The period of Isabella's personal rule (1843–68) was characterized by political unrest and a series of uprisings. Her government was dominated by military politicians, most notably Gen. Ramón María Narváez and the somewhat more liberal Gen. Leopoldo O'Donnell. Liberal opposition to the regime's authoritarianism became increasingly directed at the Queen. Scandalous reports on the private conduct of Isabella, who lived apart from her husband, Francisco de Asís de Borbón, as well as her arbitrary political interference, further damaged the monarchical cause. The abortive uprising of 1866, and the deaths of O'Donnell (1867) and Narváez (1868), weakened her position further. In the autumn of 1868 a successful revolution drove her into exile.

Isabella settled in Paris, where in 1870 she abdicated in favour of her eldest surviving son, the future Alfonso XII (1874–85). She returned to Spain for a time after Alfonso's accession but was unsuccessful in influencing political affairs.

Isabella FARNESE, Spanish ISABEL DE FARNESIO, original Italian ELISABETTA FARNESE (b. Oct. 25, 1692, Parma, Duchy of Parma—d. July 11, 1766, Aranjuez, Spain), queen consort of Philip V of Spain (reigned 1700–46), whose ambitions to secure Italian possessions for her children embroiled Spain in wars and intrigues for three decades. Her capability in choosing able and devoted ministers, however, brought about beneficial internal reforms and succeeded in improving Spain's economy.

Isabella was the daughter of Odoardo Farnese (d. 1693), the eldest son of Ranuccio II of Parma and Piacenza. She was chosen as the second wife of Philip and arrived in Spain in December 1714, whereupon she dismissed the resident royal favourite and quickly established over her weak husband an ascendancy that she continued to exercise until his death in 1746.

Since Philip's two sons by his first wife were in line to succeed him, the ambitious Isabella sought to secure lands in Italy for the children (four sons and three daughters) she bore the sovereign. This quest dominated her reign, and in the end Spanish imperialism in Italy achieved marked success. Isabella's eldest son, Charles (afterward Charles III of Spain), and his brother Philip both gained titles to Italian domains.

Isabella favoured ministers who could acquire the resources needed to advance her schemes, and the men she chose not only carried out her foreign policy but also undertook useful economic, administrative, and military improvements.

After Philip's death and the accession of her stepson Ferdinand VI (reigned 1746–59), Isabella ceased to exert any real influence and spent many of her later years away from court.

Isabella OF ANJOU: *see* Isabella I *under* Isabella (Jerusalem).

Isabella OF BAVARIA, Isabella also rendered ELIZABETH, French ISABEAU, or ÈLISABETH, DE BAVIÈRE (b. 1371—d. September 1435, Paris), queen consort of Charles VI of France, who frequently was regent because of her husband's periodic insanity. Her gravest political act was the signing of the Treaty of Troyes (May 21, 1420), which recognized King Henry V of England as heir to the French crown in place of her son Charles (afterward Charles VII), who was to be exiled from France.

The daughter of Stephen III, duke of Bavaria-Ingolstadt, she was married to Charles VI on July 17, 1385. Her husband's first severe attack of insanity (Aug. 5, 1392) caused her great distress; for years she sought remedies, both medical and supernatural. She bore

the King six children between 1393 and 1403, but, as his illness grew worse, his rebuffs (he occasionally did not recognize her) drove her into flagrant sexual misconduct. Her brother-in-law, Louis, duc d'Orléans, became her constant companion, though it has not been proved that he was her lover. After the murder of Orléans (1407) she relied on John the Fearless, duke of Burgundy, who rescued her from imprisonment by her son, the dauphin Charles (1417), and with her set up governments, at Chartres and then at Troyes, that rivalled the administration at Paris.

Capricious and politically unskilled, Isabella saw John the Fearless desert her with the intention of joining the dauphin Charles against the English, who were preparing to attack Paris. She died despised by both the French and the English.

Isabella OF FRANCE (b. 1292—d. Aug. 23, 1358), queen consort of Edward II of England, who played a principal part in the deposition of the King in 1327.

The daughter of Philip IV the Fair of France, Isabella was married to Edward on Jan. 25, 1308, at Boulogne. Isabella's first interventions in politics were conciliatory. During the height of the influence of the King's favourite Piers Gaveston and after Gaveston's murder in 1312, she attempted to promote peace between Edward and the barons. In the 1320s, however, Edward's new favourites, the Despensers, aroused her antagonism. Isabella sailed for France in 1325 to settle a long-standing dispute over Gascony. Joined there by her son, the future Edward III, she announced her refusal to return to England until the Despensers were removed from court. She became the mistress of Roger Mortimer of Wigmore and with Mortimer and other baronial exiles crossed to Essex in 1326 and routed the forces of Edward and the Despensers.

After the accession of Edward III (1327) Isabella and Mortimer enjoyed a brief period of influence until 1330 when the young king asserted his independence by the arrest and execution of Mortimer. Isabella was sent into retirement. In her old age she joined an order of nuns, the Poor Clares.

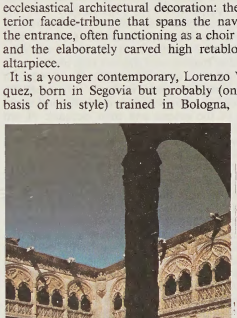
Isabella Clara Eugenia, ARCHDUCHESS OF AUSTRIA, German ERZHERZOGIN VON ÖSTERREICH (b. Aug. 12, 1566, Segovia, Spain—d. Dec. 1, 1633, Brussels), infanta of Spain who became the instrument of her father's claims to the thrones of England and France; as archduchess of Austria, she ruled the Spanish Netherlands with her husband, Archduke Albert, from 1598 to 1621.

The daughter of King Philip II of Spain and his third wife, Elizabeth of Valois, Isabella was unsuccessfully proposed by her father as the Catholic heir to the throne of England after the execution (1587) of Mary, Queen of Scots, and as a claimant through her mother to the throne of France after the murder of her uncle, the French king Henry III (1589). On her betrothal to Albert, archduke of Austria, she received as dowry joint sovereignty with Albert of the Low Countries, with the stipulation that, if they had no children, the throne would revert to the Spanish crown.

Because the seven northern provinces (the United Provinces) of the Low Countries were effectively independent, Isabella and Albert, on their marriage (April 1599), had control over only the 10 southern provinces of the Netherlands.

Their attempts, both diplomatic and military, to reunite the 17 provinces met with failure. After Albert's death (1621), sovereignty of the Spanish Netherlands reverted to Spain, and Isabella ruled as governor of the country for her nephew, King Philip IV of Spain, until her death.

Isabelle (French personal name): *see under* Isabella.



Isabelline, vigorous, inventive, and cosmopolitan architectural style created during the joint reign of Ferdinand of Aragon and Isabella of Castile, which in turn formed the basis for the Plateresque style. The Isabelline style is not a pure style in that but few of the buildings created during the decades that it encompasses (*c.* 1480–1510) represent a true architectural synthesis. Many of the characteristics of later Spanish (and Spanish colonial) architecture in the period of Spain's preeminence, following its successful explorations in the New World, can be traced to the innovations first seen in Isabelline buildings. One of the outstanding architects of the period, Juan Guas (died *c.* 1496), a Frenchman trained in Flanders, can be credited with introducing two of the most popular features of Spanish ecclesiastical architectural decoration: the interior facade-tribune that spans the nave at the entrance, often functioning as a choir loft, and the elaborately carved high retablo, or altarpiece.

It is a younger contemporary, Lorenzo Vázquez, born in Segovia but probably (on the basis of his style) trained in Bologna, who is credited with having introduced many of the Italian Renaissance ideas and ornamental motifs into Spanish architecture of the time. Major monuments in the Isabelline style include San Juan de los Reyes, in Toledo; Infantado Palace, in Guadalajara; San Gregorio, in Valladolid; Parral monastery and Santa Cruz, in Segovia; Medinaceli Palace, in Cogolludo; Calahorra Castle, in Granada; and Santa Engracia, in Zaragoza.

Isabey, Jean-Baptiste (b. April 11, 1767, Nancy, Fr.—d. April 18, 1855, Paris), gifted French painter of miniatures who enjoyed official favour from the time of Louis XVI until his death. His portrait "Napoleon at Malmaison" (Musée National de Versailles et des Trianons) is considered one of the best likenesses of the Emperor.

Isabey studied under, among others, the celebrated French Neoclassical painter Jacques-Louis David and received one of his first commissions from Marie-Antoinette, Louis XVI's consort. Patronized by Napoleon and Joséphine, he arranged the ceremonies of their coronation and prepared 32 drawings (Louvre, Paris), intended as an official commemoration of the event. He had an immense success at the Salon of 1820 with "Isabey's Boat," a drawing of himself and his family. During the reign of King Louis-Philippe (1830–48) he directed the artists' studio at the Sèvres porcelain factory. Less known than the portraits are Isabey's caricatures of many famous European politicians of the first half of the 19th century. Though most of these remained unpublished, they were known to many artists of the time. The genre painter Eugène Isabey (1804–86) was his son and student.

Isaeus (b. *c.* 420 BC—d. *c.* 350 BC), professional speech writer at Athens specializing in testamentary law, whose lucidity and logical method were a landmark in the development of forensic oratory.

Accounts of his life are scanty and contradictory. According to one ancient source Isaeus was a Chalcidian, according to another an Athenian. At any rate, he spent his professional life in Athens, where he appears to have taken no part in public life.

His profession was to write speeches for clients. He appears to have confined himself entirely to forensic speeches and almost entirely to those concerned with private suits. He had a minute knowledge of the laws of inheritance and expert skill in exploiting this knowledge to win a case. Every one of his 11 extant speeches deals, directly or indirectly, with a will.

Perhaps Isaeus' most significant contribution to forensic oratory lay in his method of argument; he appears to have been the first orator to build up his case point by point with logic and reason.

In the arrangement of his matter he showed himself remarkably independent of the rules for subdivision prescribed by rhetoricians. He

followed no single plan but varied the structure according to the needs of each particular speech. He showed particular skill in interweaving narrative and proof, thereby avoiding a long, unbroken relation of facts, which in testamentary cases might be complicated and difficult to follow. In general, Isaeus' style is lucid and businesslike, and the fact that it lacked literary charm probably added to its effectiveness.

Ísafjördhur, town, northwestern Iceland, on Vestfjarda Peninsula, overlooking Ísa Fjord (Ísafjördhur). It is a regional market centre and is the principal fishing port of northwestern Iceland. In addition to fishing and fish-processing industries, Ísafjördhur has a plant that manufactures windows. Boatbuilding and net making are also important industries. The town has a commercial airport. Pop. (1988 est.) 3,448.

Isahaya, city, Nagasaki *ken* (prefecture), Kyushu, Japan, at the neck of the three peninsulas of Shimabara, Nagasaki, and Nishisonoki. The city has been an important commercial centre for the surrounding agricultural area since the 13th century. It

Megane Bridge, Isahaya, Japan

became a castle town of the Isahaya family in the Tokugawa era (1603–1867). Since the late 19th century, coastal reclamation has increased the area used for the cultivation of high-quality rice. Isahaya is now a local administrative and cultural centre. Its economy is based on the food-processing industry and tourism to Unzen-Amakusa National Park and Tara-dake Prefectural Park. Pop. (1985) 88,376.

Isai (biblical figure): *see* Jesse.

Isaiah, Hebrew YESHA'YAHU ("God Is Salvation") (fl. 8th century BC, Jerusalem), prophet after whom the biblical Book of Isaiah is named (only some of the first 39 chapters are attributed to him), a significant contributor to Jewish and Christian traditions. His call to prophecy in about 742 BC coincided with the beginnings of the westward expansion of the Assyrian empire, which threatened Israel and which Isaiah proclaimed to be a warning from God to a godless people.

Isaiah's vision. The earliest recorded event in his life is his call to prophecy as now found in the sixth chapter of the Book of Isaiah; this occurred about 742 BC. The vision (probably in the Jerusalem Temple) that made him a prophet is described in a first-person narrative. According to this account he "saw" God and was overwhelmed by his contact with the divine glory and holiness. He became agonizingly aware of God's need for a messenger to the people of Israel, and, despite his own sense of inadequacy, he offered himself for God's service: "Here am I! Send me." He was thus commissioned to give voice to the divine word. It was no light undertaking; he was to condemn his own people and watch the nation crumble and perish. As he tells it, he was only too aware that, coming with such a message, he would experience bitter opposition, willful disbelief, and ridicule, to withstand which he would have to be inwardly fortified. All this came to him in the form of a vision and ended as a sudden, firm, and lifelong resolve.

Personal history. Presumably, Isaiah was already prepared to find meaning in the vision before the arrival of that decisive moment. Information about that period of his life is inconclusive, however, and consists mainly of inferences drawn from the biblical text.

At times the prophet's private life shows through the record as an aspect of his public message. Once when he went to confront a king, he took with him, to reenforce his prophetic word, a son with the symbolic name Shear-yashuv ("A Remnant Shall Return"). Again, to memorialize a message, he sired a son on the "prophetess" (his wife) and saddled the child with his message as a name: Maher-shalal-hash-baz ("Speed-spoil-hasten-plunder"), referring to the imminent spoliations by the Assyrians. If the sons had not been wanted as walking witnesses to the prophet's forebodings, posterity would not know of this wife or these sons.

Of Isaiah's parental home it is known only that his father's name was Amoz. Since he often spoke with kings, it is sometimes suggested that Isaiah was an aristocrat, possibly even of royal stock. The same reasoning, however, might apply to any number of prophets; from Nathan in David's time onward, prophets had dealings with kings and were, like Isaiah, well informed about public affairs. Moreover, Isaiah's sympathies were emphatically with the victimized poor, not with the courtiers and well-to-do. Also, it is sometimes argued that he was of a priestly family, but his knowledge of cultic matters and the fact that his commissioning seemingly occurred in the Temple in Jerusalem are slender evidence for his priestly descent as against his unreserved condemnation of the priests and their domain: "I am fed up with roasting rams and the grease of fattened beasts," he has God proclaim in a famous passage in the first chapter.

One could argue with equal force that Isaiah is descended from a family of prophets (though his father, the otherwise unknown Amoz, is not to be confused with the prophet Amos). He is thoroughly schooled in the traditional forms and language of prophetic speech. It is an educated speech—strong, vivid, the finest of classical Hebrew. Isaiah is particularly well acquainted with the prophetic tradition known to his slightly older contemporary, Amos. Four eminent Hebrew prophets addressed themselves to the people of Israel and Judah in the latter half of the 8th pre-Christian century: Amos, Hosea, Micah, and Isaiah. Strangely, no evidence suggests that any of these knew in person any of the others. Seemingly, they were apart and alone, yet Isaiah and Amos follow essentially the same lines of thought and differ significantly only in that Amos had addressed the northern kingdom (Israel) while Isaiah would emphatically include Judah and Jerusalem. The basic similarities in style and substance strongly suggest influence, direct or indirect, of the one on the other—and both invoke a recognizable Israelite tradition.

Isaiah's experience bridges the classes and occupations. Whatever his family circumstances, still in his youth he came to know the face of poverty—and the debauchery of the rich. He was at home with the unprotected, the widowed and orphaned; with the dispossessed, homeless, landless; and with the resourceless victims of the moneyed man's court. He was also acquainted with the rapacious authors of the prevailing misery: promulgators of discriminatory laws, venal judges, greedy landgrabbers, fancy women, thieving and carousing men of means, and irresponsible leaders, both civil and religious. In other words, he was intimately aware of the inequities and evils of human society—which may have been no worse in Israel in the 8th century before Christ than many critics believe they are almost everywhere in the 20th century after Christ.

Isaiah's theology. It is in his theology that Isaiah leans most heavily on Israelite tradition and shows an acquaintance with the thoughts of Amos. Isaiah shared with him and with the people the long-standing tradition that a special bond united Israel and its God. Since patriarchal times there had been an agreement, a solemn "Covenant" between them: Israel was to be God's people and he their God. He had chosen them and cared for them. His solicitude for their welfare had been clearly established. Such was the traditional message. Isaiah knew and honoured this ancient tradition; but, more significantly, he also shared the conviction of Amos that this arrangement was wholly conditional, contingent on the people's conduct. Behaviour such as Amos saw about him in Samaria and Isaiah saw about him in Jerusalem could cancel that Covenant—had in fact done so; that is the meaning of the vineyard parable in the fifth chapter of Isaiah. There God is compared to the careful and industrious cultivator of a vineyard—Israel—who, angry at the "wild grapes" of injustice and violence that is his crop, threatens to take away his care and protection.

As Isaiah knew him, Israel's God did not fit into the picture of utter injustice and consequent misery rampant in 8th-century Israel. To that people's God, as Isaiah knew him, persons mattered. God was, in fact, more concerned about people than about how his subjects performed for him their oft-rehearsed rituals. A literal interpretation of the 13th verse of chapter 29 and verses 10 to 15 of chapter 1 would suggest that God finds the motions of worship repugnant, and this may well have been Isaiah's meaning. He was overawed by the holiness—the otherness—of his God and must have thought that the customary gifts of meat, grain, and flattery were unseemly or, at the least, irrelevant. Although, like Amos, Isaiah appears most often to speak in absolutes, it is indeed possible to interpret these two passages less strictly (as some scholars do) and to say that he spoke in relative terms and that, in his scale of religious values, he merely ranked moral conduct above ritual conformity.

Isaiah's theology included the sometimes comforting view that God shapes history, traditionally entering the human scene to rescue his people from national peril. But, according to Isaiah's discomfiting surmise, God could intervene quite as properly to chastise his own aberrant nation, and he could employ a human agent (*e.g.*, a conquering foe) to that end.

More readily than Amos, perhaps because a decade had passed, Isaiah could identify the agent: Assyria. Isaiah's call to prophecy roughly coincides with the beginning—after a period of relative inactivity—of the westward expansion of the Assyrian empire under the victorious generalship of Tiglath-pileser III (reigned 745–727 BC). Current events did not escape the prophet's attention. Isaiah appears to have read the omens, as Amos had done; he could clearly see in Assyria the instrument of God's wrath: "Ah, Assyria, the rod of my anger, the staff of my fury! Against a godless nation I send him . . ." (10:5–6).

Prophetic mission. If, then, Isaiah was prepared by schooling in tradition and life for the vision that set him on his prophetic course, the preparation involved the mingling in his nature of such elements as those sketched above. In the year that King Uzziah died (742 BC), according to chapter 6, Isaiah was one of a crowd gathered for an occasion at the

Jerusalem Temple when of a sudden it occurred—and he became a prophet: "Go, and say to this people . . . ." The experiences that had gone into the shaping of his young life—his acquaintance with the arrogant rich and the suffering poor; his seeming knowledge of Amos and his heritage of tradition, ethnic and religious; his dismay at the threat of Assyria; above all, perhaps, a new and overwhelming sense of the majestic holiness of God—all merged, coalesced; and he knew that his God was sending him with words for his people and that, reluctant or not, he was compelled to go. From the start or retrospectively, he was aware of a frantic need—impossible to satisfy—to call his people back from the brink of peril. His vision was his moment of insight and resolve when, with complete clarity and instantaneously, he knew what he must do and say.

In its present sophisticated form the record of this experience is hardly contemporary with the event; he did not go home from the Temple and write down chapter 6. The record is the reflection not of a confident and eager youth but of a man buffeted by long experience, embittered and despairing. Three times in other chapters the prophet says of his people that they have "refused" to hear him; it was as though he, a messenger, had been ordered irrationally to "close their minds, plug their ears, veil their eyes," as he says in chapter 6 of his errand to those to whom he was sent. The message that he had to deliver was bad news—unwelcome tidings. And when he spoke of it, as repeatedly he did, he chose such unambiguous language and spoke with so much moral certainty that, as men normally do, his hearers tuned him out: he was foredoomed to speak unheard. A great deal of anguished living intervened between the vision itself and the writing of it. His words "How long, O Lord?" are an expression of utter weariness.

If chapter 6 marks the beginning of his career as prophet, the judgment oracle about the conquest of Jerusalem in chapter 22 probably brings his grim story to a close. It is at any rate the latest Isaianic product that can be dated with any degree of certainty. The last recorded words of Isaiah, in chapter 22, do nothing to relieve the sombre tone of his message, but they do shed further light on his mood and personality. After he had exclaimed in the vision in chapter 6, "How long, O Lord?" he learned to his dismay that even a last remaining 10th of the populace must in turn succumb; just so here the oracle ends with assurance of total disaster: the nation's guilt can be purged by nothing short of death—"Surely this iniquity will not be forgiven you till you die . . . ." Chapters 6 and 22 set the tone of his message and the hue of his mood, and from the first to the last the gloom has not lifted.

This 22nd chapter contains the most personally revealing of all Isaiah's words. Quite unexpectedly the Assyrians have lifted the siege and departed, and the amazed defenders of Jerusalem, flushed and jubilant, give way to celebration; Isaiah cannot share the holiday spirit since for him there has been only a postponement. Nothing has changed, and in his "valley of vision" he sees the day of rout and confusion that God yet has in store for Zion. And so it is that he lays bare his private grief:

> Look away from me, let me weep bitter tears;
> do not labor to comfort me for the destruction
> of the daughter of my people.

Message to Israel. The historical allusions in the scattered chapters of Isaiah's work agree with the title verse, according to which he was a contemporary of the Judaean kings Uzziah, Jotham, Ahaz, and Hezekiah. His prophetic call is precisely dated by him "in the year that King Uzziah died." At least a part of chapter 7 refers to the event of the year 734 when Ephraim and Syria jointly threatened King Ahaz of Judah. In 732 Tiglath-pileser conquered Damascus, the fall of which Isaiah had anticipated. In 722 Samaria, the capital of Ephraim, fell to King Sargon of Assyria, which event Isaiah had also foreseen. By the end of the century (701) Sennacherib had laid siege to Jerusalem—and had subsequently withdrawn. Chapters 1:4–8; 10:27–34; 28:14–22; 30:1–7; and 31:1–4 point to those difficult days when Jerusalem was beleaguered and King Hezekiah feverishly sought help from Egypt. Isaiah brought sparse comfort to his kings—even when the siege was lifted, as noted in the passage cited from chapter 22.

It would be wrong to suppose that Isaiah came to Israel simply to announce the approaching disaster. Painfully sensitive to the rottenness of his society, Isaiah foresaw its consequent collapse. But he also knew and offered an alternative to tragedy: his people's survival depended on their acceptance again of the ancient moral demands. By returning they might be saved. To obtain their return was his program. Or, differently and more properly stated, because he spoke for God and of God, his goal was to redirect his people into the ways acceptable to the God whom by their conduct they had alienated, and so to save them from catastrophe. He screamed dread warnings and pleaded for amendment. He gave way to despair only because his program had no success. His people seemed to him bent on self-destruction; that was the sickening course of their destiny as he saw it unfolding.

His impossible program comes through in the crisis of 701, during which he stands in violent opposition to the generals ready to go to Egypt for help against the Assyrians laying siege to Zion. Isaiah looked neither to allies nor to armaments for security. If it is God who decides the destiny of nations, security is for God to grant and for men to deserve. Isaiah held the daring view that the best defense is no defense—none other than the reconciling response to the moral demand. No men are secure when some are denied security. "This," he said, "is rest [*i.e.,* security]: give rest to the weary."

A case can be made for a theory that Isaiah drew back at the brink, incapable of conceiving a world wholly emptied of his people. What supports this view is a paradox: the observation that, irrationally, he entrusted his rejected message to his disciples and preserved it in a book for the instruction of the survivors of a people doomed to leave no survivors.

There is no consensus as concerns the precise limits of the words of the 8th-century Isaiah or the degree of consistency with which he sustained his tragic monotone. Certainly in his book as it has come down, his nature is elusive—both stern and tender. Magnificently hopeful passages constantly mingle with the prevailing atmosphere of doom. Probably his son's name, Shear-yashuv, means something like "a mere fragment will survive," but possibly it has a hopeful ring: no total disaster—some shall survive. Possibly the name Immanuel (God Is with Us), prophesied for the child who shall be a sign from God that Judah will not be overcome by Israel and Syria, expresses the confidence that God will never forsake his people. And possibly other such assurances are in fact words of Isaiah himself, compelled by his love to palliate the blow.

But there is an alternative solution. Although Isaiah was far from popular in his day, he does appear to have attracted some followers: "Seal the teaching among my disciples." These may have been the circle that kept alive his name and his words—in writing or learned "by heart"—the nucleus of what was to become, through a developing tradition, the biblical Book of Isaiah. And quite possibly successive generations of such Isaiah-men, piously keeping his words alive through radically changing times, added the sustaining messages of hope, well designed to seize the fancy of suffering humanity down the centuries.

Later interpretations of Isaiah's message. Ironically, perhaps, the Book of Isaiah is most widely known and loved just for those comforting words—which may not be his. A passage in the Babylonian Talmud (one of the two Talmud compilations, the other being Palestinian) can say that from beginning to end the book is consolation. The presence of Isaiah scrolls in the archives of the Qumrān (Dead Sea) community is not surprising. By that time (*c.* 1st century BC) it had become the fashion to assume that prophets spoke not to their times only but of things to come, and in times of stress men studied prophetic texts intent on learning when redemption was to come.

The Greek translation of Isaiah by Jewish scholars (the Septuagint), accomplished before the Christian Era, reflects a developing tradition of interpretation; it renders the Hebrew *'alma* ("young woman") as *parthenos* ("virgin") in the verse (7:14) about Immanuel, thus drawing Isaiah further into the messianic ring. Now it is a virgin who "shall conceive and bear a son." The promise of a more than ordinary king, a "messiah," was enticing. According to the New Testament accounts, when Jesus entered a synagogue in Nazareth and got up to read they handed him a scroll of Isaiah. He read the beginning of chapter 61: "The Spirit of the Lord God is upon me, because the Lord has anointed me . . ." and he said: "Today this scripture has been fulfilled."

The Gospels lean more heavily on the Book of Isaiah than on any other prophetic text. Beyond any denominational differences is the utopian dream, the "swords-into-plowshares" passage in Isaiah 2. These and many gleaming words from the expanded Book of Isaiah live on in the present day and today's culture. The word "prophetic" has now become a value-term, closely associated with the primacy of the moral demand and the bearing of justice on the stability of nations, quite in accord with the emphasis of the early Isaiah.

Isaiah, Ascension of, pseudepigraphal work surviving intact only in a 5th–7th-century-AD Ethiopic edition. Fragments exist in Greek, Coptic, Latin, and Old Slavonic. Three separate works comprise the total book, the final version by a Christian editor, which appeared in the 2nd century AD. The first section is entitled "The Martyrdom of Isaiah," a Midrash on the Manassch story in II Kings 21, possibly written originally in Hebrew or Aramaic in the early 1st century AD. It includes a legendary martyr motif and extensive passages on demonology. The second is the "Testament of

Hezekiah," a Christian work, dating from the late 1st century AD, that contains a concept of Antichrist as a spirit dwelling in the Roman emperor Nero (AD 54–68), whose persecution of Christians in 64–65 was thought to be the chaos preceding the advent of the messianic age. The third work is called the "Ascension (or Vision) of Isaiah," also written by a Christian at the beginning of the 2nd century. It contains a description of the seven tiers of heaven paralleling that found in the *Second Book of Enoch* and in the New Testament.

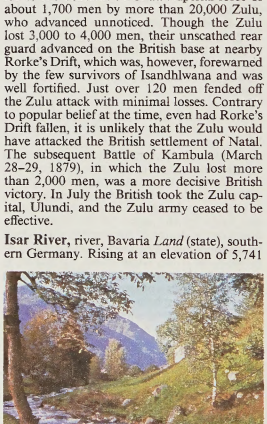
Both of the Christian sections are apocalypses, although they contain certain historical details on the state of the church at the end of the 1st century that coincide with descriptions given in the Second Letter of Peter, Second Letter of Paul to Timothy, and the letters of Clement of Rome. The martyr legend in the Jewish section has been linked with the tradition of royal persecutors associated with Antiochus IV Epiphanes of Syria (175–164/163 BC), although the details of Isaiah's martyrdom may represent the incorporation into Judaism of the myth of Adonis, the Near Eastern (later Greek) god. It has also been suggested that *The Martyrdom of Isaiah* was written by a member of the Qumrān sect of Essene Jews, who saw Isaiah as a type figure of their leader, the Teacher of Righteousness.

Isaiah, Book of, also spelled ISAIAS, one of the major prophetical writings of the Old Testament. The superscription identifies Isaiah as the son of Amoz and his book as "the vision of Isaiah . . . concerning Judah and Jerusalem in the days of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah." According to 6:1, Isaiah received his call "in the year that King Uzziah died" (742 BC), and his latest recorded activity is dated in 701 BC. Only chapters 1–39, however, can be assigned to this period. Chapters 40–66 are much later in origin and therefore known as Deutero-Isaiah (Second Isaiah). Sometimes a further distinction is made between Deutero-Isaiah (chapters 40–55) and Trito-Isaiah (chapters 56–66).

Chapters 1–39 consist of numerous sayings and reports of Isaiah along with several narratives about the prophet that are attributed to his disciples. The growth of the book (1–39) was a gradual process, its final form dating from perhaps as late as the 5th century BC, a date suggested by the arrangement of the materials and the late additions. In spite of the lengthy and complicated literary history of the book, however, Isaiah's message is clearly discernible. He was much influenced by the cult in Jerusalem, and the exalted view of Yahweh in the Zion traditions is reflected in his message. He was convinced that only an unshakable trust in Yahweh, rather than in political or military alliances, could protect Judah and Jerusalem from the advances of their enemies—specifically, in this period, the Assyrians. He called for a recognition of the sovereignty of Yahweh and passionately denounced anything that worked against or obscured Yahweh's purposes—from social injustices to meaningless cultic observances. Although Isaiah pronounced Yahweh's judgment upon Judah and Jerusalem for their unfaithfulness, he also announced a new future for those who relied on Yahweh.

Deutero-Isaiah (40–55), consisting of a collection of oracles, songs, and discourses, dates from the Babylonian Exile (6th century BC). The anonymous prophet is in exile and looks forward to the deliverance of his people. The destruction of Babylon is prophesied and the return of the exiles to their homeland is promised. The servant-of-Yahweh songs in Deutero-Isaiah (42:1–4; 49:1–6; 50:4–9; 52:13–53:12) have generated animated discussions among scholars, but the ideas reflected in the songs suggest that they were written under the influence of the ideology of the king—the anointed one who, through his righteous rule, had the power to effect his people's deliverance.

Trito-Isaiah (56–66), coming from a still later period, reflects a Palestinian point of view, with the latter chapters in particular addressed to the cultic concerns of the restored community. The diversity of materials in these chapters suggests multiple authorship. How the three "Isaiahs" came together is not known.



Īśānavarman (fl. AD 554), chief of the Maukhari family of northern India, originally a feudatory of the Gupta Empire, who by the middle of the 6th century had declared his independence from the Guptas and set himself up as a king in the Ganges Valley.

Little is known of Īśānavarman except that during the second half of the 6th century he and his successors were involved in continuous conflict with the kings of the later Gupta line; they seem to have ruled the greater portion of the modern state of Uttar Pradesh and to have had some control over Magadha (southern Bihār state). There is some evidence of Maukhari raids in the Deccan. Their capital was Kanyakubja (modern Kannauj), and they played an important role in the development of this city.

Īśānavarman's only notable successor was Grahavarman, who was defeated and killed by the Guptas soon after his accession and whose capital was occupied. His brother-in-law, Harṣa, however, drove out the Guptas around 606 AD and thus gained control of the Maukhari kingdom. After this, the Maukhari family disappeared into obscurity.

Isandhlwana and Rorke's Drift, Battles of (Jan. 22–23, 1879), the major battles of the Zulu War, in South Africa. At Isandhlwana, the British failure to defend their encampment led to the obliteration of an imperial force of about 1,700 men by more than 20,000 Zulu, who advanced unnoticed. Though the Zulu lost 3,000 to 4,000 men, their unscathed rear guard advanced on the British base at nearby Rorke's Drift, which was, however, forewarned by the few survivors of Isandhlwana and was well fortified. Just over 120 men fended off the Zulu attack with minimal losses. Contrary to popular belief at the time, even had Rorke's Drift fallen, it is unlikely that the Zulu would have attacked the British settlement of Natal. The subsequent Battle of Kambula (March 28–29, 1879), in which the Zulu lost more than 2,000 men, was a more decisive British victory. In July the British took the Zulu capital, Ulundi, and the Zulu army ceased to be effective.

Isar River, river, Bavaria *Land* (state), southern Germany. Rising at an elevation of 5,741 feet (1,750 m) in the Karwendelgebirge, just northeast of Innsbruck, Austria, the Isar runs west and then north crossing into Germany at Scharnitz Pass. The river there flows through a deep gorge that was used by the ancient Romans, who called it Porta Claudia. A rail line and road now thread the gorge. Turning east and north once again, the Isar emerges upon the Bavarian plain to flow northeast through Munich; it finally enters the Danube downstream from Regensburg. Much of the river, which is 183 miles (295 km) long, is swift and too shallow for navigation. Principal tributaries of the Isar are the Loisach, Würm, and Amper.

Isar River at its source in the Karwendelgebirge (mountains), Bavaria, Germany

Isauria, ancient inland district of south central Anatolia. Its inhabitants, a mountain people described by Greco-Roman authors as warlike and uncivilized, were conquered by the Roman general Servilius "Isauricus" early in the 1st century BC. Their country with its capital, Isaura Palaia, was joined with Cilicia by Pompey; and under the emperor Augustus (reigned 27 BC–AD 14) it became part of the Roman province of Galatia. Isauria was later prominent as the birthplace of the East Roman (Byzantine) emperor Zeno, whose reign (474–491) is sometimes known as the "Isaurian Ascendancy." The Byzantine emperor Leo III (reigned 717–741) was once called the Isaurian, but on the mistaken belief that he had been born in Isauria.

Ischia, Antonio Canova, marchese d' (sculptor): *see* Canova, Antonio.

Ischia, Island of, Italian ISOLA D'ISCHIA, Latin AENARIA, island at the northwest entrance to the Bay of Naples, opposite Capo (cape) Miseno, Napoli province, Campania region, southern Italy, just west-southwest of Naples. Oblong in shape, with a circumference of 21 mi (34 km) and an area of 18 sq mi (47 sq km), the island consists almost entirely of volcanic rock and rises to 2,585 ft (788 m) at Monte Epomeo, an extinct volcano. The date of the first eruption is estimated to have been about 2200 BC; an eruption of the 7th century BC, according to the Roman scholar Pliny the Elder, drove away the first Greek settlers, and another in 470 BC put a Syracusan garrison to flight. There were several eruptions in Roman times. The last on record occurred in 1301–02, when the population fled to Baia on the mainland and did not return for four years. There have been destructive earthquakes more recently, the last in 1883 when the entire town of Casamicciola was destroyed. The island was known to the Greeks as Pithecusa (probably meaning "island of monkeys") and to the Romans as Aenaria. From the Middle Ages it was subjected to frequent attacks and invasions, usually related to the struggles for supremacy on the mainland. Its volcanic soils are fertile, and the wine, called Epomeo, that is produced on Ischia is famous. Wheat, olive oil, and citrus fruits are also economically important. The clay of Ischia is believed to have been used by the ancient potteries of Cumae and Puteoli (Pozzuoli). Well known for its mild climate, picturesque scenery, and numerous thermal mineral springs, Ischia is much frequented as a health and vacation resort. The more important towns are in the north of the island: Ischia, the administrative centre and seat of a bishop, consisting of the fishing village of Ischia Ponte with a medieval castle, and Ischia Porto; Casamicciola Terme; Lacco Ameno; and Forio. There are regular shipping services from Naples and Pozzuoli and a car ferry from Pozzuoli. Pop. (1981 prelim.) mun., 15,914.

Ischl (Austria): *see* Bad Ischl.

Ise, formerly (until 1956) UJI-YAMADA, city, Mie Prefecture (*ken*), southern Honshu, Japan, on Ise Bay (Ise-wan) of the Pacific Ocean. The city contains several major Shintō shrines. Central among these is the Grand Shrine of

Entrance to the Outer Shrine of the Grand Shrine, Ise, Japan
FPG—EB Inc.

Ise (Ise-daijingū; more commonly called the Ise Shrine, or Ise-jingū), which consists of the Inner and Outer shrines, about 4 miles (6 km) apart. According to tradition, the Inner Shrine (Naikū) was built in 4 BC. It is dedicated to Amaterasu Ōmikami, the sun goddess and traditional progenitor of the Japanese Imperial family. The Sacred Mirror, one of the Three Sacred Treasures of Japan (Sanshu no Jingi), is preserved there. The Outer Shrine (Gekū), founded in the late 5th century, is dedicated to Toyuke (Toyouke) Ōkami, the god of food, clothing, and housing.

At both shrines the main building is a thatched hut built in ancient Japanese style with unpainted Japanese cypress (*hinoki*). From the 7th century to the early 17th century, the buildings were reconstructed every 20 years; since then they have been rebuilt every 21 years. Pilgrimages to the shrines are popular and supplement the city's tourism industry. Pop. (1985 prelim.) 105,455.

Ise-Shima National Park, Japanese ISE-SHIMA KOKURITSU KOEN, national park on the Shima Peninsula, central Honshu, Japan. Its two main cities are Ise (*q.v.*), famous for its Shintō shrines, and Toba, a seaport that guards the southern entrance to Ise Bay (Ise-wan). The bay has many islands and is renowned for its Mikimoto cultured-pearl industry. Pearl Island in Toba Harbour is the site where Mikimoto Kōkichi first succeeded in producing a cultured pearl at the beginning of the 20th century. The Toba area now produces the great majority of Japan's cultured pearls. Between Ise and Toba is Futamigaura beach and resort, famed for its two rocks Meotoiwa, or "Wedded Rocks," which one legend says sheltered the creators of Japan, Izanagi and Izanami.

Ise Shintō, also called WATARAI SHINTŌ, school of Shintō established by priests of the Watarai family who served at the Outer Shrine of the Ise Shrine (Ise-jingū). Ise Shintō establishes purity and honesty as the highest virtues, realizable through religious experience.

The school began in the Kamakura period (1192–1333) as an attempt to emancipate Shintō from the domination of Buddhist thought (for example, it reversed the Buddhist teaching of the period and declared that the Buddhas and *bodhisattvas* or Buddhas-to-be, were manifestations of Shintō *kami*). Later, Confucian elements were added. The theology of Ise Shintō was summarized in a five-volume apologia, the *Shintō gobusho,* which appeared in the 13th century.

Iselin, Columbus O'D(onnell) (b. Sept. 25, 1904, New Rochelle, N.Y., U.S.—d. Jan. 5, 1971, Vineyard Haven, Mass.), American oceanographer who, as director of the Woods Hole Oceanographic Institution (1940–50; 1956–57) in Massachusetts, expanded its facilities 10-fold and made it one of the largest research establishments of its kind in the world.

The scion of a New York banking family (his great-grandfather had helped found the Metropolitan Opera House and the Metropolitan Museum of Art), Iselin attended Harvard University (A.B., 1926; A.M., 1928). From 1926 on, he made a series of summer sea excursions toward Labrador and the Arctic with his own schooner and crew, collecting material and data for Harvard's Museum of Comparative Zoology. For Harvard he served as assistant curator of oceanography (1929–48) and research oceanographer of the Museum of Comparative Zoology. Concurrently, in 1932 he joined the newly established Woods Hole institution and, from 1936, taught oceanography at Harvard.

In 1940 he was named director of Woods Hole and, with wartime funds from the U.S. Navy, vastly increased the institution's budget and size. Wartime studies—factors in seaborne invasions, ocean currents, underwater explosions, and other matters—turned in 1946 to peacetime studies of fisheries, the dynamics of currents, the profiles of ocean floors, and other oceanographic concerns. Later, Iselin was professor of oceanography at the Massachusetts Institute of Technology (1959–70) and Harvard University (1960–70).

Isengrim, greedy and dull-witted wolf who is a prominent character in many medieval European beast epics. Often cast as a worldly and corrupt churchman, he appears first as a character in the Latin *Ecbasis captivi* (*c.* 940), in which the beasts are unnamed, and under his own name in *Ysengrimus* (1152). He is the main character in both epics. In the first he is represented as a monk to symbolize slothful and degenerate clergy of the period; in one episode of *Ysengrimus* he is tricked into becoming a monk by Reynard the Fox's report of the good food in monasteries. While Isengrim is being tonsured and ordained with blows and insults, Reynard goes to his house and possesses his wife. In beast epics written after *Ysengrimus,* Reynard the Fox supplants the wolf as the chief character. In these tales the clever animals have French traits of manner and speech, while the uncouth Isengrim is German.

isentropic chart, meteorological map that shows the moisture distribution and flow of air along a surface of constant entropy; which is also a surface of constant potential temperature (the temperature a parcel of dry air would have if brought from its initial state to a standard pressure [1,000 millibars] without exchange of heat with its environment). The isentropic surface varies in height from place to place over the Earth, the variation being indicated on the isentropic chart by isobars, lines showing the pressure at which the isentropic surface is found. The moisture distribution is shown by lines of constant mixing ratio (which expresses the mass of water vapour per unit mass of dry air) and of constant specific humidity (which expresses the mass of water vapour per unit mass of air). The flow of air at the isentropic surface is represented by streamlines, computed from the field of pressure and temperature.

The isentropic chart was first suggested by Sir Napier Shaw in Great Britain in 1933 and later, in 1936, by Carl-Gustav Rossby in the United States, when the network of weather stations taking upper-air observations became sufficient to make construction practical. Because air particles tend to flow along isentropic surfaces rather than at constant levels, the life history of air currents can be conveniently followed from day to day by means of isentropic charts. In addition, they give a fair picture of many of the physical processes that produce the weather.

Iseo, Lake, Italian LAGO D'ISEO, Latin LACUS SEBINUS, lake in Lombardia (Lombardy) region, northern Italy, between Bergamo and Brescia provinces, at the southern foot of the Alps at an altitude of 610 feet (186 m). The lake is 15.5 miles (25 km) long with a maximum width of 3 miles (5 km), a maximum depth of 820 feet (250 m), and a surface area of 24 square miles (62 square km). It is fed by the Oglio River, a tributary of the Po River, which enters the northern end near Lovere from the deep, wide Val (valley) Camonica and leaves the southern end at Sarnico. Monte Isola, in the centre of the lake, is Italy's largest lacustrine island (area 5 square miles [13 square km]); it rises to 1,965 feet (599 m) and is crowned by a chapel. The islet of San Paolo, south of Monte Isola, is occupied by the buildings of a small disused Franciscan convent, and that of Loreto, north, has a ruined chapel containing frescoes.

Olives, vines, and fruits are grown on the lake's shores. Iseo, at the southern end of the lake, is a summer resort.

Iser River (Europe): *see* Jizera River.

Isère, *département,* Rhône-Alpes region, southeastern France, created from the northern part of the historic province of Dauphiné. It occupies an area of 2,869 square miles (7,431 square km), extending from the Hautes-Alpes *département* in the southeast almost to Lyon,

Meotoiwa ("Wedded Rocks") at Futamigaura beach, Ise-Shima National Park, Japan
©Bob Davis—Aspect Picture Library, London

in neighbouring Rhône *département,* in the northwest. The Rhône River makes a great bend along the northern boundary, leaves it to traverse Lyon, and bends again to form the border and flows southward past Vienne. The mountain-bound capital, Grenoble, lies in south central Isère at the juncture of the Isère River and its tributary the Drac. The highest mountains are in the southeast, where peaks of the Massif de Loisans and the Massif du Pelvoux rise to more than 12,800 feet (3,900 m). The country northwest of the Isère and of the Pre-Alps embraces the forests and wastelands of Bas Dauphiné, extending to the fertile Rhône Valley.

Isère receives abundant rain and snow and has hot summers and cold winters. Fertile strips of farmland are found in the great Graisivaudan depression northeast of Grenoble and in other valleys. The mountains, forested to heights of more than 6,000 feet (1,800 m), are exploited for timber. The development of hydroelectric power has permitted the rapid growth of industry, particularly in the environs of Grenoble, the valley of the Drac River, and along the cluses (mountain gaps) that mark the mountains' faces toward the lowlands; these industries include electrometallurgical, electrochemical, paper, and food-processing enterprises. More than half of the population is occupied in the transportation sector.

Winter and summer sports and scenery draw great numbers of tourists to the mountains. The Grande Chartreuse monastery near Grenoble is not open to the public, but monks distilling the liqueur that bears its name may be seen in neighbouring Voiron. The historic château of Vizille (16th–17th century) is open to the public. Isère was the homeland of the novelist Stendhal and the composer Hector Berlioz. Divided into three *arrondissements*—Grenoble, La Tour-du-Pin, and Vienne—it is in the educational division of Grenoble. Pop. (1985 est.) 970,000.

Isère River, river, southwestern France, originating in the Savoy Alps on the Italian frontier and flowing 180 miles (290 km) to its confluence with the Rhône above Valence, draining a basin of approximately 4,600 square miles (12,000 square km). It rises in an amphitheatre of glaciers at 7,900 feet (2,400 m) near the Col (pass) de l'Iseran and rushes down past Val d'Isère into the artificial lake formed by Tignes Dam. It continues through the Tarentaise Valley past Bourg-Saint-Maurice, where it is dammed again. The river then zigzags across mountain ranges passing through Albertville, where it receives the Arly and turns southwest, flowing through the Combe de Savoie depression. The Arc River, which rises in the Mont Levanna glaciers to the southwest of the Isère on the Italian frontier and flows along the Maurienne Valley through Modane and Saint-Jean-de-Maurienne, joins it from the west, midway along the Combe de Savoie depression. The combined stream crosses into the Isère *département* and flows along the Vallée de Graisivaudan depression, passing through Grenoble. It makes a sharp northwestward bend before continuing its southwesterly course to the Rhône. The Isère is not navigable, but it is used in many places for hydroelectric power.

The Isère River at Grenoble, Fr.

Isergebirge (eastern Europe): *see* Jizera Mountains.

Iserlohn, city, North Rhine-Westphalia *Land* (state), western Germany, at the entrance to the hilly, wooded Sauerland region, southeast of Dortmund. First mentioned in the 11th century, Iserlohn was chartered in 1237 and was famous in the Middle Ages for armaments and light metalware. Although the city was burned down in 1712 and was the scene of a rebellion in 1849, the 11th-century St. Pankratius Church and the Oberste Stadtkirche (*c.* 1350) survive. Manufactures include machinery, chemicals, and rubber, leather, and metal products. Pop. (1989 est.) 93,337.

Isernia, capital of Isernia province (formed 1970), Molise region, south central Italy, between the Carpino and Sordo rivers, west of Campobasso. It originated as Aesernia, a town of the Samnites (an ancient Italic people), and later became a Roman colony. Isernia suffered severe damage in World War II but has been rebuilt. Notable landmarks include a Roman bridge, the cathedral (rebuilt after an earthquake in 1805), the Fraterna Fountain, and the civic museum. A commercial centre and transport junction, the town manufactures food products, textiles, and lace. Pop. (1984 est.) mun., 20,777.

Isesaki, city, Gumma Prefecture (*ken*), Honshu, Japan, on the Ryomo Line (railway) between Takasaki and Oyama. Isesaki prospered as a market town around a castle built in the early Tokugawa period (1603–1867) and was known for its silk manufacture, which employed a large number of women. After the Meiji Restoration (1868) the city rapidly became a centre of the silk-weaving industry; synthetic textiles were introduced in 1957. Other industrial products include machinery, transport equipment, and electrical appliances. Pop. (1985 prelim.) 112,458.

Iseult (medieval romance): *see* Tristan and Iseult.

Iseyin, town, Oyo State, southwestern Nigeria, at the intersection of roads from Oyo to Iwere and from Abeokuta to Okaka. In the early 1860s, the Yoruba Mission opened an Anglican church in the town. The Iseyin riots of 1916 protested the policy of Lord Lugard, the British governor-general, who made the traditional Yoruba *alafin* ("king") at Oyo (25 miles [40 km] east-southeast) a public ruler responsible to the British colonial authorities.

A traditional centre for cotton spinning and weaving, Iseyin is best known for its dyeing (using locally grown indigo as well as imported dyes) of heavy, imported cloth. The town's Yoruba inhabitants cultivate tobacco and teak, as well as cotton and vegetable dyes, for export; most of their cassava, yam, corn (maize), and peanut (groundnut) crops are consumed locally. Although Iseyin was formerly a centre for opencast mining and the making of pig iron, its blacksmiths now depend upon imported iron for their metalworking. The town is the headquarters of a local government council and has several Christian-sponsored secondary schools and a hospital. Pop. (1983 est.) 157,000.

Isfahan (Iran): *see* Eṣfahān.

Iṣfahānī, al-: *see* Abū al-Faraj al-Iṣbahānī.

İsfendiyar DYNASTY: *see* Candar dynasty.

Isham, John, Isham also spelled ISUM (b. *c.* 1680—d. June 1726), English composer and organist.

Educated at Merton College, Oxford, he went to London and became an assistant to the organist and composer William Croft, whom he succeeded as organist of St. Anne's, Soho (serving 1711–18). He accompanied Croft to Oxford in 1713 and there acquired a bachelor of music degree. In 1718 he became organist of St. Andrew's, Holborn (London), and, the following year, organist of St. Margaret's, Westminster, and held both posts until his death. During his career a few of his anthems and songs were published, including the popular "Bury delights my roving eye."

Isham, Ralph Heyward (b. July 2, 1890, New York City—d. June 13, 1955, New York City), American collector of rare manuscripts who discovered the long-missing manuscripts of James Boswell's *Life of Samuel Johnson* and other Boswell papers and letters.

The son of a wealthy railroad executive, Isham attended Cornell University (1908–09) and Yale University (1910–11), went big-game hunting in Mexico and the Malay Peninsula, and then wrote a series of newspaper articles. In London from 1916 to 1919 he served in the British Army, rising in the ranks to become a colonel (with the permanent rank of lieutenant colonel) and acquiring a somewhat British accent and manner. In civilian life thereafter he continued to affect the name of "Colonel Isham."

Although, back in New York City, he held some corporate offices at times, he became principally a book and manuscript collector, traveling frequently abroad. In 1927 he sought out some Boswell papers from Boswell's great-great-grandson, the 6th Baron Talbot de Malahide, at Malahide Castle, near Dublin. For more than 20 years Isham continued the reassembly of Boswell's papers, finding most of the papers at Malahide Castle or at Fettercairn House, Scotland; the manuscripts were uncovered in old boxes and bundles in attics and other half-hidden reaches. In 1948 Isham announced the completion of the collection (though a few more pieces were still to be discovered at Malahide, Fettercairn, and other sites after Isham's death).

Isham himself privately published *The Private Papers of James Boswell, from Malahide Castle, in the Collection of Lt.-Colonel Ralph Heyward Isham* (1928–34) and secured the commercial publication of *Boswell's Journal of a Tour to the Hebrides* (1936). In 1949 he sold the bulk of the collection to Yale University for $450,000, a great sum at the time; he sold his remaining Boswellian items to Yale in 1950. In January 1950 Professor Frederick A. Pottle of Yale began the massive task of sorting and cataloging the Boswell papers; the first volume, *London Journal, 1762–1763,* was published in November.

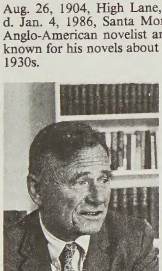
Ishbosheth, also spelled ISBOSETH, also called ISHBAAL, or ESHBAAL (fl. 11th century BC), in the Old Testament (II Samuel 2:8–4:12), fourth son of King Saul and the last representative of his family to be king over Israel (the northern kingdom, as opposed to the southern kingdom of Judah). His name was originally Ishbaal (Eshbaal; I Chronicles 8:33; 9:39), meaning "man of Baal." *Baal,* which could mean "master," was a title of dignity. Because the name came to be increasingly associated with Canaanite fertility gods, Hebrew editors later substituted *bosheth,* meaning "shame," for *baal.*

Ishbosheth was proclaimed king of Israel by Abner, Saul's cousin and commander in chief, who then became the real power behind the throne. The House of Judah, however, followed David, and war broke out between the two kingdoms. When Abner took Rizpah, one of Saul's concubines, Ishbosheth objected, because Abner's action was a symbolic

usurpation of power. Abner then defected to David, leaving the northern tribes without effective leadership, and Ishbosheth was soon murdered by two of his captains. David had the murderers put to death. Ishbosheth's stand against Abner, weak as it was, led to Abner's defection to David and then to Abner's death at the hand of one of his enemies, events that caused strife in David's divided kingdom for some time to come.

Although the Bible states that Ishbosheth was 40 years old when he became king and that his reign lasted two years, scholars have found that these figures are incorrect. More likely he was quite young and his reign equaled that of David at Hebron, about 7½ years.

Ishekiri (people): *see* Itsekiri.



Isherwood, B(enjamin) F(ranklin) (b. Oct. 6, 1822, New York City—d. June 19, 1915, New York City), U.S. naval engineer who, during the American Civil War, greatly augmented the U.S. Navy's steam-powered fleet.

The son of a physician, Isherwood attended Albany (N.Y.) Academy (1831–36) and then learned mechanics and engineering working successively on the Utica & Schenectady Railroad, on the Croton Aqueduct, on the Erie Railroad, at various U.S. Treasury lighthouses, and at the Novelty Iron Works (New York City). In 1844 he joined the Engineer Corps of the U.S. Navy, serving thereafter on several ships and land-based posts. After the American Civil War began, he became engineer in chief of the Navy and, in 1862, the first chief of its Bureau of Steam Engineering. At the beginning of the war the Navy had but 28 steam-powered ships and boats; by the end of the war it had about 600. Isherwood oversaw the design and construction of most of these ships and, in large part, personally designed the machinery and hulls of ships of the Wampanoag class, which, when built, were the world's fastest at 17¾ knots.

During these years Isherwood wrote two major treatises on steam power for ships: *Engineering Precedents for Steam Machinery,* 2 vol. (1859), and *Experimental Researches in Steam Engineering,* 2 vol. (1863–65). The latter became a standard text and was translated into a number of foreign languages.

