds, among them the American water spaniel, a sturdily built, curly-coated, dark brown dog used to hunt birds and small animals; the Brittany spaniel, a setter-like, tailless or short-tailed French dog and the only spaniel that points, rather than flushes, birds; the Clumber spaniel, a low-slung, long-bodied, powerful dog, slow but thorough in the field; and the Irish water spaniel, an old breed valued as both a water retriever and a companion dog. *See also* English toy spaniel; Japanese spaniel.

**Spanish–American War** (1898), conflict between the United States and Spain that ended Spanish colonial rule in the Americas and resulted in U.S. acquisition of territories in the western Pacific and Latin America.

The war originated in the Cuban struggle for independence from Spain, which began in February 1895. Spain's brutally repressive measures to halt the rebellion were graphically portrayed for the U.S. public by several sensational newspapers, and American sympathy for the rebels rose. The growing popular demand for U.S. intervention became an insistent chorus after the unexplained sinking in Havana harbour of the battleship USS *Maine* (Feb. 15, 1898; *see* Maine, destruction of the), which had been sent to protect U.S. citizens and property after anti-Spanish rioting in Havana. Spain announced an armistice on April 9 and speeded up its new program to grant Cuba limited powers of self-government, but the U.S. Congress soon afterward issued resolutions that declared Cuba's right to independence, demanded the withdrawal of Spain's armed forces from the island, and authorized the President's use of force to secure that withdrawal while renouncing any U.S. design for annexing Cuba.

Spain declared war on the United States on April 24, followed by a U.S. declaration of war on the 25th, which was made retroactive to April 21. The ensuing war was pathetically one-sided, since Spain had readied neither its army nor its navy for a distant war with the formidable power of the United States. Commo. George Dewey led a U.S. naval squadron into Manila Bay in the Philippines on May 1, 1898, and destroyed the anchored Spanish fleet in a leisurely morning engagement that cost only seven American seamen wounded. Manila itself was occupied by U.S. troops by August.

The elusive Spanish Caribbean fleet under Adm. Pascual Cervera was located in Santiago harbour in Cuba by U.S. reconnaissance. An army of regular troops and volunteers under Gen. William Shafter (and including Theodore Roosevelt and his 1st Volunteer Cavalry, the "Rough Riders") landed on the coast east of Santiago and slowly advanced on the city in an effort to force Cervera's fleet out of the harbour. Cervera led his squadron out of Santiago on July 3 and tried to escape westward along the coast. In the ensuing battle all of his ships came under heavy fire from U.S. guns and were beached in a burning or sinking condition. Santiago surrendered to Shafter on July 17, thus effectively ending the war.

By the Treaty of Paris (signed Dec. 10, 1898), Spain renounced all claim to Cuba, ceded Guam and Puerto Rico to the United States, and transferred sovereignty over the Philippines to the United States for $20,000,000. The Spanish–American War was an important turning point in the history of both antagonists. Spain's defeat decisively turned the nation's attention away from its overseas colonial adventures and inward upon its domestic needs, a process that led to both a cultural and a literary renaissance and two decades of much-needed economic development in Spain. The victorious United States, on the other hand, emerged from the war a world power with far-flung overseas possessions and a new stake in international politics that would soon lead it to play a determining role in the affairs of Europe.

**Spanish Armada:** *see* Armada.

**Spanish cedar:** *see* cigar-box cedar.

**Spanish Civil War** (1936–39), military revolt against the Republican government of Spain, supported by conservative elements within the country. When an initial military coup failed to win control of the entire country, a bloody civil war ensued. The Nationalists, as the rebels were called, received aid from fascist Italy and Nazi Germany. The Republicans received aid from the Soviet Union, as well as from International Brigades, composed of volunteers from Europe and the United States.

A polarization of Spanish life and politics had developed over previous decades. On one side (the Nationalist) were most Roman Catholics, important military elements, most landowners, and many businessmen. On the other side (the Republican) were urban workers, most agricultural labourers, and many of the educated middle class. Politically their differences often found vehement expression in parties such as the fascist-oriented Falange and the militant anarchists. Between these extremes were other groups covering the political spectrum from monarchism to socialism, including a small communist movement divided among followers of Joseph Stalin and Leon Trotsky. In 1934 there was widespread labour conflict; a bloody uprising by miners in Asturias was suppressed by troops led by General Francisco Franco. Elections on Feb. 16, 1936, brought to power a Popular Front government supported by most of the left and opposed by the right and remnants of the centre.

A well-planned military uprising began on July 17, 1936, in Spanish garrison towns. By July 21 the rebels had achieved control in Spanish Morocco, the Canary Islands, and the Balearic Islands (except Minorca) and in much of Spain north of the Guadarrama mountains and the Ebro River. The Republican forces had put down the uprising in other areas, except for some of the larger Andalusian cities. Republican violence occurred primarily during the early stages of the war before the rule of law was restored, but the Nationalist violence was part of a conscious policy of terror. The proliferation of executions, murders, and assassinations on both sides reflects the great passions that the Civil War unleashed.

The captaincy of the Nationalists was gradually assumed by General Franco, leading forces he had brought from Morocco. On Oct. 1, 1936, he was named head of state and set up

a government in Burgos. The Republican government, beginning in September 1936, was headed by the socialist leader Francisco Largo Caballero. He was followed in May 1937 by Juan Negrín, also a socialist, who remained premier throughout the rest of the war and served as premier in exile until 1945. The president of the Spanish Republic until nearly the war's end was Manuel Azaña, an anticlerical liberal. Internecine conflict compromised the Republican effort from the outset. On one side were the anarchists and militant socialists, who viewed the war as a revolutionary struggle; on the other were the more moderate socialists and republicans, whose objective was the preservation of the Republic. Seeking allies against the threat of Nazi Germany, the Soviet Union had embraced a Popular Front strategy and the Comintern directed Spanish communists to support the Republicans.

Both the Nationalist and Republican sides turned abroad for help. Germany and Italy sent troops, tanks, and planes to aid the Nationalists. The Soviet Union contributed equipment and supplies to the Republicans, who also received help from the Mexican government. Initially the Popular Front government of France also supported the Republicans, but internal opposition forced a change of policy. In August 1936, France joined Britain, the Soviet Union, Germany, and Italy in signing a nonintervention agreement that would be ignored by the Germans, Italians, and Soviets. About 40,000 foreigners fought on the Republican side in the International Brigades largely under the Comintern's command, and 20,000 others served in medical or auxiliary units.

By November 1936 the Nationalists had laid siege to Madrid but were unable to get beyond the University City area. By October 1937, though, they held the whole northern coast. A war of attrition began. The Nationalists drove a salient eastward, reaching the Mediterranean and splitting the republic in two in April 1938. In December 1938, they forced the Republican armies in Catalonia northward toward France. By February 1939, 250,000 Republican soldiers, together with an equal number of civilians, had fled to France. On March 5 the Republican government flew to exile in France. On March 7 a civil war broke out in Madrid between communist and anticommunist factions. By March 28 the Republican armies had begun to disband and surrender, and Nationalist forces entered Madrid on that day.

Nationalist forces put the number of persons killed in the war at 1,000,000, including not only those killed in battle but also the victims of bombardment, execution, and assassination. More recent estimates have been closer to 500,000 or less. This does not include all those who died from malnutrition, starvation, and war-engendered disease.

The political and emotional reverberations far transcended those of a national conflict, for many in other countries saw the Spanish Civil War as part of an international conflict between tyranny and democracy, or fascism and freedom, or communism and civilization. The war also had mobilized many artists and intellectuals to take up arms. Among notable artistic responses to the war were the novels *Man's Hope* (1938) by André Malraux, *Homage to Catalonia* (1938) by George Orwell, *The Adventures of a Young Man* (1939) by John Dos Passos, and *For Whom the Bell Tolls* (1940) by Ernest Hemingway, as well as Pablo Picasso's painting *Guernica* (1937) and Robert Capa's photograph *Loyalist Soldier, Spain* (1936).

**Spanish lace,** lace made in Spain; the name is also erroneously given to much lace that was in fact imported into Spain from the 17th century onward. The Spaniards imported a great deal of Venetian needle lace for church use in the 17th century. When the Spanish monasteries were dissolved in 1830, much ecclesiastical lace came to light that was described as "Spanish point," but little, if any, of this can be said to be indigenous. Similarly, bobbin-made lace was imported from the Spanish-dominated parts of the Netherlands. At Barcelona, lace of a rather undistinguished sort was made in the 18th century, but good-quality lace for mantillas was imported from France, especially Chantilly. At the beginning of the 19th century, blonde and black blonde silk lace (*see* blonde lace) was made in Catalonia and La Mancha, the silk being spun near Barcelona. Various lace-making centres at different times have produced laces specifically in the Spanish style, which generally denotes a somewhat heavier than usual type of lace.

(Top) Spanish lace from Barcelona, mid-19th century, in the Victoria and Albert Museum, London; (bottom) Spanish lace from Nottingham, Eng., made by Brooksbank & Sanby, *c.* 1883, in the Museum and Art Gallery, The Castle, Nottingham, Eng.

**Spanish language,** Spanish ESPAÑOL, Romance language spoken by more than 250,000,000 persons in Spain, the Americas, and Africa. The earliest written materials in Spanish, in the form of glosses on Latin texts, date from the 10th century, and works of literature in Spanish first appeared *c.* 1150.

Spanish is also known (particularly in Latin America) as Castilian, after the dialect from which modern standard Spanish developed. That dialect arose in the 9th century around the town of Burgos, in north central Spain (Old Castile), and, as Spain was reconquered from the Moors, spread southward to central Spain (New Castile) around Madrid and Toledo by the 11th century. In the late 15th century the kingdoms of Castile and Leon merged with that of Aragon, and Castilian became the official language of all Spain. The regional dialects of Aragon, Navarre, Leon, Asturias, and Santander were crowded out gradually and today survive only in secluded rural areas. Galician, a Portuguese dialect spoken in northwestern Spain, was also much reduced.

The dialect of Spanish used in Arab-occupied Spain prior to the 12th century was called Mozarabic (*see* Mozarabic language). A remarkably archaic form of Spanish with many borrowings from Arabic, it is known primarily from Mozarabic refrains (called *kharjahs*) added to Arabic and Hebrew poems.

Outside the Iberian Peninsula, Spanish is spoken in virtually all of Central and South America except Brazil (where the closely related Portuguese language is spoken), as well as in the Canary Islands, parts of Morocco, and the Philippines. Latin-American Spanish has a number of regional dialects; all are derived from Castilian but differ in several points of phonology from European Spanish. Typical of Latin-American Spanish is the use of the *s* sound where Castilian has the lisplike *th* sound (*z* or *c* before *e* or *i* in spelling) and replacement of the Castilian *ly* sound (spelled *ll*) with a *y* sound or even with the *zh* sound of the *z* in English "azure" or the *j* in French *jour.*

In Spanish the case system of Latin has been completely lost except for subject and object forms for pronouns. Nouns are marked for masculine or feminine gender, and plurals are marked by the addition of *-s* or *-es;* adjectives change endings to agree with nouns. The verb system is complex but by and large regular; it uses indicative, imperative, and subjunctive moods, preterite, imperfect, present, future, conditional, and a variety of perfect and progressive tenses, and passive and reflexive constructions.

**Spanish lime** (*Melicoccus bijugus*), tree, of the soapberry family (Sapindaceae), native to the West Indies. It grows to about 15 metres (50 feet). The flowers are small, greenish white, and fragrant. The green fruit is a drupe (a single stony seed covered by soft, fleshy tissue) with yellow or white tasty, juicy flesh.

Spanish lime (*Melicoccus bijugus*)
W.H. Hodge

**Spanish literature,** the body of literary works produced in Spain, consisting principally of those written in Castilian but including those in the Catalan language and the Galician dialect as well. Although the latter two forms have substantial literary traditions, it was Castilian, with its political and linguistic predominance, that established itself as "Spanish."

A brief treatment of Castilian literature follows. For full treatment and a survey of Catalan and Galician letters, *see* MACROPAEDIA: Spanish Literature.

Literature in Castilian began to emerge in the 12th century. Its earliest surviving masterpiece, the epic poem *Poema* (or *Cantar*) *de mío Cid* ("Poem [or Song] of My Cid"), appeared *c.* 1140 and was followed by other heroic narratives centring on subjects from Castilian feudal history. Clerics and scholars also began to produce learned narrative poetry on devotional themes at this time.

Castilian prose was adopted in place of Latin for literary purposes in about the mid-1200s owing to the efforts of King Alfonso X of Castile and Leon. Compilations of Castilian laws, historical chronicles, and translations of Arabic scientific works were all undertaken in the vernacular under his direction. The 14th century saw the rise of such new forms as the moral tale and the chivalric romance. Spanish poetry came into its own with the *Libro de buen amor* (1330; "Book of Good Love") by Juan Ruiz and reached a considerable degree of sophistication in the Italian-influenced lyrics of the Marqués de Santilla and the allegorical epics of Juan de Mena. The first masterpiece of Spanish prose fiction, *La Celestina*

(1499), was a novel in dialogue form that was remarkable for the time in its psychological intensity and realism.

The unification of Spain in 1479 marked the beginning of the Renaissance there as well as the start of the Golden Age (*q.v.*) of Spanish literature. Garcilaso de la Vega revitalized Spanish lyric poetry with his adept transformation of Italian metres into Castilian verse. The mystic poets St. John of the Cross and St. Teresa of Avila treated spiritual and religious themes, while Luis de Góngora y Argote developed an ornate poetic style (*gongorismo*) that featured extravagant imagery, elaborate classical allusions, and complex syntax.

In prose fiction, various genres emerged to replace the chivalric romance that had so long dominated popular taste. The pastoral novel was derived from Italian literature and idealized simple rural life. The picaresque novel was a native Spanish form that originated with the anonymous *Lazarillo de Tormes* in 1554 and reached its height with Mateo Alemán's *Guzmán de Alfarache* (1599). In its description of the comical adventures of low-born rogues, the picaresque novel guided Spanish fiction to the direct and candid observation of society and its mores. The greatest novel of the Golden Age, however, was Miguel de Cervantes' classic *Don Quixote* (part 1, 1605; part 2, 1615), which raised contemporary fiction to a new level of psychological subtlety and social insight.

The Spanish drama, which had slowly evolved from medieval church plays, finally achieved artistic distinction in the work of Lope de Vega. Lope synthesized the disparate sources of the contemporary theatre and produced enormous numbers of plays that featured clever stagecraft and intricate, gripping plots. The most talented of Lope's successors were Tirso de Molina and Pedro Calderón de la Barca. While Tirso achieved considerable mastery of characterization, Calderón was unmatched in dramatic craftsmanship, producing tightly structured works whose formal artistry and thematic depth mark the high point of Spanish Baroque drama.

By 1681, when Calderón died, Spain was politically and economically prostrate. Literary creativity, too, seemed virtually extinct. Recovery came with the 18th-century Bourbon dynasty, whose remaking of Spanish culture on French classical lines promoted many new ideas and institutions but less by way of worthwhile literary production.

Spanish letters was reinvigorated by the Romantic movement, which arrived in Spain in the 1830s and achieved a rapid but brief ascendancy. Among the leading figures of Spanish Romanticism were the poet and playwright Ángel de Saavedra, the playwright José Zorrilla, and the lyric poet José de Espronceda. Saavedra's play *Don Alvaro o la fuerza del sino* (1835; "Don Alvaro; or, The Force of Destiny") embodied all the elements of the Romantic mode and triggered a series of works in a similar vein, culminating in Zorrilla's treatment of the Don Juan theme, *Don Juan Tenorio* (1844). After 1850 there appeared a new generation of poets—Gustavo Adolfo Bécquer, Rosalía de Castro, and Ramón de Campoamor—who succeeded in preserving the sensitivity and emphasis on feeling of the earlier Romantics while avoiding their formal and stylistic excesses.

Spanish prose literature of the first half of the 19th century was dominated by *costumbrismo,* a genre that focused on the customs and manners of the inhabitants of a particular Spanish region or locale. The satirical form of the short *costumbrismo* literary sketch became the principal vehicle for Mariano José de Larra, who mercilessly criticized the foibles of the Madrid bourgeoisie in his *Articulos* (1835–37). A second form of the *costumbrismo* sketch that emphasized local colour and folklore laid the groundwork for the realistic Spanish regional novel that reached predominance during the last half of the 19th century. *Marta y Maria* (1883) by Armando Palacio Valdés and *Penas arriba* (1893) by José María de Pereda are outstanding examples of the regional novel in their emphasis on the traditional values of religion, family, and country life. Juan Valera and Benito Pérez Galdós went beyond the limits of regional Realism, producing novels that dealt with broader and more universal concerns. Galdós in particular thought in national terms in the 46 novels of his *Episodios nacionales* (1873–79, 1898–1912), which recapitulate Spanish history during the 19th century. Emilia Pardo Bazán experimented with Naturalistic writing but quickly returned to regional Realism after recognizing the incompatibility of Spain's deeply Catholic outlook with the determinism of French Naturalism. The only major Spanish novelist who found both the doctrines and techniques of Naturalism congenial was Vicente Blasco Ibáñez, as evidenced by those of his early novels set in Valencia.

The ignominy of Spain's defeat in the Spanish–American War of 1898 caused many Spanish intellectuals to analyze the causes of Spain's long decline and reassess its traditional values, and a group of writers called the Generation of '98 soon attempted to revitalize their nation's cultural life. Foremost among them were the prose-fiction writers Miguel de Unamuno, Azorín (pseudonym of José Martínez Ruiz), Pío Baroja, and Ramón María del Valle-Inclán; the poets Antonio and Manuel Machado; and the philosopher-critic José Ortega y Gasset. The novelists among them broke from the regional Realist tradition, introducing innovative narrative and structural techniques as well as a new seriousness of purpose into the Spanish novel. The critical, psychological, and philosophical essay rose to new importance in Spain at this time, while many poets adapted the Modernist inventions of the Nicaraguan poet Rubén Darío.

Other significant Spanish literary artists during the early 20th century were the novelist Ramón Pérez de Ayala and the lyric poet Juan Ramón Jiménez. A group of brilliant poets known as the Generation of 1927 (Federico García Lorca, Pedro Salinas, Jorge Guillén, Vicente Aleixandre, and Rafael Alberti, among others) followed in the footsteps of the Machado brothers and Jiménez. They took inspiration from Spain's literary past as well as from contemporary trends such as Surrealism to produce an intensely personal poetry characterized by the sophisticated use of symbolic imagery and myth. During the early 20th century, Spanish drama achieved new vigour with the witty bourgeois satires of Jacinto Benavente y Martínez, the historical dramas of Eduardo Marquina, and the intense, lyrical tragedies of García Lorca.

The Spanish Civil War (1936–39) drove many gifted writers into political exile and broke the continuity of Spanish literature. The trauma of the war and its cultural and economic repercussions gave rise to various forms of intense realism in literature, as exemplified by the *tremendismo* (a blend of Naturalistic techniques and Existentialist views) of Camilo José Cela and the stark Social Realism of such politically committed novelists as Carmen Martín Gaite and Elena Quiroga. From the early 1960s, experimentation with structure, narrative technique, and language became a key concern, as seen in the works of Juan Goytisolo, José María Gironella, and others who had earlier embraced Social Realism. Formal and technical innovations similarly are important elements in the drama of Antonio Buero Vallejo and in that of Fernando Arrabal, a proponent of Absurdist theatre, while Alfonso Sastre favoured a more direct, committed approach to social problems in his writings.

Lyric poetry since the Civil War reflects a trend away from the complexities of the Modernists and the Generation of 1927 and toward a simpler approach stressing discipline of form, clarity of expression through direct imagery, and increased social content. This direction in lyric expression is best represented by the works of such poets as Gabriel Celaya, Blas de Otero, and Claudio Rodríguez.

**Spanish Marriages, Affair of the,** the political maneuvering surrounding the dual marriages (Oct. 10, 1846) of Queen Isabella II of Spain to her cousin Francisco de Asís de Bourbon, duke of Cadiz, and of her younger sister and heiress to the throne, Luisa Fernanda, to Antoine, duc de Montpensier, the youngest son of King Louis-Philippe of France. The marriages revived dynastic ties between Spain and France but caused the breakdown of friendly relations between England and France.

In 1843 and 1845 the French foreign minister, François Guizot, had assured the British that Isabella would marry within the Spanish or Neapolitan branches of the House of Bourbon and that her sister Luisa would not marry a French prince before the birth of one or more children to Isabella. This agreement was upset when, in June 1846, Viscount Palmerston returned to the British Foreign Office and revived the idea of a marriage between Isabella and Prince Leopold of Saxe-Coburg, the cousin of the English prince consort. Palmerston also opposed the French support of the Moderados, Spaniards who accepted the conservative royal constitution of 1834. The Spanish and French governments feared the British designs, including possible British support for the Progresistas, who sought restoration of the liberal constitution of 1812, and so they planned and carried out the double marriage. Isabella had to be pressured into accepting her cousin, partly because he was thought to be impotent. Palmerston fruitlessly protested that the marriages were contrary to the terms of the Treaty of Utrecht (1713), which forbade the union of the French and Spanish Bourbons. The effect of the rupture with Britain and the liberal principles it represented was to push Louis-Philippe into closer alliance with the conservatives, led by Guizot, at a time when the liberals were gathering strength. This alliance contributed to Louis-Philippe's downfall in 1848.

**Spanish moss,** also called BLACK MOSS, LONG MOSS, or VEGETABLE HORSEHAIR (*Tillandsia usneoides*), epiphyte (a nonparasitic plant that is supported by another plant and has aerial roots exposed to the humid atmosphere) of the pineapple family (Bromeliaceae). It is found in southern North America, the West Indies, and Central and South America.

The silvery-gray plant often grows in large, beardlike masses. It has threadlike stems up to 6 to 7.5 metres (about 20 to 25 feet) long. The leaves, also threadlike, are about 2.5 to 7.5 centimetres (1 to 3 inches) long. The yellow flowers, which appear rarely, are stalkless, have three yellow petals, and three sepals, and usually grow singly. Hairlike scales that cover the whole plant absorb water from the air. Spanish moss sometimes is used as a filler in packing boxes and as upholstery.

**Spanish Netherlands** (*c.* 1579–1713), Spanish-held provinces located in the southern part of the Low Countries (roughly corresponding to present Belgium and Luxembourg).

Although the provinces of the Low Countries had for some years and for many reasons been chafing under foreign rule, the revolt against Spain received its major impetus from the zeal of members of the nascent Calvinist movement. It was to quell their insurrection that Fernando Álvarez de Toledo y Pimen-

tal, duque (duke) de Alba, was sent in 1567. His harsh, repressive measures (*see* Troubles, Council of) and heavy taxation met with immediate resistance. King Philip II, recognizing his mistake, recalled the hated Alba in 1573. Although the largely Roman Catholic southern provinces had remained loyal to Spain to this time, an active Protestant movement and the growing desire to be autonomous influenced them to join in a united resistance to Spain. In 1576 delegates from the union of northern and southern provinces, known collectively as the States General, met and issued the Pacification of Ghent (*see* Ghent, Pacification of). Yet within three years it was apparent that the religious truce would not hold. The differences between the agrarian, Roman Catholic south and the commercial–industrial, Calvinist-dominated north were too great. In addition, the Spanish king had chosen as his representative Alessandro Farnese (later duke of Parma), well known for his diplomatic and military skills. By emphasizing Roman Catholic unity and showing moderation in his treatment of the Protestants in the south, he regained the confidence of the southern provinces and reestablished Spanish control over them; by 1585 the union of the northern and southern Low Countries was over.

Despite the warfare and confusion, the Spanish Netherlands experienced a resurgence of economic and intellectual growth in the early 17th century. The linen industry quickly recovered from the Spanish reconquest and soon surpassed its former production levels. Flemish painting flourished in the hands of Peter Paul Rubens, Anthony van Dyck, and others. The major cities of Ghent and Bruges grew rapidly. Agriculture advanced through the digging of canals and the introduction of new crops and harvesting methods, and prosperity continued into the mid-17th century.

Although the southern provinces were far from independent, they did experience a considerable degree of freedom in internal affairs. They controlled their own judiciary system and set up councils to aid the governor general. They also enjoyed the privileges established with the Joyeuse Entrée (*q.v.*). Foreign affairs, however, were strictly the domain of the Spanish throne.

Beset on all sides, the Spanish Netherlands was the scene of constant warfare. It was in the unfortunate position of being a buffer between Protestant and Roman Catholic states. Consequently, it was mercilessly carved up. Northern Brabant, Zeeland, and the region east of the Meuse River was ceded to the United Provinces (Dutch Republic) in 1648. The county of Artois was taken by France in 1659, to be followed later by large southern portions of Hainaut, Luxembourg, and Flanders. In 1648 the Peace of Münster closed the flourishing port of Antwerp to foreign trade.

Under these conditions, the territory began to decline. Spanish control was lost when Charles II of Spain died without issue (1700), naming Philip, duc d'Anjou of France as his successor (as Philip V). The Spanish Netherlands was ruled for six years by Bourbon France and occupied for another seven by British and Dutch troops. In 1713 the Treaties of Utrecht divided the Spanish inheritance, and rule of the Spanish Netherlands passed to the Holy Roman emperor Charles VI and the Austrian Habsburgs (*see* Austrian Netherlands).

**Spanish North Africa,** five small areas, in special relationship with the Spanish government, on and off the Mediterranean coast of Morocco. They are Alhucemas, Ceuta, the Chafarinas Islands, Melilla (*qq.v.*), and Peñón de Vélez de la Gomera, with a combined area of about 12 square miles (31 square km). Ceuta is administered as part of Cádiz province, the rest as part of Málaga province.

**Spanish Riding School of Vienna,** also called (until 1918 and 1939–45) SPANISH IMPERIAL RIDING SCHOOL, German SPANISCHE REITSCHULE WIEN, or SPANISCHE HOFREITSCHULE, school of classical horsemanship in Vienna, probably founded in the late 16th century. It is the only remaining institution where haute école ("high school") riding and training methods are exclusively practiced, much as they were in the 18th century. The school is particularly noted for its white Lipizaner (*q.v.*) horses, bred especially for haute école performance. The horses were originally imported from Spain, giving the school its name.

**Spanish Sahara** (West Africa): *see* Western Sahara.

**Spanish Socialist Workers' Party,** Spanish PARTIDO SOCIALISTA OBRERO ESPAÑOL (PSOE), Socialist party that played an important role in 20th-century Spanish politics. The party was founded in 1879 by the Madrid typographer Pablo Iglesias. He was also the founder in 1888 of the party's affiliated trade union confederation, the Unión General de Trabajadores (UGT; General Union of Workers). The party grew slowly at first, partly because the UGT had to compete with the anarchist trade union confederation in organizing the working class. But by the time the Spanish Republic was proclaimed in 1931, the PSOE was the largest political party in the country. It participated in coalition governments during the years 1931–36. The Socialists were among the principal supporters of the Republic during the Spanish Civil War, and the head of the UGT, Francisco Largo Caballero, served as prime minister of Republican Spain during 1936–37. The PSOE was banned following the victory of the Nationalist forces and the fall of the Republic in 1938.

The PSOE was revived during the 1970s as the Nationalist regime of Francisco Franco waned. The internal wing of the party took over the leadership from its aging, exiled leaders in 1972 and elected the young Felipe González as the party's secretary-general. The PSOE, along with other political parties, was legalized in 1977 and took about 30 percent of the vote in national elections that year. González and other pragmatic leaders dropped the party's official Marxist-Socialist orientation in 1979 and thereafter managed to woo large numbers of middle-class and moderate voters.

The Socialists won a sweeping victory in the 1982 national elections. The charismatic and highly popular González became prime minister, and his party was easily retained in power in elections during 1986. By the time of their initial victory, the Socialists were a rather moderate party that spurned large-scale nationalization but favoured government planning and intervention to facilitate the equitable distribution of income. They were strongly democratic and advocated liberalizing divorce and other social laws. They supported Spain's membership in the European Economic Community and, once they came to power, in NATO. The party held office continuously from 1982 until March 1996, when it lost the general election to the conservative Popular Party (*q.v.*) after suffering a series of financial and security scandals.

**Spanish Succession, War of the** (1701–14), conflict that arose out of the disputed succession to the throne of Spain following the death of the childless Charles II, the last of the Spanish Habsburgs. In an effort to regulate the impending succession, to which there were three principal claimants, England, the Dutch Republic, and France had in October 1698 signed the First Treaty of Partition, agreeing that on the death of Charles II, Prince Joseph Ferdinand, son of the Elector of Bavaria, should inherit Spain, the Spanish Netherlands, and the Spanish colonies. Spain's Italian dependencies would be detached and partitioned between Austria (to be awarded the Duchy of Milan) and France (Naples and Sicily). In February 1699, however, Joseph Ferdinand died. A second treaty, signed on June 11, 1699, by England and France and in March 1700 by the Dutch Republic, awarded Spain and the Spanish Netherlands and colonies to Archduke Charles, second son of the Holy Roman emperor Leopold I, and Naples, Sicily, and other Spanish territories in Italy to France. Leopold, however, refused to sign the treaty, demanding that Charles receive all the Spanish territories intact. The Spanish grandees likewise did not recognize it, being unalterably opposed to partition. Charles II allowed himself to be persuaded that only the House of Bourbon had the power to keep the Spanish possessions intact, and in the autumn of 1700 he made a will bequeathing them to Philip, duc d'Anjou, grandson of Louis XIV of France. On November 1 he died, and on November 24 Louis XIV proclaimed his grandson king of Spain, as Philip V (the first Bourbon king of Spain), and then invaded the Spanish Netherlands. An anti-French alliance was formed (Sept. 7, 1701) by England, the Dutch Republic, and the emperor Leopold. They were later joined by Prussia, Hanover, other German states, and Portugal. The electors of Bavaria and Cologne and the dukes of Mantua and Savoy allied themselves with France, although Savoy switched sides in 1703. William III of England, a strong opponent of Louis XIV, died in 1702, but the government of his successor, Queen Anne, upheld the vigorous conduct of the war. John Churchill, duke of Marlborough, played the leading role in Queen Anne's government and on the battlefield until his fall in 1711. He was ably seconded on the battlefield by the imperial general Prince Eugene of Savoy.

The markedly superior generalship of Marlborough and Eugene brought them a series of victories over France from 1704 to 1709. A Franco-Bavarian offensive in Germany was smashed at Blenheim in 1704. The French were then driven out of the Low Countries by the battles of Ramillies in 1706 and Oudenaarde in 1708. The French were also expelled from Italy after their attempted siege of Turin was broken (Sept. 7, 1706) by Eugene's brilliant campaign. The only theatre of the land war in which the alliance had no real success was Spain, where Philip V successfully maintained his position.

Louis XIV sought to end the war from 1708 and was willing to give up the Spanish inheritance to the House of Habsburg. The British, however, insisted on the unrealistic demand that Louis use his army to remove his own grandson from Spain. Louis refused, broke off negotiations, and resumed the war. Two developments in 1711 altered the situation in favour of France. On April 17, 1711, Archduke Charles became heir to all the Austrian Habsburg possessions. Britain and the Dutch had no intention of continuing the war in order to give him the Spanish inheritance as well and thereby resurrect the old empire of Charles V. In Britain the enemies of Marlborough won influence with the Queen and had him removed from command on Dec. 31, 1711. With the collapse of the alliance, peace negotiations began in 1712. Because of the conflicts of interest between the former allies, each dealt separately with France. The first group of treaties was signed at Utrecht in April 1713. These and the later treaties of Rastatt and Baden ignored the will of Charles II and divided his inheritance among the powers. Louis XIV's grandson remained king of Spain, but the treaties of Utrecht marked the rise of the power of Britain and the British colonial empire at the expense of both France and Spain.

**Spanish Town,** city, southeastern central Jamaica. It is situated along the Rio Cobre, 10 miles (16 km) west of Kingston. Probably laid out by Diego Columbus (*c.* 1523), it was originally called Santiago de la Vega (St. James of the Plain) and was Jamaica's capital from 1692 until 1872. It is now a commercial and processing centre for produce of the irrigated Liguanea Plain (bananas, sugarcane, annatto, breadfruit, coffee, cacao, and citrus fruit). The most striking historical buildings of Spanish Town include St. Catherine's Cathedral (1655), the Rodney Memorial, the House of Assembly, the Court House, and the 17th-century Eagle House. The ruined Old King's House (1762) was the official residence of Jamaica's governors until 1870; it was destroyed by fire in 1925. The new National Repository contains documents going back as far as the early years of English settlement. The Jamaica School of Agriculture was founded in Spanish Town in 1910. Pop. (1982) 89,097.

**Spanish treasure fleet,** from the 16th to the 18th century, Spanish convoy of ships transporting European goods to the Spanish colonies in the Americas and transporting colonial products, especially gold and silver, back to the mother country.

Beginning in the 1560s, shipping between Spain and the Americas was organized on a regular basis. Two fleets of between 30 and 90 vessels sailed from Seville to the American colonies each year: the *flota* left in the spring for Vera Cruz, in what is now Mexico, detaching ships in the West Indies and at Honduras on the way; the *galeones,* or Tierra Firme fleet, left in August for Cartagena, in present Colombia, and Porto Bello (now Portobelo), on the Atlantic coast of Panama. After wintering in America, both fleets met at Havana the following spring and returned to Spain together, protected by warships.

The immense wealth in gold and silver carried by these fleets on the return voyage offered a tempting prize to English, Dutch, and French seamen. One fleet was looted and destroyed by the Dutch admiral Piet Hein off Cuba (1628) and another by the English under Robert Blake in the Azores (1657), but usually the Spanish treasure fleet presented a formidable challenge to marauders.

By the 18th century, Spain had greater control over the sea-lanes and had changed its policies to allow freer trade among Spanish and American ports. As unlimited sailings became the norm, the fleet system declined in importance. The *galeones* were discontinued in 1740 and the *flota* in 1789. *See also* Manila galleon.

**spanner** (hand tool): *see* wrench.

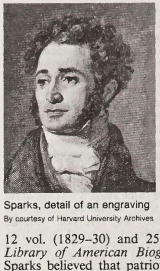
**Spark, Muriel (Sarah),** *née* CAMBERG (b. Feb. 1, 1918, Edinburgh), British novelist, critic, poet, and playwright who progressed from fantastic themes to a preoccupation with the weighty and malign. Her best-known novel

Muriel Spark
Camera Press—Pictorial Parade/EB Inc.

is *The Prime of Miss Jean Brodie* (1961), which also became popular in its stage (1966) and film (1969) versions.

Educated in Edinburgh, Muriel Spark spent some years in Central Africa and then returned to Great Britain during World War II. Thereafter she served as general secretary of the Poetry Society and editor of *The Poetry Review* (1947–49) and later published a series of critical biographies of literary figures and editions of 19th-century letters, including *Child of Light: A Reassessment of Mary Shelley* (1951), *John Masefield* (1953), and *The Brontë Letters* (1954). She converted to Roman Catholicism in 1954, and much of her work concerns questions of good and evil.

Many of Muriel Spark's early novels—such as *The Ballad of Peckham Rye* (1960) and *The Girls of Slender Means* (1963)—were characterized by a mildly humorous fantasy. *The Mandelbaum Gate* (1965), however, marked a departure toward weightier themes, and later novels—*The Driver's Seat* (1970, film 1974), *Not to Disturb* (1971), and *Loitering with Intent* (1981)—are of a distinctly sinister nature. Her novel *The Abbess of Crew* (1974) was made into the film *Nasty Habits* (1977). *Territorial Rights* (1979) is lighter and livelier. Other works include *Collected Poems I* and *Collected Stories I* (both 1967).



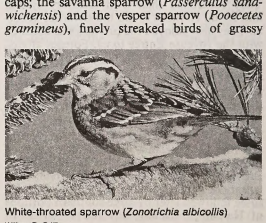
**spark chamber,** radiation detector useful for the investigation of subatomic particles in high-energy particle physics. It consists of a series of thin metal plates, parallel to each other, separated by small gaps, and enclosed in a container filled with neon or another inert gas. A very high potential drop, or voltage, is applied as a brief pulse across the two sets of alternate plates. Sparks are produced between the plates along the paths of charged subatomic particles that enter or are produced within the spark chamber because the particles leave a trail of ionized gas molecules that conduct a current. The paths of ionization remain in the chamber for about a millionth of a second, a sufficient time interval for a logic circuit to identify whether the particles that have emerged are of interest and consequently whether the high voltage pulse be sent to the plates and the resultant spark pattern be photographed for later analysis.

**spark plug,** also called SPARKING PLUG, device that fits into the cylinder head of an internal-combustion engine and carries two electrodes separated by an air gap, across which current from a high-tension ignition system discharges, to form a spark for igniting the fuel. The electrodes must be able to resist high temperatures, and the insulator separating them must withstand high temperatures and also an electric stress up to several thousand volts. Spark-gap length affects the energy of the spark, and the shape of the insulator affects the temperature of operation. When too cool, operation leads to carbonization and short-circuiting of the gap; when too hot, there may be preignition.

**Sparks, Jared** (b. May 10, 1789, Willington, Conn., U.S.—d. March 14, 1866, Cambridge, Mass.), American publisher and editor of the *North American Review,* biographer, and president of Harvard College.

Educated at Phillips Exeter Academy and Harvard College, Sparks served as minister of the First Independent Church (Unitarian) from 1819 to 1823. From then until 1830, under his ownership and editorship, the *North American Review* became the arbiter of literature in New England. He was appointed the first professor of secular history at Harvard and served as president of the college from 1849 to 1853.

He was the author of biographies of Benjamin Franklin, George Washington, and Gouverneur Morris. He edited *The Diplomatic Correspondence of the American Revolution,*



Sparks, detail of an engraving
By courtesy of Harvard University Archives

12 vol. (1829–30) and 25 volumes of *The Library of American Biography* (1834–48). Sparks believed that patriotism obliged him, when editing source materials, to omit passages likely to cause international ill will, and he sometimes embellished what the Founding Fathers had actually written. The exacting scholarly standards of a later age rendered much of his work obsolete.

**sparrow,** any of a number of small, chiefly seed-eating birds having conical bills. The name sparrow is most firmly attached to birds of the Old World family Ploceidae (*q.v.*; order Passeriformes), particularly to the house sparrow (*q.v.; Passer domesticus*) that is so common in temperate North America and Europe, but also to many New World members of the Fringillidae. The house sparrow and its relatives, however, probably do not belong in Ploceidae and may be classified as a separate family, Passeridae.

Most members of the New World family Fringillidae (subfamily Emberizinae) are called sparrows. Examples breeding in North America are the chipping sparrow (*Spizella passerina*) and the tree sparrow (*S. arborea*), trim-looking little birds with reddish-brown caps; the savanna sparrow (*Passerculus sandwichensis*) and the vesper sparrow (*Pooecetes gramineus*), finely streaked birds of grassy

White-throated sparrow (*Zonotrichia albicollis*)
William D. Griffin

fields; the song sparrow (*Melospiza melodia*) and the fox sparrow (*Passerella iliaca*), heavily streaked skulkers in woodlands; and the white-crowned sparrow (*Zonotrichia leucophrys*) and the white-throated sparrow (*Z. albicollis*), larger species with black-and-white crown stripes. The rufous-collared sparrow (*Z. capensis*) has an exceptionally wide breeding distribution: from Mexico and Caribbean islands to Tierra del Fuego. A great many emberizine sparrows are native to Central and South America. *See also* accentor.

**sparrowhawk,** any of various small birds of prey usually of the genus *Accipiter* (family Accipitridae), classified with the goshawks as "accipiters," or true hawks. They eat small birds such as sparrows, small mammals, and insects.

The African little sparrowhawk (*A. minullus*), slate gray above with white tail bars, barred white below, inhabits woods of East and South Africa. The Eurasian sparrowhawk (*A. nisus*), dark gray above and brown barred white below, is a common inhabitant of wooded areas

throughout Europe, in coastal northwestern Africa, and in temperate to sub-Arctic forests of Asia. The Levant sparrowhawk, or shikra (*A. brevipes*), is gray above and brown barred white below. It occurs from southeastern Eu-

Eurasian sparrowhawk (*Accipiter nisus*)

rope throughout most of continental southern Asia and subequatorial Africa. For the small falcon called sparrow hawk in the United States, *see* kestrel.

**Sparta,** Modern Greek SPARTÍ, historically LACEDAEMON, ancient capital of the Laconia district of the southeastern Peloponnese, Greece, and capital of the present-day *nomós* (department) of Lakonía on the right bank of the Evrótas Potamós (river). The sparsity of ruins from antiquity around the modern city reflects the austerity of the military oligarchy that ruled the Spartan city-state from the 6th to the 2nd century BC.

A brief treatment of ancient Sparta follows. For full treatment, *see* MACROPAEDIA: Greco-Roman Civilization, Classical.

Reputedly founded in the 9th century BC with a rigid oligarchic constitution, the state of Sparta for centuries retained as lifetime corulers two kings who arbitrated in time of war. In time of peace, power was concentrated in a Senate of 30 members. Between the 8th and 5th century BC, Sparta subdued Messenia, reducing the inhabitants to serflike status. From the 5th century the ruling class of Sparta devoted itself to war and diplomacy, deliberately neglecting the arts, philosophy, and literature, and forged the most powerful army standing in Greece.

The Metropolis (cathedral) dedicated to St. Demetrios at Mistra, ruined Byzantine city near Sparta, Gr.
© Mairani—CLICK/Chicago

Sparta's single-minded dedication to rule by a militarized oligarchy precluded any hope of a political unification of classical Greece, but it performed a great service in 480 BC by its heroic stand at Thermopylae and its subsequent leadership in the Greco-Persian wars. The Battle of Salamis (480) revealed the magnitude of Athenian naval power and set in motion the deadly struggle between the two powers that ended in Athenian defeat at the close of the Peloponnesian War in 404 and the emergence of Sparta as the most powerful state in Greece. In the Corinthian War (395–387) Sparta had two land victories over Athenian allied states and a severe naval defeat at Cnidus by a combined Athenian and Persian fleet. Sparta's involvement in Persian civil wars in Asia Minor under Agesilaus II (ruled 399–360) and the subsequent Spartan occupation (382) of the Theban citadel, Cadmea, overextended Spartan power and exposed the state to defeat at Leuctra (371) by the Theban Epaminondas, who went on to liberate Messenia. A century-long decline followed.

Sparta's continued agitation spurred Rome's war on the Achaeans (146) and the Roman conquest of the Peloponnese. In AD 396 the modest city was destroyed by the Visigoths. The Byzantines repopulated the site and gave it the ancient Homeric name Lacedaemon. After 1204 the Franks built a new fortress city, Mistra, on a spur of the Taygetus range southwest of Sparta; after 1259 Mistra was capital of the Despotate of Morea (*i.e.,* the Peloponnese) and flourished for about two centuries. From 1460 until the War of Greek Independence (1821–29), except for a Venetian interlude, the region was under Turkish rule.

The present-day town was built in 1834 on the ancient site; it is called Néa (New) Spartí locally to distinguish it from the ruins that were excavated in 1906–10 and 1924–29. A small commercial and industrial centre of the Eurotean plain, the city trades in citrus fruits and olive oil. As in antiquity, it is served by the small port of Githion, modern Greek Yithion (*q.v.*), 28 miles (45 km) southeast, to which it is linked by a paved road. Pop. (1981) metropolitan area, 14,388.

**Spartacus** (d. 71 BC), leader in the Gladiatorial War (73–71) against Rome.

A Thracian by birth, Spartacus served in the Roman Army, perhaps deserted, led bandit raids, and was caught and sold as a slave. With about 70 fellow gladiators he escaped a gladiatorial training school at Capua in 73 and took refuge on Mount Vesuvius, where other runaway slaves joined the band. After defeating two Roman forces in succession, the rebels overran most of southern Italy. Ultimately their numbers grew to at least 90,000. Spartacus defeated the two consuls for the year 72 and fought his way northward toward the Alps, hoping to be able to disperse his soldiers to their homelands once they were outside Italy. When his men refused to leave Italy, he returned to Lucania and sought to cross his forces over to Sicily but was thwarted by the new Roman commander sent against him, Marcus Licinius Crassus. Hemmed in by Crassus' eight legions, Spartacus' army divided; the Gauls and Germans were defeated first, and Spartacus himself ultimately fell fighting in pitched battle. Pompey's army intercepted and killed many slaves who were escaping northward, and 6,000 prisoners were crucified by Crassus along the Appian Way.

Spartacus was apparently both competent and humane, although the revolt he led inspired terror throughout Italy. Although his uprising was not an attempt at social revolution, his name has frequently been invoked by revolutionaries such as Adam Weishaupt in the late 18th century and Karl Liebknecht, Rosa Luxemburg, and the other members of the German Spartacus League of 1916–19.

**Spartacus League,** German SPARTAKUSBUND, revolutionary socialist group active in Germany from autumn 1914 to the end of 1918. It was officially founded in 1916 by Karl Liebknecht, Rosa Luxemburg, Clara Zetkin, and Franz Mehring. The name derived from their illegally distributed pamphlets *Spartakusbriefen* (Spartacus Letters). The league developed as an offshoot of the Social Democratic Party, among elements who violently opposed Germany's role in World War I and who called for a socialist revolution.

The Spartacus League was transformed into the Communist Party of Germany at a party congress held from Dec. 30, 1918, to Jan. 1, 1919. Meanwhile, the Spartacists had encouraged demonstrations in December that led to the abortive Spartacus Revolt in Berlin in January 1919. On January 15, Luxemburg and Liebknecht were arrested and murdered in Berlin by members of the conservative Free Corps (Freikorps), who had seized control of the city's police presidium.

**Spartan alliance:** *see* Peloponnesian League.

**Spartanburg,** city, seat (1785) of Spartanburg County, in the Piedmont section of northwestern South Carolina, U.S. It lies in the foothills of the Blue Ridge Mountains, 30 miles (48 km) northeast of Greenville. The name is derived from the Spartan Rifles, a regiment of local militia that fought in the American Revolution. Established first as a courthouse village in 1785, the community was in an area noted before 1860 for ironworks, cotton planting, and a few cotton mills. After 1865 growth was accelerated by the intersection of three major rail lines at Spartanburg. Its diversified industry now includes textile mills, metalworking plants, the manufacture of machinery, office furniture, chemicals, clothing, ceramics, and carpets. Agriculture is still an important economic factor, the chief products being peaches, cotton, livestock, and poultry.

Spartanburg is the site of Wofford College (1854; Methodist), Converse College (1889), Spartanburg Methodist College (1911), a branch of the University of South Carolina (1967), and Spartanburg Technical College (1961). The South Carolina School for the Deaf and Blind (1849) is a few miles south. In Morgan Square stands a bronze statue of a Revolutionary rifleman, in memory of General Daniel Morgan, commander of American forces at the Battle of Cowpens (Jan. 17, 1781), fought 12 miles (19 km) northeast of Spartanburg. Inc. 1831. Pop. (1990) city, 43,467; Greenville-Spartanburg MSA, 640,861.

**Spassky, Boris Vasilyevich** (b. Jan. 30, 1937, Leningrad), Soviet chess master, world champion from 1969 to 1972.

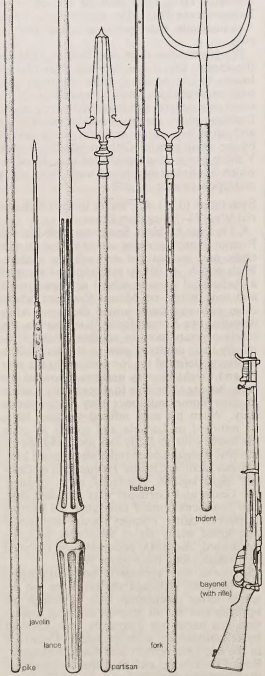
When Spassky was evacuated from Leningrad during World War II to a children's home in Kirov Region, he learned to play chess. While still in his teens he gained the rank of international master (1953). In 1955 he won the World Junior Championship, and the same year he won the title of international grand master. In the following years, however, he was overshadowed by the rise of the young Riga chess genius Mikhail Tal and also was occupied with his journalism studies at Leningrad University. In 1966, still having little international reputation, Spassky first challenged Tigran Petrosyan for the world title, but he was not successful at taking the title until three years later. Spassky's style was characterized by an adaptability rarely matched in the history of chess. His victory over Petrosyan was narrow (12½–10½), however, and his subsequent tournament results were unremarkable. In 1972 he lost the world title to Bobby Fischer of the United States.

**spatial disorientation,** the inability of a person to determine his true body position, motion, and altitude relative to the earth or his surroundings. Both airplane pilots and underwater divers encounter the phenomenon.

Most clues with respect to orientation are derived from sensations received from the eyes, ears, muscles, and skin. The human sensory apparatus, however, is often not delicate enough to perceive slow and gradual changes in motion; also, when motion changes are abrupt, the sense organs tend to overestimate the degree of change. Spatial disorientation in aircraft can arise from flight situations or visual misinterpretation. Banks and turns often create false sensations. When turning gradually, a pilot may feel as though he were on a straight course but ascending; when a turn is corrected, the impression is that of descending. If the plane banks or ascends or descends slowly, the pilot may not perceive the change, and the plane will feel level to him. If the plane skids while turning, the sensation is one of being banked in the direction opposite from the skid. A reaction called "leans" is caused by level flight after a rapid roll; the inertia of the roll causes the body to lean in a direction opposite to the direction of turning even after the motion of the roll has been stopped. If the pilot rapidly looks downward while turning, the so-called Coriolis effect occurs, in which the plane feels as though it is descending. The usual reaction of the pilot is to pull back on the stick to raise the plane. In a spin, the illusion of nonmotion is created if the spin is continued long enough; when the pilot corrects the spin, he has the feeling of spinning in the opposite direction, and his natural reaction is to counter his corrective measures and go back into the original spinning pattern. This phenomenon is known as the "graveyard spin." The "graveyard spiral" results when the sensation of turning is lost in a banked turn. Because the pilot's instruments show that he is losing altitude, he may pull back on the stick and add power, thus inducing a spiral motion. The oculogyral illusion is created by acceleration and turning; a turning target watched by a pilot while turning himself appears to move faster than it is actually going; it may appear to continue to turn even after the pilot has stopped his motion and the target has stopped. Another illusion is caused by forward acceleration: when a pilot takes off from land, the increased speed gives the impression of nosing the plane too high; to compensate the pilot may lower the nose and dive back to the ground. During a rapid deceleration the nose of the plane appears to drop; if the pilot corrects this feeling by trying to gain more altitude, the plane stalls and goes into a spin. The gravitational forces on a pilot cause the oculoagravic illusions: a target watched by a pilot appears to rise if weightlessness occurs and appears to fall when gravity is increased.

Visual misinterpretations do not usually depend on acceleration factors or on the sense of equilibrium but, rather simply, on visual illusions. The autokinetic phenomenon is the apparent wandering of an object or spot of light; when following another plane at night, the pilot may have trouble distinguishing between real and apparent movements of the lead plane. If two planes are flying parallel and level but at different speeds, they give the pilots the illusion of turning. Ground lights can be mistaken for the horizon or stars; fixed beacon lights can be mistaken for another plane flying in formation.

The only measures that can prevent spatial disorientation are thorough training and instrumentation.



**spatterware,** in the United States, American and English pottery of about 1800–50 with patterns either spattered or sponged on. The technique has a wider incidence in pottery history, however, occurring, for instance, in Staffordshire, England, about 1750. About 1800–20 spatterware was made at the Wedgwood factory in England, sometimes specifically for sale in the United States, where it was also made.

**SPD** (German political party): *see* Social Democratic Party of Germany.

**speaker** (electronics): *see* loudspeaker.

**spear,** a pole weapon with a sharp point, either thrown or thrust at an enemy or prey. It appears in an infinite variety of forms in societies around the world.

One of the earliest weapons devised by man, the spear was originally simply a sharpened stick. Primitive peoples used spears primarily as thrown weapons. When military practice evolved from the independent action of individuals to the group movements of masses of soldiers, the spear became a thrusting weapon. It took the form of the pike, the lance, and later the ax-bladed halberd, among other variations. The spear-carrying phalanx, or massed formation of closely ranked men, was used by Sumerian armies as early as 3,000 BC. Two thousand years later the Greeks refined the concept, using pikes 6 to 9 feet (2 to 3 m) long. Around 350 BC, Philip II of Macedon introduced the sarissa, a pike 13 to 21 feet (4 to 6.5 m) long that gave the Macedonian infantry an extra reach before the pike blades of the opposing Greeks could reach them. These close formations of men marched or ran toward their opponents bristling with spear points, which they then thrust into the enemy's line. Alexander the Great used sarissa-equipped infantry to conquer his huge empire.

Major types of spears

Roman legionaries used the pilum, a heavy seven-foot-long javelin. Foot soldiers were not the only ones to use spearlike weapons. Greek, Macedonian, and Roman cavalry and the mounted knights of the European Middle Ages all carried lances. Pole-arms and tactics evolved along these lines until the 14th, 15th, and 16th centuries, when soldiers used elaborate pikes like the halberd—a combination spear with a point, an ax-blade for cleaving helmets, and a hook for pulling armoured knights off their horses. The masters of pike warfare in this period were the Swiss, who were employed as fighters by various European monarchs. Then the introduction of gunpowder weapons gradually rendered the pike, lance, halberd, and other pole-arms largely obsolete. The modern bayonet attached to a rifle, however, may be considered a thrusting spear. *See also* halberd; lance; pike.

**spear-thrower,** also called THROWING-STICK, or ATLATL, a device for throwing a spear (or dart) usually consisting of a rod or board with a groove on the upper surface and a hook, thong, or projection at the rear end to hold the weapon in place until its release. Its purpose is generally to give greater range to the spear.

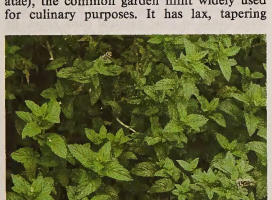
Usually constructed of wood, bamboo, bone, or antler, the spear-thrower performs the function of an extra joint in the arm. The spear lies along the spear-thrower, with its butt resting against a projecting peg or in the slight socket made by the septum of the node (in the case of bamboo devices). Typical of Australia, the spear-thrower is also used in parts of New Guinea and in some of the islands of Micronesia, and it was formerly used in Central and South America, as among the Mayan and the Aztecs (who called it the atlatl). Eskimo and Indian tribes of the northwest coast of North America also used it for discharging harpoons and fish spears. In East Africa an unusual form of spear-thrower consisted of a shaft of wood with a hollowed-out, swollen head into which the butt of the spear was placed. The man then manipulated the thrower as though it were a part of the spearshaft, but it did not leave his hand.

Allied to these spear-throwers is the becket, a short length of cord that operates like a sling, causing the hurled spear to spin as it flies. A similar contrivance used by the soldiers of ancient Greece and Rome was also used by some North African peoples; it differs from the becket in that the cord is attached to the spear and is not retained in the hand.

**spearfish,** any of certain marine fishes of the genus *Tetrapterus,* family Istiophoridae (order Perciformes). Spearfishes are characterized by a relatively short snout in comparison with other spear-nosed fishes. Several species may be recognized; two, *T. audax* and *T. albidus,* are commonly called marlin (*q.v.*). The shortbill, or short-nosed, spearfish (*T. angustirostris* or *T. brevirostris*) is a Pacific member of the genus—scarce, little-known, and rather small

for a billfish. Blue above and silvery below, it usually does not exceed 1.8 m (6 feet) and 27 kg (60 pounds). The species *T. belone* is a Mediterranean form resembling *T. angustirostris.*

**spearfishing,** the sport of underwater hunting that became popular in the early 1930s and after World War II spread rapidly throughout the world.



Underwater weapons range from the simple hand spear to guns capable of penetrating the largest fish. The simplest weapon is the Hawaiian sling, a hollow wooden tube with an elastic loop at one end. The shaft, which is tipped by one of a variety of spearheads, is drawn through the tube and pulled back, stretching the loop. When released, the shaft is propelled forward. In the mid-1930s, Alec Kramarenko patented an underwater gun in which the spear was propelled by a compressed spring. Shortly after, there appeared a spring-propulsion-type gun invented by a Frenchman, Maxime Forlot, and the popular spear gun designed by his compatriot Georges Beuchat and propelled by a rubber elastic band. Other guns were designed that used gunpowder, carbon dioxide, or compressed air to propel the spear; one of the latter type, invented in 1956 by Juan Vilarrubis of Spain, became popular because of its accuracy, power, and simplicity of operation.

The foregoing are rifle-type weapons in which the spear either travels through a long barrel or is guided along its upper surface. In all of them the spear shaft is released by a trigger mechanism. Spearfishing guns often have a line attached to the shaft, making retrieval easier. On strike, the line holds the quarry securely. The targets of underwater hunters may include sharks, barracuda, and fish weighing several hundred pounds, as well as the ordinary game prized by fishermen everywhere.

Stalking and shooting his quarry underwater is usually only the beginning of a skin diver's battle. After a fish is hit, it must be held on a harpoon line and landed. With large fish this may mean an underwater ride as the diver is towed through the water.

Underwater spearfishing is so popular among diving clubs that local, national, and international competitions are held each year. The competitions do not permit the use of scuba, and the contestants dive while holding their breath.

**spearmint** (species *Mentha spicata*), aromatic herb of the mint family (Lamiaceae, or Labiatae), the common garden mint widely used for culinary purposes. It has lax, tapering

Spearmint (*Mentha spicata*)
Runk/Schoenberger from Grant Heilman

spikes of flowers similar to peppermint flowers and sharply serrated leaves that are used fresh or dried to flavour many foods, particularly sweets, beverages, jellies, salads, soups, cheeses, meats, fish, sauces, fruits, and vegetables. The aroma and taste of spearmint are similar to those of peppermint but less strong. Native to Europe and Asia, spearmint has been naturalized in North America.

Oil obtained from spearmint leaves is used to flavour candies and jellies. The principal component is carvone.

**special economic zone** (SEZ), Chinese (Wade-Giles) CHING-CHI T'E-CHÜ, or (Pinyin) JINGJI TEQU, in late 20th-century China, any of several localities in which foreign and domestic trade and investment are conducted without the authorization of the Chinese central government in Peking. Special economic zones are intended to function as zones of rapid economic growth by using tax and business incentives to attract foreign investment and technology.

The first four special economic zones were created in 1979 in southeastern coastal China, and consisted of the small cities of Shenchen, Chu-hai, and Swatow in Kwangtung province and Amoy in Fukien province. In these areas, local governments are allowed to offer tax incentives to foreign investors and to develop their own infrastructure without the approval of the central government. Business enterprises make most of their own investment, production, and marketing decisions, and foreign ownership of such ventures was legalized. Though they began as little more than small towns, the new SEZs soon attracted foreign investment and became boomtowns, with rapidly expanding light and consumer-goods industries and growing populations.

Encouraged by the zones' success, the Chinese government in 1984 opened 14 larger and older cities along the coast to foreign trade and investment. These "open" cities offered foreign investors much the same incentives as in the special economic zones, but their corporate income taxes were higher. In 1988 Hainan Island was made a separate province and a special economic zone, and in 1990 the city of Shanghai became a special economic zone with policies even more flexible than those already in force in the original four SEZs. In 1992 the Chinese government decided to adopt some of the same policies in 23 major cities in inland China, including many provincial capitals, in hopes of encouraging foreign investment in them.

**special education,** also called SPECIAL NEEDS EDUCATION, the education of children who differ socially, mentally, or physically from the average to such an extent that they require major modifications of usual school practices. These include children with emotional, behavioral, or cognitive impairments, mental retardation, hearing, vision, or speech disabilities, gifted children, and those with orthopedic and neurological impairments.

*Historical background.* Although there are isolated examples of caring for and treating disabled individuals in ancient Greece and Rome, early societies typically shunned people who differed from the norm. During the Middle Ages the church became the first institution to provide care for physically or mentally impaired people, but the development of techniques associated with special education did not emerge until the Renaissance with its emphasis on human dignity. In the mid-1500s Pedro Ponce de Leõn succeeded in teaching deaf pupils in Spain to speak, read, and write; it is assumed that his methods were followed by Juan Pablo Bonet, who, in 1620, published the first book on the subject. This gave rise to a wider European interest in the education of deaf individuals. In 17th-century England John Bulwer published an account of his experiences teaching deaf persons to speak and lip-read, and, in France, similar work was carried on by Charles-Michel, abbé de l'Epée (1712–89), who changed the nature of communication for deaf and hard-of-hearing individuals by developing the natural sign language they used into a systematic and conventional language for more universal use. His work was developed by the abbé Roch-Ambroise Cucurron Sicard and gave rise to the manual system, or silent method, of teaching people with hearing impairments. In Germany Samuel Heinicke educated deaf children orally, and in the 19th century Friedrich Moritz Hill (1805–74) developed this method in accordance with the concept that education must relate to the "here and now" of the child—known as the "natural method." Thus arose the oral method of instruction that became an accepted practice worldwide.

No serious attempt was made to educate or to train persons with visual impairments, however, until the late 18th century. Valentin Haüy, known as the "father and apostle of the blind," opened the National Institution of Blind Youth (Institution Nationale des Jeunes Aveugles) in Paris in 1784, with 12 blind children as his first pupils. News of Haüy's success in teaching these children to read soon spread to other countries. Subsequently, schools for blind individuals were founded in Liverpool, Eng. (1791), London (1799), Vienna (1804), Berlin (1806), Amsterdam and Stockholm (1808), Zürich (1809), Boston (1829), and New York City (1831).

Scientific attempts to educate children with mental retardation originated in the efforts of Jean-Marc-Gaspard Itard, a French physician and otologist. In his classic book, *The Wild Boy of Aveyron* (1801), he related his five-year effort to train and educate a boy who had been found running wild in the woods of Aveyron. Itard's work with the boy became notable for the possibilities it raised regarding the education of persons with mental or emotional disabilities. Years later his student Edouard Séguin, who emigrated from France to the United States in 1848, devised an educational method that used physical and sensory activities to develop the mental processes. Séguin's published works influenced Maria Montessori, an Italian pediatrician who became an educator and the innovator of a unique method of training young mentally retarded and culturally deprived children in Rome in the 1890s and early 1900s. Her approach emphasized self-education through specially designed "didactic materials" for sensorimotor training.

Special education for people with disabilities became universal in developed countries by the late 20th century. Concurrent with this development was the identification of two concepts of individual differences: (1) "interindividual differences," which compares one child with another, and (2) "intraindividual differences," which compares the child's abilities in one area with the child's abilities in other areas. The grouping of children in special classes rests on the concept of interindividual differences, but the instructional procedures for each child are determined by intraindividual differences—that is, by a child's abilities and disabilities.

*Diagnostic patterns.* Children with a particular kind of disability do not necessarily form a homogeneous group, so diagnosis must go beyond merely classifying the children according to their major differences. A child with cerebral palsy, for example, has a motor handicap but may also be of superior intelligence or have a learning disability. Hence children with certain labels of impairment—cerebral palsy or deafness or blindness, for example—must be carefully assessed before they can be properly placed in a particular group.

For the gifted and the mentally retarded, the primary criterion of identification is an individually administered intelligence (IQ) test. Children who score particularly high (IQ scores higher than 130 indicate giftedness) or low (scores below 75 indicate mental retardation) are considered for special programs. The determination is made by psychologists who in most cases certify a child's eligibility for such programs. In making these assessments,

psychologists also consider criteria such as school achievement, personality, and the adjustment of the child in the regular grades.

Medical specialists evaluate the needs of children who have sensory, neurological, or orthopedic disabilities. Children who have learning disabilities are assessed primarily by psychoeducational diagnosticians who, through educational and psychological diagnostic tests, determine a child's potential for learning and achievement. Ancillary diagnoses by medical, psychological, and other personnel also help determine a child's eligibility for special programs. Children with social and emotional disabilities might be evaluated by any number of specialists, including psychiatrists, clinical psychologists, social workers, and educational personnel.

*Patterns of instructional adaptation.* The goals of special education are similar to the goals for ordinary children; only the techniques for attaining them are different. An effort is made, for example, to teach all children with special needs (except those unable to profit at all from school experience) to read. Children who have learning and mental disabilities require prolonged periods of intensive and more individualized instruction; for them the learning process might include techniques to maintain interest, more active participation, and much more repetition of similar material in varied form. Children with severe sensory handicaps (such as deafness and blindness) must learn to read through other sense modalities. Deaf individuals learn to read

A teacher uses sign language to communicate with hearing-impaired students
© Gabe Palmer/Corbis

through visual methods while blind individuals learn to read Braille through the tactile and kinesthetic sense.

Children who have motor handicaps require few, if any, academic adjustments. Unless the child has additional problems such as learning disabilities, mental retardation, or speech problems (which are often found among the cerebral palsied), children with disabilities learn like other children, and they can follow the same classroom materials. Special techniques are necessary, however, to help such children to adapt to their environment and to adapt the environment to their disability. Wheelchairs, modified desks, and other apparatus aid the child in mobility and the manipulation of classroom materials. One of the most important aspects of the education of the orthopedically disabled is attitudinal—that is, preparing children for adapting to the world outside the classroom and maximizing their potential for leading relatively normal lives.

Children with learning disabilities and those with speech defects require highly specialized techniques, usually on an individual basis.

For children with social and emotional problems, special therapeutic and clinical services may be provided. Psychotherapy and behaviour therapy by clinical psychologists, social workers, and psychiatrists are generally a part of the educational program. Academic teachers in these classes stress personality development, social adjustment, and habits of interpersonal relations. With this group of children, these factors are prerequisite to academic achievement. Academic work is, however, sometimes therapeutic in itself and is promoted as much as possible.

*Grouping patterns.* Special classes for children who are gifted, who have mental retardation, who have visual or hearing impairments, or who have been diagnosed with other disabilities are found in school systems throughout the world. This type of organization allows the child to live at home and attend a neighbourhood school that offers specialized instruction. "Residential schools" enroll handicapped children for 24 hours a day and are usually attended by children who cannot obtain services in their community.

One of the major goals of special education (beyond developing skills and imparting information) is the ultimate adjustment into society. Increasing emphasis on this goal has led to criticism of special-education programs that segregate children with special needs. As a result, efforts are made to integrate the special-needs child with other children. The 1994 World Conference on Special Needs Education: Access and Quality in Salamanca, Spain, endorsed inclusive schooling on a worldwide basis. As a result of this conference, UNESCO was charged with promoting special education concerns among teachers, documenting progress in various regions and among different programs, and encouraging research in special needs education. For the gifted, special programs of enrichment and acceleration are increasingly preferred to special classes. Resource rooms for those with sight or hearing impairments allow children to participate in regular classroom activities for part of the day. Older, educable persons with mental retardation can be assigned to regular workshops, physical education classes, and other nonacademic classes for part of the day. The eventual goal is to prepare these students for life in the larger society before they leave school.

**special-interest group:** *see* interest group.

**special jury:** *see* blue-ribbon jury.

**Special Olympics,** international program to provide mentally retarded persons (age eight or older) with year-round sports training and athletic competition in a variety of Olympic-type summer and winter sports. Inaugurated in 1968, the Special Olympics was officially recognized by the International Olympic Committee on Feb. 15, 1988. International headquarters are in Washington, D.C.

In June 1963, with support from the Joseph P. Kennedy, Jr., Foundation, Eunice Kennedy Shriver (sister of U.S. President John F. Kennedy) started a summer day-camp for children with mental retardation at her home in Rockville, Md. Between 1963 and 1968, the Kennedy Foundation promoted the creation of dozens of similar camps in the United States and Canada. Special awards were developed for physical achievements, and by 1968 Shriver had persuaded the Chicago Park District to join with the Kennedy Foundation in sponsoring a "Special Olympics," held at Soldier Field on July 19–20. About 1,000 athletes from 26 U.S. states and Canada participated. The games were such a success that, in December, Special Olympics, Inc. (now Special Olympics International), was founded, with chapters in the United States, Canada, and France. The first International Winter Special Olympics Games were held on Feb. 5–11, 1977 (in Steamboat Springs, Colo.). The number of participating countries proliferated so that by the early 21st century there were chapters in some 150 countries. More than one million athletes participate annually in some 20,000 meets and tournaments held worldwide, culminating in the International Special Olympics Games every two years, alternating between winter and summer sports and each lasting for nine days.

**speciation,** the formation of new and distinct species in the course of evolution. In individual cases, it involves the splitting of a single evolutionary lineage into two or more genetically independent ones. *See* species.

**Specie Circular** (July 11, 1836), in U.S. history, an executive order issued by President Andrew Jackson requiring that payment for the purchase of public lands be made exclusively in gold or silver. In an effort to curb excessive land speculation and to quash the enormous growth of paper money in circulation, Jackson directed the Treasury Department, "pet" banks, and other receivers of public money to accept only specie as payment for government-owned land after Aug. 15, 1836. But actual settlers and bona fide residents of the state in which they purchased land were permitted to use paper money until December 15 on lots up to 320 acres. The Specie Circular, by seriously curtailing the use of paper money, was highly deflationary and at least in part produced the ensuing credit crunch and the economic crisis called the Panic of 1837. On May 21, 1838, a joint resolution of Congress repealed the Specie Circular.

**specie payment,** the redemption of U.S. paper money by banks or the Treasury in metallic (usually gold) coin.

Except for a few periods of suspension (1814–15, 1836–42, and 1857), Americans were able to redeem paper money for specie from the time of the ratification of the Constitution (1789) to the onset of the Civil War (1861). The suspensions had occurred during periods of war or economic crisis. With the outbreak of hostilities between the North and the South, the federal government again suspended specie payments late in 1861.

In 1862 the government began issuing paper money, called "greenbacks" and "shinplasters," and in 1863 it authorized federally chartered banks to issue national bank notes. By the end of the war in 1865, more than $430,000,000 worth of paper money (declared legal tender by Congress) was in circulation.

"Hard money" advocates wanted to resume paying specie for this paper money, while "soft money" supporters feared the deflationary impact resumption would produce. After the Supreme Court sanctioned the legitimacy of the paper money in the Legal Tender Cases (1870–71), congressional backers of a return to specie payments passed the Resumption Act of 1875.

In accord with the Resumption Act, specie payments were resumed on Jan. 1, 1879. But the knowledge that the government could indeed redeem each greenback or bank note at par in gold made the public favourably inclined to keep using the much more convenient paper money.

**species,** biological classification comprising related organisms that share common characteristics and are capable of interbreeding. The term speciation designates the process by which one species of organism splits into two or more species. Speciation is one of the fundamental processes of evolution.

A brief treatment of species and speciation

follows. For full treatment, *see* MACROPAEDIA: Evolution, Theory of.

The classification of species is helped by the international system of nomenclature, which assigns new species a standard two-part name of "genus" and "species." The genus is the generic name that includes closely related species; the Gila monster, for example, is classified as *Heloderma suspectum* and is a close relative to the lizard found in Mexico called *Heloderma horridum*, their relation being indicated by their sharing the same genus name, *Heloderma*. Similarly, genera that have shared traits are classified in the same "family"; related families are placed in the same "order"; related orders are placed in the same "class"; and related classes are placed in the same "phylum."

Organisms are grouped into species partly according to their morphological, or external, similarities, but more important in classifying sexually reproducing organisms is the organisms' ability to successfully interbreed. Individuals of a single species can mate and produce viable offspring with one another but not with members of other species. Separate species have been known to produce hybrid offspring (for example, the horse and the donkey producing the mule), but, because the offspring are almost always inviable or sterile, the interbreeding is not considered successful.

Interbreeding only within the species is of great importance for evolution in that individuals of one species share a common gene pool that members of other species do not. Within a single pool there is always a certain amount of variation among individuals, and those whose genetic variations leave them at a disadvantage in a particular environment tend to be eliminated in favour of those with advantageous variations. This process of natural selection results in the gene pool's evolving in such a way that the advantageous variations become the norm. Because genetic variations originate in individuals of a species and because those individuals pass on their variations only within the species, then it is at the species level that evolution takes place. The evolution of one species into others is called speciation.

Subspecies are groups at the first stage of speciation; individuals of different subspecies sometimes interbreed, but they produce many sterile male offspring. At the second stage are incipient species, or semispecies; individuals of these groups rarely interbreed, and all their male offspring are sterile. Natural selection separates incipient species into sibling species, which do not mate at all but which in morphology, or appearance, are nearly indistinguishable. Sibling species then evolve into morphologically (and taxonomically) different species.

Speciation may occur in many ways. A population may become geographically separated from the rest of its species and never be rejoined. Through the process of adaptive radiation (*q.v.*) this population might evolve independently into a new species, changing to fit particular ecological niches in the new environment and never requiring natural selection to complete its reproductive isolation from the parent species. Within the new environment, populations of the new species might then radiate into species themselves. A famous example of adaptive radiation is that of the Galápagos finch.

Quantum speciation is a rapid process of reproductive isolation often brought about by chromosomal mutation in one population of a species. When the mutant population interbreeds with the parent population, unfit hybrid offspring are produced; then, as in geographic speciation, natural selection completes the isolation of the two groups.

Polyploidy is a form of quantum speciation that creates the beginnings of a new species in two or three generations. It is most common among flowering plants. As a consequence of abnormal cell division at the gamete stage, a hybrid plant may develop not two sets of chromosomes (one inherited from each parent) but four or more in each cell nucleus. Through self-fertilization at the flowering stage, the hybrid may produce its own viable offspring, which, being polyploid (of multiple chromosomes), would be reproductively isolated from the parent species that is diploid (of double chromosomes).

The evidence for speciation was formerly found in the fossil record by tracing successive changes in the morphology, or structure and form, of organisms. Genetic studies now show that morphological change does not always accompany speciation, as many apparently identical groups are, in fact, reproductively isolated.

**species ecology:** *see* autecology.

**specific gravity,** also called RELATIVE DENSITY, ratio of the density of a substance to that of a standard substance. The usual standard of comparison for solids and liquids is water at 4° C (39.2° F), which has a density of 1.000 kg per litre (62.4 pounds per cubic foot). Gases are commonly compared to dry air, which has a density of 1.29 g per litre under so-called standard conditions (0° C and 1 atmosphere pressure). For example, the liquid mercury has a density of 13.6 kg per litre; therefore, its specific gravity is 13.6. The gas carbon dioxide, which has a density of 1.976 g per litre under standard conditions, has a specific gravity of 1.53. Because it is the ratio of two quantities that have the same dimensions (mass per unit volume), specific gravity has no dimension.

Buoyancy is intimately related to specific gravity. If a substance has specific gravity less than that of a fluid, it will float on that fluid: helium-filled balloons will rise in air, oil will form a slick on water, and lead will float on mercury. The specific gravity of a substance is characteristic; it is the same for different samples of a substance (if pure, the same in composition, and free from cavities or inclusions) and is used to help identify unknown substances. Specific gravity has many other applications: gemologists use it to distinguish similar gems; chemists, to check on the progress of reactions and the concentration of solutions; and auto mechanics, to test battery fluid and antifreeze.

Specific gravity is the basis of methods used throughout history to concentrate ores. Panning, jigging, shaking, spiral separation, and heavy-medium separation are among the ore-dressing methods that depend on differences in specific gravity to obtain concentrated ore. Specific gravity is highest in rocks rich in iron, magnesia, and the heavy metals and lowest in those rich in alkalies, silica, and water.

The ease with which specific gravity can be precisely determined leads to its widespread use in chemical science and technology; for example, determination of the specific gravity is part of the routine characterization of a new liquid compound. The specific gravity of most organic compounds containing only carbon, hydrogen, and oxygen is less than one.

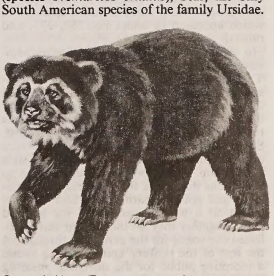
Among the devices used to measure specific gravity are the Jolly balance, the Westphal balance, the pycnometer, and the hydrometer.

**specific heat,** ratio of the quantity of heat required to raise the temperature of a body one degree to that required to raise the temperature of an equal mass of water one degree. The term is also used in a narrower sense to mean the amount of heat, in calories, required to raise the temperature of one gram of a substance by one Celsius degree. The Scottish scientist Joseph Black, in the 18th century, noticed that equal masses of different substances needed different amounts of heat to raise them through the same temperature interval, and, from this observation, he founded the concept of specific heat. In the early 19th century the French physicists Pierre-Louis Dulong and Alexis-Thérèse Petit demonstrated that measurements of specific heats of substances allow calculation of their atomic weights (*see* Dulong-Petit law). *See also* heat capacity.

**specific humidity,** mass of water vapour in a unit mass of moist air, usually expressed as grams of vapour per kilogram of air, or, in air conditioning, as grains per pound. The specific humidity is an extremely useful quantity in meteorology. For example, the rate of evaporation of water from any surface is directly proportional to the specific humidity difference between the surface and the adjoining air.

Furthermore, the specific humidity does not vary as the temperature or pressure of a body of air changes, as long as moisture is not added to or taken away from it. (Certain other indices of humidity are sensitive to the pressure and temperature.) This stability of the specific humidity makes it useful as an identifying property of a moving air mass. The specific humidity of saturated air (*i.e.*, that in equilibrium with a vapour source, either water or ice) increases rapidly with increasing temperature.

**Speck, Frank Gouldsmith** (b. Nov. 8, 1881, Brooklyn, N.Y., U.S.—d. Feb. 6, 1950, Philadelphia, Pa.), American cultural anthropologist known for his work on the Algonquin Indian tribes of the eastern United States.



Speck studied under Franz Boas at Columbia University. He founded the anthropology department at the University of Pennsylvania and was its chairman for much of his life.

Speck attempted, as did others of the period, to preserve and analyze fragments of information about the rapidly fading aboriginal cultures of the indigenous peoples. From only scattered remnants of ritual and lore, Speck was able in some cases to reconstruct extensive information on the historic culture of the Delaware and other tribes. He pioneered investigations in ethnoscience and ethnomusicology and gathered a large body of native folklore. He is remembered for the respect he enjoyed in Indian communities.

**specklebelly:** *see* white-fronted goose.

**speckled trout:** *see* brook trout.

**spectacled bear,** also called ANDEAN BEAR (species *Tremarctos ornatus*), bear, the only South American species of the family Ursidae.

Spectacled bear (*Tremarctos ornatus*)
Painting by Donald C. Meighan

It inhabits mountainous regions (particularly of the Andes), dwelling primarily in forested areas, and it feeds mainly on shoots and fruit.

The spectacled bear is an agile climber. The adult stands to 64 cm (about 25 inches) at the

shoulder and varies from 1.2 to 1.8 m (4 to 6 feet) in length, with a 7-centimetre (3-inch) tail. Its shaggy coat varies from dark brown to black. Characteristic whitish to yellowish marks usually encircle the eyes partially or completely to form "spectacles," often extending down the neck and to the chest. Litters of one to three cubs have been born in captivity after a gestation period of 8–8½ months.

**spectacled owl** (species *Pulsatrix perspicillata*), nocturnal bird of prey of the tropical American forests, belonging to the family Strigidae (order Strigiformes). The juvenile is white with a dark mask. The adult, about 50 cm (1.7 feet) long, is brown above and light below except for a brown chest. The face is brown with white brows. The bird has no ear tufts. Little is known of the spectacled owl's feeding habits.

**spectacles:** *see* eyeglasses.

**Spectator, The,** a periodical published in London by the essayists Sir Richard Steele and Joseph Addison from March 1, 1711, to Dec. 6, 1712 (appearing daily), and subsequently revived by Addison in 1714 (for 80 numbers). It succeeded *The Tatler,* which Steele had launched in 1709. In its aim to "enliven morality with wit, and to temper wit with morality," *The Spectator* adopted a fictional method of presentation through a "Spectator Club," whose imaginary members extolled the authors' own ideas about society. These "members" included representatives of commerce, the army, the town (respectively, Sir Andrew Freeport, Captain Sentry, and Will Honeycomb), and of the country gentry (Sir Roger de Coverley). The papers were ostensibly written by Mr. Spectator, an "observer" of the London scene. Though Whiggish in tone and opinion, *The Spectator* generally steered clear of party politics.

Because of its fictional framework, *The Spectator* is sometimes said to have heralded the rise of the English novel in the 18th century. This is perhaps an overstatement, since the fictional framework, once adopted, ceased to be of primary importance and served instead as a social microcosm within which a tone at once grave, good-humoured, and flexible could be sounded. The real authors of the essays were free to consider whatever topics they pleased, with reference to the fictional framework (as in Steele's account of Sir Roger's views on marriage, which appeared in issue no. 113) or without it (as in Addison's critical papers on *Paradise Lost,* John Milton's epic poem, which appeared in issues no. 267, 273, and others).

In addition to Addison and Steele themselves, contributors included Alexander Pope, Thomas Tickell, and Ambrose Philips. Addison's reputation as an essayist has surpassed that of Steele, but their individual contributions to the success of *The Spectator* are less to the point than their collaborative efforts: Steele's friendly tone was a perfect balance and support for the more dispassionate style of Addison. Their joint achievement was to lift serious discussion from the realms of religious and political partisanship and to make it instead a normal pastime of the leisured class. Together they set the pattern and established the vogue for the periodical throughout the rest of the century and helped to create a receptive public for the novelists, ensuring that the new kind of prose writing—however entertaining—should be essentially serious.

**Spectator, The,** weekly magazine of news and opinion, published in London and widely noted for its critical reviews and essays on political, literary, and economic issues. Its editorial stance is moderately conservative and much more conservative than the larger journals with which it shares its eminence, *The Economist* and *New Statesman & Society. The Spectator* has been a serious journal of intellectual discussion since it was founded in 1828. For many years it was noted for its witty essays, but in modern times it has turned to more straightforward treatment of political and cultural affairs. It is noted for outstanding book reviews in particular and for the quality of its writing in general. Its influence is much greater than is suggested by its limited circulation.

**spectral line series,** any of the related sequences of wavelengths characterizing the light and other electromagnetic radiation emitted by energized atoms. The simplest of these series are produced by hydrogen. When resolved by a spectroscope, the individual components of the radiation form images of the source (a slit through which the beam of radiation enters the device). These images, in the form of lines, appear to have a regularity in spacing, coming closer together toward the shortest wavelength, called the series limit. Hydrogen displays five of these series in various parts of the spectrum, the best-known being the Balmer series in the visible region. Johann Balmer, a Swiss mathematician, discovered (1885) that the wavelengths of the visible hydrogen lines can be expressed by a simple formula: the reciprocal wavelength ($1/\lambda$) is equal to a constant ($R$) times the difference between two terms, $1/4$ (written as $1/2^2$) and the reciprocal of the square of a variable integer ($1/n^2$), which takes on successive values 3, 4, 5, etc., *i.e.*, $1/\lambda = R(1/2^2 - 1/n^2)$. The constant $R$ is known as the Rydberg constant, after Johannes Robert Rydberg, a Swedish physicist, and, in the case of hydrogen, has a value of 109,677.58 reciprocal centimetres. When $n = 3$, Balmer's formula gives $\lambda = 656.21$ nanometres (1 nanometre $= 10^{-9}$ metre), the wavelength of the line designated H$\alpha$, the first member of the series (in the red region of the spectrum), and when $n = \infty$, $\lambda = 4/R$, the series limit (in the ultraviolet).

The four other spectral line series, in addition to the Balmer series, are named after their discoverers, Theodore Lyman, A.H. Pfund, and F.S. Brackett of the United States and Friedrich Paschen of Germany. The Lyman series lies in the ultraviolet, whereas the Paschen, Brackett, and Pfund series lie in the infrared. Their formulas are similar to Balmer's except that the constant term is the reciprocal of the square of 1, 3, 4, or 5, instead of 2, and the running number $n$ begins at 2, 4, 5, or 6, respectively, instead of 3.

Atoms of other elements that have lost all their electrons, save one, and therefore are hydrogen-like (*e.g.,* singly-ionized helium and doubly-ionized lithium), also emit radiation that can be analyzed into spectral line series that can be expressed by formulas similar to Balmer's.

**spectrochemical analysis,** methods of chemical analysis that depend upon the measurement of the wavelength and the intensity of electromagnetic radiation. Its major use is in the determination of the arrangement of atoms and electrons in molecules of chemical compounds on the basis of the amounts of energy absorbed during changes in the structure or motion of the molecules. In its restricted and more common usage two methods usually are implied: (1) ultraviolet (nonvisible) and visible emission spectroscopy and (2) ultraviolet, visible, and infrared absorption spectrophotometry.

In emission spectroscopy, atoms are excited to energy levels higher than their lowest normal levels (ground states) by means of electrical discharges (arcs, sparks) or flames. Identification of the elemental composition of an unknown substance is based on the fact that when the excited atoms return to lower energy states, they emit light of characteristic frequencies. These characteristic frequencies are separated into an ordered sequence (spectrum) by diffraction or refraction (deflection of the path of the light by a grating or a prism) for observation in a spectroscope (visual), spectrograph (photographic), or spectrometer (photoelectric). The process consists of four interdependent steps: (1) vaporization of the sample, (2) electronic excitation of its atoms or ions, (3) dispersion of the emitted or absorbed radiation into its component frequencies, and (4) measurement of the intensity of the radiation, usually at wavelengths at which the intensity is greatest.

Ordinarily, emission spectrochemical analysis is applied to the qualitative and quantitative determination of metallic elements, but it is not restricted to them. The method is among the most sensitive of all analytical methods: a few milligrams of a solid sample usually suffice for the detection of metallic elements present to the extent of a few parts per million or less. In addition, the method is capable of detecting several atomic species simultaneously, thus obviating chemical separations.

Quantitative analysis by emission spectroscopy depends upon the fact that the quantity of light (*i.e.,* the intensity) emitted at a given wavelength is proportional to the number of atoms vaporized and excited. The quantity of a given element is usually determined by a comparative method—that is, the intensity of the radiation emitted at a selected wavelength by the sample is compared with the intensity of the radiation emitted by a standard of known composition. Other spectrochemical methods useful in elemental analysis are atomic absorption spectrometry and atomic fluorescence spectrometry. Both methods resemble the flame method of emission spectroscopy (*i.e.,* a method that uses flame as the energy source to excite atoms) in that a solution of the sample is usually vaporized into a flame of hydrogen or acetylene in air or oxygen. In addition, light of the same wavelength as that emitted by the desired element is passed through the flame. A certain fraction of the light is absorbed by atoms that are in their ground electronic state. The quantity of radiation absorbed is proportional to the concentration of atoms in the flame in their ground state and, because thermal equilibrium exists, to the total concentration of that atomic species.

Atomic fluorescence spectrometry makes use of the same basic instrumental components as atomic absorption spectrometry; however, it measures the intensity of the light emitted by atoms that have been excited from their ground state by the absorption of light of shorter wavelength than that emitted. The atomic absorption method is particularly well adapted to the determination of the alkali and alkaline earth metals.

**spectrophotometry,** branch of spectroscopy that deals with measurement of the radiant energy transmitted or reflected by a body as a function of the wavelength. Ordinarily the intensity of the energy transmitted is compared to that transmitted by some other system that serves as a standard. Different types of modern spectrophotometers cover wide ranges of the electromagnetic spectrum: X-ray, ultraviolet, visible, infrared, or microwave.

Two laws express the relationship between the absorption of radiant energy and the absorbing medium. According to Bouguer's (or Lambert's) law, each layer of equal thickness of the medium absorbs an equal fraction of the energy traversing it. According to Beer's law, the absorptive capacity of a dissolved substance is directly proportional to its concentration in a solution.

Ultraviolet spectrophotometry is particularly useful in detecting colourless substances in solution and measuring their concentration. In-

frared spectrophotometry is most commonly used in studying the molecular structures of complex organic compounds.

**spectroscopy,** the investigation of spectra, the phenomena observed when electromagnetic radiations from a particular source are separated into their constituent colours or wavelengths. Such separation results from refraction (as by a prism) or from diffraction (as by a grating). Instruments designed for this purpose are called spectroscopes, if used for direct visual observation, and spectrographs, if photography or other methods of recording the spectra are employed. Through spectroscopy, chemical elements present on distant stars have been identified, and an increased understanding of atomic and molecular structure and such phenomena as luminescence has been achieved.

A brief treatment of spectroscopy follows. For full treatment, *see* MACROPAEDIA: Analysis and Measurement, Physical and Chemical.

The composite nature of white light was first demonstrated by Isaac Newton (1664) when he allowed sunlight entering a round hole in a shutter to pass through a glass prism and fall on a screen. The resulting elongated image of the Sun, showing the same gradation of colours as the rainbow, he called a spectrum. In 1800 William Herschel studied the solar spectrum with the aid of thermometers and found the greatest effect beyond the red end, thus discovering infrared radiation. In 1801 Johann Wilhelm Ritter, studying the effect of solar radiation upon silver salts, found this action extending beyond the violet, thus discovering ultraviolet rays.

The first connection between spectral colour and wavelength appeared in 1802, when Thomas Young applied his wave theory of light to calculate the approximate wavelengths of the seven colours recognized by Newton. In 1814 Joseph von Fraunhofer modified Newton's experiment by substituting a narrow slit for a hole and a telescope for a screen. Under these conditions he observed the continuous spectrum of the Sun interrupted by hundreds of dark lines, still known as Fraunhofer lines. Fraunhofer constructed the first diffraction gratings, and with these he determined the wavelengths corresponding to many of these lines. Although Fraunhofer and others observed that certain bright lines in the spectra of flames seemed to coincide with dark lines in the solar spectrum, it remained for Gustav Robert Kirchhoff in 1859 to enunciate the generality of this phenomenon and to emphasize the fact that each species of atom has a uniquely characteristic spectrum.

Kirchhoff and Robert Wilhelm Bunsen in 1861 systematically compared the lines in the solar spectrum with those in the flame or spark spectra of the purest elements available, thereby making the first chemical analysis of the Sun's atmosphere and founding spectrochemical analysis and astrophysics. In the course of these investigations, they discovered two new elements, cesium and rubidium. In 1868 Anders Jonas Ångström measured the wavelengths of about 1,000 Fraunhofer lines and expressed them in units of $10^{-10}$ metre—a unit now known as the angstrom and used for many spectroscopic measurements.

Because light rays of different colours, or wavelengths, are refracted differently on passing obliquely from one medium to another of different density, a spectrum can be produced by the use of a prism of any transparent material. A composite ray of light is accordingly dispersed as well as refracted in passing through a prism, the amount of refraction being usually greater for shorter wavelengths. A continuous spectrum comprises an uninterrupted gamut of wavelengths over a considerable range. Discontinuous spectra exhibit bright lines or bands of different colours or wavelengths on a dark background. Continuous spectra are emitted by incandescent solids and liquids (gas mantle, lamp filament, hot molten metal) or by certain electrical discharges (underwater sparks). Discontinuous spectra are emitted by atoms, ions, or molecules in a gaseous state in which the individual particles are excited by absorbing energy either from collisions with other particles or from incident radiation. Light sources producing discontinuous spectra are flames, furnaces, and electrical discharges in arcs and sparks at atmospheric pressure or in lamps containing gases or metal vapours at reduced pressure.

As a consequence of Kirchhoff's law, practically everything that has been said about emission spectra applies also to absorption spectra. There are, however, some experimental conditions that permit molecular identification and quantitative chemical analysis by means of absorption spectra that cannot be duplicated in emission spectra.

Any experiment in spectroscopy involves: (1) a source of light; (2) a prism or grating for forming the spectrum; (3) detectors for observing or recording details of the spectrum; (4) measurements of wavelengths and intensities; and (5) the interpretation of such measurements either as chemical identifications or as clues to the structure of atoms and molecules.

There are, in general, four ways of observing spectra: visual, photoelectric, radiometric, and photographic; each has advantages and limitations. The photographic method provides a permanent, detailed record of a spectrum that can be examined as often as desired without repeating the experiment. Furthermore, the cumulative nature of photographic exposures imparts additional advantages in integrating the light from intermittent or extremely faint sources by prolonged exposure.

Until spectroscopy was introduced there was no way—save for chemical analysis of meteorites that fell to Earth—to learn anything concerning the chemical and physical conditions of celestial bodies. The application of spectroscopy to astronomy has provided a wealth of information on the radial motions, chemical compositions, and physical conditions of planets, comets, stars, and nebulae, making possible the new science of astrophysics.

In terrestrial laboratories the application of spectroscopy to chemical analysis had to compete with conventional chemical methods. Progress was slow until precise photographic photometry was introduced in about 1925, whereupon quantitative spectrochemical analysis quickly became common practice.

**spectrum,** in optics, the arrangement according to wavelength of visible, ultraviolet, and infrared light. An instrument designed for visual observation of spectra is called a spectroscope; an instrument that photographs or maps spectra is a spectrograph. Spectra may be classified according to the nature of their origin, *i.e.,* emission or absorption. An emission spectrum consists of all the radiations emitted by atoms or molecules, whereas in an absorption spectrum, portions of a continuous spectrum (light containing all wavelengths) are missing because they have been absorbed by the medium through which the light has passed; the missing wavelengths appear as dark lines or gaps.

The spectrum of incandescent solids is said to be continuous because all wavelengths are present. The spectrum of incandescent gases, on the other hand, is called a line spectrum because only a few wavelengths are emitted. These wavelengths appear to be a series of parallel lines because a slit is used as the light-imaging device. Line spectra are characteristic of the elements that emit the radiation. Line spectra are also called atomic spectra because the lines represent wavelengths radiated from atoms when electrons change from one energy level to another. Band spectra is the name given to groups of lines so closely spaced that each group appears to be a band, *e.g.,* nitrogen spectrum. Band spectra, or molecular spectra, are produced by molecules radiating their rotational or vibrational energies, or both simultaneously.

**spectrum analyzer:** *see* harmonic analyzer.

**speculative grammar,** a linguistic theory of the Middle Ages, especially the second half of the 13th century. It is "speculative" not in the modern sense but as the word is derived from the Latin *speculum* ("mirror"), indicating a belief that language reflects the reality underlying the physical world. In accordance with this belief, speculative grammarians searched for a universal grammar, valid for all languages despite the "accidents" of their differences. The categories of this grammar would correlate with the categories of logic, epistemology, and metaphysics; *e.g.,* nouns and pronouns were thought to express the metaphysical category of "permanence," whereas verbs and participles expressed "becoming." Speculative grammarians took over Priscian grammar but relabeled the parts of speech to show their "modes of signifying." So many of their works were titled *De modis significandi* ("The Modes of Signifying") that they have come to be called the Modistae.

The search by speculative grammarians for a universal grammar has been criticized as the result of their shortsightedness: the privileged, predominant position of Latin in their culture made "universality" seem more likely. Nevertheless, speculative grammar was more coherent and theoretical than any previous grammar, and its proponents investigated ideas still of interest today, such as deep structure, the incorporation of meaning into grammatical systems, and universals.

**Spedding, Frank Harold** (b. Oct. 22, 1902, Hamilton, Ont., Can.—d. Dec. 15, 1984, Ames, Iowa, U.S.), American chemist who, during the 1940s and '50s, developed processes for reducing individual rare-earth elements to the metallic state at low cost, thereby making these substances available to industry at reasonable prices. He also helped to purify the uranium used in 1942 for the first self-sustaining nuclear chain reaction experiment.

After studying at several American institutions of higher education, Spedding held various teaching and research positions until he became professor of physical chemistry at Iowa State University of Science and Technology, Ames, in 1941. The following year he joined other scientists at the University of Chicago who were seeking to determine whether a self-sustaining nuclear chain reaction was possible. Dividing his time between Chicago and Ames, Spedding, together with Harley A. Wilhelm and C.F. Gray, found a way to produce very pure uranium metal; that substance was used in the first self-sustaining nuclear chain reaction experiment at Stagg Field, University of Chicago, on Dec. 2, 1942.

After World War II Spedding returned to Ames, where research by his group resulted in the theoretical and practical advances that made possible the production of rare-earth metals at low cost. Spedding was director of the Institute for Atomic Research and of the Ames Laboratory of the Atomic Energy Commission at Iowa State University until 1968, when he became principal scientist at the Ames Laboratory. From 1968 to 1976 he was a member of the Committee on Radioactive Waste Management for the National Academy of Sciences.

**Spee, Maximilian (Johannes Maria Hubert), Graf von** (count of) (b. June 22, 1861, Copenhagen—d. Dec. 8, 1914, off Falkland Islands), admiral who commanded German forces in the battles of Coronel and the Falk-

land Islands early in World War I. He entered the German Navy in 1878, and in 1887–88 he commanded the port in German Cameroon. In 1908 he was made chief of staff of the German Ocean (North Sea) Command, and at the end of 1912 he was appointed commander of the Far Eastern Squadron.

When World War I began, Spee was in the Caroline Islands. Japan's declaration of war against Germany (Aug. 22, 1914) caused him to abandon plans for operations in Chinese waters and to head for South America. After bombarding Tahiti on September 22, he defeated the British 4th Cruiser Squadron, on Nov. 1, 1914, off Coronel, Chile.

Two battle cruisers under Vice Admiral Sir Frederick Doveton Sturdee were sent from England against Spee. They arrived at Port Stanley, Falkland Islands, on Dec. 7, 1914. Spee, who had left Chile on November 26, appeared off the Falklands on December 8, perhaps not knowing that the British squadron was there. The Germans were defeated; Spee's flagship, the armoured cruiser *Scharnhorst,* went down with all hands.

**speech,** human communication through spoken language. Although many animals possess voices of various types and inflectional capabilities, human beings have learned to modulate their voices by articulating the laryngeal tones into audible oral speech.

A brief treatment of speech follows. For full treatment, *see* MACROPAEDIA: Speech.

Most speech sounds are made with the pulmonary airstream (that is, air exhaled from the lungs) as it passes between the vocal cords at the base of the throat and out through the vocal tract (consisting of the pharynx, oral cavity, and nasal cavity). Speech sounds may be voiced or unvoiced. In making voiced sounds, the vocal cords are tensed so as to narrow the air passageway (glottis) between them; a cyclic series of changes in pressure of the air passing through the glottis is initiated by this original tension, vibrating the vocal cords and the air between them to produce sound. The frequency of these vibrations determines the pitch of the voice: for a bass voice, 75–100 cycles per second is usual; for a soprano, more than 400 cycles per second.

The airstream passing through the vocal tract is shaped into a series of syllabic, or segmented, speech sounds by the articulators: mainly the tongue, palate, and lips. Articulatory phonetics describes individual speech sounds in terms of whether they are voiced or unvoiced and in terms of the position and action of the articulators used in making them. For instance, the S sound in the English word "sing" is an unvoiced labial-alveolar fricative—that is, a friction sound made by air passing between the raised tongue and the alveolar ridge (upper gums) and lips (labia). Other types of consonants include stops, or plosives (where the oral airstream is closed off and then released, as with the sounds for T and D), approximants (where the airstream is almost closed off but friction is not produced, as with the W sound in "weep"), trills (where an articulator is vibrated, as in the Spanish R sound), or laterals (where the airstream moves along the edges of the tongue, rather than through the centre of the vocal tract, as with the sound for the double L in "pullet").

Vowels are produced with the vocal tract unobstructed and are traditionally specified in terms of which part of the tongue is raised highest in articulation and how high it is raised; thus, the sound for the double E in English "keep" is a high front vowel, that for the O in "shoe" a low (or open) back vowel.

Speech is also described in terms of syntax (rules for putting words together to form phrases, clauses, or sentences), lexicon (meanings of words or of morphemes, the smallest meaningful segments of words [*e.g.,* the prefix *un-*]), and phonology (sounds). Phonological rules specify which sounds are used in a language to distinguish one meaning from another; these sounds are called phonemes. For instance, English phonology carries /b/ and /p/ as distinct phonemes, since the substitution of one for the other will change the meaning of some utterances (as in "bin" and "pin"). American English has 13 or more distinct vowel phonemes.

The phonological rules of a language also specify the alternate forms (allophones) of each phoneme and which allophone will be used in a given context. For instance, in English, the aspirated P and unaspirated P are allophones of the phoneme /p/, since it is the context of adjacent sounds, and not of meaning, that determines which is used; *e.g.,* aspirated P occurs at the beginning of a word ("park"), unaspirated P occurs following S ("spark").

Thus, the lexicon of a language will consist of a list of combinations of phonemes, each combination representing the basic form of a word having a certain meaning. The phonological rules will yield the forms that each phoneme takes as it is combined with other phonemes to make the sentences allowed by the grammar.

**speech, figure of,** any intentional deviation from literal statement or common usage that emphasizes, clarifies, or embellishes both written and spoken language. Forming an integral part of language, figures of speech are found in primitive oral literatures, as well as in polished poetry and prose and in everyday speech. Greeting-card rhymes, advertising slogans, newspaper headlines, the captions of cartoons, and the mottoes of families and institutions often use figures of speech, generally for humorous, mnemonic, or eye-catching purposes. The argots of sports, jazz, business, politics, or any specialized groups abound in figurative language.

Most figures in everyday speech are formed by extending the vocabulary of what is already familiar and better known to what is less well known. Thus metaphors (implied resemblances) derived from human physiology are commonly extended to nature or inanimate objects as in the expressions "the mouth of a river," "the snout of a glacier," "the bowels of the earth," or "the eye of a needle." Conversely, resemblances to natural phenomena are frequently applied to other areas, as in the expressions "a wave of enthusiasm," "a ripple of excitement," or "a storm of abuse." Use of simile (a comparison, usually indicated by "like" or "as") is exemplified in "We were packed in the room like sardines." Personification (speaking of an abstract quality or inanimate object as if it were a person) is exemplified in "Money talks"; metonymy (using the name of one thing for another closely related to it), in "How would the Pentagon react?"; synecdoche (use of a part to imply the whole), in expressions such as "brass" for high-ranking military officers or "hard hats" for construction workers.

Other common forms of figurative speech are hyperbole (deliberate exaggeration for the sake of effect), as in "I'm so mad I could chew nails"; the rhetorical question (asked for effect, with no answer expected), as in "How can I express my thanks to you?"; litotes (an emphasis by negation), as in "It's no fun to be sick"; and onomatopoeia (imitation of natural sounds by words), in such words as "crunch," "gurgle," "plunk," and "splash."

Almost all the figures of speech that appear in everyday speech may also be found in literature. In serious poetry and prose, however, their use is more fully conscious, more artistic, and much more subtle; it thus has a stronger intellectual and emotional impact, is more memorable, and sometimes contributes a range and depth of association and suggestion far beyond the scope of the casual colloquial use of imagery.

In European languages figures of speech are generally classified in five major categories: (1) figures of resemblance or relationship (*e.g.,* simile, metaphor, kenning, conceit, parallelism, personification, metonymy, synecdoche, and euphemism); (2) figures of emphasis or understatement (*e.g.,* hyperbole, litotes, rhetorical question, antithesis, climax, bathos, paradox, oxymoron, and irony); (3) figures of sound (*e.g.,* alliteration, repetition, anaphora, and onomatopoeia); (4) verbal games and gymnastics (*e.g.,* pun and anagram); and (5) errors (*e.g.,* malapropism, periphrasis, and spoonerism). Figures involving a change in sense, such as metaphor, simile, and irony, are called tropes.

All languages use figures of speech, but differences of language dictate different stylistic criteria. In a culture not influenced by classical Greece and Rome, some figures may be absent; irony is likely to be confined to fairly sophisticated cultures. Japanese poetry is based on delicate structures of implication and an entire vocabulary of aesthetic values almost untranslatable to the West. Arabic literature is rich in simile and metaphor, but the constructions used are so different from those familiar in the West that translation requires much adaptation. This condition is also true of the oral literatures of Africa and of the written literatures deriving from them.

One of the most powerful single literary influences upon world cultures has been the Bible. Both the Old Testament and the New Testament are rich in simile, metaphor, and personification and in the special figure of Hebrew poetry, parallelism.

**speed,** in photography, any of those standards that indicate (1) the size of the lens opening, or aperture, (2) the duration of exposure, and (3) the sensitivity of the film to light.

The aperture, or lens speed, of a camera is the size of the opening in the lens. Aperture settings provide one means of controlling the amount of light that falls on the film by determining the maximum diameter of the light beam entering the camera body. A standard set of numbers, called f-stops, describe the lens aperture as a ratio of the focal length (*see* relative aperture).

The shutter speed regulates the length of time that the shutter is open during an exposure. Varying the shutter speed controls the film's exposure to light and determines the speed of action that the photograph can "freeze," or reproduce without blurring the image. Shutter speeds generally range from one second to 1/2,000 of a second.

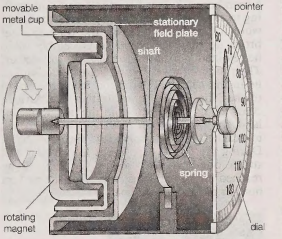
Film speed indicates the sensitivity of a particular emulsion to light. It is usually expressed as an ISO (International Standards Organization) number (formerly called, and identical to, the ASA [American Standards Association; now American National Standards Institute] number), or, in Europe, as a DIN (Deutsche Industrie Norm) number. A film with a speed of 32 ISO/ASA, or 16/10 DIN, for example, would be considered a slow film—*i.e.,* relatively insensitive to light, and most effectively used in bright light—whereas one with a speed of 400 ISO/ASA, or 27/10 DIN, would be considered fast—*i.e.,* relatively sensitive to light and therefore usable in dim light or with a very fast shutter speed.

**speed skating,** the sport of racing on ice skates that originated in The Netherlands, possibly as early as the 13th century. Organized international competition developed in the late 19th century, and the sport was included in the first Winter Olympics in 1924.

The blade of the modern speed skate is longer and thinner than that of the hockey or figure skate. When planted on the ice with weight upon it, the blade describes a nearly straight

Becky Sundstrom (U.S.) competing in the 100-metre event at the 2002 Olympics
Tony Marshall—EMPICS

line. Only the last few feet of the stride curve slightly outward as the skate leaves the ice. Length of stride has tended to diminish since the days of the 11- to 16-metre (12- to 17-yard) stride attributed to the English champion William Smart, who was active during the mid-19th century. The modern racing stride rarely exceeds 9 m (10 yards) and is usually about 5 or 6 m. The clapskate, introduced in 1996, features a hinge at the toe of the shoe, allowing for greater extension and a longer stride.



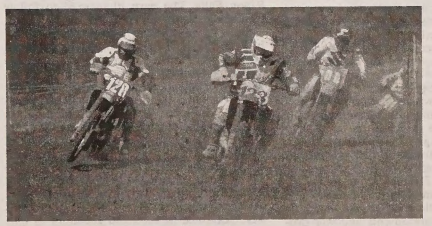
International long-track speed skating involves a course with straight sides and curved ends of such a radius that no slackening of speed is necessary. The competitors race two at a time on a double track, and their times are recorded. Each skater must keep his own course. The advantage of the inner curve is given alternately, and a space is left open between the tracks at one point for the skaters to switch tracks. The 500-metre event requires skaters to race twice per heat—once in each of the lanes. The times are then combined. The official track measures 400 m. World championships are decided annually under the supervision of the International Skating Union (ISU) at distances of 500, 1,000, 1,500, 5,000, and 10,000 metres for men and 500, 1,000, 1,500, 3,000, and 5,000 metres for women.

Unlike long-track speed skating, which takes place on indoor or outdoor rinks, a later development, short-track speed skating, is done indoors on a 111-metre track. Events are held over distances of 500, 1,000, 1,500, and 3,000 metres. There are also four-person relay events for men and women. Four to six skaters race in each elimination heat, and passing strategies and pacing are important components of the sport. World championships were held annually from 1978 to 1980 before being recognized by the ISU in 1981. Short-track speed skating became a medal sport in the 1992 Winter Olympics.

*See* Sporting Record: *Ice skating. See also* Olympic Games.

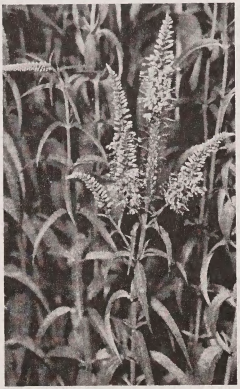
**speedometer,** instrument that indicates the speed of a vehicle, usually combined with a device known as an odometer that records the distance traveled. Speedometers and odometers measure speed and distance using electronic sensors and counters and then display them digitally on liquid-crystal displays; or they work mechanically through linkages to the vehicle's transmission and display their measurements on circular dials and drums.

The speed-indicating mechanism of a traditional mechanical speedometer is actuated by a circular permanent magnet that is rotated as the vehicle travels by a flexible shaft driven by gears at the rear of the transmission. The magnet turns within a movable metal cup made of a light nonmagnetic metal that is attached to the shaft carrying the indicating pointer; the magnetic circuit is completed by a circular stationary field plate surrounding the movable cup. As the magnet rotates it exerts a magnetic drag on the movable cup that tends to turn it against the restraint of a spiral spring. The faster the magnet rotates, the greater is the pull on the cup and the pointer. The speed-indicating dial is graduated in miles per hour, kilometres per hour, or both. The speedometer is frequently augmented by a cruise-control device that is coupled to the throttle of the engine so as to maintain the vehicle at a selected speed.



Mechanism of a circular-dial speedometer
EB Inc.

The odometer registers the distance traveled by the vehicle; it consists of a train of gears that turns a series of drums whose numerals are visible through a rectangular window. The numbers appearing in the window represent the vehicle's accumulated mileage.



**speedway racing,** automobile or motorcycle racing on a racecourse or track, usually oval and flat. Both speedway racing and Grand Prix racing, which is done on closed highways or other courses partly simulating road conditions, began in 1906. Speedway racing became the dominant kind of automobile racing in the United States. For the position of speedway racing in the history of automobile racing, *see* automobile racing.

Speedway racing for motorcycles began much later, originating in Australia in the 1920s. It also became popular in Europe by the 1930s and remained so. The racing is done on small, flat, oval tracks with lightweight motorcycles that have small fuel tanks and no brakes. Tracks measure about 320 metres (350 yards) and have unpaved surfaces of dirt, cinders, grass, or sand. Competition ranges from local to international in Europe, Australia, and New Zealand. World championships under the supervision of the Fédération Internationale Motocycliste were held from 1937.

Speedway motorcycle racing on a dirt track

**speedwell,** any plant of the genus *Veronica* (order Scrophulariales; *q.v.*), especially the small, sometimes weedy, herbaceous types. The about 250 to 300 species are found mostly in the Northern Hemisphere. Speedwells are grown as ornamentals. Their small blossoms are usually white, blue, purple, or pink.

Speedwell (*Veronica longifolia*)
Werner W. Schulz

**Speedwriting,** shorthand system using the letters of the alphabet and punctuation marks. The name is a registered trademark for the system devised in the United States by Emma Dearborn about 1924. In Speedwriting, words are written as they sound, and only long vowels are expressed. Thus, "you" is written *u*, and "file" is *fil.* Some letters are modified for speed (*e.g.*, the *i* is not dotted). The system also uses abbreviations and flourishes. One flourish is the underscoring of a final letter to express "ing." Speedwriting is considered easier to learn but not as rapid as the Pitman or Gregg shorthand systems, which use symbols rather than longhand letters.

**Speelman, Cornelis Janszoon** (b. March 3, 1628, Rotterdam, Dutch Republic [now The Netherlands]—d. Jan. 11, 1684, Batavia, Dutch East Indies [now Jakarta, Java, Indonesia]), Dutch military leader and governor-general of the Dutch East Indies (1681–84) who spurred the transformation of the Dutch commercial empire in the Indies into an expanding territorial one.

Speelman went to the Indies in 1645 as a clerk for the Dutch East Indies Company and by 1663 was appointed governor of the Coro-

mandel Coast of southeast India. In 1666 he led an expedition that subjugated Macassar, on the south coast of Celebes. In the resulting Treaty of Bongaais the Dutch gained a monopoly of trade with, and control of, all of Macassar's possessions. Speelman was named to the Council of the Indies (1671), an advisory body to the governor general, and in that capacity urged the use of force in settling native disputes and thus obtained territory for the Dutch. In a dispute between two factions fighting for the throne of Mataram, Java's great empire, Speelman was appointed commander of the Dutch forces and subdued Mataram, which became a vassal to the Dutch. In 1677 he won trade concessions for Semarang and a large territory south of Batavia.

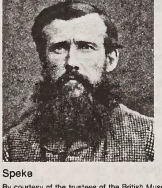
In 1681 Speelman managed to establish Dutch interests in Bantam (a kingdom of extreme western Java), driving out all other foreigners and gaining a monopoly of trade. As governor general, however, he was arbitrary in his rule and often neglectful of his duties.

**Speenhamland system,** practice of economic relief for the poor that was adopted over much of England following a decision by local magistrates at the Pelican Inn, Speenhamland, near Newbury, Berkshire, on May 6, 1795. Instead of fixing minimum wages for poor labourers, the practice was to raise workingmen's income to an agreed level, the money to come out of the parish rates. This allowance was designated as the price of 3 gallon loaves a week for each man (a gallon loaf was 8½ pounds [about 4 kilograms]) plus the cost of 1½ loaves each for a wife and every child. The money was to cover all expenses. This allowance system lasted until the enactment of the Poor Law Amendment (1834).

Contemporary commentators and modern historians alike have condemned the system; the former claim it encouraged the poor in idleness, while the latter stress the opportunity it gave unscrupulous employers and landlords to reduce wages and raise rents respectively, knowing their depredations would be redressed from the public pocket.

**Speer, Albert** (b. March 19, 1905, Mannheim, Baden, Ger.—d. Sept. 1, 1981, London), German architect who was Adolf Hitler's chief architect (1933–45) and minister for armaments and war production (1942–45).

Speer studied at the technical schools in Karlsruhe, Munich, and Berlin, and acquired an architectural license in 1927. After hearing Hitler speak at a Berlin rally in late 1930, he enthusiastically joined the Nazi Party (January 1931) and so impressed the Führer by his efficiency and talent that, soon after Hitler became chancellor, Speer became his personal architect. He was rewarded with many important commissions, including grandiose plans to rebuild the whole of Berlin (never accomplished) and the design of the parade grounds, searchlights, and banners of the spectacular Nürnberg party congress of 1934, filmed by Leni Riefenstahl in *Triumph of the Will.*



In 1942 Speer became minister of armaments and munitions, a title enlarged the following year to minister of armaments and war production, when he was charged not only with armaments production, transportation, and placement but also with final authority over raw materials and industrial production. With this authority, Speer expanded a system of conscript and slave labour, supplied primarily from concentration camps, that maintained production of war material for Nazi Germany.

Speer confessed his guilt at the Nürnberg trials in 1945–46 and served a 20-year sentence at Spandau prison in West Berlin. Following his release in 1966 he had a career as a writer. His published works include *Erinnerungen* (1969; *Inside the Third Reich,* 1970), *Spandauer Tagebücher* (1975; *Spandau: The Secret Diaries,* 1976), and *Der Sklavenstaat* (1981; *Infiltrator,* 1981).

**Speier** (Germany): *see* Speyer.

**Speke, John Hanning** (b. May 3, 1827, Bideford, Devon, Eng.—d. Sept. 15, 1864, near Corsham, Wiltshire), British explorer who was the first European to reach Lake Victoria in East Africa, which he correctly identified as a source of the Nile.

Commissioned in the British Indian Army in 1844, he served in the Punjab and travelled in the Himalayas and Tibet. In April 1855, as a member of Richard Burton's party attempting to explore Somaliland, Speke was severely wounded in an attack by the Somalis that broke up the expedition. In December 1856 he rejoined Burton on the island of Zanzibar. Their intention was to find a great lake said to lie in the heart of Africa and to be the origin of the Nile. After exploring the East African coast for six months to find the best route inland, the two men became the first Europeans to reach Lake Tanganyika (February 1858). During the return trip, Speke left Burton and struck out northward alone. On July 30 he reached the great lake, which he named in honour of Queen Victoria.

Speke
By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd

Speke's conclusion about the lake as a Nile source was rejected by Burton and was disputed by many in England, but the Royal Geographical Society, which had sponsored the expedition, honoured Speke for his exploits. On a second expedition (1860), he and James Grant mapped a portion of Lake Victoria. On July 28, 1862, Speke, not accompanied by Grant for this portion of the journey, found the Nile's exit from the lake and named it Ripon Falls. The party then tried to follow the river's course, but an outbreak of tribal warfare required them to change their route. In February 1863 they reached Gondokoro in the southern Sudan, where they met the Nile explorers Samuel Baker and Florence von Sass (who later became Baker's wife). Speke and Grant told them of another lake said to lie west of Lake Victoria. This information helped the Baker party to locate another Nile source, Lake Albert.

Speke's claim to have found the Nile source was again challenged in England, and, on the day he was to debate the subject publicly with Richard Burton, he was killed by his own gun while hunting. Accounts of his explorations were published in 1863 and 1864.

**speleology,** scientific discipline that is concerned with all aspects of caves and cave systems. Exploration and description of caves and their features are the principal focus of speleology, but much work on the chemical solution of limestone, rates of formation of stalagmites and stalactites, the influence of groundwater and hydrologic conditions generally, and on modes of cave development has been accomplished within this discipline. Speleology requires, essentially, the application of geological and hydrological knowledge to problems associated with underground cavern systems. Amateur exploration of caves, as a hobby, is called spelunking.

**speleothem:** *see* cave deposit.

**spell,** words uttered in a set formula with magical intent. The correct recitation, often with accompanying gestures, is considered to unleash supernatural power. Some societies believe that incorrect recitation can not only nullify the magic but cause the death of the practitioner.

The language of spells is sometimes archaic and is not always understood by the reciter. In some cases meaningless but familiar terms are believed to be efficacious because of their traditional value. Much magical language, however, is clearly and directly correlated with the aim of the recital. In symbolic statement by analogy it represents and foreshadows the technical achievement, and metaphor and simile are freely used. An example is a Maori spell giving speed and grace to a canoe, which speaks of the swiftness of a bird on the wing and the lightness of a sea gull and which uses such onomatopoeic effects as speed noises or the wailing of the sea.

In blessings and curses, which are similar types of verbal expressions, the efficacy of the recitation is also believed to be connected to the magical power of the words themselves or to the sacred power of a supernatural being. Certain gestures as well as words may be bound up with the act of blessing, as in putting one's hands on the head of the person being blessed. The curse, a wish to cause harm or misfortune, is usually directed against others, although an important form of curse, associated with oaths, contracts, and treaties, is conditionally directed against oneself, should one fail to keep one's word or tell the truth.

**spelling bee,** also called SPELLING MATCH, or SPELLDOWN, contest or game in which players attempt to spell correctly and aloud words assigned them by an impartial judge. Competition may be individual, with players eliminated when they misspell a word and the last remaining player being the winner, or between teams, the winner being the team with the most players remaining at the close of the contest. The spelling bee is an old custom that was revived in schools in the United States in the late 19th century and enjoyed a great vogue there and in Great Britain. In the United States, local, regional, and national competitions continue to be held annually.

**spelter,** zinc in the form of slabs cast from the liquid obtained in the process of reducing the ores. Spelter is the most common commercial form of zinc metal. *See* zinc.

**Spelthorne,** district (borough), county of Surrey, England, bounded on the south and west by the River Thames and on the north and east by Greater London. It includes Staines (the principal settlement and district headquarters), Ashford, Shepperton, Sunbury, and the southern edge of London's Heathrow Airport. It is crossed by the M3 motorway and other major roads out of London. A remarkable feature of the district is the large fraction of its area covered by water. There is a series of large reservoirs, including a vast one at Littleton, fed by the Thames and designed to supply the needs of London. The area of the district is 22 sq mi (56 sq km). Pop. (1983 est.) 91,100.

**Spelvin, George,** U.S. theatrical convention used in the credits commonly to conceal dual roles or for a corpse or other anthropomorphic props. Spelvin first "appeared" on Broadway in the cast list of Charles A. Gardiner's *Karl the Peddler* in 1886. Winchell Smith employed the character in many of his plays, beginning with *Brewster's Millions* in 1906. He appeared with Maude Adams in *Joan of Arc* (1908), as a Betting Man in *High Button Shoes* (1947), and as Colonel Dent in *Jane Eyre* (1958).

D.W. Griffith cast Spelvin as a Union soldier in his epochal film *The Birth of a Nation* (1915) and as a dancer in *Way Down East* (1920). He also had a small role in the Academy Award-winning *From Here to Eternity* (1953). Spelvin was first listed in television credits in the dramatic series *The Fugitive,* and from time to time he has filled out the cast of such daytime soap operas as *The Guiding Light* and *Edge of Night.*

When a female character is needed, the player is listed as Georgiana, or Georgette, Spelvin. Spelvin's British counterparts are Walter Plinge, Mr. F. Anney, and Mr. Bart.

**Spemann, Hans** (b. June 27, 1869, Stuttgart, Württemberg [now in Ger.]—d. Sept. 12, 1941, Freiburg im Breisgau, Ger.), German embryologist who was awarded the Nobel Prize for Medicine or Physiology in 1935 for the discovery of the effect now known as embryonic induction, the influence exercised by various parts of the embryo that directs the development of groups of cells into particular tisues and organs.

Spemann, initially a medical student, attended the universities of Heidelberg, Munich, and Würzburg and graduated in zoology, botany, and physics. He worked at the Zoological Institute of Würzburg (1894–1908), held a professorship at Rostock (1908–14), was director of the Kaiser Wilhelm Institute for Biology in Berlin (1914–19), and occupied the chair of zoology at Freiburg (1919–35).

Spemann's concept of induction was based upon a lifetime of research into the early development of the newt. His work showed that, in the earliest stages, the fate of the embryonic parts has not been determined: if a piece of presumptive skin tissue is excised and transplanted into an area of presumptive nervous tissue, it will form nervous tissue, not skin. These results illuminated not only normal processes of development but also the origin of congenital abnormalities. Spemann summarized his researches in *Experimentelle Beiträge zu einer Theorie der Entwicklung* (1936; *Embryonic Development and Induction,* 1938).

**Spence, A. Michael** (b. 1943, Montclair, N.J., U.S.), American economist who, with George A. Akerlof and Joseph E. Stiglitz, won the Nobel Prize for Economics in 2001 for laying the foundations for the theory of markets with asymmetric information.

Spence attended Yale University (B.A., 1966), the University of Oxford (B.A., M.A., 1968), and Harvard University (Ph.D., 1972). He later taught at Harvard and at Stanford University, serving as dean of the latter's business school from 1990 to 1999.

Through his research on markets with asymmetric information, Spence developed the theory of "signaling" to show how better-informed individuals in the marketplace communicate their information to the less-well-informed to avoid the problems associated with adverse selection. In his 1973 seminal paper, "Job Market Signaling," Spence demonstrated how a college degree signals a job seeker's intelligence and ability to a prospective employer. Other examples of signaling included corporations giving large dividends to demonstrate profitability and manufacturers issuing guarantees to convey the high quality of a product.

**Spence, Sir Basil (Urwin)** (b. Aug. 13, 1907, Bombay, India—d. Nov. 19, 1976, Eye, Suffolk, Eng.), English architect best known for the new Coventry cathedral, built to replace the cathedral that had been gutted during a World War II bombing raid.

He was educated at the schools of architecture of London and Edinburgh universities and worked in Sir Edwin Lutyens' office on drawings for the Viceroy's House in New Delhi. Before the war he built large country

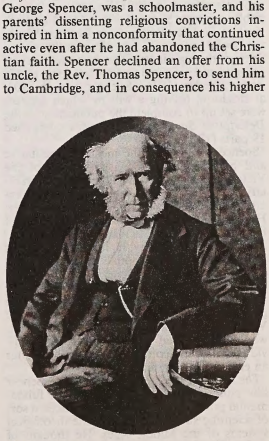
Sir Basil Spence, 1972
J.S. Lewinski

houses, and in 1951 he won the competition for the new Coventry cathedral (completed in 1962). This monumental, richly decorated structure incorporates the ruins of the bombed 14th-century cathedral. He gave his account of the project in *Phoenix at Coventry* (1962).

Spence had a strong sense of the relations of buildings to landscape, as shown especially in his designs for the University of Sussex (first quadrangle 1962–63), in a beautiful Downland setting. He also designed parish churches, housing developments, apartment buildings, theatres, factories, and office buildings. He was knighted in 1960, and from 1961 to 1968 he was professor of architecture at the Royal Academy. He was architect for the British Embassy at Rome (completed in 1971) and for the British pavilion at Expo 67 in Montreal. His *New Buildings in Old Cities* was published in 1973.

**Spencer, Sir (Walter) Baldwin** (b. June 23, 1860, Stretford, Lancashire, Eng.—d. July 14, 1929, Tierra del Fuego), English biologist and anthropologist, the first trained and experienced scientist to enter the field of Australian anthropology.

After briefly studying art, Spencer went to Owens College and in 1881 to Exeter College, Oxford, receiving a B.A. with first-class honours in natural science in 1884. He became a professor of biology at the University of Melbourne in 1887.



Spencer's interest in anthropology blossomed in 1894, when he joined the Horn Scientific Expedition to explore central Australia and met Francis James Gillen, who had been independently pursuing studies of the Aboriginals. In 1896 Spencer and Gillen began the study that resulted in the publication of *The Native Tribes of Central Australia* (1899). Getting to know the Aboriginals intimately and winning their trust, the two men accumulated an immense amount of information about Aboriginal customs, rituals, and beliefs. In 1904 they published *The Northern Tribes of Central Australia,* which drew on their travels around the Gulf of Carpentaria and conveyed a living picture of seminomadic, food-gathering and hunting people engaged in everyday economic and social activities and rituals. Spencer believed that the Aboriginals' social organization illustrated an early stage in the development of mankind.

In 1900 Spencer became a fellow of the Royal Society and was knighted in 1916. He also wrote *The Arunta: A Study of a Stone Age People* (1927), in which he renewed and confirmed his earlier views, and *Wanderings in Wild Australia* (1928), a popular account of his experiences. He died while on an expedition to Tierra del Fuego to study the last Indians at Ushuaia.

**Spencer, Charles:** *see* Sunderland, Charles Spencer, 3rd earl of.

**Spencer, Herbert** (b. April 27, 1820, Derby, Derbyshire, Eng.—d. Dec. 8, 1903, Brighton, Sussex), English sociologist and philosopher, an early advocate of the theory of evolution, who achieved an influential synthesis of knowledge, advocating the preeminence of the individual over society and of science over religion. His magnum opus was *The Synthetic Philosophy,* a comprehensive work completed in 1896 and containing volumes on the principles of biology, psychology, morality, and sociology.

*Life and works.* Spencer's father, William George Spencer, was a schoolmaster, and his parents' dissenting religious convictions inspired in him a nonconformity that continued active even after he had abandoned the Christian faith. Spencer declined an offer from his uncle, the Rev. Thomas Spencer, to send him to Cambridge, and in consequence his higher

Herbert Spencer
The Gernsheim Collection, the University of Texas at Austin

education was largely the result of his own reading, which was chiefly in the natural sciences. He was, for a few months, a schoolteacher and from 1837 to 1841 a railway civil engineer.

In 1842 he contributed some letters (republished later as a pamphlet, *The Proper Sphere of Government,* 1843) to *The Nonconformist,* in which he argued that it is the business of governments to uphold natural rights and that they do more harm than good when they go beyond this. After some association with progressive journalism through such papers as *The Zoist* (devoted to mesmerism and phrenology) and *The Pilot* (the organ of the Complete Suffrage Union), Spencer became in 1848 a subeditor of *The Economist.* In 1851 he published *Social Statics* (reissued in 1955), which contained in embryo most of his later views, including his argument in favour of an extreme form of economic and social laissez-faire. About 1850 Spencer became acquainted with Marian Evans (the novelist George Eliot), and his philosophical conversations with her led some of their friends to

expect that they would marry; but in his *Autobiography* (1904) Spencer denies any such desire, much as he admired Evans' intellectual powers. Other friends were G.H. Lewes, T.H. Huxley, and J.S. Mill. In 1853 Spencer, having received a legacy from his uncle, resigned his position with *The Economist*.

Having published the first part of *The Principles of Psychology* in 1855, Spencer in 1860 issued a prospectus and accepted subscriptions for a comprehensive work, *The Synthetic Philosophy*, which was to include, besides the already published *Principles of Psychology*, volumes on first principles and on biology, sociology, and morality. *First Principles* was published in 1862, and between then and 1896, when the third volume of *The Principles of Sociology* appeared, the task was completed. In order to prepare the ground for *The Principles of Sociology*, Spencer started in 1873 a series of works called *Descriptive Sociology*, in which information was provided about the social institutions of various societies, both primitive and civilized. The series was interrupted in 1881 because of lack of public support. Spencer was a friend and adviser of Beatrice Potter, later Beatrice Webb, the social reformer, who frequently visited Spencer during his last illness and left a sympathetic and sad record of his last years in *My Apprenticeship* (1926). Spencer died in 1903, at Brighton, leaving a will by which trustees were set up to complete the publication of the *Descriptive Sociology*. The series comprised 19 parts (1873–1934).

Spencer was one of the most argumentative and most discussed English thinkers of the Victorian period. His strongly scientific orientation led him to urge the importance of examining social phenomena in a scientific way. He believed that all aspects of his thought formed a coherent and closely ordered system. Science and philosophy, he held, gave support to and enhanced individualism and progress. Though it is natural to cite him as the great exponent of Victorian optimism, it is notable that he was by no means unaffected by the pessimism that from time to time clouded the Victorian confidence. Evolution, he taught, would be followed by dissolution, and individualism would come into its own only after an era of socialism and war.

*The synthetic philosophy in outline.* Spencer saw philosophy as a synthesis of the fundamental principles of the special sciences, a sort of scientific summa to replace the theological systems of the Middle Ages. He thought of unification in terms of development, and his whole scheme was in fact suggested to him by the evolution of biological species. In *First Principles* he argued that there is a fundamental law of matter, which he called the law of the persistence of force, from which it follows that nothing homogeneous can remain as such if it is acted upon, because any external force must affect some part of it differently from other parts and cause difference and variety to arise. From this, he continued, it would follow that any force that continues to act on what is homogeneous must bring about an increasing variety. This "law of the multiplication of effects," due to an unknown and unknowable absolute force, is in Spencer's view the clue to the understanding of all development, cosmic as well as biological. It should be noted that Spencer published his idea of the evolution of biological species before the views of Charles Darwin and the British naturalist Alfred Russel Wallace were known, but Spencer at that time thought that evolution was caused by the inheritance of acquired characteristics, whereas Darwin and Wallace attributed it to natural selection. Spencer later accepted the theory that natural selection was one of the causes of biological evolution, and he himself coined the phrase "survival of the fittest" (*Principles of Biology* [1864], vol. 1, p. 444).

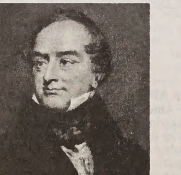
*Sociology and social philosophy.* That Spencer first derived his general evolutionary scheme from reflection on human society is seen in *Social Statics*, in which social evolution is held to be a process of increasing "individuation." He saw human societies as evolving by means of increasing division of labour from undifferentiated hordes into complex civilizations. Spencer believed that the fundamental sociological classification was between military societies, in which cooperation was secured by force, and industrial societies, in which cooperation was voluntary and spontaneous.

Evolution is not the only biological conception that Spencer applied in his sociological theories. He made a detailed comparison between animal organisms and human societies. In both he found a regulative system (the central nervous system in the one, government in the other), a sustaining system (alimentation in the one case, industry in the other), and a distribution system (veins and arteries in the first; roads, telegraphs, etc., in the second). The great difference between an animal and a social organism, he said, is that, whereas in the former there is one consciousness relating to the whole, in the latter consciousness exists in each member only; society exists for the benefit of its members and not they for its benefit.

This individualism is the key to all of Spencer's work. His contrast between military and industrial societies is drawn between despotism, which is primitive and bad, and individualism, which is civilized and good. He believed that in industrial society the order achieved, though planned by no one, is delicately adjusted to the needs of all parties. In *The Man Versus the State* (1884) he wrote that England's Tories generally favour a military and Liberals an industrial social order but that the Liberals of the latter half of the 19th century, with their legislation on hours of work, liquor licensing, sanitation, education, etc., were developing a "New Toryism" and preparing the way for a "coming slavery." "The function of liberalism in the past was that of putting a limit to the powers of kings. The function of true liberalism in the future will be that of putting a limit to the powers of parliaments."

*Metaphysics.* In his emphasis on variety and differentiation, Spencer was unwittingly repeating, in a 19th-century idiom, the metaphysics of liberalism that Spinoza and Leibniz had adumbrated in the 17th century. Spinoza had maintained that "God or Nature" has an infinity of attributes in which every possibility is actualized, and Leibniz had argued that the perfection of God is exhibited in the infinite variety of the universe. Though neither of them believed that time is an ultimate feature of reality, Spencer combined a belief in the reality of time with a belief in the eventual actualization of every possible variety of being. He thus gave metaphysical support to the liberal principle of variety, according to which a differentiated and developing society is preferable to a monotonous and static one.

*Evaluation.* Spencer's attempt to synthesize the sciences showed a sublime audacity that has not been repeated because the intellectual specialization he welcomed and predicted increased even beyond his expectations. His sociology, although it gave an impetus to the study of society, was superseded as a result of the development of social anthropology since his day and was much more concerned with providing a rationale for his social ideals than he himself appreciated. Primitive men, for example, are not the childlike emotional creatures that he thought them to be, nor is religion to be explained only in terms of the souls of ancestors. When T.H. Huxley said that Spencer's idea of a tragedy was "a deduction killed by a fact," he called attention to the system-building feature of Spencer's work that led him to look for what confirmed his theories and to ignore or to reinterpret what conflicted with them. (H.B.A.)



MAJOR WORKS. *Philosophy and religion. The Nature and Reality of Religion*, 1885 (withdrawn from publication). Spencer's series on *Synthetic Philosophy* comprises: *First Principles*, 1862; *The Principles of Biology*, 2 vol., 1864–67; *The Principles of Psychology*, 1855; *The Principles of Sociology*, 3 vol., 1876–96; *The Principles of Ethics*, 2 vol., 1892–93.

*Political and social. The Proper Sphere of Government*, 1843; *Social Statics*, 1851; *Education: Intellectual, Moral, Physical*, 1861; *The Study of Sociology*, 1872; *The Man Versus the State*, 1884; *Facts and Comments*, 1902.

*Other works.* Essays: *Scientific, Political, and Speculative*, 3 vol., 1891; *Autobiography*, 1904, an intellectual rather than a personal autobiography.

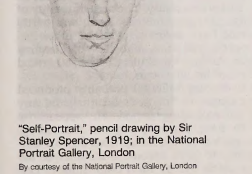
BIBLIOGRAPHY. A so-called official biography is that by David Duncan, *Life and Letters of Herbert Spencer*, 2 vol. (1908). T.H. Huxley, in "Evolution and Ethics," in *Collected Essays*, vol. 9 (1894), accuses Spencer of "fanatical individualism" and "reasoned savagery." H. Sidgwick, *Lectures on the Ethics of T.H. Green, Mr. Herbert Spencer and J. Martineau*, pp. 135–312 (1902), and G.E. Moore, *Principia Ethica*, sect. 31–35 (1903, reprinted 1954), contain detailed criticisms of Spencer's ethical theory. See also J. Rumney, *Herbert Spencer's Sociology: A Study in the History of Social Theory* (1934); S. Andreski (ed.), *Principles of Sociology*, abr. ed. (1969), which includes an analysis and assessment of Spencer's sociological theory; D. MacRae (ed.), *The Man Versus the State: With Four Essays on Politics and Society* (1969), in which the introduction (pp. 7–54) deals with Spencer's views on society and politics; J.Y.D. Peel, *Herbert Spencer: The Evolution of a Sociologist* (1971); and David Wiltshire, *Social and Political Thought of Herbert Spencer* (1977).

**Spencer, John Charles Spencer, 3rd Earl,** also called (until 1834) VISCOUNT ALTHORP (b. May 30, 1782, London—d. Oct. 1, 1845, near Clayworth, Nottinghamshire, Eng.), statesman, leader of the British House of Commons

The 3rd Earl Spencer, detail of a chalk drawing by Charles Turner; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

and chancellor of the Exchequer from 1830 to 1834; he greatly aided Lord John Russell (afterward 1st Earl Russell), chief author of the Reform Bill of 1832, in securing its passage in the Commons. Courageous, honest, and sensible though not brilliant, he successfully led an ill-assorted majority of Whigs, Radicals, and Irish against an opposition powerfully directed by Sir Robert Peel.



As Viscount Althorp, he sat in the House of Commons for 30 years, from 1804. In 1827 he declined the leadership of the Whig opposition, but in November 1830 he accepted office in the new ministry of the 2nd Earl Grey. In addition to his work on the Reform Bill, he sponsored the Factory Act of 1833 (Althorp's Act), restricting the employment of children in textile mills. His opposition to a "coercion" bill against Irish nationalists led to Grey's resignation (1834). Althorp remained

in office four more months, but when he inherited the Spencer earldom and left the House of Commons, King William IV took the opportunity to dismiss (November 15) the government of Grey's successor, the 2nd Viscount Melbourne. Spencer then retired from politics.

**Spencer, Robert:** *see* Sunderland, Robert Spencer, 2nd Earl of.

**Spencer, Sir Stanley** (b. June 30, 1891, Cookham, Berkshire, Eng.—d. Dec. 14, 1959, Taplow, Buckinghamshire), one of the leading painters in England between the world wars, whose work primarily draws upon Christian religious subjects. Spencer's work has Surrealistic overtones, a curiously distorted style of drawing, and a strong element of satiric social comment.

Spencer studied at the Slade School and first exhibited at the New English Art Club. He frequently used his hometown as a setting and employed modern dress in his paintings based on biblical themes. In the huge "Resurrection" (1928–29; Sandham Memorial Chapel, Burghclere, Hampshire) dead soldiers in Cookham churchyard struggle from their tombs into a cross-strewn landscape. In "The Resurrection: Port Glasgow" (1950; Tate Gallery, London)

"Self-Portrait," pencil drawing by Sir Stanley Spencer, 1919; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

the swollen figures swarm and writhe over the picture space in attitudes that suggest the apocalyptic visions of early medieval sculpture.

Spencer also painted highly finished landscapes and humorous comments on the absurdity of human behaviour. "The Nursery" (1936; Museum of Modern Art, New York City) is a biting satiric comment on the parent-child relationship. Spencer was elected to the Royal Academy (1950) and knighted in 1959.

**Spencer carbine,** any of a family of rim-fire repeating arms—both carbines and rifles—that were widely used in the American Civil War. The carbine was invented by Christopher M. Spencer of Connecticut and was patented in 1860. Its buttstock contained a magazine carrying seven cartridges that could be fired in about 18 seconds. The cartridges were fed to the breech by pressure from a spring in the magazine. With the addition of the Blakeslee cartridge box as an auxiliary, the Spencer carbine had greatly improved capacity for sustained fire. The box contained from 6 to 13 tin tubes, each of which held seven cartridges. The carbine was almost exclusively a cavalry weapon, and it was normally chambered in .52 calibre. The weapon had a 22-inch (56-centimetre) barrel and was 39 inches long overall. The Spencer rifle was of similar design but had a barrel 47 inches long.

**Spencer Gulf,** triangular inlet of the Indian Ocean, indenting the southeastern coast of South Australia, between the Eyre and Yorke peninsulas. Its maximum width is 80 miles (130 km) and overall length 200 miles (320 km). The Sir Joseph Banks, Thistle, Gambier, and Neptune islands are located in its 50-mile- (80-kilometre-) wide mouth. Mangrove swamps line the eastern shore and marine fibre beds the western. Major ports are Whyalla, Port Pirie, and Port Augusta (near the head of the inlet) and Port Lincoln (at the entrance on the west). Explored by Matthew Flinders in 1802, the gulf was named in honour of Earl Spencer, first lord of the Admiralty (1794–1801).

moted by five sons and a nephew, the Spencerian method became the most widely known system of handwriting instruction in the third quarter of the 19th century. In partnership with Victor M. Rice, who became New York state superintendent of public instruction, Spencer in 1848 began issuing engraved copy slips in series and by the thousands. These were followed in the 1850s by copybooks with engraved and lithographed models that were used in American schoolrooms for several decades.

**Spender, Sir Stephen,** in full SIR STEPHEN HAROLD SPENDER (b. Feb. 28, 1909, London, Eng.—d. July 16, 1995, London), English poet and critic, who made his reputation in the 1930s with poems expressing the politically conscience-stricken, leftist "new writing" of that period.

A nephew of the Liberal journalist and biographer J.A. Spender, he was educated at University College School, London, and at University College, Oxford. While an undergraduate he met the poets W.H. Auden and C. Day-Lewis, and during 1930–33 he spent many months in Germany with the writer Christopher Isherwood. Among important influences shown in his early volumes—*Poems* (1933); *Vienna* (1934); *Trial of a Judge,* a verse play (1938); and *The Still Centre* (1939)—were the poetry of the German Rainer Maria Rilke and of the Spaniard Federico García Lorca. Above all, his poems expressed a self-critical, compassionate personality. In the following decades Spender, in some ways a more personal poet than his early associates, became increasingly more autobiographical, turning his gaze from the external topical situation to the subjective experience. His reputation for humanism and honesty is fully vindicated in subsequent volumes—*Ruins and Visions* (1942), *Poems of Dedication* (1947), *The Edge of Being* (1949), *Collected Poems* (1955), *Selected Poems* (1965), *The Generous Days* (1971), and *Dolphins* (1994).

From the 1940s he was better known for his perceptive criticism and his editorial association with the influential reviews *Horizon* (1940–41) and *Encounter* (1953–67) than he was as a poet. Spender's prose works include short stories (*The Burning Cactus,* 1936), a novel (*The Backward Son,* 1940), literary criticism (*The Destructive Element,* 1935; *The Creative Element,* 1953; *The Making of a Poem,* 1955; *The Struggle of the Modern,* 1963), an autobiography (*World Within World,* 1951, reissued 1994), and uncollected essays with new commentary (*The Thirties and After,* 1978).

During World War II Spender was a member of the National Fire Service (1941–44). After the war he made several visits to the United States, teaching and lecturing at universities. In 1970 he was appointed professor of English at University College, London; he became professor emeritus in 1977. He was knighted in 1983.

**Spener, Philipp Jakob** (b. Jan. 23, 1635, Rappoltsweiler, Upper Alsace [now Ribeauvillé, France]—d. Feb. 5, 1705, Berlin, Prussia [Germany]), theologian, author, and a leading figure in German Pietism, a movement among 17th- and 18th-century Lutherans that stressed personal improvement and upright conduct as the most important manifestations of Christian faith.

During his studies at Strassburg (1651–59) Spener developed an interest in reforming Lutheran orthodox theology and practice. In particular, he objected to the rigidity of ecclesiastical structures and the lack of moral discipline among the clergy. At the age of 31, Spener became president of the Lutheran Church at Frankfurt am Main, where he began his *collegia pietatis* ("schools of piety"), devotional gatherings intended to encourage personal spiritual growth, prayer, and Bible study. His extensive correspondence with the German clergy contributed to the growth of Pietism, as did his major work, *Pia Desideria* (1675; *Pious Desires*). That work outlined Pietism's basic program and earned Spener a reputation throughout Germany as the spokesman for the movement. His emphasis upon practice was often considered extreme, to the detriment of doctrine. But the doctrinal conflicts of his time deeply concerned Spener, who considered many of them harmful and irrelevant. In 1686 he was made first court chaplain at Dresden, then the most valued position in the German Lutheran Church, but his views soon aroused opposition. Attacks upon Pietism came from the orthodox Lutherans at the University of Leipzig and from the Saxon court, whose elector, John George III, had been rebuked by Spener for drunkenness.

Spener consequently moved to Berlin in 1691 to become provost of St. Nicholas' Church. There he gained from the Brandenburg-Prussian court the support that enabled him to carry out numerous reforms. At the new University of Halle, founded on a Pietist basis by the Elector of Brandenburg in 1694, Spener obtained positions for his disciples Christian Thomasius and August H. Francke. By the time of Spener's death, Pietism was well established in Germany, and its influence reached to England and eventually to the British colonies in America. Other important works among Spener's more than 300 writings are *Das geistliche Priestertum* (1677; "The Spiritual Priesthood") and *Die allgemeine Gottesgelehrtheit* (1680; "General Theology").

**Spengler, Oswald** (b. May 29, 1880, Blankenburg, Ger.—d. May 8, 1936, Munich), German philosopher whose reputation rests entirely on his influential work *Der Untergang des Abendlandes,* 2 vol. (1918–22; *The Decline of the West*), a major contribution to social theory.

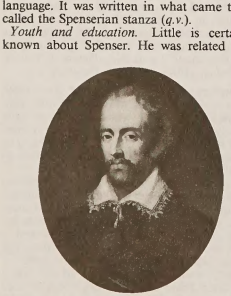
After taking his doctorate at the University of Halle (1904), Spengler worked as a schoolmaster until 1911, when he went to live in Munich on a small inheritance and began work on *Der Untergang.* The first volume, published in 1918, won him immediate acclaim from the general public. The second volume followed in 1922, and a revised edition of the first a year later. From 1919 onward, Spengler tried to turn his reputation to account as a political commentator, but he met with little success.

*Der Untergang* is a study in the philosophy of history. Spengler contended that because most

civilizations must pass through a life cycle, not only can the historian reconstruct the past but he can predict "the spiritual forms, duration, rhythm, meaning and product of the still unaccomplished stages of our Western history."

Spengler, pencil drawing by K. Grossmann, 1920; in a private collection
Deutsche Fotothek, Dresden

Unlike Arnold Toynbee, who later held that cultures are usually "apparented" to older cultures, Spengler contended that the spirit of a culture can never be transferred to another culture. He believed that the West had already passed through the creative stage of "culture" into that of reflection and material comfort ("civilization" proper, in his terminology) and that the future could only be a period of irreversible decline. Nor was there any prospect of reversing the process, for civilizations blossomed and decayed like natural organisms, and true rejuvenation was as impossible in the one case as the other.



Spengler's work won scant approval from professional scholars, who were scandalized by his unorthodox methods and contemptuous of his errors of fact. He was also criticized by the National Socialist Party, despite some affinity between his political ideas and Nazi dogma, and, after Adolf Hitler's rise to power in 1933, Spengler lived in isolation until his death.

Among his other works, *Der Mensch und die Technik* (1931; *Man and Technics*) stands out.

BIBLIOGRAPHY. H. Stuart Hughes, *Oswald Spengler* (1952, reprinted with a new introduction, 1992).

**Spenser, Edmund** (b. 1552/53, London, Eng.—d. Jan. 13, 1599, London), English poet whose long allegorical poem, *The Faerie Queene,* is one of the greatest in the English language. It was written in what came to be called the Spenserian stanza (*q.v.*).

*Youth and education.* Little is certainly known about Spenser. He was related to a noble Midlands family of Spencer, whose fortunes had been made through sheep raising. His own immediate family was not wealthy. He was entered as a "poor boy" in the Merchant Taylors' grammar school, where he would have studied mainly Latin, with some Hebrew, Greek, and music.

Spenser, oil painting by an unknown artist; in the collection of Pembroke College, Cambridge, Eng.
By courtesy of the Master and Fellows, Pembroke College, Cambridge, Eng.

In 1569, when Spenser was about 16, his English versions of poems by the 16th-century French poet Joachim du Bellay and his translation of a French version of a poem by the Italian poet Petrarch appeared at the beginning of an anti-Catholic prose tract, "The Theatre for Worldlings"; they were no doubt commissioned by its chief author, the wealthy Flemish expatriate Jan van der Noodt. (Some of these poems Spenser later revised for his *Complaints* volume.)

From May 1569 Spenser was a student in Pembroke Hall (now Pembroke College) of the University of Cambridge, where, along with perhaps a quarter of the students, he was classed as a sizar—a student who, out of financial necessity, performed various menial or semimenial duties. He received his bachelor of arts degree in 1573. Because of an epidemic Spenser left Cambridge in 1574, but he received his master of arts degree in 1576.

His best-known friend at Cambridge was the slightly older Gabriel Harvey, a fellow of Pembroke, who was learned, witty, and enthusiastic for ancient and modern literature but also pedantic, devious, and ambitious. There is no reason to believe that Spenser shared the most distasteful of these qualities, but, in the atmosphere of social mobility and among the new aristocracy of Tudor England, it is not surprising that he hoped for preferment to higher position.

Spenser's period at the University of Cambridge was undoubtedly important for the acquisition of his wide knowledge not only of the Latin and some of the Greek classics but also of Italian, French, and English literature of his own and earlier times. His knowledge of the traditional forms and themes of lyrical and narrative poetry provided foundations for him to build his own highly original compositions. Without the Roman epic poet Virgil's *Aeneid,* the 15th-century Italian Ludovico Ariosto's *Orlando Furioso,* and, later, Torquato Tasso's *Gerusalemme liberata* (1581), Spenser could not have written his heroic, or epic, poem *The Faerie Queene.* Without Virgil's *Bucolics* and the later tradition of pastoral poetry in Italy and France, Spenser could not have written *The Shepheardes Calender.* And without the Latin, Italian, and French examples of the highly traditional marriage ode and the sonnet and canzone forms of Petrarch and succeeding sonneteers, Spenser could not have written his greatest lyric, *Epithalamion,* and its accompanying sonnets, *Amoretti.* The patterns of meaning in Spenser's poetry are frequently woven out of the traditional interpretations—developed through classical times and his own—of pagan myth, divinities, and philosophies and out of an equally strong experience of the faith and doctrines of Christianity; these patterns he further enriched by the use of medieval and contemporary story, legend, and folklore.

Spenser's religious training was a most important part of his education. He could not have avoided some involvement in the bitter struggles that took place in his university over the path the new Church of England was to tread between Roman Catholicism and extreme Puritanism. Contrary to a former view, there is little reason to believe that he inclined toward the Puritanical side. His first known appointment (after a blank of several years, when he may have been in the north of England) was in 1578 as secretary to Bishop John Young of Rochester, formerly master of Spenser's college at Cambridge. His first important publication, *The Shepheardes Calender* (1579 or 1580), is more concerned with the bishops and affairs of the English church than is any of his later work.

*Early works. The Shepheardes Calender* can be called the first work of the English literary Renaissance. Following the example of Virgil and of many later poets, Spenser was beginning his career with a series of eclogues (literally "selections," usually short poems in the form of pastoral dialogues), in which various characters, in the guise of innocent and simple shepherds, converse about life and love in a variety of elegantly managed verse forms, formulating weighty—often satirical—opinions on questions of the day. The paradoxical combination in pastoral poetry of the simple, isolated life of shepherds with the sophisticated social ambitions of the figures symbolized or discussed by these shepherds (and of their probable readership) has been of much interest in modern literary criticism.

The *Calender* consists of 12 eclogues, one named after each month of the year. One of the shepherds, Colin Clout, who excels in poetry but is ruined by his hopeless love for one Rosalind, is Spenser himself. The eclogue "April" is in praise of the shepherdess Elisa, really the queen (Elizabeth I) herself. "October" examines the various kinds of verse composition and suggests how discouraging it is for a modern poet to try for success in any of them. Most of the eclogues, however, concern good or bad shepherds—that is to say, pastors—of Christian congregations. The *Calender* was well received in its day, and it is still a revelation of what could be done poetically in English after a long period of much mediocrity and provinciality. The archaic quality of its language, sometimes deplored, was partly motivated by a desire to continue older English poetic traditions, like that of Geoffrey Chaucer. Archaic vocabulary is not so marked a feature of his later work.

The two years 1578–80 probably produced more changes in Spenser's life than did any other corresponding period. He appears by 1580 to have been serving the fascinating, highly placed, and unscrupulous Earl of Leicester and to have become a member of the literary circle led by Sir Philip Sidney, Leicester's nephew, to whom the *Calender* was dedicated and who praised it in his important critical work *The Defence of Poesie* (1595). Spenser remained permanently devoted to this brilliant writer and good nobleman, embodied him variously in his own poetry, and mourned his early death in an elegy. By 1580 Spenser had also started work on *The Faerie Queene* and in the previous year had apparently married one Machabyas Chylde. Interesting sidelights on his personal character, of which next to nothing is known, are given in a small collection of letter's between Spenser and Gabriel Harvey that was printed in 1580. The ironies in Harvey's and Spenser's exchange of letters are so intricate, however, as to make it difficult to draw many conclusions from them about Spenser, except that he was young, ambitious, accomplished, and sincerely interested in the theory and practice of poetry. In 1580 Spenser was made secretary to the new lord deputy of Ireland, Arthur Lord Grey, who was a friend of the Sidney family.

*Career in Ireland.* Sixteenth-century Ireland and the Irish were looked on by the English as a colony, although the supposed threat of an invasion by Spain and the conflict between an imposed English church and the Roman Catholicism of the Irish were further complicating factors. Irish chieftains and the Anglo-Irish nobility encouraged native resistance to newly arrived English officials and landowners. As Grey's secretary, Spenser accompanied the lord deputy on risky military campaigns as well as on more routine journeys. But Ireland was certainly no exile for Spenser. He became deeply attached to the country, its people and its landscapes. He several times gives poetic form to romantic or

idyllic reactions to the Irish scene, along with an equally strong dislike for its unproductive wildness and lawlessness. The conflict between Grey's direct, drastic governmental measures and the queen's characteristic procrastinating and temporizing style soon led to his frustration and recall. But Spenser, like many others, admired Grey's methods; his later tract, *A View of the Present State of Ireland* (written 1595–96, published 1633), argues lucidly for a typically 16th-century theory of rule: firm measures, consistently applied, with gentleness only for completely submissive subject populations.

For four or five years from about 1584, Spenser carried out the duties of a second important official position in Ireland, deputizing for his friend Lodowick Bryskett as clerk of the lords president (governors) of Munster, the southernmost Irish province. The fruits of his service in Ireland are plain. He was given a sinecure post and other favours, including the right to dispose of certain forfeited parcels of land (he no doubt indulged in profitable land speculation). For a time he leased the small property of New Abbey, County Kildare, and on this basis was first designated "gentleman." Finally, he obtained a much larger estate in Munster. One of the chief preoccupations of the presidents of this province, scarred as it was by war and starvation, was to repopulate it. To this end, large "plantations" were awarded to English "undertakers," who undertook to make them self-sustaining by occupying them with Englishmen of various trades. In 1588 or 1589 Spenser took over the 3,000-acre plantation of Kilcolman, about 25 miles to the north and a little to the west of Cork. No doubt he took there his son and daughter and his wife, if she was still alive (she is known to have died by 1594). By acquiring this estate, Spenser made his choice for the future: to rise into the privileged class of what was, to all intents, a colonial land of opportunity rather than to seek power and position on the more crowded ground of the homeland where he had made his poetic reputation. In his new situation he, like other undertakers, had much conflict with the local Anglo-Irish aristocracy and had limited success in filling the plantations with English families. Nevertheless, it was under these conditions that Spenser brought his greatest poetry to completion.

*"The Faerie Queene" and last years.* In its present form, *The Faerie Queene* consists of six books and a fragment (known as the "Mutabilitie Cantos"). According to Spenser's introductory letter in the first edition (1590) of his great poem, it was to contain 12 books, each telling the adventure of one of Gloriana's knights. Like other poets, Spenser must have modified his general plan many times, yet this letter, inconsistent though it is with various plot details in the books that are extant, is probably a faithful mirror of his thinking at one stage. The stories actually published were those of Holiness (the Red Cross Knight), Temperance (Sir Guyon), Chastity (Britomart, a female knight), Friendship (ostensibly concerning Triamond and Cambello, although these play a small part), Justice (Artegall), and Courtesy (Calidore). As a setting, Spenser invented the land of Faerie and its queen, Gloriana. To express himself he invented a nine-line stanza, the first eight of five stresses and the last of six, whose rhyme pattern is ababbcbcc.

What is most characteristic of Spenser in *The Faerie Queene* is his serious view of the capacity of the romance form to act as a paradigm of human experience: the moral life as quest, pilgrimage, aspiration; as eternal war with an enemy, still to be known; as encounter, crisis, the moment of illumination—in short, as ethics, with the added dimensions of mystery, terror, love, and victory and with all the generous virtues exalted. Modern readers' impatience with the obscure allusions in the poem, with its political and ecclesiastical topicalities, is a failure to share the great conflict of Spenser's time between Protestant England and Roman Catholic Spain—to Spenser, the war between good and evil was here and now. In *The Faerie Queene* Spenser proves himself a master: picture, music, metre, story—all elements are at one with the deeper significance of his poem, providing a moral heraldry of colours, emblems, legends, folklore, and mythical allusion, all prompting deep, instinctive responses.

The poem was published with the help of Sir Walter Raleigh, who owned large lands to the east of Spenser's estate. He and the poet came together at Kilcolman in 1589 and became well acquainted with one another's poetry. Spenser implies that Raleigh persuaded Spenser to accompany him back to England to present the completed portion of *The Faerie Queene* to Queen Elizabeth herself. The history of this episode is charmingly evoked in *Colin Clouts Come home againe* (completed 1595), which is also one of Spenser's most effective pastoral embodiments of a provincial innocent up against the sophistications of a centre of power, with subsequent reflections on false, superficial love and the true love that finally animates a concordant universe.

Arriving thus in London with the support of the queen's favourite, Spenser was well received—not least by Elizabeth herself. The first three books of *The Faerie Queene* were duly published in 1590, together with a dedication to her and commendatory sonnets to notables of the court. Spenser saw the book through the press, made a hurried visit to Ireland, and returned speedily to London—presumably in the hope of preferment. At this time he supervised the printing of certain other of his poems in a collection called *Complaints* (1591), many of which had probably been written earlier in his career and were now being published so as to profit from the great success of his new heroic poem. It is difficult to believe that the many titles of poems that have not survived but were mentioned earlier in his career were not published in revised form and under other titles in his known work; for *Complaints* suggests by its miscellaneous and uneven character that Spenser was hastily bringing to the light of day nearly every last shred that he had to offer: early translations, an elegy, and the delightful mock-heroic poem "Muiopotmos" are contained in it; another item, the beast fable "Prosopopoia, or Mother Hubberd's Tale," apparently caused the authorities to withdraw unsold copies of the volume (perhaps in 1592) because it contained a covert attack on Lord Burghley, who was one of the most powerful figures of the court. Nevertheless, in 1591 Queen Elizabeth gave Spenser a small pension for life.

Back in Ireland, Spenser pressed on with his writing, in spite of the burdens of his estate. In early 1595 he published *Amoretti* and *Epithalamion,* a sonnet sequence and a marriage ode celebrating Spenser's marriage to his second wife (Elizabeth Boyle) after what appears to have been an impassioned courtship in 1594. This group of poems is unique among Renaissance sonnet sequences in that it celebrated a successful love affair culminating in marriage. As in passages in *The Faerie Queene,* Spenser develops in *Epithalamion* an aspect of Platonism according to which the changes wrought by time in our imperfect universe imitate the unchanging excellence of eternity through their cyclical character, continually restoring what they continually remove. Such are day and night, the circling year, the rebirth of plant and animal life, and human reproduction under the stimulus of sexual pleasure in marriage. Spenser conveys the unity of these cycles in his marriage ode, where he symbolizes the daily and annual cycles of the sun by giving the poem 24 stanzas (representing the hours) and a total of 365 pentameter and hexameter lines (representing the days). In that year Spenser may have again been busy in London supervising the publication of a number of works, including Books IV, V, and VI of *The Faerie Queene,* which appeared in 1596.

This burst of publication was the last of his lifetime. His early death may have been precipitated by the penetration into Munster of the Irish uprising of 1598. The undertakers and other loyalists failed to make head against this. Kilcolman was burned, and Spenser, probably in despair despite the Privy Council's having just recommended his appointment to the important post of sheriff of Cork, carried official letters about the desperate state of affairs from the president to London, where he died. He was buried with ceremony in Westminster Abbey close by the grave of Geoffrey Chaucer.

*Assessment.* Spenser was considered in his day to be the greatest of English poets, who had glorified England and its language by his long allegorical poem *The Faerie Queene,* just as Virgil had glorified Rome and the Latin tongue by his epic poem the *Aeneid.* Spenser had a strong influence upon his immediate successors, and the sensuous features of his poetic style, as well as his nine-line stanza-form, were later admired and imitated by such poets as Lord Byron and Percy Bysshe Shelley in the Romantic period of the late 18th and early 19th centuries. He is widely studied today as one of the chief begetters of the English literary Renaissance and as a master who embodied in poetic myth a view of the virtuous life in a Christian universe. (A.K.H./Ed.)

MAJOR WORKS. *Poems. The Shepheardes Calender* (1579); *The Faerie Queene,* Books I–III (1590); *Complaints* (1591); *Daphnaïda* (1591); *Amoretti* and *Epithalamion* (1595); *The Faerie Queene,* Books I–VI, 2 vol. (1596); *Fowre Hymnes* (1596); *Prothalamion* (1596); *The Faerie Queene,* Books I–VI with the fragment of Book VII known as "Mutabilitie Cantos" (1609).

*Prose. Three Proper, and Wittie, Familiar Letters,* by Gabriel Harvey and Spenser (1580); *A View of the Present State of Ireland* (1633).

**Spenserian stanza,** verse form that consists of eight iambic pentameter lines followed by a ninth line of six iambic feet (an alexandrine); the rhyme scheme is *ababbcbcc.* The first eight lines produce an effect of formal unity, while the hexameter completes the thought of the stanza. Invented by Edmund Spenser for his poem *The Faerie Queene* (1590–1609), the Spenserian stanza has origins in the Old French ballade (eight-line stanzas, rhyming *ababbcbc*), the Italian ottava rima (eight iambic pentameter lines with a rhyme scheme of *abababcc*), and the stanza form used by Chaucer in his "Monk's Tale" (eight

lines rhyming *ababbcbc*). A revolutionary innovation in its day, the Spenserian stanza fell into general disuse during the 17th and 18th centuries. It was revived in the 19th century by the Romantic poets—*e.g.*, Byron in *Childe Harold's Pilgrimage,* Keats in "The Eve of St. Agnes," and Shelley in "Adonais."

**Spenta Mainyu,** in Zoroastrianism, the Holy Spirit, created by the Wise Lord, Ahura Mazdā, to oppose the Destructive Spirit, Angra Mainyu.

Spenta Mainyu is an aspect of the Wise Lord himself. Through the Holy Spirit, Ahura Mazdā creates life and goodness. According to Zoroastrian belief, Spenta Mainyu protects and maintains many realms and creatures—the sky, water, earth, plants, and children yet to be born.

**Speransky, Mikhail Mikhaylovich, Graf** (Count) (b. Jan. 12 [Jan. 1, old style], 1772, Cherkutino, Russia—d. Feb. 23 [Feb. 11, O.S.], 1839, St. Petersburg), Russian statesman prominent during the Napoleonic period, administrative secretary and assistant to Em-

Speransky, detail of a portrait by an unknown artist
Novosti Press Agency

peror Alexander I. He later compiled the first complete collection of Russian law, *Complete Collection of the Laws of the Russian Empire,* 45 vol. (1830), leading to his supervision of the *Digest of the Laws,* 15 vol. (1832–39).

*Early life.* Mikhail, or Misha, Mikhaylovich was the son of the village priest of Cherkutino in central Russia. He was sent at the age of 12 to the ecclesiastical seminary in Vladimir, the provincial capital. His lack of a surname (Mikhaylovich indicating simply "son of Mikhail") was overcome by an imaginative uncle, who dubbed him Speransky, a Russified form of the Latin word for hope. The boy soon distinguished himself by his ability to analyze problems and to express his thoughts with grace and clarity, but he already displayed an aloofness that emphasized his consciousness of his intellectual superiority yet cloaked his very real desire to feel the affection of those whom he respected, a quality that was to be a handicap in his later official career.

As a priest's son, he was sent at government expense to the Main Seminary newly founded in St. Petersburg. On completion of the course, he should have returned to his native diocese as a teacher. But a practice sermon so pleased the Metropolitan of St. Petersburg that the Synod granted permission to retain Speransky as a teacher of mathematics in the Main Seminary. Speransky resisted the urging of the Metropolitan that he take monastic vows, a step that would have opened to him the possibility of rising to the highest offices in the church. Despite his refusal, he was, in 1795, appointed instructor of philosophy and prefect of the seminary.

*Secretary to Prince Kurakin.* At this point, Speransky's future prospects were radically changed. Prince A.B. Kurakin took him into his household as secretary. Here he deepened his knowledge of the thought of the French Enlightenment and was introduced to the Idealist philosophy of Immanuel Kant. On the accession of Emperor Paul I (1796), Kurakin was appointed procurator general of the Senate, a post as close as possible in the Russian system of that time to that of prime minister. He was, thus, powerful enough to secure Speransky's release from his priestly status, which enabled him to enter government service. Speransky was pushed rapidly upward through the lower bureaucratic grades; by the end of 1798, still not 27 years old, he had already risen high enough in the Table of Ranks to be entitled to enjoy, on a hereditary basis, all the privileges of "the most ancient nobility."

In the same year, Speransky met an English girl whose widowed mother had come to Russia as a governess. He became so enamored of her that, although she knew no Russian and he understood no English, a courtship in fractured French led to their marriage. In the following year a daughter was born, but the mother, suffering from tuberculosis, died a few months later. Speransky, completely shattered, disappeared for a time. He never remarried but immersed himself wholly in his work. When Kurakin suddenly fell from favour, Speransky's tact, his evident ability, and his industry enabled him to continue his career.

*Secretary to the Emperor.* Under Paul's successor, Alexander I, he was assigned to ever more responsible positions, at first in the new Ministry of the Interior, where he gained invaluable experience in drafting legislation and was the prime mover in founding *Severnaya pochta* or *Novaya Sankt-Petersburgskaya gazeta,* Russia's first official newspaper. In 1807 he became intimately associated with the Emperor himself, as his administrative secretary and assistant. In 1808 he accompanied Alexander to his meeting with Napoleon, who described him as "the only clear head in Russia." Though he proved not yet able to cope successfully with the task of codifying the country's laws, he reorganized the seminaries and secured the establishment of the first Russian lycée (state secondary school).

In 1809 he laid the basis for his own downfall by two measures that outraged the bureaucratic nobility: one required that holders of court titles perform actual service to the state; the other required that all officials must pass examinations in order to be promoted at various stages of their careers. The angry nobles began to refer contemptuously to him as the *popovich* ("priest's son"). It was in this year, also, that Speransky proposed his new "constitution" (the Plan of 1809). Well aware that Alexander wanted no tampering with the essence of the autocracy or with its basis in serfdom, Speransky prepared complicated plans for dividing the population into three classes with varying degrees of political and civil rights and for creation of elective assemblies, the dumas, and an appointive State Council. The latter was set up on Jan. 1, 1810, but the dumas, innocuous though they would have been, remained on paper.

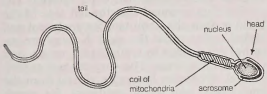
In these years (1807–12) when he had the Emperor's confidence, Speransky was responsible for a number of financial and administrative reforms designed not to change the essence of the state structure but to improve its functioning. His obvious pro-French leanings, however, added to the hostility of the nobles, whose pocketbooks had suffered by Russian participation in the Continental System, the systematic economic warfare employed by Napoleon against England.

Speransky's aloof personality and his continued association with persons inferior to him in social standing had prevented him from making friends among men with political prestige. He was thus left defenseless against his high-placed enemies at court, including the Emperor's sister, Catharine of Oldenburg. In 1811 the renowned historian N.M. Karamzin attacked him in his well-known memoir, *Of Old and New Russia.*

*Exile.* In March 1812, Speransky was summarily dismissed. Returning to his home at midnight, he found a police carriage waiting at his door. Without even taking leave of his daughter, the fallen minister started on the long journey to exile in Nizhny-Novgorod, whence he was soon transferred to the even more distant Perm, in the Urals.

Two years later he was permitted to return to his estate near Novgorod, but it was not until 1816 and only after he had stooped to appeal to his successor in Alexander's favour, Count A.A. Arakcheyev (whom the poet Pushkin contrasted with Speransky as Alexander's "evil genius"), that he was permitted to reenter state service—though only as provincial governor in remote Penza. In 1819, however, he was promoted to be governor general of Siberia, where he effected significant administrative reforms. In 1821 he was summoned to St. Petersburg and appointed a member of the State Council, in which he was to prudent to advocate further reforms, lest he again irritate his master.

*Work for Nicholas I.* Under Alexander's successor, Nicholas I, Speransky's great talents were again utilized, first as a member of the special tribunal that tried and sentenced the Decembrists, a group of officers who staged a liberal revolt on Nicholas' accession in December 1825. Here he again demonstrated his ability to read an emperor's mind; it was he who drafted the letter to the court that secured a significant reduction of the sentences the tribunal had imposed. In the same year he became, in effect, the head of the Second Division of the Emperor's personal chancellery. Still an efficient workhorse, he took part in the labours of Nicholas' secret committees for study of the peasant problem. His major achievement, however, was the publication, in 1830, of the first *Complete Collection of the Laws of the Russian Empire* (*Polnoye sobraniye zakonov Rossiyskoy imperii*). On the basis of this compilation, which began with the *Code* (*Sobornoye ulozheniye*) of 1649, he supervised preparation of a *Digest of the Laws* (*Svod zakonov Rossiyskoy imperii*). In 1837 he was awarded the highest grade of the Order of Andrew the First-Called and, in January 1839, was accorded the title of count. He died a few weeks later in St. Petersburg.