Isherwood remained on active duty until 1884, when he retired as chief engineer, the highest permanent rank in the Engineer Corps. Through his later years of duty he presided over many experimental researches involving both U.S. Navy ships and bases and foreign navies. After his death, the United States Naval Academy, Annapolis, named Isherwood Hall in his honour.

Isherwood, Christopher, byname of CHRISTOPHER WILLIAM BRADSHAW-ISHERWOOD (b. Aug. 26, 1904, High Lane, Cheshire, Eng.—d. Jan. 4, 1986, Santa Monica, Calif., U.S.), Anglo-American novelist and playwright best known for his novels about Berlin in the early 1930s.

Isherwood, 1966
Camera Press—Pictorial Parade/EB Inc.

After working as a secretary and a private tutor, Isherwood gained a measure of coterie recognition with his first two novels, *All the Conspirators* (1928) and *The Memorial* (1932). During the 1930s he collaborated with his friend W.H. Auden on three verse dramas, including *The Ascent of F6* (1936). But it had been in 1929 that he found the theme that was to make him widely known. Between 1929 and 1933 he lived in Berlin, gaining an outsider's view of the simultaneous decay of the Weimar Republic and the rise of Nazism. His novels *Mr. Norris Changes Trains* (1935; *The Last of Mr. Norris*) and *Goodbye to Berlin* (1939), which were later published together as *The Berlin Stories*, established his reputation as an important writer and inspired the play *I Am a Camera* (1951; film 1955) and the musical *Cabaret* (1966; film 1972). These books are detached but humorous studies of dubious characters leading seedy expatriate lives in the German capital. In 1938 Isherwood published *Lions and Shadows,* an amusing and sensitive account of his early life and friendships while a student at the University of Cambridge.

The coming of World War II saw not merely a change of outlook in Isherwood's writing but also a permanent change of domicile. He immigrated to the United States in 1939 and settled in southern California, where he taught and wrote for Hollywood films. He was naturalized in 1946. It was also in 1939 that Isherwood turned to pacifism and the self-abnegation of Indian Vedānta, becoming a follower of Swami Prabhavananda. In the following decades, Isherwood produced several works on Vedānta and translations with Prabhavananda, including one of the *Bhagavadgītā.*

Isherwood's postwar novels continued to demonstrate his personal style of fictional autobiography. *A Single Man* (1964), a brief but highly regarded novel, presents a single day in the life of a lonely, middle-aged homosexual. His avowedly autobiographical works include a self-revealing memoir of his parents, *Kathleen and Frank* (1971); a retrospective biography of himself in the 1930s, *Christopher and His Kind* (1977); and a study of his relationship with Prabhavananda and Vedānta, *My Guru and His Disciple* (1980).

From 1953 on, Isherwood lived with a companion, Don Bachardy, a painter and portraitist, and both later became involved in homosexual-rights causes.

Ishibashi Tanzan (b. Sept. 25, 1884, Tokyo—d. April 25, 1973, Tokyo), politician, economist, and journalist who was prime minister of Japan from December 1956 to February 1957.

The son of a Nichiren-sect Buddhist priest, Ishibashi studied philosophy and graduated from Waseda University and then entered the field of journalism. He joined the *Tōyō keizai shimpō,* a weekly magazine on economics, and became known for his outspoken commentaries on economic affairs. In 1934 Ishibashi began publishing an English-language magazine, the *Oriental Economist,* and by 1939 had become president of the company. He served as an adviser to various government economic organs and in 1946 became minister of finance in the Cabinet of Prime Minister Yoshida Shigeru. From 1947 to 1951 he was ineligible for public office because of an Allied Occupation directive based on his journalistic activities during World War II.

Ishibashi became international trade and industry minister in the Cabinet of Hatoyama Ichirō in 1956 and won a narrow party election victory to become president of the majority Liberal-Democratic Party and prime minister in December of that year. He advocated "independent diplomacy" for Japan and sought trade relations with the People's Republic of China. At home he tried to stimulate production to achieve full employment in a welfare-state structure. But his Cabinet proved unstable amid intraparty factional dissensions, and serious illness caused him to resign in favour of his former rival Kishi Nobusuke in February 1957.

Despite ill health, he became president of the Japan–Soviet Friendship Association (1960) and the International Trade Promotion Association of Japan. He toured Russia and Europe (1964) to promote trade. In 1959 he visited China and returned there in 1963 as chairman of a Japanese trade fair. He advocated a multilateral peace treaty among Japan, the United States, China, and the Soviet Union, but his increasingly progressive policies had made him unpopular with the Liberal-Democratic Party, and he was defeated in an election bid for the House of Representatives (1963).

Ishida Baigan (b. Oct. 12, 1685, Tamba Province, Japan—d. Oct. 29, 1744, Kyōto), Japanese scholar who originated the moral-education movement called Shingaku ("Heart Learning"), which sought to popularize ethics among the common people.

The son of a farmer, Ishida began studying ethical doctrines in Kyōto as a young man while apprenticed to a merchant house. In 1729 he launched the Shingaku movement with lectures in his home. Confucianism supplied the fundamental ethics, but Ishida also incorporated Taoist, Buddhist, and Shintō elements. Explaining moral education in simple terms, Ishida used many parables in speaking directly to the people. He toured the country lecturing and in 1739 published *Tohi mondō* ("Question and Answer Between City and Countryside").

Some 400 disciples carried on the movement after Ishida's death, and Shingaku grew, partly with government encouragement, until it had 81 schools all over Japan. As the teaching became more dogmatic and stereotyped, however, it declined in popularity, and by the end of the Tokugawa period in 1867 the movement was in a final decline. Ishida's works include *Seika ron* (1774), an essay on family government espousing the Confucian view that a man who cannot govern his family cannot govern a nation. His disciples published *Ishida sensei goroku* ("The Sayings of Professor Ishida") in 1806.

Ishida Mitsunari (b. 1563, Ōmi Province, Japan—d. Nov. 6, 1600, Kyōto), Japanese warrior whose defeat in the famous Battle of Sekigahara (1600) allowed the Tokugawa family to become undisputed rulers of Japan.

Distinguished in the service of Toyotomi Hideyoshi, the warrior who reunified Japan after more than a century of civil war, Ishida was appointed head of a small fief and soon became one of the most prominent officials in the new government. After Hideyoshi's death in 1598, Ishida maintained his government position, but real power was exercised by a council of five regents, acting in the name of Hideyoshi's infant son Hideyori. Foremost among the regents was Tokugawa Ieyasu, and in 1599, when Ishida attempted to improve his own position by plotting to sow dissension among Japanese lords, several of Tokugawa's retainers resolved to execute him, but Tokugawa spared his life.

The following year, however, Ishida persuaded Uesugi Kagekatsu, one of the five regents, to marshal his forces against Tokugawa. While Tokugawa's troops were diverted fighting Uesugi in the north, Ishida rallied many of the other lords to his side and attacked the Tokugawa position from the rear. When several of Ishida's crucial allies failed to commit their full strength to the battle, Tokugawa quickly returned from the north to deal a decisive defeat to Ishida's troops at Sekigahara. Ishida's capture and execution marked the last

major opposition to Tokugawa rule, and in 1603 Tokugawa assumed the hereditary title of shogun, or military dictator, a post that was held by the Tokugawa family until 1868.

Ishii Kikujirō, SHISHAKU (Viscount) (b. March 10, 1866, Awa Province, Japan—d. May 25, 1945, Tokyo), Japanese statesman and diplomat who effectively championed a cautious expansion of Japan and cooperation with the West in the decades immediately before and after World War I.

Ishii Kikujirō
BBC Hulton Picture Library

In 1907 he was sent to investigate rising anti-Japanese sentiment in San Francisco and Vancouver, B.C. He helped negotiate the "gentlemen's agreement" between Japan and the United States, by which the Japanese government promised to withhold passports from labourers intending to migrate to the United States. In 1917 he negotiated the Lansing–Ishii Agreement, in which the United States rather ambiguously acknowledged Japan's special interests in China, while Japan affirmed its respect for the U.S. Open Door policy, which sought to preserve China's independence and territorial integrity and to allow all nations equal trading rights with China (at that time outside nations were trying to carve China into special spheres of influence). Ishii was killed in a U.S. bombing raid during World War II. His memoirs, *Gaikō yoroku,* have been partially translated into English as *Diplomatic Commentaries.*

Ishikari-gawa (Japanese: Ishikari River), river, in Hokkaido, Japan, rising near the centre of the Kitami-sammyaku (Kitami Mountains). It flows for 120 mi (200 km) southwest in a broad arc, draining the Kamikawa-bonchi (Kamikawa Basin), the Sorachi-gawa (Sorachi River) lowland, and the Ishikari-heiya (Ishikari Plain). The river empties into Ishikari-wan (Ishikari Bay) of the Sea of Japan. Its name is derived from the Ainu term *ishikaribetsu* ("greatly meandering river"), which describes the flow of its lower course. Inundations usually occur twice a year, after the thaw of spring and the rains of summer. An extensive flood control project, providing a dependable water supply for heavy industries, has induced serious water pollution in the river valley, which was sacred to the Ainu.

Ishikawa, prefecture (*ken*), western Honshu, Japan, facing the Sea of Japan. Its area of 1,620 sq mi (4,196 sq km) includes the western stretch of the Japanese Alps (southeast). Although snowfall is abundant, temperatures are not low. There is a predominance of rice paddies, and agriculture is characterized by comparatively large individual landholdings. Industry is centred on the prefectural capital, Kanazawa; products include machinery, silk and rayon, lacquer ware, and the traditional Kutani ware (porcelain). During the 1960s Ishikawa industrialized rapidly. Pop. (1990) 1,164,627.

Ishikawa Takuboku, pseudonym of ISHIKAWA HAJIME (b. Oct. 28, 1886, Hinoto, Iwate Prefecture, Japan—d. April 13, 1912, Tokyo), Japanese poet, a master of tanka, a traditional Japanese verse form, whose works enjoyed immediate popularity for their freshness and startling imagery.

Although Takuboku failed to complete his education, through reading he acquired surprising familiarity with both Japanese and Western literature. He published his first collection of poetry, *Akogare* ("Yearning"), in 1905. In 1908 he settled in Tokyo, where, after associating with poets of the romantic Myōjō group, he gradually shifted toward naturalism and eventually turned to politically oriented writing.

In 1910 his first important collection, *Ichiaku no suna* (*A Handful of Sand,* 1934), appeared. The 551 poems were written in the traditional tanka form but were expressed in vivid, untraditional language. The tanka acquired with Takuboku an intellectual, often cynical, content, though he is also noted for the deeply personal tone of his poetry.

In Tokyo he earned his living as a proofreader and poetry editor of the *Asahi* newspaper, enduring financial hardship occasioned partly by his own improvidence. His life during this period is unforgettably described in his diaries, particularly *Rōmaji nikki* (first published in full in 1954; partial trans., *The Romaji Diary,* 1956). In this diary, which he wrote in Roman letters so that his wife could not read it, Takuboku recorded with overpowering honesty his complex emotional and intellectual life.

He also published fiction; but, despite its flashes of brilliance, it fails to match his poetry. A collection of poems in nontraditional forms, *Yobuko no fue* (1912; "The Flute"), shows some influence of anarchistic and socialistic thought. He died of chronic illness complicated by malnutrition, leaving the posthumous collection *Kanashiki gangu* (1912; *A Sad Toy,* 1962).

Ishikawajima-Harima Heavy Industries Company, Ltd., Japanese ISHIKAWAJIMA–HARIMA JŪKŌGYŌ KK, major Japanese manufacturer of heavy machinery and oceangoing ships. Headquarters are in Tokyo.

The company was founded by the Mito branch of the Tokugawa family in 1853 as a shipbuilding yard in Edo (modern Tokyo); it was incorporated in 1889. The Harima Dock (later Harima Shipbuilding and Engineering) was established in 1907 in Kōbe. The merger of the two shipyards in 1960 resulted in the present company. Ishikawajima-Harima pioneered in the development of tankers to transport liquid natural gas, and the company remains in the forefront of ship design for the energy industry. One of its largest projects was the construction of a floating pulp factory, designed to process pulpwood.

Aggressive merger tactics have helped bring the company to its present status as one of Japan's major corporations, and acquisition of a number of varied companies in the 1960s has diversified the scope of the firm beyond shipbuilding. The company and its subsidiaries also produce marine and aircraft engines, chemical products, iron and steel manufacturing equipment, and material-handling machinery.

The company operates on a global scale, with offices throughout North and South America, Europe, and the Far East. Export revenues account for approximately half of the company's annual sales.

Ishim River, Russian REKA ISHIM, also spelled IŠIM, river in Kazakhstan and Tyumen and Omsk *oblasti* (provinces) of south-central Russia. A left-bank tributary of the Irtysh, it rises in the Niyaz Hills in the north of the Kazakh Uplands, flows west through Tselinograd, and then north through Petropavlovsk and the flat Ishim Steppe before entering the Irtysh at Ust-Ishim. Its total length is 1,522 mi (2,450 km), and it drains an area of 55,600 sq mi (144,000 sq km). Mainly snow fed, it overflows its banks in spring and becomes shallow in summer. There is some navigation. From the Sergeyevka Reservoir southwest of Petropavlovsk large water mains carry water 2,175 mi to farm settlements in Severo-Kazakhstan, Kokchetav, and Kustanay *oblasti.*

Ishimbay, also spelled IŠIMBAJ, or ISHIMBAI, city, Bashkiriya republic, western Russia. Ishimbay lies along the Belaya (White) River. It was the earliest centre of the oil industry in the Volga–Urals oil field, which was first exploited in 1932, and of the first oil refinery started in 1936. Deposits have been depleted, but the city now is part of the Sterlitamak–Ishimbay–Salavat petrochemical complex, one of the most important in Russia. Pop. (1991 est.) 71,000.

Ishinomaki, city, Miyagi Prefecture (*ken*), Honshu, Japan, on the estuary of the Kitakami-gawa (Kitakami River). The city was founded in the 4th century and was a prosperous rice-shipping port during the Tokugawa era (1603–1867). The opening of the Tohoku Line (railway) in the late 19th century caused a decline in river traffic, but the port revived as a major deep-sea fishing (skipper and tuna) centre. Oysters and seaweed are cultivated along the coast. Ishinomaki's industry produces processed marine products, whaling harpoons, and pulp. Fruit and vegetables are grown on reclaimed land in the city's western sector. Ishinomaki serves as a distribution centre for both the Pacific coast and inland areas of the Tohoku region (*chihō*). Efforts have been made to protect the city from tidal

Ishinomaki port at the mouth of the Kitakami River, Japan
Kokunai Jigyo Kouku

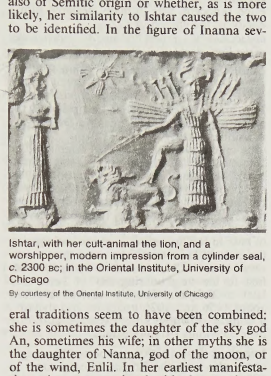
waves by building breakwaters and cement walls. Pop. (1983 est.) 123,034.

Ishkur, in Mesopotamian religion, Sumerian god of the rain and thunderstorms of spring. He was the city god of Bit Khakhuru (perhaps to be identified with modern al-Jidr) in the central grasslands region.

Ishkur closely resembled Ninhar (Ningubla) and as such was imagined in the form of a great bull and the son of Nanna (Akkadian Sin), the noon god. When he is portrayed in human shape, he often holds his symbol, the lightning fork. Ishkur's wife was the goddess Shala. In his role as god of rain and thunder, Ishkur corresponded to the other Sumerian deities Asalluhe and Ninurta. He was identified by the Akkadians with their god of thunderstorms, Adad (*q.v.*).

Ishmael ben Elisha (fl. 2nd century AD), Jewish tanna (Talmudic teacher) and sage who left an enduring imprint on Talmudic literature and on Judaism. He is generally referred to simply as Rabbi Ishmael.

As a young child, Ishmael, whose parentage is not known but who traced his lineage through a high priest, was taken captive and transported to Rome when the second Temple was destroyed at Jerusalem. He was ransomed from Rome by the older tanna and sage, Rabbi Joshua (Joshua ben Hananiah), on one of the latter's trips there. Ishmael was taught by Rabbi Joshua, who reputedly had seen in him, even as a captive, great promise as a teacher of the Jews. He lived and taught in southern Palestine. He was a close colleague of Rabbi Akiba (Akiba ben Joseph), who also had studied under Rabbi Joshua. Ishmael used set, rational rules and a simple, literal approach to Biblical exposition, and he occasionally upbraided Akiba for the latter's excessive interpretations of superficial Biblical words or phrases. As tanna he was held in affection for his human approach; one of his dicta was, "Receive all men joyfully." He is remembered for his flexible approach to Judaic practice, and he interpreted the Law so as to mitigate rather than introduce hardship.



Ishmael founded a Talmudic school, known simply as "the house of Ishmael," that is credited with the Midrash, or commentary, on the book of Exodus, the *Mekhilta* (Measure), and the *Sifre* (a form of commentary) on Numbers and part of the *Sifre* on Deuteronomy. Ishmael himself refined the exegetical principles known as the Seven Rules of Hillel and amplified them to thirteen in number.

The literature of the tanna period dealing with mysticism mentions Ishmael, and a number of mystical works are attributed to him, including several of the type known as *ma'ase bereshit* ("work of creation") and several in the genre of *ma'ase Merkava* ("work of the chariot," a reference to the divine chariot seen by the prophet in Ezekiel I). *Ma'ase bereshit* dealt with mystical cosmology and cosmogony, while *ma'ase Merkava* was the basic element of Jewish mysticism of the era. Ishmael is best remembered, however, for his work as tanna and exegete of the Torah.

Ishpeming, city, Marquette county, northwestern Upper Peninsula of Michigan, U.S., in the Marquette Iron Range, 12 mi (19 km) southwest of Marquette. Founded in 1844 as a centre for iron-mining activities, its name is Indian for "high grounds." Since the 1880s Ishpeming has been a popular ski resort. The mining of iron ore, the manufacture of explosives, lumbering, marble quarrying, and winter sports are economically important. The National Ski Hall of Fame and Museum is in Ishpeming, and an international ski tournament is held annually. Nearby are Van Riper State Park and Mud Lake, where Lewis H. Morgan collected data for his book, *The American Beaver and Its Works* (1868). Inc. village, 1871; city, 1873. Pop. (1990) 7,200.

Ishrāq, Shaykh al-: *see* Suhrawardī, as-.

Ishtar (Akkadian), Sumerian INANNA, in Mesopotamian religion, goddess of war and sexual love. Ishtar is the Akkadian counterpart of the West Semitic goddess Astarte. Inanna, an important goddess in the Sumerian pantheon, came to be identified with Ishtar, but it is uncertain whether Inanna is also of Semitic origin or whether, as is more likely, her similarity to Ishtar caused the two to be identified. In the figure of Inanna several traditions seem to have been combined: she is sometimes the daughter of the sky god An, sometimes his wife; in other myths she is the daughter of Nanna, god of the moon, or of the wind, Enlil. In her earliest manifestations she was associated with the storehouse and thus personified as the goddess of dates, wool, meat, and grain; the storehouse gates were her emblem. She was also the goddess of rain and thunderstorms—leading to her association with An, the sky god—and was often pictured with the lion, whose roar resembled thunder. The power attributed to her in war may have arisen from her connection with storms. Inanna was also a fertility figure, and, as goddess of the storehouse and the bride of the god Dumuzi-Amaushumgalana, who represented the growth and fecundity of the date palm, she was characterized as young, beautiful, and impulsive—never as helpmate or mother. She is sometimes referred to as the Lady of the Date Clusters.

Ishtar, with her cult-animal the lion, and a worshipper, modern impression from a cylinder seal, *c.* 2300 BC; in the Oriental Institute, University of Chicago

By courtesy of the Oriental Institute, University of Chicago

Ishtar's primary legacy from the Sumerian tradition is the role of fertility figure; she evolved, however, into a more complex character, surrounded in myth by death and disaster, a goddess of contradictory connotations and forces: fire and fire-quenching, rejoicing and tears, fair play and enmity. The Akkadian Ishtar is also, to a greater extent, an astral deity, associated with the planet Venus: with Shamash, sun god, and Sin, moon god, she forms a secondary astral triad. In this manifestation her symbol is a star with 6, 8, or 16 rays within a circle. As goddess of Venus, delighting in bodily love, Ishtar was the protectress of prostitutes and the patroness of the alehouse. Part of her cult worship probably included temple prostitution, and her cult centre, Erech, was a city filled with courtesans and harlots. Her popularity was universal in the ancient Middle East, and in many centres of worship she probably subsumed numerous local goddesses. In later myth she was known as Queen of the Universe, taking on the powers of An, Enlil, and Enki.

Ishtar Gate, enormous burnt-brick entryway located over the main thoroughfare in the ancient city of Babylon (now in Iraq). It was built in about 575 BC, the eighth fortified gate in the city. The Ishtar gate structure was more than 38 feet (12 metres) high and was decorated with glazed brick reliefs, in tiers, of dragons and young bulls. The gate itself was a double one, and on its south side was a vast antechamber. Through the gatehouse ran a stone- and brick-paved avenue, the so-called Processional Way, that has been traced over a length of more than half a mile.

The sides of the street were decorated with brick lions passant. It has been estimated that there were 120 lions along the street and 575 dragons and bulls, in 13 rows, on the gate. Not all of these reliefs were visible at the same time, however, for the level of the street was raised more than once; and originally even the lowest rows, which were irregularly laid, may have been treated as foundation deposits. The Iraq antiquities department reconstructed the thoroughfare at one of the higher levels.

Isidore OF KIEV (b. *c.* 1385, southern Greece—d. April 27, 1463, Rome), Greek Orthodox patriarch of Russia, Roman cardinal, Humanist, and theologian who strove for reunion of Greek and Latin Christendom but was forced into exile because of concerted opposition, particularly from the Byzantine and Russian Orthodox churches, and by the fall of Constantinople to the Ottoman Turks in 1453.

Abbot of St. Demetrius monastery in Constantinople and recognized for his cultured rhetoric, Isidore was sent abroad as envoy of the Byzantine emperor John VIII Palaeologus to arrange for a council to unite the Eastern and Western churches. Unsuccessful, he returned to Constantinople and in 1436 was named patriarch of Kiev and of all Russia; his mission was to convince the Russian grandduke Vasily II to participate in the movement for reunion set by Pope Eugenius IV as the agenda for the general Council of Ferrara-Florence (Italy). Failing to gain Vasily II's support, Isidore attended the council, first in Ferrara (1438), then in Florence (1439), at which he was one of six Greek spokesmen. Together with the Greek cardinal John Bessarion, he drew up the document of unification that was proclaimed on July 5, 1439; soon after, he was made a Roman cardinal, thenceforth referred to as "the Ruthenian (Ukrainian Roman Catholic) cardinal." Commissioned papal legate by Eugenius IV, Isidore successfully implemented the decree of union at Kiev, but, by energetically attempting to introduce it in Moscow, he encountered the hostility of Vasily II and the Russian Church. He was convicted by an ecclesiastical court of apostasy to the Orthodox faith and imprisoned but escaped on Easter 1444 and received sanctuary from King Ladislas of Hungary-Poland. From Siena, Isidore was dispatched by Pope Nicholas V to Constantinople and in December 1452, on the eve of the city's fall to the Turks, solemnly announced to the hard-pressed Byzantines in the basilica of Hagia Sophia ("Holy Wisdom") the union of the Greek and Latin churches. Although the court and hierarchy were agreeable, the people rejected relations with the papacy. Isidore and his staff then joined in the futile defense of Constantinople. Wounded, he escaped capture by fleeing to Crete. Returning to Rome in 1454, he wrote of the traumatic experience of Constantinople's collapse in his *Epistula lugubris* ("The Mournful Letter"). After resigning his other ecclesiastical offices in 1459, he received the honorary title Greek Patriarch of Constantinople from Pope Pius II, at whose election he assisted.

Isidore OF SEVILLE, SAINT, Latin ISIDORUS HISPALENSIS (b. *c.* 560, Cartagena or Seville, Spain—d. April 4, 636, Seville; canonized 1598; feast day April 4), theologian, last of the Western Latin Fathers, archbishop, and encyclopaedist, whose *Etymologies,* an encyclopaedia of human and divine subjects, was

one of the chief landmarks in glossography (the compilation of glossaries) and was for many centuries one of the most important reference books.

Isidore succeeded his brother St. Leander as archbishop of Seville about 600, during a time when the Spanish church witnessed numerous councils, one of the greatest being the fourth Council of Toledo (633). Isidore headed this council, which, among other politico-religious matters, decreed union between church and state, toleration of Jews, and uniformity in the Spanish Mass. He successfully continued Leander's conversion of the Visigoths from Arianism (the heretical doctrine teaching that the Son was neither equal with God the Father nor eternal) to orthodox Christianity.

St. Isidore, detail of a mural; in Seville Cathedral
Archivo Mas, Barcelona

Outstanding among Isidore's extraordinary literary production was his *Etymologiae* (*Etymologies*), which, in 20 sections, compiled for posterity much that he had extracted from works of previous encyclopaedists, specialists, and various Latin writers; the etymological part (Book X) became a great mine for later glossographers. Almost 1,000 medieval manuscripts of the *Etymologies* are still in existence. Isidore's principal sources were Servius (the 5th-century Latin grammarian and teacher), the Fathers of the Church, and Aelius Donatus (the 4th-century rhetorician and commentator). The *Etymologies,* which became one of the most studied works during the Dark and Middle Ages, treats the seven liberal arts by applying them to general, comprehensive knowledge—such as anthropology, cosmology, architecture, history, and agriculture.

Isidore's other special treatises included linguistic studies (*Differentiarum libri,* or "Books of Differences"), works on natural science and cosmology (*De natura rerum,* or "On the Nature of Things," and *De ordine creaturarum,* or "On the Order of Creatures"), and works on history. His theological works include *De ortu et obitu patrum* ("On the Origin and Death of the Fathers"), biographies of 86 biblical persons; *Sententiarum libri tres* ("Three Books of Sentences"), a handbook of morals and theology in the form of collected sentences; *De officiis ecclesiasticis* ("On Church Duties"), a liturgical work dealing with offices and clerical members; and *Synonima* ("Synonyms"), a spiritual meditation.

It is uncertain whether Isidore produced the original edition of the *Hispana collectio,* the canon law of the Spanish church sometimes known as the *Collectio canonum Isidoriana* ("The Collection of the Canons of Isidore"); a mid-9th-century enlarged edition of the *Hispana,* falsely attributed to Isidore, is now called the Pseudo-Isidorian Decretals. He was canonized by Pope Clement VIII in 1598. Pope Innocent XIII formally declared him a doctor of the church in 1722.

Isin, ancient Mesopotamian city, probably the origin of a large mound near Ad-Diwāniyah, in southern Iraq.

An independent dynasty was established at Isin about 2017 BC by Ishbi-Erra, "the man of Mari." He founded a line of Amorite rulers of whom the first five claimed authority over the city of Ur to the south. The fifth of the rulers of Isin, Lipit-Ishtar (reigned 1934–24 BC), is famous as having published a series of laws in the Sumerian language anticipating the code of Hammurabi by more than a century. About 1794 Isin lost its independence, first to the neighbouring city of Larsa and later to Babylon. The city revived between about 1156 and 1025 under its 2nd dynasty, a number of whose kings exercised authority over Babylonia (southern Iraq).

Isinglass (foaled 1890), racehorse (Thoroughbred) who won the British Triple Crown in 1893 and earned a then record for a British horse of more than $235,000 (record broken in 1952) during his racing career.

Sired by Isonomy and foaled by Dead Lock, he was owned by H. McCalmont and trained by J. Jewitt. After winning three races in 1893, as a two-year-old, ridden by Tom Loates, he won the Two Thousand Guineas, the Derby, and the Saint Leger, comprising the British Triple Crown. He also won the Newmarket Stakes. In 1894 he won the Eclipse Stakes at Sandown, and in 1895, as a five-year-old, he won the Ascot Gold Cup.

isinglass, thin sheets of mica, particularly of muscovite (*q.v.*).

Isis, Egyptian ASET, or ESET, one of the most important goddesses of ancient Egypt. Her

Isis with Horus, bronze figurine of the Late Period; in the Egyptian Museum, Berlin
By courtesy of the Staatliche Museen Preussischer Kulturbesitz, Berlin

name is the Greek form of an ancient Egyptian word that is perhaps associated with a word for "throne."

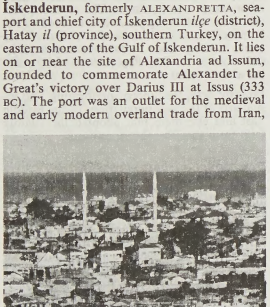
Little is known of Isis' early cult. In the Pyramid Texts (*c.* 2350–*c.* 2100 BC), she is the mourner for her murdered husband, the god Osiris. In her role as the wife of Osiris, she discovered and reunited the pieces of her dead husband's body, was the chief mourner at his funeral, and through her magical power brought him back to life.

Isis hid her son, Horus, from Seth, the murderer of Osiris, until Horus was fully grown and could avenge his father. She defended the child against many attacks from snakes and scorpions. But because Isis was also Seth's sister, she wavered during the eventual battle between Horus and Seth, and in one episode Isis pitied Seth and was beheaded by Horus during their struggle. Despite her variable temperament, she and Horus were regarded by the Egyptians as the perfect mother and son. The shelter she afforded her child gave her the character of a goddess of protection. But her chief aspect was that of a great magician, whose power transcended that of all other deities. Several narratives tell of her magical prowess, with which she could even outwit the creator god Atum. She was invoked on behalf of the sick, and, with the goddesses Nephthys, Neith, and Selket, she protected the dead. She became associated with various other goddesses who had similar functions, and thus her nature became increasingly diverse. In particular, the goddess Hathor and Isis became similar in many respects. In the astral interpretation of the gods, Isis was equated with the dog star Sothis (Sirius).

Isis was represented as a woman with the hieroglyphic sign of the throne on her head, either sitting on a throne, alone or holding the child Horus, or kneeling before a coffin. Occasionally she was shown with a cow's head. As mourner, she was a principal deity in all rites connected with the dead; as magician, she cured the sick and brought the dead to life; and, as mother, she was herself a life-giver.

The cult of Isis spread throughout Egypt. In Akhmīm she received special attention as the "mother" of the fertility god Min. She had important temples throughout Egypt and Nubia. By Greco-Roman times she was dominant among Egyptian goddesses, and she received acclaim from Egyptians and Greeks for her many names and aspects. Several temples were dedicated to her in Alexandria, where she became the "patroness of seafarers." From Alexandria her cult was brought to all the shores of the Mediterranean, including Greece and Rome. In Hellenistic times the mysteries of Isis and Osiris developed; these were comparable to other Greek mystery cults.

Iskandar Muda (b. 1590—d. Dec. 27, 1636), sultan of Acheh (Atjeh) in northern Sumatra, under whom the region achieved its greatest territorial expansion and an international reputation as a centre of trade and of Islāmic learning.



When Iskandar Muda began his reign in 1607, he immediately undertook a series of naval actions that won for him effective control over the northwestern portion of the Indonesian archipelago. His overlordship included all major ports on the west coast of Sumatra and much of the east coast, as well as Kedah, Perak (with its tin), and Pahang on the Malay Peninsula. He seriously threatened the Portuguese position in Malacca, but an alliance of smaller powers including Portuguese Malacca, Johore, and Patani (now part of Thailand) built a fleet that crushed Acheh in a naval battle near Malacca in 1629. The economic basis of Acheh's position was the spice trade, and these conflicts grew out of Acheh's attempt to consolidate a monopoly over the pepper trade.

During the reign of Iskandar Muda eminent Islāmic writers such as the Ṣūfī mystics Hamzah Fansuri and Ṣjamsuddin dari Pasai, as well as their enemy Nūr ud-Dīn ibn Ali ar-Rānīri, made Acheh an important centre of scholarship. In addition, Iskandar Muda's system of law and administration served as a model for other Islāmic states of the archipelago. After the Sultan's death, however, Acheh's fortunes declined with the military defeat suffered in 1629, the increasingly aggressive Dutch presence in the area, particularly after their capture of Malacca in 1641, and Acheh's failure to produce another outstanding leader.

Iskandarīyah, al-: *see* Alexandria.

Iskandarīyah, al-, *muḥāfaẓah* (governorate), Lower Egypt. The *muḥāfaẓah* is densely settled in the north in and around its capital, Alexandria (Arabic al-Iskandarīyah); it includes a desert hinterland extending south more than 50 mi (80 km) into the Western Desert. Its area is 1,034 sq mi (2,679 sq km). Alexandria, in the northeastern "panhandle" of the *muḥāfaẓah*, is built on a strip between the Mediterranean and Buḥayrat Maryūt, the classical Lake Mareotis, and juts northward into the Mediterranean on an artificial T-shaped promontory, creating two harbours. Ongoing land reclamation has brought about 190,000 ac (77,000 ha) into agricultural production. There are natural gas wells at Abū Qīr, on a natural promontory just northeast of the city. The Alexandria urban area has numerous industries and port and land transportation facilities. At Abū Qīr are the extensive remains of the ancient Egyptian centre of Pe-Gewat, known in Hellenistic times as Canopus. A pleasure resort in Ptolemaic times, it had an important temple of the god Sarapis; the temple was destroyed in the 4th century AD. Pop. (1996) 3,328,196.

Iskenderun, formerly ALEXANDRETTA, seaport and chief city of Iskenderun *ilçe* (district), Hatay *il* (province), southern Turkey, on the eastern shore of the Gulf of Iskenderun. It lies on or near the site of Alexandria ad Issum, founded to commemorate Alexander the Great's victory over Darius III at Issus (333 BC). The port was an outlet for the medieval and early modern overland trade from Iran, India, and eastern Asia, before the development of alternate shipping routes around the Cape of Good Hope and later through the Suez Canal. Traditionally it was the port for the Ottoman province of Aleppo, now in Syria, and in 1918–37 it served as the capital of the autonomous *sancak* (subdivision of an Ottoman province) of Alexandretta under French mandate.

Iskenderun, Tur., with the Gulf of Iskenderun in the background

Farrell Grehan—Photo Researchers

After the return of the district (renamed Hatay) to Turkey (1939), Iskenderun was replaced by Antioch (Antakya) as provincial capital but grew rapidly through improvement in its port facilities, its choice as a military centre and Turkish naval base on the Mediterranean, the establishment of industries (chiefly fertilizer and steel), and the construction of the oil pipeline from Raman Dağı. By 1955 it had surpassed Antioch in population.

Lying on an alluvial plain below the Nur Dağları (mountains), modern Iskenderun has fine buildings and avenues and is well served by highways and a railway linking it with other Turkish towns. It is also linked by air with Adana, Ankara, and Istanbul. Pop. (1997 est.) city, 161,728.

Iskowitz, Edward Israel (U.S. entertainer): *see* Cantor, Eddie.

Iskūr River, also spelled ISKER, or ISKAR, Latin OESCUS, longest river in Bulgaria, formed south of Samokov in the Rila Mountains by its headstreams, the Beli (White) Iskūr and Cherni (Black) Iskūr. It cuts a 40-mi (65-km) gorge through the Balkan Mountains to bring the high basin of Sofia (1,800 ft [550 m]) into communication with the Danube tableland. The river empties into the Danube about 20 mi west of Nikopol after a course of 250 mi. Along its lower course, southeast of Sofia, is a chain of small hydro stations associated with the Iskūr Reservoir. The Malūk Iskūr and Panega are tributaries.

Isla, José Francisco de, in full JOSÉ FRANCISCO DE ISLA DE LA TORRE Y ROJO, byname EL PADRE ISLA (b. March 24, 1703, Vidanes, Spain—d. Nov. 2, 1781, Bologna, Papal States), Spanish satirist and preacher noted for his novel known as *Fray Gerundio.*

Isla showed intellectual promise early and entered the Jesuit order as a novice in 1719, studying at the University of Salamanca. He was named professor of sacred literature in 1727 and taught this subject in various Spanish schools until 1754, when he retired to Villagarcía to begin work on his masterpiece, *Historia del famoso predicador Fray Gerundio de Campazas, alias Zotes* (1758; *History of the Famous Preacher Friar Gerundio of Campazas, alias Zotes*). This work is a brilliant satire on the vain and tastelessly bombastic preaching that predominated in Spanish churches. The book provoked a controversy that ended with its being banned by the Inquisition in 1760. Exiled from Spain with the general expulsion of the Jesuits in 1767, Father Isla went to live temporarily in Corsica and finally in Bologna. Among his other works is a masterly Spanish translation of *Gil Blas* by the French novelist Lesage.

Islām, a world religion revealed, according to tradition, to the Arabian apostle, or prophet, Muḥammad in the 7th century AD and emphasizing an uncompromising monotheism and a strict adherence to certain religious practices. Although there have been many sects and movements within the religion, and although there are striking cultural and religious differences among the regions of the Islāmic world, all followers of Islām are bound by a common faith and a sense of belonging to a single community.

Islām is treated in a number of articles in the MACROPAEDIA. For full treatment of the religion, *see* Islām, Muḥammad and the Religion of. For full coverage of Islāmic arts, *see* Islāmic Arts. For a broad discussion of the prehistory and history of the Muslim community, *see* Islāmic World, The.

The word *islām* is used repeatedly in the Qur'ān, the Islāmic scripture, in the sense of "surrender to the will of Allāh (God)." For Muslims, as adherents of Islām are called, the Qur'ān is the Word of God, confirming and consummating earlier revealed books and thereby replacing them. The Word's instrument or agent of revelation is the Prophet Muḥammad, the last and most perfect of a series of messengers of God to humankind—from Adam through Abraham to Moses and Jesus, the Christian claims for whose divinity are strongly rejected. Although Muḥammad is only a human creature of God, he has nevertheless an unequaled importance in the Qur'ān itself, which sets him next only to God as deserving of moral and legal obedience. Hence, his sayings and deeds (*sunnah*) served as a second basis, besides the Qur'ān, of the belief and practice of Islām.

The Qur'ānic theology is rigorously monotheistic: God is absolutely unique, omnipotent, omniscient, and merciful. Individuals are exhorted to obey his will (*i.e.,* to be Muslim), and special responsibility is laid on humanity. The Muslim creed consists of five articles of faith: (1) belief in one God; (2) in angels; (3) in the revealed books; (4) in the prophets; and (5) in the Day of Judgment. To these was added, during the early development of the dogma, the belief in God's predetermination of good and evil. The profession of the faith (*shahādah*) is: "There is no God but God, and Muḥammad is the prophet of God."

All Muslims are enjoined to practice the Five Pillars of Islām: (1) to recite the profession of faith at least once in one's lifetime; (2) to observe the five daily public and collective prayers; (3) to pay the *zakāt* ("purification") tax for the support of the poor; (4) to fast from daybreak to sunset during the entirety of the month of Ramaḍān; and (5) to perform if physically and financially possible the *ḥajj,* or pilgrimage to the holy city of Mecca.

The most important and fundamental religious concept of Islām is that of the Sharīʿah (*q.v.*), or the Law, which embraces the total way of life as explicitly or implicitly commanded by God. The Sharīʿah, as formulated by Muslim religious teachers in the 2nd and 3rd centuries of the Muslim era (8th–9th century AD), includes both the doctrine, or belief, and practice, or the law. Historically, the formulation and systemization of the law took place earlier than the crystallization of the formal theology.

Despite the notion of a unified and consolidated community, as taught by the Prophet, violent differences arose among Muslims within a few years after his death. The Khārajīs, for example, responding to what they regarded as the nepotism and misrule of the third caliph (deputy or successor of Muḥammad), interpreted the Qur'ān as enjoining jihad, or holy militancy, and thus as justifying the caliph's assassination. The group incessantly resorted to rebellion and, as a result, were virtually wiped out during the first two centuries of Islām.

In the increasing world-consciousness of 8th- and 9th-century Arabia, a powerful movement of rational theology emerged; its representatives, known as the Muʿtazilah (Seceders), held that human reason, independent of revelation, was capable of discovering what is good and what is evil, and viewed God as pure Essence, without eternal attributes. Thus the Qur'ān, regarded by other Muslims as the immutable record of God's attribute of speech, was seen by the Muʿtazilah as created in time and not eternal. Muʿtazilism became the state creed of the caliphate in the 9th century, but in the century following, reaction against it culminated in the formulation and general acceptance of what came to be called Sunnī, or "orthodox," theology.

While Sunnī orthodoxy, the central community of Islām, condemned schisms and branded dissent as heretical, it developed at the same time the opposite trend of accommodation, catholicity, and synthesis. A broad theological platform was adopted that saved the integrity of the community at the expense of moral strictness and doctrinal uniformity.

Shīʿite Islām, the only important surviving sect outside orthodoxy, arose from a purely political conflict in the late 7th century. Gradually, however, the group's political stand acquired a theological content. Probably under Gnostic and old Iranian dualistic influences, Shīʿism developed a doctrine of esoteric knowledge, centred upon the figure of the Imam, or exemplary "leader," through whom the truths of the Qurʾān are revealed. Such a doctrine was adopted also by the Ṣūfīs, an ascetic movement that arose, largely within orthodoxy, in reaction to the worldliness of the early Muslim dynasties. Five centuries after the initial spread of Islām under the banner of jihad, the Ṣūfīs inaugurated a much more massive expansion that was mainly responsible for the establishment of the faith in India, Central Asia, Turkey, and sub-Saharan Africa. Muslim traders also contributed significantly to the enlargement of the Muslim world.

Despite the loss of political power during the period of Western colonialism in the 19th and 20th centuries, the concept of the Islāmic community became stronger and helped various Muslim peoples in their struggle to gain political independence and sovereignty in the mid-20th century.

Islam, Nation of, also called AMERICAN MUSLIM MISSION, or WORLD COMMUNITY OF AL-ISLAM IN THE WEST, or BLACK MUSLIM MOVEMENT, religious and cultural community that evolved in the 20th century in the United States out of various quasi-religious black nationalist organizations. Prominent among these precursor groups was the Moorish Science Temple, founded in Newark, N.J., in 1913 by Prophet Drew Alī, born Timothy Drew, who posited the Moorish, and thus Muslim, origins of all blacks and advocated a return to Islām as the only means of redemption from racial oppression. The secular Universal Negro Improvement Association, founded in 1914 by Marcus Garvey, also espoused principles later adopted by the black Muslims.

The movement proper was founded by Wallace Fard Muhammad (also called W.D. Fard, or Wali Farad), believed to have been an orthodox Muslim born in Mecca around 1877. He immigrated to the United States in 1930 and established a temple (or mosque) in Detroit a year later.

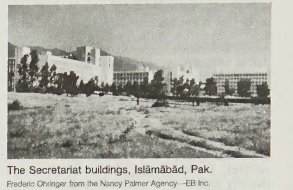
Most of Fard's initial followers were black migrants from the southern United States who, because of prevailing racial policies and economic conditions, were clustered together in the black ghettos of the great northern industrial cities. They believed Fard to be an incarnation of Allāh who had come to liberate what he called the "Lost-Found Nation of Islam in the West." Fard promised that if they would heed his teachings and learn the truth about themselves, they would overcome their white "slave masters" and be restored to a position of dignity and primacy among the peoples of the world.

The chief developer of the movement was Elijah Muhammad (*q.v.*), who succeeded Fard as leader of what had come to be called the Nation of Islam after the latter's mysterious disappearance in 1934. Shortly thereafter Muhammad founded the movement's second temple in Chicago. The movement spread slowly at first. By the end of World War II American blacks had caught the spirit of protest and black nationalism that was sweeping Africa. The Nation of Islam benefited directly from the pent-up frustrations of the black masses and offered those frustrations a militant, if avowedly nonviolent, expression. Soon there were mosques in all larger cities with sizable black populations.

Under Muhammad's leadership, the Nation of Islam professed the moral and cultural superiority of "black men," who were seen as destined by Allāh to assume cultural and political leadership of the Earth. Blacks were enjoined to give up Christianity, which was regarded as the white man's chief stratagem for the enslavement of nonwhite people. The white race was conceived of as a race of devils whose time to reign was coming to an end. Meanwhile black people were urged to work together to reclaim their fallen (criminals, drug addicts, etc.), learn their true history, strive for economic independence, and prepare for the Battle of Armageddon, the final struggle between good and evil.

During the 1960s the movement achieved national prominence through the personality of Malcolm X, Elijah Muhammad's spokesman, whose forceful articulations of racial pride and Muslim principles made him a cultural hero, especially among black youth. The publication of a book by C. Eric Lincoln entitled *The Black Muslims in America* (1961) established during this period what became the standard, though never official, name for the movement in the public mind. Disagreements among the sect hierarchy eventually led to Malcolm's suspension and to the establishment of a rival group, the Muslim Mosque, Inc., under his leadership. Violent disputes between the two groups were suspected as a contributing factor to Malcolm's assassination in 1965.

A series of changes in the social, intellectual, and spiritual direction and development of the Nation of Islam was effected in the late 1970s under the leadership of Elijah Muhammad's successor, his son Warith Deen (or Wallace D.) Muhammad. During this period all precepts of colour-consciousness, racism, and the deification of Fard were repudiated, and the organization was renamed the American Muslim Mission. In May 1985 W.D. Muhammad announced the dissolution of the American Muslim Mission in order that its members might become a part of the worldwide orthodox Islāmic community. The centralized leadership and organization that had previously characterized the movement thus came to an end, although its network of mosques and their attendant religious, educational, and economic programs continued to function.



A splinter group based in Chicago and under the leadership of Louis Farrakhan retained both the name and the founding principles of the Nation of Islam.

Islām, Pillars of, Arabic ARKĀN AL-ISLĀM, the five duties incumbent on every Muslim: *shahādah* (*q.v.*), the Muslim profession of faith; *salat* (*q.v.*), or ritual prayer, performed in a prescribed manner five times each day; *zakāt* (*q.v.*), the alms tax levied to benefit the poor and the needy; *ṣawm* (*q.v.*), fasting during the month of Ramaḍān; and *ḥajj* (*q.v.*), the major pilgrimage to Mecca.

Islāmābād (Jammu and Kashmir): *see* Anantnāg.

Islāmābād, capital of Pakistan, on the Potwar Plateau, 9 miles (14 km) northeast of Rāwalpindi, the former interim capital.

The city's site was chosen by a commission in 1959 after Karāchi was found unsuitable as the capital. Construction began in 1961 with an effort to blend traditional Islāmic architecture with modern patterns and requirements. Such world-renowned names in town planning and architecture as Konstantinos Doxiádes, Edward Durell Stone, and Gio Ponti have been associated with the city's development. It is a compact city (area 25 square miles [65 square km]), lying at elevations ranging from 1,500 to 2,000 feet (450 to 600 m). The second phase of construction ended with

The Secretariat buildings, Islāmābād, Pak.
Frederic Ohringer from the Nancy Palmer Agency —EB Inc.

completion of the Secretariat, Pakistan House, President's House, National Assembly Building, Grand National Mosque, and housing for government staff. The University of Islāmābād was established in 1965 and the People's Open University (later renamed the Allama Iqbal Open University) in 1974. The war with India in 1971 slowed construction temporarily.

The urban area is divided into eight zones: administrative, diplomatic, residential, institutional, industrial, commercial, a greenbelt, and a national park that includes an Olympic village and gardens and dairy, poultry, and vegetable farms, as well as such institutions as the Atomic Research Institute and the National Health Centre. The name Islāmābād (City of Islām, or City of Peace) was chosen to reflect the country's ideology.

The planned capital area (350 square miles) is an expanse of natural terraces and meadows surrounding the city. A further 1,049 square miles of hinterland, known as the Specified Areas and subject to planning control, is roughly a trapezoid, with the Margala Hills, 3,000–5,000 feet, in the north and northeast. The southern portion is an undulating plain. It is drained by the Kurang River, on which the Rāwal Dam forms a lake holding about 50,000 acre-feet (61,650,000 cubic m) of water. Pop. (1998) 525,000; capital area, 799,000.

Islāmic arts, the literary, performing, and visual arts of the vast populations of the Middle East and elsewhere that adopted the Islāmic faith from the 7th century onward.

A brief treatment of Islāmic arts follows. For full treatment, *see* MACROPAEDIA: Islāmic Arts.

Islāmic visual arts are decorative, colourful, and, in the case of religious art, nonrepresentational. The characteristic Islāmic decoration is known as arabesque. Arabesque is an ornament or style that employs flower, foliage, or fruit motifs and sometimes animal and figural outlines or geometric patterns to produce an intricate design of interlaced, sometimes angular and sometimes curved, lines. This decoration is used on both architecture and objects.

Ceramics, glass, metalwork, textiles, manuscript illustration, and woodwork have been of primary importance in Islāmic culture. Pottery was the most important of the early Islāmic decorative arts. Lustreware, the greatest Islāmic contribution to ceramics, is pottery decorated by applying metallic compounds to the glazes that when fired become iridescent metallic films. Other outstanding objects produced during the period of the caliphates (AD 750 to the mid-11th century) are Egyptian bronzes and carved wood, stuccoes from Iraq, and carved ivories from Spain.

In the Seljuq period (mid-11th to the mid-13th century) pottery, textiles, and glass continued to be important. In addition, utilitarian objects of bronze and brass were inlaid with silver and copper and intricately adorned. Manuscript illustration also became an im-

portant and greatly respected art. Miniature painting was the greatest and most characteristic art of Iran in the period following the Mongol invasions (1220–60).

In Islām the written word is accorded a special status as the medium of divine revelation. Calligraphy therefore developed in a number of rich and complex ways using a variety of elegant scripts. The calligraphic arts were used not only in manuscripts but also as an important feature of architectural and other decoration.

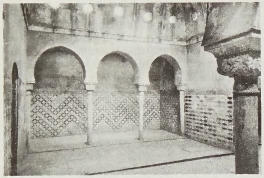
Islāmic architecture finds its highest expression in the mosque and related religious buildings. Early Islāmic religious architecture, exemplified by the Dome of the Rock (691) in Jerusalem and the Great Mosque (705) in Damascus, drew upon Christian architectural features such as domes, columnar arches, and mosaics but also included large courtyards for congregational prayer. Religious architecture came into its own in the period of the caliphates with the creation of the hypostyle mosque in Iraq and Egypt. A building with the roof resting on rows of columns, this mosque had a square or rectangular plan that was flexible in that it could be increased or decreased by adding or removing columns.

In Seljuq and Ṣafavid Iran a different mosque plan was used that consisted of four *eyvāns* (vaulted halls) opening onto a central courtyard. These brick-built mosques also incorporated domes and decorated squinches. Persian architectural features spread to India, where they are found in the Pearl Mosque (1653) and the Tāj Mahal (1645). Ottoman architecture, derived from Islāmic and Byzantine traditions, is exemplified by the Selimiye Mosque (1575) at Edirne, Tur., with its great central dome and slender minarets. One of the greatest examples of secular Islāmic architecture is the Alhambra (13th–14th century) at Granada, Spain.

Islāmic literature is written in four main languages: Arabic, Persian, Turkish, and Urdu. Arabic is of overwhelming importance as the language of the revelation of Islām and of the Qur'ān, which Muslims regard as the epitome of literary excellence.

The basic elements of Arabic poetry, inherited from pre-Islāmic models, are monorhyme (a scheme in which all the lines of a poem have the same end rhyme) and complicated metres (long and short syllables arranged into 16 basic metres). There are three main poetic genres in Arabic poetry. The ghazal, usually a love poem, is written in 5 to 12 monorhymed verses. The qasida consists of from 20 to more than 100 monorhymed verses and is used for the expression of formal and elaborate praise.

The Persians used the genres, forms, and rules of Arabic poetry in their own language but elaborated on them. The Persians also developed a new genre, the *mašnavī*, composed of a series of rhyming couplets, which they employed for epic poetry (a form not known to the Arabs), the most famous example being the *Shāh-nāmeh*, or *Book of Kings*, by Ferdowsi (d. 1020). Persian literature in turn influenced both Urdu and Turkish literature, especially with regard to vocabulary and metres. Turkish literature also has a rich separate tradition of folk poetry.



Islāmic literature also includes literary, didactic, and popular prose. The literary form typifying Islāmic prose is the *maqāmah*, in which a relatively simple story is told in an elaborate and complicated manner, with many metaphors and puns and other plays on words. In the realm of popular literature, the best-known work is *The Arabian Nights' Entertainment*, a rich collection of fairy tales from different parts of the Muslim world.

Islāmic music is monophonic, devoid of harmony, and characterized by distinctive systems of rhythms and melodies, extensive ornamentation of the single melodic line, and virtuoso improvisation. Rhythms and melodies are organized in accordance with certain conventions or modes. Ornamentation of the melody is achieved by the use of microtones—*i.e.*, tones that are not an exact number of half steps apart, such as the three-quarter tone—and by the use of both smaller and larger intervals.

Islāmic music is usually performed by a small ensemble—a singer and several instrumentalists who alternate solo vocal and instrumental passages. The melody is carried by the singer or instrumentalist, and rhythm is supplied by a percussion instrument, among which are frame drums, cymbals, and percussion sticks. Wind instruments include the *zornā* (an oboelike instrument), various flutes, a long trumpet, a horn, and double-piped single-reed instruments resembling clarinets. The stringed instruments, however, are the most favoured. The best known is the oud (*'ūd*), a short-necked lute having four or five strings. Additionally there are trapezoid-shaped instruments: the *santūr*, whose strings are hit with two thin sticks, and the *qānūn*, which is plucked. Other stringed instruments include the violin and bowed lutes such as the *kamān*, *kamanjā*, and *rabāb*.

Islāmic Association (Indonesian political party): *see* Sarekat Islām.