(J.D.C.)

BIBLIOGRAPHY. Marc Raeff, *Michael Speransky: Statesman of Imperial Russia, 1772–1839* 2nd rev. ed. (1969, reprinted 1981), is an excellent biography. See also his *Siberia and the Reforms of 1822* (1956). For Speransky's own early writings (to 1809), see *M.M. Speranskii: Proiekty i zapiski,* ed. by S.N. Valka (1961).

**sperm,** also called SPERMATOZOON, plural SPERMATOZOA, male reproductive cell, produced by most animals. With the exception of nematode worms, decapods (*e.g.,* crayfish), diplopods (*e.g.,* millipedes), and mites, sperm are flagellated; that is, they have a whiplike tail. In higher vertebrates, especially mammals, sperm are produced in the testes. The sperm unites with (fertilizes) an ovum (egg) of the female to produce a new offspring. Mature sperm have two distinguishable parts, a head and a tail.

The head of the sperm varies in shape for each animal species. In man it is flattened and almond shaped, four to five microns long and two to three microns wide (there are about 25,000 microns in an inch). The head portion is mainly a cell nucleus; it consists of genetic substances, called chromosomes, which are responsible for transmitting specific characteristics of an individual, such as the colour of eyes, hair, and skin. In each body cell of

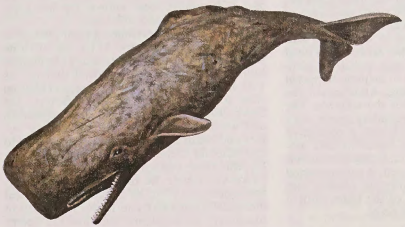
normal human beings, there are 46 chromosomes, which are responsible for the individual's general physical makeup. The sperm cells have only 23 chromosomes, or half of the usual number. When a sperm cell unites with the ovum, which also has 23 chromosomes, the resulting 46 chromosomes determine the offspring's characteristics. The sperm cells also carry the X or Y chromosome that determines the sex of the future child.

Human sperm

Covering the head of the sperm is a cap known as the acrosome, which contains chemical substances that help sperm to enter an egg. Only one sperm fertilizes each egg, even though 300,000,000 to 400,000,000 sperm are contained in an average ejaculation. Each egg and sperm produced has slightly different genetic information carried in the chromosomes; this accounts for the differences and similarities between children of the same parents.

A small middle portion of the sperm contains the mitochondria. The tail of the sperm, sometimes called the flagellum, is a slender, hairlike bundle of filaments that connects to the head and middle portion. The tail is about 50 microns long; its thickness of one micron near the mitochondria gradually diminishes to less than one-half micron at the end of the tail. The tail gives the sperm cell movement. It whips and undulates so that the cell can travel to the egg. Sperm deposited in the reproductive tract of the female travel through the tract until they fertilize an egg or die.

Sperm cells may live in the human body for two or three days after mating. Sperm may also be stored in a frozen state for months or years and still retain their capacity to fertilize eggs when thawed. *See also* spermatogenesis.



*Consult the* INDEX *first*

**sperm oil,** pale yellow liquid wax obtained with spermaceti (*q.v.*) from the head cavities and blubber of the sperm whale, used formerly as a fuel for lamps but now chiefly as a lubricant. The fluid-filled spermaceti organ, occupying a volume as large as 500 gallons (1,900 l), in the head of the whale is believed to act either as a cushion to protect the whale's vital organs from the water pressures of the ocean depths, or as part of the animal's "sonar." The organ is cooked with the blubber to produce crude sperm oil, from which spermaceti, a wax, is removed.

Upon being treated with sulfur, crude sperm oil provides lubricants that are resistant to extreme pressures. The oil can also be hardened to make textile sizes and wax compositions. Saponification yields fatty acids for soap manufacture and fatty alcohols for cosmetics and detergents. Refined sperm oil, after removal of spermaceti, is used for lubricating high-speed machinery and precision instruments and for textile lubrication.

**sperm whale,** also called CACHALOT (*Physeter catodon*), blunt-snouted whale of the family Physeteridae. The white, presumably albino, whale of Herman Melville's novel *Moby Dick* is of this species. The sperm whale is a thick-set animal with small, paddlelike flippers and a series of rounded humps on its back. It is distinguished by an enormous head, squarish in profile, and a narrow, underslung lower jaw equipped with large, conical teeth. When the mouth is closed, the teeth fit into sockets in the usually toothless upper jaw. The sperm whale is dark blue-gray or brownish, with a paler belly. The male attains a maximum length of about 19 m (62 feet); the female is much smaller.

The sperm whale is found in temperate and tropical waters throughout the world, usually in herds of about 15 to 20. Solitary males, however, may wander into colder regions. A deep diver, the sperm whale commonly reaches a depth of about 350 m (1,150 feet) and has been found tangled in cables 1,134 m (3,720 feet) below the surface. It feeds primarily on

Sperm whale (*Physeter catodon*)
Painting by Richard Ellis

cephalopods, including the giant squid (*Architeuthis*). It is a commercially valuable whale and has been hunted for several centuries. Among other things, it produces spermaceti (a waxy substance contained in the snout) and ambergris (a material sometimes found floating in the sea and thought to be formed by feces impacted around a core of solid matter, such as squid beaks). Spermaceti is used in ointments, cosmetics, and other products, and ambergris as a fixative to hold the scent of fine perfumes.

The pygmy sperm whale (*Kogia*) of the Northern Hemisphere is the only other member of the family Physeteridae. It is a little-known, dolphinlike whale, black above and paler below, and about 4 m (13 feet) long. It is of no commercial value.

**spermaceti,** solid wax, easily liquefied at moderate temperatures, obtained from the head cavities and from the oils of whales, porpoises, and dolphins. It is used chiefly in pomades, ointments, cosmetic creams, fine wax candles, and in textile finishing. Spermaceti was so named from the Latin *sperma,* "sperm," and *cetus,* "whale," in the belief that it was the coagulated semen of the whale.

The great spermaceti organ in the whale's head is usually cooked together with the blubber to obtain crude sperm oil (*q.v.*) containing spermaceti. The spermaceti is removed by chilling, called wintering; it separates as a white, crystalline, waxy solid. Chemically, spermaceti consists principally of cetyl palmitate and other esters of fatty acids with fatty alcohols.

**spermatic cord,** either of a pair of tubular structures in the male reproductive system that support the testes in the scrotum. Each cord is sheathed in connective tissue and contains a network of arteries, veins, nerves, and the first section of the ductus deferens, through which sperm pass in the process of ejaculation. The cords extend from the testes to the inguinal rings (openings at the level of the bladder) in the fascia transversalis, the connective-tissue sheath of abdominal wall muscles.

In surgery of the spermatic cord, the aims are to preserve the blood supply to the testicle and the continuity of the ductus deferens. Varicocelectomy is the operation performed when dilated veins of the spermatic cord cause pain. The dilated portions are excised, leaving the arteries to the testicle intact and sufficient veins to drain the testicle. An operation for correction of torsion is performed when the spermatic cord becomes twisted through overactivity of the cremaster muscle, which surrounds the cord. Prompt correction of this condition is necessary to prevent gangrene of the testicle. In the operation the cord is untwisted and the testicle is fixed to the base of the scrotum, the fixation being called orchiopexy. Because torsion is likely to occur on both sides, bilateral orchiopexy is performed even though torsion affects only one side. In bilateral vasectomy, small sections of the two ductus deferentes are excised through small scrotal incisions to prevent passage of the spermatozoa to the epididymis (and eventually on to the prostate and urethra), thus rendering the male sterile.

**spermatogenesis,** the origin and development of the sperm cells within the male reproductive organs, the testes. The testes are composed of numerous thin, tightly coiled tubules known as the seminiferous tubules; the sperm cells are produced within the walls of the tubules. Within the walls of the tubules, also, are many randomly scattered cells, called Sertoli cells, that function to support and nourish the immature sperm cells by giving them nutrients and blood products. As the young germ cells grow, the Sertoli cells help to transport them from the outer surface of the seminiferous tubule to the central channel of the tubule.

Sperm cells are continually being produced by the testes, but not all areas of the seminiferous tubules produce sperm cells at the same time. One immature germ cell takes as long as 74 days to reach final maturation, and during this growth process there are intermittent resting phases.

The immature cells (called spermatogonia) are all derived from cells called stem cells in the outer wall of the seminiferous tubules. The stem cells are composed almost entirely of nuclear material. (The nucleus of the cell is the portion containing the chromosomes.) The stem cells begin their process by multiplying in the process of cell duplication known as mitosis. Half of the new cells from this initial crop go on to become the future sperm cells, and the other half remain as stem cells so that there is a constant source of additional germ cells. Spermatogonia destined to develop into mature sperm cells are known as primary sperm cells. These move from the outer portion of the seminiferous tubule to a more central location and attach themselves around the Sertoli cells. The primary sperm cells then develop somewhat by increasing the amount of cytoplasm (substances outside of the nucleus) and structures called organelles within the cytoplasm. After a resting phase

the primary cells divide into a form called a secondary sperm cell. During this cell division there is a splitting of the nuclear material. In the nucleus of the primary sperm cells there are 46 chromosomes; in each of the secondary sperm cells there are only 23 chromosomes, as there are in the egg. When the egg and sperm combine and their chromosomes unite, the characteristics of both individuals blend and the new organism starts to grow.

The secondary sperm cell still must mature before it can fertilize an egg; maturation entails certain changes in the shape and form of the sperm cell. The nuclear material becomes more condensed and oval in shape; this area develops as the head of the sperm. The head is covered partially by a cap, called the acrosome, which is important in helping the sperm to gain entry into the egg. Attached to the opposite end of the head is the tailpiece. The tail is derived from the secondary sperm cell's cytoplasm. In the mature sperm, it consists of a long, slender bundle of filaments that propel the sperm by their undulating movement. Once the sperm has matured, it is transported through the long seminiferous tubules and stored in the epididymis of the testes until it is ready to leave the male body.

**spermatophyte,** also called SEED PLANT, any of the flowering plants (angiosperms) and conifers and allies (gymnosperms). An earlier classification considered these plants subgroups of the Spermatophyta, a taxonomic unit no longer generally considered valid.

**spermatozoon** (biology): *see* sperm.

**Sperrgebiet** (German: "restricted area"), also called DIAMOND AREA 1, diamond-rich area in the southern Namib (desert), southwestern Namibia, to which access by unauthorized persons is rigidly prohibited. It lies along the Atlantic coast from Oranjemund and the Orange River north to about 45 miles (72 km) north of Lüderitz (26° S latitude), encompassing an area approximately 60 miles (97 km) wide and 200 miles (322 km) long. The visual aspect of the Sperrgebiet is drab, characterized mainly by north-south sand dunes.

Rich deposits of guano on offshore islands were exploited in the mid-19th century, and a few diamonds were found on some of these islands in 1905–06. Major discoveries of diamonds in 1908 on the mainland in the vicinity of the port of Lüderitz led to the German colonial government's closing of the area to unauthorized persons later in the same year. In 1920 the assorted German-owned mining companies of northern Sperrgebiet (the Lüderitz area) sold their interests to Consolidated Diamond Mines of South West Africa, Ltd. (CDM; a subsidiary of the De Beers Consolidated Mines, Ltd. of South Africa), which has held the monopoly of the mining rights in Sperrgebiet ever since.

Today the mining operations in Sperrgebiet extend north from the CDM company town of Oranjemund (directly north of the Orange River mouth) for about 60 miles (97 km) along the coast. Giant earthmoving equipment is used to remove overlying sand to uncover diamond-bearing, alluvially deposited gravels, which often lie as far as 50 feet (15 m) below the surface. The Owambo (Ovambo) people of northern Namibia are the chief contract workers for the CDM. A remarkably high 95 percent of all diamonds recovered are of gem quality. Political instability in Namibia was a major factor in Sperrgebiet's overall production decline from more than 20 percent of the world's gem diamond production in 1977 to less than 5 percent in the mid-1980s. Gem diamonds continue to be mined in the coastal Namaqualand region of South Africa immediately south of the mouth of the Orange River.

**Sperrin Mountains,** Irish SLIABH SPEIRÍN, mountain range disposed along an arc about 20 miles (32 km) southeast of Londonderry city, Northern Ireland. The highest peaks—Sawel, Mullaclogher, and Mullaghaneany—all exceed 2,000 feet (608 m) and are capped with crystalline limestone. The Sperrins were extensively glaciated and bear evidence of both erosion and deposition. They are partly penetrated by glaciated glens and are mainly covered in blanket bog and heather.

**Sperry, Elmer Ambrose** (b. Oct. 12, 1860, Cortland, N.Y., U.S.—d. June 16, 1930, Brooklyn, N.Y.), versatile American inventor and industrialist, best known for his gyroscopic compasses and stabilizers.

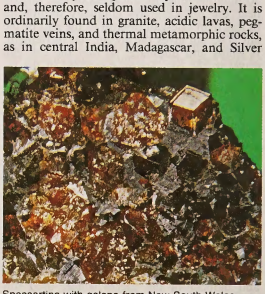
As a boy, Sperry developed a keen interest in machinery and electricity. At the age of 19 he persuaded a Cortland manufacturer to finance him in developing an improved dynamo as well as an arc lamp. The next year (1880) he went to Chicago and opened a factory, the Sperry Electric Company, to make dynamos and arc lamps. He invented the electric rotary and chain undercutting machines, and, to manufacture them, he established the Sperry Electric Mining Machine Company (1888).

Two years later, he turned his attention to transportation. First, he designed an electrical industrial locomotive and motor transmission machinery for streetcars, founding the Sperry Electric Railway Company in Cleveland (later sold to General Electric Company). From 1894 he made electric automobiles powered by his patented storage battery.

After 1900 he established an electrochemical research laboratory with C.P. Townsend at Washington, D.C. There they invented the chlorine detinning process—for salvaging tin from old cans and scrap—and processes for producing white lead from impure lead and caustic soda from salt. Around this time he also founded the Chicago Fuse Wire Company to manufacture electric fuse wire by machines he had invented. In the meantime, he had not forsaken his old interest in lighting; by 1918 he was producing a high-intensity arc searchlight six times brighter than any earlier light.

Sperry's greatest inventions sprang from what for decades had been a toy—the gyroscope, which, once properly aligned, always points to true north. The German inventor H. Anschütz-Kaempfe developed the first workable gyrocompass in 1908; Sperry's version was first installed on the U.S. battleship *Delaware* in 1911. Sperry set up his Sperry Gyroscope Company in Brooklyn in 1910. He extended the gyro principle to guidance of torpedoes, to gyropilots for the steering of ships and for stabilizing airplanes, and finally to a ship stabilizer.

The Sperry Corporation (now part of Unisys Corporation) manufactured computers, precision instruments and controls, farm machinery, and electric and hydraulic equipment and was a direct descendant of his gyroscope firm. In his lifetime, Sperry founded eight manufacturing companies and took out more than 400 patents.



**Sperry, Roger Wolcott** (b. Aug. 20, 1913, Hartford, Conn., U.S.—d. April 17, 1994, Pasadena, Calif.), American neurobiologist, corecipient with David Hunter Hubel and Torsten Nils Wiesel (*qq.v.*) of the Nobel Prize for Physiology or Medicine in 1981 for their investigations of brain function. Sperry in particular for his study of functional specialization in the cerebral hemispheres.

Sperry earned a bachelor's degree in English literature and a master's degree in psychology from Oberlin (Ohio) College and a doctorate in zoology from the University of Chicago in 1941. He then became an associate of Karl Lashley, first at Harvard University and then at the Yerkes Laboratories of Primate Biology in Orange Park, Fla. In 1946 he joined the faculty of the University of Chicago and in 1954 moved to the California Institute of Technology as Hixon professor of psychobiology.

Sperry's early research was on the regeneration of nerve fibres. He eventually became interested in brain function and undertook research on animals and then on human epileptics whose brains had been "split"; *i.e.,* in whom the thick cable of nerves (the corpus callosum) connecting the right and left cerebral hemispheres had been severed. His studies demonstrated that the left side of the brain is normally dominant for analytical and verbal tasks, while the right hemisphere assumes dominance in spatial tasks, music, and certain other areas. The surgical and experimental techniques Sperry developed from the late 1940s laid the groundwork for much more specialized explorations of the mental functions carried out in different areas of the brain.

**Sperry Corporation,** formerly (1955–79) SPERRY RAND CORPORATION, American corporation that merged with the Burroughs Corporation in 1986 to form Unisys Corporation (*q.v.*), a large computer manufacturer.

**spessartine,** manganese aluminum garnet that is a semiprecious gem when clear. Found combined with almandine, it ranges in colour from pale orange yellow, when nearly pure, to orange or deep red, when appreciable proportions of almandine are present. It is similar in colour to grossular, but, unlike that species, it is commonly transparent. Spessartine is rare and, therefore, seldom used in jewelry. It is ordinarily found in granite, acidic lavas, pegmatite veins, and thermal metamorphic rocks, as in central India, Madagascar, and Silver

Spessartine with galena from New South Wales, Australia

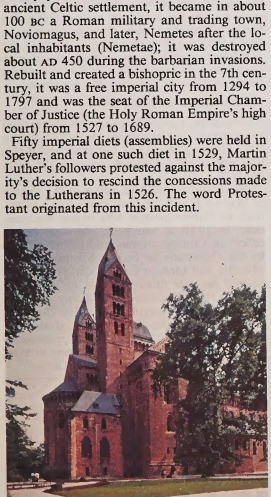
Cliff, Colo., U.S. For details of chemistry and occurrence, *see* garnet.

**Speusippus** (d. 339/338 BC), Greek philosopher who became head, or scholarch, of the Greek Academy after the death in 347 BC of Plato, who had founded it in 387. A nephew and disciple of Plato, Speusippus accompanied him on his journey to Sicily in 361. He was also a partisan in his uncle's relations with political rulers, including Dionysius II of Syracuse.

Little survives of Speusippus' philosophical writings except a long excerpt from his work *On Pythagorean Numbers,* a few other fragments, and reports by other writers. Like his contemporaries and early successors in the beginning years of the Academy, he stressed the importance of numbers and numerical combinations and deemphasized ideas. The excerpt from *Numbers,* for example, explains the "perfections," or special importance, of the number 10.

According to Aristotle's report, which is frequently criticized for representing Plato inaccurately, Speusippus adopted the Platonic doctrine asserting the timeless derivation of



all reality from two opposite principles, often called "the One" and "the indeterminate dyad," terms meant to explain the presence of both unity and multiplicity in the universe. His colleagues, however, viewed "the One" and "the dyad" as principles of good and evil, respectively, but Speusippus denied the attachment of moral qualities. Using numerical labels, he also organized reality into successively more spiritual spheres. Between the spheres of pure numbers, or "mathematicals," and of the body, or "the sensible," he inserted the sphere of the soul, considered immortal in all of its parts. Though Speusippus is strongly criticized by Aristotle, his *Homoia* ("Similitudes"), a comparative study of plant and animal physiology, has been favourably compared with Aristotle's own *History of Animals* and conceivably reflects Speusippus' view that no single thing can be defined unless all are, because classification and definition are closely related.

**Spey River,** river in Scotland, flowing for 107 miles (172 km) northeast across the Highlands into the North Sea. Rising at about 1,150 feet (350 m) in the Corrieyairack Forest, it derives tributaries also from the Monadhliath Mountains, the Grampians, and the Cairngorms. In its wider, lower valley of Strathspey, it swings between great swells of terraces and finally enters the sea by a shifting mouth across a shingle spit between Buckie and Lossiemouth.

It is esteemed for salmon, and its valley is known for its high-quality whisky distilleries.

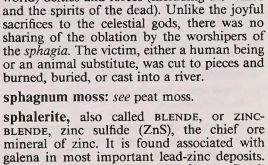
**Speyer,** also spelled SPEIER, English SPIRES, city, Rhineland-Palatinate *Land* (state), southwestern Germany. Speyer is a port on the left bank of the Rhine River at the mouth of the Speyer River, south of Ludwigshafen. An ancient Celtic settlement, it became in about 100 BC a Roman military and trading town, Noviomagus, and later, Nemetes after the local inhabitants (Nemetae); it was destroyed about AD 450 during the barbarian invasions. Rebuilt and created a bishopric in the 7th century, it was a free imperial city from 1294 to 1797 and was the seat of the Imperial Chamber of Justice (the Holy Roman Empire's high court) from 1527 to 1689.

Fifty imperial diets (assemblies) were held in Speyer, and at one such diet in 1529, Martin Luther's followers protested against the majority's decision to rescind the concessions made to the Lutherans in 1526. The word Protestant originated from this incident.

East towers of the cathedral at Speyer, Ger.
Hans Huber

Destroyed by French troops (1689) during the War of the Grand Alliance, Speyer was incorporated into the French Republic in 1797, passed to Bavaria in 1815, and was the capital of the Bavarian (Rhenish) Palatinate from 1816 to 1945.

Historic remains in the city include the Altpörtal ("old gate"), with a 13th-century gate tower, the subterranean Jews' Bath (1104), and the Baroque Trinity Church (1701–17). The city's Romanesque cathedral, founded in 1030 by the Holy Roman emperor Conrad II, contains a unique crypt and the tombs of eight German emperors and kings and three empresses. Gutted in 1689 and rebuilt several times, it was consecrated in 1961 after its most recent restoration.



The medieval city is surrounded by modern industrial and residential areas. The city's bridge across the Rhine, destroyed in 1945, has been rebuilt (1956). Speyer has electrotechnical industries, an oil refinery, metal and wood processing, and textile, chemical, and shoe plants. There are also stoneworks, glassworks, and brickworks, breweries, sparkling-wine (*sekt*) cellars, and aircraft factories. Pop. (1989 est.) 45,089.

**Spezia** (Italy): *see* La Spezia.

**sphagia,** in ancient Greek religion, a propitiatory sacrifice made to the chthonic (underworld) deities and forces (including the winds and the spirits of the dead). Unlike the joyful sacrifices to the celestial gods, there was no sharing of the oblation by the worshipers of the *sphagia.* The victim, either a human being or an animal substitute, was cut to pieces and burned, buried, or cast into a river.

**sphagnum moss:** *see* peat moss.

**sphalerite,** also called BLENDE, or ZINC-BLENDE, zinc sulfide (ZnS), the chief ore mineral of zinc. It is found associated with galena in most important lead-zinc deposits. The name sphalerite is derived from a Greek word meaning treacherous, in allusion to the

Sphalerite from Baxter Springs, Kan.
By courtesy of the Ted and Elsie Boente Collection; photograph, John H. Gerard—EB Inc.

ease with which the dark-coloured, opaque varieties are mistaken for galena (a valuable lead ore). The alternative names blende and zincblende, from the German word meaning "blind," similarly allude to the fact that sphalerite does not yield lead. For detailed physical properties, *see* sulfide mineral (table).

In the United States the most important sphalerite deposits are those in the Mississippi River valley region. There it is found associated with chalcopyrite, galena, marcasite, and dolomite in solution cavities and brecciated (fractured) zones in limestone and chert. Similar deposits occur in Poland, Belgium, and North Africa.

Sphalerite also is distributed worldwide as an ore mineral in hydrothermal vein deposits, in contact metamorphic zones, and in high-temperature replacement deposits.

**sphene,** also called TITANITE, titanium and calcium silicate mineral, $CaTiSiO_4(O,OH,F)$, that, in a crystallized or compact form, makes up a minor component of many igneous rocks and gneiss, schist, crystalline limestone, and pegmatite. Occurrences include the Tirol, Austria; Trentino, Italy; Norway; Switzerland; Madagascar; and the United States (New York). Sphene's relatively high dispersion causes it to be a brilliant gem of various colours; it is usually faceted. For detailed physical properties, *see* silicate mineral (table).

Sphene (titanite) from Brazil: a natural crystal (right) and a faceted stone
Joseph and Helen Guetterman collection; photograph, John H. Gerard—EB Inc.

**sphenisciform** (bird order): *see* penguin.

**Sphenoclea,** the only genus in the plant family Sphenocleaceae (order Campanulales). It contains one species (*S. zeylanica*), an herb 1.5 m (4 feet) tall with spikes of whitish flowers.

*Sphenoclea* is widespread in moist areas of warm temperate and tropical zones, including southern North America, but is native to the Old World tropics. It is sometimes united with the family Campanulaceae, from which it differs by having overlapping corolla (petal) lobes in bud and a capsule that opens by a lid. The five-lobed flowers are in tight masses, and the narrow leaves are oval in shape.

**Sphenophyllum,** a genus of plants representative of the extinct order Sphenophyllales, class (or subdivision) Sphenopsida. It appeared first in the Late Devonian Epoch (374 to 360 million years ago). The wood of its stems is unique in showing a central triangle of tracheids (water-conducting elements). There is great variation in leaf form and in apparent growth habit.

**Sphenophyta,** also called ARTICULATAE, a division of spore-bearing, vascular plants with three extinct orders and only one living genus, *Equisetum,* order Equisetales. The 15 living species of *Equisetum* are commonly known as horsetails or scouring rushes.

A brief treatment of sphenophytes follows. For full treatment, *see* MACROPAEDIA: Ferns and Other Lower Vascular Plants.

Sphenophytes, both fossil and living, are characterized by conelike structures called strobili located at the tips of the branches. The living members are all perennial herbaceous plants, with creeping underground rhizomes and hollow upright stems, both having a segmented structure. The leaves and branches grow in whorls from the nodes and continue to grow upward along the stem. The highly branched stems of some species give the appearance of a horse's tail.

Members go through distinct gametophytic (sexual) and sporophytic (asexual) stages in their life cycle. Horsetails reproduce by releasing spores that give rise to lobed, bisexual gametophytes. After fertilization, a sporophyte develops from each gametophyte. Two or more sporophytes may grow from one gametophyte before the latter decays, leaving only the rhizome and horsetail.

Some extinct sphenophytes developed as vines (order Sphenophyllales) or shrubs (Hyeniales) in the Devonian Period (408 to 360 million years ago). The Calamitaceae, a family of treelike forms up to 30 m (100 feet) in height and about one metre (three feet) in diameter, were abundant in the later, coal-producing Carboniferous Period. *See also* horsetail.

**sphere of influence:** *see* influence, sphere of.

**spherical helix** (navigation): *see* loxodrome.

**spheroidal joint** (anatomy): *see* ball-and-socket joint.

**sphincter muscle,** any of the ringlike muscles surrounding and able to contract or close a bodily passage or opening. One of the most important human sphincter muscles is the sphincter pylori, a thickening of the middle layer of stomach muscle around the pylorus (opening into the small intestine) that holds food in the stomach until it is thoroughly mixed with gastric juices. Other sphincters are involved in excretion of waste: the sphincter ani externus keeps the anal opening closed by its normal contraction, and the sphincter urethrae is the most important voluntary control of urination. There is also a sphincter in the eye, the sphincter pupillae, a ring of fibres in the iris that contracts the pupil in the presence of bright light. *Compare* dilator muscle.

**sphingolipid,** any member of a class of lipids (fat-soluble constituents of living cells) containing the organic aliphatic amino alcohol sphingosine or a substance structurally similar to it. Among the most simple sphingolipids are the ceramides (sphingosine plus a fatty acid), widely distributed in small amounts in plant and animal tissues. The other sphingolipids are derivatives of ceramides.

Glycolipids, a large group of sphingolipids, are so called because they contain one or more molecules of sugar (glucose or galactose). Glycolipids, a general property of which is immunological activity, include the cerebrosides, gangliosides, and ceramide oligosaccharides. Of limited distribution in nature, cerebrosides are most abundant in the myelin sheath surrounding nerves. Sulfate-containing cerebrosides, known as sulfatides, occur in the white matter of brain. Gangliosides, most abundant in nerve tissue (especially the gray matter of brain) and certain other tissues (*e.g.,* spleen) are similar to cerebrosides except that, in addition to the sugar component, they contain several other molecules of carbohydrate (*N*-acetylglucosamine or *N*-acetylgalactosamine and *N*-acetylneuramine). Ceramide oligosaccharides also contain several molecules of carbohydrate; an example is globoside from red blood cells.

Sphingomyelins, which are the only phosphorus-containing sphingolipids, are most abundant in nervous tissue, but they also occur in the blood.

Abnormal sphingolipid metabolism is a characteristic of a variety of diseases known collectively as sphingolipidosis, or sphingolipodystrophy. One of the more common forms of cerebral sphingolipidosis (or cerebral lipidosis), formerly called amaurotic familial idiocy, is Tay-Sachs disease (*q.v.*), a rare, inheritable disorder caused by the accumulation of sphingolipids in the brain. Another inheritable lipidosis is Niemann-Pick disease (*q.v.*), in which lecithin and sphingomyelin accumulate in various body tissues, such as the spleen and the liver.

**sphinx,** mythological creature with a lion's body and human head, an important image in Egyptian and Greek art and legend. The word *sphinx* was derived by Greek grammarians from the verb *sphingein* ("to bind," or "to squeeze"), but the etymology is not related to the legend and is dubious.

The winged sphinx of Boeotian Thebes, the most famous in legend, was said to have terrorized the people by demanding the answer to a riddle taught her by the Muses—what is it that has one voice and yet becomes four-footed and two-footed and three-footed?—and devouring a man each time the riddle was answered incorrectly. Eventually Oedipus gave the proper answer: man, who crawls on all fours in infancy, walks on two feet when grown, and leans on a staff in old age; the sphinx thereupon killed herself. From this tale apparently grew the legend that the sphinx was omniscient, and even today the wisdom of the sphinx is proverbial.

The Great Sphinx at Giza, 4th dynasty
E. Streichan—Shostal Assoc.

The earliest and most famous example in art is the colossal recumbent Sphinx at Giza, Egypt, dating from the reign of King Khafre (4th king of 4th dynasty, *c.* 2575–*c.* 2465 BC). This is known to be a portrait statue of the king, and the sphinx continued as a royal portrait type through most of Egyptian history. (Arabs, however, know the Sphinx of Giza by the name of Abū al-Hawl, or "Father of Terror.") Through Egyptian influence the sphinx became known in Asia, but its meaning there is uncertain. The sphinx did not occur in Mesopotamia until about 1500 BC, when it was clearly imported from the Levant. In appearance the Asian sphinx differed from its Egyptian model most noticeably in the addition of wings to the leonine body, a feature that continued through its subsequent history in Asia and the Greek world. Another innovation was the female sphinx, which first began to appear in the 15th century BC. On seals, ivories, and metalwork they were portrayed sitting on their haunches, often with one paw raised, and were frequently paired with a lion, a griffin (part eagle and part lion), or another sphinx.

In about 1600 BC the sphinx first appeared in the Greek world. Objects from Crete at the end of the middle Minoan period and from the shaft graves at Mycenae throughout the late Helladic age showed the sphinx characteristically winged. Although derived from the Asian sphinx, the Greek examples were not identical in appearance; they customarily wore a flat cap with a flamelike projection on top. Nothing in their context connected them with later legend, and their meaning remains unknown.

After 1200 BC the depiction of sphinxes disappeared from Greek art for about 400 years, though they continued in Asia in forms and poses similar to those of the Bronze Age. By the end of the 8th century, the sphinx reappeared in Greek art and was common down to the end of the 6th century. Often associated with Oriental motifs, it was clearly derived from an Eastern source, and from its appearance it could not have been a direct descendant of the Bronze Age Greek sphinx. The later Greek sphinx was almost always female and usually wore the long-tiered wig known on contemporary sculptures of the Daedalic style; the body became graceful, and the wings developed a beautiful curving form unknown in Asia. Sphinxes decorated vases, ivories, and metal works and in the late Archaic period occurred as ornaments on temples. Although their context is usually insufficient to enable their meaning to be judged, their appearance on temples suggests a protective function. By the 5th century clear illustrations of the encounter between Oedipus and the sphinx appeared on vase paintings, usually with the sphinx perched on a column (*e.g.,* the red-figured Nolan amphora in Boston). Other monuments of classical age showed Oedipus in armed combat with the sphinx and suggested an earlier stage of the legend in which the contest was physical instead of mental. Of such a stage the literature gave no hint, but battles of men and monsters were common in Asian art from prehistoric times down to the Achaemenidian Persians, and Greek art may have adopted from the Middle East a pictorial theme that Greek literature did not share.

**sphinx moth:** *see* hawk moth.

**Sphrantzes, George,** Sphrantzes also spelled SPHRANTES, or PHRANTZES (b. 1401—d. late 15th century), Byzantine historian and diplomat who wrote a chronicle covering the years 1413–77.

Sphrantzes rose to high office in the service of Manuel II and the later Palaeologan rulers, both in Constantinople and in the Peloponnese. In 1451 he was great logothete (chancellor) in Constantinople, and on its capture by the Ottomans he fled to Mistra (modern Mistrás) and then to Corfu (Kérkyra), where he and his wife finally entered monastic life (1468). His chronicle is probably what is known as the *Chronicon Minus.* The chronicle was written for the Corfiotes and deals with the last years of the Palaeologi in Constantinople and the Peloponnese, and it shows marked aversion to the Ottomans and the Latins.

*Consult the* INDEX *first*

**sphygmomanometer,** instrument for measuring blood pressure. It consists of an inflatable rubber cuff, which is wrapped around the upper arm and which is connected to an apparatus that records pressure, usually in terms of the height of a column of mercury or on a dial. A blood pressure reading consists of two numbers, which typically may be recorded as $x/y$. The $x$ is the systolic pressure, and $y$ is the diastolic. Systole refers to the contraction period of the heart, when it forces blood from the heart into the circulating system, and diastole refers to the resting period, when the heart expands and receives another supply of blood. At each heartbeat, blood pressure is raised to the systolic level, and, between beats,

it drops to the diastolic level. As the cuff is inflated with air, a stethoscope is placed against the skin at the crook of the arm. As the air is released, the first sound heard marks the systolic pressure; as the release continues, a dribbling noise is heard. This marks the diastolic pressure.

**Spica** (Latin: Head of Grain), also called ALPHA VIRGINIS, brightest star in the zodiacal constellation Virgo and one of the 15 brightest in the entire sky, having an apparent visual magnitude of 0.96. It is a bluish star; spectroscopic examination reveals Spica to be a binary, with two components of the first and third magnitudes, respectively. Spica lies about 270 light-years from the Earth.

**spice and herb,** dried parts of various plants cultivated for their aromatic, pungent, or otherwise desirable substances. Spices and herbs consist of rhizomes, bulbs, barks, flower buds, stigmas, fruits, seeds, and leaves. They are commonly spoken of loosely as spices, spice seeds, and herbs. Spices are the highly esteemed, fragrant or pungent plant products of tropical and subtropical regions, the dominant species of the trade including cardamom, cinnamon, cloves, ginger, and pepper. Spice seeds are the tiny aromatic fruits and oily seeds of herbaceous plants including anise, caraway, cumin, fennel, poppy, and sesame. Herbs are the fragrant leaves of such plants as marjoram, mint, rosemary, and thyme. Spices, spice seeds, and herbs are employed as adjuncts to impart flavour and aroma or piquancy to foods. In the small quantities used to prepare culinary dishes they have little or no nutritive value, but they stimulate the appetite, add zest to food, enhance the taste, and delight the gourmet.

The most notable uses of spices and herbs in very early times were in medicine, in the making of holy oils and unguents, and as aphrodisiacs. Priests employed them in worship, incantations, magical rites, and rituals.

Ancient herbals, including those of Cathay, Sumer, Assyria, Egypt, Greece, and Rome, testify to the use of spices and herbs in the treatment of disease. Hippocrates, Galen, and Pedanius Dioscorides, among others, employed them. In the 1st century of the Christian Era Pliny the Elder, in his *Natural History,* extols at length the efficacy and healing powers of spices and herbs in the treatment of just about every ailment known in his day. Such virtues, tempered and moderated, filtered down into the Middle Ages and early modern times.

It is not known when man first used spices and herbs in food. Sesame seems to have been known and employed as food, for making wine, and for its oil from time immemorial. Garlic and onions were employed as part of the diet in very early times. Certainly by the time of the ancient Greeks and Romans many spices and herbs had come into use to flavour food and beverages.

Herodotus (*c.* 484–*c.* 425 BC) describes the food of peoples he had met or heard about and relates that some ate fish and meats raw, sun-dried, salted, or pickled. Dried, salted, and pickled meats were staple items of food in many lands centuries after his time, and it requires no effort to imagine the welcome change the gratifying flavour of spices and herbs brought to foods, not only to opulent Greeks and Romans but to the affluent of society everywhere long after them.

Only the wealthy could indulge in the use of imported aromatic spices, and this was apparently true all over the world. Marco Polo observed, in 13th-century Cathay, that the higher class people ate meat that had been preserved in several of their spices, but the poor had to be content with meat steeped in garlic juice.

In Europe, in the course of time, knowledge slowly spread of the use of spices and herbs to aid in the preservation of food by retarding or preventing rancidity or other deterioration caused by oxidation and to flavour dishes. By medieval times large quantities of culinary herbs were in use. Eastern spices were beyond the purse of the greater number of people, but with the ascendency of the western European nations in the Oriental spice trade these conditions gradually changed, and the aromatic and pungent spices finally came into general use by rich and poor alike.

Modern uses of spices, spice seeds, and herbs are legion. There are few culinary recipes that do not include them, and their judicious use brings a delectable, distinctive aroma and taste to a host of dishes (see Table).

In the food industry they are employed in the preparation of numerous products including processed meats, fancy sausages, sauces and vinegars, prepared mustard, pickles, chut-

neys, preserves, mayonnaise, salad dressings, biscuits, cookies, cakes, confections, and beverages.

Their essential oils and oleoresins are the basis of a number of spice flavourings and seasonings employed in food manufacturing, where oil spices are preferred to the whole or ground spices for the preparation of certain products.

Spices and herbs—or their oils where processing temperature permits—go into the preparation of a number of liqueurs, including absinthe, anisette, benedictine, crème de menthe, curaçao, and kümmel.

Their essential oils are the flavouring components of a number of extracts, and they are employed in perfumery, cosmetics, toilet preparations, hair oils, toothpastes, toilet soaps, and tobacco.

In medicine the spices and herbs have not entirely lost their reputation. In India and other Asiatic countries their curative virtues enjoy respect. They still have a place, though limited, in Western medicine. Present-day herbalists extol the efficacies of some spices, spice seeds, and herbs in the treatment of certain ailments.

**spice trade,** the merchandising of spices and herbs, an enterprise of ancient origins and great cultural and economic significance.

Cinnamon, cassia, cardamom, ginger, and turmeric were known to Eastern peoples thousands of years ago, and they became important items of commerce early in the evolution of trade. Cinnamon and cassia found their way to the Middle East at least 2,000 years before the Christian era. From time immemorial, southern Arabia (Arabia Felix of antiquity) had been a trading centre for frankincense, myrrh, and other fragrant resins and gums. Arab traders artfully withheld the true source of these spices. To satisfy the curious, to protect their market, and to discourage competitors, they spread fantastic tales to the effect that cassia grew in shallow lakes guarded by winged animals and that cinnamon grew in deep glens infested with poisonous snakes. Pliny the Elder (AD 23–79) ridiculed these stories and boldly declared that "all these tales, however, have been evidently invented for the purpose of enhancing the price of these commodities."

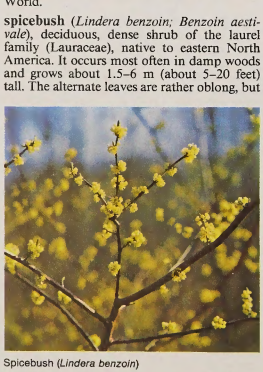
Whatever part the overland trade routes across Asia played, it was mainly by sea that the spice trade grew. Arabians were making direct sailings before the Christian era. In the Far East, the Chinese were moving through the waters of the Malay Archipelago and trading in the Spice Islands (the Moluccas or the East Indies generally). Ceylon was a central trading point.

In Egypt, Alexandria's revenues from port dues were already enormous when Ptolemy XI bequeathed the city to the Romans in 80 BC. Under the Romans, Alexandria became the greatest commercial centre of the world and the emporium for the aromatic and pungent spices of India that found their way to the markets of Greece and the Roman Empire.

Roman trade with India was extensive for more than three centuries and then began to decline. It had, no doubt, weakened but not broken the Arabian hold on the spice trade. The Roman trade revived in the 5th century but dwindled in the 6th, whereas the Arabian trade endured through the Middle Ages.

By the 10th century Venice was beginning to prosper in the trade of the Levant; by the early part of the 13th century it enjoyed a monopoly of the trade of the Middle East; and by the 15th century it was a formidable power in Europe. Part of Venice's great wealth came from trading in the spices of the East, which it obtained in Alexandria and sold to northern and western European buyer-distributors at exorbitant prices.

The Europeans knew the origin of the spices reaching Alexandria and, unable to break the hold of Venice, determined in the last third of the 15th century to build ships and venture abroad in search of a route to the spice-producing countries. So began the famed voyages of discovery. The Portuguese were first in the race and the first to bring spices from India to Europe by way of the Cape of Good Hope in 1501. In 1492 Christopher Columbus sailed under the flag of Spain, and in 1497 John Cabot sailed for England; but both failed to find the fabulous spice lands.



Ferdinand Magellan took up the quest for Spain in 1519. Of the five vessels under his command, only one, the *Victoria,* returned to Spain, but triumphantly, laden with cloves.

In 1577 Sir Francis Drake began his adventurous voyage around the world by way of the Strait of Magellan and the Spice Islands and brought the *Golden Hind,* heavily laden with the cloves of Ternate and other treasures, into Plymouth harbour in 1580.

For Holland, a fleet under the command of Cornelis de Houtman sailed for the Spice Islands in 1595; another, commanded by Jacob van Neck, put to sea in 1598; and their ships returned home with rich cargoes of cloves, mace, nutmegs, and pepper. In 1602 the Dutch East India Company came into existence by authority of the Estates-General of the Netherlands. In 1664 the French East India Company was organized by state authorization under Louis XIV. Other European nations granted charters to East India companies with varying success. There followed struggles and conquests to gain advantage and monopolistic control of the trade. For more than 100 years Portugal was the dominant power, eventually yielding to English and Dutch enterprise and conquest; by the 19th century British interests were firmly rooted in India and Ceylon, and the Dutch were in control over the greater part of the East Indies.

For mariners it was an age of adventure, risk, hardship, disease, and death; for nations it was an age of struggle, defeat, or conquest and an age for acquiring new, near-primitive lands and colonizing and gaining dominion over civilized foreign territories. For European commercial interests it was an age of rewarding success, which broke the monopoly of Venice, overcame the Muslim domination of the spice trade, created a voluminous trade in a great variety of merchandise between Europe and the Far East, and opened up a New World.

**spicebush** (*Lindera benzoin; Benzoin aestivale*), deciduous, dense shrub of the laurel family (Lauraceae), native to eastern North America. It occurs most often in damp woods and grows about 1.5–6 m (about 5–20 feet) tall. The alternate leaves are rather oblong, but wedge-shaped near the base, and 8–13 cm (3–5 inches) long. The small, yellow, unisexual flowers are crowded in small, nearly stalkless clusters. The seed of the fleshy red fruit has a stony covering. Young twigs, leaves, and fruit are sometimes used to make tea.

Spicebush (*Lindera benzoin*)
Walter Chandoha

**spicule,** in astronomy, rising jet of comparatively cool, dense gas extending through the chromosphere, or lower atmosphere, of the Sun. The corona, or outer atmosphere, is above the spicules and seems to be formed from them.

About 100,000 spicules are active in the Sun at any given time. Each rises from the lower chromosphere at about 20 km (12 miles) per second to a height of several thousand kilometres and then within a few minutes disperses or collapses. Spicules appear to be independent of sunspots and other local events in the underlying photosphere. *See* chromosphere.

**spider,** order name ARANEIDA, or ARANEAE, a member of a group of arachnids characterized by having six pairs of appendages, including four pairs of legs and two main body parts (the prosoma, or cephalothorax, and the opisthosoma, or abdomen) attached by a narrow stalk.

A brief treatment of spiders follows. For full treatment, *see* MACROPAEDIA: Arachnids.

Spiders are abundant worldwide except in Antarctica and usually occur at elevations

Wolf spider showing eye arrangement, chelicerae, and fang at end of each chelicera
Anthony Bannister—The Natural History Photographic Agency

from sea level to 5,000 m (16,000 feet). Some 34,000 species of spiders have been described. Most are terrestrial animals. They range in body length from less than 1 mm (0.04 inch) to about 90 mm (3.5 inches). Spiders are predatory and prey mostly on insects.

All spiders have venom glands, but the venoms of only a few (*e.g.,* black widow, brown spider; *qq.v.*) are harmful to humans. There are eight or fewer eyes, always simple rather than compound (*i.e.,* multifaceted). The number and arrangement of these eyes are major considerations in the classification of species. A pair of chelicerae—two-segmented, pincer-like appendages—occur at the front of the prosoma and usually point downward. The end segment of each chelicera is fanglike and is connected to a venom gland. The legs have seven segments. At the tip of the opisthosoma are several fingerlike structures, known as spinnerets, which produce viscous droplets of silk from the silk glands, forming threads.

Spiders change little during growth, except in size. They usually molt, or shed their cuticles (skins), seven or eight times before maturing. If a leg is broken off during development, it is usually replaced.

Spiders exhibit characteristic behaviours during and after courtship and mating, primarily

because, unless the male clearly identifies himself, the female of certain species, commonly larger than the male, often kills and eats the male after mating. The eggs are usually laid in a silken sac that, in some cases, is carried by the female until the eggs hatch; in other cases the female deposits the egg sac either in or near the web, in a crevice, among leaves, or on twigs or bark. The eggs usually hatch soon after being laid.

Insects, the main diet of most spiders, usually are captured in silken webs. In the webs of some species the strands are covered with droplets of a sticky substance that prevents or delays escape. The jumping spider and the wolf spider (*qq.v.*) chase and pounce upon their prey. The crab spider (*q.v.*) awaits its prey in flowers.

The house spider (*see* comb-footed spider) extends its silken strands in almost any direction. The sheet-web weaver (*q.v.*) usually makes a sheetlike, horizontal web. The funnel-web spider (*q.v.*) builds its web in the shape of a funnel. The trap-door spider (*q.v.*) and the wolf spider make tunnels. Others make nests of leaves.

**spider beetle,** any member of about 500 species of insects sometimes considered a part of the family Anobiidae (order Coleoptera) and sometimes placed in their own family, Ptinidae. These spider-shaped beetles have a globular body, long thin legs, and no wings. They range in colour from reddish brown to black and in size from 1 to 5 mm (0.04 to 0.2 inch).

Spider beetles, which occur throughout the world, live in plant or animal remains, stored food products, dry wood, and museum specimens. The white-marked spider beetle (*Ptinus fur*) and the shiny American spider beetle (*Mezium americanum*) are household pests in North America.

**spider crab,** any species of the decapod family Majidae (or Maiidae; class Crustacea). Spider crabs, which have thick, rather rounded bodies and long, spindly legs, are generally slow-moving and sluggish. Most are scavengers, especially of dead flesh.

Spider crab (*Libinia*)
Walter Dawn

Majids, a widely distributed marine group, are fished commercially in temperate waters, such as in the North Pacific. Some are quite small; for example, the long-beaked spider crab (*Macropodia rostrata*) of European coastal waters has a body about 1 cm (less than 0.5 inch) in diameter. The largest spider crab, and perhaps the largest known arthropod, is the giant crab (*q.v.*) of the Pacific waters near Japan. The outstretched claws of this crab (*Macrocheira kaempferi*) measure more than 4 m (13 feet) from tip to tip.

The head of the spider crab is rather beak-shaped; the body surface is generally covered with hairs, spines, and tubercles (knobby projections) that are frequently matted with algae, sponges, and other organisms. The crabs fasten a good deal of this material to themselves by means of a mucuslike secretion from the mouth.

The kelp crab (*Pugettia producta*), a spider crab found among seaweed on the Pacific coast from Canada to Mexico, is about 1.25 cm (0.5 inch) wide and 2.5 cm (1 inch) long. It is green and red on top and green underneath.

*Parthenope investigatoris,* a spider crab of the Indian Ocean, is camouflaged to resemble the coral on which it lives.

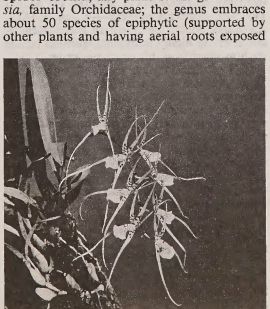
Spider crabs of the genera *Libinia, Hyas, Sternorhynchus, Pitho,* and *Lambrus* are common on the Atlantic coast of North America. Pacific coast spider crabs include the genera *Loxorhynchus, Pugettia,* and *Epialtus.*

*Pisa,* 1.3 to 6 cm (0.5 to 2.4 inches) long, is found in the Mediterranean Sea and in the eastern Atlantic Ocean. *Maja squinado,* which attains lengths of 18 cm (7 inches), is found in the Mediterranean Sea and along the southwest coast of Europe.

**spider hunter,** any of several sunbird species. *See* sunbird.

**spider-hunting spider:** *see* pirate spider.

**spider mite:** *see* red spider.



**spider monkey** (*Ateles*), any of several large, extremely agile monkeys, belonging to the family Cebidae, found in forests from Mexico to Brazil. Spider monkeys, of which there are four species, are lanky, somewhat potbellied animals 35–66 cm (14–26 inches) long; they have long limbs, thumbless hands, and a long (60–92 cm [24–36 inches]), heavily furred, prehensile tail that acts as an extra limb. Their hair, of variable length and fineness, ranges in the several species from gray to reddish, dark brown, or black.

Spider monkeys live in bands, roaming the highest branches during the day. They do not normally descend to the ground. Sometimes they move rapidly through the trees, swinging by their hands and tails; at times they leap or drop spread-eagled from one tree to another. They feed on fruit, nuts, and some flowers and buds. A single young, born in seclusion after a gestation period of about 139 days, is dependent on its mother for almost a year.

Spider monkeys shot for food sometimes remove the arrow and attempt to stem the bleeding. They are susceptible to malaria and are used in laboratory studies of the disease. Although they may be gentle pets, adult spider monkeys are likely to throw tantrums and may prove dangerous.

The woolly spider monkey (*q.v.*) is of the genus *Brachyteles.*

**spider orchid,** any plant of the genus *Brassia,* family Orchidaceae; the genus embraces about 50 species of epiphytic (supported by other plants and having aerial roots exposed

Spider orchid (*Brassia verrucosa*)
G.C.K. Dunsterville

to the humid atmosphere) orchids native to southeastern North America, the West Indies, and parts of Central and South America. Each stem of a spider orchid has one to three leaves. The flower spike extends laterally from the plant in most species.

Spider orchid flowers are yellow, greenish yellow, or orange-yellow, often with spots or markings. The long, thin sepals and petals give each flower a spidery appearance.

**spider plant,** African plant of the genus *Chlorophytum* (*q.v.*) of the lily family.

**spider wasp,** any insect of the family Pompilidae, also known as Psammocharidae (order Hymenoptera). They are distributed throughout most of the world. About 40 species occur in Great Britain, and more than 100 species are found in North America. Although they feed on spiders helpful to humans, the wasps are not regarded as economically destructive.

The spider wasps include the largest members of the order; some exceed 5 cm (2 inches) in length. Most are 1.0 to 2.5 cm (0.4 to 1 inch) long. The slender body is usually dark; in many cases the wings are smoky or yellow-

Spider wasp (*Cryptocheilus*)
Jacques Six

ish. Most can run rapidly on legs that are long and spiny. They inflict a very painful sting.

There is apparently much variation in the method of stinging prey. The method of *Cryptocheilus* is a refined process during which the wasp first stings the spider between its poison fangs and then stings it again near the junction of the cephalothorax and abdomen. This produces complete immobility. *Pompilus,* on the other hand, has a less refined sting. It sometimes kills the spider; in other cases, the spider may survive for a few weeks.

Spiders captured and paralyzed by the sting of the spider wasp are fed to the young. (Certain wasps other than pompilids also capture spiders for this purpose.) Adult spider wasps are commonly found on flowers and either on the ground or hovering above it in search of prey. The nest, or cell, is made in soil, on rotten wood, or among rocks. Species of the North American genus *Pseudagenia* construct cells of mud under bark or among stones. Some species construct the nest before capturing the spider; others capture the spider first, then set it aside until the nest is completed. A single spider and a single egg are placed in the nest. The spider, alive but paralyzed, is eaten by the wasp larva.

*Anoplius fuscus,* a European species, captures spiders of five different families. Larvae of the European genus *Homonotus* live on the body of a spider that remains active in its normal habitat until it is gradually killed by the feeding larva.

Methods of carrying the paralyzed spider to the nest vary. *Pompilus plumbeus,* found in North America and Europe, carries its prey before it. Others carry the prey sideways or drag it behind. *Anoplius depressipes,* which captures swamp spiders (*Dolomedes*), drags its prey across the water. Some spider wasps fly with their prey.

Among the best-known spider wasps are the tarantula hawks (*Pepsis*), steel-blue-bodied insects with orange wings; some of the largest members of the family belong to this genus. Especially common in the southwestern United States, they provision their nests with trapdoor spiders and tarantulas and often attack spiders many times their own size.

**spiderflower,** any of about 200 species of plants constituting the genus *Cleome* of the caper family (Capparaceae), mostly tropical annual herbs with a pungent odour.

The popular cultivated spiderflower (*C. hasslerana*), with dark pink flowers fading almost to white by noon, is native to sandy thickets

Spiderflower (*Cleome hasslerana*)
G.R. Roberts

and hillsides of the tropical Western Hemisphere. It has five to seven leaflets and a finely spined stem. It is frequently confused with *C. spinosa,* which has dirty-white flowers. Rocky Mountain bee plant, or stinking clover (*C. serrulata*), is a summer-flowering annual of North American damp prairies and mountains. About 50 to 150 cm (20 to 60 inches) tall, it has three-parted leaves and clusters of spidery pink flowers with long stamens.

**spiderwort,** any member of the genus *Tradescantia* (family Commelinaceae), which includes 20 or more erect to trailing, weak-stemmed herbs native to North and South America. Several species are grown as indoor plants in baskets, especially the wandering Jews (*T. albiflora* and *T. fluminensis*); among other slight differences, the former is green-leaved and the latter has purplish undersides. White velvet, or white-gossamer (*T. sillamontana*), has leaves and stems covered with a whitish fuzz. Flowering inch plant (*T. blossfeldiana*), with leaves green and smooth above, purplish and fuzzy beneath, has purplish hairy blossoms. The chain plant (*T. navicularis*) has fleshy, narrow, lengthwise-folded leaves about 2.5 cm (1 inch) long. *T.* × *andersoniana* comprises a complex series of garden hybrids. Also grown in the garden is the common spiderwort, or widow's tears (*T. virginiana*), an upright juicy-stemmed plant with white to purple flowers. The spiderworts are of extremely easy culture, taking root readily from cuttings, and thus are very popular indoor plants. Certain species resemble but should not be confused with *Zebrina* species.

**Spiegel, Der** (German: "The Mirror"), weekly newsmagazine, preeminent in Germany and one of the most widely circulated in Europe, published in Hamburg since 1947. Founded in 1946 as *Diese Woche* ("This Week"), the magazine is renowned for its aggressive, vigorous, and well-written exposés of government malpractice and scandals and for its photography. Its format resembles that of its American counterparts *Time* and *Newsweek,* although it is usually more than twice as thick. *Der Spiegel* is noted for its aggressive pursuit of news without regard to the peace of mind of the German government. A continuing exposé in 1962 revealed the financial problems of the then West German armed forces. The articles involved Defense Minister Franz Josef Strauss and implied that the armed forces would be unable to withstand a Communist attack, although huge sums of money were being spent on defense. The editor, Rudolf Augstein, was arrested, along with four others on the magazine's staff, and charged with the publication of secret information. He was detained for 104 days. The magazine's hard-hitting news approach won it one of Europe's biggest circulations and an abundance of advertisers. It is widely respected both for its coverage of news events and news analysis and for its concise writing, and it is generally regarded as one of the best news weeklies in Europe.

**Spiegel, Sam,** in full SAMUEL SPIEGEL (b. Nov. 11, 1903, Jaroslau, Austria [now Jaroslaw, Pol.]—d. Dec. 31, 1985, Saint-Martin, Lesser Antilles), Austrian-born American motion-picture producer.

Spiegel studied at the University of Vienna and worked as a Young Pioneer in Palestine in the early 1920s. In 1927 he went to Hollywood to work as a story translator, and in 1930 he was sent by Universal Pictures to head that studio's European headquarters in Berlin. He fled Germany after the Nazis came to power in 1933 and lived in Vienna before settling in Hollywood in 1939. He soon became a producer, and among his earlier projects were *Tales of Manhattan* (1942) and Orson Welles's *The Stranger* (1946).

Spiegel's most important productions were done in the 1950s and included *The African Queen* (1951), *On the Waterfront* (1954), *The Bridge on the River Kwai* (1957), and *Suddenly Last Summer* (1959). He continued producing in the 1960s and '70s with *Lawrence of Arabia* (1962), *Nicholas and Alexandra* (1971), and *The Last Tycoon* (1976). The last film he produced was a motion-picture version of Harold Pinter's play *Betrayal* (1983). Most of Spiegel's films were expensive, large-scale productions that utilized some of the leading actors, screenwriters, and directors of the day. The classic films *The African Queen, The Bridge on the River Kwai,* and *Lawrence of Arabia* were largely shot on location in jungles and deserts, often under difficult conditions.

**Spieghel, Henric Laurenszoon,** also spelled HENDRIK LAURENSZOON SPIEGEL (b. March 11, 1549, Amsterdam, Neth.—d. Jan. 4, 1612, Alkmaar), poet of the northern Dutch Renaissance whose highly individual spiritual beliefs set him apart from his contemporaries.

In Spieghel's greatest work, *Hertspiegel* (1614; "Heart-Mirror"), a long, often allegorical poem written in hexametres, he set out his philosophical vision in simple, direct style. His strong religious faith is based on an amalgamation of Christian and Platonic ideas, together with an underlying pantheism that sees God manifested in all things. Spieghel was also active in the movement toward the purification and wider use of the Dutch language, principles that he advocated in his *Twe-spraack van de Nederduitsche Letterkunst* (1584; "Dialogue on Dutch Literature").

**Spielberg, Steven** (b. Dec. 18, 1947, Cincinnati, Ohio, U.S.), American motion-picture director and producer whose highly entertaining and escapist films enjoyed unprecedented popularity.

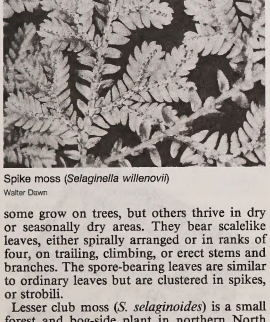
An amateur filmmaker even before he entered high school, Spielberg attended California State College, Long Beach, and attracted the attention of Universal Pictures with his short films. For Universal he directed episodes of television series and television movies, including the thriller *Duel* (1971), whose success enabled him to begin making theatrically released motion pictures, beginning with *The Sugarland Express* (1974).

His next picture, the thriller *Jaws* (1975), became one of the highest-grossing films and established many of the touchstones of Spielberg's work. In the typical Spielberg film, an ordinary but sympathetic main character is enlightened through a confrontation with some extraordinary being or force that gradually reveals itself as the narrative unfolds. Among these antagonists are a great white shark in *Jaws*, extraterrestrials in *Close Encounters of the Third Kind* (1977), a whimsical alien in *E.T.—the Extraterrestrial* (1982), and dinosaurs in *Jurassic Park* (1993). Spielberg's films, such as *Raiders of the Lost Ark* (1981) and its sequels, used rich colour cinematography, brisk editing, memorable musical soundtracks, and inventive special effects to create a cinematic experience that was typically light yet highly suspenseful. The aggressive commercialism and optimism of Spielberg's films became the prevailing style in Hollywood in the late 20th century. His pervasive influence was recognized in 1987 by the Academy of Motion Picture Arts and Sciences, when it honoured him with the Irving G. Thalberg Award.

Though Spielberg enjoyed tremendous popular success with these films, his proclivity for broad storytelling hampered his attempts at more complex filmmaking. While generally well received, *The Color Purple* (1985) and *Empire of the Sun* (1987), in the view of many critics, lacked emotional depth or insight. *Schindler's List* (1993), the true story of a group of Polish Jews who avoided Nazi extermination camps with the aid of a German industrialist, quieted many of Spielberg's critics. Shot in black and white and with unflinching detail, it won Academy Awards for best picture and best director. Five years later Spielberg again received the best director honour, for another World War II film, *Saving Private Ryan* (1998). *AI: Artificial Intelligence* (2001), a science-fiction film project that Spielberg inherited from director Stanley Kubrick, is perhaps his most emotionally complex film, though it left critics and audiences divided. In 2002 he returned to his signature themes and style with *Minority Report* and *Catch Me if You Can.*

Spielberg was also the executive producer of many television series, documentaries, and films by other directors. In 1994 he joined with Jeffrey Katzenberg and David Geffen to form DreamWorks SKG, an entertainment company created to produce movies, animation, recordings, and television programs.

**Spielhagen, Friedrich von** (b. Feb. 24, 1829, Magdeburg, Prussian Saxony [Germany]—d. Feb. 25, 1911, Berlin, Ger.), popular writer whose works are considered representative of the social novel in Germany.



After studying at the universities of Berlin, Bonn, and Greifswald, Spielhagen was a teacher in a gymnasium (high school) at Leipzig, but after 1854 he became entirely involved with literature. From 1878 to 1884 he was editor of *Westermanns Monatshefte;* he was also an actor and an active partisan in democratic movements. After two earlier novels, his *Problematische Naturen,* 4 vol. (1861; *Problematic Characters*), was a remarkable success and considered one of the best works of its time. The hero is pulled in opposite directions by the democratic ideals of society and state and by the distractions of social life. This was followed by *Durch Nacht zum Licht,* 4 vol. (1862; *Through Night to Light*), *Hammer und Amboss,* 5 vol. (1869; *Hammer and Anvil*), and *Sturmflut,* 3 vol. (1877; *The*

*Breaking of the Storm*). The last is a powerful romance, using a tempest that flooded the Baltic coast in 1872 as a symbol for the economic storm that burst on Berlin that same year.

Although the years between 1860 and 1876 are considered his most productive, Spielhagen later produced many other novels. His dramas include *Liebe für Liebe* (1875) and *Hans und Grete* (1868).

**Spielmann** (German: "player," or "entertainer"), plural SPIELLEUTE, wandering entertainer of the European Middle Ages who performed at fairs, markets, and castles. The *Spielleute* included singers, mimics, and sword-swallowers. Also among them were the storytellers credited with keeping alive the native Germanic vernacular legends at a time when nearly all written literature was religious and when the court poets, under foreign influence, were concerned chiefly with love lyrics and Arthurian legends. A number of carefree adventure tales, such as the 12th-century *König Rother,* are evidence of a highly developed underground literature characterized by its humour, amoral tone, and powers of social observation and presumably propagated by the *Spielleute.*

**spike moss,** any member of the plant genus *Selaginella* of the order Selaginellales with more than 700 species of mossy, in some cases fernlike, perennials. They are widely distributed in all parts of the world, particularly in the tropics. Many are forest plants;

Spike moss (*Selaginella willenovii*)
Walter Dawn

some grow on trees, but others thrive in dry or seasonally dry areas. They bear scalelike leaves, either spirally arranged or in ranks of four, on trailing, climbing, or erect stems and branches. The spore-bearing leaves are similar to ordinary leaves but are clustered in spikes, or strobili.

Lesser club moss (*S. selaginoides*) is a small forest and bog-side plant in northern North America and Eurasia. Its branches trail along the ground, but the upright yellow-green strobili rise up to 8 cm (about 3 inches). The similar rock selaginella (*S. rupestris*) of North America has smaller leaves, and its branching stems grow on rocks or in sand. Resurrection plant, or resurrection fern (*S. lepidophylla*), is so named because as an apparently lifeless ball it unrolls when the wet season begins. Spreading club moss (*S. krausiana*), from southern Africa, roots readily along its trailing stems of bright green branches. It sometimes is grown as a houseplant, as are *S. emmeliana* from tropical America, *S. martensii* from Mexico, *S. uncinata* from southern China, and *S. caulescens* from East Asia.

**spikenard,** also called AMERICAN SPIKENARD, PETTY MORREL, or LIFE-OF-MAN (*Aralia racemosa*), North American member of the ginseng family (Araliaceae) of the order Cornales, characterized by large spicy-smelling roots. It grows 3.5 m (11 feet) tall and has leaves divided into three heart-shaped parts. The flowers are grouped into numerous clusters at the end of the central stem.

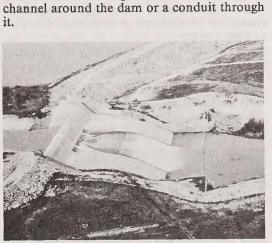
The roots of *A. nudicaulis,* a close relative of spikenard, are used as a substitute for sarsaparilla flavouring. *Smilacina racemosa,* one of the false Solomon's seals in the family Liliaceae (order Liliales), is sometimes called wild spikenard.

**spilite,** fine-grained or dense, extrusive igneous (volcanic) rock that is usually free of visible crystals and is commonly greenish or grayish green in colour. Spilites are of basaltic character but contain the feldspar albite in place of the normal labradorite. The dark mineral is a pale-brown augite; spilites are, however, usually decomposed, and augite is represented by chlorite and calcite.

Spilites are often blistered or pocked and show a wonderfully preserved pillow structure, a feature in most cases indicative of lavas of submarine origin. The individual pillows are filled with concentric zones of vesicles containing chlorite and calcite. Some spilites showing pillow structure are not strictly lavas but are shallow intrusions into unconsolidated submarine ooze. Excellent examples of such intrusive spilites are those found at Nundle, N.S.W., Australia.

The term spilite was first used for altered basic lavas free from phenocrysts and possessing well-marked vesicular textures, but now it denotes a large suite of igneous rocks genetically associated with the spilites, with a status comparable to that of the alkaline and calc-alkaline series. The composition of the rocks in this suite varies widely, but all possess a high percentage of soda and are usually extensively altered. The rocks included are albite-dolerites, minverites, picrites, keratophyres, soda-felsites, and soda-granites.

The spilitic series is peculiar to districts that have undergone a long, continued, and gentle subsidence with few or slight upward movements and no important faulting. These lavas are poured out on the margins of geosynclines, within which black shales, limestones, and radiolarian cherts accumulate. Because geosynclines are the centres of subsequent fold movements, many ancient spilites have become extensively folded and metamorphosed, with production of new minerals, including albite of metamorphic origin. Spilitic eruptions have occurred repeatedly over a wide area and on a large scale.



**Spillane, Mickey,** pseudonym of FRANK MORRISON SPILLANE (b. March 9, 1918, Brooklyn, N.Y., U.S.), American writer of detective fiction whose popular work is characterized by violence and sexual licentiousness.

Spillane began his career by writing for pulp magazines and comic books in order to pay for his schooling. His first novel—*I, The Jury* (1947)—introduced detective Mike Hammer, who appeared in other works, such as *My Gun Is Quick* (1950) and *The Big Kill* (1951). In the early 1950s Spillane retired from writing. Ten years later he resumed his career with *The Deep* (1961). Spillane wrote the script and played the role of Hammer for the 1963 film version of *The Girl Hunters* (1962). *Day of the Guns* (1964) initiated another series, with the international agent Tiger Mann. Among Spillane's later books were *The Last Cop Out* (1973) and *The Day the Sea Rolled Back* (1981).

Spillane, who claimed to write solely for monetary gain, flouted literary taste with recurring elements of sadism that disturbed some readers, but the captivating vigour of his narrative and of his central characters brought him popular success.

**spillikins** (game): *see* jackstraws.

**spillway,** passage for surplus water over or around a dam when the reservoir itself is full. Spillways are particularly important safety features for earth dams, protecting the dam and its foundation from erosion. They may lead over the dam or a portion of it or along a channel around the dam or a conduit through it.

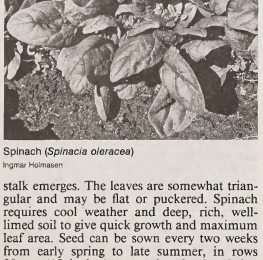
Spillway of the Kirwin Dam of the Missouri River Basin Project, Kansas
Ewing Galloway

The erosive energy of the water at the foot of the spillway is dissipated by a stilling basin or by a sloping apron tempering the fall and ending in a curved bucket that directs the flow away from the foundation.

**spin,** in physics, the amount of angular momentum associated with a subatomic particle or nucleus and measured in multiples of a unit called the Dirac $h$, or $h$-bar ($\hbar$), equal to the Planck constant divided by $2\pi$. For electrons, neutrons, and protons, the multiple is .5; pions have zero spin. The spin (more correctly, the total angular momentum) of nuclei more complex than the proton is the vector sum of the orbital angular momenta and intrinsic spins of the constituent nucleons. For nuclei of even mass number, the multiple is an integer; for those of odd mass number, the multiple is a half-integer. All nuclei with even numbers of neutrons and protons have spin zero in their ground states.

**spin-statistics theorem,** in quantum mechanics, fundamental mathematical proof that subatomic particles having integral values of spin (such as photons and helium-4 atoms) must be described by Bose-Einstein statistics (*q.v.*) and that subatomic particles having half-integral values of spin (such as electrons and protons) must be described by Fermi-Dirac statistics (*q.v.*).

**Spina,** ancient Etruscan port on the Adriatic coast of Italy, now about 6 miles (10 km) inland. Spina was founded at the mouth of the Po River toward the end of the 6th century BC and was one of two main ports of entry for the rich Greek commerce with northern Etruria. Soon after 400 BC Spina was sacked



Greek krater from Spina, 5th century BC; in the National Archaeological Museum, Ferrara, Italy
Hirmer Fotoarchiv, München

by the Gauls, and with the collapse of its market and the silting of its port, it rapidly lapsed into obscurity.

Excavations since 1922 in the cemeteries of Valle Trebba and of Valle Pega have yielded many fine bronzes and an unrivaled collection of Greek pottery.

**spina bifida,** congenital cleft of the vertebral column, a form of neural tube defect (*q.v.*).

**spinach** (species *Spinacia oleracea*), hardy, leafy annual of the goosefoot family (Chenopodiaceae), used as a vegetable. The edible leaves are arranged in a rosette, from which a seed-

Spinach (*Spinacia oleracea*)
Ingmar Holmasen

stalk emerges. The leaves are somewhat triangular and may be flat or puckered. Spinach requires cool weather and deep, rich, well-limed soil to give quick growth and maximum leaf area. Seed can be sown every two weeks from early spring to late summer, in rows 30 cm (12 inches) apart, the plantlets being thinned in the row. The last sowings produce young plants that yield a crop in the autumn and stand over the winter, providing leaves in early spring or even through the winter if the weather is not too severe.

Widely grown in northern Europe and the United States, spinach is marketed fresh, canned, and frozen. It received considerable impetus as a crop in the 1920s when attention was first called to its high content of iron and vitamins A and C. Spinach is served as a salad green and as a cooked vegetable. Spinach can be made into various soups, soufflés, and mousses and is used as an ingredient in various prepared dishes.

**spinal column** (anatomy): *see* vertebral column.

**spinal cord,** major nerve tract of vertebrates, extending from the base of the brain through the canal of the spinal column. It is composed of nerve fibres that mediate reflex actions and that transmit impulses to and from the brain.

A brief treatment of the spinal cord follows. For full treatment, *see* MACROPAEDIA: Nerves and Nervous Systems.

Like the brain, the spinal cord is covered by three connective-tissue envelopes called the meninges. The space between the outer and middle envelopes is filled with cerebrospinal fluid, a clear, colourless, noncellular fluid that cushions the spinal cord against jarring shock.

In cross-section the spinal cord appears as a white oval with a gray, butterfly-shaped area in the centre. The white matter consists of myelinated (sheathed) fibres, or axons (*see* axon); the gray matter contains cell bodies, unsheathed motor-neuron fibres, and interneurons connecting either the two sides of the cord or the dorsal and ventral ganglia (*see* ganglion). In humans, 31 paired spinal nerves originate in the spinal cord: 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal. Information about internal and external conditions travels up the ascending tracts of neurons. This information is sorted by the brain, and the proper responses are induced by nerve impulses traveling down the descending tracts to stimulate motor neurons or to initiate glandular secretion.

**spinal curvature,** any of a group of spinal deviations, including scoliosis, lordosis, and kyphosis.

Scoliosis is a lateral, or sideways, deviation of the spine usually including two curves—the original abnormal curve and a later developing compensatory curve. Possible causes of scoliosis include asymmetrical development of back, chest, or abdominal musculature, as may occur in poliomyelitis or cerebral palsy; significant difference in the lengths of the legs; or malformation or disease of the spinal column and associated structures, as in spondylitis, spina bifida, fracture, dislocation, hemivertebrae, or rickets. Treatment, which depends on the cause, usually includes orthopedic surgery, the use of traction, plaster casts, and exercises. Lordosis is an increased curvature in the lumbar (middle-to-lower) region of the vertebral column, and it may be associated with diseases of the hip joint, cirrhosis of the liver, or obesity. Kyphosis is an increased curvature of the thoracic (upper) vertebral column, and it may be caused by rickets or tuberculous spondylitis (Pott's disease).

**spinal nerve,** in vertebrates, any one of many paired nerves that leave the spinal cord at regular intervals. Each pair connects the spinal cord with a specific region of the body. Near the spinal cord each spinal nerve branches into two roots. One, with fibres of sensory nerve cells (neurons), enters the spinal cord via the dorsal root; its cell bodies lie in a spinal ganglion that is outside the spinal cord. The other, with fibres of motor neurons, leaves the spinal cord via the ventral root; its cell bodies lie in specific areas of the spinal cord itself.

**spinal tap** (medicine): *see* lumbar puncture.

**spinalis muscle,** any of the deep muscles of the back near the vertebral column that, as part of the erector spinae (sacrospinalis) muscle group, assist in extension (*e.g.*, bending backward), lateral flexion (bending to the side), and rotation of the spine. The spinalis thoracis is the major spinalis muscle, arising from the bones of the lower thoracic and upper lumbar vertebral spine and inserted into the bones of the upper thoracic vertebral spine. It may be prolonged into the neck (spinalis cervicis) and head (spinalis capitis).

**spine** (anatomy): *see* vertebral column.

**spinel,** mineral composed of magnesium aluminum oxide ($MgAl_2O_4$) or any member of a group of rock-forming minerals, all of which are metal oxides with the general composition $AB_2O_4$, in which $A$ may be magnesium, iron, zinc, manganese, or nickel; $B$ may be aluminum, chromium, or iron; and O is oxygen. The spinel group is divided into three immiscible series; the spinel (aluminum-spinel) series, in which $B$ is aluminum; the chromite (chromium-spinel) series, in which $B$ is chromium; and the magnetite (iron-spinel) series, in which $B$ is iron.

The aluminum spinels are harder, more transparent, and less dense than the others. The spinel series contains the mineral spinel, also called ruby spinel (*q.v.*) or magnesia spinel; other members include hercynite (iron aluminum oxide, $FeAl_2O_4$), gahnite (zinc aluminum oxide, $ZnAl_2O_4$), and galaxite (manganese aluminum oxide, $MnAl_2O_4$). The colour of magnesia spinel ranges from bloodred to blue, green, brown, and colourless; gahnite is dark blue-green; hercynite and galaxite are black. These minerals are found as glassy, hard octahedrons, grains or masses in basic igneous rocks, granite pegmatites, and contact metamorphic limestone deposits. The members of the spinel series often substitute for one another in the crystal structure, so that most specimens are mixtures.

For general information on the use and occurrence of the chromium- and iron-spinel series, *see* chromite; magnetite. For detailed physical properties of any of the spinel minerals, *see* oxide mineral (table). More than 200 synthetic varieties of spinels have been prepared, several as gemstones and many as ferrimagnetic materials (*see also* ferrite).

**Spinello** ARETINO, byname of SPINELLO DI LUCA SPINELLI (b. *c.* 1346, Commune of Arezzo [Italy]—d. March 14, 1410, Arezzo), late Gothic Italian painter noteworthy for his vigorous narrative sense. His style anticipates the realistic painting of the early Renaissance of the 15th century. Early in his career he came under the influence of Orcagna and Nardo di Cione, whose style shows in his first major work, a fresco cycle in San Francesco at Arezzo.

A facile artist, Spinello soon gained a reputation beyond his native town. About 1387 he executed a fresco cycle in the small church at Antella, near Florence, and a cycle of scenes from the life of St. Benedict in the sacristy of San Miniato al Monte, Florence. A triptych (1391) commissioned for Sant' Andrea at Lucca, now in the Accademia, Florence, was painted in conjunction with Lorenzo di Niccolò. In the same year he began work on some frescoes in the Campo Santo (cemetery) at Pisa.

Further commissions at Arezzo followed, and between 1404 and his death he seems to have divided his time between Arezzo and Siena, where he undertook work (lost) for the cathedral and painted (1407–10) a cycle of fresco scenes from the life of Pope Alexander III in the Palazzo Pubblico. These and the Pisa frescoes constitute his most important works.

**spinet,** small form of the harpsichord, generally wing-shaped, with a single set of strings placed at an oblique angle to the keyboard. The wing-shaped spinet may have originated in Italy during the 16th century; later it became known in France and England.

Italian spinet, *c.* 1600; in the Victoria and Albert Museum, London
By courtesy of the Victoria and Albert Museum, London

Spinets were popular substitutes for the larger, more expensive harpsichords and were made in large numbers during the late 17th and 18th centuries, especially in England. Their cases were often highly ornamented and decorated. The name spinet may derive from the Latin *spinae* ("thorns"), perhaps reflecting the shape of the tiny quills or leather wedges that pluck the strings. In modern usage, "spinet" commonly refers to a short form of upright piano.

**spinneret,** also spelled SPINNERETTE, in the spinning of man-made fibre, small, thimble-shaped, metal nozzle having fine holes through

which a spinning solution is forced to form a filament. The viscous or syrupy solution, prepared by melting or chemically dissolving raw material, emerges from the spinneret as long fibres that are then solidified by coagulation, evaporation, or cooling.

Most spinnerets are made of stainless steel, but rayon production requires platinum. The size and shape of the spinneret holes determine the filament's cross-sectional shape. Each hole forms a single filament, and the combined filaments form filament yarn. The structure in spiders and silkworms through which silk is extruded is also called the spinneret.

**spinning,** in textiles, process of drawing out fibres from a mass and twisting them together to form a continuous thread or yarn. In man-made fibre production the name is applied to the extrusion of a solution to form a fibre, a process similar to the method by which silkworms and similar insect larvae produce filament to make their cocoons from a viscous fluid that they secrete.

Common industrial spinning techniques include ring spinning, open-end (rotor) spinning, and air-jet spinning.

**spinning wheel,** early machine for turning fibre into thread or yarn, which was then woven into cloth on a loom. The spinning wheel

Early American foot-pedal spinning wheel
By courtesy of the New York State Historical Association, Cooperstown

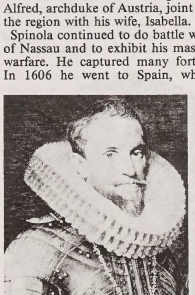
was probably invented in India, though its origins are obscure. It reached Europe via the Middle East in the European Middle Ages. It replaced the earlier method of hand spinning, in which the individual fibres were drawn out of a mass of wool held on a stick, or distaff, twisted together to form a continuous strand, and wound on a second stick, or spindle. The first stage in mechanizing the process was to mount the spindle horizontally in bearings so that it could be rotated by a cord encircling a large, hand-driven wheel. The distaff, carrying the mass of fibre, was held in the left hand, and the wheel slowly turned with the right. Holding the fibre at an angle to the spindle produced the necessary twist.

The Saxon, or Saxony, wheel, introduced in Europe at the beginning of the 16th century, incorporated a bobbin on which the yarn was wound continuously; the distaff on which the raw fibre was held became a stationary vertical rod, and the wheel was actuated by a foot treadle, thus freeing both of the operator's hands.

The improvement of the loom in 18th-century Great Britain created a yarn shortage and a demand for mechanical spinning. The result was a series of inventions that converted the spinning wheel into a powered, mechanized component of the Industrial Revolution.

**Spinola** FAMILY, one of the noble families that dominated the history of Genoa, Italy, during the city-state's great period, from the 12th to the 14th century.

They were descended from a younger son of Ido, the viscount who ruled Genoa in the 10th century as the representative of its feudal lord, the Marchese Obertinghi. The Spinola furnished many consuls to the aristocratic "consular" commune of the 12th century. Guido Spinola served as consul several times between 1102 and 1121. In 1190 his descendant, also named Guido, commanded a Genoese fleet in the Third Crusade, afterward being repeatedly elected consul and serving on a number of embassies.



During the first half of the 13th century, in predominantly Guelf (pro-papal) Genoa, the Spinola headed the Ghibellines, the party supporting the Holy Roman emperor Frederick II in the factional struggles of the period. Niccolò Spinola (d. 1240) became grand admiral of Frederick's fleet. In 1237 Guglielmo Spinola led an unsuccessful coup against the Guelf podesta (chief magistrate), who sentenced the rebels to exile and destruction of their houses and property but revoked the sentence on intervention of the archbishop of Genoa. In 1270 Oberto Spinola and Oberto Doria instituted the first of a series of governments headed by members of their two families when they seized power as captains of the people. The two men ruled Genoa for the 15 years that have been termed the golden age of the Genoese medieval commune. Other Spinola who served jointly with Doria as captains of the people were Oberto Spinola's son Corrado; Opizzino (Opicino) Spinola during Emperor Henry VII's invasion of Italy; and, after a long interruption, Galeotto Spinola in 1335. At that time the resumption of the rule of the two powerful families ended in a popular revolt and the installation of the first doge of Genoa (1339). The Spinola made several unsuccessful attempts to regain power.

In later periods, first under the domination of Genoa by the Visconti of Milan and then by Spain, Austria, and France, the Spinola distinguished themselves as soldiers, prelates, ambassadors, and literary men. When the constitutional reforms of Andrea Doria reinstated the dogeship, Battista Spinola occupied that office from 1531 to 1533. Notable among the family's military men was the Spanish general Ambrogio di Spinola (1569–1630). The family contributed three archbishops to Genoa and 13 cardinals. Among its literary figures were several historians, including Massimiliano Spinola (1812–79), the author of works on Ligurian history. Among the famous women of the family was Laura di Negro Spinola (d. 1838), who aided the cause of Giuseppe Mazzini, the Italian revolutionary patriot, and his followers.

**Spinola, Ambrogio di Filippo,** MARQUÉS DE LOS BALBASES (b. 1569, Genoa [Italy]—d. Sept. 25, 1630, Castelnuovo Scrivia), an outstanding military commander in the service of Spain and one of the ablest soldiers of his time. Though he won fame in the wars against the Dutch Republic in the early 17th century, he was ultimately unable to break Dutch military power.

Spinola was born into an old and powerful family of Genoa, an Italian city-state that during his time was a close ally of Spain. To advance the fortunes of his family, Spinola contracted for service in the Spanish Netherlands and marched there in 1602 with a force of 9,000 men he had raised at his own expense. With his disciplined troops, Spinola showed himself a match for his major opponent, the skillful Dutch commander Maurice of Nassau, in his successful one-year siege of Ostend, which fell on Sept. 22, 1604. After that victory, Spinola was appointed commander in chief of the Spanish armies in the Netherlands and the next in line to head its government after Alfred, archduke of Austria, joint sovereign of the region with his wife, Isabella.

Spinola continued to do battle with Maurice of Nassau and to exhibit his mastery of siege warfare. He captured many fortified places. In 1606 he went to Spain, where he was

Spinola, detail of a portrait by an unknown artist
By courtesy of the Biblioteca Nacional, Madrid

forced to pledge his entire fortune as security for the expenses of the Dutch war before bankers would advance funds to the Spanish government. Spinola was never repaid and ultimately suffered financial ruin. The next year he signed a suspension of arms with Maurice and two years later played a major role in the negotiation of a truce that lasted 12 years. During this entire period, Spinola kept his Netherlands forces in readiness and directed repair and maintenance efforts.

Shortly after the opening of the Thirty Years' War (1618–48), Spinola seized nearly all of the Palatinate, a fertile and strategic German region along the Rhine River (1620). He thereby removed a Protestant-held barrier on the route by which money and men reached the Spanish armies in the Netherlands; he was rewarded with the rank of captain general. He returned to the Netherlands to assume command of the Spanish armies in 1621, after Spain had decided to break the truce with the Dutch. There Spinola gained his most famous victory, the capture of the strategic Dutch fortress of Breda, after a long siege (Aug. 28, 1624–June 5, 1625). This victory drew attention throughout Europe and served as the subject for the great painting by Velázquez, "The Surrender of Breda." After Breda, the lack of funds and the enmity of the conde-duque de Olivares, the administrator for the Spanish boy-king Philip IV, hindered Spinola's military efforts. Also, the new Dutch commander, Frederick Henry, prince of Orange, proved himself a formidable opponent.