Islāmic bath, Arabic ḤAMMĀN, public bathing establishment developed in countries under Islāmic rule that reflects the fusion of a primitive Eastern bath tradition and the elaborate Roman bathing process. A typical bath house consists of a series of rooms, each varying in temperature according to the height and shape of the domed roof and to the room's distance from the furnace. Each series of rooms is composed of a warm room, a hot room, and a steam room, corresponding roughly to the tepidarium, caldarium, and laconicum of the Roman thermae. In some bathhouses, the cold room, or frigidarium, is replaced by a basin of cold water at one end of the warm room. In addition to these vaulted chambers, there are dressing rooms and frequently a luxurious rest area, where refreshments are served after bath and massage. Separate facilities for men and women are provided.

Bath in the Alhambra, Granada, Spain
Archivo Mas, Barcelona

Some Islāmic baths are opulently decorated with mosaics, fountains, and pools. Excellent examples can be seen in the Alhambra in Granada, Spain (1358); the Citadel at Aleppo, Syria (1367); and the Haseki Hürrem Ḥammān in Istanbul (1556).

Islāmic calendar: *see* Muslim calendar.

Islāmic caste, any of the units of social stratification that developed among Muslims in India and Pakistan as a result of the proximity of Hindu culture. Most of the South Asian Muslims were recruited from the Hindu population; despite the egalitarian tenets of Islām, the Muslim converts persisted in their Hindu social habits. Hindus, in turn, accommodated the Muslim ruling class by giving it a status of its own.

In South Asian Muslim society a distinction is made between the *ashrāf* (Arabic, plural of *sharīf*, "nobleman"), who are supposedly descendants of Muslim Arab immigrants, and the non-*ashrāf*, who are Hindu converts. The *ashrāf* group is further divided into four subgroups: (1) Sayyids, originally a designation of descendants of Muḥammad through his daughter Fāṭimah and son-in-law 'Alī, (2) Shaykhs (Arabic: "Chiefs"), mainly descendants of Arab or Persian immigrants but also including some converted Rājputs, (3) Pashtuns, members of Pashto-speaking tribes in Afghanistan and northwestern Pakistan, and (4) Mughals, persons of Turkish origin, who came into India with the Mughal armies.

The non-*ashrāf* Muslim castes are of three levels of status: at the top, converts from high Hindu castes, mainly Rājputs, insofar as they have not been absorbed into the Shaykh castes; next, the artisan caste groups, such as the Julāhās, originally weavers; and lowest, the converted untouchables, who have continued their old occupations. These converts of Hinduism observe endogamy in a manner close to that of their Hindu counterparts.

Two of the principal indexes of Hindu caste, commensality and endogamy (principles governing eating and marital arrangements), do not appear as strongly in Islāmic castes. Commensality is prohibited between *ashrāf* and non-*ashrāf*, between Muslim and Hindu, and between the various castes of the non-*ashrāf*. The principle of endogamy is altered by the Muslim preference of marriage within very narrow limits (*e.g.*, to the daughter of the father's brother), which in South Asia is known as *biyāhdārī*.

Islāmic Conference, Organization of the (OIC), Arabic MUNAẒẒAMAT AL-MŪ'TAMIR AL-ISLĀMĪ, an Islāmic organization established in Jeddah, Saudi Arabia, in May 1971, following summits by Muslim heads of state and government in 1969 and by Muslim foreign ministers in 1970. The membership includes Afghanistan, Algeria, Bahrain, Bangladesh, Benin, Brunei, Burkina Faso, Cameroon, Chad, Comoros, Djibouti, Egypt, Gabon, The Gambia, Guinea, Guinea-Bissau, Indonesia, Iran, Iraq, Jordan, Kuwait, Lebanon, Libya, Malaysia, Maldives, Mali, Mauritania, Morocco, Niger, Oman, Pakistan, Palestine Liberation Organization (PLO), Qatar, Saudi Arabia, Senegal, Sierra Leone, Somalia, The Sudan, Syria, Tunisia, Turkey, Uganda, United Arab Emirates, and Yemen.

The conference aims at promoting Islāmic solidarity by coordinating social, economic, scientific, and cultural activities. Under the banner of strengthening the struggle of Muslims, the conference pledges to eliminate racial segregation and discrimination, especially in regard to the PLO. Projects include the International Islāmic News Agency, the Islāmic Development Bank, the Islāmic Solidarity Fund, and the World Centre for Islāmic Education. Egypt was suspended in 1979 after it signed the agreement known as the Camp David Accords with Israel; in 1984 it accepted an offer to rejoin the organization.

Islāmic Development Bank, Arabic AL-BANK AL-ISLĀMĪ LIL-ISTITHMĀR, Muslim bank directed toward financing the economic and social development of members in accordance with the principles of the Sharī'ah (Islāmic sacred law). Conceived by the Organization of the Islāmic Conference in 1973, the bank was headquartered in Jeddah, Saudi Arabia, and formally opened in October 1975. Its member nations are drawn from the ranks of those states belonging to the Organization of the Islāmic Conference.

The Islāmic Development Bank seeks to spur economic and financial growth by participating in equity capital, by investing in economic and social infrastructure projects, and by making loans to the public and private sectors.

Special funds are available for technical assistance to Muslim communities in nonmember countries. (*See* Islāmic Conference, Organization of the.)

Ísland: *see* Iceland.

island, any area of land smaller than a continent and entirely surrounded by water. Islands may occur in oceans, seas, lakes, or rivers. A group of islands is called an archipelago.

Islands may be classified as either continental or oceanic. Oceanic islands are those that rise to the surface from the floors of the ocean basins. Continental islands are simply unsubmerged parts of the continental shelf that are entirely surrounded by water. Many of the larger islands of the world are of the continental type. Greenland (840,000 square miles [2,175,000 square km]), the largest island, is composed of the same materials as the adjacent North American continent, from which it is separated by a shallow and narrow sea. Likewise the world's second largest island, New Guinea (309,000 square miles [800,000 square km]), is part of the Australian continental platform and is separated from it only by the very shallow and narrow Torres Strait. A slight warping of the sea bottom in the vicinity of Torres Strait would be sufficient to join New Guinea to Australia; conversely, a slight rise in sea level may submerge a hilly coast and leave the hilltops remaining as small islands just off shore (such are those off the coast near Boston, Mass., and the islands off the Maine coast).

The islands that rise from the floors of the ocean basins are volcanic. Lava accumulates to enormous thickness until it finally protrudes above the ocean surface. The piles of lava that form Hawaii rise as high as 32,000 feet (9,700 m) above the ocean floor.

Island life exhibits features of special interest. The sea is a barrier to some forms of life but acts as a carrier of others, which, once established in their new home, frequently develop new features in their isolated surroundings. A long-established sea barrier results in marked differences between the animal life and vegetation even of adjacent islands, and from these differences may be deduced the origin of an island. Further, any detailed map of the biological regions of the globe illustrates the importance of islands in the determination of the boundaries of animal-life and vegetational types. For example, to the west of a line (Wallace's Line) running between Bali and Lombok and between Borneo and Celebes, the islands are biologically Asian, but to the east of the line, notwithstanding the narrowness of the Lombok Strait, the vegetation and animal life are Australian. Oceanic islands are usually colonized by only a few animal forms, chiefly seabirds and insects. They are often covered with abundant vegetation, the seeds of which have been carried there, for example, by air and water currents or by birds; but the plant variety is relatively limited.

island arc, long, curved chain of oceanic islands associated with intense volcanic and seismic activity and orogenic (mountain-building) processes. Prime examples of this form of geologic feature include the Aleutian-Alaska Arc and the Kuril-Kamchatka Arc.

A brief treatment of island arcs follows. For full treatment, *see* MACROPAEDIA: Oceans.

Most island arcs consist of two parallel, arcuate rows of islands. The inner row of such a double arc is composed of a string of explosive volcanoes, while the outer row is made up of nonvolcanic islands. In the case of single arcs, many of the constituent islands are volcanically active.

An island arc typically has a land mass or a partially enclosed, unusually shallow sea on its concave side. Along the convex side there almost invariably exists a long, narrow oceanic trench (*q.v.*). The greatest ocean depths are found in these depressions of the seafloor, as in the case of the Mariana and Tonga trenches.

Destructive earthquakes occur frequently at the site of island arcs. Unlike the shallow earthquakes that are recorded in other areas of the world, these are deep-focus seismic events emanating from as much as 370 miles (600 km) below the base of an arc. The quakes tend to have foci of progressively greater depth toward the arc's concave side.

The majority of island arcs occur along the western margin of the Pacific Basin. The few exceptions are the East Indian and the West Indian arcs and the Scotia Arc in the South Atlantic. According to prevailing theory, island arcs are formed where two lithospheric plates (enormous rigid slabs that constitute segments of the Earth's surface) converge. Upon colliding, one of the plates—that bearing heavy, oceanic crust—buckles downward and is forced into the partially molten lower mantle beneath the second plate with lighter, continental crust. An island arc is built up from the surface of the overriding plate by the extrusion of basalts and andesites. The basalts are thought to be derived from the semimolten mantle, whereas the andesites are probably generated by the partial melting of the descending plate and the sediments that have accumulated on its surface.

island stage: *see* theatre-in-the-round.

Islands, Bay of, bay of the South Pacific Ocean and geographic region, northern North Island, New Zealand, formed when the sea flooded an old river valley system. The bay has a shoreline of 500 miles (800 km) and about 150 islands. It opens to the sea through an 11-mile- (18-kilometre-) wide passage flanked by Brett Cape on the east and Wiwiki Cape on the west.

The first European to enter the inlet was Captain James Cook in 1769. Three years later the French explorer Marion du Fresne founded a short-lived settlement on Moturoa Island. In 1814 the Reverend Samuel Marsden established the first permanent European settlement in New Zealand at Rangihoua. A centre for whalers during the 1830s, the bay was the site of the signing of the Treaty of Waitangi in 1840 between Great Britain and native Maoris. The bay is now a resort area. It offers historic sites such as the Waitangi Treaty House, as well as deep-sea fishing, hunting, and scenic beauty. Principal towns are Russell, Paihia, and Kerikeri. Urapukapuka is a tourist centre. A deepwater port of entry for overseas shipping is located at Opua.

islands area, any one of three areas created in Scotland by the administrative reorganization of 1975: Orkney, Shetland, and Western Isles, with a combined land area of 2,149 square miles (5,566 square km). Each islands area's authority combines most regional and district functions but is linked with the Highland region for police and fire services. Pop. (1987 est.) 72,815.

islands of Langerhans (biology): *see* Langerhans, islets of.

Islay, most southerly island of the offshore Atlantic group known as the Inner Hebrides (*q.v.*), in the district of Argyll and Bute, Strathclyde region, Scotland. It is separated from the island of Jura by the Sound of Islay (0.9 miles [1.5 km] wide). The island is 25 miles (40 km) long, with a maximum width of 20 miles (32 km). The westerly district of the Rhinns is almost separated from the remainder by deeply incised sea lochs (inlets). The island is rich and productive, with good salmon and trout fishing, and has been called the "Queen of the Hebrides." It is also known for its distilleries. Pop. (latest est.) 3,855.

Islay, Archibald Campbell, earl of: *see* Argyll, Archibald Campbell, 3rd duke of.

Isle of ———: *see under* substantive word (*e.g.,* Wight, Isle of).

Isle Royale, centre of a wilderness archipelago and the largest island in Lake Superior, northwestern Michigan, U.S. Administered as part of Keweenaw county, it lies 56 miles (90 km) from the Upper Peninsula shore and 20 miles (32 km) from the Canadian shore and is 45 miles (72 km) long and 9 miles (14 km) across at its widest point. Visited by the French explorer Étienne Brûlé in 1622, its early name was Minong (Chippewa Indian for "good high place"); it was renamed by French Jesuit missionaries to honour their royal patrons.

Its streams and inland lakes contain pike, perch, and other game fish. Coniferous and deciduous forests provide an outstanding example of forest transition; many species of wildflowers, ferns, lichens, mosses, and fungi grow undisturbed. Moose and fur-bearing animals are common, and a small population of timber wolves lives on the island. There are more than 200 kinds of birds, including herring gulls and warblers. According to radioactive-carbon tests, prehistoric coppermining pits date back nearly 4,000 years. A greenstone (chlorastrolite) from Isle Royale was adopted as the state gem in 1972.

Travel is possible only on foot or by canoe. Ferry service from the mainland is available from Houghton and Copper Harbor, or from Grand Portage, Minn. Isle Royale, with its surrounding islets and numerous rocks, was established as a national park in 1931.

islets of Langerhans (biology): *see* Langerhans, islets of.

Islington, inner borough of Greater London, with an area of 6 square miles (15 square km). A densely built-up borough, it lies astride the Great North Road (A1). The London–Edinburgh main-line railway approaches King's Cross Station through the borough.

As the City of London spread beyond its northern wall, Finsbury (the southern part of the borough) became residential, with waves of building following the dissolution of the monasteries (1536–39) and the Great Fire of London (1666). Further north, medicinal wells were discovered, and one famous spa gave its name to the Sadler's Wells Theatre built on its site. Gradually, however, the rural pleasure gardens were overtaken by urban growth associated with new roads (New North Road, 1812), the Regent's Canal (started 1812), and North London Railway (1850). Many of the squares and terraces built in the late 19th century have been rehabilitated by new residents attracted by Islington's proximity to London.

Various light industries are found throughout the borough. Educational institutions include the City University (formerly Northampton College of Advanced Technology) and the Polytechnic of North London. Many famous religious dissenters, including John Bunyan, Daniel Defoe, Isaac Watts, and William Blake are buried at Bunhill Fields, City Road. Pop. (1986 est.) 168,000.

Islwyn: *see* Thomas, William.

Islwyn, district, western Gwent county, southeastern Wales. It was created in 1974 and covers an area of 39 square miles (101 square km). It is bordered by the districts of Torfaen to the east, Rhymney Valley to the west, and Newport to the south. It extends northward along the deep, wooded Ebbw and Sirhowy river valleys to the border of Balenau Gwent district. An Iron Age fort and a medieval castle mound have been discovered north of the town of Risca. Situated on the western edge of the Welsh Marches (border country), the area covered by the district experienced significant

*Area given may include small adjoining islands. Conversions for rounded figures are rounded to nearest hundred.

Norman influence in the early 1100s. Industry in the valleys did not undergo significant development until the late 1800s and early 1900s, when numerous coal mines were sunk. Celynen South and Celynen North collieries, located just north of the town of Abercarn, were sunk in 1873 and 1913 respectively, and a coal viaduct, stretching 200 ft (60 m) high and 1,500 ft long between two mountain peaks near Crumlin, was completed in 1857.

Although some of the coal mines were still operating in the second half of the 20th century, the area's dependence on the iron and coal industry has greatly diminished. The district has become well known for offering a wide range of recreational opportunities, as many of the old mining sites have been reclaimed and much of the district is now devoted to parks and open spaces, including the Ebbw forest with its numerous nature trails and scenic drives. A highway and a railroad run up the River Sirhowy valley from Risca through Crumlin, with the highway branching to the northeast at Nebridge. The town of Blackwood is the administrative seat of the district. Pop. (1991 prelim.) 64,900.

Isly, Thomas-Robert Bugeaud, duc d' (duke of): *see* Bugeaud, Thomas-Robert.

Ismāʿīl, in full ISMĀʿĪL IBN SHARĪF (b. 1645/46—d. March 1727, Meknès, Mor.), second ruler of the ʿAlawī dynasty of Morocco; his long reign (1672–1727) saw the consolidation of ʿAlawī power, the development of an effective army trained in European military techniques, and the introduction of French influence in Morocco.

Virtually nothing is known about Ismāʿīl's youth. In 1672, with the sudden death of his half brother, Mawlāy (Lord) ar-Rashīd, founder of the dynasty, Ismāʿīl, then acting viceroy in Fès, immediately seized the treasury and had himself proclaimed ruler. His claim was challenged by three rivals—a brother, a nephew, and al-Khiḍr Ghīlān, a tribal leader of northern Morocco. These rivals were supported by the Ottoman Turks, acting through Algiers, who hoped to weaken the ʿAlawīs by supporting internal subversion so that they could extend their rule over Morocco. As a result, relations with the Ottoman regent of Algiers were strained throughout Ismāʿīl's reign. The succession war lasted five years. Al-Khiḍr Ghīlān was defeated and killed in September 1673, but Ismāʿīl had greater difficulties with the brother and nephew. He finally included them in the Moroccan power structure by recognizing them as semi-independent governors of important provinces. He completed the internal pacification of Morocco in 1686 with the final defeat and death of his nephew Aḥmad ibn Mahraz.

In 1673 Ismāʿīl created the ʿAbid (Black) al-Bukhārī army known colloquially as *buḵḵar* and made up of slaves bought from their masters and enlisted into this army together with freeborn blacks. This contingent was provided with women, and the offspring of these unions were entered into special schools and given specialized military training. Toward the end of his reign he had a black army of more than 150,000 men, of whom about 70,000 were kept as a strategic reserve in and around Meknès. His army was equipped with European arms, and his officers learned to combine artillery with infantry effectively. He used these forces against the Ottomans in Algiers in the years 1679, 1682, and 1695/96 in expeditions designed to pacify his frontiers and to punish the regent of Algiers. In the end the Ottomans agreed to respect Moroccan independence.

Ismāʿīl's relations with the European powers were much more complex. He hated the Europeans as infidels, yet needed them as suppliers of arms and other finished products. Throughout his reign there was intermittent warfare with the European settlers of the Moroccan seaports: in 1681 he captured al-Maʿmūrah from the Spanish, and in 1684 he expelled the English from Tangier. In order to challenge Spain for possession of its settlements within Morocco, he became increasingly friendly with Louis XIV of France, the enemy of Spain. France was to reap great commercial benefits from this friendship. French influence became paramount in Morocco; French officers trained Moroccan artillerymen and helped in the building of public works. The palace of Meknès, styled on that of Versailles, was a massive monument to Ismāʿīl's will and determination.

Ismāʿīl was frugal in financial matters. He raised the necessary revenues for his army and his public works by holding a monopoly on foreign trade, and he was not above encouraging piracy. He maintained his authority and religious legitimacy by supporting the notion that he was a direct descendant of the prophet Muḥammad and, thus, had special spiritual gifts, which entitled him to rule. He demanded not only temporal but also spiritual allegiance and recognition from his people.

Ismāʿīl has been criticized for cruelty and capriciousness, but iron rule was necessary for the ʿAlawī dynasty to survive. He was credited with having 700 sons and countless daughters. Upon his death, supreme power became vested in his ʿAbid troops, who became the arbitrators of the dynastic fortunes. He was succeeded by his son Mawlāy Aḥmad.

Wilfrid Blunt's *Black Sunrise: The Life and Times of Mulai Ismail, Emperor of Morocco 1646–1727* appeared in 1951.

Ismāʿīl I, also spelled ESMĀʿĪL I (b. July 17, 1487, Ardabīl?, Azerbaijan—d. May 23, 1524, Ardabīl, Ṣafavid Iran), shah of Iran (1501–24) and religious leader who founded the Ṣafavid dynasty (first native dynasty to rule the kingdom in 800 years) and converted Iran from the Sunnī to the Shīʿī sect of Islām.

According to tradition, Ismāʿīl was descended from an *īmām*. His father, leader of a Shīʿī group known as the Kizilbash (Red Heads), died in battle against the Sunnīs when Ismāʿīl was only a year old. Fearful that the Sunnīs, the majority sect, would wipe out the entire family, Shīʿī supporters kept family members hidden for a number of years.

Ismāʿīl emerged at the age of 14 to take his father's position as head of the Kizilbash. He quickly established a base of power in northwestern Iran, and in 1501 he took the city of Tabriz and proclaimed himself shah of Iran. In a succession of swift conquests he brought all of modern Iran and portions of present-day Iraq under his rule.

In 1510, Ismāʿīl moved against the Sunnī Uzbek tribes in what is now Uzbekistan. By skillful use of ambush Ismāʿīl was able to defeat a 28,000-man Uzbek force with only 17,000 Iranians in a battle near the city of Marv. Muḥammad Shaybānī, leader of the Uzbeks, was killed trying to escape after the battle, and Ismāʿīl had his skull made into a jewelled drinking goblet.

The Shīʿī sect of Islām was proclaimed by Ismāʿīl to be the established religion. The fact that much of the population considered him a Muslim saint as well as shah facilitated the process of conversion. Ismāʿīl's action provoked the Ottoman Turks. Religious friction grew after the Turkish ruler Sultan Selim I executed large numbers of his Shīʿī subjects as heretics and potential spies. He then wrote Ismāʿīl a series of belligerent letters. Ismāʿīl replied that he had no wish for war, adding that he thought the letters had been written under the influence of opium; he also sent Selim's royal secretary a box of the drug. Selim was an opium user, and the gesture hit home.

In 1514 the Ottomans, with highly trained professional troops armed with muskets and artillery, invaded northwest Iran. Ismāʿīl rushed from his campaigns in Central Asia to oppose the threat to his capital at Tabriz. In a hard-fought battle, Selim and a force of 120,000 troops defeated Ismāʿīl and his army of 70,000. Ismāʿīl was wounded and nearly captured as he tried to rally troops. The Ottomans then took Tabriz without opposition; a mutiny among his troops, however, forced Selim to withdraw, giving Ismāʿīl time to recover his strength.

The warfare continued as a series of border skirmishes for a number of years, but Ismāʿīl remained strong enough to prevent further inroads by the Ottomans. In 1517, Ismāʿīl moved northwest, subduing the Sunnī tribes in what is now the Soviet Socialist Republic of Georgia. The basic conflict between the Shīʿī empire Ismāʿīl had founded and the Sunnī Ottomans in the west and the Sunnī Uzbek tribes in the east continued for more than a century. Ismāʿīl died at the age of 36, but the Ṣafavid dynasty ruled Iran for two centuries, until 1722.

Ismāʿīl I ibn Aḥmad, also spelled ESMĀʿĪL EBN AḤMAD (reigned 892–907), one of the Persian Sāmānid dynasty's most famous sovereigns, who was generous, brave, just, and cultivated. Originally governor of Transoxiana at the age of 21, he extended his domains throughout Ṭabaristān and Khorāsān and, though nominally under the caliph of Baghdad, established independent rule throughout eastern Persia with his capital at Bukhara.

Ismail bin Dato' Abdul Rahman, Tun (b. Nov. 4, 1915, Johore Baharu, Straits Settlements—d. Aug. 2, 1973, Kuala Lumpur, Malaysia), Malay politician who held several ministerial portfolios.

Tun Ismail, a medical doctor trained in Singapore and Melbourne, entered Malaysian politics in 1951 when he was elected vice-president of the United Malays National Organisation, the dominant Malay political party. An active participant in the negotiations that led, in 1957, to the independence of Malaya, he served in various government offices during the last days of colonial rule before being sent as his country's first ambassador to the United States and representative to the United Nations, from 1957 to 1959.

Returning to Malaya, Tun Ismail was successively minister of external affairs, internal security, and home affairs but resigned because of ill health in 1967. He came into his own in 1969, however, when, recalled to government after the serious racial riots of that year and the consequent suspension of the parliamentary process, he did much to defuse racial tensions and to lead the country back to normalcy. He was appointed deputy prime minister in 1970 and died in office three years later.

Ismāʿīl Pasha (b. Dec. 31, 1830, Cairo—d. March 2, 1895, Istanbul), viceroy of Egypt under Ottoman suzerainty, 1863–79, whose administrative policies, notably the accumulation of an enormous foreign debt, were instrumental in leading to British occupation of Egypt in 1882.

Ismāʿīl studied in Paris and undertook various diplomatic missions in Europe before becoming viceroy in 1863. In 1867 he obtained from the Ottoman sultan the hereditary title of khedive. As viceroy he conducted important negotiations regarding completion of the Suez Canal. The canal neared completion in the summer of 1869, and Ismāʿīl turned the celebration of the canal's opening in November into a magnificent display of khedival splendour.

One of the most significant of Ismāʿīl's innovations was the establishment of an assembly of delegates in November 1866. Although this body served only in an advisory capacity, its

members eventually came to have an important influence on the course of governmental affairs. Village headmen dominated the assembly and came to exert increasing political and economic influence over the countryside and the central government. This was demonstrated in 1876, when the assembly prevailed upon Ismā'īl to reinstate the law (promulgated by him in 1871 to raise money and later repealed) that allowed landownership and tax privileges to persons paying six years' land tax in advance.

Ismā'īl, hoping to bring the vast areas of the Sudan under effective Egyptian control, hired Europeans and Americans to direct the military and administrative aspects of this venture, feeling that they would be more immune to the intrigues to which his own officials would have been subjected. Although some progress was made, Ismā'īl did not realize his goal of creating a new southern province but did assert what later became an important element in nationalist thought—the political unity of the Nile valley.

Ismā'īl's administrative policies consumed an enormous amount of money, much of it supplied by European financiers. When he assumed power, the Egyptian national debt stood at £7,000,000; by 1876 this debt had increased to almost £100,000,000. The Commission of the Public Debt was set up at the urging of Ismā'īl's foreign creditors, but he did not cooperate fully because some of the measures he was required to take would have infringed on his domestic authority. The Ottoman sultan dismissed him in June 1879.

Ismā'īl Shahīd, Muḥammad (b. April 29, 1779, Phulat, India—d. May 6, 1831, Balakote), Indian Muslim reformer who attempted to purge Indian Islām from idolatry and who preached holy war against the Sikhs and the British.

As a preacher in Delhi, Ismā'īl Shahīd attracted attention as a young man for his forceful preaching against such popular superstitions as grave worship, the veneration of saints, and other practices regarded as heretical. Returning from a pilgrimage to Mecca in 1823, he began to preach holy war (jihad) against the Sikhs who had been oppressing their Muslim subjects. In 1824–26 Ismā'īl accompanied a voluntary force of Muslim warriors led by Sayyid Aḥmad to fight a holy war against the Sikhs in the Punjab. Ismā'īl assumed leadership of the *mujāhidīn* (holy warriors) in 1830, when they were driven out of their stronghold of Peshāwar. The Muslims went down to death before a superior Sikh force at the battle of Balakote, on May 6, 1831, where Ismā'īl lost his life.

Ismailia, also transliterated AL-ISMĀ'ILIYAH, capital of Al-Ismā'īliyah *muḥāfaẓah* (governorate), northeastern Egypt. The city is about at the midpoint of the Suez Canal, on the northwestern shore of Lake At-Timsāḥ. The lake, in a natural depression, was connected to the Gulf of Suez of the Red Sea in pharaonic times.

The city was founded in 1863 by the French engineer Ferdinand de Lesseps, builder of the Suez Canal, as a base camp. It was named for the ruling Egyptian khedive (viceroy) Ismā'īl Pasha, whose elaborate palace built for the gala opening of the canal in 1869 has fallen into ruin. Laid out in contemporary 19th-century style, with broad avenues, tree-lined squares, parks, and gardens, it has a gridiron street plan.

Ismailia played an important role in modern Egyptian history: British suppression of an uprising by rebellious Egyptian police there in January 1952 was a key event leading to the overthrow of King Farouk I later that year and the Egyptian Revolution that followed. During the period that the canal was open to traffic (1869–1956; 1957–67), Ismailia prospered. The operating headquarters of the Suez Canal Company and the Central Movement Office, which regulated canal traffic, were there. When the canal was closed for eight years following the Six-Day War of June 1967, the city's economic base was undermined; much of the population was resettled elsewhere in Egypt.

With the cease-fire and peace following the 1973 war with Israel, especially after the Suez Canal reopened in 1975, Ismailia returned to prosperity. The refugees were returned, new housing was built by the government, and a tax-free industrial zone was created as part of President Anwar el-Sādat's "Open Door" policy. Industries that have been established include food processing, tractor and engine construction, and shipyard work. In the early 1980s a power plant was built in the city. The Suez Canal University opened in 1975.

The city is linked to the national rail network of Egypt via Banhā in Al-Qalyūbiyah governorate. Another railway along the Suez Canal serves Ismailia. The city has a ferry service across the canal. Pop. (1986 prelim.) 212,567.

Ismā'īlite, a sect of the Shī'ites (one of the major branches of Islām) that was most active as a religio-political movement in the 9th–13th century through its subsects, the Fāṭimids, the Qarāmiṭah (Qarmatians), and the Assassins.

The Ismā'īlites came into being after the death of Ja'far ibn Muḥammad (765), the sixth imam, or spiritual successor to the Prophet, who was recognized by the Shī'ites. Ja'far's eldest son, Ismā'īl, was accepted as his successor only by a minority, who became known as the Ismā'īlites. Those who accepted Ja'far's younger son, Mūsā al-Kāẓim, as the seventh imam and acknowledged his successors through the 12th imam became known as the Ithnā 'Asharīyah, or Twelvers, the largest and most conservative of the Shī'ite sects. Certain of the Ismā'īlites (known as Wāqifīyah, or Stoppers) believed Ismā'īl to have been the seventh and last imam and were designated as Seveners (Sab'īyah), while the majority of Ismā'īlites believed the imamate continued in the line of the Fāṭimid caliphs. The Seveners later claimed that Ismā'īl's son Muḥammad at-Tamm was expected to return at the end of the world as the mahdi ("divinely guided one").

Ismā'īlite doctrine, formulated during the late 8th and early 9th centuries, stressed the dual nature of Qur'anic interpretation, exoteric and esoteric, and, like Manichaeism, made a corresponding distinction between the ordinary Muslim and the initiated Ismā'īlite. The secret wisdom of the Ismā'īlites was accessible only through a hierarchical organization headed by the imam and was disseminated by *dā'īs* (missionaries), who introduced believers into the elite through carefully graded levels. The *Rasā'il ikhwān aṣ-ṣafā' wa khillān al-wafā'* ("Epistles of the Brethren of Purity and Loyal Friends"), a 10th-century philosophical and religious encyclopaedia influenced by Neoplatonism, was said to have been composed by a secret confraternity connected with the Ismā'īlites.

The Ismā'īlites became active in the second half of the 9th century in southern Iraq under the leadership of Ḥamdān Qarmaṭ. This branch of the sect, which came to be known as the Qarāmiṭah, established itself in Iraq, Yemen, and especially Bahrain, in the 9th–11th century.

In Tunis, 'Ubayd Allāh established himself as the first Fāṭimid caliph in 909, claiming descent—through a line of "hidden imams"—from Muḥammad, son of Ismā'īl, and through him from Fāṭimah, daughter of the Prophet, whence the dynastic name. The Fāṭimids conquered Egypt in 969; while they did not succeed in converting the bulk of their subjects during their brilliant rule of two centuries, they did create a widespread Ismā'īlite missionary network with followers all over the Islāmic world.

A fatal schism split the movement over the succession to the Fāṭimid caliph al-Mustanṣir (d. 1094). The Egyptian Ismā'īlites recognized his son al-Musta'lī, but the Ismā'īlites of Iran and Syria upheld the claims of his older son, Nizār; hence, there are two branches of Fāṭimids, the Musta'lis and the Nizāris.

When Ismā'īlīyah came to an end in Egypt with the deposition of the last Fāṭimid caliph by Saladin in 1171, the Musta'lī Ismā'īlites survived in Yemen. They had not recognized any Fāṭimid after al-Āmir, al-Musta'lī's son, and believed that al-Āmir's infant son aṭ-Ṭayyib remained alive and that the line of the imams was hidden until a future time. In the interim they are governed by the chief *dā'ī*. In the 16th century the *dā'ī* of a major branch of the Musta'lis relocated in India and now resides in Surat, in Gujarāt district. His followers in India are usually known as Bohrās.

The Nizāris, led by Ḥasan-e Ṣabbāh, gained control of a number of fortresses in Iran and Syria, the chief being Alamūt (1090). Known as Assassins, they remained in political power through the 13th century until displaced by the Mongols and the Mamlūks. The Nizāris survived, though in two rival lines. The minor line died out by the 18th century, while the major line, led by an imam called the Aga Khan, moved from Iran to India in 1840. The Aga Khan has a following, estimated in the millions, in India and Pakistan and in parts of Iran, Africa, and Syria.

The Druze, a hill people living in modern southern Lebanon, neighbouring Syria, and Israel, separated from the main body of the Ismā'īlites early in the 11th century. They then formed a special closed religion of their own, which acknowledged the imams as incarnations of the godhead.

Ismā'īliyah, Al-, *muḥāfaẓah* (governorate), northeastern Nile delta, Lower Egypt. It is a square-shaped territory with a long, narrow extension northward along the Suez Canal, ending just south of Port Said. Its eastern boundary is the Suez Canal, including Lake Murrah al-Kubrā, a shallow, marshy salt lake forming part of the Suez Canal. The governorate's total area is 557 square miles (1,442 square km), mainly desert except in the northern part.

It is traversed east–west by the Al-Ismā'īlīyah Canal, formerly called the Sweet Water Canal, built 1858–63 from the Būlāq quarter of Cairo on the Nile to the city of Ismailia on Lake At-Timsāḥ to provide fresh water for the thousands of workmen building the Suez Canal. A branch, commencing just west of the city, runs south along the waterway to Suez city. There is extensive irrigation along the main (east–west) section, and the area, otherwise waterless desert, produces fine truck crops. Cattle raising and fish farming have been introduced. Poor, sandy soils have hindered agricultural development on the Suez Canal branch. In the northern areas of the governorate, fruit and vegetables are raised on land receiving winter rains.

Just outside Ismailia to the west is a military base, established by the British in World War I. Enlarged and improved over the years, it was evacuated by the British in 1956 under the terms of the treaty of 1954 and is now occupied by Egyptian armed forces.

Ancient ruins have been discovered at Tall al-Maskhūtah, about 10 miles (16 km) west of Ismailia on the Al-Ismā'īlīyah Canal. Some scholars identify them with biblical Pithom, a site of pharaonic storehouses built by the Hebrews under Egyptian bondage (Exodus 1:11). Other scholars identify the site with biblical Succoth, the Israelites' first halt in the exodus

from Egypt (Ex. 12:37). The canal itself follows the course of an ancient Red Sea–Nile canal, first built by the Saite pharaoh Necho II (610–595 BC). Pop. (1983 est.) 447,000.

Ismay (of Wormington), Hastings Lionel Ismay, Baron (b. June 21, 1887, Naini Tāl, India—d. Dec. 17, 1965, Broadway, Worcestershire, Eng.), British soldier who became Prime Minister Winston Churchill's closest military adviser during World War II and participated in most major policy decisions of the Allied powers.

Ismay
Karsh of Ottawa—Camera Press

Commissioned in 1905, Ismay served in India and Africa. After World War I he became assistant secretary (1926–30) and secretary (1938– 40) of the Committee of Imperial Defense but exercised his greatest influence after his appointment, in May 1940, as chief of staff to Churchill in his capacity as minister of defense and his personal representative to the Chiefs of Staff's Committee, positions he retained until 1946. He actively participated in most major inter-Allied conferences throughout World War II, playing a major role in the decision to make Germany the Allies' first-priority target and in the planning for the invasion of France in 1944. He was raised to the peerage in 1947. After renewed service in India (1947), he became secretary of state for Commonwealth relations (1951–52) and secretary general of the North Atlantic Treaty Organization from 1952 until his retirement in 1957. He had daughters but no sons, and his barony lapsed upon his death.

isnād (from Arabic *sanad*, "support"), in Islām, a list of authorities who have transmitted a report (*ḥadīth*) of a statement, action, or approbation of Muḥammad, one of his Companions (Saḥābah), or of a later authority (*ṭabr*); its reliability determines the validity of a *ḥadīth*. The *isnād* precedes the actual text (*matn*) and takes the form, "It has been related to me by A on the authority of B on the authority of C on the authority of D (usually a Companion of the Prophet) that Muḥammad said. . ."

During Muḥammad's lifetime and after his death, *ḥadīth*s were usually quoted by his Companions and contemporaries and were not prefaced by *isnād*s; only after a generation or two (*c.* AD 700) did the *isnād* appear to enhance the weight of its text. In the 2nd century AH (after AD 720), when the example of the Prophet as embodied in *ḥadīth*—rather than local custom as developed in Muslim communities—was established as the norm (*sunnah*) for an Islāmic way of life, a wholesale creation of *ḥadīth*s, all "substantiated" by elaborate *isnād*s, resulted. Since *ḥadīth*s were the basis of virtually all Islāmic scholarship, especially Qur'ānic exegesis (*tafsīr*) and legal theory (*fiqh*), Muslim scholars had to determine scientifically which of them were authentic. This was done by a careful scrutiny of the *isnād*s, rating each *ḥadīth* according to the completeness of its chain of transmitters and the reliability and orthodoxy of its authorities (*see* 'ilm al-ḥadīth).

Early compilations of the most reliable *ḥadīth*s (known as *musnad*s) were even arranged by *isnād*; that is, classified according to the Companion of Muḥammad to whom they were attributed. Most notable of these was the *Musnad* of Aḥmad ibn Ḥanbal (d. 855), incorporating about 29,000 traditions. *Musnad*s proved difficult to use efficiently, however, and later compilations, known as *muṣannaf*, grouped *ḥadīth*s according to subject matter.

Iso-Hollo, Volmari (b. May 1, 1907, Ylöjärvi, Fin.—d. June 23, 1969, Heinola), Finnish runner who won two successive gold medals in the Olympic Games (1932, 1936) for the 3,000-metre steeplechase. He also won a silver medal for the 10,000-metre race in the 1932 Olympic Games at Los Angeles and a bronze medal in the same event during the 1936 games at Munich. During the 1932 Olympic steeplechase, an official's error forced the competitors to run an extra lap.

isoamyl nitrite: *see* isopentyl nitrite.

isobar, line on a weather map of constant barometric pressure drawn on a given reference surface. The isobaric pattern on a constant-height surface is extremely useful in weather forecasting because of the close association between pressure and weather. Regions of low pressure at sea level tend to be areas of bad weather, especially in winter. At higher elevations the wind blows approximately parallel to the isobars, with low pressure to the left in the Northern Hemisphere and to the right in the Southern Hemisphere; the closer together the isobars are, the stronger is the wind speed. Only sea-level pressure patterns are routinely used in meteorology. At higher elevations pressure itself is used to define the reference surface upon which contours of the height above sea level are drawn; dynamically, the height contours of a constant pressure surface are completely analogous to the isobars of a constant-height surface.

isobar, in nuclear physics, any member of a group of atomic or nuclear species all of which have the same mass number—that is, the same total number of protons and neutrons. Thus, chlorine-37 and argon-37 are isobars. Chlorine-37 has 17 protons and 20 neutrons in its nucleus, whereas argon-37 has a nucleus comprising 18 protons and 19 neutrons. In beta decay, mother and daughter nuclei are always isobars, because either a neutron is converted to a proton or a proton is converted to a neutron in the process.

isobaric spin (particle physics): *see* isospin.

isobutane (chemistry): *see* butane.

isocarboxazid, antidepressant drug of the monoamine-oxidase inhibitor type, introduced into medicine about 1960 and used to treat moderate to severe mental depression. Like other monoamine-oxidase inhibitor drugs, it prevents the enzymatic breakdown of norepinephrine, the brain-neurotransmitter substance concerned with emotional stimulation. Isocarboxazid is administered orally and is readily absorbed from the stomach. The onset of action is delayed, the effects of the drug developing slowly over the first two weeks of therapy. As with other monoamine-oxidase inhibitor drugs, liver damage is a possible side effect.

Isocrates (b. 436 BC, Athens—d. 338, Athens), ancient Athenian orator, rhetorician, and teacher whose writings are an important historical source on the intellectual and political life of the Athens of his day. The school he founded differed markedly in its aims from the Academy of Plato and numbered among its pupils men of eminence from all over the Greek world.

Early life and influences. Isocrates was born into a prosperous family shortly before the outbreak of the Peloponnesian War (431–404 BC). He passed his youth in a gloomy period following the death of Pericles, the great Athenian leader and statesman, a period in which wealth—both public and private—was dissipated, and political decisions were ill-conceived and violent. He would have been 14 years old when the democracy voted to put to death all male citizens of the small Thracian city of Scione. Isocrates was deeply moved by a desire to see Greece united and at peace and was influenced by, among others, the Sicilian sophist Gorgias, who not only inspired his pupil with a taste for Gorgianic prose but also put before him as the cure for Greece's ills the Panhellenist program; that is, union of Greeks in an attack on the Persian Empire and the settlement therein of the impoverished, thus securing peace between and within cities. This became and remained Isocrates' political creed.

In the closing years of the Peloponnesian War, Isocrates lost his inherited wealth and began to earn money by writing speeches for others to use in the courts. A few of these speeches survive. This was, in fact, the conventional start to a career as an orator, but since he lacked both the voice and the self-confidence necessary for a public speaker he turned his attention to education, and for more than 40 years his main effort was to prepare for successful public life those who could afford to pay his heavy fees.

Of his hundred pupils the most notable were Timotheus, the Athenian general, prominent in Athens' history between 378 and 355; Nicocles, the ruler of Salamis in Cyprus; and the two greatest Greek historians of the 4th century, Ephorus—who wrote a universal history—and Theopompus—who wrote the history of Philip II of Macedon. In this way his influence permeated both politics and literature.

At the same time he continued to publish a series of speeches on the state of Athens and of Greece. How far these influenced his contemporaries has been fruitlessly debated. Their importance for historians is that they provide an index of Panhellenist, conservative Greek opinion, and whoever reads with attention the "Panegyric" (380), "On Peace" (355), "On the Areopagus" (354?), "To Philip" (346), and the "Panathenaic" oration (begun 342, completed 339) will have gained considerably in understanding of the larger issues of the age.

Isocrates as rhetorician. Isocrates, however, was a man of no great intellectual power, and it is not surprising to find him contemptuous of the philosophical subtleties of the Platonic circle. He cared above all for polished expression; he is said to have taken 10 years in the composition of the "Panegyric," and a man who could expend effort on such showpieces of oratory as the "Encomium of Helen" (390) clearly had little of real intellectual importance to say. His defects and his preferences showed themselves in the system of education that he developed. Unfortunately, his discussion in the speeches "Against the Sophists" and in "On the Exchange" tells one more of what he objected to in other systems than of what he actually had in his own, but it can be safely asserted that, whereas the training of the Platonic Academy was essentially philosophical, that of Isocrates was almost entirely given over to rhetoric, the art of persuasion.

There is indeed a strong suspicion that Isocrates would lend his talents to any cause whatsoever, merely for the pleasure of presenting it well. The so-called Cyprian orations—"To Nicocles" (*c.* 372), the "Nicoles" (*c.* 368), and the "Evagoras" (*c.* 65)—are concerned with the laudations of monarchs, while the "Archidamus" (366) puts into the mouth of the heir to one of the Spartan kings a speech full of praise for Sparta and Spartanism. One

is correspondingly less impressed when in the "Panegyric" and "Panathenaic" orations he professed admiration for Athens. Such exaltation of style and indifference to matter is contemptible, and, insofar as his purpose in his system of education appears to have been to train others to a similar facility, he can hardly escape the censure he accorded to other rhetorical schools.

Isocrates did have beliefs, however, some of which are revealed in "On the Areopagus," composed at the end of the Social War, when Athens' fortunes were at their lowest for 50 years. In this work he commends the ancient constitution of Athens, under which the aristocratic council of the Areopagus exercised a general supervision over the conduct of citizens. Isocrates' proposals for returning to the system in operation before the days of democracy were not practical but display profoundly conservative inclinations.

His other mainstay was Panhellenism, and this is what chiefly interests historians. In the "Panegyric" he developed the theme that many, notably Gorgias and the rhetorician Lysias, had recently argued: he called on Sparta to establish concord in Greece by recognizing the fitness and right of Athens to share with Sparta hegemony in Greece and by proceeding with the national crusade against Persia. This amounted to a reassertion of the political faith of the great 5th-century opponent of Persia, Cimon. More than 30 years later, in the letter "To Philip," Isocrates appealed to the King of Macedonia to reconcile the Greeks and lead them against Persia. Since Philip was on the point of intervening in Greece to settle the Second Sacred War (355–346), many have believed that Isocrates was prepared to submit his country to an outside master.

This is unjust, for Isocrates, a political innocent, had only the vaguest idea of what the consequences of such a policy might be. He had in fact made earlier similar appeals to Agesilaus, king of Sparta, to Dionysius I, tyrant of Syracuse, and to Alexander, tyrant of Pherae in Thessaly, none of whom could conceivably have become political master of Greece. The truth is that Isocrates was seeking merely a military leader. These earlier appeals came to nothing, and in the 350s, when Greece was divided first by the Social War, precipitated by the Athenian policy of sending cleruchies (colonizing groups) to Samos, the subjection of Cos and Naxos to Athenian jurisdiction, and the arbitrary demands of Athenian generals for money, and then by the Sacred War, fought as a result of the refusal of the Phocians to pay a fine levied by the Amphictyons, and when Persia was again threatening, there could be no question of Greece uniting to attack. Isocrates thus had to confine himself to pleading for peace, notably in the speech "On Peace" at the end of the Social War.

Isocrates' disillusionment and death. The rise of Philip led him to hope that all was not lost—he had his general at last. But he never paused to ask what would happen to Greece when Macedonia had succeeded in gratifying Panhellenist dreams. And, when all hopes for peaceful relations between Athens and Philip faded, he promptly forgot about Philip, and in his last great speech, the "Panathenaic" oration, Philip has no part. After the Battle of Chaeronea, at which Greek independence was lost and as a result of which Philip indeed became master, Isocrates in despair starved himself to death (338).

Historians debate whether he was the prophet of the Hellenistic world, that great expansion of Hellenism resulting from the foundation of cities in Asia by Philip's son Alexander the Great and his successors. Certainly, he adhered to the Panhellenist idea that Asia should be colonized by the Greeks, but he appears to have envisaged no more than the colonization of Asia Minor, and the actual Macedonian settlements were far from the comfortable retreats Isocrates had dreamed of for the poor of Greece. He had, furthermore, merely thought of exporting the poor. He had no vision of the great new common market that would save Greece from misery. So perhaps the title prophet is too much. But he did see that at the heart of Greek troubles was poverty, and in his unwavering belief in colonization he showed a common sense denied in this matter to his greater contemporaries, Plato and Aristotle.

(G.L.Ca.)

(1963; *A History of Greek Literature*, 1966), gives an up-to-date statement (pp. 582–591) of Isocrates' literary achievement and importance; George A. Kennedy, *The Art of Persuasion in Greece* (1963), surveys and assesses the contribution of Isocrates to Greek rhetoric; Georges Mathieu, *Les Idées politiques d'Isocrate* (1925), provides a full account of the dating, circumstances, and importance of the political writings of Isocrates; N.H. Baynes, *Byzantine Studies and Other Essays*, pp. 144–167 (1955), makes a spirited attack on Isocrates' intellectual standing and integrity and claims to expose the shameful self-interest that inspired his work; H.I. Marrou, *Histoire de l'éducation dans l'antiquité* (1948; *A History of Education in Antiquity*, 1956), assesses Isocrates' place in the history of education, and particularly in relation to Plato; Klaus Bringmann, *Studien zu den politischen Ideen des Isokrates* (1965), contains ample bibliography.

isocyanide, also called ISONITRILE or CARBYLAMINE, any of a class of organic compounds having the molecular structure $R{-}N^{+}{\equiv}C^{-}$, in which R is a combining group derived by removal of a hydrogen atom from an organic compound. The isocyanides are isomers of the nitriles; they were discovered in 1867 but have never achieved any large-scale utility. They are usually prepared from primary amines by treatment with chloroform and alkali and often are obtained as minor products in the synthesis of nitriles from metal cyanides and organic halogen compounds. They possess remarkably powerful and repulsive odours.

isodrin, chlorine-containing organic compound used as an insecticide; *see* aldrin.

Isoetes (plant genus): *see* quillwort.

Isoko, people of the northwestern part of the Niger Delta in Nigeria, speaking a language of the Kwa branch of the Niger-Congo family. The term Sobo is used by ethnographers as a cover term for both the Isoko and their neighbours the Urhobo, but the two groups remain distinct from one another.

Isoko economy is based on farming, fishing, and the production of palm oil and kernels. The main food crops are yams and cassava, supplemented by corn (maize), beans, peppers, and peanuts (groundnuts).

The family, consisting of a man, his wife or wives, and their children, lives together in a compound; one or more groups of families related through patrilineal descent occupy a ward of the village. The village itself is a compact settlement, usually containing fewer than 500 persons. Both men and women are grouped into age-grades, each with particular responsibilities. The duties of the women's grades include the ritual surrounding fertility and childbirth, and control of the market. Young boys perform simple communal tasks; adult men do major community work and are the fighting and executive unit of the village; older men form the nucleus of the village council. Membership in certain title organizations is available on payment of fees and is an important source of political authority. The Isoko never formed a single social or political unit; local communities remain autonomous.

Traditional religion includes belief in a creator god and his messengers, in spirits, and in ancestral spirits. Diviners are consulted to explain failures in any activity, on occasions of illness or death, and before economic activity. Witches are believed to be organized into groups that meet regularly in large trees. Many Isoko, however, are now Christians.

isolating language, a language in which each word form consists typically of a single morpheme. Examples are Classical Chinese (to a far greater extent than the modern Chinese languages) and Vietnamese. An isolating language tends also to be an analytic language (*q.v.*), so that the terms isolating and analytic are often used interchangeably in linguistics.

isolation, in medicine, separation of an infected individual (human or animal) from the healthy until that individual is no longer able to transmit the disease. In its strictest sense, the practice of isolation differs from that of quarantine, which is the detention of an individual who may have been exposed to a communicable disease until it is deemed certain that he has escaped infection. *See* quarantine.

Isolation is also a technique used in medicine and in biological research to maintain a germfree environment. *See* germfree life.

Isolde, also spelled ISOLT (in medieval romance): *see* Tristan and Iseult.

isoleucine, an amino acid present in most common proteins, sometimes comprising 2 to 10 percent by weight. First isolated in 1904 from fibrin, a protein involved in blood-clot formation, isoleucine is one of several so-called essential amino acids for chicks, rats, and other higher animals, including man; *i.e.*, they cannot synthesize it and require dietary sources. In microorganisms and plants, isoleucine is synthesized from the amino acid threonine.

isomer, in nuclear physics, any of two or more nuclides (species of atomic nuclei) that consist of the same number of protons and the same number of neutrons but differ in energy and manner of radioactive decay, and that exist for a measurable interval of time. The half-life of the more energetic isomer may be as short as about 10^{-11} second but, in some extreme cases, as long as several years. Two nuclear isomers of cobalt-58, for example, are known: the lower energy isomer, ^{58}Co, of 71-day half-life (which decays by electron capture and positron emission); and the high-energy isomer, ^{58m}Co (*m* for metastable), of 9-hour half-life (which undergoes gamma decay, forming ^{58}Co).

Nuclear isomers are formed as a direct result of reactions such as bombardment of nuclei by subatomic particles or as intermediate decay products of radioactive nuclei. Extremely unstable nuclei that decay as soon as they are formed in nuclear reactions and intermediate decay products the half-lives of which are less than about 10^{-11} second are not generally classified as nuclear isomers.

isomer, in meteorology, line on a map connecting points having the same monthly or seasonal precipitation, expressed as a percentage or fraction of the annual total; it is similar to an isohyet, a line that connects points of the same total precipitation for a given time period or for a particular storm. Isomers and isohyets generally will not coincide. In regions with more than one rainy season isomeric analysis is useful in establishing the relative importance of each rainfall regime.

isomerase, any one of a class of enzymes that catalyze reactions involving a structural rearrangement of a molecule. Alanine racemase, for example, catalyzes the conversion of L-alanine into its isomeric (mirror-image) form, D-alanine. An isomerase called mutarotase catalyzes the conversion of α-D-glucose into β-D-glucose. *cf.* ligase, lyase.

isomerism, the existence of sets of two or more substances that have identical molecular formulas but different molecular structures or configurations, and hence different properties. The substances that make up these sets differ only in the arrangement of their component atoms and are called isomers.

It is now generally accepted that the differences in the properties of isomers result from differences in the arrangements of atoms within the molecules, but at the time (1830) that isomerism was recognized and named (by the Swedish chemist Jöns Jakob Berzelius), even the existence of molecules was not well established. The idea that atoms might unite in a given ratio but different patterns was quite novel; indeed, the investigation of isomerism contributed to the development of the concept that many substances are made up of particles whose composition is defined by not only the numbers and proportions of different atoms but also their arrangement.

For the rest of the 19th century, the study of isomerism was practically a branch of organic chemistry. In 1893, however, the Swiss chemist Alfred Werner published his findings on the structures of the inorganic coordination compounds. These structures correctly account for the complex isomerism of covalent inorganic compounds.

The two principal classes of isomers are constitutional (or structural) isomers and stereoisomers. Substances are said to be constitutional isomers if they have the same elemental composition and molecular weight but differ in the order in which the atoms are bonded. On the other hand, they are called stereoisomers if they have the same composition, molecular weight, and bonding pattern but differ in the spatial arrangements that their atoms can assume without breaking any covalent bonds. (At ordinary temperatures all polyatomic molecules constantly undergo internal vibration, torsion, and flection, but the differing shapes that result are not regarded as isomers.)

A typical example of constitutional isomerism is provided by the two compounds ethyl alcohol and methyl ether, which both have the molecular formula C_2H_6O. At atmospheric pressure ethyl alcohol is a liquid that boils at 78° C (172° F) and is converted to ethyl iodide upon reaction with hydriodic acid. Methyl ether is a gas that liquefies at −24° C (−11° F) and is converted to methyl iodide by reaction with hydriodic acid. The molecular structure of ethyl alcohol is $CH_3{-}CH_2{-}OH$; that of methyl ether is $CH_3{-}O{-}CH_3$.

Constitutional isomers that can be readily changed into each other are called tautomers. Typical is the ester ethyl acetoacetate, which under ordinary circumstances is a mixture of the so-called keto form (about 92 percent) and the enol form (about 8 percent).

Two classes of stereoisomeric compounds are generally recognized: optical isomers and geometric isomers. Optical isomers occur in pairs that are nonsuperimposable mirror images of each other, like right- and left-handed gloves. They take their name from their effect of rotating the plane of polarization of a beam of polarized light that is directed through them: one member of each pair causes rotation in one direction, the other in the opposite direction. This phenomenon, called optical activity, arises from any of several kinds of imbalance in the three-dimensional structure of the molecule that cause it to have no point, line, or plane of symmetry.

The optical activity of these compounds is the only physical property that differentiates them. The chemical properties of optical isomers also are identical, except in their interactions with other dissymmetric compounds.

Geometric isomerism results from rigidity in the molecular structure; in organic compounds this rigidity most often is associated with a double bond or a ring of atoms. In most compounds in which two carbon atoms are linked by a double bond, each of these atoms is also linked by single bonds to two other atoms (or groups of atoms), which may differ from one another—say, *A* and *B*. The two carbon atoms and the four atoms directly bonded to them are held in a plane by the double bond. There are therefore two different arrangements: one, called *cis,* in which the two *A* atoms are on the same side of the double bond, and one, called *trans,* in which the two *A* atoms are on opposite sides. In any such pair, the *cis* isomer differs from the *trans* both physically and chemically.

The molecules of the simplest cyclic hydrocarbons consist of three or more methylene (CH_2) groups joined in a ring. In cyclopropane, for example, there are three such groups; the three carbon atoms define a plane, and the two hydrogen atoms bonded to each of them lie on different sides of this plane. If the hydrogen atoms attached to two of the carbon atoms are replaced by other atoms—say, *A*—two different structures are possible. In one (*cis*), the two *A* atoms lie on the same side of the plane; in the other (*trans*), the *A* atoms lie on opposite sides.

Cis-trans isomerism also occurs in two groups of inorganic compounds. In coordination compounds such as dichlorodiammineplatinum(II), $PtCl_2(NH_3)_2$, in which a metal atom is surrounded by two pairs of covalently bonded atoms or groups of atoms (ligands) that are situated at the vertices of a square, the ligands of one pair—say, the two chlorine atoms—occupy adjacent vertices in the *cis* isomer and diagonally opposite vertices in the *trans* isomer. If the metal atom is linked to six ligands, two of one kind and four of another, located at the vertices of an octahedron, the ligands of the pair occupy adjacent vertices in the *cis* isomer and opposite vertices in the *trans* isomer.

isomerization, the chemical process by which a compound is transformed into any of its isomeric forms, *i.e.,* forms with the same chemical composition but with different structure or configuration and, hence, generally with different physical and chemical properties. An example is the conversion of butane, a hydrocarbon with four carbon atoms joined in a straight chain, to its branched-chain isomer, isobutane, by heating the butane to 100° C or higher in the presence of a catalyst. Butane and isobutane have widely different properties. Butane boils at −0.5° C and freezes at −138.3° C, whereas isobutane boils at −11.7° C and freezes at −159.6° C. More important from the commercial standpoint, branched-chain hydrocarbons are better motor fuels than their straight-chain isomers. The isomerization of straight-chain hydrocarbons to their corresponding branched-chain isomers is an important step (called reforming) in gasoline manufacture. There are numerous other examples of isomerization reactions of great industrial importance.

isometric drawing, also called ISOMETRIC PROJECTION, method of graphic representation of three-dimensional objects, used by engineers, technical illustrators, and, occasionally, architects. The technique is intended to combine the illusion of depth, as in a perspective rendering, with the undistorted presentation of the object's principal dimensions, that is, those parallel to a chosen set of three mutually perpendicular coordinate axes.

The isometric is one class of orthographic projections. (In making an orthographic projection, any point in the object is mapped onto the drawing by dropping a perpendicular from that point to the plane of the drawing.) An isometric projection results if the plane is oriented so that it makes equal angles (hence "isometric," or "equal measure") with the three principal planes of the object. Thus, in an isometric drawing of a cube, the three visible faces appear as equilateral parallelograms; that is, while all of the parallel edges of the cube are projected as parallel lines, the horizontal edges are drawn at an angle (usually 30°) from the normal horizontal axes, and the vertical edges, which are parallel to the principal axes, appear in their true proportions.

isometric system, also called CUBIC SYSTEM, one of the crystal systems to which a given crystalline solid can be assigned. Crystals in this system are referred to three mutually perpendicular axes of equal lengths. If the atoms or atom groups in the solid are represented by points and the points are connected, the resulting lattice will consist of an orderly stacking of blocks, or unit cells. The isometric unit cell is distinguished by four lines, called axes of threefold symmetry, about which the cell can be rotated by 120° without changing its appearance. This characteristic requires that the cell be a perfect cube; the threefold axes are the diagonals of the cube.

A cube has six square faces, but many of the crystal forms in the isometric system display more complex configurations; among the most symmetrical forms of the isometric (or cubic) system are the octahedron (8 faces), trisoctahedron (24 faces), and hexoctahedron (48 faces).

Only a small fraction of the thousands of recognized crystalline solids are included in the isometric system. Some of these are sodium chloride (table salt), copper, gold, silver, platinum, iron, fluorite, leucite, diamond, garnet, spinel, pyrite, galena, and magnetite.

isoniazid, also called ISONICOTINIC ACID HYDRAZIDE (INH), drug used in the chemotherapy of tuberculosis in combination with other drugs, such as rifampin, ethambutol, or streptomycin; these drugs are used with isoniazid in order to prevent, or at least delay, the development of isoniazidresistant strains of the infective agents, tuberculin bacilli. Treatment usually is continued for many months. The most important drug in the therapy of tuberculosis, isoniazid was introduced into medicine in 1952; it usually is administered orally, but it can be given by injection. It may cause dizziness or headache, but side effects are not common.

Isonzo, Battles of the (1915–17), 12 battles along the Isonzo River on the eastern sector of the Italian Front in World War I.

Although it is now located in Slovenia, the Isonzo River at the time ran roughly northsouth just inside Austria along its border with Italy at the head of the Adriatic Sea. The river is flanked by rugged peaks, and the Austrians had fortified the mountains prior to Italy's entry into the war on May 23, 1915, giving them quite a considerable advantage over the Italians. The Italian general Luigi Cadorna launched his first attack against the Austrians on June 23. For 14 days the Italian army attempted to cross the river and scale the heights beyond, but they were beaten back. Again during July 18–August 3, October 18–November 3, and November 10–December 2, the Italians attacked, but they penetrated only a few miles into the Austrian sector at the cost of heavy losses. From March 9 to 17, 1916, Cadorna tried again—and again failed. In the sixth battle, August 6–17, 1916, Gorizia was captured and a bridgehead was secured across the Isonzo, the first real victories. In the next three battles, September 14–17, October 10–12, and November 1–4, the Italians changed their tactics to short, intense attacks in order to limit their casualties, but they still could not penetrate the formidable natural barriers protected by Austrian artillery. In the 10th battle, May 12–June 8, 1917, Cadorna struck in two places with reinforced troops and

greater numbers of artillery but gained only a few yards of ground.

During August 19–September 12 the Italians struck again, this time with a total of 51 divisions and 5,200 guns, and they slowly pushed forward, dislodging the Austrians as they advanced. The Germans feared that the Austrian front might collapse and sent reinforcements. On October 24 the Austrian-German forces took the offensive, beginning with a heavy bombardment. By afternoon the Italian army was in a rout. War-weary and demoralized territorial troops threw down their arms, the Austrians poured over the Isonzo, and Caporetto fell, though many Italian units continued to fight as they retreated toward the Piave River, where they held the line on November 7, after one of the worst defeats in Italian history.

Consult the INDEX *first*

isopentyl nitrite, also called ISOAMYL NITRITE, one of the oldest and most important vasodilators (*i.e.,* agents that expand blood vessels). It is used in medicine to provide relief from attacks of angina pectoris (chest pain precipitated by oxygen deficiency in the heart muscles) and to treat ischemia (insufficient arterial blood flow) of smooth muscle. Isopentyl nitrite is administered by inhalation and is very rapidly absorbed from the lungs. Its action is nonspecific; *i.e.,* it affects all smooth muscles, causing them to relax.

Isopentyl nitrite is a clear, pale yellow liquid with a characteristic penetrating odour.

isoperimetric problem, in mathematics, the determination of the shape of the closed plane curve having a given length and enclosing the maximum area (the curve is a circle). The calculus of variations evolved from attempts to solve this problem and the brachistochrone (*q.v.*) problem. Isoperimetrics was made the subject of an investigation by 17th- and 18th-century Swiss mathematicians, the Bernoullis, who found and classified many curves having maximum or minimum properties. A major step in generalization was taken by the Swiss mathematician Leonhard Euler, who published the rule (1744) later known as Euler's differential equation, useful in the determination of a minimizing arc between two points on a curve having continuous second derivatives and second partial derivatives. His work was soon supplemented by that of Joseph-Louis Lagrange, Adrien-Marie Legendre, and others.

Techniques of the calculus of variations are frequently applied in seeking a particular arc from some given class for which some parameter (length or other quantity dependent upon the entire arc) is minimal or maximal. Surfaces or functions of several variables may be involved. A problem in three-dimensional Euclidean space (that of finding a surface of minimal area having a given boundary) has received much attention and is called Plateau's problem. As a physical example, consider the shapes of soap bubbles and raindrops, which are determined by the surface tension and cohesive forces tending to maintain the fixed volume while decreasing the area to a minimum. Other examples may be found in mechanics, electricity, relativity, and thermodynamics.

isopod, any member of the order Isopoda (class Crustacea), a group of diverse, widely occurring forms including marine, freshwater, and terrestrial species. Most are free-living, but a number of marine species are parasitic on other animals. They are usually inconspicuous. Most of the 4,000 species, which include the pill bug, the sow bug, and the gribble (*qq.v.*), are from 0.7 to 35 mm (0.28 to 1.4 inches) long; however, *Bathynomus giganteus,* a marine species of the Caribbean Sea, grows to 35 cm (14 inches).

Isopod (*Asellus*)
E.R. Degginger

The body is elongated, rather flat, and somewhat arched. The back is covered by a series of wide, armour-like plates; the thorax, or midsection, has seven segments, the abdomen six. There are usually six pairs of limbs, but sometimes as few as two or as many as eight are found.

Sow bugs and pill bugs are often found in leaf litter. Aquatic forms are abundant among water plants near the shore. Parasitic forms live in the internal organs of fishes and prawns.

isoprene, also called 2-METHYL-1,3-BUTADIENE, a colourless, volatile liquid hydrocarbon obtained in processing petroleum or coal tar and used as a chemical raw material. The formula is C_5H_8.

Isoprene, either alone or in combination with other unsaturated compounds (those containing double and triple bonds), is used principally to make polymeric materials (giant molecules consisting of many small, similar molecules bonded together) with properties dependent upon the proportions of the ingredients as well as the initiator (substance that starts the polymerizing reaction) employed. The polymerization of isoprene using Ziegler catalysts yields synthetic rubber that closely resembles the natural product. Butyl rubber, made from isobutene with a small amount of isoprene, using aluminum chloride initiator, has outstanding impermeability to gases and is used in inner tubes.

Many plant substances have formulas that are small multiples of C_5H_8. The formation of isoprene upon thermal decomposition of these materials led to the proposal by the German chemist Otto Wallach in 1887 that they are built up from isoprene units. This "isoprene rule" was verified in numerous cases and has proved useful in studies of the structures of terpenes and terpenoids.

isoprenoid, any of a class of organic compounds composed of two or more units consisting of five carbon atoms in a specific pattern. Isoprenoids play widely varying roles in the physiological processes of plants and animals. They also have a number of commercial uses.

A brief treatment of isoprenoids follows. For full treatment, *see* MACROPAEDIA: Chemical Compounds.

Isoprenoids in living organisms range in function from pigments and fragrances to vitamins and precursors of sex hormones. One of the most familiar natural substances, rubber, is a polyisoprene. Other commercially valuable isoprenoids are those used as flavourings, solvents, and raw materials for chemicals.

The five-carbon unit that constitutes the basic building-block of isoprenoids is a hydrocarbon called isoprene. Isoprene (2-methyl-1,3-butadiene) is a branched-chain, unsaturated hydrocarbon, unsaturated meaning it contains one or more double bonds between carbon atoms. Isoprene has, in fact, two carbon–carbon double bonds. Isoprenoids contain from two to many thousands of isoprene units. Most of the natural isoprenoids are composed of two, three, four, six, or eight isoprenes. Those containing two to four isoprenes are formed by simple addition of the five-carbon units. The six- and eight-unit molecules are made by linking together two three-unit and four-unit molecules, respectively. The carbon backbone can have one or more functional chemical groups, such as hydroxyl and carbonyl, attached to it. These help to give isoprenoids their diversity.

The isoprenoids are also known as terpenes. The smallest terpene molecules—those containing 10 carbon atoms—are called monoterpenes. The larger molecules, which increase by five-carbon units at a time, are called sesquiterpenes, diterpenes, triterpenes, and tetraterpenes, respectively. The monoterpenes are mostly volatile, which accounts for their fragrances. Terpenes of higher molecular weight are less volatile, although sesquiterpenes contribute to the flavours of some foods. Adding water molecules to a pyrophosphate group connected to a monoterpene produces geraniol, a component of geranium oil and an important contributor to rose perfumes. Related molecules are menthol from peppermint oil; citral from lemongrass oil; and limonene from lemon and orange oils. Other monoterpenes include pinene, from turpentine, and camphor.

Many of the larger terpenes are cyclic—*i.e.,* they contain ring structures. However, the diterpene called phytol, an important precursor of the plant pigment chlorophyll, is acyclic. A related diterpene that contains one ring of six carbon atoms is vitamin A.

One of the most important triterpenes is squalene. Although acyclic, it is a precursor of the four-ring steroids that play a key role in controlling many biological activities. Squalene is found widely in nature, notably in fish-liver oils. Five-ring triterpenes, which are derived from squalene, like steroids, are found in many plants. They are often linked chemically to sugars to form compounds called saponins.

The tetraterpenes include many plant pigments such as lycopene, which accounts for the red of tomatoes, and *β*-carotene, which accounts for the yellow in carrots. *β*-carotene is a symmetrical molecule that the digestive process splits to produce vitamin A.

Polyterpenes are polymers having numerous isoprene units. The best known is natural rubber, in which 4,000 to 5,000 five-carbon units are linked together. Another polymeric isoprene is gutta-percha, a tough plastic substance used in insulation and in dentistry.

isopropyl alcohol, one of the most common members of the alcohol family of organic compounds. *See* propyl alcohol.

isorhythm, in music, the organizing principle of much of 14th-century French polyphony, characterized by the extension of the rhythmic texture (*talea*) of an initial section to the entire composition, despite the variation of corresponding melodic features (*color*); the term was coined around 1900 by the German musicologist Friedrich Ludwig.

A logical outgrowth of the rhythmic modes (fixed patterns of triple rhythms) that governed most late medieval polyphony, isorhythm first appeared in 13th-century motets, primarily in cantus firmus or tenor parts but occasionally in other voices as well. Abandoning

all modal limitations, the isorhythmic motet of the 14th century managed to derive decisive structural benefit from the systematic application of given rhythmic patterns without the inescapable dance associations of its 13th-century predecessor. The first great master of the isorhythmic motet was Guillaume de Machaut (*c.* 1300–77), but instances of isorhythm occurred as late as the early work of the 15th-century Burgundian composer Guillaume Dufay (*c.* 1400–74). As an analytical concept, isorhythm has proved valuable in connection with musical practices quite unrelated to those of the European Middle Ages—for example, peyote cult songs of certain North American Indian groups.

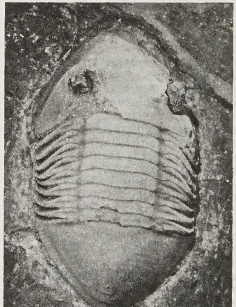
isospin, also called ISOBARIC SPIN, or ISOTOPIC SPIN, property that is characteristic of families of related subatomic particles differing principally in the values of their electric charge. The families of similar particles are known as isospin multiplets: two-particle families are called doublets, three-particle families are called triplets, and so on.

The component particles of atomic nuclei, the neutron and proton, form an isospin doublet, since they appear to differ in nothing but electric charge and subsidiary properties. They are commonly thought of as different versions, or charge states, of the same object, called a nucleon. The isospin of a nucleon has a value of one-half. Isospin values are found by subtracting one from the number of members in its multiplet and then dividing by two.

The main importance of isospin in physics is that, when particles collide or decay under the influence of the strong nuclear force, their isospin is conserved. That is to say, even as the particles rearrange themselves or change into new particles, their total isospin value, computed in a specified way from the individual values, remains constant. Rules like this and others applicable to isospin (known as isospin selection rules) help physicists to consolidate their understanding of fundamental laws.

Isospora, genus of parasitic protozoans of the sporozoan subclass Coccidia. *Isospora* causes the disease known as coccidiosis (*q.v.*) in humans, dogs, and cats. The species that attack humans, *I. hominis* and *I. belli,* inhabit the digestive tract and are endemic in many areas of southern Europe, Asia, Africa, Latin America, and Oceania. Symptoms of human infection include weight loss, digestive disturbances, and fever. Dogs and cats are infected by the species *I. bigemina, I. rivolta,* and *I. felis.* The genus is recognized by spore cases containing two spores, each of which contains four infective parasites (sporozoites).

isostasy, theoretical balance of all large portions of the Earth's crust as though they were floating on a denser underlying layer, about 110 km (70 miles) below the surface. Imaginary columns of equal cross-sectional area that rise from this layer to the surface are assumed to have equal weights everywhere on Earth, even though their constituents and the elevations of their upper surfaces are significantly different. This means that an excess of mass seen as material above sea level, as in a mountain system, is due to a deficit of mass, or low-density roots, below sea level.



In the theory of isostasy, a mass above sea level is supported below sea level, and thus there is a certain depth at which the total weight per unit area is equal all around the world; this is known as the depth of compensation. The depth of compensation was taken to be 112.7 km (70 miles) according to the Hayford-Bowie concept (named for John Fillmore Hayford [1868–1925] and William Bowie [1872–1940]).

The Airy hypothesis says that the Earth's crust is a more rigid shell floating on a more liquid substratum of greater density. Sir George Biddell (1801–92) Airy assumed that the crust has a uniform density throughout. The thickness of the crustal layer is not uniform, however, and so this theory supposes that the thicker parts of the crust sink deeper into the substratum, while the thinner parts are buoyed up by it. According to this hypothesis, mountains have roots below the surface that are much larger than their surface expression. This is analogous to an iceberg floating on water, in which the greater part of the iceberg is under water.

The Pratt hypothesis (of John Henry Pratt [1809–71]) supposes that the Earth's crust has a uniform thickness below sea level with its base everywhere supporting an equal weight per unit area at a depth of compensation. In essence, this says that areas of the Earth of lesser density, such as mountain ranges, project higher above sea level than do those of greater density. The explanation for this was that the mountains resulted from the upward expansion of locally heated crustal material, which had a larger volume but a lower density after it had cooled.

The Heiskanen hypothesis (of Weikko Aleksanteri Heiskanen [1895–1971]) is an intermediate or compromise hypothesis between Airy's and Pratt's. This hypothesis says that approximately two-thirds of the topography is compensated by the root formation (Airy model) and one-third by the Earth's crust above the boundary between the crust and substratum (Pratt model).

Isotelus, genus of trilobites (extinct arthropods) restricted to Europe and North America during the Ordovician Period (505 to 438 million years ago). *Isotelus* was relatively large for a trilobite and was characterized by its distinctive flat shape. The head and the tail were well developed and large relative to the whole animal. The number of thoracic segments was small, and the eyes were large and crescentic in shape.

Isotelus

isotherm, line drawn on a map or chart joining points with the same temperature. Sometimes the prefix *choro-* ("space") or *chrono-* ("time") is added. Isotherms are commonly used in meteorology to show the distribution of temperature at the Earth's surface or on a chart indicating constant level or constant pressure. They are also used to show the time variation of temperature with height in the atmosphere or with depth in soil or water; the characteristics of heat flow into soil, for example, are easily visualized from a graph showing temperature as a function of depth and time. In climatology, a convenient way to compare thermal climates is to plot for each location temperature as a function of time of day (vertical axis) and time of year (horizontal axis); the resulting isotherms are sometimes called thermoisopleths.

isotone, any of two or more species of atoms or nuclei that have the same number of neutrons. Thus, chlorine-37 and potassium-39 are isotones, because the nucleus of this species of chlorine consists of 17 protons and 20 neutrons, whereas the nucleus of this species of potassium contains 19 protons and 20 neutrons.

isotope, one of two or more species of atoms of a chemical element with the same atomic number and position in the periodic table and nearly identical chemical behaviour but with different atomic masses and physical properties.

A brief treatment of isotopes follows. For full treatment, *see* MACROPAEDIA: Atoms: Their Structure, Properties, and Component Particles.

Before the early 1900s it was generally assumed that the mass of a standard number of atoms of any given element was a basic characteristic of the element. It was also thought that all the atoms of an element were the same and, in particular, had the same mass. The first evidence that two substances with the same chemical properties did not have to be physically identical came from the study of the radioactivity of the heavy elements. Between 1906 and 1907 several investigators showed that ionium (a decay product of uranium) and radiothorium (a decay product of thorium), when mixed with thorium, could not be separated from it by any chemical means. The two substances had radioactive properties quite different from those of thorium and could be shown to have atomic masses differing by several units from that of thorium. The term isotope was introduced in 1913 by the English chemist Frederick Soddy to cover such situations. Not long after the acceptance of these ideas as applied to the heavy elements came indications that isotopy might exist in the main group of naturally occurring stable elements. In 1919 F.W. Aston of England showed conclusively that neon consisted chiefly of two atomic species. This success was followed by the discovery that chlorine had two isotopes. It soon became clear that most elements consisted of a mixture of isotopes, each with an atomic mass close to an integer on the atomic mass scale.

The majority of elements, as found in the Earth's crust and atmosphere, are now known to be mixtures of several isotopes. Such mixtures are in almost unvarying proportions. In its natural form, tin, for example, has 10 isotopes whose atomic masses range from values approximating 112 to 124, but any given sample of the element has an average value of 118.69. In effect, ordinary tin is nature's standardized blend of these 10 atomic species.

In most cases, only the stable isotopes of elements can be found in nature. The unstable, or radioactive, forms decay (break down) spontaneously into entirely different elements at characteristic rates because their ratio of neutrons to protons is either too low or too high for stability. Isotopes of all the elements heavier than bismuth are radioactive. Some of these, such as uranium, do occur naturally because their isotopes have long half-lives.

isotope, radioactive: *see* radioactive isotope.

isotope dilution, radiochemical method of analysis for measuring the mass and quantity of an element in a substance. The procedure involves adding to a substance a known quantity of a radioisotope of the element to be measured and mixing it with the stable isotope of the element. A sample is then taken from

the mixture and analyzed. By measuring the amount of radioactive isotope and the amount of stable isotope present and determining the ratio of these amounts, both the quantity and mass of the element can be ascertained.

Isotope dilution is employed chiefly in analytical chemistry in situations in which precise quantitative analysis by conventional means is difficult. Certain kinds of geophysical investigations also require its use, as in determining the occurrence and distribution of trace elements in rock samples and meteorites.

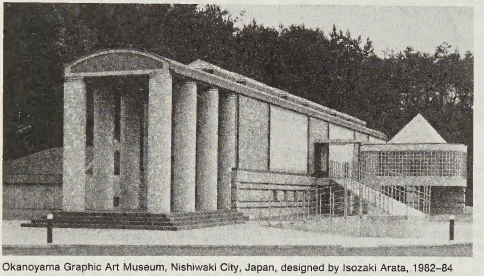
isotopic fractionation, enrichment of one isotope relative to another in a chemical or physical process. Two isotopes of an element are different in weight but not in gross chemical properties, which are determined by the number of electrons. It can be predicted theoretically and demonstrated experimentally, however, that subtle chemical effects do result from the difference in mass of isotopes. Isotopes of an element may have slightly different equilibrium constants for a particular chemical reaction, so that fractionation of the isotopes results from that reaction. The extent of isotopic fractionation can be expressed by a fractionation factor, alpha (α), also known as a separation factor, or enrichment factor, that is the ratio of the concentrations of the two isotopes in one compound or phase divided by the ratio in the other compound or phase. If N_i and N_h stand for the relative abundances of the light and heavy isotopes, respectively, in the one compound and if n_i and n_h are the corresponding abundances in the other compound, then $\alpha = (N_i/N_h)/(n_i/n_h)$. The fractionation factor is the factor by which the abundance ratio of two isotopes will change during a chemical reaction or a physical process.

The precipitation of calcium carbonate from water is an example of an equilibrium fractionation process. Oxygen-18 is enriched by a factor of 2.5 percent during this precipitation; the fractionation factor depends upon the temperature and, consequently, can be used as a means of determining the temperature of the water in which the precipitation occurred. This is the basis of the so-called oxygen isotope geothermometer.

During the process of photosynthesis, carbon-12, the light isotope of carbon, is enriched relative to the heavier isotope, carbon-13; the cellulose and lignin in wood from trees is enriched by a factor of about 2.5 percent during this process. The fractionation in this case is not an equilibrium process but rather a kinetic effect: the lighter isotope proceeds faster through the photosynthetic process and, consequently, is enriched.

Physical processes, such as evaporation and condensation and thermal diffusion, may also result in significant fractionation. For example, the light isotope of oxygen, oxygen-16, is enriched in water evaporating from the sea. On the other hand, precipitation is enriched in the heavy isotope, resulting in a further concentration of the light isotope in atmospheric water vapour. Because of the process of evaporation and condensation between the equatorial regions and polar regions, water in the polar regions may be enriched in the light isotope by as much as 5 percent.

The fissile isotope uranium-235 has been separated from the more abundant, nonfissile isotope uranium-238 by exploiting the slight difference in the rates at which the gaseous hexafluorides of the two isotopes pass through a porous barrier.



isotopic spin (particle physics): *see* isospin.

isotopic tracer, any radioactive atom detectable in a material in a chemical, biological, or physical system and used to mark that material for study, to observe its progress through the system, or to determine its distribution. An isotopic tracer must behave as does the material being studied, but, in addition, it must have some distinguishing property by which it can be detected in the presence of the other material.

The movement of a chemical element under study may be traced by adding a radioactive isotope (or radioisotope) of the same element. The radiations emitted by such a radioisotope can be tracked by means of radiation detection devices, such as Geiger-Müller counters or scintillation detectors. Radioisotopes can be detected in quantities as small as a few atoms. Radioactive tracers are widely used in science, engineering, and medicine in virtually any situation in which it is necessary to determine the distribution pattern or the rate of material transport.

Isotope dilution, in which radioisotopes are introduced into stable isotopes of the same element and mixed, is a widely used technique for determining the volume of a system. To measure the contents of the human blood system or of an industrial tank, a minute quantity of radioactive tracer is added and allowed to mix uniformly throughout the system; then a sample of known volume is removed from the system and measured for the amount of radioactive tracer it contains. The ratio of this content to the amount originally introduced is proportional to the volume of the entire system.

Isozaki Arata (b. July 23, 1931, Ōita, Kyushu, Japan), one of the best-known of a group of avant-garde Japanese architects of the late 20th century.

Okanoyama Graphic Art Museum, Nishiwaki City, Japan, designed by Isozaki Arata, 1982–84
Taisuke Ogawa/Shinkenchiku

Isozaki was born to an upper-class family, and he studied architecture at the University of Tokyo. Upon graduation, he became an apprentice for nine years to Tange Kenzō, a leading Japanese architect of the postwar period. During that period Isozaki also worked with a design team known as Urtec (Urbanists and Architects). He was somewhat influenced by the Metabolist movement, a brutalist group that combined a concern for modern technology and utilitarianism. In 1963 Isozaki formed his own design studio. He was a visiting professor at a number of universities throughout the United States.

The first building for which he is noted is the Ōita Prefectural Library (1966), a Metabolist-influenced structure. After working as chief architect for Japan's "Expo '70," Isozaki moved away from his more orthodox modernist structures and began to examine a variety of non-Oriental solutions to architectural problems. Among his innovative structures of this period are the Kita-Kyūshū City Museum of Art (1974), the Fujimi Country Clubhouse in Ōita (1974), the Okanoyama Graphic Art Museum (1982–84), and the Civic Centre for Tsukuba (1983). He also designed the Los Angeles Museum of Contemporary Art (1986). He wrote many books on architecture.

Isparta, also spelled ISPARTA, formerly HAMĪD-ABAD, or HAMĪDELI, city, western Turkey. Known as Baris under the Byzantine Empire, it was taken by the Seljuq Turks in 1203–04. Later it belonged to the Turkmen Hamid principality, the last ruler of which sold it to the Ottoman sultan about 1381. The city's monuments include a ruined medieval fortress and several mosques, of which Firdevs Paşa Cami is a work of the 16th-century master court architect Sinan. Isparta is known for its roses and attar (fragrant oil) of roses and for its carpets. A branch line connects it with the main Anatolian railway. Pop. (1985) 101,215.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Isrāʾ, in Islām, the Prophet Muḥammad's night journey from Mecca to Jerusalem. As alluded to in the Qurʾān (17:1), a journey was made by a servant of God, in a single night, from the "sacred place of worship" (*al-masjid al-ḥarām*) to the "further place of worship" (*al-masjid al-aqṣā*).

Traditionally, there was general agreement that the servant of God was Muḥammad and that the "sacred place of worship" was Mecca. Early commentators, however, interpreted the "further place of worship" as heaven, and the entire verse was considered a reference to the Prophet's ascension into heaven (Miʿrāj), an ascension which also originated in Mecca. In the period of the Umayyad caliphate (661–750), the "further place of worship" was read as Jerusalem. The two versions were eventually reconciled by regarding the Isrāʾ simply as the night journey and relocating the point of Muḥammad's ascension from Mecca to Jerusalem to avoid confusion. Some commentators also suggested that the Isrāʾ was a vision sent to Muḥammad in his sleep and not an actual journey at all; but orthodox sentiment has emphatically preserved the physical, thus miraculous, nature of the trip.

The Isrāʾ story, greatly elaborated by tradition, relates that Muḥammad made the journey astride Burāq (*q.v.*), a mythical winged creature, in the company of the archangel Gabriel. Muḥammad meets Abraham, Moses, and Jesus in Jerusalem; he then officiates as leader (*imām*) of the ritual prayer (*ṣalāt*) for all the prophets assembled and establishes his primacy among God's messengers. *See also* Miʿrāj.

Israel (Jewish patriarch): *see* Jacob.

Israel, either of two political units in the Old Testament: the united kingdom of Israel under the kings Saul, David, and Solomon

that lasted from about 1020 to 922 BC; or the northern kingdom of Israel, including the territories of the 10 northern tribes (*i.e.*, all except Judah and part of Benjamin), that was established in 922 BC as the result of a revolt led by Jeroboam I. The southern kingdom, ruled by the Davidic dynasty, was thereafter referred to as Judah. The later kingdom's history was one of dynastic instability, with only two prolonged periods of stable government, under Omri (reigned 876–869 or *c.* 884–*c.* 872 BC) and Ahab (*c.* 874–*c.* 853 BC) and the Jehu dynasty (*c.* 842–746 BC). In the 8th century BC the northern kingdom was overrun by the Neo-Assyrian Empire, with Samaria, the capital, falling in 722/721.

Israel, officially STATE OF ISRAEL, Hebrew MEDINAT YISRA'EL, Arabic ISRA'IL, Middle Eastern republic at the eastern end of the Mediterranean Sea. Israel extends for about 250 miles (400 km) from north to south and is about 75 miles (121 km) across at its widest extent from east to west. It is bordered on the north by Lebanon, on the northeast by Syria, on the east and southeast by Jordan, on the

Israel

southwest by Egypt, and on the west by the Mediterranean Sea. Israel covers an area of 7,992 square miles (20,700 square km), not including 2,887 square miles (7,477 square km) of Israeli-occupied or semiautonomous territory in Syria's Golan Heights (in the northeast), in the West Bank and East Jerusalem (in the east), and in the Gaza Strip (in the southwest). These territories were taken by Israel in the 1967 war and are disputed, as is the de facto capital, Jerusalem, which was formerly divided between Jordan and Israel. Pop. (1993 est.) including East Jerusalem and Golan Heights, 5,451,000.

A brief treatment of Israel follows. For full treatment, *see* MACROPAEDIA: Israel.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Israel may be divided into four physiographic regions: the Mediterranean coastal plain, a narrow 115-mile- (185-kilometre-) long strip along the western edge of the country that is only 20 miles (32 km) across at its widest point; a hill region extending from the northern border, through the Israeli-occupied West Bank, into central Israel; the Great Rift Valley, part of a great fissure extending the length of the country's eastern boundary south to the Gulf of Aqaba, and containing the Dead Sea, the lowest point (1,312 feet [400 m] below sea level) on the Earth's surface; and the arid Negev, the country's largest region, occupying nearly the entire southern half of Israel.

Israel's major drainage system is the interior basin formed as the Jordan River flows southward; it empties first into the Ḥula Basin (at approximately sea level) and then into the freshwater Sea of Galilee (689 feet [210 m] below sea level). The river then proceeds to the Dead Sea, one of the most saline bodies of water in the world. The Sea of Galilee is connected, through a complex of pumping stations and reservoirs, to Israel's aquifers in the west, providing water to almost half of the country's agricultural land.

The climate in Israel varies from north to south. Winter temperatures (January and February) range from about 46° F (8° C) in Jerusalem to 61° F (16° C) in Elat (Eilat), on the Gulf of Aqaba in the southern Negev; summer temperatures (July and August) for the same locations are 74° F (23° C) and 90° F (32° C). The northern highlands and the northern coastal areas receive more than 16 inches (400 mm) of rainfall annually, the extreme northern highlands receiving more than 40 inches (1,016 mm). Practically all precipitation in the north comes between October and April. More than half of the country receives less than 8 inches (203 mm) of rainfall; the Negev receives less than 4 inches (102 mm), and less than 1 inch (25 mm) falls along the 'Arava Valley south of the Dead Sea.

Cultivation is concentrated in the northern half of the country, where annual rainfall exceeds 12 inches (305 mm). Most of the original evergreen forests have disappeared, but there are continuing reforestation efforts. The hills are covered for the most part by maquis (wild shrub vegetation), while in the Negev only desert scrub grows wild. Animal life varies from such mammals as wild boars, wildcats, and gazelles to reptiles like the agama and gecko lizards.

Israel is not particularly rich in natural resources. It has limited reserves of copper and only meagre supplies of oil and natural gas.

The people. Jews constitute more than four-fifths of the total population, and Arabs about one-sixth. As the Jewish national homeland, Israel has received large numbers of Jewish immigrants since its founding in 1948. They have come primarily from western and central Europe, North Africa, Russia and other parts of the former Soviet Union, and the United States. The two main Jewish religious groups are formed by followers of the Ashkenazic rite (*i.e.*, of Jews from central and eastern Europe and their descendants in other parts of the world) and followers of the Sephardic and Oriental rites (of Jews from the Mediterranean region and from the Middle East).

Muslims, who constitute more than two-thirds of the Arab population, are the largest minority. Practically all the Muslims adhere to the Sunnite rite. Most of the remaining Arabs are Christians. The Greek Orthodox and Greek Catholic (Melkite) churches are the largest Christian communities, but there are smaller numbers of Roman Catholics and Uniates. The Druzes have constituted a separate Arabic-speaking community since 1957.

Israel's official languages are Hebrew and Arabic. The great majority of the Jewish population speak Hebrew, while the Arabs use Arabic. English is the principal foreign language taught in schools.

About three-fifths of the Jewish community was born in Israel, about one-fifth in Europe and the United States, and about one-sixth in Asia or Africa. The Jewish birth rate is about one-third lower than the Arab birth rate, and consequently the Arab proportion of the population has gradually increased, though this trend is itself offset by the immigration of Jews to Israel. Although the population growth of Israel has been primarily due to this immigration, future growth will depend more on natural increase, with the largest rate of increase occurring among the Arabs. About one-third of the country's total population is less than 15 years of age. Israel's population is nine-tenths urban and is heavily concentrated in the Mediterranean coastal plain.

The economy. Israel has a mixed economy largely based on services and manufacturing industries. Although the gross national product (GNP) is increasing more rapidly than the population, the GNP per capita is on the lower end as compared with those of the developed countries.

Approximately one-fifth of the land is arable; irrigation is concentrated in Galilee and the Negev desert. Agriculture produces approximately 3 percent of the gross domestic product (GDP) and employs a comparable portion of the population. More than three-fourths of the arable land is cultivated by Jewish kibbutzim (collectives) or moshavim (cooperatives). Citrus fruits are the main crops, and Israel is a major producer of oranges and grapefruit. Other crops produced in quantity include seed cotton, apples, avocados, potatoes, grapes, tomatoes, bananas, melons, wheat, peaches, olives, and sugar beets. Vegetables are grown as an early season crop for European markets.

Pastures occupy as much as two-fifths of the land and support sheep, cattle, and goats. Israel is one of the world's largest producers of turkeys.

Landings of fish are mostly freshwater, from the Sea of Galilee and fishponds, with some marine, from the Mediterranean and Black seas. Annual landings are dominated by carp and cape hake.

Israel is among the world's largest producers of potash. Other minerals extracted include phosphates, bromide and magnesium compounds from the Dead Sea, lime, salt, glass sands, gypsum, and clay.

Manufacturing is well diversified, accounts for about one-fifth of the GDP, employs almost one-fifth of the total labour force, and centres on processing raw and semifinished materials. Principal manufactures include electronics, weapons, cement, potassic and other fertilizers, sulfuric acid, cotton textiles and clothing, tinned and bottled fruits and fruit juices, wheat flour, polished diamonds, metal products, machinery, motor vehicles, aircraft, precision instruments, plastics, and home appliances. Electricity is generated by thermal-power plants.

Although the construction industry accounts for only about 5 percent of the GDP, it is of major importance to the economy in conjunction with the manufacturing industries that produce the building materials used. Residential buildings make up the largest share of construction.

The largest sector of the economy is services, of which finance accounts for one-fourth of the GDP. Public and community services alone employ more than one-fourth of the workforce. Tourism constitutes an important source of foreign exchange, and income from tourism ordinarily exceeds expenditures by Israelis abroad.

The Israeli government owns mining and drilling enterprises, some industrial plants, and the national railway system. The government also aids industrial development and protects existing industry through import tariffs. Large sums in aid come from Jewish communities in Europe and the Americas. The United States provides development aid in addition to military assistance and loans.

The General Federation of Labour (Histadrut; founded in 1920) is the principal labour federation and voluntary organization to which all trade unions belong. Membership is open to all workers and members of kibbutzim and moshavim, as well as to professionals. Histadrut negotiates collective-bargaining agreements, linked to the retail price index, and it administers employee-benefit programs, pension programs, and a number of social services. It owns about 5 percent of all industrial enterprises and is represented on labour-management boards and in the National Productivity Institute. It also supports pay-incentive programs for higher productivity and improved efficiency and other economic-development projects.

There are about 375 miles (600 km) of standard-gauge rail routes in Israel. The road network is fully paved and includes highways with four or more lanes. Ashdod and Haifa, on the Mediterranean, and Elat, on the Red Sea, are the principal ports. An international airport is located at Lod (Tel Aviv–Yafo), and there are other domestic airports. El Al Israel Airlines Ltd. provides international service.

Exports consist mainly of machinery and electronics, cut or mounted diamonds, chemicals, fruits and vegetables, and textiles and clothing. Major importers of Israeli products are the United States, the United Kingdom, Belgium, Germany, and Japan. Imports are dominated by rough diamonds, investment goods, consumer goods, fuel and lubricants, and foodstuffs. The main sources of imports are the United States, Belgium, Germany, the United Kingdom, and Switzerland.

Government and social conditions. Israel is a democratic republic, which has had a parliamentary system of government since its founding in 1948. The country does not have a written constitution, and government is based on a series of "basic laws," legislation, administrative acts, and parliamentary practice. Supreme authority rests with the Knesset, whose 120 members are elected to four-year terms by universal adult suffrage. A unicameral body, it assumes all legislative duties and elects the president, (chief of state) to a five-year term. Since 1948 the president, whose duties are largely ceremonial, has appointed a prime minister to head the government; between 1996 and 2001 the prime minister was directly elected, thus creating a mix between presidential and parliamentary systems. The failure of this experiment led Israel to return to the earlier system, in which the prime minister comes from the party having the plurality of seats in the Knesset and the membership of the cabinet is negotiated among the parties forming the Knesset's majority coalition. Many parties compete for parliamentary seats, but the dominant political organizations have been the Israel Labour Party and the Likud ("Unity") party. Israel's judicial system is headed by a Supreme Court whose members are appointed by the president.

Israel has an advanced system of social welfare that provides old-age pensions, industrial-injury and maternity benefits, and family allowances. The government also offers general assistance, relief grants, and unemployment benefits. Kupot Holim, the health-insurance fund of the Histadrut, covers most workers, providing both sickness benefits and medical care. Health conditions in Israel are generally good, and life expectancy averages about 78 years.

Education is compulsory and free for children between the ages of 5 and 15. Primary education lasts for eight years; postprimary education covers four years, although the last year is not compulsory. There are three types of schools in Israel: national state schools, religious state schools, and the Agudat Israel religious schools. Institutions of higher education include the Hebrew University of Jerusalem (founded in 1918), Tel-Aviv University (1953), and the Israel Institute of Technology (the Technion; 1912). Virtually the entire adult population is literate.

Israel's news media are relatively free to criticize government policy and express divergent political or religious views. Because of the country's recurrent state of national emergency, however, military censors review press and broadcasting materials concerning national security. Most radio and television broadcasting stations are government owned and operated.

Cultural life. Jews arriving from many parts of the world have brought with them both their own Jewish cultural inheritances and aspects of the diverse cultures from which they come. Different folk traditions have been preserved mainly among Sephardic Jewish communities and among the rural Arab population. In literature and drama an early concentration on themes of the Diaspora is giving way to an interest in national themes. Israel's most distinguished writer is considered to be Shmuel Yosef Agnon, winner of the Nobel Prize for Literature in 1966.

History. The record of human habitation in Israel (Palestine) is at least 100,000 years old. Evidence of the domestication of plants and animals can be dated to about 10,000 BC. The most notable achievement of ancient Palestine was the development of what is perhaps the earliest alphabet, originated by the Canaanites in the 2nd millennium BC and adopted by the Phoenicians and Israelites around 1000 BC.

According to biblical tradition, the arrival of the Israelites (Hebrews) into Palestine was completed by the 13th century BCE, and the same source dates the reign of King Solomon—Israel's golden age—to the mid-10th century, when the First Temple in Jerusalem was completed. However, the subsequent division of Solomon's kingdom and the conquest of the northern section, Israel (by the Assyrians in 772 BCE), and the southern section, Judah (by the Babylonians in 587), ended in the destruction of the Temple and the enslavement and deportation of many of the inhabitants of Judah to Babylon. The return of the Jews to Jerusalem under the Persian King Cyrus II (*c.* 550–529 BCE) was followed by the rebuilding of the Temple. During the Second Temple period Israel enjoyed brief interludes of independence interspersed with episodes of subjugation under the Ptolemaic, Seluciad, and Roman empires. The second of two Hebrew revolts against the Romans ended with yet another Jewish exile and the destruction of the Second Temple in 135 CE. Israel ceased to exist as a political entity but maintained an existence in the strong cultural memory of the Jewish Diaspora.

Jewish efforts beginning in the late 19th century to reestablish a state in Palestine (then part of the Ottoman Empire) were met with stiff resistance from the native Palestinian Arabs (Palestinians), who had lived in the region for centuries. The first Jewish nationalist, or Zionist, settlement was established in Palestine in 1882, and conflict was inevitable as Jewish immigration intensified due to increased European anti-Semitism leading up to World War I. The Balfour Declaration of 1917, designed to win Jewish support for the Allied war effort, stated the British government's support for a Jewish national homeland in Palestine. This document assumed greater importance after the British occupied Palestine in 1918 and assumed responsibility for its governance under a mandate from the League of Nations in 1923.

Attempts by the British to limit Jewish immigration to Palestine in the 1920s were largely successful, although violence between Jewish settlers and Palestinians erupted intermittently during that time. Increased persecution of Jews in Europe—particularly after the rise of Nazi Germany—hastened Jewish immigration to British-ruled Palestine during the 1930s and early '40s, and relations between Jews and Palestinians continued to deteriorate, leading to the Palestinian Arab Revolt of 1936–39. After World War II, Great Britain voluntarily relinquished its mandatory power to the newly formed United Nations (UN), whose answer to the dispute over Palestine was a vote in 1947 to partition the region into separate Jewish and Arab states. A partition plan, however, had already been suggested and rejected under the mandate and was also opposed by neighbouring Arab countries. On May 14, 1948, the State of Israel was proclaimed and Egypt, Transjordan (later Jordan), Syria, Lebanon, and Iraq declared war on the new country. Israel won the war and also won subsequent wars with its neighbours: an alliance with Britain and France in 1956 led to Israel's victory over Egypt in the Suez War; in the Six Day War of 1967 the Jewish state wrested the West Bank from Jordan, the Gaza Strip from Egypt, and the Golan Heights from Syria; and in the 1973 Yom Kippur War Israel repulsed an attack by Egypt and Syria.

Although Israel signed a peace treaty with Egypt in 1979, the Jewish state invaded Lebanon in 1982 in an effort to expel guerrillas belonging to the Palestine Liberation Organization (PLO). The question of a Palestinian state, the status of Palestinian refugees, and the issue of Jewish settlement in the occupied territories of the West Bank and Gaza have continued to be the major obstacles to a comprehensive peace between Israel and its Arab neighbours, and beginning in late 1987 Israel faced a series of disorders and riots by Palestinians in those territories known as the *intifāḍah* (Arabic: "shaking off"). Face-to-face peace negotiations between representatives of Israel and the Arab states and Palestinians began in 1992. The following year, in the first of a series of interim agreements generally referred to as the Oslo Accords, Israel and the PLO negotiated a five-year transition involving the gradual extension of self-government to the Palestinians of the West Bank and Gaza. The final agreement between the sides was to come later.

Israel signed a full peace treaty with Jordan in 1994, but implementation of the agreements with the Palestinians faltered, prompting further talks between Israel and the newly formed Palestinian Authority (PA) throughout the decade. The failure of talks with the PA in late 2000 was followed by a suspension of dialogue and a renewal of violence in the occupied territories, which left hundreds dead.

Israel, Ten Lost Tribes of: *see* Ten Lost Tribes of Israel.

Israel, Twelve Tribes of: *see* Twelve Tribes of Israel.

Israel Labour Party, Hebrew MIFLEGET HA-ʿAVODA HA-YISRAʾELIT, byname AVODA, Israeli social-democratic political party founded in January 1968 in the union of three socialist-labour parties. It and its major component party, Mapai, dominated Israel's government from the country's independence in 1948 until 1977, when the rival Likud (*q.v.*) coalition first came to power. Thereafter, Labour and Likud alternated in government, though the country's fragmented party system and unique security needs sometimes resulted in so-called "unity governments" of both Labour and Likud.

The Mapai (an acronym for Mifleget Poʾale Eretz Yisraʾel ["Party of the Workers of the Land of Israel"]) is by its antecedents the country's oldest party. It was formed in 1930 through the merger of two older labour parties, Aḥdut ha-ʿAvoda ("Unity of Workers"), founded in 1919, and ha-Poʿel ha-Tzaʿir ("Young Worker"), founded in 1905 and the first party of David Ben-Gurion, Israel's first prime minister. Mapai quickly became the dominant party among Jews in Palestine and, after Israel achieved its independence in 1948, it controlled the government for its first 29 years (from 1968 as part of the Israel Labour Party). Among the party's leading figures throughout the second half of the 20th century were Levi Eshkol, Golda Meir, Yitzhak Rabin, and Shimon Peres, all of whom served as prime minister.

The second partner in the Israel Labour Party was Aḥdut ha-ʿAvoda-Poʿale Tziyyon ("Unity of Labour-Workers of Zion"), founded in 1944 by a group of dissident Mapai members. It attracted significant support from those living in Israel's kibbutzim, or collective settlements. It rejoined Mapai in a "Labour Align-

ment" in 1965 and then joined in the founding of the Israel Labour Party three years later.

The third partner was Rafi (an acronym for Reshimat Po'alei Yisra'el ["Israel Workers List"]), formed in 1965 when Ben-Gurion, after a feud with Eshkol, withdrew with his supporters to form a new party. Although most Rafi members joined the new Israel Labour Party in 1968, Ben-Gurion instead formed another tiny party, the State List.

Since its founding, the Israel Labour Party has usually formed a Labour Alignment (Ma'arach) with Mapam, a left-wing Zionist and socialist party. The Ma'arach has included two Arab parties, Progress and Development and the Arab Bedouin List. In 1999, under the leadership of Ehud Barak (who was elected prime minister that year), the party ran under the banner of One Israel with Gesher and Meimad, two minor centrist parties.

The party has supported greater concessions to the Palestinians in the peace process than has Likud, and it generally has endorsed the controversial "land-for-peace" principle. It also has taken a fairly pragmatic approach to both economic and foreign policy. For most of its history it supported state economic planning and extensive social benefits, but later, particularly in the 1990s, it moderated its traditional socialist policies in favour of greater economic liberalization and deregulation. The party is particularly strong among secular and Ashkenazi (European) Jews, trade unionists, and those living on the kibbutzim.

Israel Museum, Hebrew MUSE'ON YISRA'EL, museum in Jerusalem opened in 1965 and consisting of the Bezalel National Art Museum, the Samuel Bronfman Biblical and Archaeological Museum, a Youth Wing, the Shrine of the Book, and The Billy Rose Art Garden. The Shrine of the Book houses the Dead Sea Scrolls in a building whose pagoda-like dome is reminiscent of the shape of the ancient jars in which the scrolls were found in 1947. The Archaeological Museum is actually 15 connected pavilions showing finds from excavations in Israel. The gates to the ancient city of Hazor are reconstructed in one pavilion, and another shows some fine Palestinian ceramics. The Bezalel Museum is devoted to various religious and ethnographic objects such as Hanukka lamps and costumes. There is also an 18th-century synagogue from Vittorio Veneto, near Venice. The display in the Billy Rose garden is of modern and abstract sculpture.

Israeli, Isaac ben Solomon, Arabic ABŪ YA-'QŪB ISḤAQ IBN SULAYMĀN AL-ISRĀ'ĪLĪ, also called ISAAC ISRAELI, or ISAAC THE ELDER (b. 832/855, Egypt—d. 932/955, Al-Qayrawān, Tunisia), Jewish physician and philosopher, widely reputed in the European Middle Ages for his scientific writings and regarded as the father of medieval Jewish Neoplatonism. Although there is considerable disagreement about his birth and death dates, he is known to have lived more than 100 years and never to have married or to have had children.

Israeli first gained note as an oculist, maintaining a practice near Cairo until about 904, when he became court physician in Al-Qayrawān to the last Aghlabid prince, Ziyādat Allāh. He also studied medicine there under Isḥāq ibn 'Imrān al-Baghdādī.

Some five years after his arrival, Israeli entered into the service of al-Mahdī, the founder of the North African Fāṭimid dynasty (909-1171), whose capital was Al-Qayrawān. At the caliph's request, Israeli wrote eight medical works in Arabic. All were translated into Latin in 1087 by the monk Constantine, who claimed to have written them himself. Not until 1515 was their true authorship uncovered, and the works were republished in Lyon under the title *Omnia Isaac Opera* ("All of Isaac's Works"); the editor, however, mistakenly included the writings of other medical scholars as well. Israeli's scientific works include standard treatises on fevers, urine, pharmacology, ophthalmology, and ailments and treatments. He wrote also on logic and psychology.

Of his philosophical writings, *Kitāb al-ḥudūd* (Hebrew: *Sefer ha-gevulim*, "The Book of Definitions") is best known. Beginning with a discussion of Aristotle's four types of inquiry, Israeli goes on to present 56 definitions, including definitions of wisdom, intellect, soul, nature, reason, love, locomotion, and time. Others of his philosophical works include *Sefer ha-ru'aḥ ve-ha-nefesh* ("Treatise on Spirit and Soul"), probably part of a larger exegetical effort, and *Kitāb al-jawāhir* ("Book of Substances").

Israeli's thought was influenced heavily by two major sources: the great 9th-century Islāmic philosopher al-Kindī and a lost pseudo-Aristotelian treatise on such matters as the source of being, the nature of the intellect, and the course of the soul. Israeli's interpretation of eschatological matters in the light of Neoplatonic mysticism was to influence Solomon ibn Gabriol in the 10th century and other later Jewish philosophers.

Israeli law, the legal practices and institutions of modern Israel. In ancient times, when the people of Israel lived in their homeland, they created their own law: the law of the Torah and the law of the Mishna and the Talmud (*see* Torah; Mishna). Then came the separation of land and people for more than 1,800 years. The law left the land together with those who had created it, and the land acquired other laws, changing from time to time with the change of consecutive conquerors. The Jews took their law with them wherever they went, continued to develop it, and submitted to it wherever their communities enjoyed any measure of autonomy. When the Jews thus eventually returned to their ancient land in the 20th century, they brought back with them a dual legal heritage: that of the historic Jewish law and that of the laws of the countries in which they had been living.

When Israel's independence was proclaimed in 1948, some of the Ottoman enactments and much law of English origin continued to be applied, but English ceased to be the predominant legal language and was immediately replaced by Hebrew. The law was thenceforth made by the democratic authorities of the autonomous state of Israel.

Israeli courts are composed of professional judges only. Secular courts are organized on three levels: magistrate's courts, dealing with certain civil matters and offenses punishable with imprisonment up to three years; district courts in the four principal cities, with general jurisdiction in civil and criminal matters; and the supreme court in Jerusalem, deciding appeals from inferior courts and exercising, as court of first and only instance, jurisdiction as high court of justice. Religious courts continue to be competent in matters of personal status.

In administrative law, legislation covers, among other things, education, compulsory military service (for men and women), and national insurance. Particularly important for the economy of the country are the water law and the law on the encouragement of capital investments. The extensive code of labour law covers such things as collective bargaining, labour exchanges, protection of wages, safety regulations, and severance payment.

Developments in criminal law, torts, and evidence have been confined to piecemeal amendments of the pre-1948 law. Among the most significant was the abolition of capital punishment for murder. The rules of criminal procedure were consolidated in 1965, and the civil procedure rules, mainly derived from their English counterpart, were also redrafted and revised.