In 1628 Spinola left for Spain, where he reluctantly accepted an appointment as general and plenipotentiary in the war with the French over the disputed succession to the duchy of Mantua, Italy (1628–31). Spinola arrived in Italy in 1629 and died there in the midst of the siege of Casale. The title of marquês de Los Balbases, which had been bestowed on Spinola, was all the compensation his family received for the great fortune Spinola had spent in the service of Philip III and Philip IV of Spain.

BIBLIOGRAPHY. Studies of his campaigns are found in Pieter Geyl, *The Revolt of the Netherlands, 1555–1609*, 2nd ed. (1958), and *The Netherlands in the Seventeenth Century*, rev. and enlarged ed. (1961).

**Spinoza, Benedict de** (English), Hebrew forename BARUCH, Latin forename BENDIC-

TUS, Portuguese BENTO DE ESPINOSA (b. Nov. 24, 1632, Amsterdam—d. Feb. 21, 1677, The Hague), Dutch-Jewish philosopher, the foremost exponent of 17th-century Rationalism.

*Early life and career.* Spinoza's grandfather and father were Portuguese and had been crypto-Jews after the Spanish Inquisi-

tion had compelled them to embrace Christianity. Later, after Holland's successful revolt against Spain and the granting of religious freedom, they found refuge in Amsterdam. His mother, who also came from Portugal, died when Benedict was barely six years old. The Spinozas were prosperous merchants and respected members of the Jewish community, and it may be assumed that Spinoza attended the school for Jewish boys founded in Amsterdam in about 1638. Outside school hours the boys had private lessons in secular subjects. Spinoza was taught Latin by a German scholar, who may also have taught him German; and he knew to some extent all of the other significant continental languages. In March 1654 Benedict's father died. There was some litigation over the estate, with Benedict's only surviving stepsister claiming it all. Benedict won the lawsuit but allowed her to retain nearly everything.

His studies so far had been mainly Jewish, but he was an independent thinker and had found more than enough in his Jewish studies to wean him from orthodox doctrines and interpretations of Scripture; moreover, the tendency to revolt against tradition and authority was much in the air in the 17th century. But the Jewish religious leaders in Amsterdam were fearful that heresies (which were no less anti-Christian than anti-Jewish) might give offense in a country that did not yet regard the Jews as citizens. Spinoza soon incurred the disapproval of the synagogue authorities. In conversations with other students, he had held that there is nothing in the Bible to support the views that God had no body, that angels really exist, or that the soul is immortal; and he had also expressed his belief that the author of the Pentateuch (the first five books of the Bible) was no wiser in physics or even in theology than were they, the students. The Jewish authorities, after trying vainly to silence Spinoza with bribes and threats, excommunicated him in July 1656, and he was banished from Amsterdam for a short period by the civil authorities. There is no evidence that he had really wanted to break away from the Jewish community, and indeed the scanty knowledge available would suggest the opposite. On Dec. 5, 1655, for example, he had attended the synagogue and made an offering that, in view of his poverty, must have been a rare event for him, and, about the time of his excommunication, he had addressed a defense of his views to the synagogue.

Among Spinoza's Christian acquaintances was Franciscus van den Enden, who was a former Jesuit, an ardent classical scholar, and something of a poet and dramatist and who had opened a school in Amsterdam. For a time, Spinoza stayed with him, helping with the teaching of the schoolchildren and receiving aid in his own further education. In this way he improved his knowledge of Latin, learned some Greek, and was introduced to Neoscholastic philosophy. It may have also been through van den Enden's school that Spinoza became acquainted with the "new philosophy" of René Descartes, later acknowledged to be the father of modern philosophy. Spinoza's other Christian acquaintances were mostly of the Collegiants, a brotherhood that later merged with the Mennonites; they were especially interested in Cartesianism, the dualistic philosophy of Descartes and his followers.

At the same time, he was becoming expert at making lenses, supporting himself partly by grinding and polishing lenses for spectacles, telescopes, and microscopes; he also did tutoring. A kind of reading and discussion circle for the study of religious and philosophical problems came into being under the guidance of Spinoza. In order to collect his thoughts, however, and reduce them to a system, he withdrew in 1660 to Rijnsburg, a quiet village on the Rhine, near Leiden. Rijnsburg was the headquarters of the Collegiants, and Spinoza's lodgings there were with a surgeon named Herman Homan. In Homan's cottage Spinoza wrote *Korte Verhandeling van God, de Mensch en deszelfs Welstand* (written *c.* 1662; *Spinoza's Short Treatise on God, Man, and His Well-Being,* 1910) and *Tractatus de Intellectus Emendatione* ("Treatise on the Correction of the Understanding"), both of which were ready by April 1662. He also completed the greater part of his geometrical version of Descartes's *Principia Philosophiae* and the first book of his *Ethica.* Spinoza's attitude in these works already showed a departure from Cartesianism. It was also during this stay that he met Heinrich Oldenburg, soon to become one of the two first secretaries of the Royal Society in London, a friendship

*Influence of Descartes and the geometrical method.* His version of Descartes's *Principia* was prepared while Spinoza was giving instruction in the philosophy of Descartes to a private pupil. It was published by his Cartesian friends under the title *Renati des Cartes Principiorum Philosophiae Pars I et II, More Geometrico Demonstratae, per Benedictum de Spinoza* (1663), with an introduction explaining that Spinoza did not share the views expressed in the book. This was the only book published in Spinoza's lifetime with his name on the title page.

The philosophy of Spinoza may thus be regarded as a development from and a reaction to that of his contemporary Descartes (1596–1650). Though it has been argued that Spinoza was also much influenced by medieval philosophy (especially Jewish), he seems to have been much more conscious of the Cartesian influence, and his most striking doctrines are most easily understood as solutions of Cartesian difficulties. Clearly, he had studied Descartes in detail. He accepted Descartes's physics in general, though he did express some dissatisfaction with it toward the end of his life. As for the Cartesian metaphysics, he found three unsatisfactory features: the transcendence of God, the substantial dualism of mind and body, and the ascription of free will both to God and to human beings. In Spinoza's eyes, those doctrines made the world unintelligible. It was impossible to explain the relation between God and the world or between mind and body or to account for events occasioned by free will.

The publication of Spinoza's version of Descartes's *Principia* had been intended to prepare the way for that of his own philosophy, for he had both to secure the patronage of influential men and to show the more philosophically minded that his rejection of Cartesianism was not out of ignorance.

Spinoza became dissatisfied with the informal method of exposition that he had adopted in the *Korte Verhandeling* and the *De Intellectus Emendatione* and turned instead to the geometrical method in the manner of Euclid's *Elements.* He assumed without question that it is possible to construct a system of metaphysics that will render it completely intelligible. It is therefore possible, in his view, to present metaphysics deductively—that is, as a series of theorems derived by necessary steps from self-evident premises expressed in terms that are either self-explanatory or defined with unquestionable correctness. His masterpiece, the *Ethica,* was set out in this manner—*Ordine Geometrico Demonstrata,* according to the reading of its subtitle. Its first part, "De Deo" ("Concerning God"), was finished and in the hands of his friends early in 1663. Initially the work was intended to have three parts only, but it eventually appeared (in 1677) in five parts. Spinoza's desire for an impersonal presentation was probably his chief motive for adopting the geometrical method, appreciating that the method guarantees true conclusions only if the axioms are true and the definitions correct. Spinoza, like his contemporaries, held that definitions are not arbitrary but that there is a sense in which they may be correct or incorrect.

The question was discussed at length in his unfinished *Tractatus de Intellectus Emendatione.* A sound definition, he held, should make clear the possibility or the necessity of the existence of the object defined. Because the *Ethica* begins with the definition of "substance," the necessary existent, the entire system is vulnerable to anyone disputing that definition, however cogent the subsequent reasoning may be. In fact, as Gottfried Wilhelm Leibniz, a Rationalist philosopher and mathematician, pointed out, though the system is closely knit, its demonstrations do not proceed with mathematical rigour.

*Period of the "Ethica."* In June 1663 Spinoza moved to Voorburg, near The Hague, and it appears that by June 1665 he was nearing the completion of the three-part version of the *Ethica.* During the next few years, however, he was at work on his *Tractatus Theologico-Politicus,* which was published anonymously at Amsterdam in 1670. This work aroused great interest and was to go through five editions in as many years. It was intended "to show that not only is liberty to philosophize compatible with devout piety and with the peace of the state, but that to take away such liberty is to destroy the public peace and even piety itself." As this work shows, Spinoza was far ahead of his time in advocating the application of the historical method to the interpretation of the biblical sources. He argued that the inspiration of the prophets of the Old Testament extended only to their moral and practical doctrines and that their factual beliefs were merely those appropriate to their time and are not philosophically significant. Complete freedom of scientific and metaphysical speculation is therefore consistent with all that is important in the Bible. Miracles are explained as natural events misinterpreted and stressed for their moral effect.

In May 1670 Spinoza moved to The Hague, where he remained until his death. He began to compose a Hebrew grammar, *Compendium Grammatices Linguae Hebraeae,* but did not finish it; instead, he returned to the *Ethica,* al-

though the prospect of its publication became increasingly remote. There were many denunciations of his *Tractatus Theologico-Politicus* as an instrument "forged in hell by a renegade Jew and the devil." When the *Ethica* was completed in 1675, Spinoza had to abandon the idea of publishing it, though manuscript copies were circulated among his close friends.

*Last years and posthumous influence.* Spinoza concentrated his attention on political problems and began his *Tractatus Politicus,* which he did not live to finish. During the post-*Ethica* period, he was visited by several important people, among them Ehrenfried Walter von Tschirnhaus (in 1675), a scientist and philosopher, and Gottfried Wilhelm Leibniz (in 1676), like Spinoza, one of the foremost Rationalists of the time. Leibniz, having heard of Spinoza as an authority on optics, had sent him an optical tract and had then received from Spinoza a copy of the *Tractatus Theologico-Politicus,* which deeply interested him. According to Leibniz' own account, he "conversed with him often and at great length." Spinoza, however, was now in an advanced stage of consumption, aggravated by the inhaling of glass dust from the polishing of lenses in his shop. He died in 1677, leaving no heir, and his few possessions were sold by auction. These included about 160 books, the catalog of which has been preserved.

In accordance with Spinoza's previous instructions, several of his friends prepared his manuscripts secretly for the press, and they were sent to a publisher in Amsterdam. The *Opera Posthuma* (Dutch version: *Nagelate Schriften*), published before the end of 1677, was composed of the *Ethica, Tractatus Politicus,* and *Tractatus de Intellectus Emendatione,* as well as letters and the Hebrew grammar. His *Stelkonstige reeckening van den regenboog* ("On the Rainbow") and his *Reeckening van kanssen* ("On the Calculation of Chances") were printed together in 1687. The *Korte Verhandeling* was lost to the world until E. Boehmer's publication of it in 1852.

Spinoza has an assured place in the intellectual history of the Western world, though his direct influence on technical philosophy has not been great. Throughout the 18th century he was almost universally decried as an atheist—or sometimes used as a cover for the detailing of atheist ideas. The tone had been set by Pierre Bayle, a Skeptical philosopher and encyclopaedist, in whose *Dictionnaire historique et critique* Spinozism was described as "the most monstrous hypothesis imaginable, the most absurd"; and even David Hume, a Scottish Skeptic and historian, felt obliged to speak of the "hideous hypothesis" of Spinoza.

Spinoza was rendered intellectually respectable by the efforts of literary critics, especially of the Germans G.E. Lessing and J.W. von Goethe and the English poet S.T. Coleridge, who admired the man and found austere excitement in his works, in which they saw an intensely religious attitude entirely divorced from dogma. Spinoza has also been much studied by professional philosophers since the beginning of the 19th century. Both absolute Idealists and Marxists have read their own doctrines into his work, and Empiricists, while rejecting his metaphysical approach, have developed certain detailed suggestions from his theory of knowledge and psychology.

BIBLIOGRAPHY. An early biography is found in Frederick Pollock, *Spinoza: His Life and Philosophy* (1880), available in many later editions. Dan Levin, *Spinoza, the Young Thinker Who Destroyed the Past* (1970), focuses on the details of the philosopher's Sephardic Jewish background. Roger Scruton, *Spinoza* (1986), is a later biography. Important analyses of his ethical and philosophical thought are offered in Henry E. Allison, *Benedict de Spinoza: An Introduction,* rev. ed. (1987); Alan Donagan, *Spinoza* (1989); Paul Wienpahl, *The Radical Spinoza* (1979); and, more specifically, in Thomas C. Mark, *Spinoza's Theory of Truth* (1972); Jonathan Bennett, *A Study of Spinoza's Ethics* (1984); Edwin Curley, *Behind the Geometrical Method: A Reading of Spinoza's Ethics* (1988); S. **Spinther, Publius Cornelius Lentulus:** *see* Lentulus Spinther, Publius Cornelius.

**spiny anteater** (mammal): *see* echidna.

**spiny eel,** any of two groups of fishes, those of the freshwater family Mastacembelidae (order Perciformes) and of the deep-sea family Notacanthidae (order Notacanthiformes).

Spiny eel (*Mastacembelus ellipsifer*)
Painting by Gilbert Emerson

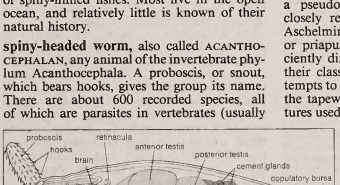
Members of both groups are elongated and eellike but are not related to true eels.

The freshwater spiny eels comprise about 50 species found in the tropics from Africa to China. Carnivorous, they are usually nocturnal, burrowing into the bottom by day. They have a long, movable snout and a row of spines preceding the soft portion of the dorsal fin. There are no pelvic fins, and the soft dorsal, anal, and tail fins are usually joined. The largest is about 90 cm (3 feet) long, but most are much smaller. Depending on the authority, these fishes may be placed in the suborder Mastacembeloidei or in a distinct order, Mastacembeliformes.

The deep-sea spiny eels comprise a small and little-known group of fishes found at depths to more than 1,980 m (6,500 feet). Usually small and with long, pointed tails and a row of dorsal spines, they are placed in the order Notacanthiformes, with the deep-sea families, Halosauridae and Lipogenyidae.

**spiny-finned fish,** also called SPINY-RAYED FISH, any member of the superorder Acanthopterygii, including four orders of marine and freshwater fishes having fins with some spiny (as opposed to soft) rays—Atheriniformes, Beryciformes, Zeiformes, and Lampridiformes.

The atheriniform (*q.v.*) is the best known of the spiny-finned group, including flying fishes, guppies, mollies, swordtails, and California grunion. Beryciforms and zeiforms are mostly deep-bodied fishes a foot or less in length. Most lampridiforms are elongated, ribbonlike fishes; the giant oarfish can reach 8 m (25 feet) in length. Beryciforms, zeiforms, and lampridiforms are the most primitive groups of spiny-finned fishes. Most live in the open ocean, and relatively little is known of their natural history.



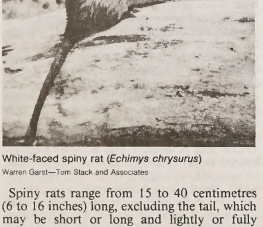
**spiny-headed worm,** also called ACANTHOCEPHALAN, any animal of the invertebrate phylum Acanthocephala. A proboscis, or snout, which bears hooks, gives the group its name. There are about 600 recorded species, all of which are parasites in vertebrates (usually fish) as adults and in arthropods as juveniles. The adults are usually less than 1 cm (0.4 inch) in length, but some reach 50 cm (about 20 inches) or more. Spiny-headed worms are found throughout the world.

*Natural history.* Spiny-headed worms are bisexual, and mating occurs in the intestines of vertebrate hosts. The eggs, which actually are shelled larvae, are excreted with the feces of the host. No further development occurs until the eggs are eaten by an arthropod, which is the intermediate host. After its release in the gut of the arthropod, the larva, called an acanthor, bores through the gut wall into the host's blood cavity (hemocoel), is encapsulated there, and develops into a new stage called an acanthella. The acanthella, a miniature version of the adult, withdraws its armed proboscis before entering a resting stage during which it is known as a cystacanth. Once again, no further development occurs until the cystacanth has been ingested by its definitive host, a vertebrate. The young spiny-headed worm emerges inside the vertebrate's intestine, uses its proboscis to bore into the gut wall, and matures there.

If a cystacanth is swallowed by the wrong host, it may bore through the gut wall into the body cavity, where it encysts and remains infective until the accidental host is eaten; then the cystacanth emerges again in its new host. This behaviour, incorporated into the life cycles of some spiny-headed worms, may provide the only means for completing the life cycle if the definitive host does not feed directly on the intermediate host. Although usually fish parasites, spiny-headed worms also occur in amphibians, reptiles, birds, and mammals. Humans are only rarely infected and then accidentally. Because they do little damage to their hosts, spiny-headed worms are of no economic importance.

*Form and function.* The body of a spiny-headed worm is divided into a proboscis and an elongated cylindrical trunk. The proboscis, which usually bears backward-pointing hooks, can be withdrawn into the trunk, which may also bear hooks or spines. Usually white, spiny-headed worms may occasionally be yellow, orange, or red in colour. The internal anatomy is simple; there is no gut, and the bulk of the trunk is occupied by a proboscis receptacle and the muscles used to retract it. Passing backward from the base of this receptacle are structures known as ligament sacs. One of these sacs in the male encloses two testes and a number of cement glands. The female has two sacs that do not necessarily persist after she matures. Externally the male possesses an eversible copulatory bursa, the female a simple vagina.

*Classification.* The affinities of the spiny-headed worms are uncertain. They possess a pseudocoelom; thus, although they are closely related to members of the phylum Aschelminthes and possibly to the rotifers or priapulids, spiny-headed worms are sufficiently different from these groups to justify their classification as a distinct phylum. Attempts to derive the spiny-headed worms from the tapeworms have not been accepted. Features used in the classification of spiny-headed

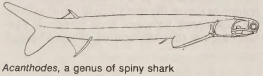


Internal structure of the male *Acanthocephalus ranae*

worms include the nature and distribution of hooks and spines, which are not of any proved phylogenetic significance. For this reason a number of taxonomic systems exist.

**spiny mouse** (*Acomys*), any of 18 species of large-eared rodents, family Muridae (order Rodentia), characterized by the hard, spiny hairs of their backs. Spiny mice are sand-coloured, reddish brown, or grayish and are about 10 centimetres (4 inches) long, excluding the long, scaly tail. Spiny mice are found in rocky or sandy areas of Africa and southwestern Asia. They are herbivorous, feeding primarily on grain and plants, and in some areas they live near or with humans.

**spiny rat,** any of the numerous species of ratlike Central and South American rodents of the family Echimyidae (order Rodentia). There are about 14 living genera; the number of recognized species varies, depending on the authority, from about 40 to more than 70.



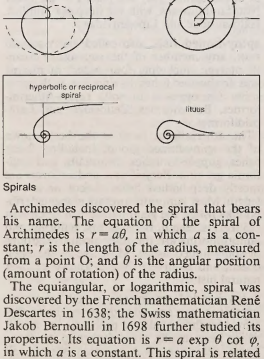
White-faced spiny rat (*Echimys chrysurus*)
Warren Garst—Tom Stack and Associates

Spiny rats range from 15 to 40 centimetres (6 to 16 inches) long, excluding the tail, which may be short or long and lightly or fully haired. They usually have pointed noses, and most have bristly, or spiny, fur. Colour varies but may be reddish brown, brown, blackish, or black and white.

Spiny rats are herbivorous and eat sugarcane, grass, nuts, and fruit. They are eaten by humans and are considered to have a good flavour. Some species are terrestrial, others are arboreal. Spiny rats live in forests or clearings, frequently near water. They are active in the evening and at night and shelter in burrows, among rocks or tree roots, in tree hollows, and occasionally in human dwellings.

**spiny shark,** also called ACANTHODIAN, any of a class (Acanthodii) of small extinct fishes, the earliest known jawed vertebrates, possessing features found in both sharks and bony fishes. Acanthodians appeared first in the Late Silurian Period and lasted into the Early Permian (from about 400,000,000 to about 280,000,000 years ago).

*Acanthodes*, a genus of spiny shark
Reprinted from *Vertebrate Paleontology* by A.S. Romer, by permission of the University of Chicago, copyright 1933, 1945, 1966; all rights reserved



Among the genera of spiny sharks most useful for fossil dating is *Acanthodes*, of the order Acanthodiformes, which attained worldwide distribution. Species of *Acanthodes* grew to be about 30 centimetres (about 12 inches) long and in many respects represent a specialized form, losing many of the traits characteristic of the acanthodians. The spiny shark's head was small compared with its elongated body, and its eyes were very large. The snout region was very short, and it is evident that these fishes relied to a large extent upon sight rather than smell.

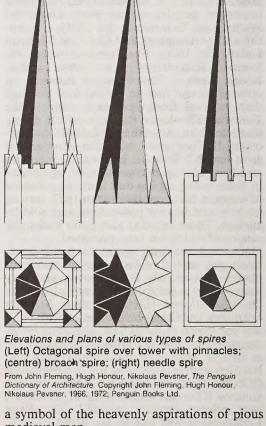
**spiny-tailed lizard** (*Uromastix*), any of several species belonging to the lizard family Agamidae. The genus is restricted to arid habitats in northern Africa and western Asia, where they live in burrows.

The lizard's tail is armed with numerous protective spines that discourage most predators. Some spiny-tailed lizards defend themselves by partly entering their burrows and then violently lashing their exposed tails from side to side at their enemies. All species lay eggs and are predominately herbivorous as adults.

**spiracle,** in arthropods, the small external opening of a trachea (respiratory tube) or a book lung (breathing organ with thin folds of membrane resembling book leaves). Spiracles are usually found on certain thoracic and abdominal segments. In elasmobranch and ganoid fishes a pair of spiracles, derived from the gills, is used as a water passageway during respiration. The nasal opening of whales and other cetaceans is called a spiracle, as is the respiratory opening behind the eyes of rays and skates. In tadpoles the spiracle is the excurrent opening from the gill chamber.

**spiral,** plane curve that, in general, unwinds around a point while moving ever farther from the point. Many kinds of spiral are known, the first dating from the days of ancient Greece. The curves are observed in nature, and human beings have used them in machines and in ornament, notably architectural—for example, the whorl in an Ionic capital.

Spirals



Archimedes discovered the spiral that bears his name. The equation of the spiral of Archimedes is $r = a\theta$, in which $a$ is a constant; $r$ is the length of the radius, measured from a point O; and $\theta$ is the angular position (amount of rotation) of the radius.

The equiangular, or logarithmic, spiral was discovered by the French mathematician René Descartes in 1638; the Swiss mathematician Jakob Bernoulli in 1698 further studied its properties. Its equation is $r = a \exp \theta \cot \varphi$, in which $a$ is a constant. This spiral is related to the circle in that the circle intersects its own radii everywhere at 90°; the equiangular spiral intersects its own radii everywhere at the same angle but other than 90°, that angle being represented in the equation above by $\varphi$. This approximate curve is observed in spider webs and, to a greater degree of accuracy in the chambered mollusk, *Nautilus,* and in certain flowers.

Other plane spirals are Euler's, or Cornu's, or Clothoid; Cotes', Fermat's, or parabolic; lituus; Poinsot's; reciprocal, or hyperbolic; and sinusoidal.

**spirant,** in phonetics, a term defined by some scholars as coextensive with fricative (*q.v.*) and by other scholars as a subclass of fricatives in which the friction is less audible.

**spire,** in architecture, steeply pointed pyramidal or conical termination to a tower. In its mature Gothic development, the spire was an elongated, slender form that was a spectacular visual culmination of the building as well as a symbol of the heavenly aspirations of pious medieval men.

*Elevations and plans of various types of spires*
(Left) Octagonal spire over tower with pinnacles; (centre) broach spire; (right) needle spire
From John Fleming, Hugh Honour, Nikolaus Pevsner, *The Penguin Dictionary of Architecture* Copyright John Fleming, Hugh Honour, Nikolaus Pevsner, 1966, 1972; Penguin Books Ltd.

The spire originated in the 12th century as a simple, four-sided pyramidal roof, generally abrupt and stunted, capping a church tower. Its history is a development toward slimmer, higher forms and a more organic relationship with the tower below. In the attempt to coordinate harmoniously an octagonal spire with a square base, the broach spire was developed: sloping, triangular sections of masonry, or broaches, were added to the bottom of the four spire faces that did not coincide with the tower sides, as in the 12th-century Church of St. Columba at Cologne. In the later 12th and 13th centuries, spires were also integrated with their towers by adding high, gabled dormers (*q.v.*) to the faces of the spire, over the centres of the tower faces—a scheme that can be seen on the southwest tower of Chartres cathedral. On many French cathedrals, steep pinnacles (*q.v.*; vertical ornaments of pyramidal or conical shape) were added to the four corners of the tower to effect the transition between quadrilateral base and octagonal spire. A fine example is a group of spires at Coutances cathedral (13th century), in which the rich treatment of the spire dormers and corner pinnacles emphasizes the sense of height and slimness in every possible way.

In Germany the timber spires of the Romanesque era evolved into Gothic stone spires of great refinement. At the Fribourg (Switz.) cathedral (spire, 1270–88), a low, square tower with corner pinnacles carries a gabled, octagonal lantern that supports the spire of 385 feet (117 metres), a mere skeleton of openwork tracery with ornamented edges giving an amazingly light and delicate effect. This type of openwork spire became the model for later churches in Germany.

In the 14th century, during the Decorated period in England, a slender, needle spire was set in from the edge of the tower, broaches

disappeared, corner pinnacles became customary, and a low parapet was added around the tower's edge, as seen in the two western spires of Lichfield cathedral.

The spire was never thoroughly accepted by the Renaissance, and it failed to become a native form in Spain or Italy. In England, France, and Germany, however, its development continued, influenced to some degree by Italian Baroque forms. During the 17th century in Germany, fantastic, spirelike forms were designed with profiles of broken concave and convex lines, crowned at the top with a sort of onionlike dome; they rose to a considerable height and, in imaginative quality, far surpassed any of the Italian examples. At the same time in England, the spire received a simpler, more straightforward treatment in the designs of Sir Christopher Wren, particularly in churches built after the Great Fire in London (1666), such as St. Martin, Ludgate, and St. Bride's on Fleet Street (only spire and steeple [1701–03] remain).

Noteworthy also are many simplified colonial American spires that were originally based upon the work of Wren and his followers. Characteristic is the type in which a small, octagonal, arcaded lantern crowns a square tower and carries, usually above an attic, a simple, slim, white spire, as in the Old South Meeting House, Boston (1729). This trend toward slender and attenuated proportions reached its climax in the exquisitely light spire of Park Street Church, Boston (1819), by Peter Banner.

Nineteenth-century architects made extravagant use of spires, particularly during the Gothic Revival period of the 1840s, '50s, and '60s. Perhaps because spires were so closely associated with picturesque eclecticism, 20th-century architects have tended to limit them to rather elementary geometric shapes, such as the truncated, octagonal spire of St. Mary's Cathedral (*c.* 1970) in San Francisco.

**spirea** (*Spiraea*), any of a large genus (nearly 100 species) of flowering shrubs, in the rose family (Rosaceae), native to the North Tem-

*Spiraea*
E.R. Degginger—EB Inc.

perate Zone and commonly cultivated for their pleasing growth habit and attractive flower clusters.

The most commonly grown—and possibly the most popular of all cultivated shrubs—is the Vanhouttei spirea, also called bridal wreath (*Spiraea ×Vanhouttei*, produced by a cross between *S. cantoniensis* and *S. trilobata*), which grows up to 2 metres (6 feet) high; the graceful arching branches bear numerous white flowers in spring. Other spring-flowering spireas include *S. crenata, S. prunifolia,* and *S. trilobata*; summer-flowering species include *S. albiflora, S. ×Bumalda* (derived from *S. albiflora* and *S. japonica*), *S. ×Billiardii* (derived from *S. douglasii* and *S. salicifolia*), *S. japonica, S. salicifolia,* and *S. tomentosa.*

Among the attractive low-growing spireas are the white-flowering snowmound spirea (*S. nipponica* 'Snowmound') and the Japanese white spirea (*S. albiflora*). The alpine Japanese spirea (*S. japonica* 'Alpina') bears rose-pink flowers. The popular hybrid Bumalda varieties provide colour variations of both flower and foliage.

Plants resembling spirea are the shrubby false spireas (*Sorbaria* species) and the perennial herbaceous spireas (*Astilbe* species).

**Spires** (Germany): *see* Speyer.

**spirillary rat-bite fever:** *see* rat-bite fever.

**Spirillum,** genus of spiral-shaped bacteria of the family Spirillaceae, aquatic except for one species (*S. minor*) that causes a type of rat-bite fever in man. The term spirillum is used generally for any of the corkscrew-like species.

*Spirillum* is microbiologically characterized as a gram-negative, motile helical cell with tufts of whiplike flagella at each end. The helix of the largest spirillum, *S. volutans,* is 5 to 8 $\mu$m (micrometres; 1 $\mu m = 10^{-6}$ metre) across by 60 $\mu$m long.

*S. minor,* found in the blood of apparently healthy mice and rats, can be transmitted to other rodents and to monkeys and man.

The genera *Aquaspirillum* and *Oceanospirillum* have been proposed for the free-living aquatic forms.

**spirit,** any of numerous alcoholic beverages produced by distillation. *See* distilled liquor.

**Spirit Lake Massacre** (March 8–12, 1857), incident in northwestern Iowa, U.S., in which a band of Sioux Indians led by Inkpaduta killed more than 30 white people. In 1856 five cabins had been built and occupied by whites near Okoboji lakes and Spirit Lake. After a severe winter, the Sioux attacked, killed 32 men, women, and children on the spot and abducted four women, of whom two were subsequently killed, one released voluntarily, and one ransomed. A relief expedition sent from Ft. Dodge arrived only in time to bury the dead. Another, sent from Ft. Ridgely in Minnesota, pursued Inkpaduta, who fled westward, but failed to overtake him. The massacre was commemorated by a monument erected in 1895 at nearby Arnolds Park.

**Spirit of Saint Louis,** airplane in which Charles A. Lindbergh made the first nonstop solo flight from New York to Paris, May 20–21, 1927. His flight was sponsored by a group of businessmen in St. Louis, Mo.

The plane was a Ryan NVP developed from the Ryan M2, a single-engine, high-wing monoplane, modified to Lindbergh's specifications. In standard conformation the airplane would have seated five people; extra fuel tanks in the "Spirit of St. Louis" occupied much of what had been cabin space. The windshield was replaced by an extension of the nose cowling. Lindbergh had direct vision only from the side windows, relying on a periscope to see straight ahead. There was no radio. The Wright Whirlwind air-cooled radial engine developed a maximum of 237 horsepower. Wing-span of the craft was 46 feet (14 metres) and length 27 feet 8 inches (8.4 metres). Fuel capacity with the extra tanks was 450 gallons; top speed at sea level, when loaded, was 120 miles (200 kilometres) per hour, and range was 4,100 miles (6,600 kilometres).

The "Spirit of St. Louis" was returned from Europe to the United States aboard ship, and Lindbergh flew it extensively throughout North, Central, and South America to promote interest in aeronautics before donating it to the Smithsonian Institution.

**spirits of turpentine:** *see* turpentine.

**Spiritual,** also called SPIRITUAL FRANCISCAN, member of an extreme group within the Franciscans, a mendicant religious order founded by St. Francis of Assisi in 1209; the Spirituals firmly espoused the austerity and poverty prescribed in the original Rule of St. Francis. Called the Fraticelli, they were opposed, to some extent, by St. Bonaventure, a leading Franciscan theologian, and some were condemned and executed as heretics. Among the Spiritual Franciscans, the works of the late 12th-century mystic Joachim of Fiore were influential, and because of their ideals the Spirituals became sources of inspiration to Protestant mystics of the 16th-century Reformation.

**spiritual,** in North American white and black folk music, an English-language folk hymn.

White spirituals include both revival and camp-meeting songs and a smaller number of other hymns. They derived variously, notably from the "lining out" of psalms, dating from at least the mid-17th century. Where congregations could not read, a leader intoned (lined out) the psalm text, one line at a time, alternating with the congregation's singing of each just-given line to a familiar melody. The tune, sung slowly, was ornamented with passing notes, turns, and other graces, each singer producing his own improvised embellishment at whatever pitch level he found comfortable. (This style persists in isolated areas in the 20th century, both in black and white churches.)

A second source was the singing of hymns (as opposed to psalms only), reintroduced by such 18th-century religious dissenters as John and Charles Wesley, the founders of Methodism. Hymn verses were composed and set to borrowed melodies, often secular folk tunes. Many of these evangelical hymns passed into oral tradition.

In the late 18th century and up to the mid-19th, there were several waves of religious revivalism. The resulting camp meetings and revivals were marked by spontaneous mass singing. It is not completely known how the camp-meeting songs and revival spirituals were sung; but it is thought that they were sung unharmonized, the tune typically begun by the high male voices, the women and basses joining in an octave (or other comfortable interval) above or below. A call-and-response pattern (as in lining out) may have at times been used. Melodies were apparently ornamented.

The texts had verses and refrains that wandered from song to song; these and a common stock of folk-melody fragments allowed new songs to be improvised upon inspiration. The themes included going home to the promised land, the defeat of Satan, and gaining ground against sin; typical refrains were "Roll, Jordan" and "Glory Hallelujah." Hymns from the earlier folk tradition were also sung. The songs were passed on orally, though many were eventually written down in folk hymnbooks using special shape-note notation.

The revival spirituals and other folk hymns passed from favour in 19th-century city churches as standardized European hymn styles came in. They survive in oral tradition in isolated areas and also among users of the shape-note hymnals (*q.v.*).

A 19th-century offshoot of the spiritual was the gospel song. Influenced by "correct" European music, it had composed melodies and texts, was sung with instrumental accompaniment, and (unlike the folk hymns) was written to be harmonized.

The black spirituals developed mostly from white rural folk hymnody. (Blacks and whites attended the same camp meetings, for instance, and black performance style possibly

counterinfluenced the revival songs.) Many black spirituals thus exist in the white folk music tradition also, and many others have melody analogues in secular white American and British folk music. The borrowing of melodies with pentatonic (five-note) and major scales is especially prominent. In voice quality, vocal effects, and type of rhythmic accompaniment, black spirituals differ markedly from white ones. Black spirituals were sung not only in worship but also as work songs, and the text imagery often reflects concrete tasks.

Musically, it is believed that a complex intermingling of African and white folk-music elements occurred and that complementary traits of African music and white U.S. folk-song reinforced each other. For example, the call-and-response pattern occurs in both, as do certain scales and the variable intonation of certain notes. Most authorities see clear African influence in vocal style and in the complex polyrhythmic clapped accompaniments. African tradition also included polyphonic and choral singing. The ring shout (a religious dance usually accompanied by the singing of spirituals and clapped rhythms) is of African ancestry.

After the Civil War the black spirituals were "discovered" by Northerners and either developed toward harmonized versions, often sung by trained choirs, or, conversely, preserved the older traditional style, especially in rural areas and certain sects.

Like the white gospel song, the modern black gospel song is a descendant of the spiritual and is instrumentally accompanied. Black gospel music is closely related to secular black music (as is the spiritual to the work song and blues) and often includes jazz rhythms and instruments alongside traditional clapped accompaniment and often dance. Though gospel songs are usually composed, the melodies are taken for improvisational bases in church services, as popular tunes are improvised upon in jazz.

**spiritual assembly,** in the Bahā'ī faith, any of numerous administrative units that conduct an extensive work of missions, publication, education, and general philanthrophy. Spiritual assemblies consist of nine members elected or designated annually on the local, national, and world levels during the holy days (April 21, April 29, May 2) commemorating the declaration of the founder's mission. Since they are said to be invested with their authority by God himself, the members of the spiritual assemblies have absolute jurisdiction over their electorates and are not answerable to them for their decisions and actions. Financial support comes from voluntary contributions from the community.

A local spiritual assembly exists in any community of nine or more Bahā'ī members. In the early 1980s there were some 26,000 local assemblies. National spiritual assemblies—numbering 130 by the early 1980s—appear when there are enough local assemblies in a country to elect a 19-member convention, which in turn will elect the nine members of the national group from among all Bahā'īs in the country. World leadership of the faith was held by Shogi Effendi Rabbani as Guardian of the Cause of God until his death in 1957; since 1963, it has been assumed by the highest spiritual assembly, the Universal House of Justice, a body elected by the national spiritual assemblies and possessing the sole right to institute new laws or abrogate the old laws laid down in Bahā'ī sacred scriptures.

**spiritualism,** in philosophy, a characteristic of any system of thought that affirms the existence of immaterial reality imperceptible to the senses. So defined, spiritualism embraces a vast array of highly diversified philosophical views. Most patently, it applies to any philosophy accepting the notion of an infinite, personal God, the immortality of the soul, or the immateriality of the intellect and will. Less obviously, it includes belief in such ideas as finite cosmic forces or a universal mind, provided that they transcend the limits of gross Materialistic interpretation. Spiritualism as such says nothing about matter, the nature of a supreme being or a universal force, or the precise nature of spiritual reality itself.

In ancient Greece Pindar (flourished 5th century BC) expounded in his odes the substance of a spiritualistic Orphic mysticism by attributing a divine origin to the soul, which resides temporarily as a guest in the home of the body and then returns to its source for reward or punishment after death. Plato's view of the soul also marks him as a spiritualist, and Aristotle was a spiritualist for distinguishing the active from the passive intellect and for conceiving of God as pure actuality (knowledge knowing itself). René Descartes, often acclaimed as the father of modern philosophy, viewed the soul as the unique source of activity, distinct from, but operating within, a body. Gottfried Wilhelm Leibniz, a versatile German Rationalist, postulated a spiritualistic world of psychic monads. The Idealists F.H. Bradley, Josiah Royce, and William Ernest Hocking saw individuals as mere aspects of a universal mind. For Giovanni Gentile, propounder of a philosophy of actualism in Italy, the pure activity of self-consciousness is the sole reality. The steadfast belief in a personal God maintained by Henri Bergson, a French intuitionist, was joined to his belief in a spiritual cosmic force (*élan vital*). Modern Personalism gives priority to persons and personality in explaining the universe. The French philosophers Louis Lavelle and René Le Senne, specifically known as spiritualists, launched the publication *Philosophie de l'esprit* ("Philosophy of the Spirit") in 1934 to ensure that spirit was given proper attention in modern philosophy. Though this journal professed no philosophical preference, it has given special attention to personality and to forms of intuitionism.

Dualism and monism, theism and atheism, pantheism, Idealism, and many other philosophical positions are thus said to be compatible with spiritualism as long as they allow for a reality independent from and superior to matter.

**spiritualism,** in religion, the belief, or practices based upon the belief, that departed souls hold intercourse with mortals, usually through a medium by means of physical phenomena or during abnormal mental states, such as trances.

The important terms in spiritualism are defined in the following ways. "Spirit" is the essential part of man. After the death of the body the spirit lives on. The "spirit world" is the world of disembodied spirits. A "medium" is a person on earth who is sensitive to vibrations from the spirit world and is able to convey messages between that world and this one and to produce other spiritualist phenomena. A "control" is a disembodied spirit who gives messages to a medium who in turn gives them to men and women on Earth. A "séance" is a meeting (usually small) around a medium to seek messages from the spirits. "Telepathy" is the communication of ideas through other than physical means. "Clairvoyance" is the power of seeing through means other than the physical eye. "Clairaudience" is the power of hearing through means other than the physical ear. "Levitation" is the lifting of an object by other than the physical means. "Materialization" is the appearance of a spirit in matter. "Apport" is the production of objects without physical means or the passing of objects through objects (*e.g.,* walls) which have no openings.

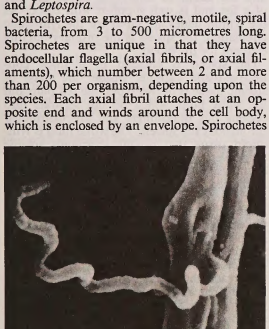
An important later development of spiritualism has been in the direction of "spirit healing." Unorthodox healings have in the past been associated with sacred places and religious rites, and medical science is inclined to attribute all such healings to the normal process of suggestion working under favourable conditions. But it is also claimed that there is a genuine power of paranormal healing found in certain persons, and from the spiritualist point of view these healers are regarded as mediums who acts as agents of spirit doctors. Healings are claimed for a variety of conditions, some of which are regarded as incurable by orthodox medicine.

The attempt to communicate with discarnate spirits seems to be one of the forms that religion may take in human societies and to be widely distributed in space and time. Practices very like those of a modern spiritualistic séance have been reported in various parts of the world, as, for example, Haiti and among the North American Indians, and there is no reason for supposing that these are of recent origin. The record of a materialization séance of long ago is preserved in the account in the Old Testament of Saul's visit to the witch, or medium, of Endor, in the course of which a materialization appeared that was regarded by the king as the prophet Samuel (I Sam. 28:7–19). Certain mediumistic phenomena were reported in the witch trials of the Middle Ages, particularly the appearance of spirits in quasi-material form and the obtaining of knowledge through spirits. It may be supposed that many of those persecuted for the practice of witchcraft were what would now be called mediums—although their mediumship was coloured by the fact that it was organized in a forbidden cult, and the spirits with which communication was established where regarded as devils. Some mediumistic phenomena were also found among those regarded in the Middle Ages as possessed by devils; *e.g.,* speaking in languages unknown to the speaker and levitation or partial levitation.

Although spiritualistic practices seem to be widespread, they were virtually unknown in modern civilized society until March 1848, when odd happenings were reported at the house of a farmer named Fox in a small town in New York state. Previous occupants of the house had been disturbed by unexplained raps at night. After a severe disturbance by raps during Mr. Fox's tenancy, his youngest daughter, Kate, was said to have successfully challenged the supposed spirit to repeat the number of times she flipped her fingers. Once communication had apparently been established a code was agreed upon by which the raps given could answer questions, and the spirit was said to have identified himself as a man who had been murdered in the house.

The practice of having sittings for communication with spirits spread rapidly from that time. Kate Fox (afterward Mrs. Fox-Jencken) and one of her sisters gave much of their later lives to acting as mediums in the United States and in England. Many other mediums gave similar sittings, and the movement became widespread. The attempt to communicate with spirits by table turning became a popular pastime in Victorian drawing rooms.

Much of this activty was motivated by mere curiosity and the fascination of the supernatural, but it also had a more serious intention. Many inquirers wished to convince themselves as to human survival of bodily death; others suffered from the loss of loved relatives and friends and found consolation in the belief that they were able to communicate with them; others wanted information about the future life. To promote these serious ends, spiritualist associations or churches were formed.



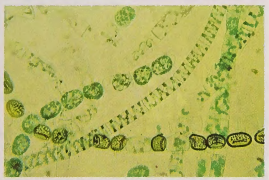
The rise of this new cult was not allowed to take place without opposition. There was not only verbal condemnation with accusations of fraud but also mob violence. This was, no

doubt, partly a popular reaction to a novel system of ideas and practices that were suspected of being based on either fraud or evil. The suspicion of evil was perhaps strengthened by a conjectured relationship to the discarded system of witchcraft. Although individual spiritualists were often members (or even ministers) of Christian churches, the general tendency of the established religious bodies was to suspect the movement and its claim to a new revelation that would either supplement or replace the Christian revelation. The spiritualist practices seemed also to some religious bodies to be a part of the forbidden activity of necromancy. A decree of the Holy Office of the Roman Catholic church in 1898 condemned spiritistic practices, although permitting legitimate scientific investigation of mediumistic phenomena.

For those who had lost their faith in traditional Christianity, there was offered a new religion based not on an ancient tradition but on fact that could be observed by anyone. For those to whom materialistic ways of thinking had closed the possibility of a life after death, there was offered a new hope of immortality. To those suffering from grief after the death of their loved ones, there was offered the possibility of communicating with them. There were strong emotional involvements in both the rejection and the acceptance of spiritualism that have made difficult an impartial appraisal of the evidence.

**spirochete,** also spelled SPIROCHAETE (order Spirochaetales), any of a group of spiral-shaped bacteria, some of which are serious pathogens for humans, causing such diseases as syphilis, yaws, and relapsing fever. Spirochetes include the genera *Spirochaeta, Treponema, Borrelia,* and *Leptospira.*

Spirochetes are gram-negative, motile, spiral bacteria, from 3 to 500 micrometres long. Spirochetes are unique in that they have endocellular flagella (axial fibrils, or axial filaments), which number between 2 and more than 200 per organism, depending upon the species. Each axial fibril attaches at an opposite end and winds around the cell body, which is enclosed by an envelope. Spirochetes



Scanning electron micrograph of the spirochete *Treponema pallidum* attached to testicular cell membranes
ASM/Science Source

are characteristically found in a liquid environment (*e.g.,* mud and water, blood and lymph).

*Treponema* includes the agents of syphilis (*T. pallidum*) and yaws (*T. pertenue*). *Borrelia* includes several species transmitted by lice and ticks and causing relapsing fever (*B. recurrentis* and others) in humans. *Spirochaeta* are free-living, nonpathogenic inhabitants of mud and water, usually in oxygen-free regions. Leptospirosis, caused by *Leptospira,* is principally a disease of domestic and wild mammals and is a secondary infection of humans.

**spirogyra,** also called WATER-SILK, MERMAID'S TRESSES, or POND SCUM (genus *Spirogyra*), any of a group of unbranched filamentous green algae, found in freshwater and usually free-floating. The slippery unbranched

*Spirogyra,* conjugative and vegetative forms
Russ Kinne—Photo Researchers/EB Inc.

filament is composed of cylindrical cells containing one or more beautiful spiral green chloroplasts, from which the genus gets its name. The nucleus is suspended in the central vacuole by fine cytoplasmic filaments. Vegetative reproduction is by fragmentation of the filament. The sexual phenomenon of conjugation also occurs; cells of two strands lying side by side are joined by the outgrowth of conjugation tubes. Rarely, cells of the same strand join end to end, and the contents of one cell passes into and fuses with the contents of the other. The resulting fused cell (zygote) is surrounded by a thick wall and overwinters while the vegetative filaments die.

On bright spring or fall days, masses of spirogyras float near the surface of streams and ponds, buoyed by oxygen bubbles released during photosynthesis. During the night, when photosynthesis decreases, the masses sink.

**spirotrich** (class Spirotrichea), any of a group of ciliated protozoans characterized by nonuniform, sparse ciliation and prominent membranelles of fused cilia around the mouth opening. The subclass contains a number of orders. *See* heterotrich; hypotrich; odontostome; oligotrich; tintinnid.

**spit,** in geology, narrow coastal land formation that is tied to the coast at one end. Spits frequently form where the coast abruptly changes direction and often occur across the mouths of estuaries; they may develop from each headland at harbour mouths. Spits, which may be composed of sand or shingle, are formed by the longshore movement of sediment. They often are complexly curved, with a characteristic recurved head (hook); this probably results from the refraction of waves around the spit's end.

**Spitfire,** also called SUPERMARINE SPITFIRE, British aircraft that was one of the fastest and most effective single-seat fighters of World War II. It was highly effective as a defensive interceptor during the Battle of Britain.

The Spitfire was a low-wing monoplane that was first flown in 1936 and was first put into service with the Royal Air Force in 1938. It was modified continuously throughout the war to serve in a variety of roles: fighter (with notable success at high altitudes), fighter-bomber, and photoreconnaissance plane. The version that entered active service in 1938 had a top speed of about 360 miles (580 km) per hour and an armament of eight .303-inch machine guns. The Spitfire XIV, one of the last models of the war, had a ceiling of 40,000 feet (12,200 m) and a top speed of 440 miles (710 km) per hour; that version shot down more than 300 German V-1 missiles in 1944. During the war the Spitfire's armament was increased to two 20-millimetre cannons along with two .50-inch machine guns or four .303-inch machine guns. Some Spitfire versions could also carry a 250- or 500-pound (115- or 230-kilogram) bomb under the fuselage and a 250-pound bomb under each wing. The last Spitfires in active service (as photoreconnaissance planes) with the Royal Air Force were retired in 1954.

**Spithead,** strait of the English Channel, forming an extensive, deep, and sheltered channel between the northeastern shore of the Isle of Wight and the mainland of England. The Spit Sand forms the western side of the channel leading into Portsmouth harbour. Besides its special association with the Royal Navy—major naval reviews have been held off Cowes (on the Isle of Wight)—Spithead provides the safest approach for large craft entering and leaving Southampton Water, one of England's most important commercial harbours. A lesser channel, The Solent (*q.v.*), forms a westward continuation of the Spithead strait.

**Spitsbergen,** main island within the archipelago of Svalbard (*q.v.*).

**Spitta, (Julius August) Philipp** (b. Dec. 7, 1841, Wechold, Hanover [Germany]—d. April 13, 1894, Berlin, Ger.), German scholar, one of the principal figures in 19th-century musicology and author of the first comprehensive work on Johann Sebastian Bach.

Spitta studied at Göttingen and in 1874 helped found the Bachverein (Bach Society) in Leipzig. In 1875 he became professor of musical history at the University of Berlin. His *Johann Sebastian Bach,* 2 vol. (1873–80), dealt with Bach's life and with religious and technical aspects of his work. His editions of the works of Heinrich Schütz and Dietrich Buxtehude established a high standard of scholarship. With Johannes Brahms, K.F.F. Chrysander, and others, he was a chief founder, in 1892, of the great edition of the works of German composers, *Denkmäler deutscher Tonkunst* ("Monuments of German Music"). He also founded, with Chrysander and Guido Adler, the first true journal of musicology, "Vierteljahrsschrift für Musikwissenschaft" (1885–94; "Quarterly Journal of Musicology").

**Spittal,** also called SPITTAL AN DER DRAU, town, *Bundesland* ("federal state") Kärnten, southern Austria. It lies along the Drava (Drau) River at the mouth of the Lieser valley, just west of Millstätter Lake and northwest of Villach. Named for a hospital founded there by the counts of Ortenburg in 1191, it received market rights in 1242 but achieved municipal status only in 1930. Many old houses, the parish church, the town hall, and the former Renaissance palace of the Porcia princes date from the 16th century. A tourist centre and rail junction, Spittal manufactures wood products, paper, building materials, shoes, and chemicals. Pop. (1981) 14,736.

**Spitteler, Carl** (b. April 24, 1845, Liestal, Switz.—d. Dec. 29, 1924, Luzern), Swiss poet of visionary imagination and author of pessimistic yet heroic verse.

A private tutor for eight years in Russia and Finland, Spitteler wrote his first great poetic work, the mythical epic *Prometheus und Epimetheus* (1881), following his return. Dur-

Spitteler, photograph by R. Dührkoop
By courtesy of the Bibliotheque Nationale Suisse, Bern

ing the next few years, when he had to make his living by teaching and journalism, he began to express himself in a wide range of literary forms. In 1892 a legacy enabled him to settle in Luzern and devote himself to creative work.

Spitteler's second great work (which won him the Nobel Prize in 1919) was the poetic epic *Der olympische Frühling* (1900–05; revised 1910; "The Olympic Spring"), in which he found full scope for bold invention and vividly expressive power. The last years of his life were given up to rewriting his first work. Tighter in composition than the early version and, like *Der olympische Frühling,* in rhyming couplets, it appeared in 1924 under the title *Prometheus der Dulder* ("Prometheus the Long-suffering").

The widely varied peripheral works belong to Spitteler's middle period. He produced, in verse, *Extramundana* (1883), seven cosmic myths of his own invention; *Balladen* (1896); *Literarische Gleichnisse* (1892; "Literary Parables"); and two cycles of lyrics, *Schmetterlinge* (1889; "Butterflies") and *Gras- und Glockenlieder* (1906; "Grass and Bell Songs"). He also wrote two masterly stories—*Die Mädchenfeinde* (1907; *Two Little Misogynists,* 1922), a childhood idyll derived from his own experience; and *Conrad der Leutnant* (1898), a dramatically finished *Novelle* in which he approached the Naturalism he otherwise hated. His novel *Imago* (1906) so sharply reflected his inner conflict between a visionary creative gift and middle-class values that it influenced the development of psychoanalysis. He published a volume of stimulating essays, *Lachende Wahrheiten* (1898; *Laughing Truths,* 1927), and some biographical works of charm, including *Meine frühesten Erlebnisse* (1914; "My Earliest Experiences"). In 1914 he published a politically influential tract, "Unser Schweizer Standpunkt," directed against a one-sided pro-German view of the war. An English translation of *Selected Poems* appeared in 1928.

**spitting spider,** any member of the family Scytodidae (order Araneida). Most species have six pearly-white eyes rather than the usual eight. Spitting spiders ensnare their prey by spitting a mucilaginous saliva. They are

Spitting spider (*Scytodes thoracica*)
Ann Moreton

most common in shady spots in the tropics. *Scytodes thoracica,* common in the eastern United States, is yellow with black spots. The body is 3½–5½ millimetres (⅛–¼ inch) long.

"Poor Poet," painting by Carl Spitzweg, 1839; in the Neue Pinakothek, Munich
By courtesy of the Bayerische Staatsgemäldesammlungen, Munich

**spittlebug:** *see* froghopper.

**spitz,** any of a group of northern dogs, such as the chow chow, Pomeranian, and Samoyed, characterized by dense, long coats, erect pointed ears, and tails that curve over their backs. In the United States, the name spitz is often given to any small, white, long-haired dog. It is also used for the American Eskimo dog, an all-white breed that weighs about 20 pounds (9 kilograms) and resembles a small Samoyed (*q.v.*). The American Eskimo dog is recognized by the United Kennel Club, a U.S. organization, but not by the more widely known American Kennel Club.

There are a number of dogs known as spitz in Europe. Among these is the Finnish spitz, a breed recognized by the Kennel Club of England. The Finnish spitz stands about 16 to 19 inches (40 to 48 centimetres), has a bright reddish brown coat, and is characterized by a lively and alert disposition. Other spitz breeds include the Eskimo dog (*q.v.*), or Greenlandic dog, and the Lapland spitz, a breed with a white, brown, black, or blackish brown coat.

**Spitz, Mark (Andrew)** (b. Feb. 10, 1950, Modesto, Calif., U.S.), U.S. swimmer, first athlete to win seven gold (first-place) medals in a single Olympic Games (1972, Munich).

Like many other outstanding U.S. swimmers, Spitz trained for several years at the Santa Clara Swim Club (California). A graduate (1972) of Indiana University, Bloomington, he served as captain of the school's intercollegiate swimming team. In the Olympic Games of 1968 (Mexico City) he aroused controversy by publicly predicting that he would capture six gold medals. In fact he won only two, both in team relay races (400-metre and 800-metre freestyle). In the 1972 Games, however, he placed first and set world records in all four individual men's events he entered: the 100-metre and 200-metre freestyle (51.2 sec and 1 min 52.8 sec), and the butterfly over the same distance (54.3 sec and 2 min 0.7 sec). He added three more gold medals as a member of victorious U.S. men's teams (in the 400-metre and 800-metre freestyle relays and the 400-metre medley relay), which also set world records (all records subsequently broken).

**Spitzweg, Carl** (b. Feb. 5, 1808, Munich—d. Sept. 23, 1885, Munich), German painter who is recognized as the most representative of the Biedermeier (early Victorian) artists in Germany.

Trained in pharmacy at the University of Vienna, Spitzweg was a pharmacist and newspaper illustrator before becoming a painter in 1833. Though widely travelled in Europe, he was provincial in his choice of subjects; tenderly, humorously, but with firm control of light, shadow, compositon, and detail, he portrayed small town misfits, street musicians, postmen, night watchmen, and lovers bidding farewell.

**spleen,** lymphoid organ located in the left side of the abdominal cavity under the diaphragm, the muscular partition between the abdomen and the chest. In man it is about the size of a fist and is well supplied with blood. As the lymph nodes are filters for the lymphatic circulation, the spleen is the primary filtering element for the blood.

The spleen is encased in a thick connective-tissue capsule. Inside, the mass of splenic tissue is of two types, the red pulp and the white pulp, which do not separate into regions but intermingle and are distributed throughout the spleen. The white pulp is lymphoid tissue that usually surrounds splenic blood vessels. The red pulp is a network of channels (sinuses) filled with blood, and it is in the red pulp that most of the filtration occurs.

The white pulp of the spleen contains such typical lymphoid elements as plasma cells, lymphocytes, and lymphatic nodules, called follicles in the spleen. Like the lymph nodes, it reacts to microorganisms and other antigens that reach the bloodstream. Phagocytic cells in both red and white pulp serve to remove foreign material from the blood and initiate an immune reaction that results in the production of antibodies. Germinal centres in the white pulp are sites of lymphocyte production.

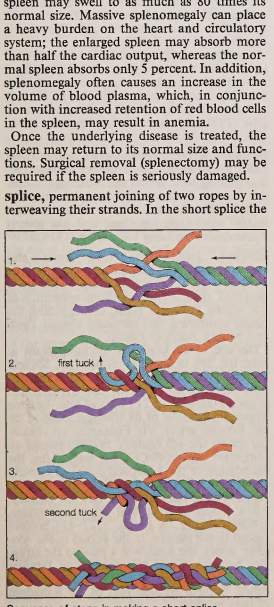
The red pulp has a specialized role in addition to filtration. It is the body's major site of the destruction of red blood cells, which normally have a life span of only 120 days. Degenerate red cells are removed from the circulation in the spleen, and the hemoglobin that they contain is degraded to a readily excretable pigment and an iron molecule that is recycled; *i.e.,* used to produce new hemoglobin elsewhere.

In some species the spleen also acts as a reservoir for blood during periods of inactivity. When such an animal is aroused for defense or flight, the capsule of the spleen contracts, forcing additional blood reserves into the circulation. The human spleen probably does not have this capability.

For depiction of the spleen in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

**splenitis,** enlargement and inflammation of the spleen as a result of infection, parasite infestation, or cysts.

Infections spread readily to the spleen from other parts of the body. In pneumonia the spleen is moderately enlarged and soft; the cut surface is reddish to gray, while the tissue may be mushy in consistency. In typhoid the enlargement is greater because of the large amount of blood congestion. In infectious mononucleosis, so called because of the presence of abnormal numbers of white blood cells of the type called mononuclear leukocytes, swelling three to four times the normal size occurs. There are large clumps of white blood cells in the sinuses and pulp.



Abscesses of the spleen are fairly uncommon. When they occur, they are usually the result of a nearby bacterial infection in the upper abdomen. Stomach ulcers, blood clots in the arteries or veins, and splenic blood tumours (hematomas) can complicate these infections. Treatment may include surgical drainage and administration of antibiotic drugs.

**splenomegaly,** enlargement of the spleen, the abdominal organ that serves as a temporary storage site for blood and filters out degenerated and old blood cells. Splenomegaly may arise as a symptom of a number of diseases, including certain systemic infections, inflammatory diseases, hematologic diseases, inherited spleen disorders, cysts, and neoplastic diseases. In one form of the disorder, called congestive splenomegaly, the spleen becomes engorged with blood because of impaired flow through the splenic vein, which empties into the portal vein. Such impairment may be caused by liver disease, portal vein or splenic vein pathology, constrictive pericarditis, or congestive cardiac failure.

Depending on the underlying cause, the spleen may swell to as much as 80 times its normal size. Massive splenomegaly can place a heavy burden on the heart and circulatory system; the enlarged spleen may absorb more than half the cardiac output, whereas the normal spleen absorbs only 5 percent. In addition, splenomegaly often causes an increase in the volume of blood plasma, which, in conjunction with increased retention of red blood cells in the spleen, may result in anemia.

Once the underlying disease is treated, the spleen may return to its normal size and functions. Surgical removal (splenectomy) may be required if the spleen is seriously damaged.

**splice,** permanent joining of two ropes by interweaving their strands. In the short splice the strands of each rope are unlayed (untwisted), interwoven, and tucked into the lay (twist) of the other rope. For neatness the strands are usually trimmed down before the final tuck is made.

Sequence of steps in making a short splice

For making a permanent eye (closed circle) in a single rope, the eye splice, in which the free end is unlayed and interwoven at some point in the standing part of the rope, is employed, especially on sailing vessels.

**Split,** Italian SPALATO, seaport, resort, and chief city of Dalmatia, in Croatia. It is situated on a peninsula with a deep, sheltered harbour on the south side, which, combined with its central position on the Adriatic coast and its good rail and road connections to the northern parts of the country, has made it of great commercial importance. The port of Split has a large shipyard. It produces plastics, chemicals, aluminum, and cement. Several island ferries depart from Split, and an international airport has been expanded since 1962. Split has a university (1974) and an oceanographic institute. The growth of the port facilities dates from the temporary loss of Fiume (Rijeka) to Italy in 1924 (recovered 1945).

The nucleus of the old town is built within the Palace of Diocletian, who abdicated the imperial crown in AD 305 and lived there until his death in 313. The immense palace (built 295–305) has walls 7 feet (2 m) thick and 72 feet (22 m) high on its seaward side and 60 feet (18 m) high on the northern side. Originally it had 16 towers, of which 3 remain, and 4 gates. A tree-lined promenade keeps the Adriatic from lapping against the south walls as it once did. The palace was damaged by the Avars, who in 614 had sacked nearby Solin (Salonae); its inhabitants first fled to the islands but then returned to seek refuge in the palace (*c.* 620), calling the settlement Spalatum. They built their homes within the 7-acre (3-hectare) palace compound, incorporating its walls and pillars.

The palace is the largest and best-preserved example of Roman palatial architecture, representing a transitional style half-Greek and half-Byzantine. Its ground plan is like a Roman camp—*i.e.,* rectangular, with four streets meeting at the middle. The streets are lined with massive arcades. At the north end were the quarters for a large population of slaves, servants, and garrisons; at the south end were the imperial apartments and offices, impressive vaulted structures. The mausoleum of Diocletian was converted to a cathedral in 653 by the first bishop of Split; it is noteworthy for its fine frescoes, marble pulpit, and Romanesque carvings. The Temple of Jupiter long has been transformed into a baptistery, to which a beautiful Romanesque campanile was added in the 14th and 15th centuries. The area within the walls of the palace has been continuously inhabited since it was built. It contains buildings and embellishments of medieval, Renaissance, and Baroque periods as well as Roman. Efforts have been made not only to further excavate the Roman remains and identify and elucidate remains of the early medieval period but also to preserve the eclectic architecture of the palace and its modern character. The palace is still thought of by the inhabitants of Split as the city centre and not a museum: the cathedral and baptistery are in use, the peristyle court is a café, shops occupy the Roman arcades, and the main market is just outside the east gate of the palace. Tourists can see architectural remains of all periods from Roman times onward while walking under the laundry lines of the modern citizens.

Museums include one devoted to the works of the Croatian sculptor Ivan Meštrović and one of armaments. The Venetian Gothic town hall is a museum of ethnography. West and south of the main square is a maze of narrow streets, the medieval expansion of the old town. The belfry (*c.* 100) of Our Lady of the Belfry Church is the oldest in Dalmatia.

From 812 Split developed as a major Byzantine city. In 1105, after brief incursions by Venice (998) and Croatia (1069), the city acknowledged the nominal suzerainty of Hungary-Croatia and fought sporadically with its rival Trogir; from 1420 to 1797 it was held by Venice. The Austrians ruled from 1797 to 1918 with a brief French interregnum in 1808–13. Split became part of Yugoslavia in 1918 and of independent Croatia in 1992. During World War II the port facilities were wrecked by the Germans and by Allied bombing, but the old city was little damaged. A new sports complex was built for the 1980 Mediterranean Games. Pop. (1991) 200,459.

**Spock, Benjamin (McLane)** (b. May 2, 1903, New Haven, Conn., U.S.—d. March 15, 1998, La Jolla, Calif.), American pediatrician whose books on child rearing, especially his *Common Sense Book of Baby and Child Care* (1946; 6th ed., 1992), influenced generations of parents; translated into some 39 languages, it sold nearly 50 million copies. The book, urging parental understanding and flexibility, made his name a household word.

Spock received his medical degree in 1929 from Columbia University's College of Physicians and Surgeons and trained for six years at the New York Psychoanalytic Institute. He practiced pediatrics in New York City and taught psychiatry and child development at various universities, including Western Reserve, Cleveland (1955–67), from which he resigned in order to devote himself more fully to the antiwar movement. Spock's bitter opposition to U.S. involvement in the Vietnam War during the 1960s led to his trial and conviction (1968) for counseling draft evasion—a conviction overturned on appeal. In 1972 he was the presidential candidate of the pacifist People's Party.

Spock's many other books on child care include *Dr. Spock Talks with Mothers* (1961), *Raising Children in a Difficult Time* (1974), and *Dr. Spock on Parenting* (1988). Spock also wrote *Decent and Indecent: Our Personal and Political Behavior* (1970). In 1989 *Spock*

*on Spock: A Memoir of Growing Up with the Century*, edited by Spock's second wife, Mary Morgan, was published.

**Spode porcelain,** porcelain introduced about 1800 in the factory of Josiah Spode and Josiah Spode II at Stoke-on-Trent, Staffordshire, Eng. This hybrid porcelain—combining the ingredients of hard-paste porcelain (china clay and china stone) and bone ash—became the standard English bone china. Early Spode porcelain consists of elaborate services and outsize vases, lavishly decorated and gilded in the Empire style. So-called Japan patterns (deriving vaguely from Japanese Imari ware)

Spode bone china potpourri with a Japan pattern, Staffordshire, England, *c.* 1835; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

were also executed at the Spode factory in the early 19th century. About 1813 William Copeland, who had run the company's London warehouse and had been a partner since about 1797, was succeeded by his son, William Taylor Copeland. When Josiah Spode III died in 1829, the firm continued under various combinations of the name Copeland. In 1846 Copeland introduced Parian ware, a white matte unglazed porcelain, resembling marble, in which statuettes were modeled.

**spodosol,** ashy gray acidic soil type showing strong horizon development of cool, humid forested areas. Formed mostly of underlying sandy parent materials, spodosols tend to be strongly leached, with low fertility and limited water storage capacity. Many areas where these soils occur have not been cleared of trees for farming. Large tracts of spodosol border the tundras of North America and Eurasia. Characteristic of these soils are subsurface horizons in which amorphous materials composed of organic matter, aluminum, and iron have accumulated. The heavy application of fertilizers and lime has enabled cultivation of grains, potatoes, berries, and silage corn (maize) on spodosol soils in the cool climate of the north-central United States.

**spodumene,** also called TRIPHANE, a lithium aluminum silicate mineral ($LiAlSi_2O_6$) in the pyroxene family, an important ore of lithium and a source of ceramic materials. It is ordinarily found in lithium-bearing granite pegmatites. When brilliant and glassy, clear spodumene is valued as a semiprecious gem (more by collectors and museums than by the public, because its colour fades when it is exposed to sunlight). Its main varieties are hiddenite (emerald green) and kunzite (pink or lilac).

**Spohr, Louis,** original name LUDWIG SPOHR (b. April 5, 1784, Brunswick, Brunswick [Germany]—d. Oct. 22, 1859, Kassel, Hesse [Germany]), German violinist, composer, and conductor whose compositions illustrate an early aspect of the Romantic period in German music.

Spohr taught himself composition by studying the scores of Wolfgang Amadeus Mozart. He studied violin with the leader of the Brunswick orchestra and in 1802 with Franz Eck, who took him on a tour of Russia. He toured Italy with the great violin virtuoso Niccolò Paganini and in 1817 became conductor of the opera in Frankfurt am Main. In 1820 Spohr made the first of his six tours of England. He became court conductor at Kassel in 1821. In his later years his political radicalism incurred the displeasure of his patron, the elector of Hesse-Kassel, who pensioned him in 1857. Shortly afterward, he broke his left arm and was no longer able to play the violin.

Though opposed to the forward-looking composers of his time—he disliked the works of Carl Maria von Weber and the late works of Ludwig van Beethoven—Spohr regarded Richard Wagner's music highly and conducted *The Flying Dutchman* and *Tannhäuser*. Spohr's 11 operas include *Faust* (1816), one of the earliest German Romantic operas, and *Jessonda*. Of his nine symphonies, the fourth, *Die Weihe der Töne* (*The Consecration of Sound*), was the most successful. He also wrote 15 violin concerti (of which No. 8 continues to be performed), 34 string quartets, 4 double string quartets, and a nonet. A selection of his works was published from 1949 onward at Kassel, where in 1954 a society to propagate his music, the Spohr-Gesellschaft, was founded.

**spoils system,** also called PATRONAGE SYSTEM, practice in which the political party winning an election rewards its campaign workers and other active supporters by appointment to government posts and by other favours. The spoils system involves political activity by public employees in support of their party and the employees' removal from office if their party loses the election. A change in party control of government necessarily brings new officials to high positions carrying political responsibility, but the spoils system extends personnel turnover down to routine or subordinate governmental positions.

The term was in use in American politics as early as 1812, but it was made famous in a speech made in 1832 by Senator William Marcy of New York. In defending one of President Andrew Jackson's appointments, Marcy said, "To the victor belong the spoils of the enemy." In Marcy's time, the term *spoils* referred to the political appointments, such as cabinet offices or ambassadorships, controlled by an elected official.

Arguments in favour of the spoils system defend it as a means of maintaining an active party organization by offering loyal workers occupational rewards. It also guarantees the ruling party loyal and cooperative employees. Supporters of the practice claim this results in more effective government because the appointed officeholders have a stake in helping the elected official to carry out his policies and fulfill his campaign promises.

On the other hand, the spoils system too often resulted in appointments that were based strictly on the needs of the party, without regard for the appointee's qualifications or ability to do the job. Extensive changes in positions that did not affect government policy, such as President Benjamin Harrison's changing 31,000 postmasters in one year, also led to inefficiency.

The spoils system flourished unchallenged in the United States from the 1820s until after the Civil War, at which time the system's abuses prompted civil-service reforms designed to cut down the number of government posts filled by appointment and to award jobs on the basis of merit. The Pendleton Federal Civil Service Act of 1883 provided the initial basis for the adoption of the merit system in the recruitment of federal officials, and by the late 20th century merit systems had almost completely replaced the spoils system at the federal, state, and city levels of government.

In addition to designating the awarding of public offices to party supporters, the term has come to refer to other abuses of political power designed to benefit and enrich the ruling party. These practices may involve, for example, siphoning public funds to the party by contracting with party contributors to handle public projects at inflated rates or by granting public franchises to party contributors at very low prices. The term also includes favouring supporters in areas like the prosecution of law cases, the placement of insurance policies, or the levying of taxes.

Although spoils system is an American political term, the practice of distributing public offices to reward supporters and strengthen a government is and has been common in many other countries as well.

**Spokane,** city, seat (1879) of Spokane county, eastern Washington, U.S., at the falls of the Spokane River.

Frequented by trappers when the North West Company built a trading post there in 1810, the site was settled in 1871 and laid out in 1878. Known as Spokane Falls (for the Spokan Indians), it was incorporated in 1881 after the arrival of the Northern Pacific Railway. Abundant waterpower and a rich hinterland (minerals, forests, and agriculture) encouraged growth as a trade and shipping point for an area (comprising eastern Washington, northern Idaho, northeastern Oregon, western Montana, and southern British Columbia) known as the "Inland Empire." A disastrous fire destroyed much of the city in 1889. Rebuilt, it was reincorporated under its present name in 1900 and established lumber, metal, and food-processing industries. Development of the nearby Coeur d'Alene mineral field (gold, silver, uranium, and copper, among others) and completion of the Grand Coulee Dam Project (1941) assured financial and industrial growth. Spokane Air Force Base and the establishment of aluminum reduction and rolling mills (during World War II) have contributed to the economy. The city's Riverfront Park was the site of EXPO '74.

Gonzaga University (1887), Whitworth College (1890), and several community colleges serve the city. Spokane is a gateway to the resorts of Mount Spokane (5,881 feet [1,793 m]) and the Colville and Kaniksu national forests. Pop. (1991 est.) city, 182,705; Spokane MSA, 372,597.

**Spokane River,** river rising in Coeur d'Alene Lake, Kootenai county, northern Idaho, U.S., and flowing west across the Washington border through Spokane for about 50 miles (80 km) to the Columbia River. The Spokane is 100 miles (160 km) long and has several dams, including Long Lake Dam (1915).

**Spoleto,** Latin SPOLETIUM, town and archiepiscopal see, Perugia *provincia*, in the Umbria *regione* of central Italy; it lies on a detached spur at the southern extremity of the central Umbrian plain, commanding the passes southward and eastward toward Terni and Norcia, north of Rome.

The site of an Umbrian township from at least the 7th to the 6th century BC, Spoleto became a Roman colony in 241 BC. It successfully repulsed an attack by the Carthaginian general Hannibal in 217 BC and later became important because of its strategic location on the Roman artery Via Flaminia. An episcopal see by the 4th century, Spoleto played an important role in the Gothic wars. After the foundation of the Lombard duchy of Spoleto about 570, it became one of the most important towns of Italy until the late 8th century, when it lost a great deal of its autonomy. Under Gregory IX (pope, 1227–41) Spoleto passed to the papacy. In the period of the Avignon popes, the town was a prey to the struggles between Guelf and Ghibelline families until 1354, when papal authority was reestablished. Spoleto became part of the Kingdom of Italy in 1860.

Spoleto has ruins of pre-Roman and Roman walls, as well as a Roman theatre, an amphitheatre, a bridge, and an arch of Drusus (AD 23) with a ruined temple beside it. The medieval town clusters picturesquely on the hillside and is dominated both by the massive Rocca (fortress), built in 1355–64 on the site of the ancient citadel, and by the cathedral, consecrated in 1198 and extensively remodeled in 1634–44. The cathedral, with eight rose windows and a central mosaic by Solsternus (1207), contains a magnificent fresco of the Coronation of the Virgin by Fra Filippo Lippi and pupils, as well as Lippi's tomb. Other notable churches include Santa Eufemia (10th century), San Pietro (13th century), San Gregorio Maggiore (12th century), and San Salvatore, an elaborately decorated monument, usually assigned to the 5th century but possibly dating from the late 8th. The town is supplied with water by an aqueduct that crosses a ravine on an arched bridge built in 1364.

Spoleto is the centre of a large agricultural district (olives), and it also has light industries (cotton goods, phosphorous products, printing). Since 1958 it has held the annual Festival of Two Worlds (drama and music). Pop. (1984 est.) mun., 37,972.

**spondee,** metrical foot consisting of two long (as in classical verse) or stressed (as in English verse) syllables occurring together. The term was derived from a Greek word describing the two long musical notes that accompanied the pouring of a libation. Spondaic metre occurred occasionally in classical verse. It does not, however, form the basis for any English verse, as there are virtually no English words in which syllables receive equal stress. An approximation of a spondaic foot is sometimes achieved with such compounds as "heyday" or "childhood," but even these words can be seen as examples of primary and secondary stress rather than equal stress. In English verse, the spondaic foot is usually composed of two monosyllables. It is frequently used as an introductory variation in a line of iambic metre, such as:

ˊ ˊ ◡ ˊ ◡ ˊ
Green grow | the rush | es, O

(Robert Burns)

**spondylitis,** inflammation of one or more of the vertebrae. Spondylitis takes several forms; the most widely occurring forms are ankylosing spondylitis, hypertrophic spondylitis, and tuberculous spondylitis.

Ankylosing spondylitis (also called Bekhterev spondylitis, deforming spondylitis, or Marie-Strümpell arthritis) is a degenerative disease of the spine that is characteristically seen chiefly in adolescent boys and young men. Its earliest symptom is chronic lower back pain. The progression of the disease can be noted in stiffness and limitation of movement, swollen joints (often indistinguishable from rheumatoid arthritis), fusion (ankylosis) and deformity of the spine, and anemia. Treatment is similar to that for rheumatoid arthritis and may include the use of nonsteroid anti-inflammatory drugs.

Hypertrophic spondylitis, also known as osteoarthritis of the spine, is a degenerative disease seen mostly in individuals over the age of 50. It is characterized by the destruction of intervertebral disks and the growth of spurs on the vertebrae themselves. Treatment includes rest, the application of heat, and exercises to maintain a normal range of movement.

Tuberculous spondylitis (also called Pott's disease, or tuberculosis of the spine) is usually a disease of childhood. It is caused by infection of the spinal column by *Mycobacterium tuberculosis* and is characterized by softening and collapse of the vertebrae, often resulting in a hunchback deformity. Sometimes the spinal nerves are affected, and rigid paralysis may result. Treatment includes chemotherapy against the tuberculosis bacilli and orthopedic care of the spine.

**spondylolisthesis,** forward slipping of the body of one of the lumbar (lower back) vertebrae on the subjacent vertebra or on the sacrum, the triangular bone at the base of the spinal column. The condition is often associated with incompleteness of the vertebral arch, which surrounds the spinal cord. Pressure transmitted to the arch from above encourages slippage. Deformity (lordosis) develops insidiously during childhood and is later followed by mild to severe backache. Rest and back support control the symptoms in most cases, but orthopedic surgery may be necessary, especially if pressure on spinal nerves causes disability.

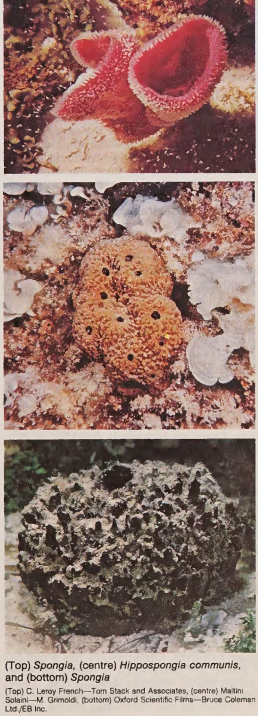
**spondylosis,** noninflammatory degenerative disease of the spine reducing mobility of the intervertebral joints and resulting in abnormal bone development around the vertebrae. It is primarily a condition of age and occurs much more commonly in men than in women; onset of symptoms is gradual, but untreated spondylosis will progress to disabling tingling pain, limited motion, and partial paralysis in affected areas of the body. The lumbar and cervical spine are more frequently affected than the thoracic spine, because curvature of the latter prevents spondylosis from impinging on the spinal cord; lumbar and cervical spondylosis frequently occur simultaneously in the same individual.

Spondylosis involves both hypertrophic degenerative changes (excessive growth of bone) and reactive osteoarthritis. The narrowing of the intervertebral spaces by the former process produces symptoms by compressing nerves that emerge from the spinal cord; these symptoms are worsened when arthritic bone growth further narrows the spinal canal. Eventual fusion of the intervertebral joints results when connecting ligaments are replaced with bone or when osteoarthritic bony spurs unite.

Lumbar spondylosis is treated by surgical decompression of the affected nerves to relieve leg pain and paralysis, although low back pain may recur after surgery. Mild, uncomplicated cervical spondylosis may respond to rest and traction, but more severe cervical symptoms also require surgical decompression.

**sponge,** any member of some 5,000 species of primitive multicellular aquatic animals that constitute the phylum Porifera. Sponges are characterized by the presence of a porous skeleton of interlocking spicules (bony, needle-like structures), glasslike rods, or horny fibres; they live in colonies or as solitary animals attached to the sea bottom or to other solid objects. Commercial natural sponges are the skeletons that support the sponge animal.

A brief treatment of sponges follows. For full treatment, *see* MACROPAEDIA: Sponges.



All of the 5,000 species of sponge are marine except for about 20 freshwater species (*Spongilla*). They occur in all seas, from the intertidal zone to depths of 8,500 m (more than 28,000 feet), and are most common in warm waters. They range in length from a few centimetres to several metres (an inch to several yards). Some rounded forms may be several metres in diameter. The body shape is variable; it may be fingerlike, treelike, or bushy. Some sponges are tubular; others are flat or shapeless masses.

Sponges are divided into three classes: Calcispongiae (Calcarea), Hyalospongiae (Hexactinellida), and Demospongiae. Calcispongiae, or calcareous sponges, are marine sponges containing needlelike or branching spicules of lime. The Hyalospongiae, or glass sponges, have a skeleton often composed of six-rayed spicules of silica; the spicules may be united into a continuous network. The skeletons of some such as that of the Venus's flower basket are often beautiful and prized as curios.

The Demospongiae, or siliceous sponges, a class that includes about 80 percent of all sponges, have a skeleton composed of spongin, a plasticlike material. Most are shallow-water species; among them are the commercial bath sponges and the freshwater sponges.

The body of the living sponge is covered by a thin, slimy, usually dark epidermal layer consisting of flat cells called pinacocytes. Numerous perforations lead through the skin into a central cavity, the spongocoel, which is lined with choanocytes—flagellum-bearing cells. These whiplike structures create currents that draw water into the spongocoel through the perforations; the water passes out through one or several large openings, the oscula (singular osculum). Between the outer and inner cell layers is the mesoglea, a jellylike substance containing free-moving cells known as amoebocytes.

The choanocytes ingest food particles—bacteria, other microorganisms, and organic debris—and absorb oxygen from the water current. The amoebocytes produce spherical eggs. After fertilization the larvae swim by means of hairs, or cilia, until they find a suitable site for permanent attachment; they then quickly develop into mature animals. Some species also reproduce by budding, an asexual process

(Top) *Spongia*, (centre) *Hippospongia communis*, and (bottom) *Spongia*

(Top) C. Leroy French—Tom Stack and Associates, (centre) Mattini Solaini—M. Grimoldi, (bottom) Oxford Scientific Films—Bruce Coleman Ltd./EB Inc.

in which a section of the adult animal separates and becomes established as a distinct individual.

Some sponges live in close association with other animals. The back of the crab *Dromia,* for example, is always covered with a growth of sponge, which serves as camouflage. Certain spider crabs transplant sponges into their own bodies. Large sponges often harbour smaller organisms that burrow into them but do not feed on the sponge tissue. The boring sponge (clionid) lives on dead and living seashells, disintegrating and absorbing the shell substance. Among the few natural enemies of sponges is a fungus that is sometimes a serious pest of commercial sponges.

The so-called bath sponge, or commercial sponge, is obtained mainly from the eastern Mediterranean and from the Gulf of Mexico and the Caribbean Sea (off the western coast of Florida and the West Indies and elsewhere) usually at depths of less than 60 m (200 feet). Sponges are harvested by means of hooks or harpoons used by men in boats, or they are cut from the bottom by skindivers. One of the most commonly used species of commercial sponge is *Spongia officinalis,* sometimes called the glove sponge, which grows in a variety of shapes and reaches a height of 12 to 15 cm (5 to 6 inches). *Hippospongia canaliculata,* variety *gossypina,* the sheep's-wool sponge, is valued for its wooly texture; it has an irregular, shaggy surface. Once in considerable demand, commercial sponges have largely been replaced by synthetic sponges.

**sponge gourd:** *see* dishcloth gourd.

**sponge rubber:** *see* foam rubber.

**Spongilla,** sponge genus that includes the freshwater sponge (*q.v.*) species.

**spongillafly,** any insect of the parasitic neuropteran family Sisyridae. The adult, a smoky brown insect, deposits clusters of eggs under a silky web near or on the water. The larva lives as a parasite on a freshwater sponge. It leaves the water when fully grown and spins a double-walled, lacelike cocoon in which it passes the pupal stage. Spongillaflies are found throughout the world wherever there are freshwater sponges.

**spontaneous abortion:** *see* miscarriage.

**spontaneous combustion,** the outbreak of fire without application of heat from an external source. Spontaneous combustion may occur when combustible matter, such as hay or coal, is stored in bulk. It begins with a slow oxidation process (as bacterial fermentation or atmospheric oxidation) under conditions not permitting ready dissipation of heat—*e.g.,* in the centre of a haystack or a pile of oily rags. Oxidation gradually raises the temperature inside the mass to the point at which a fire starts. Crops are commonly dried before storage or, during storage, by forced circulation of air, to prevent spontaneous combustion by inhibiting fermentation. For the same reason, soft coal in small size is wetted to suppress aerial oxidation.

**spontaneous fission,** type of radioactive decay in which certain unstable nuclei of heavier elements split into two nearly equal fragments (nuclei of lighter elements) and liberate a large amount of energy. Spontaneous fission, discovered (1941) by the Russian physicists G.N. Flerov and K.A. Petrzhak in uranium-238, is observable in many nuclear species of mass number 230 or more. Among these nuclides, those with lower mass numbers generally have longer half-lives. Uranium-238 has a half-life of about $10^{16}$ years when it decays by spontaneous fission, whereas fermium-256 decays with a half-life of about three hours.