In private law Israeli legislation includes a law on women's equal rights; laws dealing with capacity and guardianship, adoption, and duties of maintenance between relatives; a law on the tenure of cooperative houses with separate ownership of flats; a standard contracts law; a comprehensive law of succession; laws on agency, guarantee, mortgage, and bailment; a defamation law; and a patents law.

Jewish law is applied by the rabbinical courts within their jurisdiction in matters of personal status; it is applied also by the civil courts in some matters. Although it is not the country's supreme law, it serves as an important source for the shaping of new rules of law, both by the Knesset (parliament) and the courts.

Israelite, in the broadest sense, a Jew, or a descendant of the Jewish patriarch Jacob, whose name was changed to Israel after an all-night fight at Penuel near the stream of Jabbok (Genesis 32:28). In early Jewish history, Israelites were simply members of the 12 tribes of Israel. After 930 BC and the establishment of two independent Jewish kingdoms in Palestine, the ten northern tribes constituting the Kingdom of Israel were known as Israelites to distinguish them from Jews in the southern Kingdom of Judah. The northern kingdom was conquered by the Assyrians in 721 BC, and its population was eventually absorbed by other peoples. Thereafter, the name Israelite referred to those who were still distinctively Jewish, namely, descendants of the Kingdom of Judah.

In liturgical usage, an Israelite is a Jew who is neither a cohen (descendant of Aaron, the first high priest) nor a Levite (descendant of early religious functionaries). The distinction is significant, for if a cohen is present for synagogue service, he must be called up first for the reading of the Law; he is then followed by a Levite. Normally, therefore, an Israelite is not called up until the third reading.

Israëls, Jozef (b. Jan. 27, 1824, Groningen, Neth.—d. Aug. 12, 1911, The Hague), painter and etcher, often called the Dutch Millet. Israëls was the leader of the Hague school of peasant genre painting, which flourished in The Netherlands between 1870 and 1890. He began his studies in Amsterdam and from 1845 to 1847 worked in Paris under the academic painters Horace Vernet and Paul Delaroche.

Self-portrait, watercolour on paper by Jozef Israëls, 1908; in the Toledo Museum of Art, Ohio

By courtesy of the Toledo Museum of Art, Ohio, gift of Edward Drummond Libbey

Israëls first tried to establish himself as a painter of Romantic portraits and conventional historical pictures but had achieved little success when in 1855 ill-health compelled him to leave Amsterdam for the fishing village of Zandvoort, near Haarlem. That change revolutionized his art; he turned to realistic and compassionate portrayals of the Dutch peasantry and fisherfolk (*e.g.*, "Waiting for the Herring Boats," 1875). In 1871 he moved to The Hague, often working in nearby Scheveningen.

Besides oils, Israëls worked in watercolours and was an etcher of the first rank. His later works in all media express a tragic sense of life and are generally treated in broad masses of light and shade. His painting style was influenced by Rembrandt's later works, and, like Rembrandt, Israëls often painted the poor Jews of the Dutch ghettos (*e.g.*, "A Son of the Chosen People" [1889]). His son Isaac (1865–1934), also a painter, adopted an Impressionist technique and subject matter and had some influence on his father's later work.

Isrāfīl, in Islām, the archangel who will blow the trumpet from a holy rock in Jerusalem to announce the Day of Resurrection. The trumpet is constantly poised at his lips, ready to be blown when God so orders. In Judeo-Christian biblical literature, Raphael is the counterpart of Isrāfīl.

The archangel Isrāfīl, miniature from the *'Ajā'ib al-makhlūqāt* ("The Wonders of Creation") of Qazvīnī, Iraq, *c.* 1370–80; in the Freer Gallery of Art, Washington, D.C.

By courtesy of the Smithsonian Institution, Freer Gallery of Art, Washington, D.C.

Isrāfīl is usually conceived as having a huge, hairy body that is covered with mouths and tongues and that reaches from the seventh heaven to the throne of God. One wing protects his body, another shields him from God, while the other two extend east and west. He is overcome by sorrow and tears three times every day and every night at the sight of hell. It is said that Isrāfīl tutored Muḥammad for three years in the duties of a prophet before he could receive the Qur'ān.

Issa, a branch of the Somali (*q.v.*) people living in the Republic of Djibouti (formerly the French Territory of the Afars and Issas) on the east coast of Africa.

Issa, also called KOBAYASHI YATARŌ, original name KOBAYASHI ISSA (b. June 15, 1763, Kashiwabara, Shinano province, Japan—d. Jan. 5, 1828, Kashiwabara), Japanese poet whose works in simple, unadorned language captured the spiritual loneliness of the common man. Out of a life of tragic adversity he created a poetry of sentimental simplicity that endeared him to the Japanese people.

As a boy Issa found relations with his stepmother so difficult that in 1777 he was sent by his father to Edo (present-day Tokyo), where he studied haiku under the poet Chikua Nirokuan. He took the pen name Issa in 1793 and traveled extensively through southwestern Japan, afterward publishing his first collection of verse, *Tabishūi* (1795; "Travel Gleanings"). An inheritance feud erupted between Issa and his stepmother upon the death of his father in 1802; this was not concluded until 1814, after which he settled in his native town and married for the first time. Four children died in infancy, and his wife died in childbirth. A second marriage was unsuccessful, and Issa died before his third wife gave birth to a girl, who survived.

In Issa's poetry everyday subjects are treated with ordinary language but take on a lyrical quality through his sharp critical eye and sympathetic tone. His other important works are *Chichi no shūen nikki* (1803; "Diary of My Father's Last Days") and *Oraga Haru* (1819; *The Year of My Life*).

Issachar, one of the 12 tribes of Israel that in biblical times constituted the people of Israel who later became the Jewish people. The tribe was named after the fifth son born to Jacob and his first wife, Leah. After the death of Moses, Joshua led the Israelites into the Promised Land and apportioned the territory among the 12 tribes. The tribe of Issachar settled on land lying west of the Jordan River and southeast of the southern tip of the Sea of Galilee. After the death of King Solomon (922 BC) Issachar was one of the 10 northern tribes that established the independent Kingdom of Israel that survived until the Assyrian conquest of 721 BC. These 10 tribes, partially dispersed to other regions, eventually lost their identity and became known as the Ten Lost Tribes of Israel.

Isserles, Moses ben Israel, acronym REMA (b. *c.* 1525, Kraków, Pol.—d. May 1, 1572, Kraków), Polish-Jewish rabbi and codifier who, by adding notes on Ashkenazic customs to the great legal digest *Shulḥan 'arukh* of the Sephardic codifier Joseph Karo, made it an authoritative guide for Orthodox Jews down to the present day.

A precocious scholar, Isserles became the head of the great yeshiva (institution of Jewish learning) in Kraków while he was still a young man. Until his time, most of the great codifications of Jewish law had been written by Sephardim, *i.e.*, Jews of Spanish and Portuguese descent. Therefore many eastern European customs (*minhagim*) had been ignored, making the Sephardic codes increasingly unacceptable to the Ashkenazim, the Jews of German-Polish descent. When Joseph Karo published *Shulḥan 'arukh* (1565; "The Well-Laid Table"), its Sephardic bias provoked Isserles to write a commentary entitled *Mappa* ("The Tablecloth"), first published in Kraków in 1571 as notes to an edition of *Shulḥan 'arukh*. This commentary, which extensively utilized Ashkenazic customs, made the *Shulḥan 'arukh* acceptable all over the Jewish world. A man of unusual intellectual breadth, Isserles was greatly interested in philosophy, history, and astronomy, as well as in Kabbalistic studies. He considered philosophy and the Kabbala, the influential body of Jewish mystical writings, to be different expressions of the same religious truth.

Issigonis, Sir Alec, in full SIR ALEXANDER ARNOLD CONSTANTINE ISSIGONIS (b. Nov. 18, 1906, Smyrna [now İzmir], Tur.—d. Oct. 2, 1988, Birmingham, Eng.), British automobile designer who created the best-selling, economical Mini and the perennially popular Morris Minor.

The son of a Greek merchant, Issigonis immigrated to London in 1922 during the war between Greece and Turkey. After studying engineering, he joined Morris Motors in 1936 as a suspension designer. There he developed the Morris Minor, which remained in production from 1948 to 1971. A reliable car with excellent steering and cornering qualities, it was the first all-British car to pass the one million mark in sales; surviving models are still cherished by owners and collectors.

After briefly working elsewhere in the early 1950s, Issigonis returned to what had become the British Motor Corp., where in 1959, in response to the Suez energy crisis (1956) and the popularity of Germany's Volkswagen Beetle, he introduced the Mini. The boxy, inexpensive, fuel-efficient Mini used a transverse engine to power its front wheels—a radical design at the time—and thus could comfortably seat four passengers despite being only 10 feet (3 m) long. Its practicality and affordability made it immediately popular; by the time of Issigonis' death more than five million had been sold.

Issigonis became a fellow of the Royal Society in 1967 and was knighted in 1969.

Issus, Battle of (333 BC), conflict early in Alexander the Great's invasion of Asia in which he defeated a Persian army under King Darius III. This was one of the decisive victories by which Alexander conquered the Achaemenian Empire. Issus is a plain on the coast of the Gulf of Iskenderun, in present-day southern Turkey. The Macedonian forces, with an infantry phalanx in the centre and cavalry on the sides, approached the army of Darius, which was drawn up on the opposite bank of the Pinarus (either modern Payaz or Deli) River. Alexander led the charge across the river, shattering the Persian left wing before turning against the Greek mercenaries who formed the Persian centre. His army in confusion, Darius escaped, but his family was captured. Arrian, Alexander's biographer (2nd century AD), claimed the Macedonians lost only 450 men, with Alexander himself being wounded.

Issy-les-Moulineaux, town, suburb of Paris, in Hauts-de-Seine *département*, Île-de-France *région*, north-central France. It is bounded to the northeast by the city limits of Paris. The town has aeronautics and metallurgical industries, and it manufactures chemicals, electrical equipment, and cigarettes. Its airport (on land actually belonging to the city of Paris) was established in 1907 and is the French terminus for the Paris-Brussels helicopter service. It was at Issy that Bishop Jacques-Bénigne Bossuet and other churchmen gathered (1694–95) in an unsuccessful attempt to settle the doctrine of quietism (perfection in passivity of the soul). Pop. (1990) 46,734.

Issyk-Kul, *oblast* (province), northeastern Kyrgyzstan, with an area of 16,800 square miles (43,500 square km). In the northeast is Lake Issyk-Kul at an elevation of 5,276 feet (1,608 m) and surrounded by ranges rising to 17,100 feet (5,200 m), while in the southeast, on the frontier with China, are the highest peaks of the Tien Shan (mountains), culminating in Victory Peak at 24,406 feet (7,439 m). The climate around Lake Issyk-Kul is relatively mild, but in the mountain valleys of the southeast even the summers are cool.

Fine-fleeced sheep and pedigree horses are reared on the *oblast*'s extensive pastures, and grain and potatoes are grown in the eastern part of the Issyk-Kul Basin. The *oblast* is a major producer of raw opium. Industry is found mainly in Przhevalsk and in Issyk-Kul city. Most of the population live around the lake, which is also a summer resort area, the

town of Cholpon-Ata on its north shore being especially popular. Most of the population is Kyrgyz, with a substantial Russian minority. Pop. (1993 est.) 429,300.

Issyk-Kul, formerly RYBACHYE, town, Issyk-Kul *oblast* (province), Kyrgyzstan. It is a port located on the western shore of Lake Issyk-Kul and is linked to Frunze, about 87 miles (140 km) north-northwest. Issyk-Kul's economy centres on a food industry, including meat-packing and cereal processing, and the town serves as a major transportation centre, with a shipyard. Pop. (1989) 42,700.

Issyk-Kul, Lake, Russian OZERO ISSYK-KUL, a drainless lake in Issyk-Kul *oblast* (province) of Kyrgyzstan. Situated in the northern Tien Shan (mountains), it is one of the largest mountain lakes in the world and is famous for its magnificent scenery and unique scientific interest. It is situated within the bottom edges of the Issyk-Kul Basin, which is bordered on the north by the Kungey-Alatau Range (Khrebet) and on the south by the Terskey-Alatau Range. The lake has a length of 113 miles (182 km), a width of up to 38 miles (61 km), and a surface area of 2,425 square miles (6,280 square km). It reaches 2,303 feet (702 m) in depth and has a volume of 416 cubic miles (1,738 cubic km). The lake's name, which derives from a Kyrgyz word for "hot lake," alludes to the fact that it does not freeze over during the winter.

The Kungey-Alatau Range, with elevations up to 15,653 feet (4,771 m), and the Terskey-Alatau (up to 17,113 feet [5,216 m]) frame the Issyk-Kul Basin with steep slopes and rocky crests. The basin's climate is warm, dry, and temperate. Air temperatures in July on the shore average about 62° F (17° C), while in January, on the western edge of the basin, the temperatures average about 28° F (−2° C). The annual amount of precipitation increases sharply from west to east, from 4 inches (100 mm) to a maximum of 16–20 inches (410–510 mm) in summer. Strong winds blow frequently toward the lake, with velocities in the west averaging about 90 miles (145 km) per hour.

More than 50 rivers can be counted in the basin. The largest, the Dzhergalan and the Tyup, are nearly 60 miles (97 km) long and are located in eastern Priissykkulye. The Chu River flows along the western outskirts of the basin.

Lake Issyk-Kul's shores open out gently, with coves on the eastern and southeastern sides. Sandy soils predominate. The water of the Issyk-Kul is sky blue in colour, very clear (visibility up to 65 feet [20 m]), and salty. Unsuitable for drinking and irrigation because of its high mineral content, it is used at times without freshening for watering cattle.

Rocky deserts with sparse, saline, semibushy vegetation lie in the western part of the basin. Toward the east are steppes and meadows and a type of elm that grows in the chestnut soils and black earth. Higher up in the mountains, sub-Alpine and Alpine meadows occur.

More than 20 kinds of fish live in Lake Issyk-Kul. The basic commercial fish are the naked osman, the chebak, the little chebak, the common carp, and the marinka.

The lake's western and eastern shores serve as a wintering place for waterfowl. Pochard, mallard, bald coot, and teal are the main varieties. To conserve the wildlife, the Issyk-Kul Preserve was founded in 1948, encompassing a lake waterfront and a 1-mile (1.6-kilometre) shore zone in which hunting is forbidden. Hare, fox, and muskrat live in the thickets. In all there are some 40 kinds of mammals and 200 types of birds.

Kyrgyz and Russians predominate in the population of the basin; but there are also a number of Ukrainians, Tatars, Uzbeks, and Dungans. There are two large cities—Przhevalsk and Issyk-Kul—and hundreds of villages. The principal occupation in the area is farming: wheat, potatoes, vegetables, and the medicinal poppy are grown, and stock are raised. The shores of the lake are noted for their health resorts.

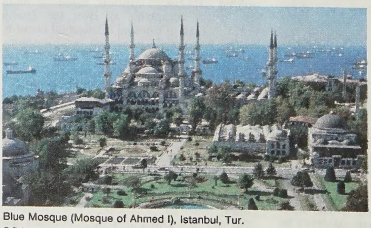
Istanbul, Turkish İSTANBUL, formerly CONSTANTINOPLE, ancient BYZANTIUM, largest city and seaport in Turkey. Strategically situated on a hilly triangular peninsula at the entrance to the Black Sea, the city lies on either side of the Bosporus (Bosphorus) Strait and thus is located in both Europe and Asia.

A brief treatment of Istanbul follows. For full treatment (including a map), *see* MACROPAEDIA: Istanbul.

Byzantium was founded as a colony by Greeks at about the end of the 8th century BC. The settlement passed to the Persian Empire in 512 BC and later to Alexander the Great. A free city under the Roman Republic, it came under direct Roman rule during Vespasian's reign (AD 69–79). In 324 Constantine I made the city his capital (renamed New Rome), and in 330 he made it the seat of the Roman Empire, later naming it Constantinople. Under Constantine it was decreed a Christian city, and in 381 it became the seat of a patriarch who was second only to the bishop of Rome; the patriarch of Constantinople is still the nominal head of the Orthodox church. Constantinople remained the capital of the Byzantine Empire (*i.e.*, the eastern half of the former Roman Empire) after the fall of Rome itself in the late 5th century. In the 6th–13th century, the city was frequently besieged by the Persians, Arabs, Bulgars, and Russians. It was captured in 1203 by the armies of the Fourth Crusade, who sacked it and turned it over to Latin Christian rule. The city was returned to Byzantine rule in 1261, but in 1453 it fell to the Ottoman ruler Mehmed II, under whom it became popularly known as Istanbul and was made the capital of the Ottoman Empire. A period of peaceful growth followed, lasting until 1922. The Turkish Republic moved the capital to Ankara in 1923, and Constantinople was officially renamed Istanbul in 1930.

Istanbul is divided into European and Asian parts by the Bosporus Strait, and the European part is itself divided into the old city of Stamboul (south) and the "new" city of Beyoğlu (north) by the channel known as the Golden Horn. The European section of the city, with some three-fourths of the total population, is the site of major businesses and hotel and office complexes. Within the old walled city (Stamboul) lie seven hills, with flat summits and steep slopes, where an essentially medieval appearance is still preserved; lying across the Golden Horn, Beyoğlu, with theatres and many Turkish government offices, is the modern section of Istanbul.

The climate of the city is subtropical and Mediterranean. Afternoon temperatures in July and August, the warmest months, average 82° F (28° C), while in January, the coolest month, they drop to 46° F (8° C). Nighttime lows are some 10° to 15° F (6° to 8° C) cooler. Annual precipitation ranges from 30 to 35 inches (760 to 900 mm).



About one-third of Turkey's manufacturing plants are located in Istanbul. The major industries are the manufacture of textiles, cement, glass, and leather goods; the processing of tobacco; and automobile and truck assembly, printing, and shipbuilding and ship repairing. Many large Turkish banks and foreign insurance companies are located in the city, and tourism is an important source of income.

Istanbul is a city of great historical interest, and many reminders of its past remain. The Underground Palace (Yerebstan Sarayı) and Constantine's Palace (Tekfur Sarayı; built a thousand years after Constantine) are among its well-preserved monuments. Many of the ancient Christian churches are still in use, some as mosques; the largest of these is the Hagia Sophia, which in 1453 was converted into a mosque and in 1935 a museum. Among the city's Ottoman buildings are the Mosque of Süleyman (1550–57) and the Blue Mosque. The walled Topkapı Palace (Seraglio) houses important Turkish collections of manuscripts, china, armour, and textiles.

The city has been the cultural centre of Turkey for centuries. Among its newer facilities is the Atatürk Palace of Culture, opened in 1969 as a centre for the arts. There are several learned societies, research institutes, museums, and libraries. The University of Istanbul (founded 15th century) is the oldest and largest institution of higher learning in the country. Other important cultural institutions are the Istanbul Technical University (1773), Marmara University (1883), the University of the Bosporus (1863), Mimar Sinan University (1883), and Yildiz University (1911).

The city is connected by railroads with eastern and western Europe and the Middle East (Syria and Iraq). The Bosporus bridges, which link the European and the Asian sections of Istanbul, are among the longest highway suspension bridges in the world. Yeşilköy International Airport is situated about 17 miles (27 km) to the west of the city. The port of Istanbul handles a large part of the country's imports and exports. Area city, 98 square miles (254 square km). Pop. (1997) 8,260,438.

Isthmian Games, in ancient Greece, a festival of athletic and musical competitions in honour of the sea god Poseidon, held in the spring of the second and fourth years of each Olympiad at his sanctuary on the Isthmus of Corinth. Legend attributed their origin either to Sisyphus, king of Corinth, or to Theseus. Open to all Greeks, the Isthmian Games were especially popular with Athenians. The victors' prize, originally a crown of dry wild celery, was changed to a pine wreath in Roman times, the pine being sacred to Poseidon. Celebration of the festival died out when Christianity became dominant in the 4th century AD.

isthmus, narrow strip of land connecting two large land areas otherwise separated by the sea. Unquestionably the two most famous are the Isthmus of Panama, connecting North and South America, and the Isthmus of Suez, connecting Africa and Asia. Historically the Isthmus of Corinth was of major importance because it connected what otherwise would be the island of the Peloponnese with the rest of the Greek peninsula. Isthmuses are of great importance in plant and animal geography because they offer a path for the migration of land plants and animals between the two land masses they connect.

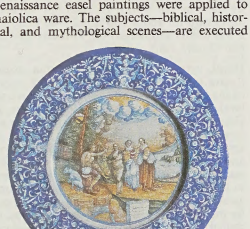
istiḥsān (Arabic: "to approve," or "to sanction"), among Muslim theologians, the use of one's own judgment to determine the best solution to a religious problem that cannot be solved by citing sacred texts. This approach to religious problems found special application as Islām spread to new lands and encountered new environments. Proponents of *istiḥsān* believe Muḥammad sanctioned this procedure when he said: "Whatever true Muslims prefer, is preferable in the eyes of God." Most religious authorities restrict the use of *istiḥsān* to cases that cannot be satisfactorily solved by applying such other well-established norms as, for example, analogy (*qiyās*) and consensus of opinion (*ijmāʿ*). Certain prominent theologians, however, among them ash-Shāfiʿī (d. 820), forbade the use of *istiḥsān* altogether, fearful that true knowledge and correct interpretation of religious obligations would suffer from arbitrary judgments infused with error. The followers of Abū Ḥanīfah (d. 767) held the modified view that *istiḥsān* is in fact a form of analogy because any judgment about what is best necessarily follows careful consideration of all alternative solutions.

istiṣlāḥ (Arabic: "to deem proper"), a norm employed by Muslim jurists to solve perplexing problems that find no clear answer in sacred religious texts. In such a situation, the judge reaches a decision by determining first what is materially most beneficial to the community as a whole, then what benefits the local community, and, finally, what benefits the individual. Almost all Muslim schools of theology acknowledge the usefulness and legitimacy of *istiṣlāḥ*, for they accept the premise that whatever is materially beneficial for humanity in general is almost certainly beneficial to individuals. *Istiṣlāḥ* may not be used when the material advantage to an individual or community directly conflicts with explicit teachings of Islām. Certain Sunnite Muslims, however, regard all material considerations as unworthy of true believers unless such decisions coincide with the spiritual needs of the community.

Istiwāʾiyah, al-, English EQUATORIA, the southernmost region of The Sudan. It is bounded by Ethiopia on the east, Kenya on the southeast, Uganda and Zaire on the south, and the Central African Republic on the west.

Al-Istiwāʾiyah is geographically isolated from the rest of The Sudan by the vast swamps of as-Sudd to the north and by intermontane rain forests that cover the southernmost part of the country. The Imatong and Dongotona mountains rise along the border with Uganda and dominate the eastern part of the region. The Imatongs are in fact the highest mountains in The Sudan, with Mount Kinyeti the country's highest peak at 10,456 feet (3,187 m). They are covered with lush rain forests, and their drainage forms extensive swamps to the north. The al-Jabal River, or Mountain Nile, flows northward through east-central al-Istiwāʾiyah. To the west, the highlands are drained northward by the Yei, Ibba, and Sue rivers. The Marra and Abū Gatta hills dominate the westernmost part of the region.

Al-Istiwāʾiyah is inhabited by various peoples who practice traditional African religions or Christianity and who speak Eastern Sudanic or Adamawa-Eastern languages (belonging to the Nilo-Saharan and Niger-Congo language families, respectively). The Azande are the largest single ethnic group in al-Istiwāʾiyah and dominate its western portion. Among the peoples in the centre and east are the Murle, Didinga, Bari, Kuku, Kakwa, Bongo, and Baka, among others. There are few Muslims in the region.



Agriculture is the principal occupation, and sedentary and shifting cultivation produce wheat, *durra* (sorghum), sesame, cotton, coffee, tobacco, corn (maize), hemp, jute, castor-oil seeds, pulses, and root crops. The lumber industry yields such products as firewood, charcoal, agricultural implements, railway ties, telegraph poles, rope fibres, and tanning materials. This industry has been periodically interrupted by civil war with the north, however. Other industries are rudimentary and are basically restricted to the production of milled flour and processed foods. Jūbā is the chief town and administrative and commercial centre of the region. Other towns include Yambio, Yei, and Amadi.

Al-Istiwāʾiyah formed part of the region conquered by Egypt in 1821. The area's traditional trade was in slaves and ivory, which were sent north to the Arabic-speaking portions of the Sudan and thence to Egypt. The Anglo-Egyptian government tried unsuccessfully to suppress the slave trade in the early 1870s, and the first attempts to spread Christianity (through mission schools) were also undertaken. During the 1880s most of the area was in the hands of the Mahdists, *i.e.,* supporters of al-Mahdi, a Muslim religious reformer who had undertaken a revolt against British rule beginning in 1881. The area was seized along with the rest of the Sudan by Anglo-Egyptian forces in 1898, and their rule continued until The Sudan gained independence in 1956.

Al-Istiwāʾiyah's history since then has been one of conflict with the Muslim, Arabic-speaking majority of central and northern Sudan, which dominates the central government. Agreements on regional autonomy for al-Istiwāʾiyah and neighbouring regions have repeatedly fallen apart, and the central government's periodic attempts to Islāmize the south have provoked deep resentment and armed resistance; a rebellion by southern troops at Juba in 1958 led to a civil war that continued until 1969. The north-south civil war that erupted again in 1983 further disrupted al-Istiwāʾiyah's economy and turned many of its people into refugees.

istoriato style, style of pottery decoration, originating about 1500 in Faenza, Italy, and popular throughout the 16th century, in which paintings comparable in seriousness to Italian Renaissance easel paintings were applied to maiolica ware. The subjects—biblical, historical, and mythological scenes—are executed with a realism (including the use of perspective) quite unlike any previous pottery decoration. Some examples are almost exact copies, others are free interpretations of the paintings and graphic work of such contemporary artists as Raphael and Albrecht Dürer. *Istoriato* painting sometimes occupies only the centre of the dish, with a border of formal ornament surrounding it; but often, notably in wares from Urbino, the painting covers the entire surface.

The greatest *istoriato* painter was Nicola Pellipario, who decorated Castel Durante and Urbino wares. His palette is soft and harmonious, and his subjects, drawn chiefly from Ovid and Lucian, are lyrically rendered. Many pieces of a service produced for Isabella d'Este, and another for the Ridolfis, survive in museums. The *istoriato* style was widely imitated in pottery centres outside of Italy, especially in France.

Faenza maiolica *istoriato* dish with a depiction of the judgment of Paris painted within a border of grotesques, 1527; in the Victoria and Albert Museum, London

Istria, Serbo-Croatian ISTRA, triangular peninsula that is part of Croatia and Slovenia. It extends into the northeastern Adriatic Sea between the Gulf of Venice (west) and the Gulf of Kvarner (east). The peninsula has an area of 1,220 square miles (3,160 square km). The northern portion is part of Slovenia, while the central and southern parts belong to Croatia. A tiny strip of coast at its northwestern base is the site of Trieste and belongs to Italy.

Istria's highly indented shoreline, 267 miles (430 km) in length, exhibits numerous drowned valleys. The west coast has a score of small offshore island groups, the most notable being Brioni (Brijuni). The terrain basically consists of a limestone plateau, much of which lacks water owing to its karst topography. The northeast section consists of the mountains of the Dinaric Alps, with a maximum elevation of 4,596 feet (1,401 m) at Mount Učka. These modest heights slope gradually south and west in undulating terraces toward the Adriatic. Parts of the peninsula have thick forests, and places suffering from the ravages of timber cutting are being reforested. In the waterless karst areas a scrub vegetation prevails. A Mediterranean climate brings hot, dry summers and warm, wet winters.

The population of Istria, approximately two-thirds of which is Croatian, engages mostly in agriculture. Wheat, corn (maize), rye, oats, figs, fruit, and olives are grown in the fertile western and southeastern coastal areas, and cattle are bred. There has been an increase in viticulture, and fishing and shipbuilding are other activities. Salt is obtained from seawater at Piran and Portorož in Slovenia. Raša, in Croatia, is an important site for the mining of high-quality anthracite coal; and bauxite, building stone, and quartz are also extracted. Istria's most important town and harbour is Pula, which has a well-preserved Roman amphitheatre. Opatija and Brioni are best known as seaside resorts.

Istria derived its name from the ancient Illyrian tribe of the Histri and was subdued by Rome in 177 BC after two wars. Under the emperor Augustus most of the peninsula became part of Italy. Slavic peoples began settling there in the 7th century AD. It was successively under the control of diverse Mediterranean powers until 1797, when the peninsula came under the rule of Austria, which developed Trieste as a port. By this time the population consisted of Italians and Austrians in the coastal towns and Slavic farmers in the rural interior. After World War I, Italy forcibly seized the peninsula from Austria in 1919 and afterward tried to Italianize the population. But, following Italy's defeat in World War II, Yugoslavia occupied most of Istria in 1947. The peninsula's northwestern section, around Trieste, was finally divided between Italy and

Yugoslavia in 1954 after decades of diplomatic wrangling and periodic political crises. Istria quietly became part of Croatia and Slovenia in 1991 when those states became independent nations. Italian minorities remain in both the Slovene and Croatian parts.

Istrie, Jean-Baptiste Bessières, Duke (duc) **d'**: *see* Bessières, Jean-Baptiste.

István (Hungarian personal name): *see under* Stephen.

Īśvara (Sanskrit: "Lord"), in Hinduism, the personal, or immanent, god, as distinct from the absolute, or transcendent, supreme being (Brahman). Īśvara refers to the personified aspect of the divine, of whom the various sectarian divinities are particular manifestations. The title is particularly favoured by devotees of the god Śiva, though its meaning transcends all sectarian differences; the comparable term Bhagavat (also meaning "Lord") is more commonly used among the Vaiṣṇava (followers of the god Vishnu).

Itabuna, city, southeastern Bahia *estado* ("state"), northeastern Brazil. It lies just west of Ilhéus on the Cachoeira River at 174 feet (53 m) above sea level. Itabuna, which was elevated to city status in 1910, is the trade centre for a rich zone yielding cacao, livestock, and other agricultural products. It was used as a setting by Jorge Amado in his novels dealing with the cacao culture. A chemical factory is located there. Goods are transported to Salvador, the state capital (150 miles [240 km] north-northeast), and to other urban centres in Bahia by highway, air, and ocean (via Ilhéus). Pop. (1991 prelim.) 170,434.

Itagaki Taisuke, Count (Hakushaku) (b. April 17, 1837, Kōchi, Japan—d. July 11, 1919, Tokyo), founder of Japan's first political party, the Liberal Party, or Jiyūtō.

Born into a middle-ranking samurai family, Itagaki entered the service of his feudal lord in 1860 and emerged from subsequent factional struggles to become the military commander in Tosa, the large feudal domain controlled by his clansmen. Under Itagaki's command the troops of Tosa participated in the Meiji Restoration in 1868, which overthrew the Tokugawa shogunate and restored national authority to the emperor. Afterward, he was one of a dozen powerful young leaders on the national scene and served from 1868 to 1873 as an official in the new government. When the majority of the cabinet thwarted his plans for a war against Korea, he resigned and founded a political club (political parties were then unknown in Japan). He denounced the government's arbitrary stand and called for the formation of a "council chamber chosen by the people" to advise the government.

In 1875 he served briefly in the cabinet but then left again. This time he founded the first nationwide organization with a mass following, the Society of Patriots, but he resisted the desire of radical members of the group to join in the rebellion that was raised in 1877 by dissatisfied samurai. In 1878 Itagaki tried to further his movement by establishing a school devoted to teaching the principles of democratic government. For this action he became known as the Jean-Jacques Rousseau of Japan. The peak of his fame came shortly after, when he organized Japan's first political party, the Jiyūtō. He was a charismatic leader and a popular speaker. In April 1882, campaigning for the Liberal Party, he was stabbed by an attacker and is reputed to have declared: "Itagaki may die, but liberty, never."

With the beginning of parliamentary government in 1890, Itagaki, who had been made a count in 1887, served as the symbolic head of his party, which frequently cooperated with Itō Hirobumi, Japan's first prime minister and one of the more liberal of the government oligarchs. Itagaki and his party felt a responsibility to demonstrate to the West that the Japanese were capable of parliamentary government. After his retirement in 1900, Itagaki wrote position papers and agitated for social reform.

Itagüí, city, Antioquia *departamento,* northern Colombia. It lies along the Porce River between the Andean Cordilleras (mountains) Occidental and Central, at 5,148 feet (1,569 m) above sea level. Formerly a resort and a local commercial and manufacturing centre, Itagüí has become part of the industrial complex centring on Medellín, 5 miles (8 km) northeast by highway and railroad. The principal industry is textile milling. Pop. (1995) 169,374.

Itaipú Dam, hollow gravity dam on the Alto (Upper) Paraná River at the Brazil-Paraguay border, north of the town of Ciudad del Este, Paraguay. In terms of power output, it is one of the world's largest hydroelectric projects. Its

Itaipú Dam on the Upper Paraná River, north of Ciudad del Este, Paraguay
Vieira de Queiroz/TYBA—Agencia Fotografica

18 massive turbine generators, located in the powerhouse at the base of the dam, are capable of generating 12,600 megawatts of electricity. Built as a joint venture by Paraguay and Brazil, the complex of dams and spillways curves across almost 5 miles (8 km) of the Alto Paraná River. The dam itself, built between 1975 and 1982, is 643 feet (196 m) high and consists of large concrete segments joined to form a hollow chamber. The upstream face is supported by two buttresses, and the downstream face is a simple concrete slab. It is the highest and largest hollow gravity dam in the world. Its reservoir stretches northward for about 100 miles (160 km), and it has totally submerged the formerly spectacular Guaíra Falls.

Itajaí, city, eastern Santa Catarina *estado* ("state"), southern Brazil. It lies at the mouth of the Itajaí River, at 20 feet (6 m) above sea level. Founded in the mid-19th century by German and Italian colonists, Itajaí is now the commercial centre and Atlantic port for an agricultural region drained by the Itajaí River and its tributaries. Wrapping paper and cotton textiles are the principal goods manufactured in the city, which also exports lumber, starch, cassava, sassafras, vegetable oil, and tobacco. In the late 1970s a fishing terminal was installed there. Itajaí is connected by highway and air to Florianópolis, the state capital (50 miles [80 km] south), and to other communities in Santa Catarina. Pop. (1991 prelim.) 114,558.

Itajubá, city, southern Minas Gerais *estado* ("state"), Brazil. It lies along the Sapucaí River, in the Mantiqueira Mountains, at 2,769 feet (844 m) above sea level. It was made the seat of a municipality in 1848 and given city status in 1862. Although basically a textile centre, it has other industries and serves a region of agriculture (coffee, rice, corn [maize], and sugarcane) and cattle ranching. Goods are transported by rail or road northeast to Belo Horizonte, the state capital, and to other cities in Minas Gerais, São Paulo, and Rio de Janeiro states. Pop. (1991 prelim.) 68,469.

Italian Communist Party: *see* Democratic Party of the Left.

Italian Confederation of Syndicated Labourers: *see* Confederazione Italiana Sindacati Lavoratori.

Italian Democratic Socialist Party, Italian PARTITO SOCIALISTA DEMOCRATICO ITALIANO (PSDI), anticommunist reform party advocating economic planning and nationalization of some industries. As a centre party, it was able to join many Italian governments in the decades after World War II.

In early 1947, socialists who opposed the Italian Socialist Party (PSI) for its cooperation with the Italian Communist Party (PCI), seceded to form the Socialist Party of Italian Workers (Partito Socialista dei Lavoratori Italiani; PSLI). After the Christian Democratic premier Alcide De Gasperi excluded the PCI and the PSI from his government in May 1947, the PSLI's support added stability to the government's majority. In 1952 the PSLI and other anticommunist socialist factions merged to form the PSDI, which participated in centre governments after 1954.

As the PSI moved away from its communist ally during the 1950s, its platform came to resemble that of the PSDI. In 1963 the PSI took part in government, and in October 1966 the PSDI rejoined under the PSI's name. The reunion lasted only a short time; after the PCI's share of the vote rose to 26.9 percent in the 1968 parliamentary election, the question of a government including communists arose. The former Social Democrats who opposed communist participation left the PSI in July 1969 and formed the Unitary Socialist Party (PSU), whose disagreement with the PSI constituted a major stumbling block to forming governments in the late 1960s. The PSU took the name of Social Democrat again in the spring of 1970. It thereafter continued to add support to the Christian Democratic governments.

Italian East Africa, Italian AFRICA ORIENTALE ITALIANA, group of Italian possessions in East Africa in the period 1936–41. It comprised Ethiopia (annexed by Italy on May 9, 1936, and was proclaimed a part of Italian East Africa that June 1) together with the Italian colonies of Eritrea, now part of Ethiopia, and Italian Somaliland, now part of the Somali Democratic Republic. Italy's king, Victor Emmanuel III, was named emperor. British

forces overran the area between January and November 1941.

Italian language, Italian ITALIANO, Romance language spoken by some 66,000,000 persons in Italy (including Sicily and Sardinia), France (including Corsica), Switzerland, and other countries. It is spoken by large numbers of emigrants and their descendants in the Americas, especially in the United States, Argentina, and Canada. Written materials in Italian date from the 10th century (a set of court records with the testimony of the witnesses in the Italian vernacular), and the first literary work of length is the *Ritmo Laurenziano* ("Laurentian Rhythm") of the late 12th century.

Although Italian has a standard literary form, based on the dialect of Florence, the common speech is dialectal or a local variant of standard Italian. The less formal the occasion and the less educated the speaker, the greater the deviation from standard speech; many Italians cannot speak the standard language at all. The following dialect groups are distinguished: Northern Italian, or Gallo-Italian; Venetan, spoken in northeastern Italy; Tuscan (including Corsican); and three related groups from southern and eastern Italy—(1) the dialects of the Marche, Umbria, and Rome, (2) those of Abruzzi, Puglia (Apulia), Naples, Campania, and Lucania, and (3) those of Calabria, Otranto, and Sicily.

The sound system of Italian is quite similar to that of Latin or Spanish. Its grammar is also similar to that of the other modern Romance languages, showing agreement of adjectives and nouns, the use of definite and indefinite articles, loss of noun declension for case, two genders (masculine and feminine), and an elaborate system of perfect and progressive tenses for the verb. The most notable difference between Italian and French or Spanish is that it does not use *-s* or *-es* to form the plural of nouns but instead uses *-e* for most feminine words and *-i* for masculine words (and some feminine words).

Italian Liberal Party, Italian PARTITO LIBERALE ITALIANO (PLI), moderately conservative Italian political party that dominated Italian political life in the decades after unification (1861) and was a minor party in the period after World War II.

The Liberal Party was first formed as a parliamentary group within the Piedmont assembly in 1848 by Count Camillo di Cavour, who eventually brought about the unification of Italy and became the new nation's first prime minister (1861). His followers, who favoured a centralized government, a restricted suffrage, regressive taxation, and free trade, became known in the new national parliament as Liberals. There was no tightly organized "Liberal Party" as such but merely various parties and parliamentary groups that formed a dominant voting bloc of basically conservative deputies in the national parliament. The Liberals split into Right and Left blocs in the 1860s, with the Left Liberals gaining control of the party in 1876. Liberal coalition governments continued to dominate Italian politics until World War I, after which the party's strength seriously declined. The party existed clandestinely during the Fascist period, and in 1944 it reemerged as a minority party, conservative but untainted by Fascist associations.

The modern Italian Liberal Party favours free enterprise and support for NATO and draws its chief support from small businessmen. From 1944 it was a minor partner in most of the Christian Democratic coalition governments.

Italian literature, the body of written works produced in the Italian language that had its beginnings in the 13th century.

A brief account of Italian literature follows. For full treatment, *see* MACROPAEDIA: Italian Literature.

Lacking political and administrative cohesion, Italy had a variety of vulgar tongues, ranging from Provençal to Sicilian, that might have replaced Latin as the lingua franca. It was largely due to the genius of Dante Alighieri, author of *La divina commedia* (*c.* 1310–21; *The Divine Comedy*), that the new literary medium became Tuscan. Thereafter, Giovanni Boccaccio, worldly and traveled, broadened the language's secular appeal, and Francesco Petrarch, with his intellectual gifts, contributed much in refining and elaborating Dante's *dolce stil novo* ("sweet new style"). Figures such as the 15th-century humanist Leon Battista Alberti, who insisted that Tuscan was in no way inferior to Latin, helped to sustain Florence's intellectual leadership, while the Venetian Pietro Bembo, credited with producing the first proper Italian grammar, himself championed Tuscan not so much for its intrinsic merits as for the excellence of its literary achievements.

With Ludovico Ariosto, Niccolò Machiavelli, and Francesco Guicciardini, 16th-century Italian humanistic writings reached a high point. Ariosto is remembered above all for *Orlando furioso* (1516), the epic poem on which he laboured for 30 years, while Machiavelli and Guicciardini, among many others, reaffirmed the role of Tuscan by employing the vernacular for their celebrated historical and political writings. From the Counter-Reformation, the only major work to have stood the test of time is Torquato Tasso's *Gerusalemme liberata* (1581; "Jerusalem Delivered"), a narrative poem inspired by the First Crusade.

The Age of Enlightenment saw a crisis in the written language, which as the vehicle of a restricted elite had tended over the years to petrify, while the Italian public, using dialect as their first tongue but with an increasing access to education, required an up-to-date literary medium more in tune with the spoken word. The poet Giuseppe Parini and the dramatist Vittorio Alfieri used conventional literary styles, but there were those, such as the 18th-century philosopher and economist Cesare Bonesana Beccaria or the journalist Pietro Giordani, who were giving thought to the creation of a standard vernacular better adapted to modern needs. Yet others, such as the Milanese poet Carlo Porta and, to a lesser degree, the Venetian dramatist Carlo Goldoni, were resorting to regional dialect in the quest for a popular, true-to-life linguistic tool. It was the Romantic Alessandro Manzoni, with his novel *I promessi sposi,* 3 vol. (1825–27; *The Betrothed*), who did more than anyone to forge a new literary idiom, basing it, despite his Milanese birth, on everyday, middle-class Florentine speech.

Italian Romanticism inevitably became involved with the patriotic myths of the Risorgimento ("Rising Again"), and much of the literature produced at this time reflects the political fervour of the age. With the notable exception of Manzoni's poetry and fiction and Giacomo Leopardi's poetry, the bulk of writing is more important for its good intentions and didactic vigour than its literary merit. The sentimental poetry of the "Second Romanticism" especially helped spark a number of reactive movements. *Verismo* ("realism"), for example, was a literary movement inspired by the French naturalists, and it reflected positivist and determinist ideas. The *veristi* tried to present life—usually that of the lower classes—objectively and without adornment and to achieve documentary, "real-life" effects. The greatest exponent of *verismo,* Giovanni Verga, in his two masterpieces, *I malavoglia* (1881; *The House by the Medlar Tree*) and *Mastro-don Gesualdo* (1889), portrays the victims of social and economic change. Luigi Capuana, the founder of *verismo,* is best remembered for his dramatic psychological study *Il marchese di Roccaverdina* (1901; "The Marquis of Roccaverdina").

In sharp contrast to the *veristi* stands the flamboyant nationalist and literary virtuoso Gabriele D'Annunzio, who answered his contemporaries' need for a new myth in the prosaic atmosphere of the post-unification era. D'Annunzio is best known for his autobiographical novel *Il piacere* (1889; *The Child of Pleasure*), his mature poetry, and his late memoirs.

The period marked by the end of World War I witnessed a need to return to traditional stylistic values. However, this understandable need for order not only produced a sterile preoccupation with form but also blended in readily with the stifling of free expression under Fascism. A notable exception to this trend was Luigi Pirandello, who achieved international recognition with his innovative, experimental drama. In his masterworks *Sei personaggi in cerca d'autore* (1921; *Six Characters in Search of an Author*) and *Enrico IV* (1922; *Henry IV*), Pirandello probes the fluctuating boundaries between reality and appearances, art and life, and sanity and insanity. Italo Svevo in *La coscienza di Zeno* (1923; *The Confessions of Zeno*) creates a gem of psychological observation and Jewish humour. Of enduring readability are works by Corrado Alvaro, Dino Buzzati, Carlo Emilio Gadda, and Ignazio Silone. The poets of the earlier part of the 20th century, influenced by the French Symbolists, wrote in an involuted manner, making use of unorthodox structures and a highly subjective language that enabled them to voice their distress obscurely. Known by the name of Ermetismo (Hermeticism), the movement included such names as Eugenio Montale and Giuseppe Ungaretti.

Post-World War II literature, which has been imprecisely labeled Neorealist, reflects the influences of *verismo,* Marxist ideas, and American literature. For their subject matter, writers relied heavily on the unusual experiences of contemporary history. Thus there are Carlo Levi's poetic evocation of Lucania, an impoverished town in the south to which he was exiled by the Fascist regime (*Cristo si è fermato a Eboli* [1945; *Christ Stopped at Eboli*]); Francesco Jovine's *Terre del Sacramento* (1950; *The Estate in Abruzzi*); and Vasco Pratolini's pictures of the Florentine working classes (*Il quartiere* [1945; *The Naked Streets*] and *Metello* [1955]).

Because the literary spectrum has become more heterogeneous, it is easiest to view contemporary writers in terms of individual domain. Giorgio Bassani's milieu, for example, is the nostalgic world of Ferrara, with particular emphasis on its Jewish community; Italo Calvino has spun fantastic philosophical tales; Leonardo Sciascia evokes his native Sicily with concerned and scholarly understanding; Natalia Ginzburg's territory is the family, be it her own, an imagined one, or a historical one. This list of authors can readily be lengthened to hold such names as Carlo Cassola, Alberto Moravia, Mario Soldati, Giovanni Arpino, Elsa Morante, and Umberto Eco.

Italian Peninsula, one of the three great peninsulas of southern Europe, the other two being the Balkan (to the east) and the Iberian (to the west). The Italian Peninsula extends from the region of the Po River southward for some 600 miles (960 km); it has a maximum width of 150 miles (240 km). To the east lies the Adriatic Sea, to the south the Ionian Sea, and to the west the Tyrrhenian and Ligurian seas. The Apennines, a volcanic mountain chain subject to frequent earthquakes, extends the length of the peninsula; lowlands are mostly along the coasts. The peninsula comprises much of Italy and includes the independent republic of San Marino as well as Vatican City.

Italian Popular Party, formerly (until 1993) CHRISTIAN DEMOCRATIC PARTY, Italian PARTITO POPOLARE ITALIANO (PPI), or PARTITO DELLA DEMOCRAZIA CRISTIANA (DC), centrist Italian political party whose several factions are united by their Roman Catholicism and anticommunism. They advocate programs ranging from social reform to the defense of free enterprise. The DC usually dominated Italian politics from World War II until the mid-1990s.

In 1919 a Sicilian priest, Luigi Sturzo, founded the original Italian Popular Party. Its tight organization and discipline won it quick success, but in 1926 the Fascists banned all political parties. After Italy's surrender in World War II (1943), old PPI leaders, with the support of many Roman Catholic organizations, founded the Christian Democratic Party. In 1945 its leader, Alcide De Gasperi, became premier. Italian politics took a decisive turn in May 1947, when he excluded the socialist and communist parties from his government. Until the early 1960s, the Christian Democrats either governed on the basis of four-party "centre" coalitions with centre and right-centre parties or, in time of stress, formed single-party "caretaker" governments.

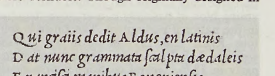
In the 1950s the Christian Democratic premiers encountered increasing difficulty in forming centre governments as their party's left wing gained strength and the centre-right parties became more conservative. Many Christian Democrats looked for an "opening to the left"—an alliance with the Italian Socialist Party (Partito Socialism Italiano; PSI)—and in 1963 Aldo Moro of the Christian Democrats succeeded in forming a government that included the PSI. DC and PSI cabinets dominated most of the 1960s and '70s. The DC weakened somewhat owing to scandal involving alleged secret government influence of a Masonic lodge, and in 1981 the DC temporarily surrendered the premiership and presidency to its coalition partners. The party remained strong, however, and was the dominant partner in a series of coalition governments until the early 1990s. By then the Cold War had ended, along with the political climate that had enabled the DC, the PSI, and their smaller centrist allies to form coalition governments that excluded the communists but tolerated political corruption. In 1992–93 the DC was rocked by the implication of some of its leading members in financial scandals and political corruption. In 1993 the struggling DC reverted to its original name, but, in parliamentary elections the following year, the Italian Popular Party fell from power and was reduced to a fairly minor party. It subsequently joined the centre-left Olive Tree coalition and from 1996 to 2001 participated in Italy's coalition government.

Italian Republican Party, Italian PARTITO REPUBBLICANO ITALIANO (PRI), anticlerical social-reform party. Although it had only a small following in the years after World War II, its position in the centre of the Italian political spectrum enabled it to take part in many coalition governments.

The party traces to the 19th century when radicals fought for a unified Italy under a republican form of government; the PRI was formally founded in 1895. Suppressed during Benito Mussolini's Fascist era, it reemerged in 1943. After World War II, the PRI refused to participate in government until Italians had voted against monarchical government. From 1947 to 1953, the PRI participated in the four-party "centre" governments. It withdrew from government in 1953 and did not return until February 1963, when the dominant centre party, the Christian Democratic Party, joined Italy's two socialist parties and the PRI in a centre-left coalition. The PRI usually remained in government thereafter, and a PRI leader, Giovanni Spadolini, served as premier (1981–82). The Republicans were among many parties caught up in the corruption scandals that rocked Italy after 1992. The PRI remained a very minor part of the centre-left Olive Tree alliance through the 1990s.

Italian Socialist Party, Italian PARTITO SOCIALISTA ITALIANO (PSI), former Italian political party, one of the first Italian parties with a national scope and a modern democratic organization. It was founded in 1892 in Genoa as the Italian Workers' Party (Partito dei Lavoratori Italiani) and formally adopted the name Italian Socialist Party in 1893.

"Figures in the Roman Forum," oil painting by Andries and Jan Both, Dutch painters belonging to a group of artists known as the Italianate painters; in the Rijksmuseum, Amsterdam



By courtesy of the Rijksmuseum, Amsterdam

The original basis of the party lay among trade unions, socialist circles, and cooperative organizations and contained an anarchist wing and a Marxist wing. Throughout the first decades of the 20th century, the party's left wing (or maximalists) fought for control against its reformists (led by Filippo Turati). During World War I the PSI took a neutral and pacifist position, yet within the party intense struggle continued between the factions. In 1919 at the Bologna Congress the left took leadership of the party, joined the Communist International (Comintern), and attempted revolutionary upheaval. After an enormous wave of strikes, demonstrations, and factory occupations in 1920, a reaction set in. While the majority of the party retreated, the left broke away to join the Italian Communist Party.

The PSI was driven underground in 1926, and in 1934 it formed an alliance with the communists that lasted until the mid-1950s, when the Soviet invasion of Hungary and Nikita Khrushchev's secret speech led the PSI to denounce the Soviet Union. The party remained torn over the question of whether to collaborate with the Christian Democrats or the communists. After much hesitation the party joined a Christian Democratic government in 1963. Thereafter the PSI was part of or supported many centre-left governments, and in 1983 Bettino Craxi became the first socialist premier. The PSI continued as a major partner in centrist coalition governments until the early 1990s, when Craxi and numerous other party figures were implicated in financial scandals and political corruption. In the 1994 elections, the PSI lost most of its seats in Parliament and was reduced to a relatively minor party. In 1994 the PSI was transformed into the Italian Socialists (Socialisti Italiani; SI), and in 1998 the SI merged with two other left-ist parties to form the Italian Democratic Socialists (Socialisti Democratici Italiani; SDI).

Italianate painters, group of 17th-century northern European painters, principally Dutch, who traveled in Italy and, consciously adopting the style of landscape painting that they found there, incorporated Italian models and motifs into their own works. Chief among the Italianates were Bartholomeus Breenbergh, Andries and Jan Both, Nicolaes Berchem, and Jan Asselijn. The Both brothers, of Utrecht, were to some degree rivals of the Haarlem-born Berchem. Andries painted the figures that populated Jan's landscapes. Berchem's own compositions were largely derived from the Arcadian landscapes of the French painter Claude Lorrain; a typical scene would contain shepherds grazing their flocks among classical ruins, bathed in a golden haze. Upon his return to Holland, Berchem occasionally worked in cooperation with the local painters and is said to have supplied figures in works of both Jacob van Ruisdael and Meindert Hobbema.

italic, in printing, a sloping, light-bodied, compact, and almost cursive letter form, which, with roman and black-letter shapes, has been one of the three major typefaces in the history of Western printing. Used today almost exclusively as a special function adjunct of roman letters, italic types were used first as body texts in small volumes in which their space-saving, humanistic characteristics were desirable. Though originally designed in

Italic type from the dedication to Virgil's *Opera*, the first book to use italic type, printed by Aldus Manutius in Venice, 1501

Courtesy of The Newberry Library, Chicago

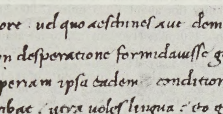
1500 or earlier, the first notable use of italic was in an edition of Virgil (the "Aldine Virgil"), created in 1501 by Francesco Griffo, typecutter to the printer Aldus Manutius, in Venice. He designed his type on models of an informal, handwritten letter used in the papal chanceries of the time, and he cut his new face in lowercase letters only. He combined these with a suitable roman capital. Still later, a simple, sloping uppercase face was introduced as an intermediate between roman and a fully developed uppercase italic letter shape.

Italic languages, Indo-European languages spoken in the Apennine Peninsula (Italy) in the 1st millennium BC. The only survivor after that period was Latin, the language of the Roman Empire and, later, western Christendom.

A brief treatment of the Italic languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World: *Italic languages*.

Although traditionally thought to be a subfamily of Indo-European like Celtic, Germanic, or Slavic, the Italic languages may represent three independent members of the Indo-European family: Latin (with Faliscan), Osco-Umbrian (with South Picene), and (according to some scholars) Venetic. Data on them comes from Greek and Roman sources, especially from inscriptions. Latin is the language of Latium and of Rome; its earliest known documents date from the 6th century BC. From the 3rd century BC, Latin began to emerge as the predominant language of Italy, and by AD 100 it had effaced all dialects between Sicily and the Alps, with the exception of Greek in the colonies of Magna Graecia.

Before the spread of Latin, Oscan was the most widely spoken group of dialects of the Apennine Peninsula. It was used by the Samnites, by the inhabitants of Lucania and Bruttium, and by smaller tribes between Latium and the Adriatic Coast. The most important Oscan texts come from Campanian cities; the most extensive Oscan inscription, the Tabula Bantina, is preserved in Lucania. The Umbrian idiom, closely related to Oscan, is known principally from the Tabulae Iguvinae (Iguvine Tables), which constitute one of the largest and most important epigraphical documents of antiquity. The South Picene inscriptions, which are from the region around present-day Teramo, show a language closely related to Oscan and Umbrian, and they antedate the Oscan and Umbrian texts by several centuries. Faliscan inscriptions appear around Falerii, in the Etruscan area of central Italy. Venetic, once used in the region surrounding present-day Venice, is known principally by inscriptions from sanctuaries at Este and Lagole di Calalzo.



The alphabets used for writing these languages included Greek, Latin, and derivations of the Etruscan alphabet. Five national "scripts" included Oscan, Umbrian, South Picene, Faliscan, and Venetic.

The Italic languages must have been brought from the original area of the Indo-European languages, probably east-central Europe. A stratum of very old place-names of non-Indo-European origin, a stratum ascribed to a "Mediterranean" language, attests to this immigration. Most phonetic differences between the reconstructed Indo-European parent language and the attested Italic languages seem to have arisen relatively late in time. Only one can confidently be placed before the migration over the Alps: the change to *ss* in combinations of dental occlusive (stop) plus *t*. This feature is common to Celtic, Germanic, and Latin—for example, Latin *visus*, 'seen,' High German *gi-wiss*, 'surely known,' from an Indo-European term with *d* + *t*, **wid-to-s* (an asterisk [*] means a word is reconstructed). Features that developed in Italy itself include the voiceless dental spirant *f*, which replaced the Indo-European voiced aspirates *bh, dh, g*^{w}*h*, in initial position—for example, Latin *frater*, 'brother' equals Umbrian *frater*, equals Indo-European **bhrātēr*.

In contrast to the many phonological correlations among the Italic languages, there are few definite connections between these languages in their grammars. Many of the morphological features common to Osco-Umbrian/South Picene and Latin are shared by other Indo-European languages—for instance, the passive ending in *-r* in the Oscan *vincter* and Latin *vincitur*, 'He is conquered,' are found in Celtic, Hittite, and Tocharian as well. More important are the discrepancies. For example, the genitive singular of *o*-stems shows *-i* in Latin, Faliscan, and Venetic and in the Celtic languages but *-eis* in Osco-Umbrian and South Picene.

Lexical comparison leads to more specific data about the history of the Italic languages. An old difference between Latin and Osco-Umbrian is found in Latin *ignis*, 'fire,' which equals Sanskrit *agni*, but Umbrian *pir* 'fire' equals Greek *pûr* and Old English *fyr*. Certain forms, reflecting the acquisition of Mediterranean culture, suggest that Latin and Osco-Umbrian speakers were not in contact with each other when they began to build cities. On the other hand, they adopted the same terms for 'write' and 'read.' Both the Latin and Osco-Umbrian alphabets are derived from the Etruscan alphabet, and Etruscan features are obvious in archaic Italic religion. Osco-Umbrians and Veneti adopted even the Etruscan word for 'god'—*ais*. Etruscan supremacy ended about 500 BC with the founding of local republics in Rome and in other cities of Italy. Early republican terminology developed independently in each of the Italic languages. The last period of Italic language history shows an increasing influence of Roman models.

italic script, in calligraphy, script developed by the Italian humanists about 1400 from antique Latin texts and inscriptions. The humanists called the Carolingian minuscule in which most of these sources were preserved *lettera antica*, mistakenly regarding it as a

Antica corsiva, from *Cicero*, italic script developed by Niccolò Niccoli, 1423 (Florence, Biblioteca Nazionale Centrale, Conv. Suppr. J.1.14, c. 32r)

By courtesy of the Biblioteca Nazionale Centrale, Florence

Roman script from the time of Cicero. The Florentine scribe Niccolò Niccoli (d. 1437) combined the rhythm and fluidity of the familiar black-letter current hand with the narrow, inclined strokes of the *lettera antica* in his *antica corsiva*, which became the model for italic printing types. As in modern italic fonts, the form of *a* is distinctive, and *f, g, k*, and a long thin *s* are more or less reminiscent of black-letter cursive. For his headings Niccoli preferred Roman capitals "italicized" by a slight inclination to the right.

Italic War (ancient Rome): *see* Social War.

Italicus, Silius: *see* Silius Italicus.

Italo-Albanian Church, also called ITALO-GREEK CHURCH, or ITALO-GREEK-ALBANIAN CHURCH, an Eastern-rite member of the Roman Catholic communion, comprising the descendants of ancient Greek colonists in southern Italy and Sicily and 15th-century Albanian refugees from Ottoman rule. The Italo-Greeks were Byzantine-rite Catholics; but, after the Norman invasion of the 11th century, most of them were forcibly Latinized. Byzantine practices were partially restored with the coming of the Eastern-rite Albanian refugees, but the monasteries continued to decline, and by the 17th century the bishops were all Latin.

Pope Benedict XIV's pronouncements of 1742 (*Esti Pastoralis*) recognized the validity of the ancient Italo-Greek-Albanian rites and customs and allowed that members of the rite should be free from Latin coercion or interference in their traditional affairs. The Italo-Albanians, however, were not organized under their own bishops until 1919, in the diocese of Lungro (Calabria), Italy, and 1937, in the Sicilian diocese of Paina degli Albanesi.

Italo-Ethiopian War (1935–36), an armed conflict that resulted in Ethiopia's subjection to Italian rule. Often seen as one of the episodes that prepared the way for World War II, the war demonstrated the ineffectiveness of the League of Nations when League decisions were not supported by the great powers.

Ethiopia (Abyssinia), which Italy had unsuccessfully tried to conquer in the 1890s, was in 1934 one of the few independent states in a European-dominated Africa. A border incident between Ethiopia and Italian Somaliland that December gave Benito Mussolini an excuse to intervene. Rejecting all arbitration offers, the Italians invaded Ethiopia on Oct. 3, 1935.

Under Generals Rodolfo Graziani and Pietro Badoglio, the invading forces steadily pushed back the ill-armed and poorly trained Ethiopian army, winning a major victory near Lake Ascianghi (Ashangi) on April 9, 1936, and taking the capital, Addis Ababa, on May 5. The nation's leader, Emperor Haile Selassie, went into exile. In Rome, Mussolini proclaimed Italy's king Victor Emmanuel III emperor of Ethiopia and appointed Badoglio to rule as viceroy.

In response to Ethiopian appeals, the League of Nations had condemned the Italian invasion in 1935 and voted to impose economic sanctions on the aggressor. The sanctions remained ineffective because of general lack of support. The war, by giving substance to Italian imperialist claims, contributed to international tensions between the fascist states and the Western democracies.

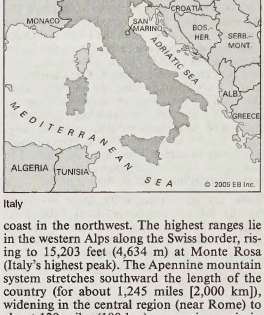
Italo-Turkish War (1911–12), war undertaken by Italy to gain colonies in North Africa by conquering the Turkish provinces of Tripolitana and Cyrenaica (modern Libya). The conflict upset the precarious international balance of power just prior to World War I by revealing the weakness of Turkey and, within Italy, unleashed the nationalist-expansionist sentiment that guided government policy in the following decades.

Italy took advantage of a period of international uncertainty following the Moroccan crisis of 1911 to achieve its long-desired goal of establishing a colony in North Africa. Using the pretext of the infringement of Italian interests in the two provinces, the Italian government issued an ultimatum to Turkey on Sept. 28, 1911, and on the next day declared war. Italian forces quickly occupied the towns of Tripoli, Darnah (Derna), and Banghāzī (Benghazi), but unexpected resistance on the part of the Muslim population forced the Italian commander General Carlo Caneva to confine operations to the coastal areas. In May 1912 Italian naval forces occupied Rhodes and some of the Dodecanese islands off the Turkish coast, but the war remained at a stalemate until a successful Italian offensive in North Africa from July to October 1912. Turkey, now menaced by the Balkan states, sought peace. By the terms of the Treaty of Lausanne (also called Treaty of Ouchy; Oct. 18, 1912), Turkey conceded its rights over Tripoli and Cyrenaica to Italy. Although Italy agreed to evacuate the Dodecanese, its forces continued to occupy the islands.

Italy, Latin ITALIA, in Roman antiquity, the Italian Peninsula from the Apennines in the north to the "boot" in the south. In 42 BC Cisalpine Gaul, north of the Apennines, was added; and in the late 3rd century AD Italy came to include the islands of Sicily, Corsica, and Sardinia, as well as Raetia and part of Pannonia to the north.

The first major power in the peninsula was the Etruscans. From Etruria, Etruscan power spread northward to the Po River valley and southward to Campania, but it later collapsed to Etruria itself. Where the Etruscans failed, the people of Rome gradually succeeded in the task of unifying the various Italian peoples into a political whole. By 264 BC all Italy south of Cisalpine Gaul was united under the leadership of Rome in a confederacy; its members were either incorporated in or allied with the Roman state. The status of the allies gradually changed until after the Italian, or Social, War (*i.e.,* the war of the *socii,* or allies) of 90 BC, when Roman citizenship was extended to all Italy. But political unification was achieved more quickly than was sentimental unity: Romans and Italici did not immediately coalesce into a nation. Cicero might talk of *tota Italia,* but Italy was not finally united in spirit until the time of Augustus, and Romanization was still slower in superseding local differences. In the meantime Cisalpine Gaul, which had received Roman citizenship in stages, was incorporated into Italy in 42 BC.

For administrative purposes the emperor Augustus divided Italy into 11 regions: (1) Latium and Campania, including the Volsci, Hernici, Aurunci, and Picentini, from the mouth of the Tiber to that of the Silarus (Sele) River, (2) Apulia and Calabria, including the Hirpini (the "heel" of Italy), (3) Lucania and Bruttium, bounded on the west coast by the Silarus, on the east by the Bradanus (Bradano) River (the "toe" of Italy), (4) Samnium, including the Samnites, Frentani, Marrucini, Marsi, Paeligni, Aequiculi, Vestini, and Sabini, bounded on the south by the Tifernus (Biferno), on the north probably by the Matrinus (Piomba) River, (5) Picenum, between the Aesis (Esino) and Matrinus rivers, (6) Umbria, including the *ager Gallicus,* bounded by the upper Tiber, Crustumius (Conca), and Aesis rivers, (7) Etruria, bounded by the Macra (Magra) and Tiber rivers, (8) Gallia Cispadana, limited by the Po River, from Placentia (Piacenza) to its mouth, and by the Crustumius, which was substituted for the Rubicon, (9) Liguria, bounded by the Varus (Var), Po, and Macra, (10) Venetia and Istria, including the Cenomani around Lake Garda in the west, and (11) Gallia Transpadana, bounded by the Alps, the Po River, and the Addua (Adda) River. This arrangement was retained almost unchanged until the emperor Diocletian's reorganization (*c.* AD 290–300), when the diocese of Italy included the islands of Sicily, Corsica, and Sardinia, as well as Raetia and part of Pannonia to the north. In practice this diocese was divided into two areas, each under a *vicarius:* that of Italy with the four northern regions and that of Rome with the seven southern areas and the islands.



Consult the INDEX *first*

Italy, officially ITALIAN REPUBLIC, Italian ITALIA, or REPUBBLICA ITALIANA, mountainous country of south-central Europe, extending southeastward into the Mediterranean Sea and including the large islands of Sicily and Sardinia. Its neighbours to the north are France, Switzerland, Austria, and Slovenia. The Adriatic Sea on the east separates it from the Balkans, and the Mediterranean Sea on the south separates it from North Africa. The capital is Rome. Area 116,343 square miles (301,328 square km). Pop. (2004 est.) 57,537,000.

A brief treatment of Italy follows. For full treatment, *see* MACROPAEDIA: Italy.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Italy is largely a country of mountains and highlands; the Alps, among the world's highest and most rugged mountains, arc from east to west along Italy's northern boundary, joining the Apennine Mountains in a narrow strip near the Ligurian (Riviera)

Italy

coast in the northwest. The highest ranges lie in the western Alps along the Swiss border, rising to 15,203 feet (4,634 m) at Monte Rosa (Italy's highest peak). The Apennine mountain system stretches southward the length of the country (for about 1,245 miles [2,000 km]), widening in the central region (near Rome) to about 120 miles (190 km), narrowing again in the south as its southern ranges continue westward into Sicily. The country's plains (or lowlands) occupy less than one-fourth of the total land area; nearly two-thirds of these lowlands lie in the Po River valley (a region about the size of Denmark). The Po valley, facing eastward toward the Adriatic Sea, is bounded on the north by the Alps and on the south by the northernmost extent of the Apennines. Most of the remaining lowlands are scattered along the coasts.

Three major tectonic plates, converging from the south, the west, and the northeast, create geologically unstable conditions throughout southern Italy and Sicily. The most famous of southern Italy's four active volcanoes is Mount Vesuvius, whose eruption in AD 79 destroyed Pompeii. Earthquakes in southern Italy were especially violent in 1693, 1783, 1908, 1916, and 1980. Mount Etna in Italy is studied as Europe's most active volcano, with notable eruptions in 1669, 1928, 1971, and 2001.

Italy's leading river, the Po, is joined by several large tributaries from the north as it flows eastward, forming a catchment area of more than 27,000 square miles (69,900 square km). The country's major Alpine lakes, including Lakes Maggiore, Lugano, and Como, drain southward to the Po valley. Rivers discharging into the Tyrrhenian Sea to the southwest—including the Arno (Florence to Pisa) and the Tiber (at Rome)—generally run parallel to the coast and are longer than those that discharge along the northeastern Adriatic and the southeastern Ionian coasts.

The country's largest islands, Sicily and Sardinia, are generally drier and warmer than the mainland; winters are mild (temperatures range between 48° and 52° F [9° and 11° C]) and summers are hot and dry (July temperatures average almost 80° F [26° C], and rainfall for June, July, and August averages less than 1 inch [25 mm]). The mainland climate varies generally from north (northwest) to south (southeast); summer temperatures are relatively uniform throughout the country. July temperatures range between 72° and 75° F (22° and 24° C), while winter temperatures range from cold (32° to 35° F [0° to 2° C]) in the Alps and the Po River valley in the north to relatively mild (41° to 46° F [5° to 8° C]) in the south. Annual average rainfall generally exceeds 40 inches (1,000 mm) in the highlands and remains below 30 inches (760 mm) in the lowlands (including a large part of the Po valley). The dry season occurs during the winter in the north and during the summer in the south; in neither area is it as marked as on the islands.

Italy is often considered as a country of four parts: north, centre, south, and the islands. These parts correspond to cultural and historical differences as well as topographical ones. The Po River valley is the principal agricultural region and has little of its original forest vegetation remaining. Natural vegetation is determined largely by elevation; the lower Alpine lake regions support cork oak, European olive, and cypress, replaced by beech slightly higher up, which finally gives way to deciduous larch and Norway spruce. The country's wildlife includes the marmot, ermine, and the Alpine rabbit among the smaller mammals; among the larger mammals are two protected species, the brown bear and the ibex. Birds include the golden eagle, black grouse, and, more rarely, the wood grouse.

The people. Italians are not easily categorized by any single physical characteristic, as their many regions were colonized by different peoples over time. Also, a wave of immigration in the late 20th century altered the ethnic mix. The country is linguistically homogeneous, nearly all of the population speaking Italian, with some variation in dialect along national borders and on the islands and in the mountains. In some Alpine border regions, foreign languages have been spoken for centuries. More than three-fourths of the populace profess Roman Catholicism, with about one-eighth claiming no religion. Italy has a stubbornly low, and oftentimes negative, rate of natural increase. The population continues to rise, however, because low or no natural growth is offset by net inward migration. The country is two-thirds urban, as rural life is in decline.

The economy. Though Italy retains a mixed private and publicly owned economy, privatization accelerated in the last decade of the 20th century. Its financial system was restructured to bring it more in line with other nations of the European Union (EU). Inflation was curtailed, public spending was reduced, and taxation was increased, to which the economy responded positively in the early 21st century.

Agriculture employs only about one-twentieth of the labour force. With the exception of the fertile Po River valley, much of Italy's agricultural land requires modification through irrigation, terracing, and soil management. The country is widely known for its cultivation of olives and grapes, and it is a leading exporter of wine and olive oil. Other leading crops are sugar beets, corn (maize), wheat, tomatoes, apples, potatoes, citrus and other fruits, rice, and barley.

Pastures, which account for about one-sixth of Italy's land area, support cattle and pigs in the north and sheep in the south. Though livestock farming is not especially significant, the breeding of pigs has increased in recent decades, and Italy's cured pork products such as salami and prosciutto are world-famous. Milks from cows, sheep, and water buffalo are made into hundreds of types of cheese, including fontina, Parmigiano-Reggiano, ricotta, Gorgonzola, and mozzarella.

The forestry industry rebounded in the late 20th century after decades of overexploitation. Broad-leaved trees are preponderant, with conifers concentrated in the Alpine foothills. Roundwood production has returned to the high levels it had maintained in the 1960s.

Fishing in the Mediterranean has declined

because of over-fishing and pollution, but Italy has managed to stabilize its catch fairly well through operations in the Atlantic and Indian oceans. Fish must also be imported to satisfy domestic needs.

The country's mineral resources are inadequate for domestic manufacturing needs. Petroleum is extracted, but only in stone is Italy well endowed; marble, pozzolan and pumice, gypsum, salt, potash, pyrites, feldspar, and bentonite and refractory clays are produced in quantity.

Industry, which accounts for one-fifth of the GDP and employs a little less than one-fifth of the labour force, is well diversified. Steel production forms the backbone of the metallurgical and engineering industries. The main manufactured products include guns and arms, textile machinery, machine tools, automobiles, and domestic electrical appliances. Also important is the manufacture of various textiles and clothing and of bricks, glass, ceramics, and chinaware. Italy was a pioneer in the production of hydroelectricity, but by the 1950s there was little room left for expansion, and the nation's need for energy was met additionally by the development of thermal-electric generation.

Tourism is well developed, centring on Italy's unsurpassed Roman antiquities and works of art and architecture from the Middle Ages through the Renaissance and on into the 18th century. Tourists come largely from Switzerland, France, Germany and Austria.

Italy's government owns and operates a number of industries through a system of financial holding companies. The producing companies thus held are also open to private investment, and, beginning in the 1980s, there were efforts to increase private participation in certain companies. Each of Italy's three major labour federations is closely allied to a political party. Italy is a member of the European Union.

Eighty percent of the rail network is controlled by the state. The rail network is well distributed throughout the peninsula, and government subsidies make trains an inexpensive mode of travel. Some 1,500 miles (2,400 km) of internal waterways include rivers, canals, and lakes. Among the principal ports are Genoa, Savona, Naples, Livorno, Trieste, Venice, and Palermo. Ferry service links the mainland to Sicily, Sardinia, and the smaller islands. Rome and Milan have the principal international airports. Alitalia and several smaller Italian airlines provide domestic air services to most cities.

Italy's principal exports are machinery and transport equipment, chemicals, textiles, clothing and shoes, and food products (olive oil, wine, fruit, and tomatoes), and these are sent mainly to Germany, France, the United States, and the United Kingdom. Imports consist mainly of machinery and transport equipment, chemicals, metal and semiprocessed metal, food and live animals, crude petroleum, and textiles—arriving principally from Germany, France, the United Kingdom, and The Netherlands.

Government and social conditions. Italy is a multiparty parliamentary republic. Supreme authority rests with the Parliament, which consists of two bodies of equal legislative power: a 326-member Senate and a 630-member Chamber of Deputies. Except for 11 senators appointed for life, all legislators in the Parliament are elected to five-year terms. According to the country's constitution of 1948, the two bodies may be dissolved by the president before the end of their normal term. The president, who is elected by an electoral college comprising the members of Parliament and regional representatives, serves as head of state. He appoints a prime minister who directs the country's executive affairs, and the president also appoints a Council of Ministers (cabinet) on the recommendation of the prime minister. All ministers are responsible to the Parliament. The judicial system in Italy is headed by a 15-member Constitutional Court.

Until the early 1990s, the nation's politics usually produced short-lived coalition governments consisting of the Christian Democratic Party in alliance with the Socialists and smaller centrist parties. Electoral reforms in 1993, prompted by public dissatisfaction with political scandals and corruption, led to a collapse of the major parties, including the Christian Democratic Party. This resulted in a reconfiguration of Italy's political parties. Italy is a member of the North Atlantic Treaty Organization (NATO).

The country's social-welfare system offers benefits for work injury, disability, maternity, unemployment, and retirement. In addition, the national health service provides low-cost medical care to all residents.

Health conditions in Italy are comparable to those found in other western European countries. Life expectancy at birth stands at 74 years for men and 80 years for women.

Education in Italy is free and compulsory for children between the ages of 6 and 13 years. This eight-year span consists of five years of primary and three of lower-secondary school. Higher-secondary education is provided by classical, scientific, and artistic lycées, schools for training elementary teachers, and technical and vocational institutes. Students who receive a higher-secondary certificate are eligible for automatic entry into any Italian university. One of Italy's (and Europe's) oldest institutions of higher learning is the University of Bologna.

Italy's press is free from government censorship. Until 1976 the broadcast media were owned and operated by the state through Radiotelevisione Italiana. Thereafter, local independent broadcasting stations became legal. In the 1990s the television broadcasting sector was dominated by three state channels and seven private channels with nationwide networks.

Cultural life. Italy's contributions to the arts are unparalleled. Through Dante, Petrarch, and Giovanni Boccaccio, Italian literature early blossomed to greatness. After the creations of Ludovico Ariosto and Torquato Tasso in the later Renaissance, Italian literature declined somewhat into formalism but was reinvigorated in the 19th century by Alessandro Manzoni and Giacomo Leopardi and in the 20th century by Gabriele D'Annunzio and Luigi Pirandello. The great names in Italian visual arts and architecture through the centuries make a long catalog and include Giotto, Donatello, Filippo Brunelleschi, Botticelli, Michelangelo, Leonardo da Vinci, Raphael, Titian, Tintoretto, Veronese, Gian Lorenzo Bernini, and Giovanni Battista Tiepolo. Italian music can boast of such composers as G.P. da Palestrina, Claudio Monteverdi, Antonio Vivaldi, Alessandro and Domenico Scarlatti, Gioacchino Rossini, Giuseppe Verdi, and Giacomo Puccini. Italy's most significant contribution to contemporary culture has probably been in cinema. Important directors include Roberto Rossellini, Vittorio de Sica, Michelangelo Antonioni, Federico Fellini, Pier Paolo Pasolini, and Luchino Visconti.

History. Italy was inhabited during Paleolithic times, and traces of Neanderthals have been found. The migrations of Indo-European peoples into Italy probably began about 2000 BC and continued down to 1000 BC. From about the 9th century BC the Etruscan civilization developed between the Arno and Tiber rivers. In the course of the 4th and 3rd centuries BC, the Romans overthrew the Etruscans. By 264 BC all Italy south of Cisalpine Gaul was under the leadership of Rome. The Roman Republic continued to expand its influence, and by the time the republic was replaced by a principate in 27 BC, an empire had been created that by AD 180 extended from Britain to Africa to the Euphrates River. The impact of Roman civilization on the Western world is immense. From its alphabet to its laws, its roads, and its arts, the heritage of Roman civilization has lasted well into the 20th century. (*See also* Roman Republic and Empire.)

The barbarian invasions of the 4th and 5th centuries AD finally destroyed the western Roman Empire. Part of Italy fell to the Byzantines, but the rest was invaded first by the Ostrogoths, then by the Lombards and Byzantines, and finally by the Carolingian Franks. The Normans invaded southern Italy in the 11th century and established a kingdom there. City-states, whose political and commercial rivalries were intense, eventually emerged in the north.

Although Italy remained politically fragmented for centuries, it became the cultural centre of the Western world from the 13th to the 16th century. The period of the Italian Renaissance stands as one of the greatest eras of artistic achievement in the history of the West.

In the late 15th century, Italy was invaded by France and later by the Holy Roman emperor Charles V, who subjugated most of the country by 1550. Through Charles, dominance in Italy passed from France to the Spanish Habsburgs until the Austrian Habsburgs gained control of much of northern Italy in the first half of the 18th century. Some states, including the republic of Venice, clung to or gained independence during this century. When the Napoleonic invasion of 1796 was brought to an end in 1815, Italy was again a grouping of major and minor independent states.

The Risorgimento is the name given to the Italian unification movement that took place in the 19th century largely through the efforts of the house of Savoy, the monarchs of the liberal northern Italian state of Piedmont. With French help, the Piedmontese had united most of Italy under the rule of their king, Victor Emmanuel II, by 1861. The annexation of Venetia in 1866 and of papal Rome in 1870 marked the complete unification of peninsular Italy into one nation under a constitutional monarchy.

Italy joined the Allies during World War I but obtained less territory than it expected in the postwar settlement. In the period of disappointment and disorder that followed, Benito Mussolini and his Fascist movement came to power. Italy invaded Ethiopia and formed an alliance with Nazi Germany in 1936. When the Allied powers invaded Italy in 1943, Mussolini fled and Italy surrendered to the Allies, joining the war against Germany.

In 1946 a republic was proclaimed, and coalition governments became the rule as Italy recovered from the ravages of the war. Economic growth thereafter was slow but steady, and Italy became an integral member of both the European Community and the North Atlantic Treaty Organization. A prolonged outbreak of terrorist activities by the left-wing Red Brigades threatened domestic stability in the 1970s, but by the early '80s the terrorist groups had been suppressed. Italy's government was shaken by a series of scandals during the early '90s, which led to the collapse of the post-World War II party system. New parties, mostly of the right, filled the political vacuum, but Italy's political and constitutional crisis remained unresolved.

Itami, city, Hyōgo *ken* (prefecture), Honshu, Japan. It lies along the Fukuchiyama railway line, 9 miles (14 km) northwest of Ōsaka. Itami was a castle town from the 13th to the 16th century and became a major sake-brewing centre in the Tokugawa period (1603–1867). The opening of the railway and the con-

struction of company-owned housing made Itami a residential suburb of the Ōsaka-Kōbe metropolitan area. The city's industrial district was founded in the 1930s and has expanded since World War II. Itami contains most of Ōsaka International Airport. Pop. (1994 est.) 189,375.

Itapetininga, city, in the highlands of east-central São Paulo *estado* ("state"), Brazil. It lies at 2,200 feet (670 m) above sea level, near the Itapetininga River. Formerly called Nossa Senhora dos Prazeres de Itapetininga, it was given town status in 1770 and was made the seat of a municipality in 1771. Agriculture and industry both contribute to Itapetininga's economy. The principal crops in the region are corn (maize), rice, *feijão* (beans), and cotton, and cotton textiles, furniture, and ceramics are manufactured in the city. Goods travel by road or rail to the state capital, São Paulo, 90 miles (145 km) east, and to other urban centres in São Paulo and Paraná states. Itapetininga also has an airfield. Pop. (1991 prelim.) 84,703.

Itapicuru River, river, Maranhão *estado* ("state"), northeastern Brazil. The river rises in several headstreams in the Itapicuru mountain range. It arches northeastward to Caxias and thence northwestward, emptying into the Atlantic Ocean through São José Bay, southeast of São Luís Island. The river's total length is approximately 750 miles (1,200 km), of which about 400 miles (640 km) are navigable.

Itard, Jean-Marc-Gaspard (b. 1775, Oraison, France—d. July 5, 1838, Paris), French physician noted for his work with deaf-mutes, especially the "wild boy of Aveyron."

Itard was originally marked for the banking profession, but, when the French Revolution intervened, he became a military surgeon, initially attached to Napoleon's famous surgeon Baron Larrey. After meeting the Abbé Sicard, the director of a school for deaf-mutes in Paris, Itard was put to work studying the functions and malfunctions of hearing. From about 1800 he devoted a great deal of his time and private fortune to the education of deaf-mutes.

Itard was one of the first to attempt the instruction of mentally retarded children on a scientific basis. In *Rapports sur le sauvage de l'Aveyron* (1807; *Reports on the Savage of Aveyron*), he explained the methods that he used (1801–05) in trying to train and educate an 11-year-old boy who had been found running naked and wild in a forest. He also wrote *Mutisme produit par lésion des facultés intellectuelles* (1824; "Mutism Produced by Lesion of the Intellectual Faculties") and *Traité des maladies de l'oreille et de l'audition* (1821, 1842; "Treatise on the Maladies of the Ear and of Hearing"). He was made a member of the Academy of Medicine in 1821.

Itārsi, city, central Madhya Pradesh state, central India. A major rail junction connected with Bhopāl, Gwalior, and Indore, Itārsi has extensive railway workshops. The city is also a trade centre for forest products from the Sātpura Range to the south. A large weekly cattle market is held in the city. Itārsi has several colleges affiliated with the Dr. Harisingh Gour University in Sāgar. Pop. (1991 prelim.) 78,700.

Itasca, Lake, lake regarded as the main source of the Mississippi River, in Clearwater county, northwestern Minnesota, U.S. Of glacial origin, it covers an area of 1.8 square miles (4.7 square km) and has an average depth of 20–35 feet (6–11 m). From the lake's surface, which is 1,475 feet (450 m) above sea level, the Mississippi flows southward 2,350 miles (3,780 km) to the Gulf of Mexico.

The fur trader William Morrison was reputedly the first white man to visit the lake in 1803. It was Henry Rowe Schoolcraft, the U.S. superintendent of Indian affairs for Michigan Territory, however, who proposed Lake Itasca as the true source of the Mississippi in 1832. The French explorer Joseph Nicollet surveyed the area in 1836 and confirmed Schoolcraft's claim. Many geologists, however, believe that other glacial lakes in the region also supply the headwaters of the river.

Schoolcraft is generally credited with originating the name Itasca from the Latin words *veritas* ("truth") and *caput* ("head," or "source"). Indian legend, however, mentions I-tesk-ka, the daughter of Hiawatha, whose tears of anguish at being spirited away to the netherworld reputedly formed the source of the Mississippi.

The Itasca basin was made a state park in 1891. The lake is stocked with muskellunge and other game fish and is popular with boaters.

Itata and Baltimore incidents (1891), two serious occurrences involving the United States and Chile, the first taking place during and the second shortly after the Chilean civil war of 1891.

The civil war was precipitated by a conflict between the Chilean Congress and President José Manuel Balmaceda, in which the navy supported the insurgent Congress and the army backed the president. The U.S. government openly favoured Balmaceda. The rebels, faced with a shortage of arms, purchased some in San Diego, Calif., and loaded them on the Chilean ship *Itata*. U.S. officials, claiming that the purchase violated their country's neutrality, attempted unsuccessfully to prevent the ship from sailing. On the *Itata*'s arrival in Chile the revolutionaries were forced to hand the ship over to U.S. naval custody. The *Itata* was escorted back to the United States, where a court ruled that there had been no violation of U.S. neutrality and that the detention of the ship had been improper. The incident aroused the intense anger of the Chilean insurgents, and, after they had gained control of the government, U.S.-Chilean relations entered a long period of tension that was further aggravated by the incident involving the cruiser USS *Baltimore*.

In August 1891 Balmaceda resigned and gained asylum in the Argentine legation, after forces loyal to him had suffered two defeats near Valparaíso. The U.S. minister to Chile then gave political asylum to some of Balmaceda's supporters. Animosity toward North Americans boiled over on Oct. 16, 1891, when the captain of the *Baltimore* injudiciously allowed his men shore leave at Valparaíso. Some of the crew members were attacked by a mob; two were killed and several wounded seriously. War was averted when the Chilean government, while maintaining that the seamen were to blame, offered to pay an indemnity of $75,000 to their families.

Itbāy, also called ʿATBĀY, mountainous region of southeastern Egypt and the northeastern part of The Sudan, paralleling the Red Sea. It lies largely south of Egypt's administrative boundary with The Sudan and separates the coastal lowland of the Red Sea from the Nile River valley. The north-south–trending mountain chains in the Itbāy region are called the Red Sea Hills.

itching, also called PRURITUS, a stimulation of free nerve endings, usually at the junction of the dermis and epidermis of the skin, that evokes a desire to scratch. It has been suggested that an itch is a subthreshold sensation of pain; however, although both itch and pain sensations share common nerve pathways, they are generally considered distinct sensory types. Itching evokes a range of sensations, from a tickling that is easily relieved to pathologic itching, which generally indicates a dermatologic or systemic disease.

The release of histamine from cells in the epidermis is usually considered to incite most sensations of itching. Scratching may temporarily relieve itching by interrupting the rhythm of nerve impulses or by inflicting transitory damage to the nerves. Persistent scratching produces redness, papules, and crusting of the skin.

Itching associated with skin lesions (such as vesicles and papules) generally indicates a dermatologic disease. Generalized itching without skin lesions can occur in systemic diseases such as those that occur in metabolic and endocrine conditions, malignant cancers, drug reactions, and renal, blood, and liver diseases. Excessive drying of the skin caused by pregnancy, old age, or weather often produces itching. A psychological cause for itching is considered only after all other possibilities have been sufficiently excluded.

No generally accepted therapy exists for the relief of itching, although many have been suggested. Topical anesthetics and other drugs usually have temporary or minor effects. Emollients, applied and blotted dry, may be helpful when applied to wet skin. Antihistamines may also be helpful. At present the choice of therapy usually depends on the underlying cause of the itching, and the focus is primarily on curing the underlying disease rather than the symptom.

Itchō (Japanese painter): *see* Hanabusa Itchō.

Itelmen, also called KAMCHADAL, people of the southern Kamchatka Peninsula, far eastern Russia, numbering about 2,500 in the late 20th century. Much reduced by conquest and epidemics, they have been largely Russianized since the 18th century. In Russian usage the surviving remnant is designated by their own term Itelmen; the name Kamchadal refers to mixed bloods in Russia.

Their Luorawetlan language of the Paleo-Siberian language group and their mythology are closely related to those of the neighbouring Chukchi and Koryak peoples. Along with many other tribes around the North Pacific, the Itelmen based their economy and pattern of life on the annual salmon run; extensive use of wild plants was also characteristic. The year's food supply was largely obtained with weirs, traps, and nets in summer, permitting relative leisure during other seasons.

The Itelmen were primarily a riverine and coastal people. Living in relative isolation, they were still technologically in the Stone Age when first reported (1697). Uniquely, they lived in underground houses in winter and in elevated pile structures during the summer. Dogsleds or small dugout canoes provided transportation, depending on the season. Warfare among local groups was frequent. Little is known about traditional Itelmen social organization, but women had considerable influence. Their religion included propitiation of countless spirits, as well as game-animal rituals to assure hunting success. Shamans were less important among the Itelmen, Chukchi, and Koryak than elsewhere in Siberia.

Iteso (people): *see* Teso.

Ithaca, Modern Greek ITHÁKI, the second smallest of the seven main Ionian Islands, in the *nomós* (department) of Kefallinía, Greece. (The smallest is Paxos.)

With an area of 37 square miles (96 square km), Ithaca consists of two limestone masses connected by a narrow, peninsula that curves to form the head of a gulf facing the Greek mainland. The island is separated from the island of Cephallenia to the west by the Ithákis Channel, approximately 2.5 miles (4 km) in width. With little arable land,

Ithaca must import grain, but some olive oil, wine, and currants are produced. The island was devastated by the earthquake of 1953 but was rebuilt. Ithāki (Vathý), the chief place and port of the island, is well protected at the head of a narrow, deep, horseshoe-shaped inlet of the gulf.

The island owes its fame almost solely to its classical associations, almost no mention of it appearing in writings of the Middle Ages. As late as AD 1504 it was almost uninhabited following depredations by corsairs, and the Venetians had to grant incentives to settlers from neighbouring islands and the mainland to repopulate it. Although its identity with the Ithaca of the legendary hero Odysseus has been disputed by scholars, the island appears to be described in the *Odyssey* with considerable coincidence of topographic detail. The Homeric "Fountain of Arethusa" has been identified with a copious spring rising at the foot of a sea cliff at the island's southeastern extremity, and counterparts have been sought for such Homeric locales as Mt. Neritos, Mt. Neion, the harbour of Phorcys, the town and palace of Odysseus, and the cave of the Naiads. Some authorities place the Homeric town on an inlet on the northwestern coast of the island, others at Aētós on the isthmus.

No amount of ingenuity, however, can fully reconcile the descriptions in the *Odyssey* with the present topography. It has been suggested that the Homeric Ithaca should be identified with Leucas (*q.v.*) and that the name may have been transferred through a migration of the inhabitants. Excavations by the British School at Athens at Polis, Aētós, and elsewhere have confirmed occupation during the appropriate period, the Mycenaean, but nothing can be identified positively with Homeric localities. These same excavations revealed traces also of a Corinthian colony (*c.* 800 BC) at Aētós.

Ithaca, city, seat (1817) of Tompkins county, central New York, U.S., at the southern end of Cayuga Lake, 55 mi (89 km) southwest of Syracuse. Within the city are picturesque gorges cut by several creeks. Founded in 1789 by Simeon DeWitt, surveyor general of New York, it had formerly been a part of the military tract granted in 1782 to veterans of the American Revolution. Named Ithaca (for the ancient Greek island) in 1795, it developed as an agricultural and lumber centre. Its growth was stimulated by the establishment there of Cornell University (founded by Ezra Cornell in 1865) and Ithaca College (1892). Located at the southern terminus of the New York State Barge Canal system, it has acquired some industry, including salt production and the manufacture of chain drives and belting, adding machines, and textiles. Ithaca is a southern gateway to the Finger Lakes recreational area, and tourism enhances the economy. Inc. village, 1821; city, 1888. Pop. (2003 est.) 30,343.

Ithnā ʿAsharīyah, also called IMĀMĪS, English TWELVERS, an important sect of the Shīʿah (one of the major branches of Islām), believing in a succession of 12 *imāms*, leaders of the faith after the death of Muḥammad, beginning with ʿAlī ibn Abī Ṭālib, fourth caliph and the Prophet's son-in-law.

Each of the *imāms*—ʿAlī, his sons Ḥasan and Ḥusayn, ʿAlī Zayn al-ʿĀbidīn, Muḥammad al-Bāqir, Jaʿfar aṣ-Ṣādiq, Mūsā al-Kāẓim, ʿAlī ar-Riḍā, Muḥammad al-Jawād, ʿAlī al-Hādī, Ḥasan al-ʿAskarī, and Muḥammad al-Mahdī al-Ḥujjah—was chosen from the family of his predecessor, not necessarily the eldest son but a descendant deemed spiritually pure. The last *imām* recognized by the Ithnā ʿAsharīyah disappeared in 873 and is thought to be alive and in hiding, ready to return at the Last Judgment. As the 12 *imāms* are viewed as preservers of the faith and the only interpreters of the esoteric meanings of law and theology, a cult has grown around them, in which they are thought to influence the world's future. Pilgrimages to their tombs secure special rewards and are legitimate substitutes for pilgrimages to Mecca. In the period from the disappearance of the *imām* to the Mongol invasion (*c.* 1050), a body of literature known as Ḥadīth (reports of Muḥammad's activities and sayings and the sayings of ʿAlī) was collected in support of Twelver beliefs.

Ithnā ʿAsharīyah became the state religion of Iran under the Ṣafavīd dynasty (1501–1736), which claimed descent from the 7th *imām* and added the words "I testify that ʿAlī is the *walī* (friend) of God" to the Muslim profession of faith (*shahādah*). The sect also has followings in India, Iraq, and Syria. *See also* imām.

itinerarium, plural ITINERARIA, road manual or route map of the ancient Roman Empire. They were constructed according to basic concepts formulated by Greek cartographers such as Agrippa and Ptolemy, and they were frequently used by private and official travellers.

The only surviving map is the Peutinger Table, a 13th-century copy of a Roman world map. The 4th-century "Antonine Itinerary," one of the few remaining manuals, provides lists of several thousand geographic names of the entire empire, with estimates of the intervening distances. The "Ravenna Cosmography," probably of the 7th century, itemizes islands of the Atlantic and places and rivers of Asia, Africa, and Europe.

Itō, city, Shizuoka prefecture (*ken*), Honshu, Japan, on the east coast of the Izu Peninsula. Although its hot springs were discovered in the late 16th century, the city did not develop as a resort until the arrival of a railway line from Atami in 1938. Itō is now the second largest spa on the peninsula (after Atami), with almost 400 hot springs. It is also an important fishing port and market for the mandarin oranges grown to the west. Historic monuments include the Otonashi Shrine to which the shogun Minamoto Yoritomo was banished in 1160. Pop. (2000) 71,720.

Itō Hirobumi, in full (from 1907) KŌSHAKU (Duke [or Prince]) ITŌ HIROBUMI, original name TOSHISUKE (b. Oct. 14, 1841, Suō province [now in Yamaguchi prefecture], Japan—d. Oct. 26, 1909, Harbin, Manchuria, China), Japanese elder statesman (genro) and premier (1885–88, 1892–96, 1898, 1900–01), who played a crucial role in building modern Japan. He helped draft the Meiji constitution (1889) and brought about the establishment of a bicameral national Diet (1890). He was created a marquess in 1884 and a duke (or prince) in 1907.

Early career. Itō's father was an adopted son of a modest samurai (warrior) family in the Chōshū domain of western Japan. Itō grew up amid convulsive political conditions surrounding the decline of the Tokugawa shogunate—which had governed Japan since 1603—and the rise of Western influence in the country. He played a minor role in the events leading to the Meiji Restoration (1868), the movement that overthrew the shogunate and reestablished the formal ruling authority of the emperor. This brought him into contact with men like Kido Takayoshi, who became one of the great leaders of early Meiji Japan and was Itō's most important mentor in those years.

Itō's talents were apparent even before the restoration, and the leaders of Chōshū sent him to England (along with his friend Inoue Kaoru) to study Western naval science (1863). His connections with Kido and Ōkubo Toshimichi, the other giant of early Meiji Japan, enabled him to undertake government assignments to the United States and the Iwakura Mission to Europe (1870, 1871–73) to study and work on matters as diverse as taxation and budgetary systems and treaty revision.

Rise to power. His political career changed decisively when the powerful Ōkubo was assassinated in 1878, and Itō succeeded him as minister of home affairs. His advancement brought him into conflict with the equally talented and ambitious statesman Ōkuma Shigenobu. In a series of masterful political strokes, Itō forced Ōkuma and his supporters out of the government in 1881 and persuaded the government to adopt a constitution; by 1889 the emperor had proclaimed it and in 1890 the national Diet was established.

Preparations for constitutional government were made with utmost seriousness. Itō, by then the most important person in the Meiji government, and other officials spent nearly one and a half years (1882–83) in Europe, notably in Germany, studying under leading constitutional scholars. The Meiji constitution, Itō's greatest handiwork, has been criticized for perpetuating authoritarian rule because the guarantees of civil rights and the Diet's powers were hedged by restrictions. Actually, given the Meiji leaders' samurai background and the tense domestic and foreign problems they faced, the unprecedented acknowledgment in writing of basic rights and the establishment of the Diet were progressive and enlightened acts. In addition, neither Itō nor any of the Meiji leaders ever pointed to these tensions and difficulties as an excuse for reverting to tight authoritarian control.

Itō's preeminence continued in the 1890s. As prime minister, he helped Japan attain two important successes. The first was an agreement with Great Britain (signed in 1894) for doing away with extraterritoriality by 1899 (*i.e.*, from that date British nationals in Japan would be subject to Japanese law). That pact was followed by more with other major Western countries. The second achievement was Japan's victory over China in 1895; both accomplishments were among the first clear signs that Japan, alone among non-Western countries, had achieved success in modernization and a weightier role in East Asian affairs.

Domestically, Itō did not fare as well. He had felt, along with other genro, that party politicians were incapable of dealing dispassionately with Japan's welfare and destiny; and, indeed, the powers guaranteed by the Meiji constitution enabled the political parties to impede

government programs in the Diet. Itō unhappily, but with characteristic flexibility, continually worked out compromises with the parties, until by 1900 no cabinet could be formed without their tacit consent. From the start the parties had been cooperating with the government in return for cabinet positions and laws favouring party growth. Itō made one last move to salvage the situation by leaving the government and forming the Rikken Seiyūkai ("Friends of Constitutional Government"), which he based on an older antigovernment party, the Kenseitō ("Constitutional Association"). The Seiyūkai became the first party to control an absolute majority in the House of Representatives during a Diet session, which led Itō to believe that he had finally created the right conditions for smooth passage of government programs. He did not count on the obstructive tactics of the House of Peers, however, whose conservative members were unhappy with Itō's alliance with the parties. Ironically, Itō had originally created the House of Peers to balance what he considered the less than responsible House of Representatives. Finally, embittered with the knowledge that dealing with party members, each with his own constituency to answer to, was infinitely more difficult and distasteful than working with a handful of genro, all of the same background and inspiration, he resigned as president of the Rikken Seiyūkai in 1903. But Itō paid for having broken genro ranks; soon afterward Yamagata Aritomo, founder of the modern Japanese army, became the leading power among the powerful genro.

Itō's legacy, however, cannot be denied, for he made cooperation between high-ranking bureaucrats and party politicians respectable, which provided an alternative to the unremitting and unproductive polarization of these two groups. Moreover, the continued commitment of the other genro to the Meiji constitution made party growth inevitable.

Assassination. In 1905, following the Russo-Japanese War, Itō was sent to Korea to negotiate the treaty that turned Korea into a Japanese protectorate. He returned there as resident general (1906–09), where he pursued a gradualist policy of economic and bureaucratic reform. However, he increasingly sought to suppress Korean nationalism (including engineering King Kojong's abdication), and he could not prevent the thrust toward annexing Korea favoured by other leaders in Japan. In October 1909 he was shot in Harbin in North China by An Chung-gŭn, a member of the Korean independence movement. His last words on being told that he was the victim of a political assassination were: "Baka na yatsu jal" ("He is a fool"). Itō probably meant that An had killed the one Japanese leader who had a moderating and sympathetic approach for Japan's Korea policy. Indeed, Itō's assassination was a factor contributing to Japan's annexation of Korea in 1910.

Itō was honoured with a state funeral. Despite his unquestioned contributions to the modernization of Japan, he has never been first in the hearts of his countrymen. The Japanese more often have favoured their romantic heroes, usually losers of great military causes. His private life also prevented his enshrinement in ethics textbooks as a paradigm for young Japanese. He is remembered instead for a boast: "Drunk, I (relax) with my head on a beauty's lap; awaken (refreshed), I grip the reins of power." His violent death was also ironic: he was never the strong-willed statesman that Ōkubo, Ōkuma, and Yamagata were. He sought the compromiser's role, the harmonious solution. His enduring monument was the creation of a viable constitutional system. It enabled the Japanese to effect orderly, evolutionary, peaceful political change accompanied by an ever-widening scope for meaningful popular participation. (G.Ak./Ed.)

BIBLIOGRAPHY. Kengi Hamada, *Prince Itō* (1936, reprinted 1979), a biography, is marred somewhat by flowery language. George Akita, *Foundations of Constitutional Government in Modern Japan, 1868–1900* (1967), provides a broad context.

Itō Jakuchū, also called JOKIN (b. March 2, 1716, Kyōto, Japan—d. Oct. 27, 1800, Kyōto), Japanese painter of the mid-Tokugawa period (1603–1867) who excelled in drawing flowers, fish, and birds, especially fowl, which he used to keep at his home in order to observe them closely.

The son of a greengrocer, he first studied drawing with a painter of the Kanō school (stressing Chinese subject matter and techniques). He

"Cocks and Hens," painting by Itō Jakuchū, mid-18th century; in the Imperial Collection, Japan
By courtesy of the Imperial Household Agency, Japan

also made copies of old Chinese masters. He developed an amazingly realistic style and added to it decorative touches that he learned in part from the works of Ogata Kōrin (1658–1716). He made a set of 30 pictures for the Shōkoku Temple, entitled "Dōshokusai-e" (coloured pictures of animals and plants), which, along with "Gunkei zu fusumae" (screen painting of fowl), are his most famous works. He later became a recluse and assumed the name Tobeiō ("Old Man Bushel of Rice"). It is said that those who got his paintings gave him one *to* (approximately two bushels) of rice in return.

Itō Jinsai (b. Aug. 30, 1627, Kyōto, Japan—d. April 4, 1705, Kyōto), Japanese sinologist, philosopher, and educator of the Tokugawa period (1603–1867). He helped found the Kogaku ("Ancient Learning") school, which opposed the official Neo-Confucianism of the time (derived essentially from the writings of the Chinese thinker Chu Hsi) and instead advocated a return to classical Confucian teaching. Through his hundreds of students, he exerted a powerful influence that tended to counteract the monolithic thought patterns imposed on the country by the Tokugawa rulers.

The son of a Kyōto lumberman, Itō turned his hereditary business over to his younger brother in order to devote himself to teaching and scholarship. He became known for his gentle manner and his dedication to humanistic ideals. Refusing all offers of employment from the powerful feudal rulers, he and his son Itō Tōgai (1670–1736) founded the Kogidō ("Hall of Ancient Meaning") school in Kyōto. It was run by his descendants until 1904, when it was absorbed into the public school system.

The outline of Itō's thought is found in the small work *Gōmōjigi* (1683), a commentary on the writings of the Chinese philosophers Confucius and Mencius. Itō was concerned with what he saw as the underlying truths of Confucian thought. He tried to develop a rational, as against an authoritarian, basis for human morality and the pursuit of happiness.

Itsekiri, also called JEKRI, ISEKIRI, or ISHEKIRI, ethnic group inhabiting the westernmost part of the Niger River delta of extreme southern Nigeria. The Itsekiri, who number more than 500,000, make up a large proportion of the present-day towns of Sapele, Warri, Burutu, and Forcados. They speak a Yoruboid language of the Benue-Congo branch of Niger-Congo languages and share elements of culture with the Yoruba, Edo, Urhobo, and Ijo through a variety of contacts.

The Itsekiri live on the coast in an area of extensive mangrove swamps and freshwater wetlands. They are primarily fishermen and have employed traps, fences, and nets, as well as rod-and-line techniques. Women make mats and baskets from reeds and palm materials.

Myths of origin establish that Ginuwa, the Itsekiri founder and first *olu* (king), was originally a prince of Benin, so that subsequent kings are descendants of the *oba* of Benin. Lesser chiefs once met as a council and advised the *olu*. Chieftaincy is being redefined in conformity with modern government, and some settlements do not participate in chieftaincy at all.

Within settlements adult males trace patrilineal descent from settlement founders. In broader context, the Itsekiri claim affiliation to groups of kin by descent in both male and female lines. Itsekiri men often take wives from neighbouring peoples, where girls unrelated to prospective husbands can more easily be found.

Living on the coast, the Itsekiri encountered Europeans before groups farther inland did. The Portuguese during the 15th century were the first to make contact, and as a result the Itsekiri established a reputation as great traders and middlemen by supplying European manufactured goods to inland peoples in exchange for slaves and palm oil from the interior. The British colonial administration broke their trade monopoly in the 1890s, and the flourishing Itsekiri economy went into decline.

In traditional Itsekiri religion, Oritse is the supreme deity and creator of the world. Among the other deities are Umale Okun, god of the sea, and Ogun, god of iron and war. Divination may be accomplished by men skilled in consulting the Ifa oracle, and ceremonies are performed to the ancestors on various occasions.

In the 1980s the Niger River delta area inhabited by the Itsekiri became noted as a major centre of petroleum production in Nigeria. In the early 21st century the region surrounding the town of Warri was the scene of ethnic strife among Itsekiri, Urhobo, and Ijo.

Itsuku Island, also called MIYA ISLAND, English SHRINE ISLAND, offshore island, Hiroshima *ken* (prefecture), Japan, in the Inland Sea. The small island, one of Japan's most scenic spots, is 19 miles (31 km) in circumference and occupies an area of 12 square miles (31 square km). It is best known for its 6th-century Itsuku island-shrine, which was built on tidal land and has the appearance of floating on the sea during high tide. It was named

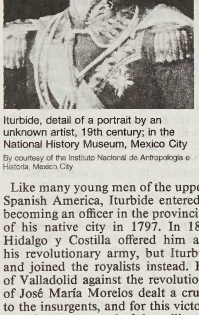
Stone lanterns and the great gateway at the Itsuku island-shrine in Hiroshima Bay, Japan
Bob Glaze—Artstreet

after one of the daughters of Susanowo, the Shintō storm god. Other religious buildings include the 9th-century temple that crowns Mount Mi, which rises to the island's highest elevation, 1,739 feet (530 m).

Because of its religious significance, births and burials were long prohibited on Itsuku Island. This ban was lifted after the Meiji Restoration (1868), but the dead are still transported to Ōno, on Honshu, for burial. The town of Miyajima on the island is a popular summer resort, with beaches, cherry trees, and tame deer.

ITT Corporation, also called (until 1983) INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION, American telecommunications company that grew into a successful conglomerate corporation before its breakup in 1995.

ITT was founded in 1920 by Sosthenes Behn and his brother Hernand Behn as a holding company for their Caribbean-based telephone and telegraph companies; it received its name in imitation of the American Telephone and Telegraph Company (AT&T). Throughout the 1920s ITT expanded into the still-undeveloped European telephone market, obtaining the concession for telephone service in Spain in 1924. In 1925 the company purchased AT&T's large foreign manufacturing subsidiary, International Western Electric, and renamed it ITT Standard Electric Corporation; this move made ITT a major telecommunications manufacturer in 11 countries.