Nuclides that undergo spontaneous fission also are subject to alpha decay (emission from the nucleus of a helium nucleus). In uranium-238, alpha decay is about 2 million times more probable than is spontaneous fission, whereas in fermium-256, 3 percent of the nuclei undergo alpha decay and 97 percent undergo spontaneous fission.

The fission that occurs in nuclear reactors and explosive devices is induced by the neutron bombardment of certain types of nuclei.

**spontaneous generation,** also called ABIOGENESIS, the hypothetical process by which living organisms develop from nonliving matter; also, the archaic theory that utilizes this process to explain the origin of life. Pieces of cheese and bread wrapped in rags and left in a dark corner, for example, were thus thought to produce mice, according to this theory, because after several weeks, there were mice in the rags. Many believed in spontaneous generation because it explained such occurrences as the appearance of maggots on decaying meat.

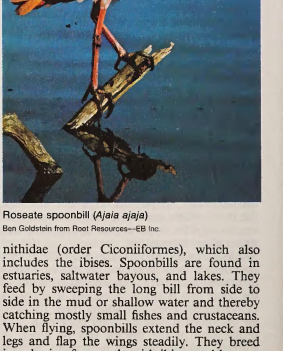
By the 18th century it had become obvious that higher organisms could not be produced by nonliving material. The origin of microorganisms such as bacteria, however, was not fully determined until Pasteur proved in the 19th century that microorganisms reproduce. *See also* biopoiesis.

**Spontini, Gaspare (Luigi Pacifico)** (b. Nov. 14, 1774, Maiolati, Papal States [Italy]—d. Jan. 24, 1851, Maiolati), Italian composer and conductor whose early operas, notably his masterpiece, *La vestale* (1807), represent the spirit of the Napoleonic era and form an operatic bridge between the works of Christoph Gluck and Richard Wagner.

Entering the Conservatorio della Pietà dei Turchini in Naples in 1793, he studied music with Nicola Sala and Giacomo Tritto before his first opera, *Li puntigli delle donne* ("The Obstinacy of Women"), was performed in Rome (1796). Its success led him to continue writing comic operas in Rome—the most famous was *L'eroismo ridicolo* (1798; "Ridiculous Heroism")—before he moved to Paris, where he established himself with *Milton* (1804). Influenced by French composers, Spontini developed the dramatic composition *La vestale* ("The Vestal Virgin") that established his European reputation. He became conductor of the Italian Opera in 1810 but left two years later for political reasons and became the court composer to Louis XVIII in 1814. He left Paris in 1819 after the failure of his opera *Olimpie.* In 1820 he received an appointment from Frederick William III of Prussia as director of music at Berlin. This appointment lasted until shortly after the king's death in June of 1840, when political intrigue forced Spontini to relinquish his duties and leave Berlin.

Additional significant operas by Spontini include *La finta filosofa* (1799; "The Fake Philosopheress"), *La fuga in Maschera* (1800; "The Masked Flight"), *Olimpie* (1819), *Nurmahal* (1822), *Alcidor* (1825), and *Agnes von Hohenstaufen* (1829).

**spookfish,** any of about 11 species of small marine fishes constituting the family Opisthoproctidae (order Salmoniformes), with representatives in each of the major oceans. The name spookfish, or barreleye, as they are sometimes called, originates from their unusual eyes, which are pointed upward and are borne at the end of short tubular stalks. Specimens have been collected at depths of almost 900 m (3,000 feet) and are nearly always found at least 100 m (330 feet) below the surface.



The barreleye (*Macropinna microstoma*), a spookfish of the Pacific, occurs along the North American coast. It is less than 10 cm (4 inches) in length and brownish in colour.

**spool furniture:** *see* bobbin furniture.

**spoon,** an implement consisting of a small, shallow, bowl-shaped receptacle supported by a handle, used for eating, serving, and cooking foods. Spoons, together with forks, are known as flatware (*q.v.*).

**Spoon River,** river in west-central Illinois, U.S. It rises in southwestern Bureau county and flows south and southwest to a point near Lewistown, where it turns southeast, joining the Illinois River opposite Havana after a course of 160 miles (257 km). The Dickson Mounds, a rich archaeological area, are near the confluence of the two rivers. Spoon River was made famous by Edgar Lee Masters, the poet who wrote *Spoon River Anthology* (1915), dealing with the frustrated ambitions of people who lived in the fictitious town of Spoon River, actually a compound of two towns, Petersburg and Lewistown. The river's name is probably a translation of *maquon,* Algonquian Indian for "mussel shell," which the Indians used as a spoon.

**spoonbill,** any member of six species of long-legged wading birds that constitute the subfamily Plataleinae of the family Threskior-

Roseate spoonbill (*Ajaia ajaja*)
Ben Goldstein from Root Resources—EB Inc.

nithidae (order Ciconiiformes), which also includes the ibises. Spoonbills are found in estuaries, saltwater bayous, and lakes. They feed by sweeping the long bill from side to side in the mud or shallow water and thereby catching mostly small fishes and crustaceans. When flying, spoonbills extend the neck and legs and flap the wings steadily. They breed in colonies, frequently with ibises and herons, building a large nest of sticks in a low bush or tree and laying three to five white eggs, blotched with reddish brown.

Spoonbills range in length from about 60 to 80 cm (24 to 32 inches). The head is partly or entirely bare. In most species the plumage is white, sometimes with a rosy tinge, but the roseate spoonbill (*Ajaia ajaja*), of North and South America, about 80 cm long, is deep pink with a white neck and upper back. It ranges from the Gulf Coast of Texas and the West Indies to Argentina and Chile. In some places it has been exterminated by plume hunters.

The European spoonbill (*Platalea leucorodia*) is a crested white bird about 60 cm long with cinnamon buff on the foreneck. It breeds in marshes of central and southern Europe and Asia, south to Egypt, India, and Taiwan. Others are the African spoonbill (*P. alba*); the lesser spoonbill (*P. minor*) of eastern Asia; and two Australian species, the royal,

or black-billed, spoonbill (*P. regia*), and the yellow-billed, or yellow-legged, spoonbill (*P. flavipes*).

**spoonbill,** also called SPOONBILL CAT, primitive North American fish, a species of paddlefish (*q.v.*).

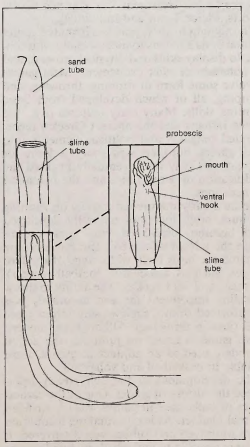
**Spooner, John (Coit)** (b. Jan. 6, 1843, Lawrenceburg, Ind., U.S.—d. June 11, 1919, New York City), U.S. senator from Wisconsin (1885–91; 1897–1907), a powerful conservative force in his state and in Congress.

Spooner moved to Wisconsin as a youth. After service in the Union Army during the Civil War, he was admitted to the bar (1867). He began a law practice at Hudson, Wis., and eventually became best known in legal circles as counsel for railroad interests. A member of the Wisconsin legislature (1872), he was elected by that body to represent the state of Wisconsin in the U.S. Senate, where he served from 1885 to 1891 and from 1897 to 1907.

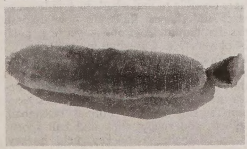
Spooner emerged as a leading conservative voice in the Senate, consistently opposing labour reform and other progressive measures. With senators Nelson W. Aldrich of Rhode Island, William B. Allison of Iowa, and Orville H. Platt of Connecticut, he formed a core of conservative leadership that exerted strong influence on national affairs at the turn of the century. He was author of the Spooner Act (1902), which authorized Pres. Theodore Roosevelt to purchase rights to build the Panama Canal. At the 1904 Republican national convention in Chicago, Spooner, as the head of the regular Wisconsin delegation, became embroiled in a bitter credentials fight with state Progressives led by Robert M. La Follette. Spooner survived the challenge, but the ascendency of Progressivism, especially in Wisconsin, was inevitable. The change in the political climate contributed to Spooner's decision to retire from public life in 1907. He thereafter practiced law in New York City.

**Spooner Amendment,** congressional amendment to the Army Appropriations Act of 1901 that called for the end of the U.S. military government in the Philippines. By the terms of the Treaty of Paris (December 1898), sovereignty over the Philippine Islands had passed from Spain to the United States.

Filipinos fought the imposition of American rule, and it was believed in the United States that their resistance was due to the harshness of military government. The Spooner Amendment authorized Pres. William McKinley to supplant military rule with civilian government, which was inaugurated in July 1901. Filipino guerrillas, however, continued hostilities for a number of years.



**spoonerism,** reversal of the initial letters or syllables of two or more words, such as "I have a half-warmed fish in my mind" (for "half-formed wish") and "a blushing crow" (for "a crushing blow"). The word was derived from the name of William Archibald Spooner (1844–1930), a distinguished Anglican clergyman and warden of New College, Oxford, a nervous man who committed many "spoonerisms." Such transpositions are sometimes made intentionally to produce comic effect.



**spoonworm,** also called ECHIURID, any member of the primarily marine invertebrate phylum Echiura, also known as Echiuroidea, or Echiurida. Spoonworms are sausage-shaped organisms with a flattened extension of the "head" that is curved along its lateral edges and sometimes shaped like a scoop or spoon to form a nonretractable anterior proboscis. Adult spoonworms vary from a few to 600 millimetres (2 feet) in length. In *Urechis* the proboscis is only a fraction of the length of the trunk; however, in *Ikeda* the proboscis may exceed 10 times the trunk length.

Apart from a few brackish-water species, spoonworms are marine and occur in seabeds throughout the world. Although some species inhabit rock crevices, most live in burrows in the mud. A flow of water is maintained through the burrow by peristaltic contractions of the body. Some respiration probably takes place across the body wall, but the hind gut is often utilized as a respiratory organ by drawing water through the anus.

*Life cycle.* The sexes are separate and, apart from members of the family Bonelliidae, superficially alike. Ova or spermatozoa produced by an unpaired gonad and shed into the coelomic fluid contained in the body cavity are nourished there until maturation is complete. The mature gametes are taken up by ciliated funnels of the anterior nephridia, which lose their excretory function. Then the gametes pass into thin-walled nephridial sacs and are stored there until their expulsion into the sea, where fertilization takes place. Spiral cleavage occurs in the zygote; a free-swimming trochophore larva develops and metamorphoses into a burrowing worm.

Species of the family Bonelliidae are unusual in that the male (only 1 to 6 mm [0.04 to 0.24 in.] long) is parasitic within a modified nephridium (or uterus) of a female. A male develops when a larva comes in contact with a female's proboscis, which secretes a hormone that affects larval development. The larva passes to the esophagus and undergoes reduced metamorphosis to a sexually mature male; however, the proboscis and circulatory system fail to develop and only a reduced digestive system forms. Cilia cover the entire body (as with the larva), yet a system of gonoducts develops fully. The male remains within the egg-storage organ of the female, presumably to fertilize the eggs as they are shed into the water.

*Spoonworms*
(Top) *Urechis caupo* and (bottom) *Echiurus echiurus*
(Top) From Paul A. Meglitsch, *Invertebrate Zoology*, copyright © 1967 by Oxford University Press, Inc., reprinted by permission; (bottom) R.N. Mariscal—Bruce Coleman Inc.

*Form and function.* The trunk of spoonworms is saclike, with a body wall composed of three muscle layers. Anteriorly is a muscular but noncontractile, tactile proboscis, which is highly mobile and capable of great extension in some species. The mouth is situated at the base of the proboscis. Typically, there is a pair of setae on the ventral surface behind the mouth and one or two circles of setae around the posteriorly located anus. The body cavity is filled with coelomic fluid containing two types of cells; in some species, one type of cell contains a respiratory pigment similar to hemoglobin. The alimentary canal is coiled and associated along much of its length with a siphon, or collateral intestine, whose function is obscure. A pair of anal vesicles with an excretory function arises from the end of the intestine. Single to numerous nephridia are attached to the ventral body wall. Most species have a closed vascular system comprising dorsal, ventral, and neurointestinal blood vessels. The nerve cord is ventral. The gonads arise from a mesentary above the nerve cord or from others near the cloaca. They are diffuse, and eggs or spermatozoa are shed into the coelomic fluid.

Feeding methods vary according to the size of the proboscis. Species with a long proboscis reach out and pick up detritus around the burrow entrance; the material collected becomes attached to strings of mucus and is transferred to the mouth. In species with a short proboscis, a mucous tube is secreted and forms a lining to the burrow. Food particles drawn into the burrow with the flow of water for respiration become fixed to the mucous tube. When this is filled, the tube and its contents are swallowed.

*Classification.* Spoonworms were earlier linked with the peanutworms, or sipunculids; then Adam Sedgewick assigned them to the phylum Annelida. They were not widely accepted as Annelida; and, after W.W. Newby (1940) studied the embryology and development of *Urechis caupo,* they became established as a separate phylum.

**Sporades,** group of Greek islands in the Aegean Sea, lying northeast of Euboea (Évvoia) island, including Skiathos, Skópelos, Skyros, and Alónnisos, as well as neighbouring islets. In antiquity these were known as the Thessalian, or Northern, Sporades, while the Thracian, or Eastern, Sporades included the now-Turkish island of Imroz (Greek Imvros), Samothrace, Thasos, Lemnos, and Áyios Evstrátios in the northeast Aegean. The Western Sporades were the scattered small islands of the southwestern Aegean, with the exception of the Cyclades and the islands of the Saronic Gulf; the Western Sporades included Hydra and Spétsai.

**spore,** a reproductive cell capable of developing into a new individual without fusion with another reproductive cell. Spores thus differ from gametes, which are reproductive cells that must fuse in pairs in order to give rise to a new individual. Spores are agents of asexual reproduction, whereas gametes are agents of sexual reproduction.

Spores are produced by bacteria, fungi, and green plants. Bacterial spores serve largely as a resting, or dormant, stage in the bacterial life cycle, serving to preserve the bacterium through periods of unfavourable conditions. Many bacterial spores are highly durable and can germinate even after years of dormancy.

Among the fungi, spores serve a function analogous to that of seeds. Produced and released by specialized fruiting bodies, such as the edible portion of the familiar mushrooms, fungal spores germinate and grow into new

individuals under suitable conditions of moisture, temperature, and food availability.

Among green plants—all of which have a life cycle characterized by alternating generations of asexually and sexually reproducing individuals—spores are the reproductive agents of the asexual generation. Produced by the sporophyte (*i.e.*, spore-bearing) generation, plant spores give rise to the gametophyte (*i.e.*, gamete-bearing) generation. Spores are most conspicuous in the non-seed-bearing plants, including algae, liverworts, mosses, and ferns. In these lower green plants, as in fungi, the spores function much like seeds. In general, the parent plant sheds the spores locally; the spore-generating organs are frequently located on the undersides of leaves. The spores of plants that inhabit the edges of bogs or lakes are frequently shed into the water or are carried there by rain and are preserved in the sediments. Wind dispersal is a factor in plants that shed their spores explosively.

Among the seed-bearing plants—the gymnosperms and the angiosperms—the spores are far less conspicuous. They are not released from the parent plant, but rather they germinate into microscopic gametophyte individuals that are entirely dependent upon the sporophyte plant. Gymnosperms and angiosperms form two kinds of spores: microspores, which give rise to male gametophytes, and megaspores, which produce female gametophytes.

**sporophyte,** in certain plants and algae, nonsexual phase (or an individual representing the phase) in the alternation of generations—a phenomenon in which two distinct phases (a haploid and a diploid phase) occur in the life history of a plant, each phase producing the other. (The alternate, sexual phase is the gametophyte.) In the sporophyte phase, a diploid plant body grows and eventually produces spores through meiosis. These spores divide mitotically to produce haploid, gamete-producing bodies called gametophytes. The union of two gametes during fertilization produces a diploid zygote, which divides mitotically to form a new sporophyte.

The character and relative extent of the two phases vary greatly among different groups of plants and algae. During the course of evolution, the gametophyte stage is progressively reduced; thus, in the higher (*i.e.,* vascular) plants, the sporophyte is the dominant phase in the life cycle, whereas in the more primitive nonvascular plants the gametophyte remains dominant. *See also* gametophyte.

**sporotrichosis,** subacute or chronic infection by the fungus *Sporotrichum,* or *Sporothrix, schenckii,* usually characterized by a chancre at the site of inoculation and, extending from the site, a chain of hard, red, pus-generating lumps along the lymphatics of the skin and subcutaneous tissue. The fungus, which is most commonly found in the soil or on vegetation or decaying wood, most often enters the body through a scratch or abrasion. Inhalation of the fungus may cause pulmonary sporotrichosis. Cutaneous lymphatic sporotrichosis is painless and feverless; it usually responds quickly to treatment with potassium iodide. In its rare, blood-borne, disseminated form, sporotrichosis may affect the muscles, bones, joints, or central nervous system, causing fever, weight loss, fatigue, and pain; this form of the disease may respond to treatment with the antibiotic amphotericin B.

**sporozoan:** *see* apicomplexan.

**Sports, Book of,** formally DECLARATION OF SPORTS, order issued by King James I of England for use in Lancashire to resolve a conflict, on the subject of Sunday amusements, between the Puritans and the gentry, many of whom were Roman Catholics. Permission was given for dancing, archery, leaping and vaulting, and for "having of May games, Whitsun ales and morris dances, and the setting up of May-poles and other sports therewith used, so as the same may be had in due and convenient time without impediment or neglect of divine service, and that women shall have leave to carry rushes to church for the decorating of it." On the other hand, "bear and bull-baiting, interludes, and (at all times in the meane sort of people by law prohibited) bowling" were not to be permitted on Sunday. In 1618 James ordered all English clergy to read the declaration from the pulpit, but so strong was the Puritan opposition to Sunday amusements that he prudently withdrew his command. In 1633 Charles I not only directed the republication of his father's declaration but insisted upon the reading of it by the clergy. Many of the clergy were punished for refusing to obey the injunction. When Charles was overthrown during the English Civil War, Puritan prohibitions against sports and games on the Sabbath again prevailed until Charles II was restored in 1660.

**sports and games,** recreational or competitive activities that involve some amount of physical strength or skill. At one time, sports were commonly considered to include only the outdoor recreational pastimes, such as fishing, shooting, and hunting, as opposed to games, which were regarded as organized athletic contests played by teams or individuals according to prescribed rules. The distinction between sports and games has grown less clear, and the two terms are now often used interchangeably.

A brief treatment of sports and games follows. For full treatment, *see* MACROPAEDIA: Sports, Major Team and Individual.

Throughout history, man has invented games primarily as a means to meet socially with others, to display skills and physical prowess, and to entertain or offer excitement. Most games involve some form of running, throwing, and jumping, all of which developed from basic hunting skills. Many early cultures (*e.g.,* the Aztec Indians and the ancient Greeks) incorporated religious and political elements into their games, but there was always a desire for recreational play that eventually inspired the codification of early games and the invention of new ones.

Because early man relied heavily on running to hunt prey, footraces naturally developed and became formalized into track events. With the advent of the ball and bat, running became the basis for a wide range of modern games, such as association football (soccer), lacrosse, and field hockey. The ability to throw a killing implement far and accurately was transformed from a survival skill into a game skill (javelin throwing). Although no modern team game is based on jumping, the action is widely used as an adjunct in games, most notably in basketball and volleyball.

The development of the ball greatly influenced the history of games. One of the earliest types of balls used in games was an air-filled animal bladder. As leather-making techniques were improved and rubber was discovered, it became possible to make balls in a wide range of sizes and shapes. Balls are now used in games that require from one player (*e.g.,* golf) to 24 players (*e.g.,* Canadian football).

The world's existing sports can be grouped into various categories, though certain sports fit more than one category. The major categories are team sports, which includes association football (soccer), football, basketball, volleyball, and rugby; stick and ball sports, such as baseball, ice hockey, field hockey, cricket, and lacrosse; court sports, such as tennis, table tennis, handball, and squash; winter sports, which includes various skating and skiing events; water sports, which includes various swimming and boating events; athletics, which includes various running, jumping, and throwing events; target sports, such as archery and firearm shooting; target ball sports, such as bowling, golf, and billiards; combat sports, such as boxing, wrestling, judo, and karate; sports on wheels, such as roller skating and motorcycle and automobile racing; animal sports, chief among which are horse racing, dog racing, and polo; and aerial sports, such as gliding, air racing, and ballooning.

An important factor in the development of modern sports was the increasing urbanization of society. The emergence of towns with relatively stable populations permitted the organization of regular teams and schedules. As more teams entered into competition, however, conflicts arose as each team insisted on playing according to its own local standards. Thus, a uniform set of rules was made to regulate equipment and principles of play. Local and national organizations were also set up to govern the games, and a distinction was made between professional and amateur competitors.

Games serve a number of important functions. As physical outlets, they allow participants to work out aggressive energies and emotions through involvement in competitive recreational activity. As entertainment, they provide diversion from the demands of day-to-day living and allow the spectator to enjoy much of the experience of play without actual involvement. In addition, the economic impact of games is unquestionable. Several of the most popular games have become major industries worldwide. Television has been at least partly responsible for this, with networks paying huge sums to broadcast major sports events to national and international audiences.

**sports-car racing,** form of motor racing involving cars built to combine aspects of racing and touring cars. Although there are many conflicting definitions of sports cars, it is usually conceded that in normal production form they do not resemble Grand Prix (Formula One) racing machines. Whereas the latter is a single-seat design carrying spartan cockpit furnishings and utterly functional equipment throughout, the sports car is usually a two-seater, sometimes a four-seater, characterized by its nimble abilities (if not speed and power) together with general suitability for high-speed touring on ordinary roads. Unlike a Grand Prix car, it is usually series-produced, seldom handmade. Some manufacturers of Grand Prix machines, such as Ferrari and Lotus, also make sports cars. Other makes include MG, Jaguar, Aston Martin, Austin-Healey, Triumph, Porsche, Lancia, Morgan, and Chevrolet Corvette. Although not usually designed exclusively for racing, sports cars are, nevertheless, able racing machines and are often entered in competitions with others of their class. Most of the world's sports-car racing is conducted for amateur drivers by local and regional organizations. Some of the world's most famous professional races are sports-car events, however, and may even be designated as Grand Prix. (When the term Grand Prix is used in this context, it does not refer to the type of car used but rather to the race's being a major automotive event of the nation in which it is held.) The development of sports cars for racing, especially in such commercially important events as the 24-hour endurance race at Le Mans, where the reputations of participating manufacturers are very much at stake, brought about some prototype sports cars that are, in reality, little different in their power and speed potentials from Formula One machines. A world sports-car championship was awarded from 1953 to 1961. It was replaced in 1962 by a manufacturer's championship, for which grand touring and prototype cars also compete, awarded annually to the make of car that achieves the best record in a specified series of races.

**Sporting Record.** The tables that follow contain the significant information about the world championships of all the major sports that are international in character. It also includes some professional and amateur sports that attract a huge national following—such as baseball in the United States and cricket in the United Kingdom, Australia, India, and the other Test Match countries—and some sports, such as rowing, in which national competition overshadows international events.

Major team and individual sports are discussed in greater detail in MACROPAEDIA: Sports. Individual articles on particular sports or sporting events can also be found in the MICROPAEDIA.

In many sports the Olympic Games held every four years constitute the world championships; they are included in the listings below. For the complete table of Olympic competition since 1896, *see* MICROPAEDIA: Olympic Games. For standing world records and for an event's most recent winners, *see* BRITANNICA BOOK OF THE YEAR.

The following sports and games are included in these tables:

archery 113

## ARCHERY

The international governing body for archery, the Fédération Internationale de Tir à l'Arc (FITA), instituted world championships in 1931. Between 1931 and 1957 a variety of scoring rounds were used. In 1957, however, FITA established its own competition standard—two FITA rounds shot over four days. A single FITA round consists of 36 arrows shot from each of four distances; different distances are used for men's and women's competition. From 1987 to 1991 the grand FITA round was used. The Olympic round was used for the 1993 world championships; under this system the highest possible individual score was 120. Since 1959 championships have been held biennially.

*Rounds shot varied from 1931 to 1957. †No competition held during unlisted years: 1940–45, 1951, 1954, 1956. Competition biennial since 1959. ‡Grand FITA round instituted.

## ATHLETICS

The world governing body for athletics, or track-and-field, is the International Amateur Athletic Federation (IAAF), founded in 1912. The sport includes relay running, a number of individual running, jumping, and throwing events, and one event (the decathlon for men and the heptathlon for women) that includes all three activities. The World Cup (inaugurated 1977) is a finals-only competition for national, hemispheric, and continental teams. In 1983 the first officially recognized non-Olympic world athletics championships were held. A long-distance event that has special status is the marathon race. The standard distance for marathons is 42,195 m (26 miles 385 yards).

## AUTOMOBILE RACING

Of the various types of automobile races, the closed-circuit, or speedway, course was largely developed in the United States. The Indianapolis 500—which is now the premiere event of the Indy Racing League (IRL) championship series—was first run in 1911. A low-slung, fenderless (open-wheel) car—called an Indy car—is essential for this race; its suspension is as important to a car's performance as its turbocharged engine. Often the chassis manufacturer is different from the engine manufacturer, resulting in cars identified, for example, as a Brabham/Repco. In such cases the chassis-maker is listed first, and the chassis-maker receives any money or awards that the car may win.

Indy car racing began in 1909, when the American Automobile Association (AAA) began sponsoring a 24-race championship series, including three races at the newly opened Indianapolis Motor Speedway. In 1956 the AAA gave up its involvement with auto racing, and the United States Auto Club (USAC) was organized as the sport's governing body. In 1978 two race-car owners broke away from USAC to form a new organization, Championship Auto Racing Teams, Inc. (CART), which sponsored its own series of races. In 1980 CART and USAC joined to form the Championship Racing League, which dissolved after five races. Subsequently CART oversaw all Indy car racing, with the exception of the Indianapolis 500. In 1997 the IRL gained sponsorship of the race and began to challenge CART's dominance.

The standard cars used for Grand Prix road (*i.e.*, closed highway) racing are known as Formula One (or F-1) cars because they are built according to an evolving formula that was established after World War I by the Fédération Internationale de l'Automobile (FIA). Like the Indy car, the Formula One racer is open-wheeled and low-slung, but the F-1 is slightly smaller and more maneuverable.

There are approximately 17 Grand Prix events held worldwide throughout the year. Drivers compete for the World Championship of Drivers (inaugurated in 1950).

Many Grand Prix drivers participate in various endurance races, the most famous of which is the Le Mans Grand Prix d'Endurance, held on the 13.4-kilometre Sarthe circuit, Le Mans, Fr.

Another type of popular driving event is the rally, which was established in 1907. More than 35 such competitions, over a specified route on public roads, take place yearly throughout the world. The classic occasion for rally driving is the Rallye Automobile Monte-Carlo, now started in various European cities with Monaco as its terminal point.

Stock car racing, which began in the United States in the first half of the 20th century, involves the racing of commercial cars that have been altered to increase their speed and maneuverability. The National Association for Stock Car Auto Racing (NASCAR) was founded in 1947 and awards the Nextel Cup to the driver who has achieved the greatest number of points over the stock car racing season. The Daytona 500 is the premiere stock car event.

## BADMINTON

The oldest, and still the classic, tournament for badminton is the All-England Badminton Championships, which have been held annually since 1900. The International Badminton Federation (established 1934) first proposed international team badminton for men in 1939, but actual tournament play for the Thomas Cup did not begin until 1948–49. A similar contest for women's teams, the Uber Cup, was inaugurated in 1956–57.

## BASEBALL

The sport of baseball—given its definitive form in the United States in the late 19th century—is popular throughout the world. It is especially popular in Japan and Latin America; it is also one of the national sports of the United States.

On a professional level, the premiere event of baseball in the United States is the seven-game World Series, in which the first team to win four games wins the Series. In fact, the Series is not contested on an international level, but rather it is played between the leading team of the National League (NL; formed 1876 and including, in later years, one Canadian team) and the leading team of the American League (AL; formed 1900 and also including, in later years, one Canadian team).

Professional Japanese baseball teams are organized into two leagues of six teams each. The seven-game Japan Series is contested between the leading team of the Central League (CL) and the leading team of the Pacific League (PL).

The modern Caribbean Series began in 1970 with the winning team from each winter league in the Dominican Republic, Mexico, Puerto Rico, and Venezuela.

Enos Slaughter of the St. Louis Cardinals (NL) sliding home to score the winning run in game seven of the 1946 World Series; Roy Partee, catcher for the Boston Red Sox (AL), lunges for the throw from the infield

## BASKETBALL

U.S. professional men's basketball is directed by the National Basketball Association (NBA; formed 1949). The NBA began a women's professional league, known as the WNBA, in 1997.

Basketball is organized on an international level. Since the inclusion of basketball as an Olympic sport in 1936, the winners of the Olympic tournament have been considered the world champions. The Fédération Internationale de Basketball Amateur (FIBA; founded 1932) instituted separate world championships in 1950 for men and in 1953 for women.

Amateur basketball in the United States is most closely followed at the collegiate level, where the most important event of the season is the National Collegiate Athletic Association (NCAA) Championship. The NCAA tournament was first contested in 1939 (by men's teams only). Women's college basketball was first played on a national level in 1972, under the auspices of the Association for Intercollegiate Athletics for Women (AIAW), which gave way in 1982 to the NCAA's first tournament for women.

## BILLIARDS

The game of billiards has a surprising number of varieties throughout the world. Factors in that variety include the number and appearance of the billiard balls, the size of the table, the existence of side and corner pockets, and the object of play. The classic form of the game—three-cushion billiards—is played on a pocketless table with one red ball and two white balls, one of which is marked with a spot; it is often known as French billiards, carom, or (simply) billiards.

Pocket billiards, which embraces both snooker and the game sometimes known (for the sake of clarity) as English billiards, is the prevalent form of billiards in the United Kingdom. The world professional snooker championship was first held in 1927; until 1947 it was won each year by Joe Davis (championships were not held during World War II). The championship was discontinued during the 1950s; it was revived during the 1960s, and in 1969 it became a knockout event. The results that are given in the table below begin with that year. Competition is open to both men and women.

The American form of pocket billiards, usually known as pool, differs markedly from the British game. Its most popular variations are eight-ball, nine-ball, and straight (or 14.1) pool. Though earlier straight pool tournaments—those that featured such players as Alfredo DeOro, Willie Mosconi, and Willie Hoppe—were held with regularity, the game has largely fallen into abeyance for national competition, and few national tournaments are held. Since the 1970s nine-ball and eight-ball pool have surpassed straight pool in popularity in the United States, and nine-ball has gained some prominence internationally. In 1990 the World Pool-Billiard Association (WPA; founded 1987) inaugurated the nine-ball world championship.

## BOWLING

The world governing body for bowling is the Fédération Internationale des Quilleurs (FIQ). It has sponsored world bowling championships since 1954. In 1979 the FIQ discontinued the eights for men and fours for women and introduced the triples competition for men and for women.

In the United States, men's bowling is governed by the American Bowling Congress (ABC), which was founded in 1895. Six years later the first national championship was organized; in 1961 the yearly competition was split into two divisions—regular (for those with a combined average score of 851 or higher) and classic for professionals. The classic division was discontinued in 1980. The Women's International Bowling Congress (WIBC) was organized in 1916 and has since sponsored an annual women's championship. The women's open division is for those with a combined average score of 851 or higher, but the highest score in the tournament wins, regardless of division. In both the ABC tournament and the WIBC tournament, competition takes place between teams, doubles, and singles. The all-events category is won by the individual who has the best score of nine games—three team, three doubles, and three singles scores. The Professional Bowlers Association (PBA) was established in 1958. One of its major tournaments is the Firestone Tournament of Champions; the event was not held in 2001 or 2002 but was scheduled for 2003.

**FIQ World Bowling Championships—men**

| year | singles | pairs | triples | fives | eights |
|---|---|---|---|---|---|
| 1954 | G. Algeskog (Swed.) | Finland | | Sweden | Sweden |
| 1955 | N. Backstrom (Swed.) | Sweden | | West Germany | Finland |
| 1958 | K. Asukas (Fin.) | Sweden | | Finland | Sweden |

*WIBC tournament. †No competition in 1917 and 1943–45.

## BOXING

Modern boxing is dated to about the 1880s, when the Marquess of Queensberry's rules (or rules derived from them) became more or less standard. John L. Sullivan (U.S.) was the last of the bare-knuckles heavyweight champions and one of the first recognized champions to fight by the "new" rules. Despite an early trend toward some kind of organization, there is no single recognized world governing body in professional boxing. Europe, the Commonwealth, and Great Britain—not to mention a number of Asian boxing federations—all have championships. The World Boxing Association (WBA), formed under a different name in 1920, is basically a U.S. organization. It was once the largely undisputed governing body for the Americas. Since 1963 it has had some competition from the World Boxing Council (WBC), which includes British and European countries as well as Latin-American and Asian countries. In 1983 another organization, the International Boxing Federation (IBF; called the United States Boxing Association International from 1983 to 1984) was born of dissatisfaction with the WBA and the WBC. Other federations, with the exception of the World Boxing Organization (WBO; formed in 1988), have not received international recognition.

The tables below contain the names of the undisputed champions in each weight class, their countries, and the dates of the title bouts. Unless otherwise indicated, a champion retains his title until he is defeated. In the early 1990s the WBA, WBC, and IBF all recognized 17 weight divisions. In the tables below the primary name given for each division is that used by the WBA. If a different name is used by the WBC or the IBF, or by both, that name is given as an alternate.

### World Heavyweight Champions—no weight limit

Undisputed champions (country; title awarded)

John L. Sullivan (U.S.; 8/29/1885)
James J. Corbett (U.S.; 9/7/92)
Bob Fitzsimmons (U.S.*; 3/17/97)
James J. Jeffries (U.S.; 6/9/99)
  retired in 1905
Marvin Hart (U.S.; 7/3/05)
Tommy Burns (Can.; 2/23/06)
Jack Johnson (U.S.; 12/26/08)
Jess Willard (U.S.; 4/5/15)
Jack Dempsey (U.S.; 7/4/19)
Gene Tunney (U.S.; 9/23/26)
  retired in 1928
Max Schmeling (Ger.; 6/12/30)
Jack Sharkey (U.S.; 6/21/32)
Primo Carnera (Italy; 6/29/33)
Max Baer (U.S.; 6/14/34)
James J. Braddock (U.S.; 6/13/35)
Joe Louis (U.S.; 6/22/37)
  retired in 1949
Ezzard Charles (U.S.; 9/27/1950)
Jersey Joe Walcott (U.S.; 7/18/51)
Rocky Marciano (U.S.; 9/23/52)
Floyd Patterson (U.S.; 11/30/56)
Ingemar Johansson (Swed.; 6/26/59)
Floyd Patterson (U.S.; 6/20/60)
Sonny Liston (U.S.; 9/25/62)
Cassius Clay (later Muhammad Ali, U.S.; 2/25/64)
  stripped of WBA title in 1965; stripped of WBC title in 1967; title in dispute

WBA

Ernest Terrell (U.S.; 3/5/1965)
  gave up title in 1967†
Jimmy Ellis (U.S.; 4/27/68)
Joe Frazier (U.S.; 2/16/70)
George Foreman (U.S.; 1/22/73)
Muhammad Ali (U.S.; 10/30/74)
Leon Spinks (U.S.; 2/15/78)
Muhammad Ali (U.S.; 9/15/78)
  retired in 1979
John Tate (U.S.; 10/20/79)
Mike Weaver (U.S.; 3/21/80)
Michael Dokes (U.S.; 12/10/82)
Gerrie Coetzee (S.Af.; 9/23/83)
Greg Page (U.S.; 12/1/84)
Tony Tubbs (U.S.; 4/29/85)
Tim Witherspoon (U.S.; 1/17/86)
James Smith (U.S.; 12/12/86)
Mike Tyson (U.S.; 3/7/87)
James Douglas (U.S.; 2/11/90)
Evander Holyfield (U.S.; 10/26/90)
Riddick Bowe (U.S.; 11/13/92)
Evander Holyfield (U.S.; 11/6/93)
Michael Moorer (U.S.; 4/22/94)
George Foreman (U.S.; 11/5/94)
  stripped of title in 1995
Bruce Seldon (U.S.; 4/8/95)
Mike Tyson (U.S.; 9/7/96)
Evander Holyfield (U.S.; 11/9/96)
Lennox Lewis (U.K.; 11/13/99)
  stripped of title in 2000
Evander Holyfield (U.S.; 8/12/2000)
John Ruiz (P.R.; 3/3/01)
Roy Jones, Jr. (U.S.; 3/1/03)
  gave up title in 2004
John Ruiz (U.S.; 2/24/04)

WBC

Joe Frazier (U.S.; 2/16/1970)
George Foreman (U.S.; 1/22/73)
Muhammad Ali (U.S.; 10/30/74)
  stripped of title in 1979
Ken Norton (U.S.; 3/18/78)
Larry Holmes (U.S.; 6/9/78)
  gave up title in 1983
Tim Witherspoon (U.S.; 3/9/84)
Pinklon Thomas (U.S.; 8/31/84)
Trevor Berbick (Can.; 3/22/86)
Mike Tyson (U.S.; 11/22/86)
James Douglas (U.S.; 2/11/90)
Evander Holyfield (U.S.; 10/26/90)
Riddick Bowe (U.S.; 11/13/92)
  stripped of title in 1992
Lennox Lewis (U.K.; 12/14/92)
Oliver McCall (U.S.; 9/24/94)
Frank Bruno (U.K.; 9/2/95)
Mike Tyson (U.S.; 3/16/96)
  gave up title in 1996
Lennox Lewis (U.K.; 2/7/97)
Hasim Rahman (U.S.; 4/21/2001)
Lennox Lewis (U.K.; 11/17/01)
  gave up title in 2004
Vitaly Klitschko (Ukr.; 4/24/04)

IBF

Larry Holmes‡ (U.S.; 11/1983)
Michael Spinks (U.S.; 9/21/85)
  stripped of title in 1987
Tony Tucker (U.S.; 5/30/87)
Mike Tyson (U.S.; 8/1/87)
James Douglas (U.S.; 2/11/90)
Evander Holyfield (U.S.; 10/25/90)
Riddick Bowe (U.S.; 11/13/92)
Evander Holyfield (U.S.; 11/6/93)
Michael Moorer (U.S.; 4/22/94)
George Foreman (U.S.; 11/5/94)
  gave up title in 1995
Francois Botha (S.Af.; 12/9/95)
  stripped of title in 1996
Michael Moorer (U.S.; 6/22/96)
Evander Holyfield (U.S.; 11/8/97)
Lennox Lewis (U.K.; 11/13/99)
Hasim Rahman (U.S.; 4/21/2001)
Lennox Lewis (U.K.; 11/17/01)
  gave up title in Sept. 2002
Chris Byrd (U.S.; 12/14/02)

*Formerly a British subject. †Defeated by Ali 2/6/67. ‡Recognized as champion in November 1983.

### World Cruiserweight Champions—top weight 200 pounds (90.7 kg)*

WBA* (country; title awarded)

Ossie Ocasio (P.R.; 2/13/1982)

## CRICKET

Cricket is one of the national sports of England, and consequently it is played in nearly all the countries with which England has been associated. The most important international cricket matches are the Test matches, which have been played since 1877. The Test-playing countries are England, Australia, South Africa (banned from international competition between about 1970 and 1992), West Indies, New Zealand, India, Pakistan, Sri Lanka, Zimbabwe (since 1992), and Bangladesh (since 2000).

The Test table is designed to be read from left to right across the columns. This will indicate, for example, that in Test match play against England, South Africa has won 23 games, has had 47 drawn matches, and has lost 50 games.

The World Cup is a one-day, limited-overs competition. It was first held in 1975.

D.M. Jones, batsman for Australia, placing the ball to the leg side against England in the Fourth Test of the 1988–89 cricket season; Australia won the six-match series 5–0

## CURLING

The game of curling is somewhat akin to bowls in its object of play, though, unlike bowls, it varies little from country to country—except perhaps in the type of broom used and in other pieces of equipment (excluding the standardized curling stone). The men's world curling championship was instituted in 1959 and has been successively known as the Scotch Whisky Cup (1959–67), the Silver Broom (1968–85), the International Olympic Committee President's Cup (1986–87), and the World Curling Championship. Although curling has been played among women of many countries since at least the mid-20th century, the first women's world curling championship was not held until 1979.

Russ Howard, skip of the Canada men's curling team, yelling for teammates to sweep as he watches his stone curl in the opening game of the 1993 World Curling Championship; Canada won the game and the cup, bringing its record number of wins to 19

## CYCLING

By all accounts, the greatest cycling event of all is the Tour de France road race (founded 1903). It is raced in several stages over distances usually exceeding 3,500 km (2,175 miles). From 1911 to 1929 distances exceeded 5,300 km. A Tour de France for women was first held, over an 18-stage course of 991 km, in 1984.

In addition to this and a great number of other road races held yearly, there are annual world championship road races. Track racing championships are also held. The oldest events of track racing are the sprint (in which only the last part of the race can actually be considered sprinting) and the pursuit (both a team and individual event in which contestants start the race on opposite sides of the track and attempt to catch each other). Mountain bike racing and cyclo-cross, a cross-country bicycle race that requires cyclists to carry their bikes over parts of the course, developed in the latter part of the 20th century. World championships were established for these sports in 1997.

## FENCING

What had been the European fencing championship from 1921 to 1935 was officially recognized as the world fencing championship at the Olympic Games of 1936. The only event that does not reflect Olympics winners in the designated years is the women's team foil competition, which was not an Olympic event until 1960. Women's épée competition has been part of the world championships since 1989 and sabre since 1999.

Men's fencing bouts last about six minutes, and the first man to score five hits with the designated portion of the weapon (for foil and épée, only hits made with the point of the weapon are scored) is the winner. Women's bouts last about five minutes, and only four hits must be scored.

Each weapon has a different target area: for the foil, it is the torso; for the épée, the entire body; and for the sabre, roughly the upper half of the body (including the head and arms).

*Olympic titles are recognized as world championships. †Consisting of athletes from the Commonwealth of Independent States and Georgia.

## FIELD HOCKEY

The sport of field hockey is quite popular in the United Kingdom, India, Pakistan, and much of Europe. Curiously, the sport was not seriously promoted among U.S. men, and, in the United States, field hockey has been largely regarded as a sport for women.

Despite its recognizable origins in the mid-19th century the game was not organized on an international level until the mid-20th century. One of a number of international tournaments is the World Cup, which is organized by the Fédération Internationale de Hockey sur Gazon (FIH; founded 1924).

## FOOTBALL

Many types of games are known as football, among them association football (also called soccer), gridiron football (also called U.S. football and known in the United States as, simply, football), Canadian football (also called rugby football), and Rugby Union and Rugby League football (also known as rugby, or rugger). Each of these games is unique, although some—such as U.S. football and Canadian football—bear more than a little resemblance, and each has its own distinct following.

*Association football.* The game of association football is governed by the Fédération Internationale de Football Association (FIFA; founded 1904). The FIFA World Cup (organized as the World Cup in 1930) was the first official internationally contested association football match. The popularity of the World Cup led to the development of several regional cup competitions, including the African Cup of Nations, the Asian Cup, the Copa América, and the European Championship Cup. Competition for the FIFA Women's World Cup began in 1991.

Diego Maradona of Argentina in the opening game of the 1986 World Cup, during which Maradona set up all three goals in Argentina's 3–1 victory over South Korea

*Uruguay won penalty shoot-out 5–3.
†Brazil won penalty shoot-out 4–2.

*American Football—professional.* The National Football League (NFL) championship playoffs were organized in 1933. The American Football League (founded 1959) was a rival organization until 1970, when it merged with the NFL. The resulting reorganization added a few new teams (1976) and divided the reconstituted NFL into two conferences, the American Football Conference and the National Football Conference. The playoff winner in each conference becomes that conference's representative in the Super Bowl, the final game of the professional football season.

*NFL-AFL championship 1966–70; NFL championship from 1971–72 season.

*American Football—college.* Historically the national champion of college football has been informally selected by two rival opinion polls—one based on a survey of collegiate football coaches (currently conducted by USA Today/ESPN) and the other by sports writers (conducted by the Associated Press [AP]). The AP sports writers' poll began in 1936. The coaches' poll was begun in 1950 by the United Press (now United Press International [UPI]). Where polls designated different teams, both are listed. Desire for a clear-cut national champion led to the creation of the Bowl Championship Series (BCS) in 1999. The BCS uses a formula involving team records, strength of schedule, and rankings to determine the top two teams, who then meet in a national championship game. The site of the game annually shifts between the four major Bowls—Fiesta, Orange, Rose, and Sugar. The first of the Bowl games, the Rose Bowl, was played in 1902 during the 12th annual Tournament of Roses festival in Pasadena, Calif. In 1935 the Sugar Bowl (played in New Orleans, La.) and the Orange Bowl (played in Miami, Fla.) were inaugurated. The Fiesta Bowl (played in Phoenix, Ariz.) began play in 1971.

*Canadian football—professional.* Since 1959, the Canadian Football League has been divided into two conferences, Eastern and Western. The two teams that win the division championships meet for the championship of the League, the Grey Cup (instituted in 1909). The game did not become strictly professional (note the university teams listed) until 1935.

*Rugby Union football.* Rugby Union football is open to amateurs only. The Six Nations Championship is organized by the Fédération Internationale de Rugby Amateur (FIRA) and is contested by England, France, Ireland, Italy, Scotland, and Wales. The international Test matches, organized by the International Rugby Football League, further include South Africa, New Zealand, and Australia. Super 12 Rugby, which originated in 1993 as Super 10, is a competition between club teams in Australia, New Zealand, and South Africa.

The table of Test matches is designed to be read horizontally. If read as it was designed, it will reveal the number of games won, the number of draws, and the number of games lost to each of the countries shown on the horizontal axis.

The World Cup was inaugurated in 1987. The competition is held every four years.

*The British Isles ("British Lions") is a combined team from the four "Home Unions" (England, Ireland, Scotland, and Wales). †No matches.

*Rugby League football.* World Cup competition began in 1954 between professionals from Australia, France, Great Britain, and New Zealand. In 1975 it was renamed the International Championship. Competition was discontinued after 1977 but revived during the 1980s; the match is held quadrennially. Papua New Guinea, which became a full member of the sport's International Board in 1978, now participates.

*Great Britain won on match points. †Called International Championship from 1975 to 1977. ‡Championships played without a grand final match; England was the runner-up.

## GOLF

*Individual events.* Two of the major golf championships, the British and U.S. Open tournaments, are played annually at a variety of golf courses in their respective countries. The Professional Golfers' Association (PGA) championship and the invitational Masters Tournament (which is held annually at the Augusta [Georgia] National Golf Course) are also top tournaments. Events for amateurs include the U.S. and British Amateur championships.

Women's golf has been around nearly as long as men's golf, but until the late 1940s, it was limited to amateurs. Thus, for women, the British and U.S. Amateur championships were the major tournaments. The U.S. Women's Open Championship started in 1946, and the Ladies' Professional Golf Association (LPGA) was formed in 1950. In 1976 the Women's British Open Championship was added to the golf calendar.

*Won by a U.S. golfer except as indicated.

*Team events.* The Ryder Cup was originally a biennial match between the United States and Great Britain, but, beginning in 1979, it was expanded into a biennial match between the United States and Europe. Teams of British and U.S. women golfers compete every two years for the Curtis Cup, which since 1964 has involved two days' play of three 18-hole foursomes and six 18-hole singles. The World Cup, formerly known as the Canada Cup, is a men's tournament for two-man professional teams.

## GYMNASTICS

Aside from the gymnastics events in Olympic Games, the most popular venue for gymnastics competition is the world championship games. Men's events are six in number with all-around individual and all-around team awards in addition. The latter two awards are given on a cumulative points basis. Women also have all-around team and individual awards, determined by their performance in four individual events.

Yuri Chechi (Italy) performing on the rings and winning first place at the 1993 World Gymnastics Championships

ALLSPORT USA/Chris Cole

Li Jing (China) performing on the parallel bars at the 1992 World Gymnastics Championships, winning first place for the third year in a row

ALLSPORT USA/Vandystadt/Yann Guichaoua

## HORSE RACING

In the oldest type of horse racing, the rider sits astride the horse; in the other type of race, best known as harness racing, he sits in a sulky—a two-wheeled vehicle attached by shafts and traces to the horse. In the former type, a Thoroughbred horse is raced over either a track or over a course of jumps and turns (steeplechase). Harness horses can be trotters or pacers and are Standardbred horses raced on a track.

*The English Thoroughbred classics.* The races are run by 3-year-old colts and fillies. The Derby, first run in 1780, is run at Epsom Downs, Surrey, over 1½ miles. The Oaks, also run at Epsom Downs, was first run in 1779; the oldest of the English races, however, is the St. Leger (1776). It is run over 1 mile 6½ furlongs at Doncaster, South Yorkshire. The 2,000 Guineas (1809) is run over 1 mile at Newmarket, Suffolk. A horse that wins the 2,000 Guineas, the Derby, and the St. Leger all in one year is said to have won the British Triple Crown.

Reference Point, with jockey Steve Cauthen in yellow silks, leading the field to win the 1987 Derby at Epsom Downs

*Won in walk-over after dead heat with Formosa. †Record time—1 min 35⅘ s.

*The American Thoroughbred classics.* The Kentucky Derby, a Triple Crown event and perhaps the best known of American horse races, is raced at Churchill Downs in Louisville, Ky., over a 10-furlong (1¼-mile) track. Another of the Triple Crown classics, the Preakness Stakes, was instituted in 1873; it is run over 9½ furlongs (1³⁄₁₆ miles) at Pimlico Race Track in Baltimore, Md. The third Triple Crown event is the 12-furlong (1½-mile) Belmont Stakes, established in 1867. It is run at Belmont Park Race Track, Long Island, N.Y. All three events are for 3-year-old horses.

## ICE HOCKEY

The National Hockey League (NHL), which was organized in Canada in 1917 with five professional teams, welcomed the first U.S. team, the Boston Bruins, in 1924. Since 1926 the symbol of supremacy in professional hockey has been the Stanley Cup, which is awarded to the winner of a play-off that concludes the season of the National Hockey League. The Stanley Cup was presented to amateur champions from 1893 to 1925.

*Though Victoria defeated Quebec in challenge games, Victoria's win was not officially recognized. †Series called because of flu epidemic.

## ICE SKATING

The world governing body for ice skating, the International Skating Union (ISU; founded 1892), held the first figure skating competition in 1896. Women's figure skating was not a separate event until 1906, and pairs championships were first held in 1908. Until 1991, individual competitors were judged on a set of compulsory figures as well as programs of freestyle moves. In 1991, the compulsory figures portion of the competition was eliminated, and judging was based on a short technical program and a long freestyle program. Ice dancing is based on compulsory and freestyle movements—in this case, dances.

In contrast to figure skating and ice dancing, speed skating involves only two factors—speed and endurance. Men compete over distances of 500 m, 1,500 m, 5,000 m, and 10,000 m. Women, who entered the sport some 40 years after men, compete over 500 m, 1,500 m, 3,000 m, and 5,000 m. World speed-skating sprint championships for both men and women were inaugurated in 1972. Short-track speed skating is held indoors over distances of 500 m, 1,000 m, 1,500 m, and 3,000 m. The skater having the best combined results is the overall winner. Championships were held annually from 1978 to 1980 before being recognized by the ISU in 1981.

## JUDO

World championships for judo were first held in 1956 under the auspices of the International Judo Federation (IJF; founded 1951). At that time all contestants participated on an equal basis. At the fourth world championship match, 65 kg, 78 kg, and 95 kg classes were added to the open weight division; at the next championship match, two more weight classes were added, and in 1979 more were added. World championships for women were first held in 1980; they are contested biennially in eight weight classes.

## ROWING

World championship rowing was established in 1962 by the Fédération Internationale des Sociétés d'Aviron (FISA; founded 1892). Events are contested over a 2,000-metre course and include single, double, and quadruple sculls; pairs (with and without coxswain); fours (with and without coxswain); and eights (with coxswain). Women's world championships, held since 1974, include single, double, and coxed quadruple sculls; coxless pairs; fours; and eights, raced over a 1,000-metre course until 1985 (2,000-metre course thereafter).

The most famous and historic of rowing courses is the 2,112-metre course at Henley-on-Thames, Oxfordshire, England. Two events of the Henley Regatta are open to the world, the Diamond Challenge Sculls for single sculls and the Grand Challenge Cup for eights. Unless otherwise mentioned, the clubs listed in the Henley Regatta events are English.

Another historic event is the University Boat Race between Eights from Oxford and Cambridge universities, which was instituted on June 10, 1829. The record time for the course of 4 miles 374 yards (6,755 m) from Putney to Mortlake on the River Thames is 16 min 19 s by Cambridge in 1998. The results including the 147th race in 2001 have been Cambridge 77 wins, Oxford 69 wins, and one dead heat (in 1877).

## SKIING

Although most of the events had been contested at the regional level since the mid-19th century, the first internationally organized skiing championships did not take place until 1924. From 1924 to 1931 only Nordic competition was involved; Alpine championship events were added to world competition in 1931 and to the Olympics in 1936. Except for Olympic years, the Nordic and Alpine championships are held separately and at different locations. Events include cross-country races, ski-jumping, biathlon, and relay races (Nordic) and downhill and slalom skiing (Alpine). Since 1967, an Alpine World Cup has been presented to the competitor with the best combined downhill, slalom, supergiant, and giant slalom performance over a series of major contests. A Nordic World Cup for cross-country events has been awarded since 1979.

## SWIMMING

The Fédération Internationale de Natation Amateur (FINA; founded 1908) is the world governing body for amateur swimming. It held the first world swimming championships in 1973. After 1975 the FINA championships were held in non-Olympic, even-numbered years. (An exception was the championship held in Australia, which took place during the summer month of January 1991.) Diving, synchronized (or synchro) swimming, and water polo events are included in the competition.

A distinction is made between long-course and short-course pools for purposes of record-setting; world championships and other major contests are held in pools that are 50 m long.

## TABLE TENNIS

Official world table tennis championships were first held in 1926 under the auspices of the International Table Tennis Federation (ITTF; founded 1926). Women's doubles competition was added in 1929 and women's team competition in 1934. In 1980 the ITTF first sponsored a men's World Cup competition for the top 16 ranking players; it has been held annually since then.

At world championships, held biennially since 1957, players compete for: the Swaythling Cup (men's team event; best of nine singles matches); the Marcel Corbillon Cup (women's team event; best of four singles and one doubles matches); the St. Bride's Vase (men's singles); the G. Geist Prize (women's singles); the Iran Cup (men's doubles championships); the W.J. Pope Trophy (women's doubles championships); and the Heydusek Prize (mixed doubles championships).

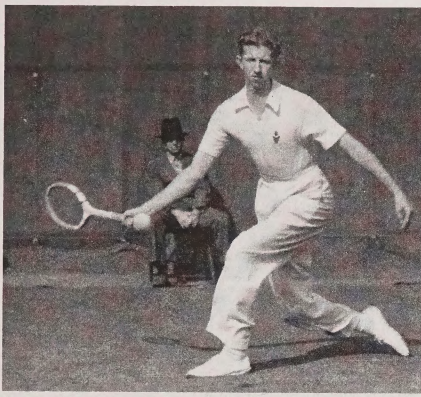
## TENNIS

Four events dominate world championship tennis. The first of the traditional "Big Four," or "grand slam," events was the All-England Lawn Tennis Championships (better known as the Wimbledon Championships), founded in 1877. Its only event the first year was the men's singles championships; women first competed in 1884. Major tennis tournaments also sprang up in the United States (1881 for men; women's singles competition first contested 1887, added officially 1889), France (1891 for men; women's singles competition added 1897), and Australia (1905 for men; women's singles competition added 1922). Open tennis (open, that is, both to professionals and to amateurs) became the rule in the Big Four tournaments in 1968.

International team tennis was organized in 1900 with the institution of the Davis Cup. Competing men's teams play four singles matches and one doubles match for the trophy. The Wightman Cup was contested yearly between British and American women's teams from 1923 to 1989. The International Tennis Federation (ITF, formerly the International Lawn Tennis Federation; founded 1913) established the Federation Cup in 1963 for international women's team competition. It is decided by elimination rounds of two singles and one doubles contest.

Serena and Venus Williams (U.S.) winning the women's doubles in the 2001 Australian Open Tennis Championship
Sean Garnsworthy—Allsport



In 2000, Pete Sampras (U.S.) winning his seventh Wimbledon Tennis Championship

*Open since 1968.

Don Budge (U.S.) winning the U.S. Open in 1938; that same year, he won the singles championships in Australia, France, and Great Britain, becoming the first amateur tennis player to win the grand slam

UPI/Bettmann

*In 1968 and 1969 both amateur and open championships were held. Lutz and Smith won both men's competitions in 1968; Crealy and Stone took the men's amateur championships in 1969. Bueno and Court won both women's competitions in 1968; Court and Wade took the women's amateur championships in 1969. Thereafter the championships were open.

## VOLLEYBALL

World volleyball championships for men were inaugurated in 1949. Women's competition began in 1952. These biennial championships are organized by the Fédération Internationale de Volley-Ball (FIVB; founded 1947).

**World Volleyball Championships**

| year | men | women | year | men | women | year | men | women |

| 1968* | U.S.S.R. | U.S.S.R. | 1986 | United States | China | | | |

*Olympic champions, considered world champions.

## WRESTLING

The first official amateur wrestling world championship was organized by the Fédération Internationale des Lutte Amateur (FILA; founded 1913, reconstituted 1921). Although Greco-Roman style wrestling championships were held in 1910 and 1920–22, they were in effect (like the championships of 1923–49 in fact) open European championships, and the first actual world Greco-Roman wrestling championships were not held until 1950. World amateur freestyle wrestling championships were first held in 1951.

(Wrestling tables follow on pages 174 and 175.)

## YACHTING

One of the classic yachting events is the race that was first proposed by the Royal Yacht Squadron (RYS), best known as the America's Cup. This cup, open to challenge since 1870, was originally the Hundred-Guinea Cup, presented by the RYS for a race around the Isle of Wight, U.K., and won handily by the U.S. yacht *America*. The most graceful of the yachts entered for the America's Cup are generally considered to have been the J-class yachts raced between 1930 and 1937. The cost of maintenance, however, was prohibitive, and since 1958, both winning and challenging vessels have been 12-metres.

The Transpacific Race was inaugurated in 1906 and usually was raced over 2,225 miles between San Pedro, Calif., and Diamond Head Light, Oahu, Hawaii. It was made biennial in 1939, alternating with the Bermuda Race.

The Bermuda Race, from 1906 to 1910, was an annual race between Gravesend Bay, N.Y. (in 1908 the starting point was Marblehead, Mass.), and Bermuda. Six races from New London, Conn., and one from Montauk Point, N.Y. (1932), were held in 1923–34. Since 1936 it has been raced biennially from Newport, R.I., over a 635-mile course. In 1982 it was divided into two classes—one for cruiser/racers and one for grand prix racers—with the craft winning its race by the greatest margin as overall winner. Since 1986 two equal awards have been offered.

The Admiral's Cup is awarded biennially to the national team accumulating the most total points in a series of six races (five until 1987) held off the southern coast of England.

**sports medicine,** medical and paramedical supervision of athletes in training and in competition and the treatment of their injuries. As participation in athletic sports and games increased in the 20th century, the need for special attention to sports medicine became apparent. With its development came increased attention to and understanding of exercise physiology.

There are four aspects to sports medicine: preparation of the athlete, prevention of illness or injury, diagnosis and treatment of illness or injury, and rehabilitation and return of the injured athlete to sports activity. Preparation, or conditioning, improves specific aspects of performance, such as speed, strength, and endurance. The diet of the athlete, specific exercise programs for specific sports, and monitoring the duration and conditions of practice sessions are all-important.

Prevention of injury begins with a physical examination to identify any preexisting conditions that might cause injury or illness to the athlete. Stretching exercises before practice or performance prevent injury from sudden strain. Practitioners of sports medicine also advise the design of equipment, *e.g.,* protective padding or headgear, so as to reduce the chance of injury.

Sports medicine has developed many surgical techniques, particularly for knee injuries, that have come to be applied in general surgical and medical practice.

In Europe, sports medicine has long been a recognized medical specialty, but it was recognized more slowly in the United States. The International Federation of Sportive Medicine was founded in 1928 and by the 1980s had about 50 national affiliates.

**spotlight,** device used to produce intense illumination in a well-defined area in stage, film, television, ballet, and opera production. It resembles a small searchlight but usually has shutters, an iris diaphragm, and adjustable lenses to shape the projected light. Coloured light is produced by a mechanism for sliding or rotating coloured gelatin filters, called gels even though later made of acetate, into the beam. The first theatrical spotlight was the limelight (*q.v.*), which gave way to such light sources as the arc, electric discharge, and incandescent lamp. The practical lensed spotlight was developed in 1879 by Louis Hartmann of the United States.

Follow spotlights project spots that can readily be changed to cover a large area or one as small as a human face. They turn easily on mounts to follow performers.

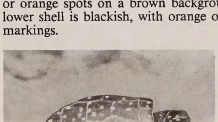
**Spotswood, Alexander** (b. 1676, Tangier, Morocco—d. June 7, 1740, Annapolis, Md.), one of the first British colonial governors of North America to appreciate the economic value of the Western frontier.

After service under the 1st duke of Marlborough in the War of the Spanish Succession (1701–14), he was appointed lieutenant governor of Virginia (1710). In this post he recommended the establishment of a Virginia company to carry on trade with the Indians, urged the construction of forts along the frontier, and personally organized and conducted in 1716 an exploring expedition into the Shenandoah Valley. After his term as governor ended (September 1722), he remained in Virginia, living near the ironworks he had established in Germanna, a settlement of Germans in Spotsylvania County (named in his honour). From 1730 to 1739 he served as deputy postmaster general of the colonies.

**Spotsylvania Court House, Battle of** (May 8–19, 1864), Union failure to smash or outflank Confederate forces defending Richmond, Va., during the American Civil War. Following the Battle of the Wilderness (May 5–6), Union Gen. Ulysses S. Grant moved his left flank forward, engaging the Confederate forces of Gen. Robert E. Lee at Spotsylvania Court House, Virginia. The battle raged for about a week and a half, and on May 20 Grant continued his march southeastward in a flanking movement toward the Confederate capital. His casualties were 17,000; Lee's, 8,000.

**spotted deer:** *see* chital.

**Spotted Tail,** also called SINTE-GALESHKA (b. *c.* 1833, Ft. Laramie [Wyoming], U.S.—d. Aug. 5, 1881, Rosebud Reservation, South Dakota), chief of the Brule Teton Indians and, briefly, the Oglala Sioux who sought compromise and accommodation with the invading whites.



Spotted Tail was not a member of a ruling family, but he won the chieftainship over the hereditary claimant on the basis of his prowess as a warrior. In 1855 he, along with two other warriors, surrendered to white authorities to prevent punishment of the tribe in the wake of an attack on a military detachment. Spotted Tail spent two years in prison and was regarded as a hero among his people upon release.

In 1865 Spotted Tail, in opposition to fellow Sioux chief Red Cloud, favoured allowing white gold-seekers to travel through Indian lands to reach the mines of Montana. In 1868 he signed a treaty confining his people to a reservation in South Dakota and conceding the right of way for a railroad to be built on Indian land. When gold was discovered in the Black Hills, Spotted Tail attempted to negotiate sale of the mineral rights to the U.S. government. But his price ($60,000,000) was too high, and U.S. officials allowed miners to seek gold in the Black Hills without compensation to the Sioux.

Recognizing the futility of resistance, Spotted Tail refused to go on the warpath even when prospectors swarmed over Indian lands. He kept his followers out of the conflicts of 1876—including Little Big Horn—and he helped persuade Crazy Horse to surrender in 1877.

Spotted Tail assumed leadership of the Oglala as well as the Brule Teton Sioux when Red Cloud was deposed in 1881. Shortly thereafter he was assassinated as he left a council meeting by a fellow tribesman named Crow Dog.

**spotted turtle** (*Clemmys guttata*), small freshwater turtle (family Emydidae) found from southern Canada to the southern and central United States. The spotted turtle has a shell about 10 centimetres (4 inches) long. The upper shell is smooth, with round, bright-yellow or orange spots on a brown background; the lower shell is blackish, with orange or yellow markings.

Spotted turtle (*Clemmys guttata*)
By courtesy of the American Museum of Natural History, New York

The spotted turtle is a rather slow-moving reptile. It lives in shallow bodies of water, such as ponds, bogs, and ditches, and it commonly basks in groups in the sun.

**Sprague, Kate Chase,** original name KATHERINE JANE CHASE (b. Aug. 13, 1840, Cincinnati, Ohio, U.S.—d. July 31, 1899, Washington, D.C.), daughter of Abraham Lincoln's secretary of the treasury, Salmon Chase; while continually attempting to advance her father's political fortunes, she became a national fashion and social celebrity.

Educated by her father and in private schools, Kate Chase became the emotional focus of her father's life after the deaths of her mother and stepmother. By the age of 16 she was acting as his official political hostess, and by the age of 20 she was striving earnestly to secure the Republican presidential nomination for him at the Chicago convention in 1860.

Moving to Washington when Salmon Chase was appointed treasury secretary, Kate Chase quickly emerged as the toast of capital society and fashion queen of the nation. On Nov. 12, 1863, she married William Sprague in an elaborate and highly publicized wedding. She used Sprague's wealth to further her father's political ambitions at the expense of Lincoln. And in 1868 she waged another vigorous campaign to win the Republican nomination for him.

The economic crisis of 1873 put the Spragues in financial difficulty, and an already troubled marriage began to fall apart. Their quarrels were detailed in newspapers, as were the eventual divorce proceedings. In 1882 Kate Chase Sprague, newly divorced, sailed for Europe with her three daughters. She returned to Washington in 1886 and lived there the rest of her life in poverty.

*To make the best use of the Britannica, consult the* INDEX *first*

**sprain,** overstretching or tearing of fibres in one or more of the ligaments that support a joint, caused by forced movement beyond their range. Symptoms include sudden severe pain, then swelling around the joint, tenderness, stiffness, and often black-and-blue marks as a result of bleeding into the joint. The common sites for sprains are the ankle, wrist, knee, finger or toe joints, and sacroiliac joint in the lower back. The usual treatment involves support and protection of the joint by adhesive bandaging and the use of graded exercises until healing is complete. If the sprain is severe, surgery to reunite ligaments may be necessary.

**Spranger (van den Schilde), Bartholomaeus,** also spelled BARTHOLOMEUS SPRANGERS, OF SPRANGERSON (b. March 21, 1546, Antwerp, Hapsburg Netherlands—d. August 1611, Prague), Antwerp painter noted for his paintings of nudes executed in the late Mannerist style. In his efforts to develop a Northern artistic canon of the human figure, Spranger employed mannered poses, slender, elongated bodies, and a gleaming, brittle texture in his work. The figures smile invitingly, and the influence of Parmigianino and Correggio is evident in their voluptuous contours.

Spranger went to Italy in 1567 and during a 10-year period spent in Rome and Parma, he assisted in completing an interrupted fresco project. Later, while working in Paris (*c.* 1565), he was influenced by the work of Francesco Primaticcio and Niccolò dell' Abbate. He returned to Rome in 1567 and became an assistant to Taddeo Zuccari, later working in Vienna for the emperor Maximilian II. In 1581 he was appointed court painter in Prague by the emperor Rudolf II, and he remained in that city thereafter. The engraver Hendrik Goltzius made popular copies of Spranger's work, resulting in their becoming widely known.

**Spranger, (Franz Ernst) Eduard** (b. June 27, 1882, Berlin—d. Sept. 17, 1963, Tübingen, W.Ger.), German educator and philosopher. He served as professor of philosophy

in Leipzig (1911–20), Berlin (1920–45), and Tübingen (from 1946), and in 1937–38 he lectured in Japan. He was briefly imprisoned in Berlin late in World War II (1944) but was released at the request of the Japanese ambassador.

Spranger was a student of Wilhelm Dilthey and continued his teacher's research in the *Geisteswissenschaften* (human sciences), emphasizing in his most important works, *Die Lebensformen* (1914; *Types of Men*) and *Psychologie des Jugendalters* (1924; "The Psychology of Youth"), the effects of culture and history on human ethics and actions. His theories on education as both a reflection of and a possible solution to the moral and social problems of the adolescent were influential on German education in the 1920s.

**sprat** (fish): *see* bristling.

**Spratling, William** (b. Sept. 22, 1900, Sonyea, N.Y., U.S.—d. Aug. 8, 1967, near Taxco, Mex.), American designer and architect, who spent more than 30 years in Mexico developing and promoting the silvercraft that made the city of Taxco famous.

A graduate of the New York Fine Arts Institute and Auburn University, in Alabama (where he studied architecture), Spratling taught art and architecture at Tulane University, New Orleans, La., for eight years before going to Mexico in 1927. For two years he taught at the National Autonomous University of Mexico in Mexico City (1927–29) and then settled in Taxco, an old silver town (founded in 1528) that had long been in decay. He befriended silver artisans from all over Mexico and began the design of silver jewelry, artwork, tableware, and tea sets, opening his first *taller,* or workshop, on the Calle Las Delicias in 1933. After World War II his workshop went bankrupt, but he continued his work from a nearby ranch. His example inspired the founding of hundreds of competing workshops.

Over the years Spratling also collected archaeological pieces (housed in the Museo Guillermo Spratling [William Spratling Museum] in Taxco) and founded a silvercraft school. He wrote several books, including *Old Plantation Houses in Louisiana* (1927), *The Frescoes of Diego Rivera* (1929), *A Small Mexican World* (1964), and *File on Spratling: An Autobiography* (1967). He died in an automobile accident.

**Spratly Islands,** group of reefs in the South China Sea, located midway between Vietnam and the Philippines and claimed by several countries. Of the 12 main islets, the largest is the 90-acre (36-hectare) Itu Aba. Another, called Spratly Island or Storm Island, measures 900 feet by 1,500 feet (275 m by 450 m). Turtles and seabirds are the only permanent inhabitants.

Before 1970 the main significance attached to the islands was their strategic location. France held them between 1933 and 1939. During World War II Japan occupied the archipelago and developed it as a submarine base. After the war China established a garrison on Itu Aba, which the Chinese Nationalists maintained after their exile to Taiwan. When Japan renounced its claim to the islands in 1951, Taiwan, mainland China, and Vietnam all declared themselves the rightful owners, and the Philippines added a claim based on proximity in 1955.

In the 1970s South Vietnam occupied three of the Spratly Islands (including Spratly Island itself) to forestall a Chinese occupation. Taiwanese troops remained on Itu Aba. The Philippines then moved forces onto seven of the remaining islets and built an airstrip (1976) on Pagasa Island. By the late 20th century, Vietnam, China, Taiwan, Malaysia (with its occupation of Turumbu Layang-Layang reef [June 1983]), and the Philippines all had conflicting claims to the Spratlys, supported (except in the case of China) by garrisons on various islands.

**spraying and dusting,** in agriculture, the standard methods of applying pest-control chemicals and other compounds. In spraying, the chemicals to be applied are dissolved or suspended in water or, less commonly, in an oil-based carrier. The mixture is then applied as a fine mist to plants, animals, soils, or products to be treated. In dusting, as an alternative method, dry, finely powdered chemicals may be mixed with an inert carrier and applied with some type of blower. Dry granular materials also have been used instead of dusts or sprays where adequate coverage can be obtained. (*See also* crop duster). In fumigation, gases or the vapours of volatile compounds are held in contact with the materials to be treated—grain in a tight bin, for example.

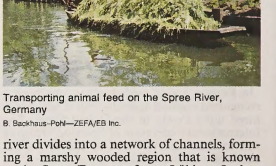
The development of more effective sprays and dusts and their increasingly widespread use in agriculture have prompted concern among biologists and others that humans may disrupt nature and endanger the food and water supply and public health. New chemicals and new precautions have only partially reduced these dangers.

Sprays and dusts are used to control insects, mites, and fungous and bacterial diseases of plants; insects, such as lice and flies, on animals; and weeds, by means of chemical weed killers or herbicides. Sprays and dusts may also be used for such special purposes as applying mineral fertilizers, increasing or decreasing fruit set, delaying the dropping of nearly mature fruits, and defoliating and vine killing to facilitate the harvest of such plants as cotton or potatoes.

Sprays have advantages over dusts in their ability to adhere to and spread over treated surfaces. Spreading-sticking agents or surfactants are commonly added to spray mixtures to increase adhesion and wetting of waxy surfaces. These wetting agents decrease the tendency of water to collect in drops and permit the chemical solution to spread over a leaf in a very thin film, bringing the spray chemical into maximum contact with the fungi, bacteria, insects, or mites to be controlled.

Row-crop sprayer applying pesticides
By courtesy of Ransomes Sims & Jefferies, Ltd., Ipswich, Eng.

There has also been an increase in the use of air sprayers or "wet dusting." The use of a concentrated spray distributed in the airsteam from a powerful fan combines many of the advantages of both spraying and dusting.



Fumigation may be used to control insects and some diseases in stored products or to control insects such as wireworms and grubs, nematodes, and sometimes fungi and weeds in soil. The chemical may be applied as a gas or as a volatile liquid. Partial fumigation of the soil may be accomplished by applying the chemical in a spray or granular material and immediately working it into the soil. For better pest control on small areas like seedbeds the treated soil is covered with gastight, plastic cover.

**spreading yew** (plant): *see* Japanese yew.

**Sprechstimme** (German: "speech-voice"), in music, a cross between speaking and singing in which the tone quality of speech is heightened and lowered in pitch along melodic contours indicated in the musical notation. *Sprechstimme* is frequently used in 20th-century music.

Its introduction is especially associated with the composer Arnold Schoenberg, who first used it in his *Pierrot Lunaire* (1912). It had been used earlier, however, in the melodrama *Königskinder* (1897; *Children of the King*), by Engelbert Humperdinck.

**Spree River,** river in northeastern Germany, rising in the Lusatian Mountains just above Neugersdorf and flowing north past Bautzen and Spremberg, where it splits temporarily into two arms. After it passes Cottbus, the

Transporting animal feed on the Spree River, Germany
B. Backhaus-Pohl—ZEFA/EB Inc.

river divides into a network of channels, forming a marshy wooded region that is known as the Spree Forest as far as Lübben. It then passes Fürstenwalde and Köpenick and winds through Berlin in several branches to join the Havel River (a tributary of the Elbe) at Spandau after a course of 250 miles (403 km). The Spree drains an area of 3,900 square miles (10,100 square km). A considerable portion of the Spree Forest is now cultivated (market gardening) and also serves as a popular excursion area for Berliners. The Spree River is connected with neighbouring rivers by canals, the most important of which is the Oder-Spree Canal running southeast from Berlin.

**Sprengel, Christian Konrad** (b. Sept. 22, 1750, Spandau, Ger.—d. April 7, 1816, Berlin), German botanist and teacher whose studies of sex in plants led him to a general theory of fertilization which, basically, is accepted today.

Sprengel studied theology and languages, spent several years as a schoolmaster in Spandau and Berlin, and became rector of Spandau. In pursuing botanical studies he neglected his duties, and, after his dismissal in 1794, with a pension, he went to Berlin. As a theologian, he believed that everything in nature was created for a purpose, and in observing plants he attempted to uncover the purpose of each minute part.

Sprengel discovered that the nectaries (nectar-producing organs in flowers) were indicated by special colours, and he reasoned that the colour attracted insects. The insects, he found, were the means of conveying pollen from the stamen (male part) of one flower to the pistil (female part) of another. He also discovered that in many bisexual flowers the stamen and pistil mature at different times, and self-fertilization thus cannot occur; fertilization is accomplished instead by the transfer of pollen from one flower to another. The process of maturation of the male and female parts at different periods he called dichogamy, a term that is still used, and he traced the process in fine detail. He discovered that some flowers rely on the wind to transfer their pollen and studied the differences between these flowers and those fertilized by insects.

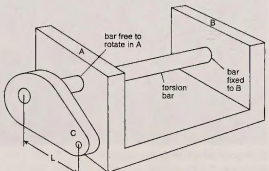
Sprengel believed that his principles explained all of the characteristics of flowers, such as position, size, form, colour, odour, and time of flowering. He published his observations and thoughts in *Das entdeckte Geheimnis der Natur im Bau und in der Befruchtung der Blumen* (1793; "The Newly Revealed Mystery of Nature in the Structure and Fertilization of Flowers"). When his book was not well received, Sprengel became depressed and did not publish the results of his other botanical research. He turned to philology but did not distinguish himself in it. His book, after long neglect, was recognized in 1841 by the English naturalist Charles Darwin, who was so impressed by it that much of his own work on flowers arose from Sprengel's researches.

**spring,** in climatology, season of the year between winter and summer during which temperatures gradually rise. It is generally defined in the Northern Hemisphere as extending from the vernal equinox (day and night equal in length), March 20 or 21, to the summer solstice (year's longest day), June 21 or 22, and in the Southern Hemisphere from September 22 or 23 to December 22 or 23. The spring temperature transition from winter cold to summer heat occurs only in middle and high latitudes; near the Equator, temperatures vary little during the year. Spring is very short in the polar regions. For physical causes of the seasons, *see* season.

In many cultures spring has been celebrated with rites and festivals revolving around its importance in food production. In European languages, the concept of spring is associated with the sowing of crops. During this time of the year all plants, including cultivated ones, begin growth anew after the dormancy of winter. Animals are greatly affected, too: they come out of their winter dormancy or hibernation and begin their nesting and reproducing activities; and birds migrate poleward in response to the warmer temperatures.

**spring,** in hydrology, opening at or near the surface of the Earth for the discharge of water from underground sources. A spring is a natural discharge point of subterranean water at the surface of the ground or directly into the bed of a stream, lake, or sea. Water that emerges at the surface without a perceptible current is called a seep. Wells are holes excavated to bring water and other underground fluids to the surface.

A brief treatment of springs and seeps follows. For full treatment, *see* MACROPAEDIA: Hydrosphere.



Water in springs, seeps, and wells generally originates as rainfall that has soaked into the soil and percolated into underlying rocks. Permeable rocks (those containing interconnected pore spaces through which water can migrate), such as limestone and sandstone, store and transmit water and are called aquifers. Sometimes the water in an aquifer becomes confined between two impermeable rock layers, such as clay or shale. When these strata are tilted or folded into a structural trap, the water in the lower part of the aquifer is stored under pressure. If the pressure is sufficiently high and a well is sunk through the capping layer, the water will rise to the surface without pumping. This is called an artesian well.

The aquifers that receive and discharge the largest quantities of groundwater are unconsolidated materials such as sand and gravel. These aquifers occur widely and discharge groundwater partly through springs, but mostly through evaporation and seepage. Well water is obtained mostly from such aquifers, particularly those underlying lowland areas. In limestone regions, rainwater sinks through holes or other openings and is drained chiefly through underground passages. Basalt and sandstone aquifers are also sources of water for many springs. Most of the springs whose individual discharges exceed 3 cubic metres per second (100 cubic feet per second) originate from limestone and basalt aquifers.

Springs can be classified by their water temperature. A thermal or hot spring has a water temperature significantly higher than the mean air temperature of the surrounding area. Thermal springs occur in volcanic regions and in areas where rock layers have been broken and folded in geologically recent time. Geysers, a spectacular form of hot spring, eject tall plumes of hot water and steam. Springs containing a noticeable amount of dissolved substances are called mineral springs. Most thermal springs are rich in dissolved minerals while many mineral springs are warm.

The quality of water discharged by a spring depends on the type of aquifer and rock strata through which the water has passed, the temperatures along the route, and the volume of circulating water, past and present. Groundwater is least modified where it travels shallowly over short distances through pervious formations depleted of soluble minerals. Sand and gravel aquifers in humid regions yield good-quality water, whereas water from springs and seeps in arid areas may be contaminated by undesirable mineral deposits. The water quality in sedimentary rocks of marine origin depends on the degree of freshwater flushing. After the brine has been washed away, limestone and sandstone rocks usually yield good-quality, though hard, freshwater.

**spring,** in technology, elastic machine component able to deflect under load in a prescribed manner and to recover its initial shape when unloaded. The combination of force and

Torsion-bar spring

displacement in a deflected spring is energy, which may be stored when moving loads are being arrested or when the spring is wound up for use as a power source. Although most springs are mechanical, hydraulic and air springs are also obtainable.

The helical spring, in which wire is wrapped in a coil that resembles a screw thread, is probably the most commonly used mechanical spring. It can be designed to carry, pull, or push loads. Twisted helical (torsion) springs are used in engine starters and hinges. Helical tension and compression springs have numerous uses, notably automobile suspension systems, gun-recoil mechanisms, and closing valves on engines.

The leaf spring is used mainly for vehicle suspension and in one form consists of a stack of slightly curved narrow plates of equal width and varying length clamped together, with the shorter plates in the centre to form a semi-elliptical shape. The ends of the longest plate are attached to the vehicle by pin connections, and the vehicle axle is clamped to the centre, at which point the stack is thickest.

The spiral spring is made from flat strip or wire coiled up in the manner of the groove on a phonograph record. As a mainspring or hairspring, it provides a compact source of energy in clocks and watches; it is also used on typewriters and parking meters.

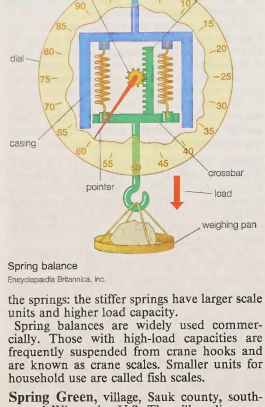
The torsion-bar spring shown in the figure is used in the suspension systems of some automobiles. The circular torsion bar is fixed in plate B and supported but free to rotate in plate A. A load applied at point C on the lever twists the bar, and the stiffness of the suspension, which depends on the length and diameter of the bar and the length of the lever, can be easily varied by changing L.

An air spring is basically a column of air confined within a rubber-and-fabric container shaped like a bellows. The spring action results from the compression and expansion of the air. When used on road vehicles, air springs can keep the vehicle at a constant standing height regardless of load.

Hydraulic springs are comparatively small, thick-walled cylinders in which the spring effect is produced by applying a load to the fluid in the cylinder through a small piston entering at the centre of one end of the cylinder. The piston movement, or deflection, is produced by the compression of the fluid and the deformation (bulging) of the cylinder walls. These springs are particularly useful in applications requiring high load capacities and stiffnesses.

**Spring, Howard** (b. Feb. 10, 1889, Cardiff, Wales—d. May 3, 1965, Falmouth, Cornwall, Eng.), Welsh-born British novelist whose chief strength lies in his understanding of provincial life and ambition. Most of his books trace the rise of a character from poverty to affluence, often melodramatically.

The son of a gardener, Spring left school at the age of 11 but continued his education in the evenings, eventually becoming a newspaper reporter and book critic. His first novel, *Shabby Tiger* (1934), had a sequel, the partly autobiographical *Rachel Rosing* (1935). With his best-selling novel *O Absalom!* (1938)—afterward reissued as *My Son, My Son* (filmed 1940)—Spring won worldwide fame. He settled in Cornwall, the setting for books that followed, such as *Fame Is the Spur* (1940), *Hard Facts* (1944), and *The Houses in Between* (1951).



**Spring and Autumn Period,** Chinese (Wade-Giles) CH'UN CH'IU SHIH-TAI, or (Pinyin) CHUN QIU SHIDAI (770–476 BC), in Chinese history, the period during the Chou (or Eastern Chou) dynasty when many vassal states fought and competed for supremacy. It was named after the title of a Confucian book of chronicles, Ch'un Ch'iu (*q.v.*), covering the period 722–479 BC.

During the Spring and Autumn Period the imperial house, with priestly, ritualistic, and diplomatic functions but with diminishing authority, slowly sank out of sight as the local nobles struggled with one another for power. Survival required coalitions, both political and economic, as well as the accumulation of productive wealth. To this end, many drainage operations, canals, dikes, reservoirs, roads, and the like were undertaken, often on an interstate or multistate basis. Long walls too were thrown up as a means of protection not only against one another but also against aboriginal and nomadic tribes. Merchants and artisans began to assume some significance. Education and intellectual life advanced, this being the period of Confucius and other famous thinkers.

**spring balance,** weighing device that utilizes the relation between the applied load and the deformation of a spring. This relationship is usually linear; *i.e.,* if the load is doubled, the deformation is doubled. In the circular balance shown in the figure, the upper ends of the helical springs are attached to the casing and the lower ends to a crossbar that can move relative to the casing and to which the load hook is attached. The pinion to which the indicating pointer is attached is pivoted in the casing and meshes with the rack, which is pivotally connected to the crossbar and is

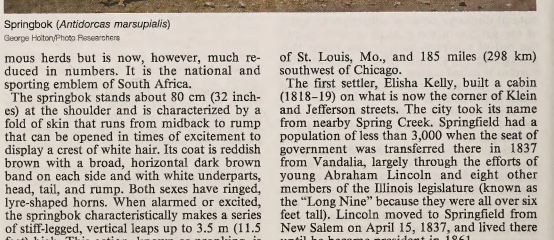
pressed into contact with the pinion by the rack spring.