Sosthenes Behn was succeeded by Harold Sydney Geneen, who ran the company from 1959 to 1978. Under Geneen, ITT became an aggressive conglomerate and underwent a second period of rapid expansion, acquiring 275 other companies and increasing its annual sales nearly 20-fold. Among its purchases were the Sheraton Corporation, one of the largest American hotel chains, in 1968, and one of the nation's leading insurance firms, the Hartford Fire Insurance Company, in 1970.

Under the leadership of Rand Araskog from 1980, however, ITT sold off many of the companies it had acquired earlier under Geneen, including its Continental Baking subsidiary. In 1987 it divested its telecommunications businesses by forming a joint venture, Alcatel N.V., with France's Cie. Générale d'Electricité, which held a controlling interest in the venture. In 1995 it sold its financial-service businesses and acquired Madison Square Garden in New York City and Caesars World, Inc., a large casino operator. Later that year ITT split itself into three separate companies: ITT Hartford Group Inc., consisting of insurance companies; ITT Industries Inc., defense-electronics and automotive-parts companies; and a 'new' ITT Corporation consisting of the Sheraton Hotel chain, Caesars World, and Madison Square Garden.

ITU: *see* International Telecommunication Union.

Ituiutaba, city, western Minas Gerais *estado* ("state"), Brazil. It lies at 1,981 feet (604 m) above sea level, in the highlands between the Tijuco and da Prata rivers. It was made the seat of a municipality in 1901. Ituiutaba is the commercial centre for the surrounding agricultural and pastoral region and processes local crops (rice, corn [maize], cotton, cassava, oranges), cottonseed oil, and livestock products. The city is accessible by highway and air from Belo Horizonte, the state capital, 493 miles (793 km) by road east-southeast, and from São Paulo. Pop. (1991 prelim.) 78,123.

Iturbide, Agustín de, also called (1822–23) AGUSTÍN I (b. Sept. 27, 1783, Valladolid, Viceroyalty of New Spain [now Morelia, Mexico]—d. July 19, 1824, Padilla, Mexico), Mexican caudillo (military chieftain) who became the leader of the conservative factions in the Mexican independence movement and, as Agustín I, briefly emperor of Mexico.

Iturbide, detail of a portrait by an unknown artist, 19th century; in the National History Museum, Mexico City
By courtesy of the Instituto Nacional de Antropología e Historia, Mexico City

Like many young men of the upper classes in Spanish America, Iturbide entered the army, becoming an officer in the provincial regiment of his native city in 1797. In 1810 Miguel Hidalgo y Costilla offered him a post with his revolutionary army, but Iturbide refused and joined the royalists instead. His defense of Valladolid against the revolutionary forces of José María Morelos dealt a crushing blow to the insurgents, and for this victory Iturbide was given command of the military district of Guanajuato and Michoacán. In 1816, however, grave charges of extortion and violence caused his removal.

By 1820 the radical independence movement was almost entirely extinguished. Both Hidalgo and Morelos had been captured and executed; only guerrilla bands (under the command of General Vicente Guerrero) prevented the complete victory of the royalists. The Mexican independence movement then performed a curious about-face. In reaction to a liberal coup d'état in Spain, the conservatives in Mexico (formerly staunch royalists) advocated immediate independence. Iturbide assumed command of the army and, at Iguala, allied his reactionary force with Guerrero's radical insurgents. Iturbide's Plan de Iguala, published on Feb. 24, 1821, proclaimed three guarantees: (1) immediate independence from Spain, (2) equality for Spaniards and Creoles, and (3) the supremacy of Roman Catholicism and a ban on all other religions. The Army of the Three Guarantees quickly subjugated the country; on Aug. 24, 1821, Juan O'Donojú, the new representative of the Spanish king, signed the Treaty of Córdoba, recognizing the independence of Mexico.

The revolutionary coalition quickly fell apart as Iturbide removed Guerrero and his insurgent following from influence. On May 19, 1822, Iturbide placed the crown upon his own head and became Agustín I, emperor of Mexico. An arbitrary and extravagant ruler, he proved unable to bring order and stability to his country, and all parties soon turned against him. Opposition solidified behind Antonio López de Santa Anna, whose own plan called for Iturbide's exile. On March 19, 1823, Iturbide abdicated and went first to Italy and then to England. In 1824, however, he returned to Mexico, unaware that the congress had decreed his death. Captured on July 15, he was executed four days later. Although regarded by most scholars as a self-serving military adventurer, he has remained for the Roman Catholic church and for the conservative classes the great hero of Mexican independence.

Ituri Forest, French FORÊT DE L'ITURI, tropical rainforest in central Africa that forms the northeastern section of the huge tropical forest covering about two-fifths of Zaire.

A brief treatment of the Ituri Forest follows. For full treatment, *see* MACROPAEDIA: Africa.

The area of the Ituri is approximately 24,300 square miles (62,900 square km). The northern and eastern limits of the Ituri Forest are defined by savanna and fertile highlands, respectively, but its boundaries to the south and west remain poorly defined. The forest climate is hot and heavy with permanent humidity, and it swarms with life. The trees reach heights of 170 feet (52 m), and their crowns are so close together that they intertwine to obscure the sky and the sun. Countless epiphytes (plants that grow on other plants and draw moisture and nutrients from the air and rain) serve to darken the undergrowth. The forest is relatively level in its northwestern reaches, whereas toward the south and southeast its contours are much more rugged. It is watered by the broad Ituri River and its tributary, the Epulu, whose wide basin forms the heart of the forest. The rivers are fed by frequent rainfall, the annual precipitation being about 75 inches (1,900 mm). The forest soil is both rich and friable, the vegetation itself providing the thick layer of humus necessary for its survival. Animal life characteristic of deep equatorial forest is abundant. Among the most notable species is the okapi (a mammal related to the giraffe). Elephant and forest buffalo are plentiful.

The forest is inhabited by two entirely different peoples, Bantu-speakers and Pygmies, who maintain a symbiotic relationship.

Itzamná (Mayan: "Iguana House"), principal pre-Columbian Mayan deity. The ruler of heaven, day, and night, he frequently appeared as four gods called Itzamnás, who encased the world. Like some of the other Mesoamerican deities, the Itzamnás were associated with the points of the compass and their colours (east, red; north, white; west, black; and south, yellow).

Itzamná was sometimes identified with the remote creator deity Hunab Ku and occasionally with Kinich Ahau, the sun-god. The moon goddess Ixchel, patroness of womanly crafts, was possibly a female manifestation of the god. Itzamná was also a culture hero who gave humankind writing and the calendar and was patron deity of medicine. *See also* Bacab.

IUD, abbreviation of INTRAUTERINE DEVICE, plastic or metal object that is implanted in the uterus to prevent conception. *See* contraception.

Iuzhnyi Bug (river, Ukraine): *see* Yuzhny Bug.

Ivan (Russian personal name): *see under* John, except as below.

Ivan, English JOHN, name of six grand princes of Moscow and tsars of Russia, grouped below chronologically and indicated by the symbol •.

•Ivan I, in full IVAN DANILOVICH, byname IVAN MONEYBAG, Russian IVAN KALITA (b. 1304?—d. March 31, 1340, Moscow), grand prince of Moscow (1328–40) and grand prince of Vladimir (1331–40) whose policies increased Moscow's power and made it the richest principality in northeastern Russia.

The son of Prince Daniel of Moscow, Ivan succeeded his brother Yury as prince (1325) and then as grand prince (1328) of Moscow. Determined to persuade the Khan of the Golden Horde, the overlord of all the Russian princes, to make him grand prince of Vladimir, he cooperated with the Khan in an expedition against his chief rival, Grand Prince Alexander of Tver, whose subjects had revolted against the Khanate (1327). Despite his efforts, when Alexander was deposed as grand prince, Ivan was not chosen to replace him until 1331; and he was never given authority over the major principalities of Tver, Suzdal, and Ryazan.

Nevertheless, Ivan maintained cordial relations with the Khan; and, while collecting tribute for the Tatars throughout his domain, he acquired a reputation for thrift and financial shrewdness that earned him the nickname Kalita ("Moneybag"). Preferring to expand his realm by purchasing territory rather than conquering it, Ivan enlarged Moscow; he also increased its influence over the neighbouring principalities, and, by forming a close alliance with the metropolitan of the Russian Orthodox Church, whose seat was transferred to Moscow in 1326, he made Moscow the spiritual centre of the Russian lands.

•Ivan II, in full IVAN IVANOVICH, byname IVAN THE RED, Russian IVAN KRASNY (b. March 30, 1326—d. Nov. 13, 1359), grand prince of Moscow and Vladimir.

The son of Ivan I, he succeeded his brother Semen on the throne of Moscow in 1353 and was granted the patent to that principality by the Khan of the Golden Horde in spite of the vigorous claim laid by Konstantin Vasilyevich of Suzdal. At first the principalities of Suzdal, Ryazan, and the republic of Novgorod refused to recognize Ivan as grand duke, and they waged war against him until 1354. Ivan was dominated by his aristocratic advisors (boyars), prominent among whom was the military commander in Moscow, Aleksey Khvost, and the metropolitan Aleksei. As grand prince Ivan continued the policies of his father, which were aimed at uniting the Russian lands. His son was Dmitri Donskoy, to whom the principates of Moscow and Vladimir passed upon Ivan's death.

•Ivan III, Russian in full IVAN VASILYEVICH, byname IVAN THE GREAT, Russian IVAN VELIKY (b. Jan. 22, 1440, Moscow—d. Oct. 27, 1505, Moscow), grand prince of Moscow (1462–1505), who subdued most of the Great Russian lands by conquest or by the voluntary allegiance of princes, rewon parts of Ukraine from Poland–Lithuania, and repudiated the old subservience to the Mongol-derived Tatars. He also laid the administrative foundations of a centralized Russian state.

Ivan III, portrait from A. Thenet, *La Cosmographie universelle,* Paris, 1575

Early life and reign. Ivan was born at the height of the civil war that raged between supporters of his father, Grand Prince Vasily II of Muscovy, and those of his rebellious uncles. His early life was dramatic and tumultuous: when his father was arrested and blinded by his cousin in 1446, Ivan was first hidden in a monastery and then smuggled to safety, only to be treacherously handed over to his father's captors later in the year; shortly after his father's release in the same year Ivan was solemnly affianced—for purely political reasons—to the daughter of the Grand Prince of Tver, whom he married in 1452. During the last years of his father's reign, he gained experience in the arts of war and government. At the age of 12 he was placed nominally in command of a military expedition dispatched to deal with the remnants of his father's internal enemies in the far north; and at 18 he led a successful campaign against the Tatars in the south. Vasily II died on March 27, 1462, and was succeeded by Ivan as grand prince of Moscow.

Little is known of Ivan's activities during the early part of his reign. Apart from a series of sporadic and largely successful campaigns against his eastern neighbours, the Tatars of Kazan, there was evidently not much beyond the routine business of ruling to occupy him. But his private life soon changed radically. In 1467 his childhood bride died (perhaps poisoned), leaving him with only one son. In view of the primitive state of Muscovite medicine and the demonstrable reluctance of Ivan's brothers to see the royal line continued longer than was necessary, the likelihood of the son predeceasing his father and thus robbing him of an heir appeared only too real, and another wife had to be sought. Curiously, the initiative seems to have come from outside; in 1469 Cardinal Bessarion wrote from Rome offering Ivan the hand of his ward and pupil, Zoë Palaeologus, niece of the last emperor of Byzantium. It took three years before the fat and unattractive Zoë, who, on entering Moscow, changed her name to Sofia (and perhaps her faith to Orthodoxy), was married to Ivan in the Kremlin.

Middle reign. At Ivan's accession many Great Russian lands were not yet under Muscovite control; the entire Ukraine and the upper Oka districts were part of the Polish–Lithuanian union and Ivan himself, in name at least, was a tributary of the Khan of the Golden Horde. He set himself the task of reconquering from Poland–Lithuania the Ukrainian possessions of his forefathers. But first the independent Great Russian lands had to be annexed or subdued and subservience to the Tatars had to be repudiated.

After rendering the Kazan Horde on his eastern flank temporarily impotent by a series of campaigns (1467–69), Ivan attempted to subdue Novgorod and its huge northern empire. He repeatedly, invaded Novgorod, formally forced it to accept his sovereignty (1478), stripped it of the last vestiges of political freedom, secularized large tracts of its church lands, annexed its colonies, and replaced many of its citizens with reliable elements from his own domains. By 1489 Novgorod could offer no more resistance to Ivan. Of the remaining Russian lands still technically independent in 1462, Yaroslavl and Rostov were annexed by treaty (1463 and 1474, respectively). Tver offered little resistance and meekly yielded to Moscow in 1485. Ryazan and Pskov alone retained their independence at the cost of abject subservience to their virtual suzerain.

Freedom from subjection to Khan Ahmed of the Golden Horde came in 1480. To counterbalance Ahmed's friendship with Poland–Lithuania, Ivan concluded an invaluable alliance with Khan Mengli Girei of Crimea. After a victorious campaign by Ivan in 1480, Ahmed withdrew his forces from Ivan's dominions, and although Ahmed's son continued to worry Moscow and Crimea until their final defeat in 1502, Ivan from 1480 no longer considered himself a vassal of the Khan and entered the field of European diplomacy as an independent sovereign. By tact and diplomacy he managed to maintain his friendship with Mengli and to avoid serious trouble in Kazan for the rest of his reign.

In 1480 Ivan also had to cope with the danger of rebellion by his two brothers Andrey and Boris, who had been incensed by his high-handed appropriation of their deceased elder brother's estates. They defected with their armies to the western frontiers but eventually returned and acknowledged Ivan's territorial acquisitions and primacy.

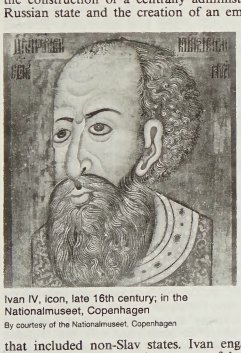
Late reign. In 1490 Ivan's eldest son by his first wife died of gout. He had been ineptly treated by a Jewish doctor who had been brought to Russia by Sofia's brother, and Ivan suspected foul play. He now had to solve the problem of who was to be his heir—his eldest son's son Dmitry (born 1483) or his eldest son by Sofia, Vasily (born 1479). For seven years he vacillated. Then, in 1497, he nominated Dmitry as heir. Sofia, anxious to see her son assured of the throne, planned rebellion against her husband, but the plot was uncovered. Ivan disgraced Sofia and Vasily and had Dmitry crowned grand prince (1498).

However, in 1500 Vasily rebelled again and defected to the Lithuanians. Ivan was forced to compromise. At that stage of his war with Lithuania he could not risk the total alienation of his son and wife. And so, in 1502, he gave the title to Vasily and imprisoned Dmitry and his mother, Yelena.

At home Ivan's policy was to centralize the administration by stripping the appanage princes of land and authority. As for the boyars, they were stripped of much of their authority and swiftly executed or imprisoned if suspected of treason. Ivan's reign saw the beginning of the *pomestie* system, whereby the servants of the grand prince were granted estates on a basis of life tenure and on condition of loyal service.

Ivan's last years were years of disappointment. The war against Lithuania had not ended as conclusively and satisfactorily as he had expected—much of Ukraine was still in the hands of a strangely buoyant enemy; his ecclesiastical plans for secularizing church lands had been thwarted at the Council of 1503, and the Khanate of Kazan, which had been so carefully neutralized during Ivan's reign, was beginning to rid itself of Muscovite tutelage. Ivan died in the autumn of 1505.

Assessment. In terms of political success, the 15th-century grand prince Ivan III was easily the greatest of all the descendants of Rurik, the reputed founder of Russia. No ruler of Muscovy until Peter I the Great, two centuries later, did more to consolidate and develop the achievements of his predecessors, to strengthen the authority of the monarch, or to lay the foundations for a centralized state. By means of cunning diplomacy and shrewdly calculated aggression, Ivan not only established Muscovy as a great power to be reckoned with by the rulers and diplomats of Europe but also set in motion the reconquest of the Ukraine from Poland and Lithuania.



In spite of his great achievements, Ivan died unmourned and seemingly unloved. Singularly little is known about him as a man. He was tall and thin and had a slight stoop. It is said that women fainted in his presence, so frightened were they by his awesome gaze. His only known pleasures were those of the bed and the table. His contemporaries are silent about his virtues. Yet few scholars have underestimated the role of Ivan in the creation of the Russian state, and none dispute the significance of his diplomatic and military successes. It may be that the excessive cautiousness of his character, the lack of élan and glamour, and the very dullness of the man have prevented historians from universally recognizing the appellation of "the Great," first attributed to him by the Austrian ambassador to his son's court.

• **Ivan IV,** Russian in full IVAN VASILYEVICH, byname IVAN THE TERRIBLE, Russian IVAN GROZNY (b. Aug. 25, 1530, Kolomenskoye, near Moscow [Russia]—d. March 18, 1584, Moscow), grand prince of Moscow (1533–84) and the first to be proclaimed tsar of Russia (from 1547). His reign saw the completion of the construction of a centrally administered Russian state and the creation of an empire

Ivan IV, icon, late 16th century; in the Nationalmuseet, Copenhagen

that included non-Slav states. Ivan engaged in prolonged and largely unsuccessful wars against Sweden and Poland, and, in seeking to impose military discipline and a centralized administration, he instituted a reign of terror against the hereditary nobility.

Early life. Ivan was the son of Grand Prince Vasily III of Moscow and his second wife, Yelena Glinskaya. He was to become the penultimate representative of the Rurik dynasty. On Dec. 4, 1533, immediately after his father's death, the three-year-old Ivan was proclaimed grand prince of Moscow. His mother ruled in Ivan's name until her death (allegedly by poison) in 1538. The deaths of both of Ivan's parents served to reanimate the struggles of various factions of nobles for control of the person of the young prince and for power. The years 1538–47 were thus a period of murderous strife among the clans of the warrior caste commonly termed "boyars." Their continual struggles for the reins of government to the detriment of the realm made a profound impression on Ivan and imbued him with a lifelong dislike of the boyars.

Early reforms. On Jan. 16, 1547, Ivan was crowned "tsar and grand prince of all Russia." The title tsar was derived from the Latin title "caesar" and was translated by Ivan's contemporaries as "emperor." In February 1547 Ivan married Anastasiya Romanovna, a great-aunt of the future first tsar of the Romanov dynasty.

Since 1542 Ivan had been greatly influenced by the views of the metropolitan of Moscow, Makari, who encouraged the young tsar in his desire to establish a Christian state based on the principles of justice. Ivan's government soon embarked on a wide program of reforms and of the reorganization of both central and local administration. Church councils summoned in 1547 and 1549 strengthened and systematized the church's affairs, affirming its Orthodoxy and canonizing a large number of Russian saints. In 1549 the first *zemski sobor* was summoned to meet in an advisory capacity—this was a national assembly composed of boyars, clergy, and some elected representatives of the new service gentry. In 1550 a new, more detailed legal code was drawn up that replaced one dating from 1497. Russia's central administration was also reorganized into departments, each responsible for a specific function of the state. The conditions of military service were improved, the armed forces were reorganized, and the system of command altered so that commanders were appointed on merit rather than simply by virtue of their noble birth. The government also introduced extensive self-government, with district administrators elected by the local gentry.

One object of the reforms was to limit the powers of the hereditary aristocracy of princes and boyars (who held their estates on a hereditary basis) and promote the interests of the service gentry, who held their landed estates solely as compensation for service to the government and who were thus dependent on the tsar. Ivan apparently aimed at forming a class of landed gentry that would owe everything to the sovereign. All the reforms took place under the aegis of the so-called "Chosen Council," an informal advisory body in which the leading figures were the tsar's favourites Aleksey Adashev and the priest Silvestr. The council's influence waned and then disappeared in the early 1560s, however, after the death of Ivan's first wife and of Makari, by which time Ivan's views and his entourage had changed. Ivan's first wife, Anastasiya, died in 1560, and only two male heirs by her, Ivan (b. 1554) and Fyodor (b. 1557), survived the rigors of medieval childhood.

Russia was at war for the greater part of Ivan's reign. Muscovite rulers had long feared incursions by the Tatars, and in 1547–48 and 1549–50 unsuccessful campaigns were undertaken against the hostile khanate of Kazan, on the Volga River. In 1552, after lengthy preparations, the tsar set out for Kazan, and the Russian army then succeeded in taking the town by assault. In 1556 the khanate of Astrakhan, located at the mouth of the Volga, was annexed without a fight. From that moment onward, the Volga became a Russian river, and the trade route to the Caspian Sea was rendered safe.

The Livonian War. With both banks of the Volga now secured, Ivan prepared for a campaign to force an exit to the sea, a traditional concern of landlocked Russia. Ivan felt that trade with Europe depended on free access to the Baltic and decided to turn his attention westward. In 1558 he went to war in an attempt to establish Russian rule over Livonia (in present-day Latvia and Estonia). Russia was at first victorious and succeeded in destroying the Livonian knights, but their ally Lithuania became an integral part of Poland in 1569. The war dragged on; while the Swedes supported Poland against Russia, the Crimean Tatars attacked Astrakhan and even made an extensive incursion into Russia in 1571; they burned Moscow, leaving only the Kremlin standing. When Stephen Báthory of Transylvania became king of Poland in 1575, reorganized Polish armies under his leadership were able to carry the war onto Russian territory while the Swedes recaptured parts of Livonia. Ivan at last asked Pope Gregory XIII to intervene, and through the mediation of his nuncio, Antonio Possevino, an armistice with Poland was concluded on Jan. 15, 1582. Under its terms Russia lost all its gains in Livonia, and an armistice with Sweden in 1583 compelled Russia to give up towns on the Gulf of Finland. The 24-year-long Livonian War had proved fruitless for Russia, which was exhausted by the long struggle.

The Oprichnina. Ivan's first executions apparently arose out of his disappointment over the course of the Livonian War and the suspected treason of several Russian boyars. The defection of one of Ivan's outstanding field commanders, Prince Andrey Kurbsky, to Poland in 1564 greatly startled the tsar, who announced later that year his intention of abdicating in view of the boyars' betrayal. The Muscovites, however, led by the clergy, implored him to continue to rule, and in 1565 he acceded to their request on condition that he should be allowed to deal with the traitors as he wished and that he should form an *oprichnina—i.e.,* an aggregate of territory that would be administered separately from the rest of the state and put under his immediate control as crown land. A bodyguard of 1,000–6,000 men, known as the *oprichniki,* was raised; and specified towns and districts all over Russia were included in the *oprichnina,* their revenues being assigned to the maintenance of the tsar's new court and household, which consisted of a number of carefully selected boyars and service gentry. Ivan lived exclusively in this entourage and withdrew from the day-to-day management of Russia's administrative apparatus (now called the *zemschina,* or "the land"), which he left in the hands of leading boyars and bureaucrats. Ivan cut himself off from almost all communication with them, while the *oprichniki* trampled with impunity on everyone beyond Ivan's immediate circle.

Since nearly all the documents relating to this epoch were destroyed in one of Moscow's periodic fires, historians tend to give differing explanations for Ivan's actions during this part of his reign. The majority tend to the view that the struggle was between the tsar and the old hereditary nobility, which, jealous of surrendering its power and privileges, had resisted his internal reforms and military projects. The *oprichnina* thus may have been Ivan's attempt to create a highly centralized state and destroy the economic strength and political power of the princes and the high nobility. The increasingly resentful boyars had indeed opposed Ivan and plotted against him on occasion, but the reign of terror that Ivan initiated by the *oprichnina* proved far more dangerous to the stability of the country than the danger that it was designed to suppress. In 1570, for example, Ivan personally led his *oprichniki* troops against Novgorod, destroying that city and executing several thousand of its inhabitants. Many boyars and other members of the gentry perished during this period,

some being publicly executed with calculated and symbolic cruelty. Ivan later sent to various monasteries memorials (*sinodiki*) of more than 3,000 of his victims, most of whom were executed in the course of the *oprichnina*.

The *oprichnina* lasted only seven years, from 1565 to 1572, when it was abolished as a result of the failure of the *oprichnina* regiments to defend Moscow from attack by the Crimean Tatars. The *oprichnina* army was reintegrated with that of the *zemschina,* and some of the estates confiscated by Ivan's followers were returned to their owners. The entire episode of the *oprichnina* leaves a bloody imprint on Ivan's reign, causing some doubts about his mental stability and leaving historians with the impression of a morbidly suspicious and vindictive ruler.

Later years. Withdrawal and flight are themes that run through the later years of Ivan's reign. He expressed an interest in establishing diplomatic and trade relations with England, even suggesting his readiness to marry an English noblewoman. In 1575 he seems to have abdicated for about a year in favour of a Tatar prince, Simeon Bekbulatovich. During the 1570s he married five wives in succession in only nine years. Finally, in a fit of rage, he murdered his only viable heir, Ivan, in 1581. This murder set the clock ticking for the political crisis, known as the Time of Troubles, that began with the extinction of the Rurik dynasty upon the infirm Fyodor's death in 1598.

Assessment. Ivan's achievements were many. In foreign policy all his actions were directed toward forcing Russia into Europe—a line that Peter I the Great was to continue. Internally, Ivan's reign of terror eventually resulted in the weakening of all levels of the aristocracy, including the service gentry he had sponsored. The prolonged and unsuccessful Livonian War overextended the state's resources and helped bring Russia to the verge of economic collapse. These factors, together with Tatar incursions, resulted in the depopulation of a number of Russian provinces by the time of Ivan's death in 1584. Nevertheless, he left his realm far more centralized both administratively and culturally than it had been previously.

Ivan also encouraged Russia's cultural development, especially through printing. He himself wrote well, and, though his surviving writings are mainly of a political nature, his command of words and his biting sarcasm are very evident. Ivan was a devout adherent of the Orthodox church. His arguments on religious questions are striking in their power and conviction, but he placed the most emphasis on defending the divine right of the ruler to unlimited power under God—a view with which most other monarchs of the time would have been in agreement. (N.An./Ed.)

BIBLIOGRAPHY. Biographies of Ivan include S.F. Platonov, *Ivan the Terrible* (1974, reissued 1986); Robert Payne and Nikita Romanoff, *Ivan the Terrible* (1975); Ruslan G. Skrynnikov, *Ivan the Terrible* (1981), interesting for its official Soviet interpretation of his place in history; and Benson Bobrick, *Fearful Majesty: The Life and Reign of Ivan the Terrible* (1987).

• Ivan V, in full IVAN ALEKSEYEVICH (b. Aug. 27 [Sept. 6, New Style], 1666, Moscow, Russia—d. Jan. 29 [Feb. 8], 1696, Moscow), nominal tsar of Russia from 1682 to 1696.

The younger son of Tsar Alexis (reigned 1645–76) by his first wife, Mariya Ilinichna Miloslavskaya, Ivan was a chronic invalid, deficient mentally and physically, who suffered from scurvy and poor eyesight and in his later years was partially paralyzed. When his elder brother Tsar Fyodor III died in 1682, Ivan's half brother Peter, the son of Alexis and his second wife, Natalya Kirillovna Naryshkina, was named tsar. But Ivan's sister Sophia, determined to maintain the Miloslavsky family in power, encouraged the *streltsy* (sovereign's bodyguard) to riot and to demand that Ivan become tsar (May 23 [June 2], 1682). Consequently, three days later the boyar duma (or council) proclaimed Ivan and Peter corulers with Ivan as the senior tsar. On June 25 (July 5) both boys were crowned, and Sophia became regent.

Although the Naryshkins overthrew Sophia in 1689, Ivan, who had adopted a conciliatory attitude toward Peter, was allowed to retain his official position until his death. He never participated in governmental affairs, however, and devoted the bulk of his time to prayer, fasting, and pilgrimages.

• Ivan VI, in full IVAN ANTONOVICH (b. Aug. 12 [Aug. 23, New Style], 1740, St. Petersburg, Russia—d. July 5 [July 16], 1764, Shlisselburg Fortress, near St. Petersburg), infant emperor of Russia in 1740–41.

The son of Prince Anton Ulrich of Braunschweig-Bevern-Lüneburg and Anna Leopoldovna, the niece of Empress Anna (reigned in Russia 1730–40), Ivan Antonovich was named heir to the throne by the empress on Oct. 16 (Oct. 27), 1740, and proclaimed emperor the next day. The empress' favourite, Ernst Johann Biron, the Duke of Courland, became regent for him. Although Biron was overthrown by the vice-chancellor, Andrey Osterman, and Field Marshal Burkhard Christoph, Count von Münnich, three weeks later, Ivan remained the nominal ruler of Russia, and his mother was installed as regent.

On Nov. 25 (Dec. 6), 1741, however, Elizabeth, the daughter of Emperor Peter I the Great (reigned in Russia 1682–1725), organized a group that opposed Anna Leopoldovna's foreign policy and her German advisers and deposed the regent, the ruling German clique, and Ivan VI. For the next 20 years Ivan remained in solitary confinement in various prisons. Although his mental and emotional development were thereby retarded, a second lieutenant of the Shlisselburg garrison, Vasily Yakovlevich Mirovich, tried in 1764 to free Ivan in order to remove Catherine II the Great, who had recently seized the throne (1762), and to restore him to power. In the course of Mirovich's mutiny, however, Ivan was assassinated by his jailers.

Ivan THE RED: *see* Ivan II.

Ivan Asen I, also called ASEN I (d. 1196), tsar of the Second Bulgarian empire from 1186 to 1196, during one of the most brilliant periods of the restored Bulgarian nation. He and his brother Peter II were founders of the Asen dynasty, which survived until the latter half of the 13th century.

Asen was a descendant of landowners and boyars from Tŭrnovo whose family name was Belgun. In 1186, after a violent dispute with the Byzantine emperor Isaac II Angelus, Asen and Peter led a popular rising of Vlachs and Bulgars and proclaimed their independence from the Byzantines. Asen was crowned tsar as Ivan Asen I at Tŭrnovo, and Peter became ruler of the eastern half of the kingdom, with his residence at Preslav (now Veliki Preslav). The brothers invaded Thrace but were defeated, withdrew to the north, and, in alliance with the Kumans, conquered northern Bulgaria. In 1187 they checked the Byzantine army in Thrace; and, in the armistice that followed, their younger brother Kaloyan was sent as hostage to Constantinople (now Istanbul). He escaped, however, and war broke out, to continue intermittently until the Byzantine forces were thoroughly defeated in 1196. Later in that year, Ivan Asen was killed by one of his boyars, Ivanko, who seized power at Tŭrnovo but soon had to seek refuge in Constantinople. Asen's brother Peter ascended the throne as Peter II but was killed by the boyars in 1197. Kaloyan was then crowned tsar, reigning from 1197 to 1207.

Ivan Asen II (d. 1241), tsar of the Second Bulgarian empire from 1218 to 1241, son of Ivan Asen I.

Ivan Asen overthrew his cousin Tsar Boril (reigned 1207–18) and blinded him, proclaiming himself tsar. A good soldier and administrator, he restored law and order, controlled the boyars, and, after defeating Theodore Ducas, despot of Epirus, in 1230, acquired large parts of Albania, Serbia, Macedonia, and Epirus. The record of his achievements, dated 1230, can still be seen in the old Church of the Forty Martyrs at Tŭrnovo.

One of Ivan's daughters was married to the Serbian prince Vladislav, whom Ivan was able to establish as king of Serbia; another was married to Manuel Angelus, ruler of Salonika; and his third daughter, Helen, was betrothed in 1228 to the 11-year-old Latin emperor Baldwin II. The regency of the Latin empire (*i.e.,* of the Byzantine Empire then under crusader rule) was then offered to Ivan, who agreed in return to give back his conquests in Epirus, western Macedonia, and Albania. The Latins, however, afraid of Bulgaria's growing power, repudiated the treaty, and Baldwin was betrothed to the daughter of John of Brienne, king of Jerusalem, who was elected emperor. Ivan Asen thereafter separated the Bulgarian church from Rome.

Ivano-Frankivsk, Russian IVANO-FRANKOVSK, formerly (1945–62) STANISLAV, *oblast* (province), western Ukraine. It was formed in 1939 from territory annexed from Poland. The *oblast* lies on the northern flank of the Carpathian Mountains and extends from the crest line northward to the Dniester River to include a small area along the Dniester's left (north) bank.

The *oblast* is one of the most densely settled parts of Ukraine. About two-thirds of the population are rural, being concentrated along the Dniester and in the mountain valleys. The *oblast*'s arable land lies chiefly along the Dniester, where there is intensive cultivation of wheat, rye, corn (maize), sugar beets, flax, hemp, sunflowers, and tobacco. In the mountain valleys and on the high pastures, many cattle and sheep are kept, with pigs also raised in the lower regions. Industry in the *oblast* is based on the extraction of a wide range of minerals. There is moderate exploitation of petroleum (which is refined at Nadvirna), natural gas, and some lignite. Potassium sulfate mining at Kalush is of national significance and supplies fertilizers for agriculture. The potash deposits also support chemical works. Apart from the capital, Ivano-Frankivsk, the cities are mostly small local centres. Area 5,400 square miles (13,900 square km). Pop. (1991 est.) 1,451,500.

Ivano-Frankivsk, Russian IVANO-FRANKOVSK, formerly (until 1962) STANISŁAWÓW, or STANISLAV, city and administrative centre of Ivano-Frankivsk *oblast* (province), western Ukraine. It lies along the Bystritsa River just above its confluence with the Dniester River. Founded in 1661 as the Polish town of Stanisławów, it occupied an important position on the northern approach to the Yablonitsky Pass over the Carpathians. From 1772 to 1919 it was held by Austria; in 1945 it was ceded to the Soviet Union and named Stanislav; and in 1962 it was given its present name. The modern city has light-engineering, timber-working, furniture-making, and food-processing industries. There are medical and teacher-training institutes and schools for training in the oil and gas industries. Pop. (1993 est.) 234,000.

Ivanov, Ilya Ivanovich (b. Aug. 1, 1870, Shigry, Kursk *guberniya*, Russia—d. March 20, 1932, Alma-Ata, Kazakh S.S.R), Soviet biologist who developed a method for artificially inseminating domestic animals.

In 1898 Ivanov established in Moscow several zoological laboratories where he studied the structure and vital processes of sex organs of farm animals, including the secretions of accessory sex glands during impregnation. From his observations he concluded that the single condition necessary for impregnation was the union of spermatozoon and egg and that spermatozoa retain their motility and potency for a certain length of time if properly preserved. Ivanov succeeded in developing techniques for obtaining, preserving, and disinfecting semen, in addition to devising a procedure for artificial insemination that could be used for all types of livestock.

In 1901 Ivanov founded the world's first centre for artificially impregnating horses at Dolgoe Village, Orlovskaya *guberniya*. He proceeded to experiment with interspecies hybridization, crossbreeding domestic animals with wild varieties by means of artificial insemination. His object was to produce commercially usable hybrids and to develop new breeds more resistant to illness and more adaptable to the harsh Russian winters. He produced, for example, a hybrid of domestic horse by crossbreeding a zebra and Przewalski's horse (*Equus caballus przewalskii*), the only true wild horse still in existence. He also sought to preserve certain endangered species of wild animals, such as the wisent (European bison).

Ivanov, Lev (Ivanovich) (b. Feb. 18 [Feb. 6, old style], 1834, Moscow—d. Dec. 24 [Dec. 11, O.S.], 1901, St. Petersburg, Russia), Russian ballet dancer who was choreographic assistant to Marius Petipa, the director and chief choreographer of the Imperial Russian Ballet.

Ivanov joined the Imperial Ballet in St. Petersburg after graduating (1852) from its school. He specialized in character roles and was promoted to premier danseur (1869); regisseur, or stage manager (1882); and assistant ballet master (1885). He staged nearly 20 new or revived works for the Imperial Ballet but received little recognition during his lifetime because the name of Petipa was always placed first on the program. Nonetheless, Ivanov became recognized as an important and innovative choreographer, for he was among the first of that era to base his work on the structure and emotional content of the musical score, rather than giving precedence to creating solos, pas de deux, or divertissements designed to display a ballerina's virtuoso technique.

Ivanov excelled in creating visual illusions through patterns of ensemble movement, as in his snowflake dance in *The Nutcracker*, and is often considered a forerunner of Michel Fokine in utilizing the corps de ballet to develop the plot or theme of a ballet. In addition to *The Nutcracker* (1892), Ivanov choreographed portions of *Swan Lake* (1895) and Act II of *Cinderella* (1893). With Petipa he revived the 18th-century *La Fille mal gardée* (1882), and with the well-known ballet teacher Enrico Cecchetti re-choreographed *Coppélia*, creating the version upon which most 20th-century productions of this ballet are based.

Ivanov, Vsevolod Vyacheslavovich (b. Feb. 24 [Feb. 12, old style], 1895, Lebyazhye, Russia—d. Aug. 15, 1963, Moscow), Soviet prose writer noted for his vivid naturalistic realism, one of the most original writers of the 1920s.

Born into a poor family on the border of Siberia and Turkistan, Ivanov ran away from home to become a clown in a travelling circus. He later was a wanderer, labourer, and itinerant entertainer. He served in the Red Army during the civil war that followed the 1917 Revolution.

In 1920 Ivanov went to Petrograd (now St. Petersburg), where he became associated with the Serapion Brothers, a literary group whose members admired and imitated the Romanticism of the early 19th-century German writer E.T.A. Hoffmann. He also came under the influence of Maksim Gorky. His graphic stories of the civil war—*Partizany* (1921; "Partisans"), *Bronepoezd 14-69* (1922; *Armoured Train 14-69*), *Tsvetnyye vetra* (1922; "Coloured Winds")—quickly established his reputation as a writer. Set in Asiatic Russia, the stories have a distinctive regional flavour.

A change in official literary policies in the late 1920s required Ivanov to revise his works to harmonize with the new principles. In 1927 he reworked *Armoured Train 14-69*— which had been severely criticized for neglecting the role of the Communist Party in the partisan movement—into a play, correcting this flaw. The drama enjoyed immediate success and has become one of the classics of the Soviet repertory. In his works composed at this time Ivanov had to temper much of the naturalism, which was considered a negative quality, that had produced such powerful effects in his earlier work. Moreover, his own attitude had changed; he turned from the affirmation of physical and instinctual life to psychological analysis. His major later works include a collection of tales, *Taynoye taynykh* (1927; "The Secret of Secrets"), and an autobiographical novel, *Pokhozhdeniya fakira* (1934–35; *The Adventures of a Fakir*).

During World War II Ivanov worked as a war correspondent for the newspaper *Izvestiya*. His wartime experiences provided material for a new collection of stories and a novel, neither favourably received by Soviet critics. His subsequent work is generally regarded as inferior to the early, unrevised stories.

Ivanov, Vyacheslav Ivanovich (b. Feb. 28 [Feb. 16, old style], 1866, Moscow—d. July 16, 1949, Rome), philosopher, classical scholar, and leading poet of the Russian Symbolist movement.

After studying philosophy at Moscow University and Roman history in Berlin (1886–91), Ivanov resided abroad almost continuously from 1891 to 1905, primarily in Italy, continuing his research and composing poetry. Under the influence of Nietzsche, Novalis, Dostoyevsky, and Vladimir Solovyov, Ivanov evolved a highly personal religious philosophy based on a synthesis of Dionysus and Christ and strongly coloured by aesthetic mysticism. His first volume of lyric poetry, *Kormchiye zvozdy* ("Pilot Stars"), appeared in 1903, immediately establishing him as a key figure among the Russian Symbolists. Further volumes—*Prozrachnost* (1904; "Translucency"), *Eros* (1907), and *Cor Ardens* (1911), the latter his most important poetical achievement—strengthened his position as high priest of the movement. From 1905 to 1910 his "Wednesdays" in his St. Petersburg "tower" became an important gathering place of Russian literati. In 1912 he published another important collection of poems, *Nezhnaya tayna* ("The Sweet Secret").

After further sojourns in Europe, Ivanov returned to Moscow in 1913, remaining in Russia through World War I and the Revolution and taking employment in the theatrical section of the People's Commissariat of Education in 1918. In 1921 his *Zimniye sonety* ("Winter Sonnets") was published by Ilya Ehrenburg in Berlin. In 1924 Ivanov left Russia for Rome, where he became a convert to the Roman Catholic Church in 1926. His sonnet sequence, *Rimskiye sonety* (1926; "Roman Sonnets") is a poetic account of this religious experience. Ivanov's later poetic works include the lyrical-philosophical cycle *Chelovek* (1939; "Man") and *Svet vechernïy* (1944; "Evening Light"). In addition to his lyrical works, Ivanov also wrote two poetic dramas, several collections of essays, and a critical study on Lermontov. His translations include works by Sappho, Aeschylus, and Dante.

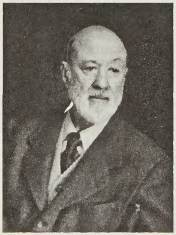
Ivanovo, *oblast* (province), western Russia, occupying an area of 9,225 sq mi (23,900 sq km), northeast of Moscow astride the middle Volga River and centred on Ivanovo city. The surface is a rolling moraine plain, with forests of spruce, pine, and fir and much swamp; most soils are infertile, though the southwest, with better soils, is largely plowed. The climate is continental, with long, cold winters and warm summers; precipitation is about 24 in. (600 mm) a year. The *oblast*, whose population is heavily urban, is part of the central industrial region; its textile industry, which has flourished since the 18th century, supplies nearly one-third of all Soviet cotton; linen and clothing also are produced. The engineering and chemical industries supply the needs of the textile mills. Agriculture is dominated by dairying, livestock raising, and flax cultivation, with some oats, rye, potatoes, and vegetables. The large peat reserves are much used for fuel. Pop. (1991 est.) 1,316,400.

Ivanovo, city and administrative centre of Ivanovo *oblast* (province), western Russia, on both banks of the Uvod River. It was created from two villages, Ivanovo and Voznesensk, in 1871; until 1932 it was known as Ivanovo-Voznesensk. The first linen mills in Russia were founded near Ivanovo by order of Peter I the Great in 1710. A large number of weaving mills and textile-printing factories were subsequently opened there, so that by the middle of the 19th century the town was known as "the Russian Manchester." In 1918 the city was the temporary capital of the revolutionary government. Ivanovo remains one of the major textile cities of Russia, producing cotton, worsted, and silk goods and clothing. Other industries produce machinery and dyes for the textile industry. Still other manufactures include peat-working machines, cranes, leather goods, lumber, and foodstuffs. A number of satellite towns produce cotton and linen. Rail and road links run to Moscow, Yaroslavl, and Vladimir. Ivanovo has a number of institutions of higher education, including textile, chemical technology, power, agricultural, medical, and teacher-training institutes. Pop. (1991 est.) 482,200.

Ivanovsky, Dmitry Iosifovich (b. Nov. 9 [Oct. 28, old style], 1864, Nizy, Russia—d. June 20, 1920, Rostov-na-Donu, Russian S.S.R.), Russian microbiologist who, from his study of mosaic disease in tobacco, first detailed many of the characteristics of the organisms that came to be known as viruses. Although he is generally credited as the discoverer of viruses, they were also independently discovered and named by the Dutch botanist M.W. Beijerinck only a few years later.

While a student at St. Petersburg University, Ivanovsky was asked in 1887 to investigate "wildfire," a disease that was infecting tobacco plantations of the Ukraine and Bessarabia. In 1890 he was commissioned to study a different disease that was destroying tobacco plants in the Crimea. He determined that the infection was mosaic disease, which was believed at the time to be caused by bacteria. Using a filtering method for the isolation of bacteria, Ivanovsky discovered that filtered sap from diseased plants could transfer the infection to healthy plants. Further researches led Ivanovsky to conclude that the causal agent was an exceedingly small parasitic microorganism that was invisible even under great magnification and that could permeate porce-

lain filters designed to trap ordinary bacteria. He differed from later researchers of viruses only in his supposition that the pathogenic agent in question was a miniscule bacterium, rather than an entirely new and different type of organism. He published his findings in an article, "On Two Diseases of Tobacco" (1892), and a dissertation, *Mosaic Disease in Tobacco* (1902).



He continued his formal education in botany and taught plant anatomy and physiology (1896–1901) but did no further work in virology. In 1908 he went to teach at Warsaw University, where he studied the process of photosynthesis, with particular attention to chloroplasts (chlorophyll-bearing structures) and to the role of pigments in plant leaves.

Ivashchenkovo (city, Russia): *see* Chapayevsk.

Ives, Charles (Edward) (b. Oct. 20, 1874, Danbury, Conn., U.S.—d. May 19, 1954, New York City), significant American composer who is known for a number of innovations that anticipated most of the later musical developments of the 20th century.

Ives received his earliest musical instruction from his father, who was a bandleader, music teacher, and acoustician who experimented with the sound of quarter tones. At 12 Charles played organ in a local church, and two years later his first composition was played by the town band. In 1893 or 1894 he composed "Song for the Harvest Season," in which the four parts—for voice, trumpet, violin, and organ—were in different keys. That year he began studying at Yale University under Horatio Parker, then the foremost academic composer in the United States. His unconventionality disconcerted Parker, for whom Ives eventually turned out a series of "correct" compositions.

After graduation in 1898, Ives became an insurance clerk and part-time organist in New

Charles Ives
Clara E. Sipprell

York City. In 1907 he founded the highly successful insurance partnership of Ives & Myrick, which he headed from 1916 to 1930. He devised the insurance concept of estate planning and considered his years in business a valuable human experience that contributed to the substance of his music. Nearly all his works were written before 1915; many lay unpublished until his death. Chronic diabetes and a hand tremor eventually forced him to give up composing and to retire from business. His music became widely known only in the last years of his life. In 1947 he received the Pulitzer Prize for his *Third Symphony* (*The Camp Meeting*; composed 1904–11). His *Second Symphony* (1897–1902) was first performed in its entirety 50 years after its composition.

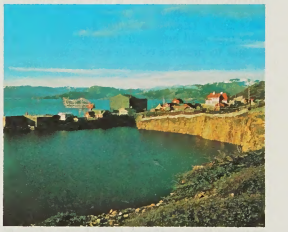
Ives's music is intimately related to American culture and experience, especially that of New England. His compositions—with integrated quotations from popular tunes, revival hymns, barn dances, and classical European music—are frequently works of enormous complexity that freely employ sharp dissonance, polytonal harmonies, and polymetric constructions. He drew from European music what techniques he wished while experimenting with tone clusters, microtonal intervals, and elements of chance in music (in one bassoon part he directs the player to play whatever he wants beyond a specific point). Believing that all sound is potential music, he was somewhat of an iconoclast and occasionally a parodist.

In *The Unanswered Question* (composed before 1908), a string quartet or string orchestra repeats simple harmonies; placed apart from them, a trumpet reiterates a question-like theme that is dissonantly and confusedly commented upon by flutes (optionally with an oboe or a clarinet). In the second movement of *Three Places in New England* (also titled *First Orchestral Set* and *A New England Symphony;* 1903–14), the music gives the effect of two bands approaching and passing each other, each playing its own melody in its own key, tempo, and rhythm. His monumental *Second Piano Sonata* (subtitled *Concord, Mass., 1840–60*), which was written from 1909 to 1915 and first performed in 1938, echoes the spirit of the New England Transcendentalists in its four sections, "Emerson," "Hawthorne," "The Alcotts," and "Thoreau." It contains tone clusters, quotes Beethoven, and includes a flute obbligato honouring Thoreau's wish to hear a flute over Walden. The mood of the sonata ranges from wild and dissonant to idyllic and mystical. It was published in 1920, together with Ives's pamphlet *Essays Before a Sonata.*

Ives conceived his *Second String Quartet* (1911–13; composition on second movement begun 1907) as a conversation, political argument, and reconciliation among four men; it is full of quotations from hymns, marches, and Beethoven, Brahms, and Tchaikovsky. His *Variations on America* (1891; additions before 1894) is the earliest polytonal piece known. In one of his piano and violin sonatas, he adds a passage for trumpet. His *114 Songs* (1919–24) for voice and piano vary from ballads to satire, hymns, protest songs, and romantic songs. In technique they range from highly complex (*e.g.*, with tone clusters, polytonality, and atonality) to straightforward and simple.

Other compositions include *Central Park in the Dark* (1906), for chamber orchestra; *General William Booth Enters into Heaven* (1914; to Vachel Lindsay's poem), for soloist or choir and band but also performed in arrangements for chamber orchestra and for voice and piano; and the four-part symphony *A Symphony: New England Holidays* ("Washington's Birthday," 1909, rescored 1913; "Decoration Day," 1912; "Fourth of July," 1912–13; and "Thanksgiving and Forefathers' Day," 1904). The Ives manuscripts were given to the Library of the Yale School of Music by his wife, Harmony Ives, in 1955, and a temporary mimeographed catalog was compiled from 1954 to 1960 by pianist John Kirkpatrick.

The standard biography of Ives is *Charles Ives and His Music* (1955), by Henry and Sidney Cowell. *Charles Ives Remembered,* by Vivian Perlis, was published in 1974.



Ives, Frederic Eugene (b. Feb. 17, 1856, Litchfield, Conn., U.S.—d. May 27, 1937, Philadelphia), American photographer and inventor.

As a boy, Ives was apprenticed to a printer at the *Litchfield Enquirer,* where he became interested in photography. By the time he was 18 years old, he was in charge of the Cornell University photographic laboratory. While there, he developed an early halftone process using a gelatin relief. He continued to improve this process, and in 1881 he worked on the first commercial production of halftone printing plates using his method; in 1885 he introduced an improved halftone screen.

Among Ives's 70 patents were those for halftone photogravure (anticipating rotogravure); the modern short-tube, single-objective binocular microscope; and the photochromoscope (also called kromskop) camera and the chromogram (also spelled kromogram). The latter, a viewing instrument that accurately combined and projected the three-separation colour negative produced by the former, was of particular importance in the development of full-colour projection. Some of his early prints are preserved in the Smithsonian Institution, Washington, D.C.

Ives, James Merritt: *see* Currier, Nathaniel; and Ives, James Merritt.

Ivittuut, also spelled IVIGTÛT, town in southwestern Greenland, on the 20-mi- (32-km-) long Arsuk Fjord, southeast of Frederikshåb. Nearby is a large open-pit cryolite mine (deposit discovered in 1794) of major economic importance to Greenland. Although the mine was closed in 1963, the stockpiled cryolite is still being exported. The community, founded in 1864 with the opening of the mine, has a radio station. During World War II a U.S. military naval base was built at the head of

Ivittuut on Arsuk Fjord, Greenland

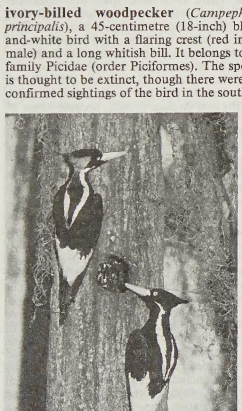
Arsuk Fjord; it is now the headquarters of Grønnedal, the Greenland Command. Pop. (1990 est.) 4.

Iviza, also called IVICA (island, Spain): *see* Ibiza.

Ivo OF CHARTRES, SAINT, French SAINT YVES DE CHARTRES (b. *c.* 1040, near Beauvais, Fr.—d. Dec. 23, 1116, Chartres; canonization date unknown; feast day May 23), bishop of Chartres who was regarded as the most learned canonist of his age.

Of noble birth, Ivo became prior of the canons regular of St. Quentin, Beauvais (*c.* 1078), and in 1090 Pope Urban II confirmed his election as bishop of Chartres. He was imprisoned in 1092 for opposing the plan of King Philip I of France to leave his wife, Bertha, and marry Countess Bertrade of Anjou. Ivo was released because of public pressure and the influence of Urban, who excommunicated Philip. At the Council of Beaugency (1104), Ivo recommended absolution for Philip, thus reconciling him with the Holy See. A moderate, Ivo served as mediator in the Investiture Conflict, a 12th-century dispute between the emperor and the papacy regarding the right to grant clerical office.

His importance as a canonist is displayed in his influential *Decretum* and his *Panormia* (17 and 8 books, respectively). His 288 letters reveal contemporary political, religious, and liturgical questions.



ivory, variety of dentin of which the tusk of the elephant is composed, prized for its beauty, durability, and suitability for carving. The tusk is the upper incisor and continues

to grow throughout the lifetime of the male and female African elephant and of the male Indian elephant; the female Indian elephant has no tusks or small ones. The teeth of the hippopotamus, walrus, narwhal, sperm whale, and some types of wild boar and warthog are recognized as ivory but have little commercial value because of their small size. Elephant tusks from Africa average about 6 feet (2 m) in length and weigh about 50 pounds (23 kg) each; tusks from Asian elephants are somewhat smaller. The elephant's tusk grows in layers, the inside layer being the last produced. About a third of the tusk is embedded in the bone sockets of the animal's skull. The head end of the tusk has a hollow cavity that runs for some distance along its interior, but the tusk gradually becomes entirely solid, with only a narrow nerve channel running through its centre to the tip of the tusk.

There are two main types of elephant ivory, hard and soft. Hard ivory generally comes from elephants in the western half of Africa, soft ivory from those in the eastern half. A hard ivory tusk is darker in colour and is more slender and straighter in form than a soft tusk. Internally, a hard tusk has more colour and is more brittle than a soft tusk, which is an opaque white and has a somewhat fibrous texture.

Ivory is a very durable material and is not easily damaged or destroyed; it will not burn and is very little affected by immersion in water. Ivory is similar to a hard wood in some of its properties. It is quite dense, it polishes beautifully, and it is easily worked with woodworking tools. Most of the ivory used commercially comes from Africa, but commercial sales of ivory have declined since the 19th and the early 20th centuries because of the shrinking numbers of African elephants. The once-flourishing ivory markets of Europe have largely shifted to South and East Asia, where skilled artisans still carve ivory into figurines and other aesthetic objects. The white tops of piano keys ("ivories") and white billiard balls were formerly made of ivory, but these objects are now made of plastics or other synthetic materials. *See also* ivory carving.

ivory-billed woodpecker (*Campephilus principalis*), a 45-centimetre (18-inch) black-and-white bird with a flaring crest (red in the male) and a long whitish bill. It belongs to the family Picidae (order Piciformes). The species is thought to be extinct, though there were unconfirmed sightings of the bird in the southern United States in the late 1990s; a small population on Cuba was last seen in the late 1980s. Its decline coincided with the logging of virgin forest, where it subsisted on deadwood insects. A subspecies, the Cuban ivory-billed woodpecker (*C. p. bairdii*), is also believed to be extinct. A related species, the imperial woodpecker (*C. imperialis*) of Mexico, is critically endangered. All these birds appear to have required large trees and isolation from disturbance.

ivory carving, the carving or shaping of ivory into sculptures, ornaments, and decorative or utilitarian articles. Elephant tusks have been the main source of ivory used for such carvings, although the tusks of walrus and other ivory-bearing mammals have also been worked.