When a load is applied, the springs are stretched, and movement of the crossbar with the rack attached rotates the pinion and the load-indicating pointer. The dial is graduated in scale units that depend on the stiffness of

Spring balance
Encyclopædia Britannica, Inc.

the springs: the stiffer springs have larger scale units and higher load capacity.

Spring balances are widely used commercially. Those with high-load capacities are frequently suspended from crane hooks and are known as crane scales. Smaller units for household use are called fish scales.



**Spring Green,** village, Sauk county, south-central Wisconsin, U.S. The village lies near the Wisconsin River, 35 miles (56 km) west-northwest of Madison. It originated in the 1860s as a shipping point for livestock and wheat and was incorporated in 1869. The place is, however, best known for its association with the architect Frank Lloyd Wright, who was born in 1867 at Richland Center, 20 miles (32 km) northwest. He chose Spring Green as the site for "Taliesin," his home begun in 1911 and rebuilt after fires of 1914 and 1925. A building that hugs the hills on which it was constructed, it is now known as "Taliesin East" to differentiate it from "Taliesin West," Wright's winter home in Scottsdale, Ariz. At Spring Green in 1933 Wright established the Taliesin Fellowship, his first architectural school for apprentices; the buildings now constitute the summer headquarters of the Frank Lloyd Wright Foundation. A few miles south is another unusual architectural structure—"The House on the Rock," designed by Alexander Jordan (a Wright disciple), 450 feet (140 m) above the Wisconsin River valley; the house winds spirally around the rock, and trees grow through the roof. The site is now surrounded by amusement attractions. Wright was buried in Spring Green until 1985 when, in accordance with the will of his third wife, his remains were exhumed and interred at Taliesin West. Pop. (2000) 1,444.

**Spring of Khosrow Carpet,** also called WINTER OF KHOSROW CARPET, ancient Persian carpet, possibly the most costly and magnificent of all time, made for the Ctesiphon palace of the Sāsānian king Khosrow I (reigned AD 531–579). Described in the historical annals of the Muslim scholar aṭ-Ṭabarī, it became the model for subsequent Garden carpets. The carpet was called the Spring of Khosrow because it represented, in silk, gold, silver, and jewels, the splendour of flowering spring. It was also called the Winter carpet because it was used in bad weather, when real gardens were unavailable. As such, it symbolized the king's power to command the return of the seasons.

Its design was a formalized paradise with streams, paths, rectangular plots of flowers, and flowering trees. Water was represented by crystals, soil by gold, and fruits and flowers by precious stones. When the Arabs captured Ctesiphon (AD 637), the carpet, which measured about 84 square feet (7.8 square m), was cut into fragments and distributed to the troops as booty.

**spring tide,** tide of maximal range, near the time of new and full moon when the Sun and Moon are in syzygy—*i.e.,* aligned with the Earth. Conjunction is the time during new moon when the Sun and Moon lie on the same side of the Earth. The other syzygy condition, opposition, occurs during full moon when the Sun and Moon are positioned on opposite sides of the Earth. In either case of syzygy, the tide-producing forces of the Sun and the Moon reinforce each other, and the tidal amplitudes on Earth are at their greatest. *See* tide.

**springbok,** also called SPRINGBUCK (*Antidorcas marsupialis*), a species of graceful, strikingly marked, gazellelike antelope of the family Bovidae (order Artiodactyla). The springbok is native to the open, treeless plains of southern Africa. It once roamed in enormous herds but is now, however, much reduced in numbers. It is the national and sporting emblem of South Africa.

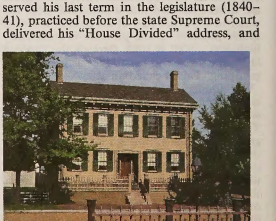
Springbok (*Antidorcas marsupialis*)
George Holton/Photo Researchers

The springbok stands about 80 cm (32 inches) at the shoulder and is characterized by a fold of skin that runs from midback to rump that can be opened in times of excitement to display a crest of white hair. Its coat is reddish brown with a broad, horizontal dark brown band on each side and with white underparts, head, tail, and rump. Both sexes have ringed, lyre-shaped horns. When alarmed or excited, the springbok characteristically makes a series of stiff-legged, vertical leaps up to 3.5 m (11.5 feet) high. This action, known as pronking, is performed with the head down, the hooves bunched, and the back arched.

**Springbok Flats,** Afrikaans SPRINGBOKVLA, extensive plain in South Africa, extending northeast from Pretoria in Gauteng province for about 100 miles (160 km) to the town of Zebediela in Northern province. The name indicates an abundance of springboks, but now little game remains except in preserves. The whole plain, with an average elevation of about 3,300 feet (1,000 m), is extremely flat and featureless. The climate is hot, with an annual rainfall of about 24 inches (600 mm) and little surface runoff. Vegetation is thornveld and grassland, and the black turf, soil derived from basalt, is fertile. The plain is mainly cattle-raising country; corn (maize), peanuts (groundnuts), and large quantities of oranges are harvested (with irrigation) near Zebediela. The plain is well served by railways and roads.

**Springer, Axel,** in full AXEL CÄSAR SPRINGER (b. May 2, 1912, Altona, near Hamburg, Ger.—d. Sept. 22, 1985, West Berlin), German publisher who founded Axel Springer Verlag AG, one of the largest publishing concerns in Europe.

Springer was the son of a printer and publisher. After limited schooling, he worked as an apprentice in various printing and publishing concerns. He received his journalism training at a news agency and at his father's paper, the *Altonaer Nachrichten.*



In 1945 Springer started to build his own publishing company. By the time of his death, the Axel Springer Publishing Group was publishing *Die Welt,* a highly regarded conservative daily newspaper; *Bild-Zeitung,* a daily tabloid; the *Hamburger Abendblatt;* the *Berliner Morgenpost;* and other newspapers, as well as radio and television program guides. The company's activities also included two book-publishing concerns (Ullstein and Propyläen) and an audiovisual enterprise.

In 1959–60 Springer moved his operations from Hamburg to West Berlin in what he intended as a symbolic protest over the partition of Germany. He also supported the state of Israel and worked to further German-Jewish reconciliation.

**Springfield,** city, capital of Illinois, U.S., and seat (1825) of Sangamon county. It lies along the Sangamon River in the central part of the state. It is situated 99 miles (160 km) northeast of St. Louis, Mo., and 185 miles (298 km) southwest of Chicago.

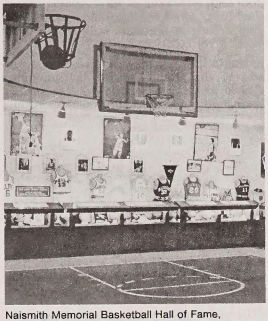
The first settler, Elisha Kelly, built a cabin (1818–19) on what is now the corner of Klein and Jefferson streets. The city took its name from nearby Spring Creek. Springfield had a population of less than 3,000 when the seat of government was transferred there in 1837 from Vandalia, largely through the efforts of young Abraham Lincoln and eight other members of the Illinois legislature (known as the "Long Nine" because they were all over six feet tall). Lincoln moved to Springfield from New Salem on April 15, 1837, and lived there until he became president in 1861.

In the Old State Capitol (1837–53, rebuilt in the 1960s as a state historic site), Lincoln served his last term in the legislature (1840–41), practiced before the state Supreme Court, delivered his "House Divided" address, and

Lincoln Home National Historic Site, Springfield, Ill.
© James P. Rowan

maintained an office as president-elect. His body lay in state there (May 4, 1865), and in the historical library is a collection of Lincolniana. The locations of Lincoln's law offices and the Globe Tavern (where his first inaugural speech was written) are marked with bronze plaques. Lincoln's unpretentious house at 8th and Jackson streets has been restored. This home, with the four-block area surrounding it, was designated a national historic site in 1971. In Oak Ridge Cemetery northwest of the city is the Lincoln Tomb, which holds the bodies of Lincoln, his wife, Mary, and their sons Edward, Willie, and Tad. The memorial is 117 feet (36 m) tall and is surmounted by a granite shaft. The First Presbyterian Church contains the Lincoln family pew.

The State House (1868–88) is 361 feet (110 m) high at the top of its dome. The Centennial Building (1918–23) commemorates the 100th anniversary of Illinois statehood. The Governor's Mansion was first occupied by Governor Joel A. Matteson in 1855.



Springfield is a wholesale and retail centre for a rich farming area producing corn (maize), wheat, soybeans, and livestock. It is the site of the Illinois State Fair, held annually since 1893. Principal manufactures include industrial tractors, garage equipment, electric metres and electronic equipment, brick and concrete products, and paints. Tourism is an economic asset. The city is the national headquarters of several insurance companies. It is the seat of Springfield College in Illinois (1925), Diocesan Seminary of the Immaculate Conception (1956), Lincoln Land Community College (1969), and Sangamon State University (1970).

The Lincoln Memorial Garden and Nature Center is near Lake Springfield (a reservoir completed in 1934) at the southeast edge of the city. The home of Vachel Lindsay, the Springfield poet, is maintained as a museum. The Daughters of Union Veterans of the Civil War have their headquarters and a memorial museum in Springfield. Camp Butler National Cemetery, formerly the site of a Civil War prison camp, is 7 miles (11 km) east. Lincoln's New Salem Historic Site is 24 miles (39 km) northwest. Clayville Stagecoach Stop, a restored wayside inn (built in 1824 and named for Henry Clay, the statesman and orator), is 14 miles (22 km) northwest. Inc. village, 1832; city, 1840. Pop. (2000) city, 111,454; Springfield MSA, 201,437.

**Springfield,** city, seat (1812) of Hampden county, southwestern Massachusetts, U.S., on the Connecticut River. It forms a contiguous urban area with Agawam and West Springfield (west), Chicopee and Holyoke (north), Ludlow (northeast), Wilbraham and Hampden (east), and East Longmeadow (south). William Pynchon, one of the original patentees of the Massachusetts Bay Colony, founded a settlement (now Agawam) on the river's west bank in 1635. The colonists' livestock did so much damage to the cornfields of the Indians, however, that the community moved to the present east-bank site in 1636. It was organized as a town in 1641 and named for Pynchon's birthplace in England. Pynchon's autocratic rule ended in 1652 when he returned to England, after being condemned by the Massachusetts General Court for a book attacking the Calvinist doctrine of atonement.

Springfield's transformation from a farming to a manufacturing community was hastened by the building of an arsenal in 1777, which supplied arms during the Revolutionary War and was a target of attack during Shays's Rebellion in 1786. During the American Civil War the Armory (built 1794 and now a national historic site) produced the well-known Springfield muskets; it became a principal manufactory of small arms and later developed the Springfield and Garand rifles. The Organ of Rifles (so-called for the resemblance of stacked arms to organ pipes), made famous by Henry Wadsworth Longfellow's poem "The Arsenal at Springfield," is displayed in the Armory Museum.

Possessing abundant waterpower and connected by railroad to Boston in 1835, Springfield soon became an industrial town. Machinery, electrical equipment, chemicals, rubber goods, plastics, printed matter, and clothing have become important products in its diversified economy. The G. & C. Merriam Company, publishers of Merriam-Webster dictionaries since 1843, has its headquarters there. A group of buildings comprising three museums, a library, a planetarium, and an art gallery, occupies the Quadrangle centre of the city. Eastern States Exposition Park in West Springfield is the site of one of the largest annual (September) industrial-agricultural fairs in the eastern United States; Storrowtown (a reconstructed old New England village) and two theatres are within the park. Springfield College was founded in 1885; other colleges are the American International College (1885), the Western New England College (1919), and the Springfield Technical Community College (1965). The city's Naismith Memorial National Basketball Hall of Fame commemorates James Naismith, who originated basketball there in 1891. Inc. city, 1852. Pop. (2000) city, 152,082; Springfield MSA, 591,932.

Naismith Memorial Basketball Hall of Fame, Springfield, Mass.
Mark Sexton

**Springfield,** city, seat (1833) of Greene county, southwestern Missouri, U.S., near the James River, at the northern edge of the Ozark Highlands, north of the Table Rock Lake area. Settled in 1829, its growth was slow until the period of heavy westward migration, when pioneers were attracted by its location on important land routes. During the American Civil War, the city was held for a few months by Confederate forces after the Battle of Wilson's Creek (Aug. 10, 1861; fought 11 miles [18 km] south) until they were expelled by Federal troops in February 1862. "Wild Bill" Hickok lived in Springfield and scouted for the Federals; he was acquitted there of the murder of Dave Tutt. An extension of the Atlantic and Pacific Railroad (1870) resulted in the development of a rival community, North Springfield, which merged with Springfield in 1887.

The city's agricultural-based economy (dairy products, poultry, stockyards) is augmented by light manufacturing (steel products, television sets, paper containers, refrigeration motors, and V-belts) and educational institutions. The latter include Drury College (1873), Southwest Missouri State University (1905), Evangel College (1955), Central Bible College (1922), and Baptist Bible College. The International Headquarters of the Assemblies of God Church is in the city. Inc. 1838. Pop. (2000) city, 151,580; Springfield MSA, 325,721.

**Springfield,** city, seat (1818) of Clark county, west-central Ohio, U.S., on Buck Creek and Mad River, 25 miles (40 km) northeast of Dayton. The original settlement by James Demint and migrant Kentuckians in 1799 was on the site of the village of Old Piqua (birthplace of Tecumseh, the Shawnee Indian chief). It was laid out in 1801 and named by the wife of Simon Kenton, an Indian scout who had settled there, for the springs in nearby cliffs. The arrival of the National (Cumberland) Road sustained its growth. The manufacture of farm machinery (now a leading industry) began there in 1855 when William Whiteley invented a successful binder. In the 1880s the journal *Farm and Fireside* was published in Springfield as a house organ by P.J. Mast; this formed the basis of the Crowell-Collier publishing ventures (now part of the Macmillan organization). One of the earliest programs of the 4-H Club movement of "learning by doing" for young people was started (1902) there by A.B. Graham. George Harrison Shull (born nearby in 1874) conducted his early hybrid corn experiments in Springfield, which is now the trading centre for a fertile agricultural area. Manufactures are well-diversified and in addition to farm implements include hoisting machinery, funeral supplies, tools, monorails, and a variety of iron and steel products. The city is the seat of Wittenberg University (Lutheran Church in America; 1845) and Clark Technical College (1962). Inc. village, 1827; city, 1850. Pop. (2000) city, 65,358; Dayton-Springfield MSA, 950,558.

**Springfield Race Riot** (August 1908), in U.S. history, brutal two-day assault by several thousand white citizens on the black community of Springfield, Ill. Triggered by the transfer of a black prisoner charged with rape (an accusation later withdrawn), the riot was symptomatic of fears of racial equality in North and South alike. Almost the entire Illinois state militia was required to quell the frenzy of the mob, which shot innocent people, burned homes, looted stores, and mutilated and lynched two elderly blacks.

Afterward, the population seemed to show no remorse, and some persons even advocated the Southern political strategy of disenfranchisement as a means of keeping blacks "in their place." In a moving account of the riot, called "Race War in the North" (Sept. 3, 1908), Southern white journalist William English Walling called for a revival of the abolitionist spirit to stem the tide of such shocking occurrences. Fearing further degeneration in race relations, white liberals were inspired by the article to join with blacks in launching the National Association for the Advancement of Colored People.

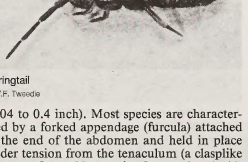
**Springfield rifle,** any of several rifles that were standard infantry weapons of the U.S. Army most of the time from 1873 to 1936, all taking their name from the Springfield Armory, established at Springfield, Mass., by the U.S. Congress in 1794. The armoury had produced smoothbore muskets from its earliest days, and between 1858 and 1865 it turned out more than 840,000 .58-calibre rifled muskets. In 1866, it began adapting the muzzle-loading rifles to breech-loading, single-shot rifles by making a "trapdoor" for the breech with latch, firing pin, and extractor for the cartridge case.

From 1873 to 1892 the armoury turned out breech-loading, single-shot Springfield .45-70s (.45 calibre with 70 grains of black powder). Between 1892 and 1903 the U.S. Army used a Norwegian-designed Krag-Jørgensen bolt-action repeating rifle, but in the meantime the Springfield gunsmiths were studying the German Mauser, a five-shot bolt-action repeating rifle. The United States adapted the Mauser into the Model 1903 Springfield, a rifle that, after some modifications to accommodate Model 1906 ammunition, entered history as the Springfield .30-06, one of the most reliable and accurate military firearms in history. The Springfield served as the principal U.S. infantry weapon until 1936, when it was replaced by the Garand (M1) rifle of World War II—also designed at the Springfield Armory. When the Springfield .30-06 was retired, it was widely modified into a sporting rifle that is still prized for its accuracy.

**springhare,** also called SPRINGHAAS, JUMPING HARE, or CAPE JUMPING HARE, either of two species of hopping African rodents constituting the genus *Pedetes* and the family Pedetidae (order Rodentia). Although they are called hares, springhares are not of the order Lagomorpha.

Springhares have short forelegs and long, powerful hind legs and feet. They are large-eyed animals with relatively long, pointed ears and have long, soft, light reddish brown fur and long, black-tipped tails. They are about 35 to 40 cm (14 to 16 inches) long, excluding a tail of about the same length.

Inhabitants of open, sandy country, springhares live in burrows and emerge at night to



Springhare (*Pedetes*)
Des and Jen Bartlett—Bruce Coleman Ltd.

feed on roots, bulbs, and other vegetation. They sometimes come bounding out of their burrows, presumably to avoid any predators at the entrance. Springhares breed in summer, and the female bears one or two young per litter. The species *P. capensis* is found from eastern to southern Africa, and *P. surdaster* in Kenya.

**Springhill,** town, Cumberland county, northern Nova Scotia, Canada. It lies 22 miles (35 km) southeast of Amherst and is situated on a hill 700 feet (210 m) high, which was once the source of numerous springs—whence its name. Coal, discovered in the vicinity in 1834 and mined commercially since 1872, is the town's economic mainstay. The first Canadian coal-mining trade union was legalized in the Springhill collieries in 1879. One of the mines, with a vertical depth of 4,000 feet (1,220 m), is said to be the deepest in Canada. Springhill has experienced several major mining disasters—in 1891, when 125 miners lost their lives; in 1956, when 39 were killed by an explosion; and in 1958, when 76 were suffocated by a massive earth disturbance. Most of the business district was destroyed by fire in 1957. Coal now is mined only intermittently. Other activities are farming, lumbering, woodworking, and machine-shop practice. Inc. 1889. Pop. (2001) 4,091.

**Springs,** town, Gauteng province, South Africa. It lies in the Witwatersrand, just east of Johannesburg, at an elevation of 5,338 feet (1,627 m). Founded as a coal-mining camp in 1885, it was sustained by the mining of gold beginning in 1908 and was incorporated in 1912. It became the largest single gold-producing area in the world by about the mid-20th century. Manufacturing (including paper, foodstuffs, and cosmetics) has now replaced gold mining as the main economic activity. Pop. (1996) 160,795.

**springtail,** any small, primitive, wingless insect of the group Collembola (sometimes ranked as an order of about 3,500 species). Springtails range in length from 1 to 10 mm

Springtail
M.W.F. Tweedie

(0.04 to 0.4 inch). Most species are characterized by a forked appendage (furcula) attached at the end of the abdomen and held in place under tension from the tenaculum (a clasplike structure formed by a pair of appendages). Although the furcula provides a jumping apparatus for the collembolan, enabling it to catapult itself (hence the common name springtail), the usual method of locomotion is crawling. Springtails also have a ventral abdominal, suckerlike tube (collaphore), which secretes a sticky, adhesive substance and also takes up water. The young hatch from spherical eggs and closely resemble the adult. There can be 3 to 12 molts before maturity and up to about 50 molts during the lifetime of a springtail.

The springtail, found in all types of soil and leaf litter throughout the world from Antarctica to the Arctic, is one of the most widely distributed insects. Certain springtails known as snow fleas are active at near-freezing temperatures and may appear in large numbers on snow surfaces. Springtails live in soil and on water and feed on decaying vegetable matter, sometimes damaging garden crops and mushrooms. The small (2 mm long), green-coloured lucerne flea (*Sminthurus viridis*), one of the most common species, is a serious pest to crops in Australia. Dusting with rotenone or Malathion controls springtails. Fossil springtails are among the oldest insect fossils known.

**sprinkler system,** in fire control, a means of protecting a building against fire by causing an automatic discharge of water, usually from pipes near the ceiling. The prototype, developed in England about 1800, consisted of a pipe with a number of valves held closed by counterweights on strings; when a fire burned the strings, the valves were opened. Many manually operated systems were installed in 19th-century buildings; in these a number of perforated pipes were fed by a main riser that could be turned on in an adjoining area. Because this system resulted in frequent water damage in parts of a room or building untouched by fire, an improvement was sought and found in the Parmelee sprinkler head, introduced in the United States in the 1870s. In this, the normally closed orifice is opened by heat from a fire. Modern versions use a fusible link or a bulb containing chemicals, which breaks at about 160° F (70° C) to open the orifice. Modern sprinkler heads are designed to direct a spray downward. Most sprinkler systems are wet-head—*i.e.,* they use pipes filled with water. Where there is danger of freezing, however, dry-head sprinklers are used in which the pipes are filled with air under moderate pressure; when the system is activated, the air escapes, opening the water-feeder valves. An improved version has air under only atmospheric pressure and is activated by heat-sensing devices. Another special type, used in high-hazard locations, is the deluge system, which delivers a large volume of water quickly.

**sprint,** also called DASH, in track-and-field athletics, a footrace over a short distance with an all-out or nearly all-out burst of speed, the chief distances being 100, 200, and 400 metres and 100, 220, and 440 yards. The course for sprint races is usually marked off in lanes within which each runner must remain for the entire race. Originally sprinters used a standing start, but after 1884 sprinters started from a crouched position using a device called a starting block (legalized in the 1930s) to brace their feet. Races are begun by a pistol shot; at 55 to 65 metres (60 to 70 yards), top sprinters attain maximum speed, more than 40 km per hour (25 miles per hour). After the 65-metre mark the runner begins to lose speed through fatigue.

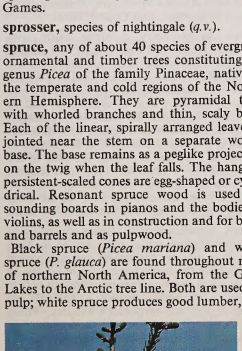
All important international races at 200 metres and 220 yards, as well as 400 metres and 440 yards, are run on an oval track. The starts are staggered (the lanes farther from the centre begin progressively farther forward on the track) so that each runner will cover an equal distance. As a result, the competitors, particularly in the 400 metres and 440 yards, have no exact knowledge of their respective positions until they have completed the final turn. Great emphasis is therefore placed on an athlete's

Marion Jones (U.S.) running the 200-metre event at the 2000 Olympics, Sydney
© AFP/Corbis

ability to judge his own pace, as well as upon his speed and endurance. For World Cup and world championship winners, *see* Sporting Record: *Athletics. See also* Olympic Games.

**sprint,** in bicycle racing, a competition over a 1,000-metre (1,094-yard) course (500-metre for women) with time taken only over the last 200 metres (219 yards). Racers compete in groups of two (sometimes called a match sprint) or three, and they frequently spend the early laps of the race moving relatively slowly and trying to maneuver their opponents into the lead, while at the same time following

Sprint bicyclists at the Vodafone Arena in Melbourne, Australia
Mark Dadswell—Getty Images



close behind and conserving energy for the final high-speed dash to the finish line.

Tandem races, an amateur event, are similar to sprint competition, with teams of two racers each competing on tandem bicycles. Speeds are slightly higher, and the racers generally maintain a more steady pace than in the individual sprints. For world champions, *see* Sporting Record: *Cycling*. *See also* Olympic Games.

**sprosser,** species of nightingale (*q.v.*).

**spruce,** any of about 40 species of evergreen ornamental and timber trees constituting the genus *Picea* of the family Pinaceae, native to the temperate and cold regions of the Northern Hemisphere. They are pyramidal trees with whorled branches and thin, scaly bark. Each of the linear, spirally arranged leaves is jointed near the stem on a separate woody base. The base remains as a peglike projection on the twig when the leaf falls. The hanging, persistent-scaled cones are egg-shaped or cylindrical. Resonant spruce wood is used for sounding boards in pianos and the bodies of violins, as well as in construction and for boats and barrels and as pulpwood.

Black spruce (*Picea mariana*) and white spruce (*P. glauca*) are found throughout most of northern North America, from the Great Lakes to the Arctic tree line. Both are used for pulp; white spruce produces good lumber, and

Black spruce (*Picea mariana*)
Grant Heilman—EB Inc.

black spruce is the source of spruce gum. White spruce usually is 18 to 21 metres (about 60 to 70 feet) tall. A drought-tolerant variety, *Picea glauca* "Black Hills," is useful in landscaping and in windbreaks. The cones of black spruce are purple, those of white spruce brown. Engelmann spruce (*P. engelmanni*) of western North America is an important timber source. The blue spruce, or Colorado spruce (*P. pungens*), has a similar range and is used as an ornamental because of its bluish leaves and symmetrical growth habit.

The Norway spruce (*P. abies*), an important timber and ornamental tree native to northern Europe, is used in reforestation both there and in North America.

**Spruce Knob,** highest point in West Virginia, U.S., located in the Allegheny Mountains in the eastern part of the state, about 25 miles (40 km) southeast of Elkins. Spruce Knob lies at an elevation of 4,863 feet (1,482 metres) at the southern end of Spruce Mountain, a ridge extending northeast-southwest along the western edge of Pendleton county. The peak, accessible by road from nearby Judy Gap, is within Monongahela National Forest and is one of the focal points of Spruce Knob–Seneca Rocks National Recreation Area. The recreation area, established in 1965, has an area of about 156 square miles (404 square km) and is a noted destination for rock climbing.

**sprung rhythm,** an irregular system of prosody developed by the 19th-century English poet Gerard Manley Hopkins. It is based on the number of stressed syllables in a line and permits an indeterminate number of unstressed syllables. In sprung rhythm, a foot may be composed of from one to four syllables. (In regular English metres, a foot consists of two or three syllables.) Because stressed syllables often occur sequentially in this patterning rather than in alternation with unstressed syllables, the rhythm is said to be "sprung." Hopkins claimed to be only the theoretician, not the inventor, of sprung rhythm. He saw it as the rhythm of common English speech and the basis of such early English poems as Langland's *Piers Plowman* and nursery rhymes such as

Ding, dong, bell;
Pussy's in the well.

Sprung rhythm is a bridge between regular metre and free verse. An example of Hopkins' use of it is:

Margaret are you grieving
Over Goldengrove unleaving?

"Spring and Fall to a Young Child"

**spun glass:** *see* fibreglass.

**spurge** (*Euphorbia*), one of the largest flowering-plant genera, with more than 1,600 species, many of which are important to man as ornamentals, sources of drugs, or as weeds. The genus takes its common name from a group of annual herbs used as purgatives, or spurges, mainly the 1-metre- (3-foot-) tall European *E. lathyris,* seeds of which were once used for their laxative effect. The diverse, worldwide genus includes many species in arid parts of Africa and India that resemble cactus plants. Unlike cacti, euphorbias have a milky sap. Euphorbia plants vary from flat, creeping herbs—such as the weedy North American prostrate spurge (*E. supine*), which grows out of sidewalk cracks—to shrubs and trees. They have one female flower consisting of a single female reproductive structure, the pistil, surrounded by numerous male flowers of one stamen each. All these reduced flowers are enclosed in a cup-shaped, leaflike structure with five lobes and a gland on each, called a cyathium. Fruits are explosive, three-seeded capsules.

The cactus-like kinds include spined, succulent (fleshy), and angled 15-metre-tall trees such as *E. candelabrum* and *E. nyikae* from

Spurge (*Euphorbia venata*)
Valerie Finnis

East Africa; spined and angled succulent shrubs, 6 metres tall, such as *E. grandicornis* from southern Africa and *E. lactea* from the East Indies, both of which are grown as hedges in areas with a mild climate.

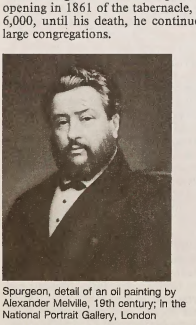
Succulent but unthorned and with upright, 6-metre, fingerlike, much-branched stems is milkbush (*E. tirucalli*) from India, used in Africa and many tropical places as a hedge for huts or cattle enclosures. Wax plant (*E. antisyphilitica*), from Mexico, has similar but unbranched, rodlike, gray-green, mostly naked, 1-metre stems from the surface of which comes an important wax used for polishes, candles, lubricants, and paper waterproofing.

The somewhat climbing, thorned, leafy, woody-stemmed crown of thorns (*E. milii* or *E. splendens*) from Madagascar is a popular houseplant in temperate areas and a good source of colour in tropical gardens.

What is probably the most appreciated of the tropical euphorbias is the poinsettia from southern Mexico and Guatemala, which has scarlet bracts (leaflike structures attached just below flowers) and is associated with Christmas. Another species associated with Christmas in southern Mexico and Central America, where it is native, is the shrub pascuita (*E. leucocephala*), 1.5 to 4 metres tall, which is covered much of the winter with a mist of small, white bracts. In some varieties the leaves are dark red. The scarlet plume (*E. fulgens*), from Mexico, a 90-centimetre- (3-foot-) tall shrub with slender stems and scarlet bract clusters, is sometimes grown as a pot plant and in mild-winter areas as a garden shrub.

Perennial ornamentals of temperate climes include: cypress spurge (*E. cyparissias*), from Europe, a globe-shaped plant with needlelike foliage that is covered with golden bracts in spring; *E. venata* or *E. wulfenii,* from Europe, a plant, 0.9 to 1.2 metres tall, with greenish yellow heads on bluish foliage; cushion spurge (*E. epithymoides*), from Europe, a 30.5-cm globe of gold to chartreuse that blooms in spring; *E. characias,* a 0.9- to 1.2-metre-tall European plant with sulfur-yellow bracts in summer; and *E. griffithii,* from the Himalayas, the fireglow variety of which has fire-orange heads in early summer.

Annual ornamentals include snow-on-the-mountain (*E. marginata*), native in the North American west; and many varieties of fire-on-the-mountain (*E. heterophylla*), from



the eastern and central United States to Peru, with red-marked, poinsettia-like green bracts and leaves of varied shape on 90-centimetre- (35-inch-) tall plants.

Important as weeds are flowering spurge (*E. corollata*), of the middle and eastern United States; the leafy spurge (*E. escula*), naturalized from Europe in the northern United States and adjacent Canada; spotted spurge (*E. maculata*); prostrate spurge and the related European petty spurge (*E. peplus*); and sun spurge (*E. helioscopia*).

Some botanists have divided the euphorbias into various genera, including *Poinsettia, Tithymalus, Tithymalopsis*, and *Dichrophyllum.*

**Spurgeon, C.H.,** in full CHARLES HADDON SPURGEON (b. June 19, 1834, Kelvedon, Essex, Eng.—d. Jan. 31, 1892, Menton, France), English fundamentalist Baptist minister and celebrated preacher whose sermons, which were often spiced with humour, were widely translated and extremely successful in sales.

Reared a Congregationalist, Spurgeon became a Baptist in 1850 and, the same year, at 16, preached his first sermon. In 1852 he became minister at Waterbeach, Cambridgeshire, and in 1854 minister of New Park Street Chapel in Southwark, London. Within a year a new structure had to be built to accommodate his following, and almost immediately an even larger church was required. From the opening in 1861 of the tabernacle, which held 6,000, until his death, he continued to draw large congregations.

Spurgeon, detail of an oil painting by Alexander Melville, 19th century; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

The editor of a monthly magazine, Spurgeon also founded a ministerial college (in 1856) and an orphanage (1867). His sermons, which he published weekly, ultimately filled more than 50 volumes in the collected edition. An ardent fundamentalist, he distrusted the scientific methods and philological approach of modern biblical criticism and in 1887 left the increasingly liberal Baptist Union.

**Spurius** (ancient Roman personal name, or praenomen): *see under* gens or family name or honorific (*e.g.,* under Cassius for Spurius Cassius Vecellinus).

**spurred snapdragon:** *see* toadflax.

**Spurs, Battle of the** (1302): *see* Golden Spurs, Battle of the.

**Sputnik,** any of a series of artificial Earth satellites whose launching by the Soviet Union beginning on Oct. 4, 1957, inaugurated the Space Age. Sputnik 1, the first satellite launched by man, was a 184-pound (83.6-kilogram) capsule. It achieved an Earth orbit with an apogee (farthest point from Earth) of 584 miles (942 km) and a perigee (nearest point) of 143 miles (230 km), circling the Earth every 96 minutes and remaining in orbit until early 1958 when it fell back and burned in the Earth's atmosphere. Sputnik 2 carried the dog Laika, the first living creature to be shot into space and orbit the Earth. Eight more Sputnik missions with similar satellites carried out experiments on a variety of animals to test spacecraft life-support systems; they also tested reentry procedures and furnished data on space temperatures, pressures, particles, radiation, and magnetic fields.

**Spyri, Johanna,** *née* HEUSSER (b. June 12, 1829, Hirzel, Switz.—d. July 7, 1901, Zürich), Swiss writer whose story for children, *Heidi,* is known all over the world. Her psychological insight into the child mind, her humour, and her ability to enter into childish joys and sorrows give her books attraction and lasting value.

After her marriage in 1852 to Bernhard Spyri, a lawyer engaged in editorial work, she moved to Zürich. Her love of homeland, feeling for nature, unobtrusive piety, and cheerful wisdom gave both her work and her life their unique quality. Her books include *Ein Blatt*

Johanna Spyri

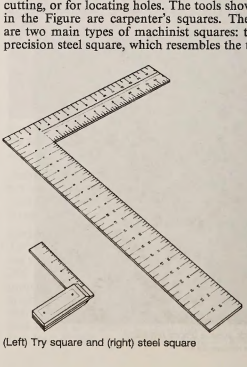
*auf Vronys Grab* (1870; "A Leaf from Vrony's Grave"), *Heidi,* 2 vol. (1880–81), *Heimatlos* (1881), and *Gritli* (1882).

**squab,** variety of domestic pigeon (*q.v.*) raised for its meat.

**squall,** sudden wind-speed increase of 8 metres per second (18 miles per hour) or more, to a peak speed of 11 metres per second (25 miles per hour) or more, for one minute or longer. It includes several briefer wind-speed changes, or gusts. A squall is often named after the weather phenomenon that accompanies it, such as rain, hail, or thunder; a line squall is one associated with a squall line of thunderstorms that is often hundreds of kilometres long. Cold air descending from slopes produces some squalls, such as the bora on the Adriatic coast of Italy and the Balkans; moving cold fronts cause others, such as the norther in North America.

**Squanto,** also called TISQUANTUM (d. November 1622, Chatham Harbor, Plymouth Colony [now Chatham, Mass., U.S.]), native American Indian interpreter and guide.

Squanto was born into the Pawtuxet tribe that occupied lands in present-day Massachusetts and Rhode Island. Little is known about his early life. Some authorities believe that he was taken from home to England in 1605 by George Weymouth and returned with explorer John Smith in 1614–15. He was, in any event, seized with other Indians by one of Smith's men, Thomas Hunt, who took them to the Mediterranean port of Málaga, Spain, to be sold into slavery. Squanto somehow escaped to England and joined the Newfoundland Company. He returned home in 1619 on his second trip back to North America only to find that his tribe had been wiped out by disease.



During the spring of 1621, Squanto was brought to the newly founded Pilgrim settlement of Plymouth by Samoset, an Indian who had been befriended by the English settlers. Squanto, who had been living with the Wampanoag tribe since his return from England, soon became a member of the Plymouth colony. Because Squanto was fluent in English, Governor William Bradford made him his Indian emissary, and he then served as interpreter for Edward Winslow, the Pilgrim representative, during his negotiations with Massasoit, chief of the Wampanoags. Squanto died while guiding Bradford on Cape Cod.

**Squarcione, Francesco** (b. 1397, Padua, Carrara [now in Italy]—d. *c.* 1468, Padua), early Renaissance painter who founded the Paduan school.

Squarcione was associated in 1434 with the influential Tuscan painter Fra Filippo Lippi during the latter's stay in Padua. His two extant panel paintings, a Madonna in a museum of the Prussian Cultural Property Foundation in Berlin and a polyptych of 1449–52 in the Civic Museum of Padua, show the influence of the Florentine early Renaissance style, especially that of the sculptor Donatello, who worked in Padua from 1443 to 1453. The only record of his mature style is contained in a cycle of frescoes of scenes from the life of St. Francis on the exterior of San Francesco at Padua (*c.* 1452–66). Such compositions as can be reconstructed confirm the traditional view of Squarcione as one of the channels through which the early Renaissance style of Florence diffused in Padua. According to Scardeone (the prime source for knowledge of the painter's work), Squarcione had 137 pupils. Among the artists he taught or influenced were Andrea Mantegna, Marco Zoppo, Giorgio Schiavone, and Cosmè Tura.

**square,** in geometry, a plane figure with four equal sides and four right (90°) angles. A square is a special kind of rectangle (an equilateral one) and a special kind of parallelogram (an equilateral and equiangular one). A square has four axes of symmetry, and its two finite diagonals (as with any rectangle) are equal. Bisection of a square by a diagonal results in two right triangles. If the length of the side of a square is $s$, then the area of the square is $s^2$, or "$s$ squared." From this relation is derived the algebraic use of the term *square,* which denotes the product that results from multiplying any algebraic expression by itself.

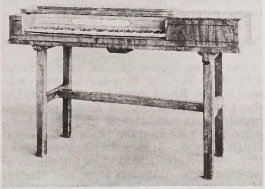
**square,** in measurement, device consisting of two straightedges set at right angles to each other. It is used by carpenters and machinists for checking the correctness of right angles, as a guide when drawing lines on materials before cutting, or for locating holes. The tools shown in the Figure are carpenter's squares. There are two main types of machinist squares: the precision steel square, which resembles the try

(Left) Try square and (right) steel square

square in the Figure but is not graduated, and the combination square set. The latter consists of a steel ruler and three attachments that can slide and be clamped on it—namely, the centre head, the protractor, and the square head. The centre head has two legs situated at right angles to each other that straddle the ruler in such a way that one edge of the ruler bisects the right angle; when the legs are in contact with a circular cylinder near one end, the edge of the ruler can be used as a guide for drawing a diametral line on the end of the cylinder.

The protractor has a blade that can be set at any angle relative to the axis of the ruler. The square has two main surfaces, one at right angles to the ruler axis and one at 45 degrees.

In drafting, a T-shaped instrument known as a T square is used for establishing a horizontal reference on the drafting board.



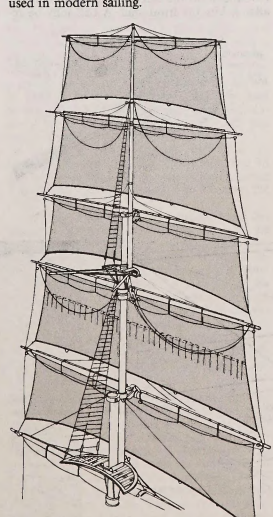
**square dance,** dance for four couples (or groups of four couples) standing in square formation, the most popular and widely known type of folk dance in the United States. It was called the square dance to distinguish it from comparable dances called the contra, or longways dance, for a double file of couples, and from the round dance for a circle of couples. Historians trace the origin of the square dance to both the Kentucky running set of English derivation and to the cotillon, a stately French dance in square formation, popular at the court of Louis XV but supplanted later by the quadrille (also a "square" dance).

The Americanized quadrille, or square dance, begins and progresses rapidly in well-ordered patterns within the framework of a relatively compact square, sets of four couples forming its four sides. To the traditional accompaniment of accordion, banjo, fiddle, and guitar and to prompting, patter, and singing calls made by a "caller," couples perform a variety of movements, all based on a smooth, "shuffling" walk. (Stepwork is less important than the cooperative movement.) Formerly danced in five main figures, the contemporary square dance is composed of three.

**Square Deal,** description by U.S. President Theodore Roosevelt (served 1901–09) of his personal approach to current social problems and the individual. It embraced Roosevelt's idealistic view of labour, citizenship, parenthood, and Christian ethics. Roosevelt first used the term following the settlement of a mining strike in 1902 to describe the ideal of peaceful coexistence between big business and labour unions. The Square Deal concept was later largely incorporated into the platform of the Progressive Party, when Roosevelt was its presidential candidate in 1912.

**square piano,** musical instrument that was popular for domestic music-making from the time of its invention in the mid-18th century (possibly by the Saxon organ-builder Ernst Christian Friderici) to about 1860 in Europe and to about 1880 in the United States. This type of piano was introduced in France by the instrument-builder Sébastien Érard (*c.* 1777) and was already popular in England after about 1760, thanks largely to the efforts of Johann Christoph Zumpe and other immigrant German builders, who concentrated on building square pianos with a simple, so-called single action (mechanism) that was adequate for the demands of most salon music.

The strings of the square (actually rectangular) piano run horizontally across the instrument from side to side, like those of a clavichord, which probably was the source of the design. The earliest square pianos were difficult to keep in tune, but engineering improvements and the introduction of metal frames stabilized the case. The compass gradually grew from the original five octaves but seldom reached the 88-key range of modern pianos. The soundboard likewise grew in size, and late square pianos were often longer than



Square piano by Johann Christoph Zumpe, 1767; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

6 feet (1.8 m) and heavier than comparable grand pianos. Near the end of the 19th century, square pianos were supplanted by upright pianos, which allowed larger soundboards, extended range, and reduced weight and floor space.

**square root,** in mathematics, a factor of a number that when multiplied by itself gives the number. *See* root.

**square sail,** simplest form of rigging and the most ancient. The sails are attached to yards (crossbars) that are hung at their centres from the mast, and there are as many as five yards, one above the other. The characteristic of the square sail, apart from its shape, is that it always presents the same face to the wind, though the yard may pivot considerably about the mast. The square sail was the only rigging used in northern European waters until late in the Middle Ages, but by the 11th century it could be turned to catch the wind on the beam. Ultimately, it was combined with the more versatile fore-and-aft lateen sail of the Mediterranean to produce the full-rigged ship of the age of exploration. Square sails are little used in modern sailing.

Square sail

**squaretail** (trout): *see* brook trout.

**squaring,** in painting, simple technique for transferring an image from one surface to another (and sometimes converting the image from one scale to another) by nonmechanical means. The original work to be transferred is divided into a given number of squares; the same number of squares is then marked off—with charcoal or some other easily removable medium—on the surface of the receiving area. The contents of each square of the original are then drawn in the corresponding square of the reproduction. The use of the grid ensures the accurate placement of images onto the reproduction.

"The Holy Family," black chalk drawing with squaring by Giovanni Battista Salvi, called Sassoferrato; in the E.B. Crocker Art Gallery, Sacramento, Calif.

By courtesy of the E.B. Crocker Art Gallery, Sacramento, California

The Egyptians used squaring at least 5,000 years ago. It has been used to transfer cartoons onto murals, to transfer preparatory drawings onto canvas paintings, and to alter the scale of any work in the same media.

**squash,** any of various fruits of plants (genus *Cucurbita*) of the gourd family (Cucurbitaceae), widely cultivated as vegetables and for livestock feed. The principal species are *C. maxima* and certain varieties of *C. pepo.*

Summer squash is a quick-growing, small-fruited, nontrailing or bush type of *C. pepo.* Plants are upright and spreading, 45 to 75 cm (18 to 30 inches) high, and produce a great diversity of fruit forms, from flattened, through oblong, to elongate and crooked fruits, coloured from white through cream to yellow, green, and variegated. Fruit surfaces or contours may be scalloped, smooth, ridged, or warty. The fruits develop very rapidly and must be harvested a few days after they form (before the seeds and rinds harden) and used soon after harvest.

Winter varieties of squash, *C. maxima,* are long-vining, generally large-fruited, long-season kinds. The fruits after harvest can be stored many months (into wintertime) if kept dry and well above freezing. The fruit stems are greatly enlarged next to the fruits; the fruits show a wide range of sizes, shapes, and colours; and the rinds are relatively harder than those for summer squash and usually inedible to human tastes. *See also* pumpkin.

Some squash may be indigenous to Asia, but most evidence suggests that squash is native to the New World, where it was widely cultivated by the Indians before European settlement.

The fruit is usually served as a cooked vegetable, and the blossoms may also be cooked and eaten.

**squash bug** (insect): *see* coreid bug.

**squash rackets,** also called SQUASH, rackets also spelled RACQUETS, singles or doubles game played in a four-walled court with a long-handled strung racket and a small rubber ball. The game is played on exactly the same principle as rackets but in a smaller court.

Squash is usually played by two people, but it can be played by four (doubles).

Two different varieties of game are played: softball (the so-called "British," or "international," version) and hardball (the "American" version). In softball, which is the standard game internationally, the game is played with a softer, slower ball on the kind of wide, tall court shown in the accompanying diagram. The ball stays in play far longer, and there is more court to cover, making it a physically demanding game that requires fitness, patience, and deliberation. Hardball squash, which is popular in the United States, is played on a narrower court with a harder, faster ball. The hardball game emphasizes quick reactions and creative shot making.

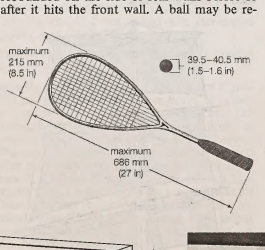
*History.* Squash rackets is a descendant of rackets, having probably originated around the middle of the 19th century at Harrow School in England. Students there who were unable to get into the rackets court took their exercise hitting an India-rubber ball, which squashed when hit against a wall. The new game soon became popular in other English boarding schools. In the 1890s private courts were built, and, after the turn of the century, club courts appeared at Bath, Queen's, and the Marylebone Cricket Club.

Not until after World War I did squash rackets catch on, and in the 1920s the game spread rapidly, becoming more popular than its parent game, rackets. Many courts were built in clubs, schools, and colleges. Rules were formulated; the English national association was organized; and dimensions of the court were established, along with regulations in regard to the ball and racket. Many competitions began: the Professional Championship in 1920, the Amateur Championship for men and women in 1922, and the Open Championship in 1930. International competition with the United States began with the sending of a British team to the United States in 1924, though such competition was later hampered by differences in British and American courts, balls, and methods of scoring.

In the United States the game played in the early years was actually squash tennis, using a lawn tennis ball and tennis racket. Squash tennis has been supplanted by squash rackets in most American cities but continues to have a following.

From England the game spread throughout the British Empire—to Canada, India, Australia, and South Africa. Today squash is played throughout the world. The World Squash Federation (WSF) promotes the game and coordinates tours and championships between nations. The WSF membership has grown to some 115 nations, each of which also belongs to one of five regional squash federations.

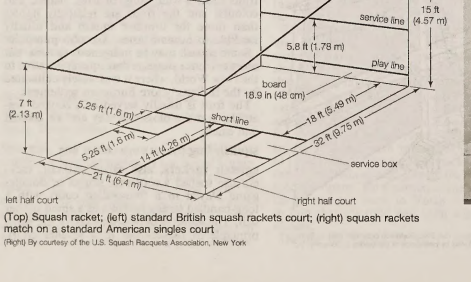
Outstanding squash players have included F.D. Amr Bey, an Egyptian amateur who won several British open titles in the 1930s; the Khans of Pakistan, a family of professional players and teachers who often dominated open play from the 1950s to the 1990s; Janet Morgan, British women's champion from 1949–50 to 1958–59 and the winner of American and Australian titles; and Heather McKay (*née* Blundell), the Australian who won the British women's championship from 1961–62 to 1976–77, as well as other championships.



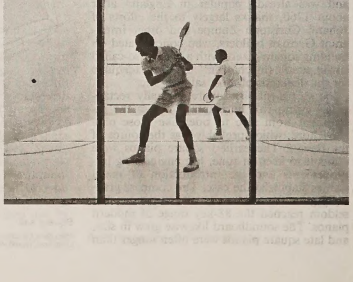
*The game.* The international version of squash is played on an enclosed rectangular court that is 32 feet (9.75 m) long and about 21 feet (6.4 m) wide. The main features of the court are, on the front wall, a service line above which a ball must bounce on a serve. Below this service line on the front wall is a board or metal liner, which extends to a height of 18.9 inches (48 cm) from the floor and which, if hit by a ball, results in a lost play or point for the striker. Another line delimits the height of play along the front and side walls. The "short line" on the floor marks the point beyond which a served ball must bounce on the floor, and the rear area enclosed by this line is divided into two smaller rectangles that function as service boxes, within one of which the server must stand while serving and within the other of which the ball that he has served must bounce on the floor.

The object of the game is to bounce, or rebound, the ball off the front wall in such a way that the opponent is unable to reach it and rebound it off the front wall in his turn. In serving and at any other time, the ball may be bounced directly off the front wall or it may be rebounded off the side or rear walls before or after it hits the front wall. A ball may be returned before it has bounced once on the floor (after rebounding off the front wall), but, after it has bounced on the floor more than once, the ball is dead. A player must give his opponent a fair chance at reaching the ball, which often means getting out of the other's way after having made one's shot. Under British rules, a point is scored only if the winner of a rally (exchange, or succession, of shots) was the one who served the ball; if he was not, the winner of the rally becomes the server, and if he wins consecutive rallies he serves consecutively. In American play, a point is scored by the winner of a rally irrespective of who served.

A game can consist of 9 or 15 points, with a tie at the 8-, 13-, or 14-point mark being decided by a tie-breaking system of play. The small, highly responsive squash ball is propelled at high speeds both to and from the front wall, and the pace of play is accordingly swift. The players try to put one another out of reach of a shot by skilled placement and by varying the speed of their shots. The game demands good eye-hand coordination and, above all, quick reflexes.



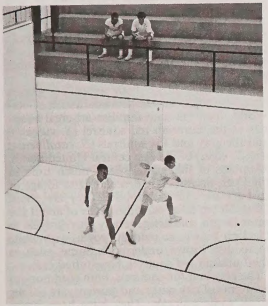
The squash racket itself is similar to that used in the game of rackets, but the handle is shorter; the American racket is heavier than the British. The ball is made of rubber or of a rubber and butyl composition.



The standard British court has four walls, usually of wood. The dimensions and markings of the British court are shown in the accompanying diagram. The board, or telltale, is a strip of sheet metal or other resonant material that produces a clearly different sound when the part of the front wall "out-of-play" is hit. The standard court for the American version is considerably narrower than the English court, being 5.6 m (18 feet 6 inches) wide, and some other dimensions are also slightly different. Doubles courts are 13.7 m (45 feet) by 7.6 m (25 feet).

**squash tennis,** racket game resembling squash rackets (*q.v.*) played by two people only in a four-walled court using a lively inflated ball that bounces very fast and is the size of a tennis ball. The game requires great speed in anticipation and turning.

Squash tennis is played in the same court as squash rackets. There are minor differences in the line markings, such as the "out" line on the back wall being two feet lower than for squash rackets. Players use a lawn tennis racket, an inch shorter in the handle, and a green, pressurized ball, similar to but slightly smaller than the tennis ball. Scoring is the same as in American squash rackets. Points were scored only by the server until a change



(Top) Squash racket; (left) standard British squash rackets court; (right) squash rackets match on a standard American singles court

(Right) By courtesy of the U.S. Squash Racquets Association, New York

made in 1954 allowed hand-out to score as well.

Squash tennis makes fewer demands than squash rackets on the legs in pursuing the ball, but puts a greater premium on agility and quickness of foot and reflexes in turning and spinning. The ball caroms off the front, side, and back walls in dizzying action. It is so volatile that it may rebound from the front wall to the back wall and again to the front wall. Squash rackets is largely a game of

Squash tennis
By courtesy of the University of Pennsylvania, Philadelphia; photograph, Lawrence S. Williams, Inc.

wrist and touch, as well as of the arm. The squash tennis stroke is more comparable to the free-swinging lawn-tennis drive. The volley—returning the ball before it touches the floor—is important in both squash games.

**squatter,** in 19th-century Australian history, an illegal occupier of crown grazing land beyond the prescribed limits of settlement. The inroad of squatters contributed to the growth of the country's wool industry and to the development of a powerful social class in Australian life. By the late 1840s the authorities recognized the economic good derived from the squatters' activity and issued them leases for their sheep runs and tenure extending as long as 14 years. By this time the squatters had a hold on the land; many had become wealthy grandees.

The 1850s saw a large influx of immigrants, as well as thousands of miners drawn to Australia by the gold strikes. A cry for land was raised from this quarter, which challenged the squatters' position. The cry was strong enough to prompt the Legislative Assemblies of the various colonies to pass "selection" acts in subsequent years. Generally, these provided for the sale of land at auction, forcing squatters to bid against prospective farmers for the land that they already controlled by leasehold. The wealthy squatters were able to purchase the choicest land, but much grazing area fell into the hands of small farmers, who found the agricultural yield disappointing. Their hostility against the selectors and their rugged pioneer ethos led the squatters often to resist social and political change.

**squatter sovereignty** (U.S. history): *see* popular sovereignty.

**squatters' rights:** *see* preemption.

**Squaw Valley,** world-famous winter sports area in Placer County, eastern California, U.S., just northwest of Lake Tahoe. The focus of a state recreation area, it was the site of the 1960 Winter Olympics and has ice-skating facilities, ski lifts, trails and slopes to Squaw Peak (8,960 ft [2,731 m]). Alpine Meadows ski resort is immediately to the south.

**squawfish,** any of several edible fishes of the genus *Ptychocheilus* found in the rivers

Squawfish (*Ptychocheilus grandis*)
Painting by Gilbert Emerson

of western North America. They are the largest members of the carp family (Cyprinidae) in North America. Squawfishes are long, large-mouthed, pike-like fishes. Voracious carnivores, they make lively sport fishes. The largest species, the Colorado River squawfish, or white salmon (*P. lucius*), may grow to about 1.5 metres (5 feet) with a reported weight of about 36 kilograms (79 pounds); because of changes in its habitat, this species has declined significantly and is considered endangered.

**Squibb, E(dward) R(obinson)** (b. July 4, 1819, Wilmington, Del., U.S.—d. Oct. 25, 1900, Brooklyn, N.Y.), U.S. chemist and pharmaceutical manufacturer who developed methods of making pure and reliable drugs and founded a company to manufacture them.

During the four years when Squibb served on various ships as a U.S. Navy medical officer, he observed the poor quality of medicines supplied to the Navy. He persuaded the Navy to manufacture their own drugs instead of contracting for them from the lowest bidder. In 1851, he was appointed to Brooklyn Naval Hospital. He set up a laboratory there and built the first still for making anesthetic ether. The ether was heated by steam passing through a coil rather than by open flame, which had been dangerous. Squibb did not patent this process or any of his later discoveries. Instead, he published his design in 1856 in *The American Journal of Pharmacy*. Between 1852 and 1857, he discovered processes for making chloroform, fluid extracts, bismuth salts, and other preparations.

After Squibb had resigned from the Navy, Dr. Richard S. Satterlee, surgeon general of the U.S. Army, suggested that Squibb start a laboratory of his own to supply the Army with reliable drugs. After borrowing $1,300 from a friend, he set up a laboratory in Brooklyn in 1858. Less than a month later, it burned to the ground in an ether explosion. Squibb saved the records of his experiments but was badly burned in the process.

A year later, his laboratory had been rebuilt and he sent out a circular advertising 38 preparations. By 1883, he was manufacturing 324 products and selling them all over the world.

His drugs and medicines were in great demand in the Civil War. After the war, he campaigned for better enforcement of the laws regulating the import of drugs. He helped revise the *Pharmacopoeia,* the basic code book of American pharmacy. From 1882 until his death, he also wrote and published *Ephemeris,* a journal of practical advice and new discoveries, to update the *Pharmacopoeia.*

His inventions include the automatic zero burette and a specific gravity apparatus. In 1892, his two sons joined the firm, which became E.R. Squibb & Sons.

**squid,** any of numerous 10-armed cephalopods (order Teuthoidea) found in both coastal and oceanic waters. Squids may be swift swimmers or part of the drifting sea life. They range in size from about 1.5 centimetres (less than ¾ inch) to more than 20 metres (more than 65 feet), including the tentacles.

Squids have elongated tubular bodies and short compact heads. Two of the 10 arms have developed into long slender tentacles with expanded ends and four rows of suckers with toothed, horny rings. The body of most squids is strengthened by a feathery-shaped, internal shell composed of a horny material. Squid eyes, almost as complex as human eyes, are usually set into the sides of the head.

Little is known of the life history of squids. Some attach their eggs to floating weeds and others to the ocean bottom. In some species the young resemble the adults at hatching; in others there is a planktonic larval stage.

The luminescent squids bear numerous light organs, which may be for recognition and for attracting prey.

Squid (*Illex coindeti*) swimming forward
Douglas P. Wilson

Squids are numerous in the sea and serve as food for many animals, including the sperm whale, bony fishes, and man.

**Squier, E(phraim) G(eorge)** (b. June 17, 1821, Bethlehem, N.Y., U.S.—d. April 17, 1888, Brooklyn, N.Y.), U.S. newspaper editor, diplomat, and archaeologist who, with the physician and archaeologist Edwin H. Davis, conducted the first major study of the remains of the pre-Columbian North American Mound Builders. He also carried out explorations in Central America, Peru, and Bolivia in an effort to find the origins of the Mound Builder civilization.

As a young man, Squier went to the heartland of the Ohio mound country to edit a newspaper at Chillicothe and began to explore the prehistoric earthworks. Between 1845 and 1847 he and Davis probed some 200 mounds, studied about 100 earthwork enclosures, and collected a large number of artifacts. Their findings appeared in the beautifully illustrated *Ancient Monuments of the Mississippi Valley* (1848), the first publication of the Smithsonian Institution. Immediately recognized as a major work of American archaeology, it remains significant to the present time. In addition to summarizing contemporary knowledge of the mounds, it also served as a model for later research. Squier's subsequent study of the mounds in New York was described in another valuable work, *Aboriginal Monuments of the State of New York* (1851).

In 1849 Squier went to Nicaragua as U.S. chargé d'affaires to Central America and secured an agreement, never ratified, permitting U.S. construction of an interoceanic canal across Nicaragua. The mission allowed him to travel widely and explore antiquities around Granada and on the islands in Lake Nicaragua. His findings appeared in *Nicaragua: Its People, Scenery, Monuments, and the Proposed Interoceanic Canal,* 2 vol. (1852). For the next 20 years, while occupied with developing a railway across Honduras, he wrote several books and a number of papers on the archaeology, ethnology, and linguistics of Honduras, Nicaragua, and El Salvador. As U.S. commissioner to Peru (1863–65), he settled financial claims and was able to visit a number of ancient sites, including the remains of the pre-Inca Chimú civilization, then scarcely known. His observations were published in *Peru: Incidents of Travel and Exploration in the Land of the Incas* (1877).

**squill,** any of the bulbous plants of the genus *Scilla* of the family Liliaceae, consisting of

about 100 species, native to temperate Eurasia. The narrow, sometimes grasslike leaves arise from the base of the plant.

Cuban lily or Peruvian jacinth (*Scilla peruviana*)
A to Z Botanical Collection

The squill's small white, blue, or purple flowers are borne in a cluster at the tip of a leafless flower stalk. Some spring-flowering species are cultivated as garden ornamentals.

**squinch,** in architecture, any of several devices by which a square or polygonal room has its upper corners filled in to form a support for a dome: by corbelling out the courses of masonry, each course projecting slightly beyond the one below; by building one or more arches diagonally across the corner; by building in the corner a niche with a half dome at its head; or by filling the corner with a little conical vault that has an arch on its outer diagonal face and its apex in the corner.

The arched squinch that is often used in Byzantine architecture originally seems to have been developed, almost simultaneously, by the Roman builders of the late imperial period and the Sāsānians in Persia. In Italy the Romanesque squinch form is either the conical type as in the church of S. Ambrogio at Milan or a succession of arched rings as in the 13th-century central tower of the abbey church at Chiaravalle. More complex forms with niches and colonnettes are characteristic of the French Romanesque of Auvergny, as in the cathedral of Le Puy-en Velay (late 11th and early 12th centuries); churches of southwestern France, such as Saint-Hilaire at Poitiers, use conical squinches of the Italian type.

Islāmic architecture, borrowing from the Sāsānian precedent, makes great use of squinch forms (*see* pendentive). The stalactite work (*q.v.*), which is so marked a feature of later Islāmic architecture, is, in essence, merely a decorative development of a combination of niche squinch forms. In Gothic architecture squinch arches are frequently used on the insides of square towers to support octagonal spires.

**squint** (eye disorder): *see* strabismus.

**squint** (architecture): *see* hagioscope.

**Squire, Sir J(ohn) C(ollings)** (b. April 2, 1882, Plymouth, Devon, Eng.—d. Dec. 20, 1958, Rushlake Green, Sussex), English journalist, playwright, a leading poet of the Georgian school, and an influential critic and editor.

Squire was educated at Blundell's School and at St. John's College, Cambridge University. He was appointed literary editor of the *New Statesman* in 1913, and acting editor in 1917. From 1919 to 1934 he was editor of the *London Mercury,* which was to become the unofficial organ of the Georgian poets. His poetry appeared in *Collected Parodies* (1921), *Poems in One Volume* (1926), *Selected Poems* (1948), and *Collected Poems* (1959), volumes that show technical competence as well as a delightful sense of parody. Squire also collaborated with J.L. Balderston on the hit play *Berkeley Square* (performed 1926), an adaptation of Henry James's *The Sense of the Past.* He was knighted in 1933.

**Squires, Sir Richard Anderson** (b. Jan. 18, 1880, Harbour Grace, Nfd.—d. March 26, 1940, St. John's), controversial prime minister of Newfoundland (1919–23; 1928–32) who gained a reputation for being opportunistic, extravagant, and corrupt but whose promotion of education and industrial development laid the foundation for the Newfoundland Liberal Party's emergence as the dominant political force in the province after its union with Canada in 1949.

Squires was elected to the Newfoundland House of Assembly in 1909 as a member of the People's Party, at that time led by his law partner Edward Patrick Morris, 1st Baron Morris. In 1917, during World War I, the party joined with the Liberals to form a war coalition government. In 1914–19 Squires served on the Legislative Council; he was minister of justice and attorney general in 1914–17 and colonial secretary in 1917–18. When a Liberal, William Lloyd, became prime minister in 1918, Squires left the coalition, denouncing, in particular, the participation in the government of the Liberal backer William Coaker, president of the Fisherman's Protective Union. When, however, Sir Michael Patrick Cashin reorganized the government in a more conservative direction the following year, dropping Coaker, Squires joined the Liberals and formed an alliance with Coaker that later proved advantageous to Squires' career. As prime minister, Squires helped develop education and industry, but the Great Depression of the 1930s finished his career. He was knighted in 1921.

*A list of the abbreviations used in the* MICROPAEDIA *will be found at the end of this volume*

**squirrel,** generally, any rodent of the family Sciuridae (order Rodentia); the name is sometimes restricted to the familiar, bushy-tailed, arboreal species. Squirrels are found almost worldwide, in a variety of habitats, including forests, deserts, plains, and tundra. There are about 50 genera and 260 species, among them the ground squirrels, marmots, and chipmunks.

Many squirrels are arboreal. Some (as marmots) are terrestrial; others (flying squirrels) glide from tree to tree by means of furry flaps of skin connecting their forelegs and hind legs. All squirrels have strong hindlegs and well-developed, hairy tails. They differ widely in colour and markings and vary in form from slender (flying squirrels) to stout (marmots). Total length ranges from about 10 centimetres (4 inches) in the African pygmy squirrel (*Myosciurus pumilio*) to about 90 cm in the giant squirrels (*Ratufa*) of Asia.

Eurasian red squirrel (*Sciurus vulgaris*)
Schunemann—Annan Photo Features

All squirrels except the gliders are diurnal. Tree dwellers are agile, live in tree hollows or nests built of leaves and twigs, and are usually active throughout the year. Ground dwellers live in burrows, and many become dormant in winter (hibernate) or summer (estivate). Squirrels are primarily vegetarian and are noted for their fondness for seeds and nuts. Some species eat insects or supplement their diets with animal protein. Females bear one or more litters a year, of 1 to 15 young; gestation is 22 to 45 days.

The genus *Sciurus,* with about 55 species found through most of Eurasia and the New World, includes such familiar arboreal squirrels as the Eurasian red squirrel (*S. vulgaris*) and the gray and fox squirrels (*S. carolinensis* and *S. niger*) of the east central United States. Members of this genus spend much time in the trees, occasionally descending to forage or to bury nuts in the ground. They are about 20 to 30 cm long, excluding tails of about the same length, and are generally gray, grayish to blackish brown, or reddish brown, with white to reddish brown underparts. Some, such as the Eurasian red squirrel, have tufted ears.

The gray and fox squirrels, both common inhabitants of city parks and gardens, are edible, small game animals. They have been introduced into western North America and (gray squirrel) into Britain and South Africa. The Eurasian red squirrel, which in colder climates sometimes is hunted for its thick winter fur, is a native of forests from Britain to Japan. In parts of Britain, it has been replaced by the gray squirrel.

The North American red squirrels (*Tamiasciurus*) are highly vocal, reddish brown animals that live primarily in coniferous forests and habitually collect large stores of pinecones for winter use. There are two species: the red, or spruce, squirrel (*T. hudsonicus*), found from Alaska to New Mexico and South Carolina; and the Douglas squirrel, or chickaree (*T. douglasii*), found from British Columbia to California. The former is about 20 cm long, without the 10- to 15-cm tail, and has white underparts; the Douglas squirrel is slightly smaller and has reddish brown underparts.

There are a number of arboreal squirrels native to Africa. Notable species include: the giant forest squirrel (*Protoxerus stangeri*), a speckled brownish or blackish animal; about a dozen species of African striped squirrels (*Funisciurus*), with one or more longitudinal stripes on their backs; about 12 species of African bush squirrels (*Paraxerus*), which are speckled grayish yellow to bright reddish brown, with or without stripes; and sun squirrels (*Heliosciurus*), which are solid-coloured, sometimes greenish squirrels.

There are also a number of tree-dwelling squirrels in Asia. Among them are: Asiatic striped palm squirrels (*Funambulus*), chipmunk-like, gray brown to blackish animals; four species of giant, or rock, squirrels (*Ratufa*), agile, variably coloured squirrels whose coats may be white, black, yellowish to reddish brown, or gray; and Oriental tree squirrels (*Callosciurus,* about 20 species), which are thick-furred, often brightly coloured inhabitants of eastern Asia.

For terrestrial squirrels, *see* chipmunk; ground squirrel; marmot; prairie dog. For gliding squirrels, *see* flying squirrel.

**squirrel corn** (*Dicentra canadensis*), wild flower of eastern and midwestern North American woodlands belonging to the fumitory family (Fumariaceae). It takes its name from the nodule-like, yellow tubers that cluster

Squirrel corn (*Dicentra canadensis*)
G. Tomsich—Shostal

along the rootstock. The fernlike leaves and flower stalks spring from these tubers. The tremulous, two-lobed flowers resemble those of the bleeding heart (*D. spectabilis*), to which it is related. The plant is approximately 30 cm (1 foot) tall.

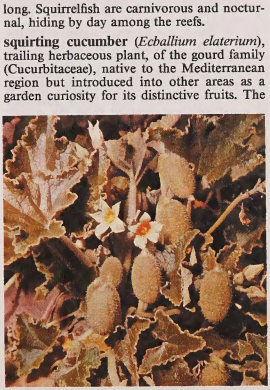
**squirrel monkey,** either of two (and possibly more) species of arboreal monkeys constituting the genus *Saimiri* of the family Cebidae. The squirrel monkeys are the most common primates in riverside forests of Central America, the Guianas, and the Amazon River basin. These monkeys associate in groups, sometimes of several hundred. They are attractive animals measuring 25–40 cm (10–16 inches) long, with a heavy, nonprehensile, 37–47-centimetre tail.

They have small, expressive faces; large eyes; large, generally tufted ears; and short, soft fur. Their muzzles are dark, their faces white, and their tail tips black. Their colour is gray- to olive-green with whitish underparts and yellow or orange arms, hands, and feet. Common squirrel monkeys (*S. sciureus*) generally have olive or grayish crowns, while red-backed squirrel monkeys (*S. oerstedii*) have black crowns and reddish backs.

Squirrel monkeys are active during the day and troop single file after a leader along constantly used pathways in the trees. They sleep huddled together on branches, tails wrapped around their bodies. They are omnivorous and eat fruit, insects, and small animals. They bear a single young after gestation of about 5½ to 6 months. The young cling to the back of either the male or the female. Squirrel monkeys

Common squirrel monkey (*Saimiri sciureus*)
© GERRY ELLIS NATURE PHOTOGRAPHY

are delicate and susceptible to cold but are good laboratory animals and also make clean, affectionate, and gentle pets with a penchant for playing with hair. They may live 10 years or more in captivity and seem to do best when kept with others of their kind.



**squirrelfish,** also called SOLDIERFISH, any of about 70 species of large-eyed, colourful, tropical reef fish of the family Holocentridae (order Beryciformes). Squirrelfish are edible fish found throughout the tropics. They have spiny fins and rough, prickly scales; some also have a sharp spine on each cheek. Most squirrelfish are red in colour, and many are marked with yellow, white, or black. The largest species is probably *Holocentrus spinifer,* a Pacific squirrelfish growing about 60 cm (24 inches)

Squirrelfish (*Myripristis jacobus*)
Carl Roessler

long. Squirrelfish are carnivorous and nocturnal, hiding by day among the reefs.

**squirting cucumber** (*Ecballium elaterium*), trailing herbaceous plant, of the gourd family (Cucurbitaceae), native to the Mediterranean region but introduced into other areas as a garden curiosity for its distinctive fruits. The

Squirting cucumber (*Ecballium elaterium*)
G. Tomsich—Shostal

hairy, rough, thick-stemmed plant may spread out to about 60 cm (about 24 inches). It has yellow, bell-shaped flowers. The long-stalked, bluish green fruits, about 4 to 5 cm long, explosively eject their brown seeds as they detach from the stem upon reaching maturity. The seeds may travel 3 to 6 m (about 10 to 20 feet) from the plant.

**sraddha,** Sanskrit ŚRĀDDHA, also spelled SHRADDHA, in Hinduism, a ceremony performed in honour of a dead ancestor. The rite is both a social and a religious responsibility enjoined on all male Hindus (with the exception of some sannyasis, or ascetics). The importance given in India to the birth of sons is to ensure that there will be a male descendant to perform the sraddha ceremony after one's death.

The rite is performed for the deceased father, grandfather, and great-grandfather and also for the mother, grandmother, and great-grandmother. It is intended to nourish, protect, and support the spirits of the dead in their pilgrimage from the lower to higher realms, preceding their reincarnation and reappearance on Earth. The rites are performed between the 11th and 31st days after death, depending on caste traditions, and at regular intervals thereafter. The first annual death anniversary is observed by a sraddha ceremony that enables the deceased (*preta*) to be admitted into the assembly of forefathers (*pitr*).

**Sranantonga,** also called SRANAN TONGO, TAKI-TAKI, or NINGRE-TONGO, a creole language spoken in Suriname (formerly Dutch Guiana) in northeastern South America. Sranantonga originated as a pidgin based on English, spoken by slaves of African descent who worked on the plantations of Suriname. The pidgin was strongly influenced by the African languages native to the slaves, as well as by Portuguese, the language of the original Guianan plantation owners, who were Portuguese Jews. These latter were displaced by the English, whose language formed the basis for Sranantonga.

In the 17th century the part of Guiana in which Sranantonga was spoken was taken over by the Dutch, and since then Sranantonga has added a strong Dutch overlay. The language as spoken currently bears very little clear resemblance to Dutch, Portuguese, or English.

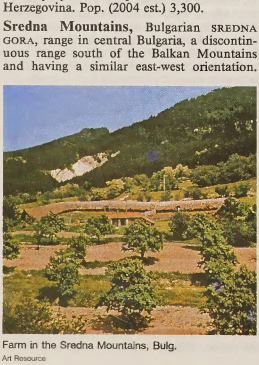
Examples of typical sentences in Sranantonga are *Mek konu gi-em moni en bai sani, dan eng sa go kir eng,* "Let the king give him money to buy things, then he will go (and) kill it"; *Mi sa gi(bi) yu tin sensi,* "I'll give you ten cents"; and *Mi doifi frei gowe, ma mi xoluk, dati tan,* "My dove flew away, but my luck, that stays."

Saramacca, another pidgin spoken by Guianan Bush Negroes, is also English-based, with Portuguese influences. However, it shows much greater evidence of African influence and less Dutch influence than does Sranantonga. Saramacca preserves an African system of pitches, a high pitch (marked by an acute accent) distinguished from a low pitch: *Mi tâ tyá deêsî dâ dí ómi,* "I am taking medicine to the man."

**Sraosha,** in Zoroastrianism, divine being who is the messenger of Ahura Mazdā and the embodiment of the divine word. His name, related to the Avestan word for "hearing," signifies man's obedient hearkening to Ahura Mazdā's word and also signifies Ahura Mazdā's omnipresent listening. Sraosha is the medium between man and God. Zoroastrians believe that no ritual is valid without his presence, and he is very prominent in Zoroastrian liturgy. Depicted as a strong and holy youth whose heavenly abode is a thousand-pillared house, he has, in addition, a protective role. It is Sraosha that Ahura Mazdā sends to chastise the demons that harass men. Thrice nightly he descends to earth to combat them, crushing their skulls. His strongest weapon is prayer. In the end of time, he will be the agent of the final extermination of evil. Sraosha also leads the righteous soul through the ordeal of judgment three days after its body's death.

**Śrauta-sūtra,** any of a number of Hindu ritual manuals used by priests engaged in the performance of the grander Vedic sacrifices, those requiring three fires and the services of many specialized priests. The manuals are called *śrauta* (from Sanskrit *śruti,* "revelation") because they are based directly on the older Vedic literature considered as a class to be *Śruti,* or revealed. The *Śrauta-sūtras,* together with the *Gṛhya-sūtras* (dealing with domestic ceremonies) and the *Dharma-sūtras* (dealing with rules of conduct), make up the *Kalpa-sūtras,* collections of brief aphoristic texts that emerged within the different schools of the Veda. Each *Śrauta-sūtra* guides the priests of its own particular Vedic school in the performance of specialized functions. The texts deal with such subjects as the laying of the three fires, the full and new moon ceremonies, and the various animal and soma sacrifices.

**Śrāvastī,** Pāli SĀVATTHI, city of ancient India, located near the Rāpti River in northeastern Uttar Pradesh.



In Buddhist times (6th century BC–6th century AD), Śrāvastī was capital of the kingdom of Kosala and was important both as a prosperous trading centre and for its religious associations. It stood at the junction of three great roads connecting it with the great cities of eastern, northern, and western India. It was closely associated with the life of the Buddha and with figures significant in later Buddhist history. Its most important religious place was the Jetavana Monastery, erected in a garden outside the city walls and presented to the Buddha by a wealthy banker, Anāthapiṇḍaka. Other Buddhist monasteries were the Rājakārāma and the Pūrvārāma. Śrāvastī was also an important centre for the Jainas.

The city has been identified with the twin villages of Saheth and Maheth northwest of Balrāmpur. Today it is surrounded by a great rampart of earth and brick. Excavation has revealed three main periods, ranging from the earliest, characterized by pre-Buddhist painted grayware, to the early wares of the final occupation.

**Srebrenica,** town, eastern Bosnia and Herzegovina. The town's name is derived from the Serbo-Croatian word *srebro,* meaning "silver." Rich deposits of silver and lead discovered in the surrounding mountains led to the town's founding in 1387 as a mining centre. Lead and zinc mining remain important.

Srebrenica was a centre of commerce and trade in the 15th century. It was populated by Ragusan merchants and German miners and was the site of a Franciscan monastery when it was seized by the Turks in 1440. Srebrenica was converted to Islām in the mid-16th century despite strong local resistance. In the 20th century its population was largely Muslim, with a significant Serbian minority. During the conflict between Muslims and Bosnian Serbs in the 1990s, the town was declared a "safe area" for Bosniacs (Muslims) by the United Nations. Bosnian Serbs laid siege to the town in 1995, massacring some 7,000 Bosniacs. Several Bosnian Serbs were later convicted of war crimes by a UN tribunal at The Hague, Neth., for their role in the massacre. A report issued in 2002 criticized both the UN and Dutch peacekeepers, prompting the resignation of the entire Dutch government; a memorial cemetery to the victims of the massacre was dedicated in 2003. Srebrenica was included in Serb-held territory by the 1995 partition of Bosnia and Herzegovina. Pop. (2004 est.) 3,300.

**Sredna Mountains,** Bulgarian SREDNA GORA, range in central Bulgaria, a discontinuous range south of the Balkan Mountains and having a similar east-west orientation.

Farm in the Sredna Mountains, Bulg.
Art Resource

Structurally, the Sredna range is a part of the Rhodope Mountains, from which it is separated by the Thracian Plain. Between the Sredna and Balkan mountains lie several basins: from west to east, the basins are marked by the towns of Sofia, Srednogorie, Karlovo, Kazanlŭk, and Sliven.

The Sredna range has three parts. Westernmost is the Ikhtimanska (Ikhtiman) Sredna, 20 miles (32 km) southeast of Sofia. It is an irregular, forested, hilly region with a sparse population. Its eastern limit is the Topolnitsa River. From the Topolnitsa to the Struma River, a distance of 42 miles (68 km), lie the Sŭshtinska, or Syshtinska ("True"), Sredna Mountains, which have a sharper spine of resistant, intrusive rocks. The maximum elevation in this section, 5,262 feet (1,604 m), is that of Bogdan, a peak 17 miles (27 km) west of the town of Karlovo. The Topolnitsa and Struma rivers are important north-south transportation routes.

East of the Struma River valley is the Sŭrnena ("Deer") Range, which rises to its highest point of 4,054 feet (1,236 m) at the summit of Bratan (formerly Morozov), then dwindles eastward to the confluence of the Tundzha and Mochuritsa rivers. This section extends 85 miles (137 km) east-west.

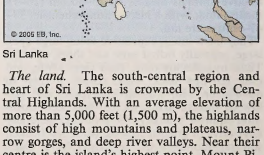
To the north, the Sŭrnena Range faces the valley of the Tundzha River, which is impounded near Kazanlŭk by the Georgi Dimitrov Dam (completed in 1955); to the south, it slopes sharply to the Thracian Plain, which is drained by the Maritsa River. Small quantities of metal ores are obtained from the ranges; near Srednogorie, on the Topolnitsa River, is a large electrolytic copper works. The intermontane basins of Karlovo and Kazanlŭk are known collectively as the Valley of Roses owing to their production of attar of roses.

**Srednyaya Tunguska River** (Russia): *see* Podkamennaya Tunguska River.

**Sremski Karlovci,** German KARLOWITZ, Hungarian KARLOCA, also spelled CARLOWITZ, town in the autonomous *pokrajina* (province) of Vojvodina, Serbia, Serbia and Montenegro. It lies along the Danube River and on the road and rail routes from Belgrade to Subotica (in Vojvodina) and Hungary. In 1698–99 the village was the site of a 72-day congress that ended hostilities between the Ottoman Empire and various European states in the Treaty of Carlowitz. The town also was host in 1848 to an assembly of Vojvodina Serbs who declared the region's independence from Hungarian rule. The surrounding area is noted for its cereals and fodder crops and the fruit farms and vineyards of the Fruška Mountains. Pop. (2004 est.) 8,900.

**Śrī** (Hindu goddess): *see* Lakṣmī.

**Sri Gangānagar** (India): *see* Gangānagar.



**Sri Indraditya,** also called SRI INDRAPATINDRADITYA, original name BANG KLANG HAO, Hao also spelled THAO (fl. *c.* 1240–60), founder and ruler of the kingdom of Sukhothai, the first independent Tai (Thai) state. Bang Klang Hao headed a petty Tai principality near Sukhothai when, about 1245, he joined with another Tai leader, Pha Muang, to rebel against the governor of Sukhothai, who was a deputy of the Khmer kings of Angkor. The two seized nearby Sawankhalok, and Bang Klang Hao defeated the Khmer governor in personal combat before Sukhothai. Pha Muang then conferred his own royal Khmer title on Bang Klang Hao, who as Śrī Indraditya now ruled independently. Over the ensuing century, Sukhothai grew and flourished as the preeminent Tai state of the region, particularly under Indraditya's second son, Ramkhamhaeng.

**Sri Jayewardenepura Kotte,** also called JAYAVARDHANAPURA KOTTE, legislative and judicial capital of Sri Lanka. It is located about 5 miles (8 km) southeast of Colombo, the country's administrative capital, in the suburb of Kotte. The new parliamentary complex of buildings, which are situated on an island in a lake and in a region of reclaimed swamps, opened in 1982. The name Sri Jayewardenepura is derived from the name of the 15th-century Sinhalese capital at Kotte *(q.v.).*

**Sri Lanka,** officially DEMOCRATIC SOCIALIST REPUBLIC OF SRI LANKA, Sinhalese SRI LANKĀ PRAJATHANTHRIKA SAMAJAVADI JANARAJAYA, formerly CEYLON, island country in the Indian Ocean, separated from the southeastern coast of peninsular India by Palk Strait. This pear-shaped island extends about 268 miles (432 km) from north to south and about 139 miles (224 km) from east to west. Its capital is Colombo. Area 25,332 square miles (65,610 square km). Pop. (2003 est.) 19,065,000.

A brief treatment of Sri Lanka follows. For full treatment, *see* MACROPAEDIA: Sri Lanka.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Sri Lanka

*The land.* The south-central region and heart of Sri Lanka is crowned by the Central Highlands. With an average elevation of more than 5,000 feet (1,500 m), the highlands consist of high mountains and plateaus, narrow gorges, and deep river valleys. Near their centre is the island's highest point, Mount Pidurutalagala (8,281 feet [2,524 m]). Encircling this elevated region to the north and east are various lowlands. The eastern plains are undulating and dotted with isolated hills, while the northern lowlands region has flat, broad, and fertile plains drained by several small rivers and marked by occasional ridges. The coastal fringe to the north and east is speckled with marshes, lagoons, spits, and sand bars; on the southwest coast, however, steep hills descend toward the sea. The Mahaweli River, flowing from the Central Highlands to the northeastern coast, is the country's largest river.

Sri Lanka has an equatorial climate, with little seasonal temperature variation. Average temperatures range from 72° to 92° F (22° to 33° C) in the lowlands to as low as 44° F (7° C) in the mountains. The relative humidity is high in most places year-round. The island's position in relation to the Indian subcontinent and to the neighbouring seas has resulted in modification of the equatorial climate by the seasonal occurrence of monsoons, whose rainfall is not uniform; average annual rainfall varies from less than 40 inches (1,000 mm) in the Dry Zone of the north and east to more than 150 inches (3,750 mm) in the Wet Zone of the southwestern highlands. The natural vegetation, which covers one-third of the island, varies from dry mixed evergreen forests (ebony and satinwood) and thorn scrub in the Dry Zone to tropical wet evergreens and montane forests in the Wet Zone. Wildlife includes deer, leopard, bear, wild pig, elephant, and a variety of monkeys.

Mineral resources of Sri Lanka include graphite, iron ore, ilmenite (titanium ore), kaolin, and gemstones. Significant quantities

of sapphires, rubies, topazes, garnets, moonstones, and zircons are found in gravel-sized alluvium near the city of Ratnapura, in the southwest.

*The people.* The Sinhalese are the predominant ethnic group, constituting about three-fourths of the population. Other ethnic groups include the Tamils and the Muslims (partly descended from Arab seafarers and sometimes miscalled Moors). Sinhalese and Tamil are the official languages; English is also widely spoken. More than two-thirds of the populace (mostly the Sinhalese) adhere to Buddhism, while approximately one-sixth (the Tamils) are Hindus. Other religious groups include Muslims and Christians.

The population growth rate is one of the lowest in southern Asia, largely because of the country's comparatively low birth rate. Sri Lanka's population density, however, is extremely high. In an effort to alleviate social and economic problems related to high population density, the government has implemented measures designed to decrease fertility levels while maintaining a balance in immigration and emigration levels.

The infant mortality rate and the overall death rate are both low for a developing country, and the average life expectancy (69 years for men and 73 years for women) is the highest in southern Asia. The government, moreover, is working to improve the health-care system with an emphasis on further lowering maternal and infant mortality.

Approximately one-fifth of Sri Lanka's population is urban, a figure that is expected to increase rapidly into the next century. Government reports indicate that, while metropolitan areas are developing rapidly, rural development is progressing at a less than satisfactory pace.

*The economy.* Sri Lanka has a developing mixed (public and private) economy, largely based on agriculture, services, and light industries. Numerous industries have been nationalized since 1971, and economic development has been heavily subsidized by the International Monetary Fund, the Asian Development Bank, the United States, and Japan. The Netherlands, Germany, and the People's Republic of China have also provided extensive foreign aid. The creation of new jobs has not kept pace with the growth of the population, and unemployment is widespread. The gross national product (GNP) is growing faster than the population; the GNP per capita, however, is very low by world standards.

Agriculture accounts for approximately one-fourth of the gross domestic product (GDP) and employs two-fifths of the workforce. Agricultural output is divided between cash crops, largely grown on plantations, and staples, which are grown on small peasant holdings. Land reform has fragmented many estates, and smallholders now produce significant quantities of rubber and tea. One-third of the island's land is arable, and government efforts to increase its productivity have centred on irrigation in the Mahaweli River valley. Despite the island's 2,000-year-long tradition of constructing irrigation tanks and canals, much of the island's irrigation potential remains undeveloped.

Harvests of rice, the chief staple, do not meet domestic demand. Increased use of fertilizer has helped to improve the productivity of paddies. Subsistence farming dominates rice production, and few paddies are larger than 5 acres (2 hectares). Tea, which is grown in the Central Highlands, is a major export; rubber and coconuts are produced at lower elevations and are also important sources of foreign exchange.

A wide variety of gemstones, for which Sri Lanka is world famous, is exported. Significant quantities of high-grade graphite, in the production of which the island leads the world, are also exported. Graphite production is a state monopoly controlled through the State Graphite Corporation since 1971.

Manufacturing industries account for approximately one-seventh of the GDP and employ one-eighth of the workforce. Chief manufactures include textiles, ceramics, petroleum products, vegetable oils, fertilizers, and cement. Most large-scale industries are now owned by the government, and the private sector produces mainly consumer goods and some capital goods such as machine tools and building materials. An Investment Promotion Zone was established north of Colombo in the late 1970s to attract foreign investment through various tax exemptions.

Electricity is produced almost totally from hydroelectric sources. The island's electrical-generating capacity was greatly increased in the 1980s as several new hydroelectric projects were completed.

Services are the largest sector of the GDP and employ one-third of the workforce. Foreign banks were allowed to open "offshore" branches in Sri Lanka in 1979 as part of a government effort to promote the country as an international financial centre for South Asia.

Sri Lanka's balance of trade has been chronically unfavourable since the mid-1970s. Remittances from citizens working abroad are a major source of foreign exchange. Public corporations control imports; private firms handle most exports. Sri Lanka's chief suppliers include Japan, Iran, the United States, Taiwan, and the United Kingdom. The United States, Germany, the United Kingdom, and Japan are likewise important markets for Sri Lanka's exports.

*Government and social conditions.* Sri Lanka is a socialist republic. Its constitution, promulgated in 1978, vests greater executive authority than previously in the president, who is directly elected to a six-year term. He functions as head of state and government and as commander in chief of the armed forces. The president governs with the assistance of an appointed cabinet. Legislative power resides in a unicameral Parliament, composed of 225 members directly elected to six-year terms. The president may summon or dissolve the Parliament at any time. The Parliament has the power to enact retroactive law and amend the constitution. The major political parties are the United National Party, the Tamil United Liberation Front, and the Sri Lanka Freedom Party. The judicial system is composed of the Supreme Court, appointed by the president; the Court of Appeal; the High Court; and the various lower courts.

Sri Lanka's social-welfare program provides a limited segment of the population with cash benefits for temporary work disability and unemployment, old age, disability, permanent work disability, and survivor grants. Hospital care is free in government facilities. The effectiveness of this service is limited, however, by a shortage of both facilities and personnel. Malnutrition and various gastrointestinal diseases persist as serious problems, but malaria, smallpox, cholera, and plague have been eliminated from the country. The housing shortage is most acute in and around Colombo. The government's housing policy is primarily concerned with the construction of low-income housing, the extension of sanitation facilities, and slum clearance.

Sri Lanka's adult literacy rate of nearly 90 percent for males and more than 80 percent for females compares favourably to that of most South Asian countries. Education is free at all levels and is compulsory between the ages of 5 and 15. Secondary, technical and vocational, and higher education are also available.

Although freedom of the press is constitutionally guaranteed, the government may exercise direct censorship as authorized by the Anti-Terrorism Law. Newspapers are published in Sinhalese, Tamil, and English. The Sri Lanka Broadcasting Corporation (radio) provides national, commercial, and educational services. Television was introduced on an experimental basis in 1979, and in 1982 broadcasts began on a regular basis throughout the country.

*Cultural life.* Sri Lanka possesses a rich cultural heritage that dates back to the 3rd century BC. The country's artistic tradition centres largely on Buddhist and Hindu religious art and dance-drama. There are three main forms of the national dance-drama: the *kōlam* (Tamil: "costume"), a masked dance-drama; the devil dance, a dance to the spirits asking relief from illness or misfortune; and the Kandyan dance, a national dance of great importance, dealing with mythological, historical, and naturalistic themes. Examples of traditional sculpture, painting, and architecture are seen in the remains of ancient works. These include colossal Buddha images, temples (especially around Kandy), and temple paintings. Other surviving art traditions include ivory carving, metal-working, lacquered woodwork, and basketry.

*History.* The island's first human settlers probably included immigrant aborigines of southern Asia, peoples of the proto-Australoid ethnic group. These peoples were absorbed by Indo-Europeans who arrived from north India about the 5th century BC and developed into the Sinhalese. The Tamils were probably later immigrants from Dravidian India, migrating over a period from the early centuries AD to about 1200.

Buddhism was introduced during the 3rd century BC, and the city of Anurādhapura was established as a major political and religious centre. As Buddhism spread, the Anurādhapura kingdom extended its political control over Ceylon (*c.* 200 BC–*c.* AD 1000). The Sinhalese lost control of Ceylon to the Cōla (invaders from southern India) from 993 to 1070, but Sinhalese rule was firmly reestablished during the Polonnaruwa period (*c.* 1070–1200). Between 1200 and 1505 Sinhalese power gravitated to the southwest part of the island, while a south Indian dynasty seized power in the north and established the Tamil kingdom in the 14th century. Foreign invasions from India, China, and Malaya occurred in the 13th, 14th, and 15th centuries.

In 1505 a Portuguese fleet landed on Ceylon. The Portuguese were permitted to build a fort and received trade concessions in 1518. They engaged in various alliances with local kings, taking advantage of any disharmony existing between the kingdoms and enthroning their own protégés whenever possible. By 1619, through a combination of active occupation and royal deeds, the Portuguese controlled most of the island.

The Kandyan kingdom enlisted the Dutch to oust the Portuguese, and Ceylon eventually came under the control of the Dutch East India Company until 1796, when control passed to the British; in 1802 Ceylon became a crown colony. From 1830 the phenomenal growth of coffee dominated Ceylon's economic development until a leaf disease destroyed the plantations. Experiments with tea were successful in the 1880s, and soon that became the plantation crop.

Ceylonese nationalism expanded on religious, social, and educational fronts in the early 20th century. In 1919 the Ceylon National Congress united Sinhalese and Tamil groups. A succession of constitutions were promulgated by the British in 1920 to satisfy nationalistic demands, and in 1948 dominion status was conferred on the colony. The United National Party (UNP) controlled the government until it was unseated in 1956 by the Sri Lanka Freedom Party (SLFP), a group dedicated to maintaining Sinhalese identity. The Tamils

objected bitterly to this period of Sinhala nationalism, and by 1965 the UNP had regained control of the government. However, in 1970 the SLFP formed a coalition with various Marxist parties and won a landslide victory in the elections. The SLFP government initiated many economic and social reforms during the early and mid-1970s, and its constitution of 1972 proclaimed Ceylon the Republic of Sri Lanka.

In 1977 the UNP was returned to power and radically revised the constitution to construct a presidential system of government. The country was renamed the Democratic Socialist Republic of Sri Lanka. Subsequent political and governmental changes occurred relatively smoothly despite recurring racial tension between Sri Lanka's Sinhala and Tamil communities. Violence erupted in 1981, and Tamil leaders began demanding a separate Tamil homeland. Sections of the Tamil community resorted to guerrilla warfare in their campaign for an autonomous Tamil state in the north and east of the country, and the violence continued into the 1990s. In 1993 Sri Lanka's president was assassinated, allegedly by radical Tamil forces.

**Śrī-Nāthajī,** unique representation of the Hindu god Krishna. It is the main cult image of the Vallabhācārya sect, an important devotional sect of India. The image is enshrined in the main temple of the cult at Nāthdwārā (Rājasthān state), where it is accorded an elaborate service of worship daily.

According to sect tradition, the image of Śrī-Nāthajī revealed itself to the sect's founder, Vallabha, while he was visiting Mount Govardhana, near Mathura (the image has one hand raised, suggestive of Krishna's lifting of Mount Govardhana to shelter the cowherds from a storm sent by the jealous god Indra). The image was first worshiped in Mathura, and, while in flight from the Mughals, the chariot carrying the image broke down at Nāthdwārā, where it was given protection by the local Rājput chief. Representations of Śrī-Nāthajī, covered with the ornaments and garlands of worship, are commonly seen in the homes and shops of devotees throughout North and West India.

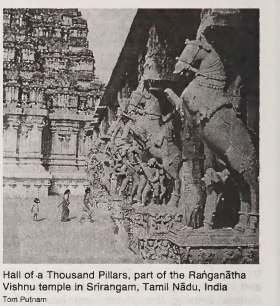
**Srihatta** (Bangladesh): *see* Sylhet.

**Srikākulam,** also called CHICACOLE, city, northeastern Andhra Pradesh state, southern India. The city lies along the Nāgāvali River. Srikākulam once served as the capital of a Muslim region that was known as the Northern Circārs (Northern Sarkārs). Of historical interest is the mosque, which was constructed in 1641. The city has several government colleges that are affiliated with Andhra University. Pop. (1991 prelim.) 88,684.

**Srinagar,** city, summer capital of the Indian-held sector of Jammu and Kashmir state, northwestern India. The city lies along the banks of the Jhelum River, at an elevation of 5,200 feet (1,600 m) in the Vale of Kashmir.

Situated amid clear lakes and lofty mountains, Srinagar has long had a considerable tourist economy. Along its course through the city the Jhelum River is spanned by seven wooden bridges, and numerous adjacent canals and waterways abound with shikaras, the gondolas of Kashmir. Srinagar is well



Shālīmār Gardens, Srinagar, Jammu and Kashmir, India
Harrison Forman

known for its many mosques and temples; the Hazratbāl Mosque contains a reputed hair of the prophet Muḥammad, and the Jāmi' Masjid, built in the 15th century, is said to be the largest mosque in Kashmir. Dal Lake with its "floating gardens" is a well-known attraction, as are the nearby Shālīmār and Nishāt gardens.

Srinagar also has specialized markets and retail shops. The city's industries include carpet and silk mills, silverware and copperware manufacture, leatherworking, and wood carving. The University of Kashmir (1969) is in the city. Regular flights connect Srinagar with Delhi and Amritsar. Not far from the city is Gulmarg, the Meadow of Flowers, at an elevation of 8,500 feet (2,590 m). It affords magnificent views of the Vale of Kashmir and also of Nanga Parbat, at 26,660 feet (8,126 m) one of the loftiest peaks in the Himalayas. The Vale of Kashmir contains the surrounding area's most fertile agricultural land, and the valley is one of the most densely populated areas of Jammu and Kashmir. The mountains among which Srinagar is situated are heavily forested with pine, fir, and deodar. Pop. (2001 prelim.) city, 894,940; metropolitan area, 971,357.

**Srirangam,** city, east-central Tamil Nādu state, southeastern India. It lies on an island at the division of the Cauvery and Coleroon rivers near the city of Tiruchchirāppali.

Srirangam is one of the most frequently visited pilgrimage centres in southern India. Its main Raṅganātha temple, though primarily Vaishnavite, is also holy to Śaivites. The temple is composed of seven rectangular enclosures, one within the other, the outermost having a perimeter more than 2 miles (3 km) in length. A remarkable feature of the temple is the Hall of a Thousand Pillars with its colonnade of rearing horses. The temple and 1,000-pillared hall were constructed in the Vijayanagar period (1336–1565). Pop. (2001 prelim.) Tiruchchirāppali metro. corp., 746,062.

**Śrīvaiṣṇava,** member of a sect of Hindus, most numerous in South India, who pay allegiance to Lord Vishnu and follow the teachings of the philosopher Rāmānuja. "Śrī" refers to Vishnu's consort, also called Lakṣmī, to whom Vishnu first taught the doctrine.

The sect reached its peak in the late 10th or 11th century, when the passionate devotional hymns of the Āḻvārs (a group of mystics) were introduced into the temple service by Nāthamuni. He is called the first *ācārya* ("teacher") of the sect and founded a Sanskrit-Tamil school at Srirangam (Tamil Nadu state), which was then and continues to be a great Vaishnavite centre in South India. Rāmānuja (11th/12th century), in an exposition of the *Vedānta-sūtras* called *Śrībhāṣya* ("Beautiful Commentary"), gave the sect a philosophical doctrine to fit its views and early literature. *Śrībhasya* was the first sectarian commentary ever written on a Hindu sacred text and the model for the many others that followed.

Toward the end of the late 14th century, a controversy arose that split the Śrīvaiṣṇavas into their present two subsects, the Vaḍakalai (or school of northern learning), which relied more on the Sanskrit scriptures, and the Teṉkalai (or school of southern learning), which stressed the Tamil hymns of the Āḻvārs.

The Śrīvaiṣṇava is among the most exclusive of the Hindu sects. They worship only Vishnu and his consorts and attendants and do not acknowledge Krishna's youthful companion, his mistress Rādhā. Brahman members take the lead in the strict observance of caste regulations in such matters as diet and interdining. Śrīvaiṣṇava Brahmans are much given to scholarly pursuits and have earned for themselves the honorary title of *ācārya,* or, in Tamil, *ayyangar,* often spelled *iyengar. See also* Teṉkalai; Vaḍakalai.

**Śrivijaya empire,** maritime and commercial kingdom that flourished between the 7th and the 13th century in the Malay Archipelago. The kingdom, which originated in Palembang on Sumatra, soon extended its influence and controlled the Strait of Malacca. The kingdom's power was based on its control of international sea trade. It established trade relations not only with the states in the archipelago but also with China and India.

Śrivijaya was also a religious centre in the region. It adhered to Mahāyāna Buddhism and

soon became the stopping point for Chinese Buddhist pilgrims on their way to India. The kings of Śrivijaya even founded monasteries at Negapatam in India.

Śrivijaya continued to grow; by the year 1000 it controlled most of Java but soon lost it to Cōla, an Indian maritime and commercial kingdom, which found Śrivijaya an obstacle on the sea route between South and East Asia. In 1025 Cōla seized Palembang, captured the King, and carried off his treasures and also attacked other parts of the kingdom. By the end of the 12th century, Śrivijaya had been reduced to a small kingdom and its dominant role in Sumatra was taken by Malayu (based in Jambi), a vassal of Java. A Javanese kingdom, Majapahit, soon began to dominate the Indonesian political scene.

**Srong-brtsan-sgam-po** (b. *c.* 608—d. 650), Tibetan king (crowned 629) who extended his dominion to include Nepal and parts of India and China and whose reign marked the beginning of recorded history in Tibet. He commissioned a court scholar to create the Tibetan written language using an Indo-European model for the script. Because two of his wives, a Nepalese and a Chinese princess, were Buddhists, he is credited by lama historians with introducing Buddhism into Tibet. To house the famous image of the Gautama Buddha brought to Tibet by his Nepalese bride, he built in Lhasa, the capital, the Gtsug-lag-khang temple, which remains Tibetan Buddhism's most sacred place.

**Śruti** (Sanskrit: "Learning by Hearing"), that class of Hindu sacred literature based on revelation, the most revered body of sacred literature in Hinduism. *Śruti* works are considered divine revelation, heard and transmitted by earthly sages, as contrasted to *Smṛti*, or that which is remembered. Though *Śruti* is considered to be the more authoritative, in practice the *Smṛti* texts are more influential in modern Hinduism. The revealed texts encompass the four Vedas—Rg, Yajur, Sāma, and Atharvaveda (the earliest Hindu sacred literature)—and the *Brāhmaṇas* (ritual treatises), the *Āraṇyakas* ("Books of the Forest"), and the *Upaniṣads* (philosophic elaborations on the Vedas that form the basis of much of later Indian philosophy).

**śruti** (Sanskrit: "heard"), in the music of India and Pakistan, the smallest tonal interval that can be perceived. The octave, in Indian theory, is divided into 22 *śrutis*. The division is not precisely equal, but these microtonal units may be compared to Western quarter tones, of which there are 24 to an octave.

The word *śruti* is used both to indicate a specific note and as a unit of measurement to describe the size of an interval encompassed by two given notes.

**SS:** *see under* Saints, or Saintes.

**SS,** abbreviation of SCHUTZSTAFFEL (German: "Protective Echelon"), the black-uniformed elite corps of the Nazi Party. Founded by Adolf Hitler in April 1925 as a small personal bodyguard, the SS grew with the success of the Nazi movement and, gathering immense police and military powers, became virtually a state within a state.

From 1929 until its dissolution in 1945, the SS was headed by Heinrich Himmler (*q.v.*), who built up the SS from fewer than 300 members to more than 50,000 by the time the Nazis came to power in 1933. Himmler, a racist fanatic, screened applicants for their supposed physical perfection and racial purity but recruited members from all ranks of German society. With their sleek black uniforms and special insignia (lightning-like runic S's, death's-head badges, and silver daggers), the men of the SS felt superior to the brawling brown-shirted Storm Troopers of the SA (*q.v.*), to which initially they were nominally subordinate.

When Hitler, with SS help, purged the SA in 1934 and reduced it to political impotence, the SS became an independent group responsible, via Himmler, to Hitler alone. Between 1934 and 1936 Himmler and his chief adjutant, Reinhard Heydrich, consolidated SS strength by gaining control of all of Germany's police forces and expanding their organization's responsibilities and activities. At the same time, special military SS units were trained and equipped along the lines of the regular army. By 1939 the SS, now numbering about 250,000 men, had become a massive and labyrinthian bureaucracy, divided mainly into two groups: the Allgemeine-SS (General SS) and the Waffen-SS (Armed SS).

The Allgemeine-SS dealt mainly with police and "racial" matters. Its most important division was the Reichssicherheitshauptamt (RSHA; Reich Security Central Office), which was made up of the Ordnungspolizei (Orpo; Order Police) and the Sicherheitspolizei (Sipo; Security Police), which, in turn, was divided into the Kriminalpolizei (Kripo; Criminal Police) and the dreaded Gestapo (*q.v.*) under Heinrich Müller. The RSHA also included the Sicherheitsdienst (SD; Security Service), a security department in charge of foreign and domestic intelligence and espionage.

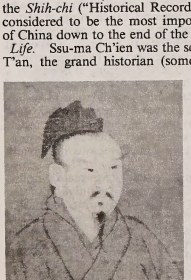
The Waffen (Armed) SS was made up of three subgroups: the Leibstandarte, Hitler's personal bodyguard; the Totenkopfverbände (Death's-Head Battalions), which administered the concentration camps; and the Verfügungstruppen (Disposition Troops), which swelled to 39 divisions in World War II and which, serving as elite combat troops alongside the regular army, gained a reputation as fanatical fighters.

SS men were schooled in racial hatred and admonished to harden their hearts to human suffering. Their chief "virtue" was their absolute obedience and loyalty to the Führer, who gave them their motto: "Thy Honour is Thy Loyalty." During World War II the SS carried out massive executions of political opponents, Gypsies, Jews, Polish leaders, Communist authorities, partisan resisters, and Russian prisoners of war. Following the defeat of Nazi Germany by the Allies, the SS was declared a criminal organization by the Allied Tribunal in Nürnberg in 1946.

**SS-Angehörigen, Organisation der** (German: Organization of SS Members): *see* Odessa.

**Ssu-ma Ch'ien,** Pinyin SIMA QIAN (b. *c.* 145 BC, Lung-men, China—d. *c.* 85 BC), astronomer, calendar expert, and the first great Chinese historian, noted for his authorship of the *Shih-chi* ("Historical Records"), which is considered to be the most important history of China down to the end of the 2nd century.

*Life.* Ssu-ma Ch'ien was the son of Ssu-ma T'an, the grand historian (sometimes translated as "astronomer royal") at the Han court during the period 140–110 BC. The office of grand historian combined responsibility for astronomical observations and for the regulation of the calendar with the duties of keeping a daily record of state events and court ceremonies. After traveling extensively in his youth, Ssu-ma Ch'ien entered court service. In 111 BC he accompanied a military expedition into the southwest of China, and in 110 BC he was a member of the Emperor's entourage when the latter visited Mt. T'ai to conduct the sacrifices symbolizing the dynasty's authority. In the same year, his father died, and after the mandatory period of mourning he was appointed in 108 BC to succeed him in the post of grand historian.



In 105 he was among those responsible for a complete reform of the Chinese calendar, a reform prompted by the Han emperor Wu Ti's inauguration of what was to be a "new beginning" to the Han dynasty. At about the same time, Ssu-ma Ch'ien began to undertake the unfulfilled ambition of his father to write a definitive history of the Chinese past, an ambition strengthened by his belief that under Wu Ti the Han had reached a peak of achievement that deserved to be recorded for posterity. Before his history was completed, however, Ssu-ma Ch'ien deeply offended the Emperor by coming to the defense of a disgraced general. Ssu-ma Ch'ien was arraigned for "defaming the Emperor," a capital crime. Either because the Emperor felt him too valuable a man to lose or because Ssu-ma Ch'ien himself requested a reprieve so that he could complete his history, he was castrated instead of executed.

Wu Ti later relented, and Ssu-ma Ch'ien again rose in the Imperial favour, becoming palace secretary (*chung-shu-ling*). But he remained bitterly conscious of the shame he had suffered and lived a retiring life, devoting himself to the completion of his great masterpiece.

*Structure and content of Shih-chi.* The *Shih-chi* is his great claim to fame. There had, of course, been many histories before Ssu-ma Ch'ien's time. The keeping of court chronicles was already an established practice under the earlier dynasties. One such work, the *Ch'un-ch'iu* ("Spring and Autumn [Annals]") of the petty state of Lu, was said to have been the work of Confucius. It had achieved status as a canonical book largely because of its ethical judgments on the events that it recounts.

Ssu-ma Ch'ien denied that his work was in any way comparable to this great Classic. He termed himself not a "maker," like Confucius, but merely a "transmitter" of past events. His great successor as historian of the Han, Pan Ku (AD 32?–92), took him to task for his haphazard use of ideas from the various schools of philosophy and for his devotion to Taoism. But the ethical standards of Han Confucianism that Pan Ku and his contemporaries could take for granted had not in Ssu-ma Ch'ien's lifetime achieved the authority they had by the 1st century AD. Like most of his contemporaries, Ssu-ma Ch'ien was an eclectic, employed at a court at which magic and the supernatural were still potent forces and where the state religious cult and accepted moral and political standards were still in a fluid state. Ssu-ma Ch'ien's moral judgments are, thus, not in accordance with any consistent theories.

His main achievement was that he reduced to an orderly narrative the complex events of the past, recorded in often contradictory sources deriving from the many independent states, each of which employed its own chronology. He organized these facts not, as in previous histories, simply as a chronologically ordered record but according to a new five-part plan.

Ssu-ma Ch'ien, detail, ink and colour on silk; in the National Palace Museum, Taipei

By courtesy of the National Palace Museum, Taipei, Taiwan, Republic of China

The "Basic Annals" gave a dated chronological outline centred on events at the court considered to have been the paramount power at the time. The following section consisted of chronological tables in which he attempted to clarify the confusion of the history of the various independent feudal kingdoms and to enable his reader to see at a glance what was happening in each of the states at any given time. The detailed accounts of each state were given in chapters entitled "The Hereditary Houses." A number of monographs dealt with various crucial aspects of government. These sections show Ssu-ma Ch'ien to have favoured the practical reformist statesmen who, in his own time, were formulating new policies for the increasingly centralized state, rather than the proponents of Confucian moral theories. The work ends with a collection of "Biographies" that deal with a variety of famous individuals, who are selected as exemplars of various types of conduct, and also with the affairs of the various foreign peoples, relations with whom were beginning to become increasingly important during the reign of Wu-ti.

*The Shih-chi* provided a model for the later dynastic histories but differs from them in many ways. Its time span is far longer: such attempts to encompass the whole of human history were rare among later Chinese historians. Its source material, too, was far more varied. It incorporated not only the court annals of the Ch'in and the Han dynasties but also various earlier histories, parts of court chronicles of various feudal states, and material from the canonical books and the philosophical writings of all the schools, even historical romances. Neither is his subject matter exclusively court-centred and "political," as were the later histories: it includes a far wider range of society, including businessmen and merchants, condottieri and bandits, actors and court favourites, good officials and bad.

Ssu-ma Ch'ien did not attempt to compose "objective" history but rather belonged unmistakably to the didactic Chinese tradition of history. He makes moral judgments on his characters. He also attempts to characterize them in types, recording an individual's exemplary deeds in one chapter and his misdeeds elsewhere. But the lessons he derives from history are varied and often mutually incompatible. He is much more notable for the critical attention he devotes to his sources. His acute critical comments are appended at the end of each chapter.

*Influence.* Ssu-ma Ch'ien is important not only as a historian but also as a master of racy, flexible Chinese prose. He exerted a potent influence on later writers, particularly upon the early writers of narrative prose and fiction. Since Ssu-ma Ch'ien's time, his history has been acknowledged as the great historical masterpiece in Chinese, a standard against which all later histories would be measured and a model for large-scale historical composition, not only in China but in all East Asian countries influenced by the Chinese literary tradition. (D.C.T.)

BIBLIOGRAPHY. The standard study of Ssu-ma Ch'ien is the extremely perceptive work of Burton Watson, *Ssu-ma Ch'ien, Grand Historian of China* (1958), which gives a full critical analysis of Ssu-ma Ch'ien's works and also translates all the relevant biographical material from early sources. Édouard Chavannes, *Les Mémoires historiques de Sema-Ts'ien*, 5 vol. (1895–1905), translated the first 47 chapters of the *Shih-chi* with copious scholarly annotation. A sixth volume (1969) includes further translations by Chavannes and a bibliography of Western-language translations. Much of the remaining portion is translated in Burton Watson, *The Records of the Grand Historian of China*, 2 vol. (1961), which deals entirely with sections on the Han period.

**Ssu-ma Hsiang-ju,** Pinyin SIMA XIANGRU (b. 179 BC, Ch'eng-tu, China—d. 117 BC, Mao-ling, Nan Yüeh), famous Chinese writer of *fu*, a form of descriptive poetry.

Self-trained in literature and fencing, Ssu-ma Hsiang-ju was appointed as bodyguard to the Han emperor Ching I, but soon he took a new position at the court of Prince Hsiao of Liang and began to compose his famous *fu* "Tzu Hsü fu" ("Master Nil"), in which three imaginary characters describe the delights of the hunt.

After the death of Prince Hsiao, Ssu-ma Hsiang-ju returned to Ch'eng-tu, where he met, seduced, and eloped with Cho Wen-chün, the recently widowed daughter of a wealthy man. Although her father at first opposed the marriage, he later relented and gave the penniless couple money and slaves as the result of Ssu-ma's appointment at the emperor's court. This appointment came about because the poet had entrusted his "Tzu Hsü fu" to a friend, who had shown it to the emperor. Immediately charmed by the poem, the emperor asked him to write a *fu* on the imperial hunt. Ssu-ma extended his original work into a highly imaginative and successful *fu* entitled "Shang-lin fu" ("Supreme Park") and was rewarded with the court post. Endowed with his wife's share of the immense family fortune, the poet lived in comfort while he continued to write his *fu*. Only 29 *fu* and 4 prose selections survive.

**Ssu-ma Kuang,** Pinyin SIMA GUANG (b. 1019, Hsia, Hunan, China—d. 1086, Pien Lian, Hunan), scholar, statesman, and poet who compiled the monumental *Tzu-chih t'ung-chien* ("Comprehensive Mirror for Aid in Government"), a general chronicle of Chinese history from 403 BC to AD 959, considered one of the finest single historical works in Chinese. Known for his moral uprightness, he was learned in several disciplines and prominent in government.

Ssu-ma Kuang studied the Confucian Classics and, after passing his civil-service examinations, rose rapidly to high office. Between 1069 and 1085 he led the faction opposing the radical reforms of the innovator Wang An-shih. Conservative in his interpretation of the Confucian Classics, Ssu-ma argued for the cause of good government through moral leadership rather than by assertive measures and through the improved functioning of tested institutions rather than by drastic changes. Shortly before his death he finally succeeded in dislodging Wang's faction from the government and became the leading minister in a government that attempted to repeal most of Wang's reforms. Until recent times most historians tended to view Ssu-ma favourably and Wang from an opposite viewpoint, but recent historical work has shown that Ssu-ma's program of antireform measures was not greatly successful.

With chosen associates, Ssu-ma compiled the *Tzu-chih t'ung-chien* in emulation of the *Ch'un-ch'iu* ("Spring and Autumn [Annals]," a chronicle believed to have been edited by Confucius). Ssu-ma criticized men and institutions from the standpoint of Confucian moral principles. He devoted most of his attention to political events, but the work also covered such diverse subjects as rites, music, astronomy, geography, and economy. In spite of Ssu-ma's moral perspective, his chronicle showed evidence of rigorous critical standards. He even compiled a separate work, the *Kao-i* ("Scrutiny"), which dealt with the discrepancies in his numerous sources and gave his reasons for preferring certain authorities.

Although the Communist government of China has attacked Confucianism, it nevertheless has high regard for Ssu-ma's scholarship. He was also an excellent poet and is the hero of modern Chinese children's books, which portray him as the child who saved a playmate from drowning by breaking the water tank into which his friend had fallen.

**Ssu-ma Yen:** *see* Wu-ti (AD 236–290).

**Ssu-mao,** Pinyin SIMAO, formerly FU-HSING-CHEN, town in southern Yunnan *sheng* (province), China. It is situated in a small basin among mountains some 5,000 feet (1,500 m) in elevation, 19 miles (30 km) south of P'u-erh, the former centre of the Yunnanese tea trade.

Ssu-mao was already a minor town in the 14th century. It was given administrative status as a subprefecture in the 19th century and became a county town in 1912. It was then an important trading centre on the routes to Burma (Myanmar) and Laos. It was opened as a treaty port for trade with the French in Indochina in 1895 and with Burma in 1896 and subsequently had a brief period of modest prosperity. The opening of the railway from Haiphong in Indochina to K'un-ming, the provincial capital of Yunnan, in 1910 took away all of its trade, except that with Burma, to which it exported lead, tin, tea, and camphor, and its population shrunk.

Reputed as one of the most unhealthy places in Yunnan, it suffered in the 1940s from various epidemics and from the plague. In 1950 it was largely deserted, and much of the surrounding basin was also abandoned. After 1953, however, when the road from K'un-ming to southwestern Yunnan replaced the old mule trains, it again became an important regional commercial centre, distributing goods imported from K'un-ming and collecting local products, such as tea, camphor, and sisal. The town also has a small power station and some rice mills. Pop. (mid-1980s est.) 10,000–50,000.

**Ssu of Ch'en** (Chinese poet): *see* Ts'ao Chih.

**Ssu-p'ing,** Pinyin SIPING, city, southwestern Kirin *sheng* (province), China.

Centrally situated in the northern Liao River Plain, Ssu-p'ing was a place of little importance until the completion in 1902 of the railway between Ch'ang-ch'un and the port of Dairen (now Lü-ta) in what is now Liaoning province. It then became a commercial centre in an area with a rapidly growing population. Its importance was further increased with the construction in 1923 of a northwest rail link to Pai-ch'eng and to Tsitsihar (in what is now Heilungkiang province) and the opening in 1934 of a railway running south to T'unghua and to northern Korea. After 1907, under the administration of the South Manchurian Railway Company, there was considerable development. A new town was built after 1921, known as Ssu-p'ing-chieh. After 1932, under the Japanese occupation, some agriculture-based industry (brewing, oil pressing, flour milling) grew up, and in the latter part of World War II the Japanese built a refinery for the production of synthetic petroleum from coal. After the war Ssu-p'ing was virtually destroyed in four major battles between the Chinese Communist and Nationalist forces.

After 1949 the city was developed as a second-rank industrial centre. The petrochemical industry was reestablished, and various engineering plants, producing agricultural machinery and machine tools, were established. Diversified chemical manufactures have been concentrated there. The city also retains its former light industries based on local agriculture. Pop. (1990) 317,223.

**Ssu shu** (Chinese: "Four Books"), Pinyin SI SHU, four ancient Confucian texts that were used as official subject matter for civil service examinations in China from 1313 to 1905 and usually serve to introduce Chinese students to Confucian literature. Students later turn to the more extensive and, generally speaking, more difficult *Wu Ching* (Five Classics).

The publication of these four texts as a unit in 1190 with commentaries by Chu Hsi, a great Neo-Confucian philosopher, helped to revitalize Confucianism in China. From 1415 onward knowledge of Chu's (and like-minded) commentaries was as indispensable to success in civil service examinations as the texts themselves.

Even with its commentaries, the *Ssu shu* is a modest volume, the four parts of which have no consistent order. The first, *Ta hsüeh* (*q.v.*), is a short ethico-political treatise linking humane government with the personal integrity of rulers. The second, *Chung yung* (*q.v.*), is somewhat longer than *Ta hsüeh* and more abstract than the other three books. It speaks of such things as the Way of Heaven, motion, spiritual beings, and religious sacrifices. For each of these two books (both direct excerpts from *Li chi*, one of the Five Classics), Chu Hsi wrote an individual preface. The third book, *Lun yü* (*q.v.*), reputedly contains direct quotations from the ancient sage Confucius (551–479 BC) as recorded by his disciples, especially Tseng-tzu (*q.v.*). It is considered the most reliable source of the Master's teachings. *Mencius* (*q.v.*), the fourth and longest of the *Ssu shu*, contains the teachings of Mencius (371–289 BC), the most revered of all Confucian scholars.

**Ssu Tsung** (Chinese emperor): *see* Ch'ung-chen.

**St.:** *see under* Saint, Sankt, or Sint.

**Sta.:** *see under* Santa.

**Staatliche Kunstsammlungen Dresden,** English DRESDEN STATE ART COLLECTIONS, art museum in Dresden, Ger., that includes collections of painting, sculpture, graphic and applied arts, and coins. It is best known for its picture gallery, the core of which is the collection of paintings that originally belonged to the Kunstkammer, founded by Prince August in 1560. Its most popular works, however, were later acquisitions dating from the 18th century. There are a dozen subsidiary galleries, including a gallery of modern art. From 1855 to 1939 the paintings were housed in a gallery in the Zwinger Palace, built according to plans by Gottfried Semper.

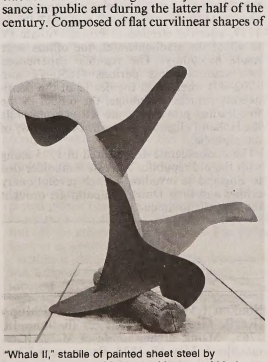
The museum's holdings were dispersed for safety at the outbreak of World War II, but many of the works were nonetheless lost or destroyed. The several buildings that had been occupied by the museum were also badly damaged, but most of the collections have been rehoused in restored quarters.

**Staatliches Bauhaus:** *see* Bauhaus.

**Staatsoper:** *see* Vienna State Opera.

**Stabiae,** ancient town of Campania, Italy, destroyed by the eruption of Vesuvius in AD 79; it lies on the coast at the eastern end of the Gulf of Naples (modern Castellammare di Stabia). Originally an Oscan settlement, it entered the Social War (the war of the Italian *socii*, "allies"; 90–88 BC) against Rome in 90 BC and was destroyed by Sulla in 89, its territory being given to Nuceria as a reward for loyalty to Rome. It was noted for the medicinal properties of its waters, and the neighbourhood became a popular locality for villas. The elder Pliny perished at Stabiae, near the villa of his friend Pomponianus, in the eruption of 79. Subsequent settlement was of minor importance.

Excavations, begun in the 18th century, were recommenced in 1949. The extent of the pre-Roman town (*oppidum*) has been assessed. The layout of the later town (89 BC–AD 79), unlike the *insula* (grid) planning of many Roman towns, appears to have been adapted to the needs of a spa. One of the more striking discoveries of the later excavations was



Artemis, wall painting from Stabiae; in the Museo Archeologico Nazionale, Naples

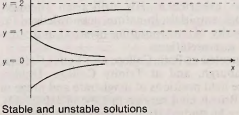
By courtesy of the Museo Nazionale, Naples; photograph, European Art Color Slides, Peter Adelberg, New York City

a number of wall paintings, which compare favourably with those of Pompeii and Herculaneum.

**stabile,** type of stationary abstract sculpture, developed by the 20th-century American artist Alexander Calder and usually characterized by simple forms executed in sheet metal; the term, coined in reference to Calder's work by Jean Arp in 1931 (*compare* mobile), was later applied to similar works by other artists.

The increasing monumentality of Calder's stabiles contributed significantly to a renaissance in public art during the latter half of the century. Composed of flat curvilinear shapes of

"Whale II," stabile of painted sheet steel by Alexander Calder, 1964; in the Museum of Modern Art, New York City



Collection, the Museum of Modern Art, New York, gift of the artist

metal welded or rivetted together and painted usually red or black, these playful, airy works are equally suited to the glass and steel confines of contemporary buildings and the free space of parks and plazas. Outstanding examples include "Flamingo" (Chicago; 1974), "Teodelapio" (Spoleto, Italy; 1962), and "El Sol Rojo" (Mexico City; 1968).

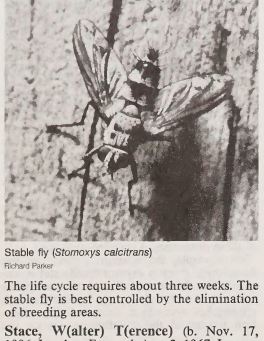
The Canadian sculptor Robert Murray (1936– ) is notable among other artists working in the monumental stabile form; his lofty curved and folded aluminum sheets, while usually more geometric and less "penetrable" than the stabiles of Calder, nonetheless share the latter's paradoxical blend of lightness and substantiality, motion and stasis.

**stability,** in mathematics, condition in which a slight disturbance in a system does not produce too disrupting an effect on that system. In terms of the solution of a differential equation, a function $f(x)$ is said to be stable if any other solution of the equation that starts out sufficiently close to it when $x = 0$ remains close to it for succeeding values of $x$. If the difference between the solutions approaches zero as $x$ increases, the solution is called asymptotically stable. If a solution does not have either of these properties, it is called unstable.

For example, the solution $y = ce^{-x}$ of the equation $y' = -y$ is asymptotically stable, because the difference of any two solutions $c_1e^{-x}$ and $c_2e^{-x}$ is $(c_1 - c_2)e^{-x}$, which always approaches zero as $x$ increases. The solution $y = ce^x$ of the equation $y' = y$, on the

Stable and unstable solutions

other hand, is unstable, because the difference of any two solutions is $(c_1 - c_2)e^x$, which increases without bound as $x$ increases. A given equation can have both stable and unstable solutions. For example, the equation $y' = -y(1 - y)(2 - y)$ has the solutions $y = 1$, $y = 0$, $y = 2$, $y = 1 + (1 + c^2e^{-2x})^{-1/2}$, and $y = 1 - (1 + c^2e^{-2x})^{-1/2}$ (*see* Graph). All these solutions except $y = 1$ are stable because they all approach the lines $y = 0$ or $y = 2$ as $x$ increases for any values of $c$ that allow the solutions to start out close together. The solution $y = 1$ is unstable because the difference between this solution and other nearby ones is $(1 + c^2e^{-2x})^{-1/2}$, which increases to 1 as $x$ increases, no matter how close it is initially to the solution $y = 1$.



Stability of solutions is important in physical problems because if slight deviations from the mathematical model caused by unavoidable errors in measurement do not have a correspondingly slight effect on the solution, the mathematical equations describing the problem will not accurately predict the future outcome. Thus, one of the difficulties in predicting population growth is the fact that it is governed by the equation $y = ce^{ax}$, which is an unstable solution of the equation $y' = ay$. Relatively slight errors in the initial population count, $c$, or in the breeding rate, $a$, will cause quite large errors in prediction, even if no disturbing influences occur.

**stabilizer:** *see* economic stabilizer.

**stable fly** (*Stomoxys calcitrans*), a vicious bloodsucking fly of the family Muscidae, sometimes placed in a separate family Stomyxyidae (order Diptera). Though usually found in open sunny areas, the stable fly may enter a house during bad weather. Often known as a

biting housefly, it may transmit anthrax and other animal diseases.

The female must feed on blood before she can lay her eggs in rotting or fermenting straw.

Stable fly (*Stomoxys calcitrans*)
Richard Parker

The life cycle requires about three weeks. The stable fly is best controlled by the elimination of breeding areas.

**Stace, W(alter) T(erence)** (b. Nov. 17, 1886, London, Eng.—d. Aug. 2, 1967, Laguna Beach, Calif., U.S.), English-born philosopher who sought to reconcile naturalism with religious experience. His utilitarian theories, though empiricist in nature, acknowledged the necessity of incorporating mystical and spiritual interpretations.

Educated at Bath College and Fettes College, Edinburgh, and at Trinity College, Dublin, Stace held positions of magistrate and judge in the British civil service in Ceylon (1910–32), where he studied Hinduism and Buddhism before teaching philosophy at Princeton University (1932–55) in the United States. Influenced by the German philosopher G.W.F. Hegel, he published many works exploring commonalities of human thought as related to religious empiricism. His key books include *The Philosophy of Hegel* (1924), *The Theory of Knowledge and Existence* (1932), *The Concept of Morals* (1937), *Time and Eternity* (1952), and *Mysticism and Philosophy* (1960).

**Stade,** city, Lower Saxony *Land* (state), northwestern Germany. It lies along the Schwinge River, 3 miles (5 km) from its junction with the Elbe River, below Hamburg. The traditional seat of district administration and once the leading port of the lower Elbe, it was chartered in the 12th century and was a member of the Hanseatic League. Under Swedish rule from 1648 to 1712, it then passed to Denmark and in 1715 to Hanover.

Much of the old town, rebuilt and fortified by the Swedes, is still surrounded by its moat; now the modern business centre, it is dominated by the Gothic churches of St. Wilhadi and St. Cosmae and the half-timbered buildings of the old Swedish military establishment. The city's museums contain remains of the early Germanic period that were preserved in the nearby peat bogs. Stade is served by rail and sea communications, and its industries include shipbuilding, oil refining, and the production of food and chemicals. Pop. (1998 est.) 45,103.

**Städel Art Institute and Municipal Gallery,** German STÄDELSCHES KUNSTINSTITUT UND STÄDTISCHE GALERIE, museum of art located in Frankfurt am Main, Ger. It was founded in 1816 by a bequest from the banker Johann Friedrich Städel (1728–1816), who donated his fortune and his art collection to found the institution as an art museum and art school. The institute opened its art collection to the public in 1817. The museum contains examples of work from most of the western European schools of painting since the Middle Ages and is particularly rich in German, Dutch, Flemish, and Italian paintings from the 16th through the 18th century. Nineteenth-century German painting is comprehensively represented as well.

**stadholder,** also spelled STADTHOLDER, Dutch STADHOUDER, provincial executive officer in the Low Countries, or Netherlands, from the 15th through the 18th century. The office acquired extensive powers in the United Provinces of the Netherlands (Dutch Republic). Introduced by the ruling Burgundian dukes in the 15th century and continued unchanged by the succeeding Habsburg rulers, the stadholderates were at first occupied by noblemen appointed by the central government. The duties of the stadholder included presiding over the provincial states (assemblies), control and command of provincial armies, and appointment to certain offices.

During the revolt of the Netherlands against the Spanish Habsburgs (from 1568), the stadholders came to be elected, first by the States General (*q.v.*) and then by the individual provincial states. This procedure remained permanent for the seven northern provinces that won their independence from Spain and formed the Dutch Republic; in the provinces that reverted to Spanish rule, the stadholders again became royal appointees and declined in importance. The offices of the Dutch stadholders soon became exclusively associated with the house of Orange-Nassau: while William I, the leader of the revolt, had been stadholder of four provinces, his son was elected to the office in five provinces and a Nassau cousin in the remaining two; this pattern endured until 1747, when a single Orange prince was elected to all of the offices.

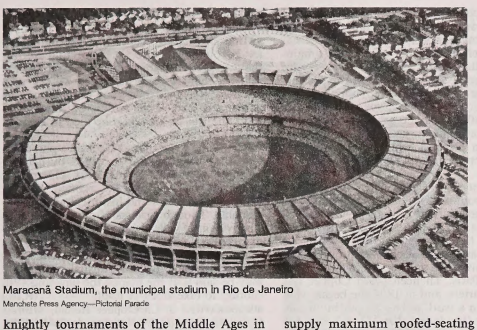
During the republic's existence the Orange stadholders were in almost continual conflict with the states of the dominant province of Holland, competing for leadership of the country. While theoretically subordinate to the states, the stadholder, in times of internal or foreign crisis and with the support of the lesser provinces and the lower classes, was able to replace the Holland leaders with his own allies and thus wield near-supreme power. In this fashion the stadholder gained preponderance in 1619–50, 1672–1702, and 1747–95. In 1747, after the election of Prince William IV to all of the stadholderates, the offices were made hereditary. The republic experienced two stadholderless periods (1650–72 and 1702–47) when, with the deaths of the domineering princes of Orange, the offices in the five leading provinces were left vacant, while the Holland oligarchs controlled the destiny of the republic.

The stadholderate disappeared in 1795 along with the old republic. The last stadholder fled to England as invading French revolutionary armies and their Dutch sympathizers brought the republic to an end.

*Consult the* INDEX *first*

**Stadion (-Warthausen), Johann Philipp (Karl), Graf von** (count of) (b. June 18, 1763, Mainz, archbishopric of Mainz [Germany]—d. May 15, 1824, Baden, near Vienna, Austria), statesman, foreign minister, and diplomat who served the Habsburg empire during the Napoleonic Wars.

After service in the imperial Privy Council (1783–87), Stadion was dispatched to the Austrian embassy in Stockholm. In 1790 he was sent to London, where he was influenced by the conservative philosophy of Edmund Burke and became a vigorous opponent of the French Revolution. To counter the subsequent march of Napoleonic France across Europe, he urged the formation of a union of Austria, Prussia, and Russia. Ambassadorial missions that he undertook to Berlin (1801) and St. Petersburg (1803) led to the conclusion of an Austrian-Russian defensive agreement (June 1804).



Following the disastrous Battle of Austerlitz (Dec. 2, 1805) and the Treaty of Pressburg (December 26), Stadion was summoned to replace Philipp, Count von Cobenzl, as Austria's foreign minister, primarily in order to prepare a war of revenge against the French. Believing that Napoleonic France could be overcome only by arousing German nationalist feeling, Stadion inaugurated a campaign of national awakening that was to be supplemented by political and social reforms. The lack of response by the German states doomed his project, however, and, with the resounding defeat of Austria by Napoleon in the Battle of Wagram (July 1809), Stadion resigned as foreign minister.

In 1813, with the fall of Napoleon imminent, Stadion led Austria to join the anti-French coalition of powers and served as Austrian plenipotentiary in the camp of the Allies. Charged with the direction of Austrian finances after 1814, he was appointed president of the exchequer that year and head of the Finance Ministry in 1816. He established an Austrian national bank and introduced a system of uniform land taxation.

**stadium,** enclosure that combines broad space for athletic games and other exhibitions with large seating capacity for spectators. The name derives from a Greek unit of measurement, the 'stade, the distance covered in the original Greek footraces (about 600 feet [180 m]). The course for the footrace in the ancient Olympic Games at Olympia was exactly a stade in length, and the word for the unit of measurement became transferred first to the footrace and then to the place in which the race was run. As a type of structure, the stadium played a significant role in 20th-century construction technology.

*Classical stadiums.* The first Greek stadiums were long and narrow and in the shape of a horseshoe. They were sometimes cut into the side of a hill, as at Thebes, Epidaurus, and Olympia, site of the Olympic Games, begun there in the 8th century BC. The Greeks also built hippodrome stadiums similar in layout but broad enough to accommodate four-horse chariot races, a feature of the Olympic Games as early as the 7th century BC. *See also* hippodrome.

The design of the Greek stadium was taken over and improved upon by the Romans, who built two types of stadiums: the circus and the amphitheatre. The circus was the Roman version of the hippodrome, a long, narrow, U-shaped structure designed for chariot races. The largest, and doubtless the finest ever built, was the Circus Maximus (*q.v.*) in Rome. In contrast to the circus, the amphitheatre, one of the most characteristic of all Roman buildings, was oval or round in plan and was completely enclosed on all sides. Intended for gladiatorial contests, in which the precise dimensions of the field were of slight importance, the amphitheatre was designed to afford maximum seating capacity and optimum visual facility for spectators. The giant amphitheatre built in Rome in the 1st century AD is known as the Colosseum. After the fall of Rome, amphitheatres survived for some time until the decline of the cities themselves terminated the spectacles that they had held. Nearly two millennia passed before the form was revived; much smaller, usually temporary stands sufficed for such intervening spectatorial events as the

Maracanã Stadium, the municipal stadium in Rio de Janeiro
Manchete Press Agency—Pictorial Parade

knightly tournaments of the Middle Ages in Europe. *See also* amphitheatre.

The renewal of large-scale spectator sports came about gradually in the 19th century with the growth of cities and the revival of interest in athletic contests; symbolically, the great impetus for the design of modern stadiums came from the revival of Olympic competition in 1896.

*Modern stadiums.* The stadium for the first modern Olympiad in Athens was a reconstruction of the ancient marble stadium built by Herodes Atticus on the site of an even earlier stadium in Athens. The Olympics since that time have provided a major focal point for the development of the modern stadium concept. In each four-year period since the first modern Olympiad, the host country has usually erected a permanent stadium to mark the event. The first stadium of the modern genre was constructed for the IV Olympiad in 1908 at Shepherd's Bush in London. The stands were partly roofed, and the stadium seated more than 50,000 people. Other Olympic stadiums of architectural note that were built before World War II include those at Stockholm (1912), Colombes, outside Paris (1924), Amsterdam (1927), and Berlin (1936). The Helsinki stadium built for the XII Olympiad (1940), which was canceled by the outbreak of World War II, served as the site for the XV Olympiad in 1952.

Stadiums rivaling the size of those of ancient Rome were constructed in several cities in the first half of the 20th century, notably the vast Strahov Stadium, in Prague, which was completed in 1934 for the Sokol gymnastics exhibition and had a seating capacity of more than 240,000. The Maracanã municipal stadium in Rio de Janeiro has accommodated 200,000 people for football (soccer) games. Auto racing venues often boast very large seating capacities, the largest being the Indianapolis Motor Speedway, Indianapolis, Ind. (250,000). Other stadiums seating in excess of 100,000 include Rungnado May Day Stadium, in P'yŏngyang, N.Kor. (150,000); Salt Lake Stadium, in Calcutta, India (120,000); Flemington Racecourse, in Melbourne, Austl. (120,000); Aztec Stadium, in Mexico City (114,465); and Michigan Stadium, in Ann Arbor, Mich. (107,501). Though these figures denote official "seating" capacities, these stadiums are actually capable of accommodating considerably more people.

American gridiron football inspired a new type of stadium design, the elliptical bowl, first employed in the Yale Bowl at New Haven, Conn., in 1914, and repeated in several other stadiums, including the Rose Bowl and Michigan Stadium. Because the bowl is entirely unsuited to the other principal American sport, baseball, another type of American stadium has evolved for baseball, in which the aim is to supply maximum roofed-seating capacity to protect spectators against the sunlight. A notable pioneer in this trend was triple-tiered Yankee Stadium, in New York City, built in 1923.

*Design innovations.* The shapes of stadiums have varied widely according to the variety of uses for which they were built. Some are rectangular with curved corners, whereas others are elliptical or U-shaped. The building of large stadiums in the 20th century was greatly facilitated by the use of reinforced concrete; this material has made possible the construction of daring new designs that would previously have been impossible to sustain structurally.

A basic difficulty of the roofed stadium was the interference with visibility by the columns supporting the roof. Dodger Stadium in Los Angeles was the first tiered stadium to provide column-free views from all seats (1959), followed by Shea Stadium in New York City, which added field seat sections that rotate around the stadium to permit conversion from a baseball to a football arrangement (1964). During the 1970s the multipurpose stadium (typically with artificial turf) became pervasive in the United States. In 1970 two such stadiums were built—in Cincinnati, Ohio, and Pittsburgh, Pa.

A significant development of the mid-20th century was the Astrodome, built in Houston, Texas; this was the first major fully roofed stadium. Indoor stadiums of considerable size had been built previously, notably Madison Square Garden in New York City (1890), and Chicago Stadium, Chicago (1928), capable of seating 17,500 (both original structures have been demolished). For the 1960 Olympics in Rome, the leading Italian architect-engineer Pier Luigi Nervi created the Roman sports complex, which included the Palazzetto dello Sport with a ribbed-dome roof. The Astrodome, however, was, by comparison, gigantic, with a seating capacity of 62,439 people and a large playing field. The dome, of transparent plastic panels supported by steel lattice, has a span of 642 feet (196 m) and rises 208 feet (63 m) above the playing field. The entire interior is air-conditioned.

Within a decade, however, the Astrodome was eclipsed by the New Orleans Superdome (opened 1975), which has an official seating capacity of 69,703 (though able to accommodate larger numbers); the 30-story structure is topped by a steel-ribbed roof that has a 680-foot (200-metre) clear span.

Another important development was the application of flexible steel cables to span large roof dimensions. Cables were able to contribute significantly to speed of construction, to lightness of the roof, and to economy of construction costs in covered stadiums. A stadium with this system was opened in 1982 in Minneapolis–St. Paul, Minn., and is called the Metrodome.

In the late 1980s stadiums with retractable domes began to appear, most notably Toronto's SkyDome (opened 1989). Retractable roofs became increasingly common by the turn of the 21st century.

The 1990s saw a tremendous surge in stadium construction throughout the world. New stadiums were designed to meet the needs of a particular sport and to include amenities such as luxury suites, multiple restaurants, and shopping, lodging, and banquet facilities. New baseball parks built during this period, such as Camden Yards in Baltimore, Md., combine modern amenities with the atmosphere of the classic parks of the early 20th century.

The Sapporo Dome stadium (opened in 2002) in Japan features a mobile playing surface. The stadium's natural grass field is held by a tray that allows the surface to be maintained outdoors and then moved into the stadium for matches. (L.Z./Ed.)

**stadholder:** *see* stadholder.

**Staël, Germaine de,** in full ANNE-LOUISE-GERMAINE NECKER, BARONNE (baroness) DE STAËL-HOLSTEIN, byname MADAME DE STAËL (b. April 22, 1766, Paris, France—d. July 14, 1817, Paris), French-Swiss woman of letters, political propagandist, and conversationalist, who epitomized the European culture of her time, bridging the history of ideas from Neoclassicism to Romanticism. She also gained fame by maintaining a salon for leading intellectuals. Her writings include novels, plays, moral and political essays, literary criticism, history, autobiographical memoirs, and even a number of poems. Her most important literary contribution was as a theorist of Romanticism.

Germaine de Staël, portrait by Jean-Baptiste Isabey, 1810; in the Louvre, Paris
Giraudon—Art Resource

*Early life and family.* She was born Anne-Louise-Germaine Necker, the daughter of Swiss parents, in Paris. Her father was Jacques Necker, the Genevan banker who became finance minister to King Louis XVI; her mother, Suzanne Curchod, the daughter of a French-Swiss pastor, assisted her husband's career by establishing a brilliant literary and political salon in Paris.

The young Germaine Necker early gained a reputation for lively wit, if not for beauty. While still a child, she was to be seen in her mother's salon, listening to, and even taking part in, the conversation with that lively

intellectual curiosity that was to remain her most attractive quality. When she was 16, her marriage began to be considered. William Pitt the Younger was regarded as a possible husband, but she disliked the idea of living in England. She was married in 1786 to the Swedish ambassador in Paris, Baron Erik de Staël-Holstein. It was a marriage of convenience and ended in 1797 in formal separation. There were, however, three children: Auguste (b. 1790), who edited his mother's complete works; Albert (b. 1792); and Albertine (b. 1796), who was allegedly fathered by Benjamin Constant.

*Political views.* Before she was 21, Germaine de Staël had written a romantic drama, *Sophie, ou les sentiments secrets* (1786), and a tragedy inspired by Nicholas Rowe, *Jane Gray* (1790). But it was her *Lettres sur les ouvrages et le caractère de J.-J. Rousseau* (1788; *Letters on the Works and the Character of J.-J. Rousseau*) that made her known. There is in her thought an unusual and irreconcilable mixture of Rousseau's enthusiasm and Montesquieu's rationalism. Under the influence of her father, an admirer of Montesquieu, she adopted political views based on the English parliamentary monarchy. Favouring the French Revolution, she acquired a reputation for Jacobinism. Under the Convention, she elected body that abolished the monarchy, the moderate Girondin faction corresponded best to her ideas.

Protected by her husband's diplomatic status, she was in no danger in Paris until 1793, when she retreated to Coppet, Switz., the family residence near Geneva. It was here that she gained fame by establishing a meeting place for some of the leading intellectuals of western Europe. Since 1789 she had been the mistress of Louis de Narbonne, one of Louis XVI's last ministers. He took refuge in England in 1792, where she joined him in 1793. She stayed at Juniper Hall, near Mickleham in Surrey, a mansion that had been rented since 1792 by French émigrés. There she met Fanny Burney (later Mme d'Arblay), but their friendship was cut short because Mme de Staël's politics and morals were considered undesirable by good society in England.

She returned to France, via Coppet, at the end of the Terror in 1794. A brilliant period of her career then began. Her salon flourished, and she published several political and literary essays, notably *De l'influence des passions sur le bonheur des individus et des nations* (1796; *A Treatise on the Influence of the Passions upon the Happiness of Individuals and of Nations*), which became one of the important documents of European Romanticism. She began to study the new ideas that were being developed particularly in Germany. She read the elderly Swiss critic Karl Viktor von Bonstetten; the German philologist Wilhelm von Humboldt; and, above all, the brothers August Wilhelm and Friedrich von Schlegel, who were among the most influential German Romanticists.

But it was her new lover, Benjamin Constant, the author and politician, who influenced her most directly in favour of German culture. Her fluctuating liaison with Constant started in 1794 and lasted 14 years, although after 1806 her affections found little response.

*Literary theories.* At about the beginning of 1800 the literary and political character of Mme de Staël's thought became defined. Her literary importance emerged in *De la littérature considérée dans ses rapports avec les institutions sociales* (1800; *A Treatise of Ancient and Modern Literature* and *The Influence of Literature upon Society*). This complex work, though not perfect, is rich in new ideas and new perspectives—new, at least to France. The fundamental theory, which was to be restated and developed in the positivism of Hippolyte Taine, is that a work must express the moral and historical reality, the zeitgeist, of the nation in which it is conceived. She also maintained that the Nordic and classical ideals were basically opposed and supported the Nordic, although her personal taste remained strongly classical. Her two novels, *Delphine* (1802) and *Corinne* (1807), to some extent illustrate her literary theories, the former being strongly sociological in outlook, while the latter shows the clash between Nordic and southern mentalities.

*Banishment from Paris.* She was also an important political figure and was regarded by contemporary Europe as the personal enemy of Napoleon. With Constant and his friends she formed the nucleus of a liberal resistance that so embarrassed Napoleon that in 1803 he had her banished to a distance of 40 miles (64 km) from Paris. Thenceforward Coppet was her headquarters, and in 1804 she began what she called, in a work published posthumously in 1821, her *Dix Années d'exil* (*Ten Years' Exile*). From December 1803 to April 1804 she made a journey through Germany, culminating in a visit to Weimar, already established as the shrine of J.W. von Goethe and Friedrich von Schiller. In Berlin she met August Wilhelm von Schlegel, who was to become, after 1804, her frequent companion and counselor. Her guide in Germany, however, was a young Englishman, Henry Crabb Robinson, who was studying at Jena. The journey was interrupted in 1804 by news of the death of her father, whom she had always greatly admired. His death affected her deeply, but in 1805 she set out for Italy, accompanied by Schlegel and Simonde de Sismondi, the Genevan economist who was her guide on the journey. Returning in June 1805, she spent the next seven years of her exile from Paris for the most part at Coppet.

While *Corinne* can be considered the result of her Italian journey, the fruits of her visit to Germany are contained in her most important work, *De l'Allemagne* (1810; *Germany*). This is a serious study of German manners, literature and art, philosophy and morals, and religion in which she made known to her contemporaries the Germany of the Sturm und Drang movement (1770–1780). Its only fault is the distorted picture it gives, ignoring, for example, the violently nationalistic aspect of German Romanticism. Napoleon took it for an anti-French work, and the French edition of 1810 (10,000 copies) was seized and destroyed. It was finally published in England in 1813.

Meanwhile Mme de Staël, persecuted by the police, fled from Napoleon's Europe. Having married, in 1811, a young Swiss officer, "John" Rocca, in May 1812 she went to Austria and, after visiting Russia, Finland, and Sweden, arrived, in June 1813, in England. She was received with enthusiasm, although reproached by such liberals as Lord Byron for being more anti-Napoleonic than liberal and by the Tories for being too liberal. Her guide in England was Sir James Mackintosh, the Scottish publicist. She collected documents for, but never wrote, a *De l'Angleterre:* (the material for it can be found in the *Considérations sur la Révolution française* [1818; *Considerations on the Principal Events of the French Revolution*], which represents a return to Necker's ideas and holds up the English political system as a model for France).

On the Bourbon Restoration in 1814, Mme de Staël returned to Paris but was deeply disillusioned: the fall of Napoleon had been followed by foreign occupation and had in no way reestablished liberty in France. During the Hundred Days she escaped to Coppet and in September 1815 set out again for Italy. In 1816 she returned to spend the summer at Coppet, where she was joined by Byron, in flight from England after his unhappy matrimonial experience. A strong friendship developed between the two writers.

Mme de Staël's health was declining. After Byron's departure she went to Paris for the winter. Though poorly received by the returned émigrés and suspected by the government, she held her salon throughout the winter and part of the spring, but after April 1817 she was an invalid. She died in Paris in July of that year.

*Assessment.* Germaine de Staël's purely literary importance is far exceeded by her importance in the history of ideas. Her novels and plays are now largely forgotten, but the value of her critical and historical work is undeniable. Though careless of detail, she had a clear vision of wider issues and of the achievements of civilization. Her involvement in, and understanding of, the events and tendencies of her time gave her an unusual position: it may be said that she helped the dawning 19th century to take stock of itself.
(R. Es.)

BIBLIOGRAPHY. J. Christopher Herold, *Mistress to an Age: A Life of Madame de Staël* (1958, reissued 1981), is an excellent English-language introduction to Staëlian studies. Renee Winegarten, *Mme. de Staël* (1985), places the writer in her historical context and assesses her works. Madelyn Gutwirth, *Madame de Staël, Novelist: The Emergence of the Artist as Woman* (1978), thoughtfully and lucidly examines the impact of the writer's femaleness on her works as well as on her critics. Charlotte Hogsett, *The Literary Existence of Germaine de Staël* (1987), traces the development of her style.

**staff,** also spelled STAVE, in the notation of Western music, five parallel horizontal lines that, with a clef, indicate the pitch of musical notes. The invention of the staff is traditionally ascribed to Guido of Arezzo in about the year 1000, although there are earlier manuscripts in which neumes (*q.v.*; signs from which musical notes evolved) are arranged around one or two lines in order to orient the singer. Guido used three or four lines of different colours. A four-line staff is still used to notate plainchant.

The standard five-line staff appeared in about 1200 in polyphonic music. Some 16th-century keyboard music used staves of more lines. A precise staff notation made possible composition of the complex polyphonic works that characterize Western art music.

**Staff, Leopold** (b. Sept. 14, 1878, Lwów, Pol. [now Lviv, Ukraine]—d. May 31, 1957, Skarżysko-Kamienna, Pol.), influential poet associated with the Young Poland movement at the end of the 19th century.

After completing his education at Lwów University, Staff moved to Kraków. In 1901 his *Sny o potędze* ("Dreams of Power"), the first of his more than 30 volumes of verse, was published in Warsaw; two years later *Dzień duszy* (1903; "The Day of the Soul") appeared. From the very beginning Staff showed a talent for handling poetic form; he would create new forms if the old seemed insufficient. A later collection, *Ucho igielne* (1927; "The Needle's Eye"), was dominated by religious feeling, expressed in concise and direct verse. His last collection of poems appeared in 1954. Staff also made translations and wrote some dramas, though this work is less well-known than his poetry.

**Stafford,** district (borough), county of Staffordshire, England, with an area of 231 square miles (599 square km), lying along the River Sow. It includes rural agricultural areas and the urban communities of Stone (a parish with a town council) and Stafford.

Founded by Aethelflaed, daughter of Alfred the Great, the town of Stafford had its own mint from the reign of Aethelstan to that of Henry II. Stafford town was chartered in 1206 and grew as a market town. It was the historic county town of Staffordshire. In 1643, during the English Civil Wars, Royalist Stafford was

occupied by Parliamentarians who demolished its 11th-century town walls and castle. Public buildings include the Shire Hall (1798–99), Borough Hall (1876–77), Guildhall (1934), and the Municipal Central Library, with an art gallery and museum (1914, extended 1962). The College of Further Education, the College of Art, and county administrative buildings are also in the borough. The Swan Hotel was associated with the 19th-century literary figures Charles Dickens and George Borrow.

Stafford lies on the London-Birmingham-Manchester road and rail routes. Industries include electrical and mechanical engineering and the production of salt and shoes. Pop. (1981) town, 62,242; (1988 est.) district, 117,-900.

**Stafford, Edward:** *see* Buckingham, Edward Stafford, 3rd Duke of.

**Stafford, Sir Edward William** (b. April 23, 1819, Edinburgh, Scot.—d. Feb. 15, 1901, London, Eng.), landowner and statesman who served three times as prime minister of New Zealand (1856–61, 1865–69, 1872).

The son of a landed Irish family, Stafford began farming sheep in New Zealand (1843), was elected superintendent of Nelson province (1853) and representative from Nelson to the General Assembly (1855), and formed his first ministry in 1856. During this five-year term as premier, Stafford negotiated financial settlements between the British government, the New Zealand Company, and the provinces. He also secured the passage of legislation that created three new provinces out of the existing ones, thus weakening and diffusing the provinces' power. Stafford's next ministry (1865–69) was primarily concerned with the problem of New Zealand's dependence on British troops during a flareup of hostilities with the Maoris. Stafford wished to retain the troops, but popular opposition to the financial burden of their maintenance resulted in the fall of his ministry. Stafford's third ministry lasted less than a month (Sept. 6 to Oct. 4, 1872), but he remained a member of the House during the "continuous ministry" of Sir Julius Vogel as a strong advocate of the abolition of the provinces (1875). He retired from politics, returned to England (1878), and was knighted in 1879.

**Stafford, Henry:** *see* Buckingham, Henry Stafford, 2nd Duke of.

**Stafford, Jean** (b. July 1, 1915, Covina, Calif., U.S.—d. March 26, 1979, White Plains, N.Y.), American short-story writer and novelist noted for deft development of fictional characters.

After graduating from the University of Colorado at Boulder (B.A., 1936; M.A., 1936), Stafford studied at Heidelberg University in Germany (1936–37). When she returned to the United States and settled in Boston, she painstakingly completed a four-year effort, the novel *Boston Adventure* (1944), which became a best-seller, reaching 400,000 copies. Its publication launched her career and guaranteed her a position of prominence in literary circles. She later wrote two more novels, *The Mountain Lion* (1947) and *The Catherine Wheel* (1952), as well as children's books. Her *The Collected Stories of Jean Stafford* (1969) won a Pulitzer Prize, and she contributed frequently to such journals as *The New Yorker, Kenyon Review, Partisan Review,* and *Harper's Bazaar.*

Stafford's personal life was somewhat tragic, marked by bouts of alcoholism and illnesses and by three troubled marriages (to the writers Robert Lowell, Oliver Jensen, and A.J. Liebling).

**Stafford, Thomas P(atten)** (b. Sept. 17, 1930, Weatherford, Okla., U.S.), American astronaut who flew two Gemini rendezvous missions (1965–66) and commanded the Apollo 10 mission (1969)—the final test of Apollo systems before the first manned landing on the Moon—as well as the Apollo spacecraft that docked with a Soviet Soyuz craft in space in 1975.

A graduate (1952) of the U.S. Naval Academy, Annapolis, Md., Stafford transferred to the Air Force and studied at the Air Force Experimental Flight Test School.

Thomas P. Stafford, 1966

By courtesy of the National Aeronautics and Space Administration

Stafford was Walter M. Schirra's copilot on the Gemini 6 mission, launched Dec. 15, 1965. Their rendezvous with the previously launched Gemini 7 was the world's first successful space rendezvous. On June 3, 1966, Eugene A. Cernan and command pilot Stafford were launched into space in Gemini 9. Stafford performed three rendezvous with a target vehicle, but a protective covering on the target had failed to detach, preventing docking.

Apollo 10, manned by Stafford, Cernan, and John W. Young, was launched on May 18, 1969. Three days later the spacecraft attained lunar orbit. The flight rehearsed every phase of a Moon landing except the landing itself. Cernan and Stafford descended in the Lunar Module to within 9.5 miles (15 km) of the Moon's surface. Apollo 10 completed 31 orbits of the Moon before returning to Earth, landing in the Pacific Ocean on May 26.

Stafford resigned from the space program in 1975 to become commander of the Air Force Flight Test Center, Edwards Air Force Base, California. In 1978 he was promoted to lieutenant general and became Air Force Deputy Chief of Staff for Research and Development, stationed in Washington, D.C. After retiring from the Air Force in 1979, he became an executive of a transportation company in Oklahoma.

**Staffordshire,** county of central England, in the Midlands north of the Birmingham industrial area. It includes Cannock Chase, East Staffordshire, Lichfield, South Staffordshire, and Staffordshire Moorlands districts; the city of Stoke-on-Trent; and the boroughs of Newcastle-under-Lyme, Stafford, and Tamworth. Its area is 1,049 square miles (2,716 square km).

The county lies across the upper reaches of the River Trent, the third longest river in England, which rises on Biddulph Moor near the Cheshire border and then flows southeastward across the county before turning northeastward to form the boundary with Derbyshire for several miles. From north to south the county can be divided into five physical regions. The northern moorlands, developed on grit and limestone, form the southern tip of the Pennines, the upland spine of northern England. Immediately to their south lie the coal measures, consisting of sandstones, clays, and shales interspersed with coal seams. This is the northern Staffordshire coalfield region, more familiarly known as The Potteries. The central agricultural belt is developed upon sandstones and marls; beyond this undulating countryside lies a fairly extensive exposure of the pebble strata that give rise to an area of barren heathland known as Cannock Chase. This area, formerly a royal forest, rises to between 600 and 700 feet (180 and 200 m). Finally an arm of Staffordshire extends south of Cannock Chase and west of the metropolitan area of West Midlands into the headwaters of the River Stour, a tributary of the River Severn.

Traces of Neolithic and Bronze Age settlements remain, especially in the northeast where there are long, low Neolithic burial mounds, and there are several Iron Age hill forts. The Romans built roads through the forests that covered the county, including what are now Watling Street and Rykneld Street, intersecting near Lichfield. From the 7th until the 9th century the area formed the centre of the Anglo-Saxon kingdom of Mercia. Tamworth was the kingdom's political capital, and Lichfield became its religious centre. At the end of the 9th century the area was ravaged by the Danes, and during the remainder of the 10th and much of the 11th century the county was the scene of much fighting. Domesday Book (1086) noted a sparsely populated and poor area.

Staffordshire's later history is largely bound up with that of its various industries. Coal and iron have been mined on the upper River Trent and around Cannock Chase since the 13th century, but they did not achieve real importance until the 18th century. The long-established pottery industry of northern Staffordshire also became renowned during the 18th century, particularly in association with the name of Josiah Wedgwood. The brewing industry of Burton-upon-Trent acquired similar recognition in the 19th century.

The greater part of Staffordshire is still devoted to agriculture, dairying being particularly important. Arable farming is largely concerned with the production of fodder crops, except in the extreme south and around Tamworth and Lichfield, where market gardening is important. The Forestry Commission has planted conifers on large areas of Cannock Chase. The Chase and the Pennines uplands, designated part of the Peak District National Park in 1951, are important as recreational centres for the industrial population of the West Midlands. The most important industrial area is on the northern Staffordshire coalfield around the towns of Tunstall, Burslem, Hanley, Stoke-upon-Trent, Fenton, and Langton. The pottery industry is still of major importance. Most towns in the county have also attracted various modern industries: Stafford has light engineering and shoe manufacture; Stoke, shoe and glass manufacture; and Leek, silk and rayon production. Burton-upon-Trent is still famous for its beer. In 1949 the University College of North Staffordshire was founded near Newcastle-under-Lyme, and in 1962 it became the University of Keele. Pop. (1988 est.) 1,032,900.

**Staffordshire figure,** type of pottery figurine made in Staffordshire, England, from the 18th century. The earliest figures, made from about 1740, are naive but effective renderings of the human body in salt-glazed stoneware—*e.g.,* the pew groups, or figures seated on a high-backed settle. Later some particularly happy effects were achieved in clouded, lead-glazed earthenware in which a subdued range of watery-looking colours—yellow, green, pale brown, and several grays—was used. Musicians, animals, shepherds, classical deities, allegorical figures, and portraits were in the repertoire. Among known artists are the potters Ralph Wood, Sr., and Ralph Wood, Jr., and the modeler Jean Voyez. Nineteenth-century figures, mostly portraits of English and American personages, such as Queen Victoria and George Washington,

were often vivacious and colourful but rather crude. Most 19th-century figures were theatrical in origin, and these are very much

Staffordshire lead-glazed earthenware figure, *c.* 1780; in the Victoria and Albert Museum, London

sought, but politicians, preachers, sportsmen, and criminals were all popular subjects.

**Staffordshire Moorlands,** district, county of Staffordshire, central England, occupying an area of 222 sq mi (576 sq km) directly east of the city of Stoke-on-Trent. Staffordshire Moorlands overlaps into the Peak District National Park on the northeast, where it is characterized by many bleak gritstone and limestone moorlands. Within the southern extremity of the Pennines, the moorlands extend from northwest to southeast in long ridges separated by deep valleys and decline in elevation from more than 1,600 ft (500 m) in the north to about 600 ft in the south to form an area of more fertile, gently rolling terrain.

Staffordshire Moorlands' rich resources of fireclays in the Keupermarls of the extreme southwest and coal in the extreme west were exploited between the late 18th and early 20th century. Coal is still mined in the west, and more than a century of mining has left behind huge heaps of rubble; the fireclay extraction left large and deep pits in the marl subject to flooding. Heightened sensitivity to environmental conservation finally generated efforts in the 1980s to reclaim some of the wastelands. Sheep rough graze the uplands, and dairy farming is commonplace in the southern valleys. Coal continues to be mined in the west. The parishes (towns) in the south and west (including Biddulph, Leek, and Cheadle) manufacture assorted textiles and are local agricultural centres. St. Giles Roman Catholic church in Cheadle is a mid-19th-century Gothic Revival masterpiece built by Augustus Welby Northmore Pugin. Potholing (exploration of underground caverns) is a popular sport in the limestone moorlands in the southeastern part of the district. Leek is the district seat. Pop. (1983 est.) 95,500.

**Staffordshire terrier,** breed of terrier developed in 19th-century England for fighting other dogs in pits. The breed was created by crossing the bulldog, then a longer legged and more agile dog, with a terrier, possibly the fox terrier or one of the old breeds known as the white English and the black-and-tan terriers. Once known by such names as bull-and-terrier, half and half, and pit bull terrier, the Staffordshire is a stocky, muscular, and unusually strong dog standing 17 to 19 inches (43 to 48 centimetres), with an average weight of about 30 to 50 pounds (14 to 23 kilograms). Its coat is stiff and short and may be any canine colour, solid or variegated.

**Staffordshire ware,** lead-glazed earthenware and unglazed or salt-glazed stoneware made in Staffordshire, England, from the 17th century onward. Abundance of local clays and coal gave rise to a concentration of pottery factories that made Staffordshire one of the foremost pottery centres in Europe. Porcelain was first made at Longton Hall *c.* 1750. Among

Fair Hebe lead-glazed earthenware jug designed and signed by Jean Voyez, Staffordshire, England, 1788; in the Victoria and Albert Museum, London
By courtesy of the Victoria and Albert Museum, London; photograph, EB Inc.

the distinguished factories located there were Spode, Minton, Wedgwood, and New Hall.

**stag beetle,** also called PINCHING BUG, any member of the approximately 900 species of the insect family Lucanidae (order Coleoptera). The mandibles (jaws) are greatly developed in the male and resemble the antlers of a stag. In many species the elaborately branched and toothed mandibles may be as long as the beetle itself; their pinch usually draws blood from a person. In some cases, however, the mandibles are large enough to be a handicap.

Stag beetles are robust and black or brown; they are attracted to lights at night. Paintings of a few brightly coloured species have been used on postage stamps: *Chaisognathus granti* from Chile is metallic green and iridescent red; *Phalacrognathus muelleri* from Australia is metallic carmine and edged with green.

Adult stag beetles range between 8 and 40 millimetres (1/3 to 1 2/3 inches) in length, although the male of the East Indian *Odontolabis alces* is more than 100 mm long. The male giraffe stag beetle (*Cladognathus giraffa*) of India and Java is almost as long, and its jaws make up about half of its total length. Most stag beetles live around rotting logs; they feed on sap.

**stage design,** the aesthetic composition of a dramatic production as created by such aspects of stagecraft as lighting, set, costume, sound, and stage architecture and machinery.

A brief treatment of stage design follows. For full treatment, *see* MACROPAEDIA: Theatrical Productions.

The evolution of staging in European culture can be seen as variations on the principles established by the classical Greek and Roman theatres. In the Hellenistic period, from the 4th century BC, the Greek theatre was already using within its permanent semicircular structure a number of movable scenic elements. These are thought to have included painted screens, wheeled platforms, and cranes for "flying" actors.

Most of the innovations in indoor staging that occurred during the Renaissance came from the Italian theatre. On its recreated classical stage, it enhanced the scenic background by applying the perspective techniques recently discovered in painting. Initially, two-dimensional street scenes were depicted, but with the development of the proscenium arch, more complex perspective architectural settings emerged. These included painted backdrops and flat wings at the sides of the stage. The visual effects became increasingly elaborate, often with numerous changes of scenery taking place before the audience's eyes.

Outside this tradition, the English Elizabethan theatre, with its deep thrust stage, featured a permanent architectural structure at the rear that enabled the action to take place vertically on different levels as well as horizontally in different directions. Although the actors used properties extensively, locations were suggested through the poetry rather than through painted scenery. This allowed a swiftness of action not possible in theatres where scene changes were cumbersome.

During the Baroque period, from the 17th century, the Italian influence spread through Europe. The demand for scenic spectacle meant a deepening of the stage to accommodate the newly developed machinery and the elaborate effects that came to dominate both opera and ballet. Italian staging was introduced to England in 1605 by the architect Inigo Jones, who designed many court masques adapting ideas that he had seen in Italy.

With the Romantic movement and its sentimentalization of nature, the landscape became a popular alternative to the architectural setting, and the scene painter became increasingly influential. The most common type of staging during the 19th century was a series of flats or cut-outs forming natural arches across the stage, through which could be seen a panorama at the back.

Changes in theatre architecture and improvements in stage machinery led to a new naturalism at the end of the 19th century, partly initiated by the Duke of Saxe-Meiningen. In his company, which toured throughout Europe, scenic details were determined by archaeological research rather than artistic fancy. In England this trend was reflected in lavish but historically accurate productions of the classics and in realistic box settings for modern plays. David Belasco, the American producer, carried realism to extremes by using live animals on stage.

As the perspective painters had influenced the Renaissance theatre, so the Cubists and Expressionists made their mark on the theatre of the early 20th century in a reaction against Realism. The emphasis changed from illusion to style. Such designers as Adolphe Appia and Gordon Craig introduced bolder, more symbolic shapes to interpret the mood of the play.

This simplification in staging meant that the actor, who had formerly been overwhelmed by the scenery, now became preeminent. A consequence in England was that Shakespeare's plays could, for the first time in centuries, be played as a continuous flow of action. In the 1920s the French director Jacques Copeau rediscovered the advantages of the bare platform stage. By the 1960s, Jerzy Grotowski introduced in Poland "poor theatre," a rejection of elaborate costumes, make-up, and scenery, with a more fluid actor-audience arrangement determined by the requirements of each play. Often the actors and audience occupied almost the same space.

The other major influence on 20th-century staging was the "alienation effect" introduced by the German dramatist Bertolt Brecht. He exposed the equipment of the stage to discourage the spectator from being swept away by the spell of theatre and, thus, losing objectivity.

One of the greatest influences on staging and scenic design has been the advancements made in stage lighting. Until the 16th century, theatre was mainly an outdoor activity. When the indoor theatres of the Renaissance ap-

peared, illumination was provided by torches, tallow candles, and open-wick lamps.

Reflectors to intensify the light were used in the 17th century, and, toward the end of the 18th century, glass-chimney oil lamps appeared, although the level of light was still very low. In order to make their features more distinctive, the actors resorted to painting their faces with cosmetics. Gas lighting, introduced to the London stage in 1803, was much brighter, and its intensity could be easily adjusted. Following Thomas Edison's invention in 1879, electric lighting was first used on stage by the Paris Opéra in 1880, and the other theatres were quick to follow.

It was the development of spotlights in the early part of the 20th century that made stage lighting a refined art. Though the visibility of the actor is regarded as the prime function of lighting, modern techniques have given designers complete lighting control of the stage space, allowing them to "paint with light," using it where and as they need it, rather than having to drench the stage with as bright a wash as possible. Similarly, make-up techniques have become more subtle, and, in smaller theatres, actors often use no make-up at all.

Today, the lighting designer has at his disposal a wide range of powerful spots and floodlights, as well as projectors capable of simulating water, cloud and fire effects, and other moving images. Lighting control boards also have reached a high efficiency through computerization, making them easy to operate however complex the lighting plot and however large the number of cues. With its almost limitless possibilities, modern stage lighting has become a vital means of unifying all the visual elements in a stage production.

Because of the immense size of the auditorium, costumes in the Greek and Roman theatre were usually stereotyped, so that the characters, who also wore masks, could be instantly identified. In the Renaissance theatre, classical modes of dress, though exaggerated and embellished, were the main inspiration for theatrical costume. These were taken to greater levels of extravagance and fantasy in the Baroque operas and ballets of the late 17th century, though by the end of the 18th century there was a trend toward historical authenticity.

The most imaginative innovations in costume design during the 20th century have been in the field of dance, which has frequently attracted avant-garde artists. Today, the designer has a choice between authentic and interpretative costume. A classical play may therefore be dressed in an indeterminate period to suggest the universality of the play.

**stage machinery,** devices designed for the production of theatrical effects, such as rapid scene changes, lighting, sound effects, and illusions of the supernatural or magical. Theatrical machinery has been in use since at least the 5th century BC, when the Greeks developed deus ex machina (*q.v.*), by which an actor could be lowered to the stage. During the Hellenistic period, the Greeks also used movable scenery, mounted on wheels or on revolving prisms called *periaktoi* (*q.v.*). The Romans elaborated on these devices, adding traps (*see* trap) and underground pumping systems so that their outdoor theatres could be flooded for aquatic shows. The mystery plays of the Middle Ages also used stage machinery, including a trapdoor, or a hellmouth, for the emergence of devils and flying machines for angels. But the art did not reach its zenith until the Italian Renaissance.

In the late 14th century Italian artists, architects, and engineers began to design elaborate machinery for spectacles produced in the churches on holy days. One such device was the Paradiso, a system of ropes and pulleys by which a whole chorus of angels was made to descend, singing, from a heaven of cotton clouds. Greek and Roman stage machinery was rediscovered, and Bastiano de Sangallo developed new variations on the ancient method of using *periaktoi* for quick changes of scenery. Italian stage machinery eventually became so elaborate that it was necessary to introduce a highly decorated proscenium arch to hide it. The early Italian operas were famous for their special effects: ocean waves were simulated on stage by painted spiral columns, laid across the stage in diminishing perspective and slowly turned; mock sea monsters and other fabulous creatures were operated by teams of men inside them; deities mounted on clouds flew on complicated systems of wires; and portions of the theatres could even be flooded for water spectacles.

In the 17th century the English masque designer Inigo Jones and Giacomo Torelli, one of the greatest Italian stage engineers, invented many important pieces of stage equipment, some of which are in use today. The most famous was a system for moving the wings at either side of the stage, thus making it possible to change scenery almost instantaneously.

The tradition of mechanical spectacle on stage was carried on into the 18th century by court theatres and by the Jesuit college theatre, but there was little new development. When lighting methods improved enormously in the 19th century, with such inventions as the limelight (*q.v.*), it became possible to spotlight the actors and to create special effects such as sunlight and moonlight. Magical illusions were also developed to a high art on the 19th-century English stage, which produced great refinements in the use of trapdoors and mirror devices for the simulation of ghosts and apparitions. In general, the "picture frame" stage of the later 19th century allowed the refinement of extraordinarily vivid spectacles, realistic and otherwise, by the use of treadmills, moving panoramas, and other stage machinery.

In the early 20th century, particularly in Germany, much use was made of revolving turntables and hydraulically elevated stages, on which complex scenes could be preset and then brought into view when needed, but such machinery was generally found to be too elaborate and expensive. The trend toward increasing intimacy between the actor and his audience led in the second half of the 20th century to the return of open stages and theatre-in-the-round, which require little scenery or stage machinery of any kind.

**stage wagon,** early, four-wheeled, American vehicle, used to carry both passengers and cargo. It was a precursor of the stagecoach. The first stage wagons had no springs, backless wooden benches, sides of wood, and canvas tops. Later improvements were roll-up leather curtains, solid flat tops, backrests, and springs or straps for the seats. A stage wagon of 1771, whose owner called it "The Flying Machine," was able to travel the 90-odd miles between Philadelphia and New York City in a day and a half.

In England stage wagons referred to great covered wagons, probably first used in the middle of the 16th century to carry freight and, later, passengers who could not afford stagecoach fares. Through a series of modifications the stage wagon evolved into the coach by the early 19th century.

**stagecoach,** any public coach regularly travelling a fixed route between two or more stations (stages). Used in London at least by 1640, and about 20 years later in Paris, stagecoaches reached their greatest importance in England and the United States in the 19th century, where the new macadam roads made travel quicker and more comfortable. In the United States, coaches were the only means that many people had to travel long overland distances. In 1802 one could travel by different coaches 1,200 miles (1,900 kilometres) between Boston and Savannah, Ga., with the total price of travel and lodging amounting to $100. In England, in 1828, coaches ran 12 times daily from Leicester to London alone. They were also very quick; the London–Edinburgh stagecoach travelled its 400-mile route at an average speed of 10 miles an hour. Washington Irving's essay "The Stage Coach" describes a journey by stagecoach in England and provides an interesting picture of the coachmen. Many of Dickens' novels retrospectively present the great age of the stagecoach. Gradually, after the 1840s, coaches succumbed to the railroad, although they continued to be used in less accessible places into the 20th century.

Stagecoach, *c.* 1868; in the Henry Ford Museum, Dearborn, Mich.
Owned by the Henry Ford Museum

Stagecoaches have passed into folklore and literature. Few films with a locale in the American West would be complete without one. Especially notable is John Ford's *Stagecoach*, which uses the coach to present a little ark of humanity thrown together to react to and learn from each other and so follows such literary examples as Smollett's *The Expedition of Humphry Clinker* and Maupassant's "Boule de suif." *See also* Concord coach; diligence.

**staged rocket,** vehicle driven by several rocket systems mounted in vertical sequence. The lowest, or first stage, ignites and then lifts the vehicle at increasing velocity until exhaustion of its propellants. At that point the first stage drops off, lightening the vehicle, and the second stage ignites and accelerates the vehicle further. Most space launch vehicles have three stages. *See also* launch vehicle.

**Stagg, Amos Alonzo** (b. Aug. 16, 1862, West Orange, N.J., U.S.—d. March 17, 1965, Stockton, Calif.), U.S. college football coach who had the longest coaching career—71 years—in the history of the sport. In 1943, at the age of 81, he was named college coach of the year, and he remained active in coaching until the age of 98. He is the only person selected for the National Football Hall of Fame, New Brunswick, N.J., as both a player and a coach. He was also important in the development of intercollegiate basketball.

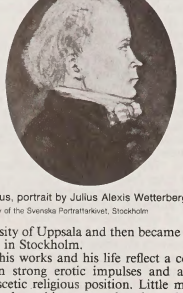
As an end for Yale, where he was also an outstanding baseball pitcher, Stagg was chosen for Walter Camp's first All-America football team (1889). He then attended the International Young Men's Christian Association Training School, afterward Springfield (Mass.) College; there he both played and coached football and became one of the first enthusiasts of basketball, which was invented by James Naismith at the Springfield school in 1891. On Jan. 18, 1896, Stagg's University of Chicago team defeated the University of Iowa in the first intercollegiate basketball game with five players on each side.

During Stagg's 41-year tenure (1892–1932)

as football coach at Chicago, the Maroons won six Western Conference (Big Ten) championships outright (1899, 1905, 1907, 1908, 1913, 1924) and tied for another (1922). They were undefeated and untied in two seasons (1905, 1913) and undefeated but tied at least once in two other years (1899, 1908). For his Chicago teams he devised the end-around play, the man in motion, the huddle (also credited to Bob Zuppke, coach at the University of Illinois), the shift (later employed with great success by Knute Rockne at the University of Notre Dame), and the dummy for tackling practice. After his enforced retirement from Chicago at the age of 70, he was head coach at the College (now University) of the Pacific, Stockton, Calif. (1933–46); advisory coach at Susquehanna University, Selinsgrove, Pa., under his son, head coach Amos Alonzo Stagg, Jr. (1947–52); and advisory coach at Stockton Junior College (1953–60).

**staghead,** progressive slow death of tree branches from the top down. *See* dieback.

**staghorn fern,** member of the genus *Platycerium* (family Polypodiaceae), which is bizarre in appearance and frequently displayed in conservatories and other collections. *Platycerium* is epiphytic—*i.e.,* the plants grow upon



*Platycerium*
John Kohout from Root Resources—EB Inc.

other plants. The leaves are of two forms; one type is elongated, erect or pendulous, and repeatedly forked, hence the name staghorn. The other leaf type is flat or bowl-shaped and grows closely appressed to the support on which the plant lives. Termed mantle leaves, these provide in some species a kind of cavity in which humus collects and roots develop and absorb moisture and nutrients. The spore-producing structures (sporangia) are variously disposed on the lower sides of these leaves according to species.

Staghorn fern is also a common name for 10 species constituting the genus *Gleichenia,* native to subtropical and south temperate areas. They have small leaf segments and form dense growths in sunny places.

**Stagnelius, Erik Johan** (b. Oct. 14, 1793, island of Öland, Sweden—d. April 3, 1823, Stockholm), one of the strangest and most romantic of the Swedish Romantic poets.

Most of his childhood and youth were spent on the island of Öland where he was born. Educated by tutors and self-taught from his clergyman father's library, he attended the

Stagnelius, portrait by Julius Alexis Wetterbergh

University of Uppsala and then became a civil servant in Stockholm.

Both his works and his life reflect a conflict between strong erotic impulses and a radically ascetic religious position. Little more is known about him; even the chronology of most of his works cannot be determined with any certainty. During the last few years of his short life, he did, however, publish two dramas, *Martyrerna* (1821; "The Martyrs") and *Backanterna* (1822; "The Bacchantes"), as well as a collection of religious lyrics, *Liljor i Saron* (1821; "Lilies in Sharon"). His *Samlade skrifter* (1824–26; "Collected Works"), containing his vast unpublished material, appeared shortly after his death.

**Stahl, Franklin W(illiam)** (b. Oct. 8, 1929, Boston), U.S. geneticist who (with Mathew Meselson) elucidated (1958) the mode of replication of deoxyribonucleic acid (DNA; the gene substance), a double-stranded helix that dissociates to form two strands, each of which directs the construction of a new sister strand.

Educated at Harvard and the University of Rochester, Stahl pursued his research at the California Institute of Technology (1955–58) and the University of Missouri (1958–59). He joined the faculty of the University of Oregon in 1970.

**Stahl, Georg Ernst** (b. Oct. 21, 1660, Ansbach, Franconia—d. May 14, 1734, Berlin), German physician and chemist who developed the phlogiston theory of combustion and of such related biological processes as respiration, fermentation, and decay. The theory dominated chemical thought for almost a century. He also, at times, believed in alchemy and animism.

Georg Ernst Stahl, detail of a copper engraving attributed to a member of the Bernigeroth family, 18th century

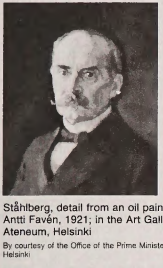
*Life.* Stahl grew up under the influence of Pietism, a vigorous movement for moral reform in the Lutheran Church that had begun to spread across Germany. German Pietism stressed the inward, practical, devotional, and tolerant aspects of Christianity in a manner not unlike that of the Friends (Quakers) in England.

Stahl studied medicine at Jena, Thüringen. His teacher, Georg Wolfgang Wedel (1645–1721), was a proponent of the chemiatric school, which sought to explain life processes in terms of chemical composition. Even when Stahl later broke new ground in chemistry as well as in medicine, his early training remained apparent in his firm belief in the essential unity of these two sciences. At Jena, Stahl formed a close friendship with his fellow student Friedrich Hoffmann (1660–1742). Stahl was graduated in 1684, having begun to teach the year before. In 1687 he was appointed court physician by Johann Ernst, duke of Sachsen-Weimar.

In 1694, Frederick III, elector of Brandenburg, founded the University of Halle. When Hoffmann was asked to organize the medical school of the new university, he asked Stahl to join him. For the next 20 years the two worked side by side; Stahl taught theoretical medicine, physiology, pathology, dietetics, pharmacology, and botany, while Hoffmann lectured on practical medicine, anatomy, physics, and chemistry. Gradually, however, deep temperamental differences, which were reflected in increasingly divergent views on theoretical questions, divided them. Hoffmann became an ardent convert to the school of iatromechanics, which saw living organisms as machines to be explained by the laws of classical mechanics. Stahl could not accept such an oversimplification. He remained faithful to his iatrochemical training in seeing physiological processes as chemical changes, but he insisted that neither mechanical nor chemical laws alone were sufficient to account for the phenomenon of life. To live, an organism required direction by a force for which Stahl used the Latin word *anima.* That word, the full meaning of which is not well caught in the usual translations of "soul" or "spirit," gave rise to the name animism for this theory. Vitalism and animaterialism are later words for very similar views.



Their opposition in scientific matters eventually destroyed the friendship between Stahl and Hoffmann. The friends became rivals and, at last, enemies. Stahl must have welcomed his call in 1716 to Berlin, where he served as personal physician to Frederick William I, king of Prussia.

*Assessment.* Stahl's contributions to science are to an extraordinary degree reflections of his personality. By character he was contemplative, melancholy, and deeply inclined toward the inner-directed religious Pietism of the late 17th century. His intellect, on the other hand, was analytical and sweeping and compelled him toward large abstractions in the manner of the 18th century. Stahl bridged two ages, as did his phlogiston theory. It was the first systematic account of chemical transformation, but without the concepts of atom or element. The roots of his ideas lie not in the prior use of the word phlogiston by Jan Baptist van Helmont (1577–1644) or in the vaguer theories of Johann Joachim Becher (1635–82) but in Aristotelian thought: phlogiston is the property of being combustible that is lost in the process of combustion but that may be regained by contact with materials especially rich in phlogiston, such as coal. On an ancient philosophical foundation, Stahl built a practical theory that clarified fundamental chemical concepts. (C.W.B.)

BIBLIOGRAPHY. There is no published biography of Stahl; biographical information may be found in the article by C.W. Beck, "Georg Ernst Stahl," *J. Chem. Educ.,* 37:506–510 (1960).

**Ståhlberg, Kaarlo Juho** (b. Jan. 28, 1865, Suomussalmi, Oulu county, Fin.—d. Sept. 22, 1952, Helsinki), architect of the Finnish constitution and the first president of independent Finland.

Joining the Constitutionalist Party, Ståhlberg was elected to the Diet in 1904 and entered the government of the autonomous Grand Duchy of Finland in 1905 but resigned in 1907. From 1908 to 1918 he was professor of administrative law at the University of Helsinki.

Ståhlberg, detail from an oil painting by Antti Favén, 1921; in the Art Gallery of Ateneum, Helsinki

By courtesy of the Office of the Prime Minister, Helsinki

Consistently democratic in outlook, he was among the first Finnish politicians to call for universal suffrage. His draft of a republican constitution (1917) became the basis of the actual constitution of 1919. In the reshuffling of the political parties when national independence was achieved, Ståhlberg joined the National Progressive Party. Elected president of the new republic (1919), he set the pattern for his successors by making full use of his constitutional powers. He did his utmost to narrow the gap between "Reds" and "Whites" after the Civil War. At the end of his term (1925) he did not seek reelection, for he thought that the right wing would become more easily reconciled to the republic if he stood aside. He lost the presidential election of 1931 by two votes and that of 1937 by one vote.

**stained glass,** in the arts, the coloured glass used for making decorative windows and other objects through which light passes. Stained glass itself is no different from other coloured glass, being glass to which metallic oxides have been added in order to create colour. The adjective stained has traditionally been reserved to describe the glass used to create pictorial windows. Stained glass, which is purely a Western phenomenon, reached the status of a fine art in the 12th and 13th centuries, when it was combined with Gothic architecture to create brilliant and moving effects.

A brief treatment of stained glass follows. For full treatment, *see* MACROPAEDIA: Decorative Arts and Furnishings.

The effect of a stained-glass window is created not by the coloured glass itself but by light passing through the glass and by the setting in which that light is perceived. Contrast is a vital aspect of the effect, which is why the windows that light the vast, dark, Gothic interiors of medieval cathedrals seem so intensely jewellike and brilliant. Light is constantly changing—with the time of day, the seasons, and the weather—so the effect of stained glass varies almost from moment to moment. Certain effects of light will bring out certain tones, and intensity will vary from the soft and mute to the brilliant. Stained glass is similar to painting in certain respects but is probably more akin to the art of mosaic, where tiny, individually coloured components are assembled by the artist to create a unified overall design, and to the art of enameling, particularly the cloisonné technique, where raised metal strips separate the various coloured enamels and form an intrinsic part of the design.

Stained glass existed in Early Christian times but did not evolve as an important decorative art until much later. The earliest existing pictorial windows are those at the Cathedral of Augsburg in Germany. Other important 12th-century glass was made for the Abbey of St. Denis, near Paris. In the second quarter of the 13th century the Sainte-Chapelle in Paris was glazed with brilliant walls of stained glass, in a cycle of 1,134 scenes in 15 windows. The finest remaining 13th-century glass in England is at Canterbury Cathedral.

Medieval stained glass was cut from thin coloured sheets, and then the design or picture was assembled by fitting the pieces of glass into lead strips that became an integral part of the design. Black vitreous enamel was used to paint details of the design onto the glass pieces. The separately assembled lead panels were then inserted into iron framing members that formed the windows. Some windows reached enormous size—that at Chartres Cathedral depicting the life of Christ covers more than 250 square feet (23.2 square m). As window sizes increased, the stained glass assumed ever increasing importance from both an aesthetic and a catechistic point of view. Themes were usually taken from the Scriptures, and common subjects included the lives of the saints, prophets, Christ, and the Virgin, as well as the Last Judgment and the Apocalypse.

After the 13th century, stained glass began to decline as an art form, though important examples were made until the 16th century. Its decline began when stained-glass artists began to seek the realistic effects sought by Renaissance painters, effects for which the technique was less suited and that diverted artists from exploiting its intense light-refracting quality.

In the 19th century a revival of interest in medieval stained glass was part of the Gothic revival, and its techniques led to the production of many brilliant windows in England by the leader of the Arts and Crafts movement, William Morris, to designs by the artist Edward Burne-Jones and in the United States by Louis Comfort Tiffany. The Art Nouveau movement saw an increasing use of stained glass for decorative purposes, and Frank Lloyd Wright used it in much of his architectural work. In the 20th century brilliant stained glass was designed by such painters as Henri Matisse, Marc Chagall, and Fernand Léger.

**stainer** (insect): *see* red bug.

**Stainer, Sir John** (b. June 6, 1840, London, Eng.—d. March 31, 1901, Verona, Italy), English organist and church composer and a leading early musicologist.

As a boy Stainer sang in the choir of St. Paul's Cathedral (1847–56). At the age of 16 he was appointed organist at the newly opened St. Michael's College, Tenbury, a school for church musicians. Named organist at St. Paul's in 1872, Stainer served in that prestigious position until 1888, when he resigned because of failing eyesight. He was a founder of the (later Royal) Musical Association in 1874 and taught at the National Training School for Music, opened in 1876. Knighted in 1888, Stainer was professor of music at the University of Oxford from 1889 to his death.

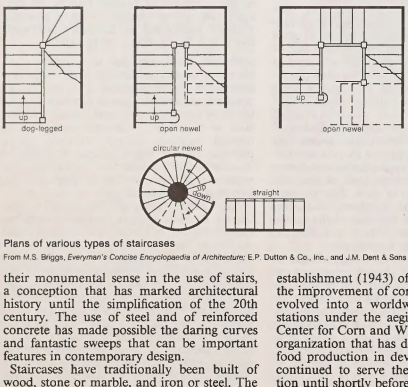
Stainer's Romantic church music is now mainly performed in England, although his best-known oratorio, *The Crucifixion* (1887), is also performed in other English-speaking countries. He wrote songs as well as cantatas, services, anthems, and other music for the church service. He also published treatises on the organ and music theory and collaborated on a dictionary of musical terms. Stainer's most lasting contribution is his compilation *Early Bodleian Music*, with musical examples from the 12th to the 16th century, and *Dufay and His Contemporaries* (publication begun in 1898), an edition of 15th-century music prepared with the help of his children. Both publications helped open the way to the study of Medieval and Renaissance music, which during Stainer's time was almost unknown.

**Staines,** locality in Spelthorne district, county of Surrey, England, on the left bank of the River Thames. A residential community on the western fringe of Greater London, Staines marks a crossing of the Thames used since Roman times by the major road from London to the southwest of Britain. Nearby are large reservoirs where Thames water is pumped, purified, and stored for London's Metropolitan Water Board. Pop. (1981) 53,815.

**stainless steel,** any one of a family of alloy steels usually containing 10 to 30 percent chromium. In conjunction with low carbon contents, chromium imparts remarkable resistance to corrosion and heat. Other elements such as nickel, molybdenum, titanium, aluminum, niobium, copper, nitrogen, sulfur, phosphorus, and selenium may be added to increase corrosion resistance to specific environments, enhance oxidation resistance, and impart special characteristics.

Most stainless steels are first melted in electric-arc or basic oxygen furnaces and subsequently refined in another steelmaking vessel, mainly to lower the carbon content. In the argon-oxygen decarburization process, a mixture of oxygen and argon gas is injected into the liquid steel. By varying the ratio of oxygen and argon, it is possible to remove carbon to controlled levels by oxidizing it to carbon monoxide without also oxidizing and losing expensive chromium. Thus, cheaper raw materials, such as high-carbon ferrochromium, may be used in the initial melting operation.

There are three major groups in the family of stainless steels: austenitic, ferritic, and martensitic. Austenitic steels, which contain 16 to 26 percent chromium and up to 35 percent nickel, usually have the highest corrosion resistance. They are not hardenable by heat treatment and are nonmagnetic. The most common type is the 18/8, or 304, grade, which contains 18 percent chromium and 8 percent nickel. Typical applications include aircraft and the dairy and food-processing industries. Standard ferritic steels contain 10.5 to 27 percent chromium and are nickel-free; because of their low carbon content (less than 0.2 percent), they are not hardenable by heat treatment and have less critical anticorrosion applications, such as architectural and auto trim. Martensitic steels typically contain 11.5 to 18 percent chromium and up to 1.2 percent carbon with nickel sometimes added. They are hardenable by heat treatment, have modest corrosion resistance, and are employed in cutlery, surgical instruments, wrenches, and turbines.



**Stainville, Étienne-François de Choiseul, Count** (comte) **de:** *see* Choiseul, Étienne-François de Choiseul, Duke de.

**stair-step moss** (*Hylocomium splendens*), plant of the order Bryales that covers areas of coniferous forest floor of the Northern Hemisphere and also occurs on dunes, ledges, and tundra. The fernlike shoots have many branches and reddish, glossy caulids (stems) with phyllids (leaves) up to 3 mm (0.12 inch) long. The capsules (spore cases) of the female plant are borne on setae (stalks) about 2 cm (0.8 inch) long.

**staircase,** series, or flight, of steps between two floors. Traditionally staircase is a term for stairs accompanied by walls, but contemporary usage includes the stairs alone.

The origin of the staircase is uncertain. On the road up Tai Shan (mountain) in China there are many great flights of ancient granite

steps; the earliest staircases seem to have been built with walls on both sides, as in Egyptian pylons that date from the 2nd millennium BC. The Cretan palaces, as at Knossos and Phaistos (both *c.* 1500 BC), make important use of stairs, and the Assyrian ziggurat of the 9th or 8th century BC was often adorned with massive stairs. The palace terrace at Persepolis has a double flight of steps (6th century BC) of great beauty. The Romans were noted for

Plans of various types of staircases
From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture*; E.P. Dutton & Co., Inc., and J.M. Dent & Sons Ltd.

their monumental sense in the use of stairs, a conception that has marked architectural history until the simplification of the 20th century. The use of steel and of reinforced concrete has made possible the daring curves and fantastic sweeps that can be important features in contemporary design.

Staircases have traditionally been built of wood, stone or marble, and iron or steel. The horizontal surface of a step is called its tread and the vertical front its riser; steps are placed between strings that are inclined to the angle of the staircase; strings are supported by newel posts that also support the handrail, forming a balustrade.

**staircase shell** (snail): *see* wentletrap.

**Staked Plain** (United States): *see* Llano Estacado.

**Stakhanov,** also spelled STACHANOV, formerly (until 1978) KADIYEVKA, also spelled KADIJEVKA, city, Luhansk *oblast* (province), eastern Ukraine. It is situated in the northern part of the Donets Coal Basin. The city developed in the 19th century as a coal-mining settlement. From 1935 to 1943, it was known as Sergo. Stakhanov is one of the major coal-mining towns of the Donets Basin, though it is declining in importance as pits become worked out and as other fuels increase in importance. There are coke-chemical and ferroalloy works and an artificial textile mill to diversify its industry. The town was renamed in 1978 for A. Stakhanov, the legendary Soviet model coal miner whose use of innovative working methods to greatly increase his personal productivity became the basis for the Stakhanovite movement in the Soviet Union. Pop. (1991 est.) 112,700.

**Stakman, Elvin Charles** (b. May 17, 1885, Algoma, Wis., U.S.—d. Jan. 22, 1979, St. Paul, Minn.), pioneering American plant pathologist and educator who established the methods for identifying and combatting diseases of wheat and other important food crops.

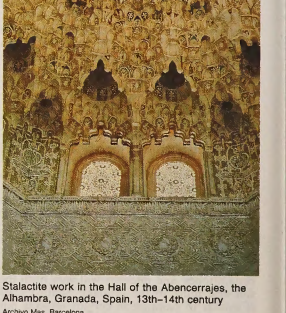
Stakman received his B.A. (1906), M.A. (1910), and Ph.D. (1913) from the University of Minnesota. In 1909 he became instructor in the newly established department of plant pathology, and in 1940 he became head of the department, a position he held until his retirement in 1953. Through the years he also held an appointment in the U.S. Department of Agriculture, where he organized and directed research at the Federal Cereal Rust Laboratory, which reflected Stakman's deep interest and prolific research in the behaviour and control of fungi-produced leaf rust in cereals.

His work with food crops led him to take an active role in international scientific affairs. In 1941 he was on a panel that advised the Rockefeller Foundation on the feasibility of cooperation between the Mexican government and the Rockefeller Foundation to improve crop production. The outcome was the establishment (1943) of a research station for the improvement of corn (maize), which then evolved into a worldwide network of such stations under the aegis of the International Center for Corn and Wheat Improvement, an organization that has done much to improve food production in developing countries. He continued to serve the Rockefeller Foundation until shortly before his death.

In addition to scientific papers, Stakman published *Principles of Plant Pathology* (1957; with J.G. Harrar), and *Campaign Against Hunger* (1967), with R. Bradfield and P. Mangelsdorf, his fellow consultants to the Rockefeller Foundation's agricultural program.

**stalactite and stalagmite,** elongated forms of various minerals deposited from solution by slowly dripping water. A stalactite hangs like an icicle from the ceiling or sides of a cavern. A stalagmite appears like an inverted stalactite, rising from the floor of a cavern.

Stalactites hanging from the ceilings of caverns commonly exhibit a central tube or the trace of a former tube whose diameter is that of a drop of water hanging by surface tension. A drop on the tip of a growing stalactite leaves a deposit only around its rim. Downward growth of the rim makes the tube. The simplest stalactite form, therefore, is a thin-walled stone straw, and these fragile forms may reach lengths of 0.5 m (20 inches) or more where air currents have not seriously disturbed the growth. The more common form is a downward-tapering cone and is simply a thickening of the straw type by mineral deposition from a film of water descending the exterior of the pendant.



Stalagmites have thicker proportions and grow up on the bottom of a cavern from the same drip-water source, the mineral from which is deposited after the water droplet falls across the open space in the rock. Not every stalactite has a complementary stalagmite, and many of the latter may have no stalactite above them. Where the paired relation exists, however, continual elongation of one or both may eventually result in a junction and the formation of a column.

The dominant mineral in such deposits is calcite (calcium carbonate), and the largest displays are formed in caves of limestone and dolomite. Other minerals that may be deposited include other carbonates, opal, chalcedony, limonite, and some sulfides.

Conditions that favour the deposition are: (1) a source rock above the cavern; (2) downward percolation of water supplied from rain; (3) tight but continuous passageways for this water, which determine a very slow drip; and (4) adequate air space in the void to allow either evaporation or the escape of carbon dioxide from the water, which thus loses some of its solvent ability.

**stalactite work,** also called HONEYCOMB WORK, Arabic AL-ḤALĪMĀT AL-ʿULIYĀ ("the overhang"), pendentive form of architectural ornamentation, resembling the geological formations called stalactites. This type of ornamentation is characteristic of Islāmic architecture and decoration. It consists of a series of little niches, bracketed out one above the other, or of projecting prismatic forms in rows and tiers that are connected at their upper ends by miniature squinch arches. Its infinite varieties may be classified into three groups, the first consisting of those basically niche shaped, in which the concave curve is the most important feature; the second group includes those in which the vertical edges between the niches are the most important feature; the last group consists of elaborately intersecting, miniature arches. The first two groups occur commonly in Syrian, Moorish, and Turkish work and, in their simpler forms, in Persia; the last group is typically Persian and is also found in Mughal work in India.

Stalactite ornamentation developed comparatively late in Islāmic art, the earliest buildings in Syria, Egypt, and North Africa showing no traces of it. It seems to appear suddenly throughout the Islāmic world toward the beginning of the 12th century, reaching its highest development in the 14th and 15th centuries, when it became the usual decoration for door heads, niches, and the bracketing under cornices and minaret galleries. The richest examples of the prismatic type are found in Moorish work in Spain, especially in the intricate wood and plaster ornament of such palaces as the 14th- and 15th-century Alhambra in Granada and the 14th-century Alcázar in Seville. A peculiar type of faceted, crystal-

Stalactite work in the Hall of the Abencerrajes, the Alhambra, Granada, Spain, 13th–14th century
Archivo Mas, Barcelona

shaped stalactite is found in Turkey; this form became the most common Turkish capital decoration. Stalactite ornamentation was also used to decorate Islāmic furniture and accessory furnishings.

**Stalin, Joseph,** Russian in full IOSIF VISSARIONOVICH STALIN, original name (Georgian) IOSEB DZHUGASHVILI (b. Dec. 21 [Dec. 9, Old Style], 1879, Gori, Georgia, Russian Empire—d. March 5, 1953, Moscow, Russia, U.S.S.R.), secretary-general of the Communist Party of the Soviet Union (1922–53) and premier of the Soviet state (1941–53), who for a quarter of a century ruled the Soviet Union as dictator and transformed it into a major world power.

A brief treatment of Joseph Stalin follows. For full treatment, *see* MACROPAEDIA: Stalin.

Though originally trained for the priesthood, Stalin joined an underground Georgian revolutionary organization in 1900 and the Bolshevik faction of the Russian Social Democrats in 1903. A relatively minor figure in the party before the Bolshevik Revolution, he served as commissar for nationalities (1917–23) and for state control (1919–23) in the Soviet government; in 1922 he also became secretary-general of the party's Central Committee, a post that later provided the power base for his dictatorship. After Vladimir Lenin died (1924), Stalin successfully overcame his rivals in the party power struggles and became the dominant figure in Soviet politics. In 1928 he launched an intensive industrialization program that forced collectivization of agriculture and sweeping, often brutal social reorganization. During the 1930s he also supervised massive purges of the Communist Party and of Soviet population in general. Although he concluded a nonaggression pact with Adolf Hitler (1939), the German invasion of the Soviet Union (1941) drew him into World War II as an ally of Great Britain and, later, the United States. Having assumed the posts of head of the Soviet government and supreme commander in chief (1941), he directed the Soviet armies as they repulsed the German invaders and occupied the eastern European lands. After the war, Stalin was a key figure of the Cold War era, establishing Soviet hegemony in eastern Europe and rivaling the United States for world leadership. At home, he continued his repressive measures to control dissent. He remained the Soviet Union's leader until his death in 1953.

**Stalinabad** (Tajikistan): *see* Dushanbe.

**Stalingrad** (Russia): *see* Volgograd.

**Stalingrad, Battle of** (summer 1942–Feb. 2, 1943), unsuccessful German assault on the city of Stalingrad (now Volgograd) in the Russian S.F.S.R. during World War II that marked the furthest extent of the German advance into the Soviet Union. As a major industrial centre, Stalingrad was an important prize in itself, and control of the city would have cut Soviet transport links with southern Russia via the Volga River. The German campaign against Stalingrad also served to anchor the northern flank of the larger German drive into the oil fields of the Caucasus.

During the summer of 1942 the Germans advanced to the suburbs of Stalingrad but failed to take the city itself against a determined defense by the Red Army, despite repeated attacks by the 6th Army under Friedrich Paulus and part of the 4th Panzer Army under Hermann Hoth. By September they reached the city's centre, where they encountered stiff resistance from the Soviet 62nd Army under General Vasily I. Chuikov. The city's Soviet defenders had been driven almost to the Volga by mid-October, but the Germans' supplies were beginning to run low, their tanks were of little value in the constant street fighting, and winter was approaching.

On November 19 the Soviets launched a counterattack in the form of pincer movements north and south of the city, and by the 23rd they had encircled the 6th Army and part of the 4th within Stalingrad. A German attempt to relieve Paulus failed in mid-December. Under orders from Adolf Hitler, Paulus continued to fight on, making possible the eventual escape of the beleaguered German forces from the Caucasus. On Jan. 31, 1943, Paulus disobeyed Hitler and surrendered, and on February 2 the last of his remaining 91,000 troops turned themselves over to the Soviets. The Soviets recovered 250,000 German and Romanian corpses in and around Stalingrad and total Axis losses (Germans, Romanians, Italians, and Hungarians) are estimated to have been 800,000 dead. Official Russian military historians esitmate that 1,100,000 Soviet soldiers lost their lives in the campaign to defend the city.

**Staliniri** (Georgia): *see* Tskhinvali.

**Stalinism,** the method of rule, or policies, of Joseph Stalin, Soviet Communist Party and state leader from 1929 until his death in 1953. Stalinism is associated with a regime of terror and totalitarian rule.

In a party dominated by intellectuals and rhetoricians, Stalin stood for a practical approach to revolution, devoid of ideological sentiment. Once power was in Bolshevik hands, the party leadership gladly left to Stalin tasks involving the dry details of party and state administration. In the power struggle that followed Vladimir Lenin's death in 1924, the intellectual sophistication and charismatic appeal of Stalin's rivals proved no match for the actual power he had consolidated from positions of direct control of the party machinery. By 1929 his major opponents were defeated; and Stalinist policies, which had undergone several shifts during the power struggle, became stabilized. Stalin's doctrine of the monolithic party emerged during the battle for power; he condemned the "rotten liberalism" of those who tolerated discussion on or dissent from party policies. Lenin's pronouncements, except those uncomplimentary to Stalin, were codified as axioms not open to question. Persons opposed to these new dogmas were accused of treason to the party. What came to be called the "cult of personality" developed as Stalin, presenting himself as Lenin's heir, came to be recognized as the sole infallible interpreter of party ideology.

Basic to Stalinism was the doctrine of "socialism in one country," which held that, though the socialist goal of world proletarian revolution was not to be abandoned, a viable classless society could be built within Soviet boundaries and despite encirclement by a largely capitalist world. Stalin, appealing both to socialist revolutionary fervour and to Russian nationalism, launched in the late 1920s a program of rapid industrial development of unprecedented magnitude. A "class war" was declared on the rich farmers in the name of the poor, and Russian agriculture was rapidly collectivized, against considerable rural resistance, to meet the needs of urban industry. The need for expertise and efficiency in industry postponed the egalitarian goals of the Bolshevik Revolution; Stalin denounced "levelers" and instituted systems of reward that established a socioeconomic stratification favouring the technical intelligentsia. Heavy industry was emphasized to ensure Russia's future economic independence from its capitalist neighbours.

While socialist ideology foresaw a "withering away" of the state as the classless society became a reality, Stalin asserted that the state must instead become stronger before it could be eliminated. Stalinism held that the enemies of socialism within and without Russia would try to avert the final victory of the Revolution. To face these efforts and protect the cause, it was argued, the state must be strong. Power became more and more centralized in Stalin, who in the late 1930s launched a bloody purge of all those he regarded as even potentially dangerous to the Soviet state. As part of the struggle against those whom he considered political rivals, Stalin identified political opposition with treason and used this as a weapon in his struggle against Leon Trotsky and Nikolay I. Bukharin and their supporters. By February 1939 most of the "Old Bolsheviks," those revolutionaries who in 1917 had begun the Revolution, had been exterminated. Millions more (estimated at from 7 million to 15 million) were sent to the forced-labour camps that Stalin made an integral part of the Soviet economy.

Three years after Stalin's death in 1953, Soviet leaders led by Nikita Khrushchev denounced the cult of Stalin and the terrorism perpetrated by his regime; they saw Stalinism as a temporary aberration in Soviet socialist development. Others saw it as a brutal but necessary and inevitable phase of that development. Still others saw in Stalinism an irrevocable Soviet break with the ideals of the Revolution.

In 1989 the Soviet historian Roy Medvedev estimated that about 20 million died as a result of the labour camps, forced collectivization, famine, and executions. Another 20 million were victims of imprisonment, exile, and forced relocation.

**Stalino** (Ukraine): *see* Donetsk.

**Stalinogorsk** (Russia): *see* Novomoskovsk.

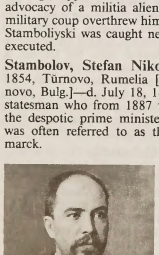
**Stalwart,** in U.S. history, member of a faction of the Republican Party that opposed the civil-service reform policies of President Rutherford B. Hayes and sought unsuccessfully a third presidential term for Ulysses S. Grant. The Stalwarts, or regular Republicans, vied with the generally more liberal Half-Breeds for control of the party in the 1870s and '80s. Among Stalwart leaders were Roscoe Conkling of New York and Chester A. Arthur, vice president under James A. Garfield.

**Stamboliyski, Aleksandŭr** (b. March 1, 1879, Slavovitsa, Bulg.—d. June 14, 1923, near Slavovitsa), leader of the Agrarian Party in Bulgaria, supporter of the Allied cause during World War I in opposition to his pro-German king Ferdinand, and prime minister of a reformist government after the war (1919–23).



Stamboliyski
EB Inc.

After attending an agricultural college in Germany, Stamboliyski turned to journalism, becoming editor of the newly formed Agrar-

ian League's organ in 1902. A lifelong supporter of peasant interests, he entered the National Assembly in 1908 as head of the Bulgarian Agrarian Union (Peasant Party). His recurrent disputes with King Ferdinand finally climaxed in 1915, when Bulgaria prepared to enter World War I on Germany's side. Stamboliyski, who viewed Russia as the liberator of the Slavs, favoured the Allied cause and threatened the person of the king. Court-martialed, he received a life sentence but was freed in September 1918. While Bulgaria's armed forces began to disintegrate near the end of World War I, he led an insurrection, forced Ferdinand's abdication, and proclaimed Bulgaria a republic. Although he was defeated and the monarchy was restored under Ferdinand's son Boris, Stamboliyski became a cabinet member in January 1919 and prime minister in October of that year. He signed the Treaty of Neuilly with the Allies (Nov. 27, 1919), which considerably decreased Bulgaria's territory; despite that unpopular act, his Agrarians gained a majority in the March 1920 elections. Stamboliyski's government, with a strong anti-urban and anti-industrial bias, redistributed land to the peasantry, reformed the judicial system, and favoured peasant cooperatives, universal suffrage, and more local self-government.

Stamboliyski loyally carried out the stipulations of the Treaty of Neuilly, winning from the Allies a reduction in reparations. He established ties with Polish and Czechoslovak peasant leaders in the hope of creating a "Green International" (in opposition to the Communist "Red International"), but this international peasant movement never lived up to his expectations. Improving relations with Yugoslavia through the Treaty of Niš (1922), Stamboliyski hoped to establish a South Slav federation. He won the 1923 election by a landslide, but his domestic policies, pacifist leanings, rapprochement with Yugoslavia, and advocacy of a militia alienated the army. A military coup overthrew him on June 9, 1923; Stamboliyski was caught near his village and executed.

**Stambolov, Stefan Nikolov** (b. Jan. 31, 1854, Türnovo, Rumelia [now Veliko Türnovo, Bulg.]—d. July 18, 1895, Sofia, Bulg.), statesman who from 1887 to 1894 served as the despotic prime minister of Bulgaria; he was often referred to as the Bulgarian Bismarck.

Stambolov, detail of a painting by Klissourov, 1892

By courtesy of the Embassy of the People's Republic of Bulgaria, London

The son of an innkeeper, Stambolov early joined the Bulgarian underground revolutionary movement against Turkish rule and led small anti-Turkish risings in 1875 and 1876. He fought with Bulgarian irregulars against Turkey in the Russo-Turkish War (1877–78), and, soon after Bulgaria gained autonomy in 1878, he was elected to the new Bulgarian assembly (Sobranye). Elected president of the assembly in 1884, he successfully urged upon Bulgaria's prince, Alexander I, a course of union with Eastern Rumelia (1885), despite the opposition of Russia. Following the forced abdication and abduction of Alexander in August 1886, Stambolov established a counter-revolutionary regime loyal to the prince at Türnovo, which undermined the pro-Russian provisional government at Sofia. Following Alexander's formal abdication (September 1886), Stambolov headed the regency council and, after successfully thwarting Russian attempts at intervention, secured the election of Prince Ferdinand of Saxe-Coburg-Gotha to the Bulgarian throne (July 7, 1887).

Under Bulgaria's new prince, Stambolov formed a ministry that remained in power from September 1887 to May 1894. Continued opposition to Russia coloured his regime, which was marked also by a rapprochement with Turkey and the dissemination of Bulgarian influence in Macedonia. Recurrent anti-dynastic conspiracies and armed risings in Bulgaria, however, led him to employ terrorist tactics to secure the continuation of the government. Moreover, his initial domination of Ferdinand was eventually overcome by the prince, who finally harassed his chief minister into resigning (May 31, 1894). Hounded for months by his enemies after his fall, Stambolov died after suffering a brutal street assault in Sofia.

**Stamford,** town ("parish"), South Kesteven district, county of Lincolnshire, England, on the River Welland. It is an ancient market town incorporated in 1462. Built of local limestone, it is largely unspoiled by modern industry and preserves much of its traditional character and architectural distinction. Noteworthy churches include St. Mary's, All Saints, and St. Martin's, and there are remains of the 7th-century Benedictine Priory of St. Leonard and of a Carmelite monastery (1291). Pop. (1981) 16,393.

**Stamford,** city, coextensive with the town ("township") of Stamford, Fairfield county, southwestern Connecticut, U.S. It lies at the mouth of the Rippowam River on Long Island Sound and is 36 miles (58 km) northeast of New York City. The town, named for its English counterpart, was founded in 1641 by 28 pioneers from Wethersfield (near Hartford). Stamford was a farming community until the railroad reached it in the 1840s, after which the town grew in size and began to acquire industries. A city government was formed within the town in 1893, and the town and city merged in 1949.

Until the late 1960s, Stamford was a residential suburb of New York City and had some industry and several industrial-research laboratories. Beginning in the early 1970s, however, several major corporations moved their headquarters from New York City to downtown Stamford, thereby revitalizing the city's economic life. Stamford's decaying downtown was razed and rebuilt with modern skyscrapers. By the late 1980s, the city had become the site of one of the largest concentrations of corporate headquarters in the United States. A branch of the University of Connecticut is situated in Stamford, and there is a branch of the Whitney Museum of American Art. Inc. 1893. Pop. (1991 est.) city, 108,183; Stamford PMSA, 202,794.

**Stamitz, Carl (Philipp)** (b. May 7, 1745, Mannheim, Palatinate [Germany]—d. Nov. 9, 1801, Jena, Saxony [Germany]), German composer of the last generation of Mannheim symphonists.

Stamitz was the son of Johann Stamitz, the founder of the Mannheim school. He played violin in the court orchestra at Mannheim in 1762 and was also a viola and viola d'amore player. He toured England and Russia and settled in Paris in 1785. In 1794 he became conductor of the orchestra at Jena. He wrote a large number of instrumental works, including symphonies, concerti and concertante works, and quartets, trios, and sonatas.

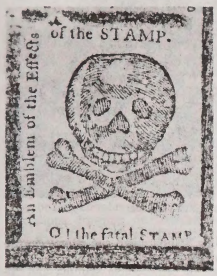
**Stamitz, Johann (Wenzel Anton)** (b. June 19, 1717, Deutschbrod, Bohemia [now Havlíčkův Brod, Czech Republic]—d. March 27, 1757, Mannheim, Palatinate [Germany]), German composer who founded the Mannheim school of symphonists, which had an immense influence on Wolfgang Amadeus Mozart.

Stamitz received early musical education from his father and appeared as a violinist at the coronation of the emperor Charles VII in Frankfurt am Main in 1742. He became a chamber musician to Prince Karl Theodor (Elector Palatine after 1743) and in 1745 was appointed concertmaster of the court orchestra at Mannheim.

Stamitz brought the Mannheim orchestra to a standard unrivaled in its day for both precision and scope of expression. The orchestral effects of a gradual crescendo and diminuendo, though not his invention, became a hallmark of his style and were imitated by later composers. Another characteristic of his style was the use of "sighing" suspensions, particularly at cadences. These were incorporated into Rococo-style music throughout Europe.

His use of the minuet and trio as the third movement of a four-movement symphony was similarly adopted by Classical composers, in place of the three-movement symphony previously common. He contributed to the evolution of the Classical sonata form by introducing contrasting themes within a single movement.

It is difficult to overestimate Stamitz' influence. Although contemporary composers in Berlin, Vienna, and Italy likewise developed some of these features, it was the first generation of Mannheimers (Stamitz and his associates) who were most influential in establishing the mid-18th-century style of orchestral writing.



**stammering:** *see* stuttering.

**Stammler, Rudolf** (b. Feb. 19, 1856, Alsfeld, Hesse [Germany]—d. April 25, 1938, Wernigerode, Ger.), German jurist and teacher who is considered to have been one of the most influential legal philosophers of the early 20th century.

Stammler was professor of law in Marburg (1882–84), Giessen (1884), Halle (1885–1916), and Berlin (1916–23). By distinguishing the concept of law, which is a purely formal definition, from the idea of law, which is the realization of justice, he emphasized, unlike most 19th-century legal philosophers, the search for ideals with which law ought to conform. Those ideals, in Stammler's view, were not immutable but reflected the degree of social harmony possible in a particular place and time. One of his major works, *Die Lehre von dem richtigen Rechte* (1902), was translated by Isaac Husik as *The Theory of Justice* (1925).

**Stamp Act** (1765), in U.S. colonial history, first British parliamentary attempt to raise revenue through direct taxation of all colonial commercial and legal papers, newspapers, pamphlets, cards, almanacs, and dice. The devastating effect of Pontiac's War (1763–64) on colonial frontier settlements added to the enormous new defense burdens resulting from Great Britain's victory (1763) in the French and Indian War. The British chancellor of the Exchequer, Sir George Grenville, hoped to meet at least half of these costs by the combined revenues of the Sugar Act (1764) and the Stamp Act, a common revenue device in England. Completely unexpected was the avalanche of protest from the colonists, who effectively nullified the Stamp Act by outright refusal to use the stamps as well as by riots, stamp burning, and intimidation of

colonial stamp distributors. Colonists passionately upheld their rights as Englishmen to be taxed only by their own consent through their own representative assemblies, as had been

"An Emblem of the Effects of the STAMP," a warning against the Stamp Act published in the Pennsylvania *Journal*, October 1765; in The New York Public Library

Rare Books and Manuscripts Division, The New York Public Library, Astor, Lenox and Tilden Foundations

the practice for a century and a half. In addition to nonimportation agreements among colonial merchants, the Stamp Act Congress was convened in New York (October 1765) by moderate representatives of nine colonies to frame resolutions of "rights and grievances" and to petition the king and Parliament for repeal of the objectionable measures. Bowing chiefly to pressure (in the form of a flood of petitions to repeal) from British merchants and manufacturers whose colonial exports had been curtailed, Parliament, largely against the wishes of the House of Lords, repealed the act in early 1766. Simultaneously, however, Parliament issued the Declaratory Act, which reasserted its right of direct taxation anywhere within the empire, "in all cases whatsoever." The protest throughout the colonies against the Stamp Act contributed much to the spirit and organization of unity that was a necessary prelude to the struggle for independence a decade later.

**stamp collecting,** the hobby of collecting postage stamps. *See* philately.

**Stampa, La** (Italian: "The Press"), morning daily newspaper published in Turin, one of Italy's most influential newspapers.

It was established in 1868 as the *Gazetta Piedmontese* and became an important voice in Italy's struggle for liberation and unification. The *Gazetta* was purchased in 1895 by two of its editors, Luigi Roux and Alfred Frassati, who changed the paper's name to *La Stampa.* When Mussolini came to power in 1926, Frassati was still editor and, by then, sole proprietor, and *La Stampa* was famous as a liberal journal with an intellectual tone and as a staunch defender of democracy. Rejecting invitations to support the Fascists, Frassati sold the paper and left the business. A Fascist staff took over, and the paper became a propaganda sheet.

After World War II *La Stampa,* temporarily renamed *La Nuova Stampa,* reappeared as a quality paper, carrying on its prewar tradition. It has maintained its long-standing concern for Italian social problems.

**standard atmosphere,** atmospheric model with a given vertical distribution of temperature, pressure, and humidity, which by international agreement is taken as a worldwide average of these parameters.

In such a model, the atmosphere is assumed to obey the perfect gas law and to be in hydrostatic equilibrium (*i.e.,* without accelerations of the air in the vertical direction). Further assumptions are that the air is dry and that the acceleration of gravity does not change with height.

Under the above conditions, the vertical variations of pressure and density may be determined for a given set of values at sea level and for any vertical distribution of temperature. Even though the real atmosphere may vary considerably from the assumed standard atmosphere, the latter is useful for such purposes as pressure altimeter calibrations, aircraft and missile designs, ballistic trajectories, and other problems. For many of these purposes, deviations of the real atmosphere from the standard do not cause serious errors in the calculations.

**standard deviation,** in statistics, a measure of the variability (dispersion or spread) of any set of numerical values about their arithmetic mean. It is specifically defined as the square root of the arithmetic mean of the squared deviations. *See also* mean.

**Standard Limited, The,** formerly EAST AFRICAN STANDARD, English-language daily newspaper published in Nairobi, Kenya. It was established in Mombasa in 1902 as a weekly, the *African Standard,* by a Parsi (Indian Zoroastrian), A.M. Jeevanjee, and an English editor-reporter, W.H. Tiller. In 1910 the paper became a daily, changed its name to the *East African Standard,* and moved to Nairobi, which was then fast developing as a commercial centre. It had already come under British ownership. In its early years the paper defended the interests of Kenya's white settlers, but by the 1970s it had developed a more balanced approach to news reporting and had built a reputation for fine writing and technical excellence. After independence the paper retained the freedom to publish but was not allowed to criticize the government's single political party or its leaders. It is published mornings except Sundays.

**standard model,** the combination of two theories of particle physics into a single framework to describe all interactions of subatomic particles, except those due to gravity. The two components of the standard model are electroweak theory, which describes interactions via the electromagnetic and weak forces, and quantum chromodynamics, the theory of the strong nuclear force. Both these theories are gauge field theories, which describe the interactions between particles in terms of the exchange of intermediary "messenger" particles that have one unit of intrinsic angular momentum, or spin.

In addition to these force-carrying particles, the standard model encompasses two families of subatomic particles that build up matter and that have spins of one-half unit. These particles are the quarks and the leptons, and there are six varieties, or "flavours," of each, related in pairs in three "generations" of increasing mass. Everyday matter is built from the members of the lightest generation: the "up" and "down" quarks that make up the protons and neutrons of atomic nuclei; the electron that orbits within atoms and participates in binding atoms together to make molecules and more complex structures; and the electron-neutrino that plays a role in radioactivity and so influences the stability of matter. Heavier types of quark and lepton have been discovered in studies of high-energy particle interactions, both at scientific laboratories with particle accelerators and in the natural reactions of high-energy cosmic-ray particles in the atmosphere.

The standard model has proved a highly successful framework for predicting the interactions of quarks and leptons with great accuracy. Yet it has a number of weaknesses that lead physicists to search for a more complete theory of subatomic particles and their interactions. The present standard model, for example, cannot explain why there are three generations of quarks and leptons. It makes no predictions of the masses of the quarks and the leptons nor of the strengths of the various interactions. Physicists hope that, by probing the standard model in detail and making highly accurate measurements, they will discover some way in which the model begins to break down and thereby find a more complete theory. This may prove to be what is known as a grand unified theory, which uses a single theoretical structure to describe the strong, weak, and electromagnetic forces.

(Ch.Su.)

**standard of living:** *see* living, standard of.

**Standard Oil Company (Indiana):** *see* Amoco Corporation.

**Standard Oil Company (New Jersey):** *see* Exxon Corporation.

**Standard Oil Company and Trust,** American company and corporate trust that from 1870 to 1911 was the industrial empire of John D. Rockefeller and associates, controlling almost all oil production, processing, marketing, and transportation in the United States.

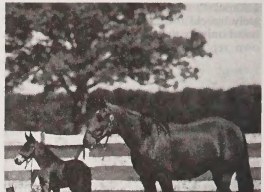
The company's origins date to 1863, when Rockefeller joined Maurice B. Clark and Samuel Andrews in a Cleveland refining business; in 1865 Rockefeller bought out Clark and two years later brought in Henry M. Flagler. By 1870 the firm of Rockfeller, Andrews, and Flagler was operating the largest refineries in Cleveland, and these and related facilities became the property of the new Standard Oil Company, incorporated in Ohio in 1870. By 1880, through elimination of competitors, mergers with other firms, and use of favourable railroad rebates, it controlled the refining of 90 to 95 percent of all oil produced in the United States.

In 1882 the Standard Oil Company and affiliated companies that were engaged in producing, refining, and marketing oil were combined in the Standard Oil Trust, created by the Standard Oil Trust Agreement signed by nine trustees, including Rockefeller. By the agreement, companies could be purchased, created, dissolved, merged, or divided; and eventually the trustees governed some 40 corporations, of which 14 were wholly owned. The trust embraced a maze of legal structures, making its workings virtually impervious to public investigation and understanding. As Ida Tarbell wrote in her *History of the Standard Oil Company* (1904), "You could argue its existence from its effects, but you could not prove it." In 1892 the Ohio Supreme Court ordered the trust dissolved, but it effectively continued to operate from headquarters in New York City.

In 1899 Standard Oil Company (New Jersey) was incorporated in New Jersey as a holding company, and all assets and interests formerly grouped in the trust were transferred to the New Jersey company.

Although consolidation did advance large-scale production and distribution of oil products, many critics believed that the resulting concentration of economic power was becoming excessive. In 1906 the U.S. government brought suit against Standard Oil Company (New Jersey) under the Sherman Anti-Trust Act; and in 1911 the New Jersey company was ordered to divest itself of its major holdings—33 companies in all.

In 1911, after dissolution of the Standard Oil empire, eight companies retained "Standard Oil" in their names; by the late 20th century the name had almost passed into history. In 1931 Standard Oil Company of New York merged with Vacuum Oil Company

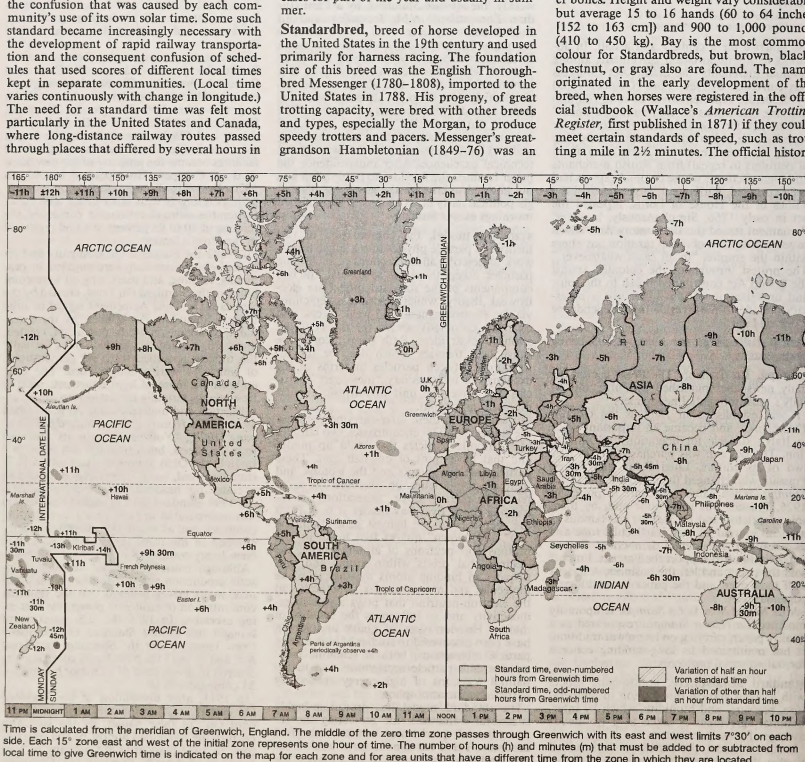


(another trust company) to form Socony-Vacuum, which in 1966 became Mobil Oil Corporation. Standard Oil (Indiana) absorbed Standard Oil of Nebraska in 1939 and Standard Oil of Kansas in 1948 and was renamed Amoco Corporation in 1985. Standard Oil of California acquired Standard Oil of Kentucky in 1961 and was renamed Chevron Corporation in 1984. Standard Oil Company (New Jersey) changed its name to Exxon Corporation in 1972. British Petroleum Company PLC completed the purchase of Standard Oil Company (Ohio) in 1987. Other companies that once were part of the trust include Atlantic Richfield Company, Buckeye Pipe Line Company (Ohio), Chesebrough-Pond's Inc., Pennzoil Company, and Union Tank Car Company (New Jersey).

**Standard Oil Company of California:** *see* Chevron Corporation.

**standard time,** the time of a region or country that is established by law or general usage as civil time.

The concept of standard time was adopted in the late 19th century in an attempt to end the confusion that was caused by each community's use of its own solar time. Some such standard became increasingly necessary with the development of rapid railway transportation and the consequent confusion of schedules that used scores of different local times kept in separate communities. (Local time varies continuously with change in longitude.) The need for a standard time was felt most particularly in the United States and Canada, where long-distance railway routes passed through places that differed by several hours in local time. Sir Sandford Fleming, a Canadian railway planner and engineer, outlined a plan for worldwide standard time in the late 1870s. Following this initiative, in 1884 delegates from 27 countries met in Washington, D.C., and agreed on a system basically the same as that now in use.



The present system employs 24 standard meridians of longitude spaced 15° apart, starting with the prime meridian through Greenwich, Eng. These meridians are theoretically the centres of 24 standard time zones (*see* Figure), although in practice the zones often are subdivided or altered in shape for the convenience of inhabitants; a notable example is the eastward extension of the International Date Line around the Pacific island country of Kiribati. Time is the same throughout each zone and differs from the international basis of legal and scientific time, Coordinated Universal Time, by an integral number of hours; minutes and seconds are the same. In a few regions, however, the legal time kept is not that of one of the 24 standard time zones because half-hour or quarter-hour differences are in effect there. In addition, daylight saving time (*q.v.*) is a common system by which time is advanced one hour from standard, in most cases for part of the year and usually in summer.

Standardbred mare and foal
Grant Heilman

**Standardbred,** breed of horse developed in the United States in the 19th century and used primarily for harness racing. The foundation sire of this breed was the English Thoroughbred Messenger (1780–1808), imported to the United States in 1788. His progeny, of great trotting capacity, were bred with other breeds and types, especially the Morgan, to produce speedy trotters and pacers. Messenger's great-grandson Hambletonian (1849–76) was an outstanding Standardbred sire whose descendants now dominate the breed.

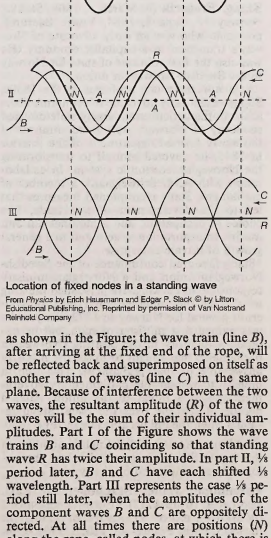
Possessed of considerable stamina and endurance, Standardbreds closely resemble Thoroughbreds but are usually smaller and have longer and lower bodies, flatter ribs, and heavier bones. Height and weight vary considerably but average 15 to 16 hands (60 to 64 inches [152 to 163 cm]) and 900 to 1,000 pounds (410 to 450 kg). Bay is the most common colour for Standardbreds, but brown, black, chestnut, or gray also are found. The name originated in the early development of the breed, when horses were registered in the official studbook (Wallace's *American Trotting Register,* first published in 1871) if they could meet certain standards of speed, such as trotting a mile in 2½ minutes. The official history

Time is calculated from the meridian of Greenwich, England. The middle of the zero time zone passes through Greenwich with its east and west limits 7°30′ on each side. Each 15° zone east and west of the initial zone represents one hour of time. The number of hours (h) and minutes (m) that must be added to or subtracted from local time to give Greenwich time is indicated on the map for each zone and for area units that have a different time from the zone in which they are located.

Based on data from the U.S. Defense Mapping Agency Hydrographic/Topographic Center

of the breed dates from the establishment in 1871 of the National Association of Trotting Horse Breeders, which was succeeded by the American Trotting Register Association, now the U.S. Trotting Association.

**standardization,** in industry, the development and application of standards that permit large production runs of component parts that can be readily fitted to other parts without adjustment. Standardization allows for clear communication between industry and its suppliers, relatively low cost, and manufacture on the basis of interchangeable parts.



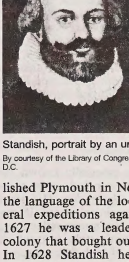
A standard is that which has been selected as a model to which objects or actions may be compared. Standards for industry may be devices and instruments used to regulate colour, size, weight, and other product attributes, or they may be physical models. Standards may also be written mathematical or symbolical descriptions, drawings, or formulas setting forth the important features of objects to be produced or actions to be performed. Standards that are applied in an industrial setting include engineering standards, such as properties of materials, fits and tolerances, terminology, and drafting practices; and product standards intended to describe attributes and ingredients of manufactured items and embodied in drawings, formulas, materials lists, descriptions, or models.

Certain fundamental standards among firms are required to prevent conflict and duplication of effort. The standards activities of governmental departments, trade associations, and technical associations serve in part to meet national standards needs, but one specialized standardizing organization is needed to coordinate the diverse standardization activities of many different types of organizations and promote general acceptance of basic standards. In the United States the American National Standards Institute (ANSI) performs this function. It does not initiate or write standards but provides the means by which national engineering, safety, and industrial standards can be coordinated. All interested groups may participate in the decision-making process, and compliance with the national standard is voluntary. The international body that serves this function is the International Organization for Standardization (ISO). Developing an international standard presents the greater challenge because of the breadth of representation and the diversity of needs and viewpoints that must be reconciled.

**standing to sue,** in law, the requirement that a person who brings a suit be a proper party to request adjudication of the issue involved. The test traditionally applied was whether the party had a personal stake in the outcome of the controversy presented and whether the dispute touched upon the legal relations of the parties having adverse legal interests.

The U.S. Supreme Court noted in *Flast* v. *Cohen* (1968) that "the issue of standing is related only to whether the dispute sought to be adjudicated will be presented in an adversary context and in a form historically viewed as capable of judicial resolution." Clearly, a plaintiff who claims physical injury or economic loss has standing. In the United States, until the 1960s, the courts took a relatively strict approach to standing. For instance, in *Frothingham* v. *Mellon* (1923) the Supreme Court held that a plaintiff who alleged that her tax liability would be increased as a result of the Maternity Act of 1921 lacked standing to challenge the act. During the 1960s the court, under the leadership of Chief Justice Earl Warren, was so lenient in recognizing standing that a federal trial court commented, in granting standing to a plaintiff challenging the secrecy of Central Intelligence Agency expenditures, that the concept of standing "has now been almost completely abandoned" by the Supreme Court. However, the court was not willing to abandon the concept completely. Reversing the trial court in the previously mentioned case, *United States* v. *Richardson* (1974), Chief Justice Warren E. Burger, writing for the majority, rejected Richardson's standing, commenting that Richardson was seeking "to employ a federal court as a forum in which to air his generalized grievances about the conduct of government."

**standing wave,** also called STATIONARY WAVE, combination of two waves moving in opposite directions, each having the same amplitude and frequency. The phenomenon is the result of interference—that is, when waves are superimposed, their energies are either added together or cancelled out. In the case of waves moving in the same direction, interference produces a traveling wave; for oppositely moving waves, interference produces an oscillating wave fixed in space. A vibrating rope tied at one end will produce a standing wave,



Location of fixed nodes in a standing wave

From *Physics* by Erich Hausmann and Edgar P. Slack © by Litton Educational Publishing, Inc. Reprinted by permission of Van Nostrand Reinhold Company

as shown in the Figure; the wave train (line *B*), after arriving at the fixed end of the rope, will be reflected back and superimposed on itself as another train of waves (line *C*) in the same plane. Because of interference between the two waves, the resultant amplitude (*R*) of the two waves will be the sum of their individual amplitudes. Part I of the Figure shows the wave trains *B* and *C* coinciding so that standing wave *R* has twice their amplitude. In part II, ⅛ period later, *B* and *C* have each shifted ⅛ wavelength. Part III represents the case ⅛ period still later, when the amplitudes of the component waves *B* and *C* are oppositely directed. At all times there are positions (*N*) along the rope, called nodes, at which there is no movement at all; there the two wave trains are always in opposition. On either side of a node is a vibrating antinode (*A*). The antinodes alternate in the direction of displacement so that the rope at any instant resembles a graph of the mathematical function called the sine, as represented by line *R*. Both longitudinal (*e.g.,* sound) waves and transverse (*e.g.,* water) waves can form standing waves.

**Standish, Myles,** Myles also spelled MILES (b. *c.* 1584, Lancashire, Eng.—d. Oct. 3, 1656, Duxbury, Mass.), British-American colonist and military leader of the Plymouth colony.

As a young man, Standish fought in the Netherlands, where he probably met the English religious exiles who later became known as the Pilgrims. He sailed with them to America on the "Mayflower" in 1620, serving as their military leader when they established Plymouth in New England. He learned the language of the local Indians and led several expeditions against hostile tribes. In 1627 he was a leader of the group in the colony that bought out the London investors. In 1628 Standish helped to break up the colony of Thomas Morton at nearby Merry Mount when it proved too unpuritanical to suit Plymouth. He also served as assistant governor and as treasurer of the Plymouth colony (1644–49). He moved to Duxbury in 1631.

Standish, portrait by an unknown artist

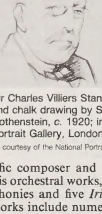
There is no historical evidence for the story that he asked John Alden to propose marriage for him to Priscilla Mullins, as told in Longfellow's poem *The Courtship of Miles Standish.*

**Stanfield, Robert L(orne)** (b. April 11, 1914, Truro, Nova Scotia, Can.—d. Dec. 16, 2003, Ottawa), Canadian politician who, as leader of the Progressive Conservative Association in Nova Scotia, served as that province's premier from 1956 to 1967.



After graduating in 1939 from Harvard University Law School, Stanfield was called to the bar in 1940. From 1939 to 1945 he served on the Halifax staff of the Wartime Prices and Trade Board. In 1947 he became president of the provincial Progressive Conservative Association, a party that held no seats in the local legislature. The following year he became provincial party leader, and in 1949 he was elected to the legislature. He led his party to victory in 1956, ending 23 years of uninterrupted Liberal rule. Stanfield took up the posts of premier, provincial treasurer, and minister of education. After resigning in 1967, he served as member of parliament for Halifax, Nova Scotia (1968–79). Until 1976 he led the federal Conservative party in the House of Commons and as its leader continuously attacked Prime Minister Pierre Trudeau's economic policies.

Known as the best prime minister Canada never had, Stanfield sought the office in 1968, 1972, and 1974 but was defeated by Trudeau in each election. Stanfield subsequently served as chairman of the Institute for Research on Public Policy.

**Stanford, Sir Charles Villiers** (b. Sept. 30, 1852, Dublin, Ire.—d. March 29, 1924, London, Eng.), Anglo-Irish composer, conductor, and teacher who greatly influenced the next generation of British composers; Ralph Vaughan Williams, Sir Arthur Bliss, and Gustav Holst were among his pupils.

Stanford studied at Trinity College, Dublin, and Queen's College, Cambridge, and between 1874 and 1877 with Karl Reinecke in Leipzig and Friedrich Kiel in Berlin. He became professor of composition at the Royal College of Music in London in 1883 and professor of mu-

sic at Cambridge in 1887. He also conducted the London Bach Choir (1885–1902) and the Leeds Triennial Festival orchestra (1901–10). He was knighted in 1901. Stanford was a pro-

Sir Charles Villiers Stanford, pencil and chalk drawing by Sir William Rothenstein, *c.* 1920; in the National Portrait Gallery, London

lific composer and was especially known for his orchestral works, which include seven symphonies and five *Irish Rhapsodies.* His other works include numerous choral pieces, 10 operas, and many songs. His music reflects the late 19th-century Romantic style, into which he introduced elements of Irish folk song.

**Stanford, Leland,** in full AMASA LELAND STANFORD (b. March 9, 1824, Watervliet, N.Y., U.S.—d. June 21, 1893, Palo Alto, Calif.), American senator from California and one of the builders of the first U.S. transcontinental railroad.

Stanford practiced law in Port Washington, Wis., from 1848 to 1852, before moving to Sacramento, Calif., where he achieved much success in retailing mining supplies and general merchandise. He also became active in local politics. A Republican, he served as governor of California from 1861 to 1863.

Leland Stanford

Stanford invested heavily in the plan to build a transcontinental railroad, and, when the Central Pacific Railroad was organized in 1861, he became its president (1861–93). He was instrumental in the success of the Central Pacific, which was built eastward to join with the Union Pacific at Promontory, Utah, in 1869. He also played a major role in railroad development throughout California and the Southwest. From 1885 to 1893 he served in the U.S. Senate. Stanford and his wife, Jane, founded Stanford University in 1885.

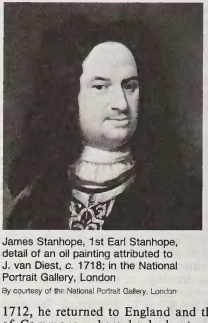
**Stanford Linear Accelerator Center:** *see* SLAC.

**Stanford University,** official name LELAND STANFORD JUNIOR UNIVERSITY, private coeducational institution of higher learning at Stanford, Calif., U.S. The university was founded in 1885 and opened in 1891 by railroad magnate Leland Stanford and his wife, Jane (*née* Lathrop), and was dedicated to their deceased only child, Leland, Jr. The doors were opened in 1891 to 559 students. The university campus consists largely of Stanford's former Palo Alto farm. The buildings, conceived by Frederick Law Olmsted, are of soft buff sandstone in a style similar to the old California mission architecture, being long and low with wide colonnades, open arches, and red-tiled roofs.

Stanford maintains branch campuses in France, Italy, Germany, Austria, and England. About half of its undergraduates study overseas at them for six-month periods. Advanced-study centres are maintained in Japan, Taiwan, and several other countries. The departments of the university are organized into schools of law, medicine, education, engineering, business, earth sciences, and humanities and sciences.

In 1921 the Food Research Institute of Stanford University was organized. The Hoover Institution on War, Revolution, and Peace, founded by Stanford alumnus Herbert Hoover during World War I, contains more than 1,000,000 printed and manuscript items dealing with 20th-century international relations. The Stanford Linear Accelerator Center (SLAC) was established in 1961 and has become a major centre for research in particle physics. The Stanford Medical Center, completed on the campus in 1959, now has more than 550 beds. The Hopkins Marine Station is maintained by the university at Pacific Grove on the Bay of Monterey.

**Stang, Frederik** (b. March 4, 1808, Stokke, Norway—d. June 8, 1884, Vestre Baerum), politician who was an early advocate of Norway's transition to a capitalist economy. He was also the first minister of state for Norway in the Swedish-Norwegian union.



As a university law professor in the 1830s, Stang was an early advocate of economic liberalism in the agricultural, largely state-directed economy of Norway. Appointed minister of the newly formed department of the interior in 1845, he devoted himself to transforming the Norwegian economic system. In collaboration with A.M. Schweigaard, a member of parliament, Stang championed measures that led to the development of free trade, free choice of occupation, and a national rail and marine transportation system and to a general growth of private enterprise.

Stang favoured continuance of the Swedish-Norwegian union and a Norwegian ministry responsible to the king. He persuaded the king to abolish the much-resented post of governor-general for Norway in 1872, the year he was named first minister of state, but he opposed a majority in the Storting (Norwegian parliament) that sought to make the ministry answerable to that parliament. This step, a prelude to responsible parliamentary government, posed a threat to the union. After a decade of struggle over the issue, Stang resigned when the bill became law in June 1880.

**Stanhope,** EARLS, titled English nobility, in the family Stanhope, grouped below chronologically and indicated by the symbol •.

**• Stanhope, James Stanhope, 1st Earl,** also called (from 1717) VISCOUNT STANHOPE OF MAHON, BARON STANHOPE OF ELVASTON (b. 1673, Paris, France—d. Feb. 5, 1721, London, Eng.), British soldier and statesman, the dominant minister during the first half (1714–21) of the reign of King George I. His policy of alliance with France secured the peace and minimized foreign support for the Jacobites, who sought to restore the Stuart monarchy in England.

The grandson of the 1st Earl of Chesterfield and the son of a British diplomat, Stanhope began a brilliant military career in 1691. In 1708, during the War of the Spanish Succession against France (1701–14), he became commander in chief of the English army in Spain and captured Minorca, but French forces defeated and captured him at Brihuega in December 1710. After his release in August

1712, he returned to England and the House of Commons, where he had sat as a Whig since 1701 and had played a major role in the attack against Henry Sacheverell in 1710.

When the Whigs came to power upon the accession of King George I, Stanhope was appointed secretary of state for the south. Although he shared with Robert Walpole the leadership of the House of Commons, it was in foreign policy that Stanhope revealed his genius. He negotiated the Triple Alliance between England, France, and Holland in 1717, and in the following year he brought Austria into the pact. He then used this quadruple alliance to enforce upon Spain a settlement of its differences with Austria. Stanhope's alliance with France thus made Britain for 15 years the diplomatic arbiter of Europe. Turning to northern Europe, Stanhope resolved England's conflicts with Sweden and thereby assured his country's continued access to the invaluable Swedish naval stores. He was a consummate practitioner of summit diplomacy.

In 1716–17 Walpole and his colleague Viscount Charles Townshend left the government in protest over Stanhope's policy of involvement in European affairs. Stanhope then became first lord of the treasury (1717–18) as well as secretary of state. At this time he distinguished himself by his policy on religious toleration toward Protestant dissenters and Roman Catholics. He received a viscountcy in 1717 and an earldom in 1718. Two years later the South Sea Company scandal, a financially disastrous speculation involving government officials, discredited his ministry without implicating him in any wrongdoing.

**• Stanhope, Charles Stanhope, 3rd Earl,** VISCOUNT STANHOPE OF MAHON, BARON STANHOPE OF ELVASTON (b. Aug. 3, 1753, London, Eng.—d. Dec. 15, 1816, Chevening, Kent), radical English politician and noted experimental scientist, a brilliant eccentric in both capacities.

The second but eldest surviving son of Philip, 2nd Earl Stanhope, he was styled Viscount, or Lord, Mahon from 1763 to 1786. He was educated at Eton and was a member of the House of Commons from 1780 until his accession to the peerage in 1786. He became chairman of the Revolution Society (founded 1788), which urged the democratization of Parliament. Calling himself Citizen Stanhope, he sympathized with the French republicans and opposed Great Britain's war with Revolutionary France. Later, he attacked the suspension (1794) of the Habeas Corpus Act, Anglo-Irish parliamentary unification (1800), and the slave trade in British overseas possessions.

An early experimenter with electricity, Stan-

hope invented two calculating machines; a kind of printing press and a microscope lens, both of which bear his name; a stereotyping machine; a steam carriage; a variety of cement much more durable than ordinary mortar; and an artificial slate, or tile. He projected a canal between the Bristol Channel and his estate at Holsworthy, Devon, and experimented with methods of raising and lowering canal barges. His writings include *Considerations on the Means of Preventing Fraudulent Practices on the Gold Coin* (1775), *Principles of Electricity* (1779), *A Letter to Burke, Containing a Short Answer to His Late Speech on the French Revolution* (1790), and pamphlets supporting Charles James Fox's libel bill (1792) and opposing the union with Ireland (1800).

Charles Stanhope, 3rd Earl Stanhope, chalk drawing by O. Humphry, 1796; in the National Portrait Gallery, London

His eldest daughter, Lady Hester Stanhope, was a traveler and an eccentric who became the de facto ruler of a mountain community in western Syria (modern Lebanon).

**• Stanhope, Philip Henry Stanhope, 5th Earl,** VISCOUNT STANHOPE OF MAHON, BARON STANHOPE OF ELVASTON (b. Jan. 30, 1805, Walmer, Kent, Eng.—d. Dec. 24, 1875, Bournemouth, Hampshire), English politician and historian who was chiefly responsible for the founding of Britain's National Portrait Gallery.

Stanhope studied at Christ Church, Oxford, and entered Parliament in 1830. Although he made no special mark in politics, he was chiefly responsible for passage of the Literary Copyright Act of 1842, which, in part, provided that books be protected by copyright for the life of the author plus seven years. He was a trustee of the British Museum and in 1856 proposed the foundation of a National Portrait Gallery; its creation was brought about by his executors. Stanhope was president of the Society of Antiquaries from 1846, and the establishment of the historical manuscripts commission in 1869 was largely the result of his efforts. His published works include *History of the War of the Succession in Spain* (1832), *History of England from the Peace of Utrecht to the Peace of Versailles* (1836–54), and *Life of William Pitt* (1861–62).

**Stanhope, Philip Dormer:** *see* Chesterfield, Philip Dormer Stanhope, 4th Earl of.

**Stanhope, William:** *see* Harrington, William Stanhope, 1st Earl of.

**Stanislaus** OF KRAKÓW, SAINT, also called SAINT STANISLAUS OF SZCZEPANOW, Stanislaus also spelled STANISLAS, Polish ŚWIĘTY STANISŁAW Z KRAKOWA, OR ZE SZCZEPANOWA (b. *c.* 1030, Szczepanów, Pol.—d. April 11, 1079, Kraków; canonized 1253; feast day April 11, feast day in Kraków May 7), patron saint of Poland, the first Pole to be canonized.

Of noble birth, Stanislaus studied at Gniezno, Pol., and probably at Paris. While serving as canon and preacher at Kraków (Cracow), he was elected—after Pope Alexander II nominated him—bishop of Kraków in 1072. During that time Poland was in a state of political unrest, with active opposition to King Bolesław II the Bold. Stanislaus joined the opposition under the leadership of Władysław Herman, the king's brother, and excommunicated Bolesław.

In 1079 Stanislaus was accused of treason. The royal court found him guilty and sentenced him to dismemberment. When the knights who had been ordered to carry out the execution hesitated, Bolesław himself killed Stanislaus in St. Michael Chapel, after which the king fled to Hungary. This act has remained a matter of controversy between those Polish historians who believe Stanislaus was part of a Bohemian-German plot designed to remove Bolesław and replace him with Władysław, and those who describe the execution as a contemptible act of revenge against a saintly bishop who had excommunicated a cruel, licentious king. In any case, miracles and legends spread the cult of the martyred bishop to Lithuania, Belorussia, and Ukraine, and Stanislaus became the patron saint of his native Poland.

**Stanislavsky, Konstantin Sergeyevich,** Stanislavsky also spelled STANISLAVSKI, original name KONSTANTIN SERGEYEVICH ALEKSEYEV (b. Jan. 5 [Jan. 17, New Style], 1863, Moscow, Russia—d. Aug. 7, 1938, Moscow), Russian actor, director, and producer, founder of the Moscow Art Theatre (opened 1898). He is best known for developing the system or theory of acting called the Stanislavsky system, or Stanislavsky method (*q.v.*).

*Early influences.* Stanislavsky's father was a manufacturer, and his mother was the daughter of a French actress. Stanislavsky first appeared on his parents' amateur stage at the age of 14 and subsequently joined the dramatic group that was organized by his family and called the Alekseyev Circle. Although initially an awkward performer, Stanislavsky obsessively worked on his shortcomings of voice, diction, and body movement. His thoroughness and his preoccupation with all aspects of a production came to distinguish him from other members of the Alekseyev Circle, and he gradually became its central figure. Stanislavsky also performed in other groups as theatre came to absorb his life. He adopted the pseudonym Stanislavsky in 1885, and in 1888 he married Maria Perevoshchikova, a schoolteacher, who became his devoted disciple and lifelong companion, as well as an outstanding actress under the name Lilina.

Stanislavsky regarded the theatre as an art of social significance. Theatre was a powerful influence on people, he believed, and the actor must serve as the people's educator. Stanislavsky concluded that only a permanent theatrical company could ensure a high level of acting skill. In 1888 he and others established the Society of Art and Literature with a permanent amateur company. Endowed with great talent, musicality, a striking appearance, a vivid imagination, and a subtle intuition, Stanislavsky began to develop the plasticity of his body and a greater range of voice. Praise came from famous foreign actors, and great Russian actresses invited him to perform with them. Thus encouraged, Stanislavsky staged his first independent production, Aleksey K. Tolstoy's *The Fruits of Enlightenment,* in 1891, a major Moscow theatrical event. Most significantly, it impressed a promising writer and director, Vladimir Nemirovich-Danchenko (1858–1943), whose later association with Stanislavsky was to have a paramount influence on the theatre.

Nemirovich-Danchenko followed Stanislavsky's activities until their historic meeting in 1897, when they outlined a plan for a people's theatre. It was to consist of the most talented amateurs of Stanislavsky's society and of the students of the Philharmonic Music and Drama School, which Nemirovich-Danchenko directed. As the Moscow Art Theatre, it became the arena for Stanislavsky's reforms. Nemirovich-Danchenko undertook responsibility for literary and administrative matters, while Stanislavsky was responsible for staging and production.

The Moscow Art Theatre opened on Oct. 14 (Oct. 26, New Style), 1898, with a performance of Aleksey K. Tolstoy's *Tsar Fyodor Ioannovich.* But Stanislavsky was disappointed in the acting that night. He found it to be merely imitative of the gestures, intonations, and conceptions of the director. To project important thoughts and to affect the spectators, he reflected, there must be living characters on stage, and the mere external behaviour of the actors is insufficient to create a character's unique inner world. To seek knowledge about human behaviour, Stanislavsky turned to science. He began experimenting in developing the first elements of what became known as the Stanislavsky method. He turned sharply from the purely external approach to the purely psychological. A play was discussed around the table for months. He became strict and uncompromising in educating actors. He insisted on the integrity and authenticity of performance on stage, repeating for hours during rehearsal his dreaded criticism, "I do not believe you."

Stanislavsky's successful experience with Anton Chekhov's *The Seagull* confirmed his developing convictions about the theatre. With difficulty Stanislavsky had obtained Chekhov's permission to restage *The Seagull* after its original production in St. Petersburg in 1896 had been a failure. Directed by Stanislavsky and Nemirovich-Danchenko in 1898, *The Seagull* became a triumph, heralding the birth of the Moscow Art Theatre as a new force in world theatre. Chekhov, who had resolved never to write another play after his initial failure, was acclaimed a great playwright, and he later wrote *The Three Sisters* (1901) and *The Cherry Orchard* (1903) specially for the Moscow Art Theatre.

Stanislavsky as Vershinin in Chekhov's *Three Sisters,* 1901

Staging Chekhov's play, Stanislavsky and Nemirovich-Danchenko discovered a new manner of performing: they emphasized the ensemble and the subordination of each individual actor to the whole, and they subordinated the director's and actors' interpretations to the dramatist's intent. Actors, Stanislavsky felt, had to have a common training and be capable of an intense inner identification with the characters that they played, while still remaining independent of the role in order to subordinate it to the needs of the play as a whole. Fighting against the artificial and highly stylized theatrical conventions of the late 19th century, Stanislavsky sought instead

the reproduction of authentic emotions at every performance.

In 1902 Stanislavsky successfully staged both Maksim Gorky's *The Petty Bourgeois* and *The Lower Depths*, codirecting the latter with Nemirovich-Danchenko. Among the numerous powerful roles performed by Stanislavsky were Astrov in *Uncle Vanya* in 1899 and Gayev in *The Cherry Orchard* in 1904, by Chekhov; Doctor Stockman in Henrik Ibsen's *An Enemy of the People* in 1900; and Satin in *The Lower Depths.* Both as an actor and as a director, Stanislavsky demonstrated a remarkable subtlety in rendering psychological patterns and an exceptional talent for satirical characterization. Commanding respect from followers and adversaries alike, he became a dominant influence on the Russian intellectuals of the time. He formed the First Studio in 1912, where his innovations were adopted by many young actors. In 1918 he undertook the guidance of the Bolshoi Opera Studio, which was later named for him. There he staged Peter Ilich Tchaikovsky's *Eugene Onegin* in 1922, which was acclaimed as a major reform in opera.

In 1922–24 the Moscow Art Theatre toured Europe and the United States with Stanislavsky as its administrator, director, and leading actor. A great interest was stirred in his system. During this period he wrote his autobiography, *My Life in Art.* Ever preoccupied in it with content and form, Stanislavsky acknowledged that the "theatre of representation," which he had disparaged, nonetheless produced brilliant actors. Recognizing that theatre was at its best when deep content harmonized with vivid theatrical form, Stanislavsky supervised the First Studio's production of William Shakespeare's *Twelfth Night* in 1917 and Nikolay Gogol's *The Government Inspector* in 1921, encouraging the actor Michael Chekhov in a brilliantly grotesque characterization. His staging of Aleksandr Ostrovsky's *An Ardent Heart* (1926) and of Pierre-Augustin Caron de Beaumarchais's *The Marriage of Figaro* (1927) demonstrated increasingly bold attempts at theatricality. His monumental *Armoured Train 14–69*, V.V. Ivanov's play about the Russian Revolution, was a milestone in Soviet theatre in 1927, and his *Dead Souls* was a brilliant incarnation of Gogol's masterpiece.