From ancient times ivory has been considered an article of luxury because of its qualities of fine grain, creamy light colour, smooth texture, and soft lustre. Ivory has been carved in such widely varied cultures as those of ancient Egypt, China, Japan, and India. In the West the use of ivory can be traced almost continuously from prehistoric times through the Roman, Carolingian, Byzantine, Gothic, Renaissance, and Baroque periods up until modern times.

Until about 1900 all ivory carvers used much the same tools: an ax, adz, or chisel for removing the outer bark, or rind, from the tusk; a bucksaw or bow saw for cutting the trunk of the tusk into sections; a special tool called a float for paring the surface; and hand chisels, fretsaws, and gauges for actually carving the piece. The great change came with power-driven rotary saws for cutting and peeling the ivory and with dental drills for carving it easily and quickly. These machine tools spread from Europe to Asia in the mid-20th century and are now in universal use for carving ivory.

Ancient Western carvings. Carvings made of ivory, bone, and horn are numerous from certain periods of the Stone Age. Most of the carvings have been found in southern France, particularly in the Dordogne region. The earlier examples take the form of small nude female figures, mostly of scant aesthetic worth. The carvings of animals belong to the succeeding Magdalenian period, and many of these have great merit. The material used is reindeer horn, with the ivory of mammoth tusks also occasionally used. The incising, or engraving, of ivory probably developed later than carving in the round. The prehistoric engravings on ivory usually represent animals, often rendered in a masterly manner and combined to form scenes.

Elephant tusks and hippopotamus teeth were carved from a very early period in ancient Egypt. Many combs, hairpins, and other utensils dating from the predynastic and early dynastic periods have been found at various sites, and to the same period probably belong some crudely carved nude female figures that were likely worn as amulets to ward off evil or harm. Among the masterpieces of early Egyptian carving are two statuettes, both found at Abydos; one represents a king of the 1st dynasty, while the other depicts the 4th-dynasty king Khufu, the builder of the Great Pyramid at Giza. The Egyptians also incised pictures on flat slabs of ivory, and sometime after 3000 BC they introduced the technique of relief carving. Later Egyptian ivory work, much of it of fine quality, is mostly decorative in intention, being used for handles, spoons, and inlays for caskets and furniture.

The ancient Phoenicians used ivory from Syria and Africa, and they seem to have specialized in ivory inlays for woodwork, often overpainted or encrusted with lapis lazuli or glass. Among the earliest preclassical Aegean ivory carvings are small figures of acrobats found at Knossos in Crete and dating from the 16th century BC. Many ivory gaming boxes, mirror handles, and plaques carved in low relief with hunting or combat scenes have been found at Cyprus and at Sparta and Mycenae; they show a strong Asian stylistic influence and were probably made in Syria or on the south coast of Asia Minor.

No ivories of importance belonging to the early Classical period of Greece have survived, though it is known from ancient writers that they existed. The high point of Classical ivory carving was most certainly the colossal chryselephantine statues (*i.e.,* those partly made of ivory and gold) sculpted by Phidias in the 5th century BC; the statue depicting a seated Zeus was in the temple at Olympia, and a statue of a standing Athena was in the Parthenon at Athens. In the last centuries of the Roman Empire, ivory diptychs (*i.e.,* a relief carved on two tablets connected by a hinge) were issued by the Roman emperors, by consuls upon their taking office each year, and by patrician families to celebrate a marriage.

Post-Classical Western carving. The most important surviving ivory carving from the Early Christian period is the Brescia casket (4th century AD); this is a small casket bearing relief carvings of scenes from the Old and New Testaments. Several reliefs on diptychs and panels having Christian subjects date from this period, and indeed depictions of Christ, the Virgin Mary, and the Apostles form the main subject matter of European figurative ivory carvings for many centuries thereafter. No Byzantine ivory from the 7th to the 9th century survives, but there do exist several magnificent carved ivory reliefs from the 10th and 11th centuries. The figures are treated in a strongly classicizing, frozen, and monumental style. Byzantine statuettes from the late 11th and the 12th centuries show a more relaxed and fluid treatment of draperies, and their figures have elongated forms.

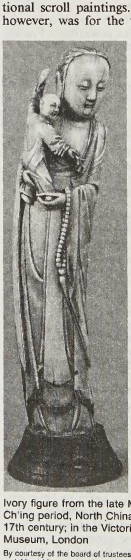
Northern European ivory carving revived during the Carolingian Renaissance, using walrus instead of elephant tusks. The Carolingians carved ivory into reliquaries, crucifixes, relief panels, and the book covers of psalters. New Testament scenes and figures were the almost invariable subject matter. These traditions continued during the Ottonian period of the 10th century, with several impressive situlae (holy-water buckets) carved with scenes from Christ's life having survived. Romanesque ivory carvings of reliquaries, tau crosses, and bishops' pastoral staffs display a multiplicity of styles, depending on the country of origin. During the Romanesque and the succeeding Gothic period, the West's artistic emphasis shifted from the decoration and embellishment of sacred objects to the building of cathedrals, monumental paintings, and stained glass. Thus, from about the 12th century on, ivory carving ceased to be a major art or an important adjunct to religious or imperial liturgies. Nevertheless, ivory diptychs and triptychs carved with religious scenes continued to be produced in the Gothic style by many workshops. Ivory was also carved into caskets, combs, mirror cases, writing tablets, cups, dagger handles, and chess pieces. Sometimes scenes of courtly love or extracts from romances were carved onto the surface of these utilitarian objects.

Renaissance ivory carving marked a notable change from that of the Middle Ages in its technical sophistication and sensitivity. By this time ivory was rarely used except for domestic articles and inlay work, but there was a revival of interest in ivory carving in 17th-century Germany and Flanders, and many elaborate and sumptuously carved objects such as candelabra, plaques, statuettes, and drinking tankards were made by highly skilled artists. By the late 18th century, ivory

carvings were regarded in Europe merely as curious and quaint decorative objects. In the 19th century, ivory came into prominence once more, chiefly for making forgeries of older, more valuable ivory objects. It was also used to make caskets, clock cases, and batons,

"An Elopement" (sometimes called "Lancelot and Guinevere"), ivory mirror case, French Gothic, 14th century

By courtesy of the Liverpool Museum, England



as well as humbler objects such as snuffboxes, fan handles, and scent bottles. By the 20th century, with the use of machine-driven tools to cut ivory and the decay of unified stylistic traditions of decoration, ivory carving in the West had degenerated into a craft still possessed of technical sophistication but almost utterly lacking in aesthetic worth.

Far Eastern carving. Ivory carving is one of China's oldest arts, and examples of skillfully carved ivory have been found in the tombs of the Shang dynasty (18th–12th century BC) kings; these pieces are so well designed and executed that they suggest a long previous development, probably going back to prehistoric times. In ancient China elephants still roamed the forests of the Huang Ho (Yellow River) region, so that the supply of ivory was close at hand. At the court of the Chou dynasty (12th–3rd century BC) it became fashionable for princes and high officials to carry narrow memorandum tablets of ivory. Called *hu,* these were generally worn as girdle pendants. In the Han dynasty (206 BC–AD 220) these ivory tablets came to be considered as marks of rank and were required for formal dress. Later, during the T'ang dynasty (618–907) and the Sung period (960–1279), these tablets were greatly elongated and were carried by court officials as a kind of sceptre as well as a writing surface for memoranda. The tablets continued to be carried as a mark of high court rank until the fall of the Ming dynasty in the 17th century. Some ivory figurines have also survived from these periods in Chinese history. Other carvings consist of flat ivory pieces that were painted or stained a dark colour and then carved to form intricate patterns of birds and animals or geometric figures, the carvings finally being stained with other colours or left plain.

By Sung dynasty times the elephants had been driven far into the wilderness areas of southwest China (modern Yunnan), which then belonged to another nation, the kingdom of Nanchao. Accordingly, new sources of ivory were sought overseas, and at this time the first African elephant tusks were brought from Zanzibar to China by Arab traders. The new nationalistic-minded Ming dynasty, after overthrowing the Mongol Yüan dynasty, proceeded in the 14th century to revive the art of ivory carving, and a renaissance of fine craftsmanship resulted. The Ming ivory carvings that have survived are mostly handsomely carved figures, not stained or painted but having the natural colouring of ivory. The tradition of fine Ming carving seems to have carried over into the first half of the Ch'ing dynasty (1644–1912). The art of colouring ivory was revived at this time, and both stains and lacquers were used to enhance the delicately carved figures that many connoisseurs have considered the finest productions of the Chinese carvers' art. Workshops in Peking and Canton were the main centres of ivory carving, producing figures, singly or in groups; cylindrical brush boxes, table screens, and armrests and other desk fittings carved in low and high relief; sceptres; snuff bottles, snuff dishes, and accessories for opium smoking; stands for fine porcelains; and perfume boxes, mirror cases, and other toilet articles for court ladies. Shanghai workshops produced such utilitarian objects as chopsticks, Mah-Jongg sets, combs, and seals.

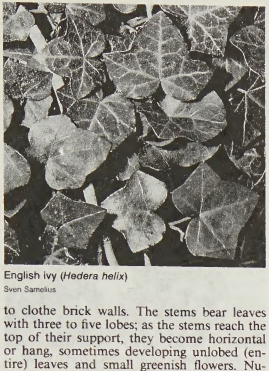
Peking and Canton continued to be centres for the finest Chinese ivory carving until after the fall of the Ch'ing dynasty in 1912. In subsequent years the output declined, resulting from the lack of Imperial patronage. From that time on, the industry was devoted chiefly to supplying foreign residents and tourists with ivory canes, card cases, and other objects. Because these buyers were not discriminating, the quality, which had been declining after the mid-19th century, deteriorated at an accelerating pace.

It is not possible to claim any great antiquity for ivory carving in Japan. Although they learned the art rather late, the Japanese ivory carvers of the Tokugawa period (1603–1867) quickly developed an astonishing mastery of this medium and created many miniature works of art that still excite admiration. Ivory was used in Japan to produce such objects as the plectrum for plucking the strings of the samisen and the ends of the rollers for traditional scroll paintings. Its major artistic use, however, was for the togglelike pieces called

Ivory figure from the late Ming or Ch'ing period, North China, 16th or 17th century; in the Victoria and Albert Museum, London

By courtesy of the board of trustees of the Victoria and Albert Museum, London

netsukes, which formed an indispensable item of men's costumes in the Tokugawa period. Netsukes were used to fasten the medicine box (inro) and pipe and tobacco pouches to a man's sash. They were often delicate and exquisitely carved miniature figures, landscapes, or animals. With the end of the Tokugawa regime in 1867, new customs of dress, and the introduction of the cigarette shortly after, netsukes became obsolete. Their former carvers, like the Chinese, gradually turned to making things for foreign residents and tourists, producing jewel boxes, chests, card cases, Chess pieces, buttons, brooches, and other objects to appeal to Victorian tastes. By about 1900, endless repetition and the use of machine tools for mass production had destroyed the remaining elements of the art. From that time on, most Japanese ivory carving has been directed toward the copying of old netsukes, complete with signatures of dead artists, and the forging of Chinese ivory antiquities.



Other carving traditions. From the time of Muhammad or before, ivory was used extensively in the Middle East and in Muslim-ruled Spain to decorate furniture, doors, caskets, and minbars (pulpits). The decoration consisted of geometric and plant-form arabesques, sometimes inhabited by birds and animals. Ivory was always plentiful in India, but few carved ivory pieces have survived to illustrate the art during most of the 4,000 years it has been practiced there. Some Hindu and Buddhist figures carved in the round are extant, along with little boxes and some reliefs.

The early Inuit, or Eskimo, of North America lacked most useful metals, and so they fashioned the ivory from walrus tusks and buried mammoth tusks into a variety of utilitarian objects, such as bucket handles, bow drills, pipes, harpoon shafts, and needle cases. They etched these objects with geometric or gracefully curving patterns of fine lines. Another type of ivory carving is that of scrimshaw (*q.v.*), which is the decoration of whales' teeth or walrus tusks with various designs and images, carried out by whale fishermen in the United States during the 19th century.

Ivrea, Latin EPOREDIA, town and episcopal see, Torino province, Piemonte (Piedmont) region, northwestern Italy, on the Dora Baltea River, north of Turin. The importance of its gold mines led the Romans to seize the district from the Salassi in 143 BC. Ivrea was a Lombard duchy and, from the 9th century, a marquessate, and two of its rulers, Berengar II (950) and Arduin (1002), became kings of Italy. It passed to Monferrato in 1266 and to the House of Savoy in 1313. Served by rail and road, Ivrea manufactures office equipment (it is the headquarters of Olivetti) and textiles. Tourism is important, and the town's annual historical carnival in February is well known. Pop. (1984 est.) mun., 27,577.

Ivry-sur-Seine, industrial suburb southeast of Paris, in Val-de-Marne *département,* Paris region, France. It is bounded on the northwest by the city limits of Paris and on the northeast by the Seine River, and it is served by the Paris subway. Its port on the Seine makes it an entrepôt for foodstuffs, fuel, and timber. A hospital for incurable diseases was moved there in 1870 from Paris. During the occupation of Paris in World War II, 860 French patriots were shot by the Germans and are buried at Ivry cemetery. The suburb's manufacturing industries include electrical and nonelectrical machinery, food processing, chemicals, and wood and paper. Pop. (1982) 55,682.

ivy, any plant of the genus *Hedera,* with about five species of evergreen woody vines (rarely shrubs), in the ginseng family (Araliaceae). The name ivy especially denotes the commonly grown English ivy (*H. helix*), which climbs by aerial roots with adhering disks that develop on the stems. English ivy is frequently planted

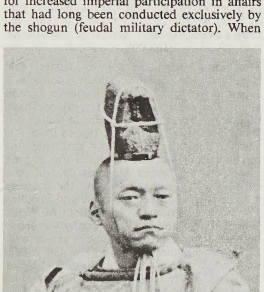
English ivy (*Hedera helix*)
Sven Samelius

to clothe brick walls. The stems bear leaves with three to five lobes; as the stems reach the top of their support, they become horizontal or hang, sometimes developing unlobed (entire) leaves and small greenish flowers. Numerous cultivated and geographical varieties of *H. helix* exist, including many with variegated leaves. Native to Europe and much of Asia, this genus has been introduced into many parts of the world.

Many varieties of ivy are cultivated in gardens. Growing them is an extremely simple matter, as they will thrive in a poor soil and endure a considerable depth of shade, so that they may with advantage be planted under trees. For example, the common Irish ivy (a variety of *H. helix*) is often used as a ground cover beneath large trees where grass has difficulty in thriving. A strong light is detrimental to the growth of ivy, but there are few hardy plants that may be compared with it for variety and beauty that will endure shade equally well. Ivies, in their many forms, are also popular houseplants.

A question of practical importance is the relation of the ivy plant to its means of support. A moderate growth of ivy is not injurious to trees; still, the tendency is from the first unfavourable to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds. In regard to buildings clothed with ivy, there is nothing to be feared as long as the plant does not penetrate the substance of the wall by means of any fissure. Should it thrust its way in, its natural and continuous expansion hastens the decay of the structure. For unrelated plants called ivies, *see* Boston ivy; poison ivy.

Ivy League, a group of colleges and universities in the northeastern United States that are widely regarded as high in academic and social prestige: Harvard (established 1636), Yale (1701), Pennsylvania (1740), Princeton (1746), Columbia (1754), Brown (1764), Dartmouth (1769), and Cornell (1865). They are members of an athletic conference for intercollegiate football and other sports known as the Ivy League. Though formally organized only in 1956, competition between the colleges dates back to football meetings in the 1870s. The Ivy League was dominant in the early years of football in the United States until 1913, as attested by the All-America teams, but faded in the 1920s.



Iwaki, city, Fukushima *ken* (prefecture), Honshu, Japan, facing the Pacific Ocean. The city is divided into several sections that are located on the Abukuma Plateau and the alluvial plains of the Natsui and Same rivers. The northern section, which is known as Taira, was a castle town during the Tokugawa period (1603–1867); the Nakoso, Jōban, and Shikura sections were post towns. Since the first exploitation of the Jōban coal mines in the late 19th century, the entire city was dominated by the mining industry. Output declined after 1951, however, and after the 1970s only the mines in the west remained in operation. Chemical and petrochemical industries have developed, especially around Onahama. Tobacco is grown in the rural areas, and there is a lumber industry. Pop. (1991 est.) 356,746.

Iwakuni, city, Yamaguchi *ken* (prefecture), Honshu, Japan. It is situated in the delta of the Nishiki River, facing Hiroshima Bay. A castle town founded in 1603 by the Kikkawa daimyo family, Iwakuni has grown into a major industrial city and is the centre of a petrochemical-producing region that extends northward to Otake, in Hiroshima prefecture. Iwakuni is noted for its Kintai Bridge over the Nishiki River, which has five gracefully arched spans. The bridge was originally built in 1673 to afford residents an escape from floods of the river. It was destroyed in a flood in 1950 but was rebuilt as before. Its shape leads local inhabitants to call it Soroban ("Abacus") Bridge. The former army and naval base contains a base for U.S. forces and Iwakuni International Airport. Pop. (1991 est.) 109,258.

Iwakura Tomomi (b. Oct. 26, 1825, Kyōto, Japan—d. July 20, 1883, Tokyo), one of Japan's most influential statesmen of the 19th century.

He was born to the family of a court noble of relatively low rank. Adopted as son and heir of the more powerful Iwakura family, he gained an important place in court circles after the U.S. naval officer Commodore Matthew C. Perry in 1853 succeeded in forcing Japan to allow foreigners to enter the country.

In 1858 Iwakura was influential in the emperor's refusal to ratify the U.S.-Japanese treaty of commerce, thereby establishing a precedent for increased imperial participation in affairs that had long been conducted exclusively by the shogun (feudal military dictator). When

Iwakura Tomomi
BBC Hulton Picture Library

the emperor's refusal angered the shogun, Iwakura retreated and advocated a reconciliation between the two factions, symbolized by the marriage of the emperor's sister to the young shogun. Iwakura, reviled by imperial loyalists for his retrenchment, was deprived of his court office, and from 1863 to 1867 he lived in obscurity near Kyōto.

As the shogunate lost influence, Iwakura was able to gain favour with the militarily powerful loyalists of the feudal domains of Satsuma and Chōshū. After his return to favour at court he was a member of the small group of conspirators that brought about the Meiji Restoration (1868), thus ending the power of the last shogun. In the new administration, which used the Meiji emperor's prestige as a force for modernizing Japan, Iwakura was one of the most powerful leaders. In 1871 he was appointed to head a group of about 50 leading government figures on a mission to Western countries. Ostensibly devoted to the task of treaty revision, the embassy became a great "learning mission," with its members divided into teams to study Western systems of education, administration, finance, and law. Upon his return Iwakura helped thwart plans made in his absence for war with Korea, as he was convinced that internal reforms were vitally needed. In the late 1870s he was the unchallenged de facto head of the government. A foe of the movement for democratic rights, he ended his career by supervising the early stages of the preparation of a constitution safeguarding the imperial prerogative.

Iwamizawa, city, central Hokkaido, Japan. It lies along the levee of the Ikushunbetsu River, northeast of Sapporo. It developed around the railway station built on the levee in 1882. With the opening of three other railway lines by 1914, Iwamizawa became an important transportation centre connected with the nearby Ishikari Coalfield. Despite the decline in the coal-mining industry in the 1960s and '70s, the city continues to be a prosperous local administrative and commercial centre. During the 1970s it became a suburb of Sapporo. Food processing, brewing, and ceramics manufacturing are the city's main industries. Pop. (1990) 80,423.

Iwasa Matabei, original name ARAKI KATSUMOCHI (b. 1578, Japan—d. July 20, 1650, Edo [now Tokyo]), Japanese painter of the early Tokugawa period (1603–1867).

Upon the defeat and suicide of his soldier-father, Araki Murashige, he took refuge in the Hongan Temple in Kyōto with his nurse and later assumed his mother's family name, Iwasa. He studied painting with different masters, but nothing definite is known about them. Because Iwasa came to consider himself an heir to the tradition of the Tosa school of painting (stressing Japanese subjects and techniques), he may have studied under Tosa Mitsunori (1583–1638).

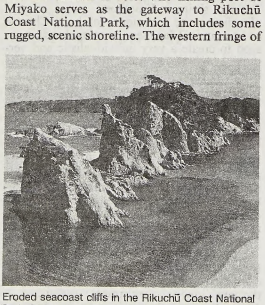
In 1623 Iwasa moved to Edo, and he was commissioned by the Tokugawa shogunate in 1640 to draw the portraits of the Sanjūrokkasen (The Thirty-Six Poets) for the Tōshōgū shrine in Kawagoe.

Mastering the techniques of both Chinese and traditional Japanese painting, Iwasa managed to create a very individualistic and versatile style. He painted numerous pictures based on Japanese classical literature, among which are "Genji monogatari zu" ("Scenes from the *Tale of Genji*") and "Ise monogatari zu" ("Scenes from the *Tale of Ise*"). He also left many works depicting famous Chinese legendary scenes.

Iwasaki Yatarō (b. Jan. 9, 1835, Tosa province, Japan—d. Feb. 7, 1885, Tokyo), industrial entrepreneur who founded the Mitsubishi *zaibatsu,* the second largest of the family-owned industrial-financial combines that dominated the economic life of Japan in the late 19th and early 20th centuries.

Of petty samurai (warrior class) origin, Iwasaki began his business career as the financial manager of the feudal fief of Tosa. When the new imperial government, established in 1868, dissolved the various feudal domains into which Japan had previously been divided,

Iwasaki was able to transfer the fief's shipping interests into his own concern, which in 1873 he named the Mitsubishi Commercial Company (Mitsubishi Shōkai). Under Iwasaki's management the company flourished, and the new government administration, which desired to end Japanese dependence on foreign shipping, encouraged him, in 1884, to acquire the newly built government shipyard at Nagasaki. Under the direction of Iwasaki and his descendants, Mitsubishi branched out into numerous other industrial and commercial activities.



Iwaszkiewicz, Jarosław (b. Feb. 20, 1894, Kalnik, Ukraine, Russian Empire [now in Ukraine]—d. March 2, 1980, Stawisko, near Warsaw, Pol.), Polish poet, novelist, essayist, and playwright, a highly gifted and prolific man of letters.

Iwaszkiewicz studied law at the University of Kiev from 1912 and at the same time attended the music conservatory. In 1918 he settled in Warsaw, where he cofounded Skamander, a group of lyrical poets. From 1923 to 1925 he was private secretary to Maciej Rataj, the Sejm (Parliament) speaker, later joining the Ministry of Foreign Affairs. From 1932 to 1935 he was a member at the Polish legations in Copenhagen and Brussels, returning afterward to writing. As a poet he was already well known for a few collections of verse.

During World War II Iwaszkiewicz lived quietly with his wife Anna (*née* Lilpop) at their country house in Stawisko. After the war he avoided participating in political activities. He agreed, however, in 1953 to be chairman of the Polish Committee to Defend Peace and to serve as a nonparty member of the Sejm. He twice presided over the Polish Writers' Union (1945–49 and 1959–80). From 1955 he was editor in chief of *Twórczość* ("Creation"), a monthly literary periodical.

Iwaszkiewicz's poems, published in *Oktostychy* (1919), *Księga dnia i księga nocy* (1922; "The Book of Day and the Book of Night"), and *Wiersze zebrane* (1968; "Collected Poems"), among others, are frequently lyrical evocations of the Polish landscape. His prose production, which took such varied forms as essays, plays, biographies, short stories, novels, and translations, includes the short-story collection *Opowiadania* (1954; "Stories") and the novel *Sława i Chwała,* 3 vol. (1956–62; "Fame and Glory"), an examination of the turbulent Polish society from 1914 to 1945.

Iwate, *ken* (prefecture), northeastern Honshu, Japan, bordering the Pacific Ocean (east). The greater part of its area is mountainous, and the climate is cold. The fishing port of Miyako serves as the gateway to Rikuchū Coast National Park, which includes some rugged, scenic shoreline. The western fringe of the prefecture is part of Towada-Hachimantai National Park.

Eroded seacoast cliffs in the Rikuchū Coast National Park, Iwate prefecture, Japan

Cent Photos—FPG

Agriculture, forestry, mining, and fishing support most of the population. Rice paddies occupy more than half the cultivated land, yielding only one crop per year. Morioka, located on the Kitakami River, is the prefectural capital and the site of Iwate University (1949). A major railway hub, it produces ironware and charcoal. The first modern ironworks in Japan were in Kamaishi. Other towns—including Hanamaki, Kitakami, Mizusawa, and Ichinoseki—are situated on the Tohoku Main Line (railway). Area 5,898 square miles (15,277 square km). Pop. (1994 est.) 1,416,000.

Iwo, town, Osun state, southwestern Nigeria. It lies 6 miles (10 km) north of the Iwo station on the Lagos-Kano railway and at the intersection of roads from Ibadan, Oyo, and Ogbomosho, on a low hill at the edge of savanna and forest. Founded in the 16th or 17th century, it became the capital of the Yoruba kingdom of Iwo. The former ruler of the Iwo kingdom, the *oluwo* ("king"), whose palace now incorporates a modern building and the local government offices, still retains important social and traditional functions and is an adviser to the local government. Within the town, many of the traditional Yoruba compounds with their rectangular courtyards have been replaced with single-story and multistory houses.

The cultivation and export of cocoa is the town's economic mainstay. Yams, corn (maize), cassava, and palm oil and kernels, the chief staple crops, are grown north of the town. Cotton weaving and dyeing (with locally grown indigo) are traditionally important activities. Iwo's predominantly Muslim population is served by a central mosque and a hospital. A Baptist mission, Muslims, Roman Catholics, and the government operate the town's schools. Although the railroad built in 1906 greatly enhanced Iwo's growth, the town's traffic is now primarily road-borne. Pop. (1995 est.) 353,000.

Iwo Jima, Japanese IŌ-JIMA, island that is part of the Volcano Islands archipelago, Japan. It lies in the western Pacific at a point about 760 miles (1,220 km) south-southeast of Tokyo. Iwo Jima is irregular in shape; it is about 5 miles (8 km) long, ranges from 800 yards to 2.5 miles (730 m to 4 km) wide, and has an area of 8 square miles (20 square km).

Iwo Jima was under Japanese control until early in 1945, when it became the scene of a fierce battle between Japanese and invading U.S. troops during the last phases of World War II. The island was strategically important because, if captured, it could serve as a base for U.S. fighter planes to accompany U.S. heavy bombers flying to Japan from bases on Saipan, an island 700 miles (1,100 km) farther south that U.S. troops had taken in 1944. Two U.S. Marine divisions landed on Iwo Jima Feb. 19–21, 1945, and were followed by a third later in the month. The island's Japanese defenders had entrenched themselves so effectively in caves that weeks of preliminary naval and air bombardment failed to appreciably weaken their ability to offer tenacious resistance to the Marines' amphibious landing. The struggle for possession of the island continued for almost a month before it was officially pronounced captured by the United States. The hardest struggles were for the occupation of a height that U.S. forces labeled Meatgrinder Hill, in the north, and Mount Suribachi, an extinct volcano in the south.

The raising of the American flag over Mount Suribachi (February 23), which was photographed by Joe Rosenthal of the Associated Press, resulted in one of the best-known photographic images of the Pacific war. This picture was widely reprinted, and statues, paintings, and a U.S. postage stamp were based on it. (The photograph actually depicts the second flag raising over Mount Suribachi, after a first flag raised an hour or two earlier had proved too small to be visible to other U.S. troops on the island.)

U.S. marines raising the American flag over Mount Suribachi, Iwo Jima, in February 1945

Joe Rosenthal—AP/Wide World

About 21,000 Japanese troops were killed and some 1,000 captured in the main battle and subsequent operations. U.S. casualties totaled about 28,000, including about 6,800 killed. Iwo Jima and the other Volcano Islands were administered by the United States from 1945 until they were returned to Japan in 1968.

IWW: *see* Industrial Workers of the World.

Ixcatec, Middle American Indians living in a single town, Santa María Ixcatlán, in northern Oaxaca, Mex. There were perhaps 10,000 Ixcatec before the Spanish conquest, but their numbers now remain stable at about 200. The Ixcatec language and culture are closely related to those of the neighbouring Chocho (*q.v.*). They practice subsistance farming, with corn (maize) and beans as the staple crops. The Ixcatec live in towns or villages, from which they go out to farm the surrounding land. Their houses are built in a variety of styles, from thatched huts to adobe and tile houses—the result of cultural change. The chief craft practiced is the weaving of palm-fibre hats for sale. Native dress has been replaced by standard Mexican peasant dress.

The Ixcatec, although they are Roman Catholics, practice a faith that has intermixed some pre-Christian beliefs. The compadrazgo, or godparent relationship, is invoked at baptism, and godparents have obligations to their godchildren at marriage.

Ixelles (French), Flemish ELSENE, *commune,* Brussels *région,* central Belgium. A southeastern suburb of Brussels, it is one of the 19 communes that make up Greater Brussels. Factories in Ixelles process metals and make chemicals and textiles. The former Cistercian Abbey of La Cambre (founded 1201) now houses the National Geographic Institute and the Institute of Architecture and Decorative Art. Some of the newer buildings of the Free University of Brussels are in the southeastern part of the town near the lakes of Bas-Ixelles. Pop. (1992 est.) 72,447.

Ixion, in Greek legend, son either of the god Ares or of Phlegyas, king of the Lapiths in Thessaly. He murdered his father-in-law and could find no one to purify him until Zeus did so and admitted him as a guest to Olympus. Ixion abused his pardon by trying to seduce Zeus's wife Hera. Zeus substituted for her a cloud, by which Ixion became the father of the Centaurs. Zeus, to punish him, bound him on a fiery wheel, which rolled unceas-

ingly through the air or, according to another tradition, in the underworld.

A plausible explanation of the myth connects it with the ancient practice of carrying a blazing revolving wheel through fields that needed the heat of the sun; thus the legend might possibly have been invented to explain the custom.

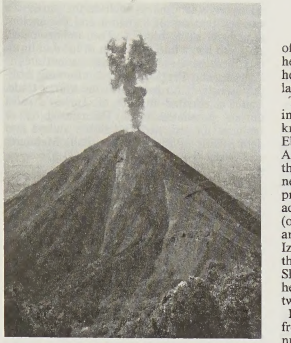
Ixtacalco (Mexico): *see* Iztacalco.

Ixtaccihuatl (volcano, Mexico): *see* Iztaccihuatl.

Ixtapalapa (Mexico): *see* Iztapalapa.

Ixtlilxóchitl (fl. 1500–1550), Aztec chieftain, the chief of Texcoco who supported the Spanish conquistador Hernán Cortés in the conquest of rival Aztecs in Tenochtitlán.

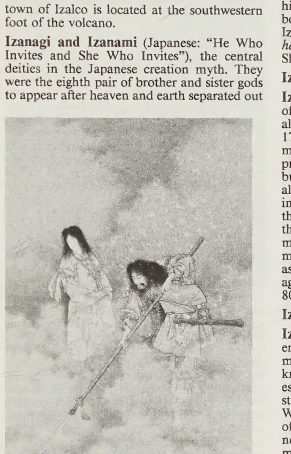
At the time of the Spanish conquest, the cities of Texcoco and Tenochtitlán (the capital of the Aztec confederation) were engaged in an active rivalry with each other. Ixtlilxóchitl, moreover, was involved in an internal dispute with his brother over leadership of the Texcocans. When Cortés offered to support his claims and the aspirations of Texcoco, Ixtlilxóchitl allied his people with the Spanish invaders and assisted in the siege of Tenochtitlán. Although he remained an ally of Spain, he eventually lost the favour of his disillusioned subjects.



Izabal, Lake, Spanish LAGO DE IZABAL, lake in northeastern Guatemala. The nation's largest lake, Izabal occupies part of the lowlands between the Santa Cruz Mountains to the northwest and the Minas and San Isidro mountains to the southwest and southeast. It is fed by the Polochic River and is drained by the Dulce River into Amatique Bay, which is part of the Caribbean Sea. Lying only 26 feet (8 m) above sea level, Lake Izabal is approximately 30 miles (48 km) long by 15 miles (24 km) wide, with a maximum depth of 59 feet (18 m); its area is 228 square miles (590 square km).

Ruins of the Spanish fort of San Felipe on Lake Izabal, Guatemala
Howard Sochurek

During the colonial period, products from the highlands were traded in the Izabal area and exported. The ruins of San Felipe fort still stand guard at the head of the Dulce. The principal settlement on the shores is El Estor, which originated as the trading outpost of the United Fruit Company and whose name is derived from the English word *store*. Nickel has been mined near the lake.



Izalco Volcano, Spanish VOLCÁN IZALCO, volcano in western El Salvador. It is the most active volcano in Central America, having erupted more than 50 times since 1700. Its black symmetrical cone, which was formed by eruptions in 1770 and 1798, is devoid of vegetation and reaches a height of 6,004 feet (1,830 m). During the 19th century, oceangoing sailors set their course by the continuous glow from Izalco's summit, nicknaming it the "Lighthouse of the Pacific." The volcano derives its name from the Izalco Indians. The

Izalco Volcano, El Salvador, during an eruption

town of Izalco is located at the southwestern foot of the volcano.

Izanagi and Izanami (Japanese: "He Who Invites and She Who Invites"), the central deities in the Japanese creation myth. They were the eighth pair of brother and sister gods to appear after heaven and earth separated out

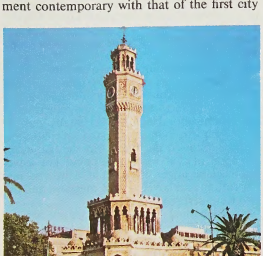
Izanagi and Izanami stirring the primeval brine to form the first land mass, painting on silk, Tokugawa period (1603–1867); in the Museum of Fine Arts, Boston
By courtesy of the Museum of Fine Arts, Boston, Bigelow Collection

of chaos. By standing on the floating bridge of heaven and stirring the primeval ocean with a heavenly jeweled spear, they created the first land mass.

Their first attempt at sexual union resulted in a deformed child, Hiruko ("Leech Child," known in later Shintō mythology as the god Ebisu), and they set him adrift in a boat. Attributing the mistake to a ritual error on the part of Izanami, who as a woman should never have spoken first, they began again and produced numerous islands and deities. In the act of giving birth to the fire god, Kagutsuchi (or Homusubi), Izanami was fatally burned and went to Yomi, the land of darkness. Izanagi followed her there, but she had eaten the food of that place and could not leave. She became angry when he lit a fire and saw her rotting and covered with maggots, and the two were divorced.

Izanagi bathed in the sea to purify himself from contact with the dead. As he bathed, a number of deities came into being. The sun goddess Amaterasu was born from his left eye, the moon god Tsukiyomi was born from his right eye, and the storm god Susanoo was born from his nose. In the Shintō religion, Izanagi's bath is regarded as the founding of *harai*, the important purification practices of Shintō.

Izdī (religious sect): *see* Yazīdī.



Izhevsk, also spelled IŻEVSK, city and capital of Udmurtiya, in west-central Russia, lying along the Izh River. Izhevsk was founded in 1760 as an ironworking and later an armaments centre, and the city remains a major producer of steel, armaments, machine tools, building machinery, and motorcycles. There is also a large automobile plant. Izhevsk's other industries include large-scale sawmilling and the processing of varied foodstuffs. Izhevsk is the cultural and educational centre of Udmurtiya, with a scientific institute of the Udmurt language, literature, and history, as well as teacher-training, medical, mechanical, and agricultural institutes. Pop. (1991 est.) 646,800.

Izium (Ukraine): *see* Izyum.

Izmail, city, Odessa *oblast* (province), southern Ukraine. It lies on the north bank of the main Danube distributary some 50 miles (80 km) from the Black Sea. The Turkish fortress established there in the 16th century was stormed by the Russians in 1790. Between World Wars I and II, Izmail, with the rest of Bessarabia, was included in Romania. It is now an important river port and transshipment point, with light industries. Pop. (1991 est.) 95,100.

İzmir, historically SMYRNA, city, western Turkey. The nation's third largest city and one of its largest ports, it lies at the head of the sheltered Gulf of İzmir on the deeply indented coast of the Aegean Sea. The modern city, with spacious avenues and modern buildings built since 1924, stands mainly on the small delta plain of the Kızılçullu (ancient Meles) River around the eastern end of the gulf and on the heights and ridges to the south. Karşıyaka (formerly Kordelia), which lies across the gulf, is nearly connected to İzmir proper by a growing chain of suburbs. Konak is the commercial centre of İzmir; the city's residential quarters are concentrated in Karantina and in Güzelyalı to the southwest and in Eşrefpaşa, north of the bazaar. South of the commercial centre lies Kadifekale (Mount Pagus; 540 feet [165 m]), on which the old citadel of İzmir was built. Alsancak to the north is the site of the recently enlarged harbour, while industry is concentrated in suburbs along the gulf to the northeast.

İzmir is one of the oldest cities of the Mediterranean world and has been of almost continuous historical importance during the last 5,000 years. Excavations indicate settlement contemporary with that of the first city

Clock tower, İzmir, Tur.
Fritz Henle—Photo Researchers/EB Inc.

of Troy, dating from the 3rd millennium BC. Greek settlement is first clearly attested by the presence of pottery dating from *c.* 1000 BC. According to the Greek historian Herodotus, the Greek city was founded by Aeolians but soon was seized by Ionians. From modest beginnings, it grew into a stately city in the 7th century, with massive fortifications and blocks of two-storied houses. Captured by Alyattes of Lydia *c.* 600 BC, it ceased to exist as a city for about 300 years until it was refounded by either Alexander the Great or his lieutenants in the 4th century BC at a new site on and around Mount Pagus. It soon emerged as one of the principal cities of Asia Minor and was later the centre of a civil diocese in the Roman province of Asia, vying with Ephesus and Pergamum for the title "first city of Asia." Roman emperors visited there, and it was celebrated for its wealth, beauty, library, school of medicine, and rhetorical tradition. The stream of Meles is associated in local tradition with Homer, who is reputed to have been born by its banks. Smyrna was one of the early seats of Christianity.

Capital of the naval theme (province) of Samos under the Byzantine emperors, Smyrna was taken by the Turkmen Aydın principality in the early 14th century AD. After being conquered in turn by the crusaders sponsored by Pope Clement and the Central Asian conqueror Timur (Tamerlane), it was annexed to the Ottoman Empire *c.* 1425. Although severely damaged by earthquakes in 1688 and 1778, it remained a prosperous Ottoman port with a large European population. In May 1919, İzmir was occupied by Greek forces. Heavily damaged in the fighting, it was recaptured by Turkish forces in September 1922.

Since World War II, İzmir has grown rapidly, partly owing to its location, for which it was selected as the site of the headquarters of the North Atlantic Treaty Organization southern command. It also has a teacher-training school and the Aegean University, founded in 1955. Second only to the Istanbul region in industry, it produces foods, cement, and cotton and woolen textiles and has petrochemical and engineering works. A large international trade fair is held annually. Exports include agricultural products from its hinterland—chiefly tobacco, figs, cotton, and vegetables—as well as manufactures, carpets, and silk.

The city's landmarks include the partly excavated remains of its agora and the ancient aqueducts of Kızılçullu. The archaeological museum has a fine collection of local antiquities. Situated near such famous ancient sites as Ephesus and Pergamum and numerous holiday resorts, İzmir has a growing tourist trade. İzmir is situated in one of Turkey's most densely populated areas. The coastal region includes the irrigated and fertile valleys and delta plains of the Küçük (small) Menderes and Gediz rivers. Pop. (1997) 2,081,556.

İzmit, city, northwestern Turkey. It lies near the head of İzmit Gulf of the Sea of Marmara. The city spreads across several hills and over a narrow plain that contains its commercial and industrial sections. Originally a Megarian city founded in the 8th century BC and called Astacus (or Olbia), it achieved its greatest fame as Nicomedia, built *c.* 264 BC by Nicomedes I of Bithynia to replace the destroyed old city. It served as the capital of the kingdom of Bithynia and later, under the Romans, was often the residence of emperors. It became the eastern capital of the Roman Empire under Diocletian. After a period of decline under the Byzantines, it fell to the Ottomans in 1326. Historical monuments in the city include the remains of the ancient walls and a Byzantine fortress; a 16th-century mosque was built by the renowned Ottoman court architect Sinan.

İzmit's growth in recent years has resulted mainly from its rapid industrialization and its position on the main road and rail line between Istanbul and Ankara. It is the centre of the Turkish paper industry, meeting about half of the country's requirements. It also has a large oil refinery. Other industries include cement, phosphate, textiles, petrochemicals, and tires. The port of İzmit handles both domestic and international shipping. The city is connected by road with major towns. Pop. (1997) 198,200.

İznik, historically NICAEA, town, northwestern Turkey. It lies on the eastern shore of Lake İznik. Founded in the 4th century BC by the Macedonian king Antigonus I Monophthalmus, it was an important centre in late Roman and Byzantine times (*see* Nicaea, councils of; Nicaea, empire of). The ancient city's Roman and Byzantine ramparts, 14,520 feet (4,426 m) in circumference, remain. The town was besieged and conquered in 1331 by the Ottoman Turks, who renamed it İznik and built the Green Mosque (1378–91). İznik's prosperity, which was interrupted by the competing growth of nearby Istanbul as an Ottoman centre after 1453, revived in the 16th century with the introduction of faience pottery making. İznik subsequently became famous for its magnificent tiles, but after the workshops were transferred to Istanbul *c.* 1700, İznik began to decline. Its economy suffered a further blow with the construction of a major railway

İznik earthenware wall tiles decorated with tulips and carnations; 2nd half of the 16th century; in the Harem of the Topkapı Palace, Istanbul
Ann Hill —©Sonia Halliday Photographs

bypassing the town. Today İznik is a small market town and administrative centre for the surrounding district. Pop. (1990) 17,232.

İznik ware, in Islāmic ceramics, a school of Turkish pottery making that flowered throughout the 16th and on into the 17th century. There may have been potteries at İznik, where there were deposits of suitable clay, as early as the 12th century, but it was not until the late 15th century that pottery making came into its own in Turkey. The chief centre of production became established in the city of İznik. Early 16th-century İznik wares were influenced by the blue-and-white porcelain of Ming-dynasty China and by Persian wares. İznik ware was soft and sandy, being of grayish-white clay covered with a thin, usually white slip (a mixture of clay and water). Flat dishes were the commonest shapes, but bowls, jugs, and flower vases were also made. They were painted with stylized and symmetrical designs of flowers, leaves, and fruits, along with abstract linear motifs based on these natural forms and others

İznik earthenware jug painted in green, red, and blue on white ground under clear glaze; *c.* 1550–80; in the Victoria and Albert Museum, London
By courtesy of the Victoria and Albert Museum, London

such as fish scales. By the mid-16th century the range of colours used in the decoration had expanded from blue and white to include turquoise, several shades of green, and purple and black. Red had become a frequently used colour by the late 16th century. The quality of İznik ware declined in the 17th century, and by 1800 manufacture had ceased.

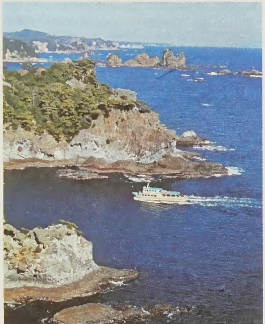
'Izrā'īl, in Islām, the angel of death who separates souls from their bodies; he is one of the four archangels (with Jibrīl, Mikāl, and Isrāfīl). 'Izrā'īl is of cosmic size: with his 4,000 wings and a body formed by as many eyes and tongues as there are living human beings, he stands with one foot in the fourth (or seventh) heaven, the other on the razor-sharp bridge that divides paradise and hell.

Before the creation of man, 'Izrā'īl proved to be the only angel brave enough to go down to Earth and face the hordes of Iblīs, the devil, in order to bring God the materials needed to make man. For this service he was made the angel of death and given a register of all mankind. While 'Izrā'īl can recognize the name of the blessed (circled in light) and the damned (circled in darkness), he does not know when anyone will die until the tree beneath God's throne drops a leaf bearing the man's name. He must then separate the body and soul after 40 days.

Man has several means for forestalling death. By reciting a dhikr (ritual prayer), he prevents the angel of death from entering the throat to take his spirit. When he is distributing *ṣadaqah* (alms), the angel cannot take him by the hand.

But when, after all protests, the angel returns with an apple from paradise inscribed with the *basmalah* (the invocation "In the name of God, the merciful, the compassionate") or writes God's name in his palm, the spirit must leave. The souls of believers are then gently drawn out and carried to the seventh heaven, but the souls of unbelievers are ripped out of their bodies and hurled down to Earth before they can reach the gates of heaven.

Iztacalco, also spelled IXTACALCO, *municipio* ("municipality"), northeastern Federal District, central Mexico. It is situated at an elevation of 7,418 feet (2,261 m) in the Valley of Mexico. Iztacalco was once simply the commercial centre of an agricultural (corn [maize], beans, oats, and alfalfa) and livestock-raising region, but, with the growth of the federal capital, it has become part of Mexico City. Among the industries in the area are canneries, chemical plants, and factories producing cardboard, mattresses, furniture, and hats. It is also known for its market. Iztacalco is easily accessible by highway, railroad, and air. Pop. (1990 prelim.) 448,357.



Iztaccíhuatl, also spelled IXTACCIHUATL, dormant volcano situated on the México-Puebla state line in central Mexico. It lies 10 miles (16 km) north of its twin, Popocatépetl, and 40 miles (65 km) south-southeast of Mexico City. Iztaccíhuatl (from the Nahuatl for "white woman") has three summits, the highest one reaching 17,159 feet (5,230 m), but no crater. As seen from the federal capital, the snow-covered peaks resemble the head, breast, and feet of a recumbent woman—hence the popular designation of sleeping woman. Iztaccíhuatl last erupted in 1868.

Iztapalapa, also spelled IXTAPALAPA, *municipio* ("municipality"), northeastern Federal District, central Mexico. It is situated at 7,480 feet (2,280 m) above sea level in the Valley of Mexico. It was formerly a city built on the site of an important pre-Columbian town. Overlooking the area is Mount Estrella, where Aztecs kindled a sacred fire to initiate each cycle of their calendar round of 52 years.

Now an agricultural district of Mexico City, Iztapalapa produces corn (maize), alfalfa, wheat, beans, and vegetables. Industry is also becoming important. The district's proximity to Mexico City, to the northwest, makes it easily accessible by highway, railroad, or air. Pop. (1990 prelim.) 1,490,981.

Izu Islands, Japanese IZU-SHICHITŌ ("Seven Islands of Izu"), archipelago off Honshu, Japan, stretching southward into the Pacific Ocean for about 190 miles (300 km) from Tokyo Bay. Administratively part of Tokyo *to* (metropolis), the volcanic islands are (north to south) Ō, To, Nii, Shikine, Kōzu, Miyake, and Mikura. The islands form the northernmost part of the Izu Archipelago, which also includes Hachijō, Aoga, and Tori islands. Ō Island, the largest of the Seven Islands group, is 35 square miles (91 square km) in area. It was known to Western cartographers as Vries Island, after the Dutch navigator Martin Hertzoon de Vries, who reached it in 1643. The islands were used by the Japanese as convict settlements after the 12th century. They are now known for their production of camellia oil, their scenic beauty, and Mount Mihara volcano (2,487 feet [758 m]), on Ō Island, which is periodically active (a sizable eruption occurred in 1986). The Izu Islands are part of Fuji-Hakone-Izu National Park.

Izu Peninsula, Japanese IZU-HANTŌ, peninsula in Shizuoka *ken* (prefecture), Honshu,

Cape Irō on Izu Peninsula, Japan
Satoshi Chikashi—Orion Press from FPG

Japan. The peninsula extends 37 miles (60 km) into the Pacific Ocean between Suruga Bay on the west and Sagami Gulf on the east. The entire peninsula is included within the Fuji Volcanic Zone. Its southern part consists primarily of volcanic breccia, and its northern section is an assembly of numerous volcanoes, among which are Mount Amagi (4,613 feet [1,406 m]) and Mount Atami (2,539 feet [774 m]) in the east and Mount Daruma (3,222 feet [982 m]) in the west. The peninsula's volcanoes are highly eroded and deformed by tectonic movements; the eastern half of Mount Atami and the northern and western portions of Mount Daruma have been downfaulted into the sea. The valley of the Kano River in the north is regarded as a graben (a depressed part of the Earth's crust that is bounded by faults).

The Izu Peninsula abounds in hot springs of both volcanic and tectonic origin and is part of Fuji-Hakone-Izu National Park. Combined with the warm winter climate, they attract numerous tourists. Chief among the peninsula's spas are Atami, Itō, and Shuzenji. The port of Shimoda, northeast of Cape Irō, received the ships of Commodore Matthew C. Perry of the United States in 1854. It was subsequently the site of the first chancellery of the U.S. consulate general in Japan.

Izúcar de Matamoros (Mexico): *see* Matamoros.

Izumi Kyōka, pseudonym of IZUMI KYŌTARŌ (b. Nov. 4, 1873, Kanazawa, Japan—d. Sept. 7, 1939, Tokyo), prolific Japanese short-story writer who created his own romantic, often mystical world and peopled it with characters representing his ideal moral values.

Kyōka was born into a family of provincial artists and artisans, from whom he inherited artistic skill and a deep faith that shaded into an actual belief in mysterious forces. He went to Tokyo in 1890, hoping to be accepted as a disciple of the then leader of the literary scene, Ozaki Kōyō. A year later he was taken in, and he lived with Kōyō's other pupils until 1894. *Yakō junsa* (1895; "Police Night Patrol") and *Gekashitsu* (1895; "Surgical Room") present Kyōka's ideal values in the classic struggle between duty and human emotions. *Kōya hijiri* (1900; "The Itinerant Monk") is representative of his fascination with strange and mysterious situations. In 1899 Kyōka met a geisha, whom he later married; his stories such as *Onna keizu* (1907; "The Genealogy of Women"), *Uta andon* (1910; "The Song Lantern"), *Shirasagi* (1909; "Snowy Heron"), and *Sannin Mekura Hanashi* (1912; *A Tale of Three Who Were Blind*) are idealized images of the geisha world. At one time a very popular author, Kyōka remained aloof from contemporary changes in literary taste, choosing to go into eclipse with a small group of devoted followers rather than compromise his highly individualistic art.

Articles are alphabetized word by word, not letter by letter

Izumi-Ōtsu, city, Ōsaka *fu* (urban prefecture), Honshu, Japan. It is situated facing Ōsaka Bay. An important port since the 8th century, it became a centre of cotton textile production during the Tokugawa period (1603–1867). Izumi-Ōtsu lost much of its function as a port town after the Meiji Restoration (1868). Its industry has since shifted to the production of woolen and cotton blankets. The city now produces most of Japan's cotton blankets, for both domestic use and export. Pop. (1990) 67,037.

Izumi-Sano, city, Ōsaka *fu* (urban prefecture), Honshu, Japan. The city faces Ōsaka Bay. An important transportation centre during the Heian period (794–1185), the city became a market for cotton, agricultural produce, and fish. Industry has been expanding on reclaimed coastal land, manufacturing textiles (especially towels) and machinery. Izumi-Sano

The smoking volcano of Mount Mihara on Ō Island, one of the Izu Islands, Japan
Orion Press, Japan

is also a trade centre for onions destined for Ōsaka and Kōbe. Pop. (1990) 88,862.

Izumo, city, Shimane *ken* (prefecture), Honshu, Japan. First formed as a market town, it has been a commercial centre for the surrounding agricultural and stock-raising area since the 18th century. The city has also served as a hub of railway and road transport since the arrival of a railway in 1910. Small-scale traditional industries include silk manufacture, woodworking, brewing, and food processing.

Entrance to the Shintō Grand Shrine of Izumo, near Izumo, Japan
Kōzō Ōsa—Eon

Izumo is well known as a Shintō religious centre. At Taisha, 5 miles (8 km) to the northwest, is the Grand Shrine of Izumo (Izumo-taisha), the oldest Shintō shrine in Japan, attracting pilgrims throughout the year. Its present buildings, constructed largely in the late 19th century, cover an area of 40 acres (16 hectares) and are approached through an avenue of pine trees. The temple complex, which contains a valuable art collection, is enclosed by hills on three sides.

There are numerous other shrines and tombs in the Izumo area. It is believed that every October all the Shintō gods meet at one of the smaller shrines. Because of this tradition, October is known as Kannazuki ("Month Without Gods") everywhere else in Japan and Kamiarizuki ("Month with Gods") in the Izumo area. Pop. (1990) 82,680.

Izumo no Okuni (Japanese dancer): *see* Okuni.

Izvestiya, also spelled IZVESTIA, formerly in full IZVESTIYA SOVETOV DEPUTATOV TRUDYASHCHIKHSYA SSSR (Russian: "News of the Councils of Working People's Deputies of the U.S.S.R."), Russian daily newspaper published in Moscow. The paper was published by the Presidium of the Supreme Soviet of the U.S.S.R. and was the official national publication of the Soviet government until 1991.

It was founded in March 1917 in Petrograd (now St. Petersburg) as an organ of the Petrograd Soviet of Workers' and Soldiers' Deputies. After the October Revolution that year, control of *Izvestiya* passed from the Mensheviks and Socialist Revolutionaries into the hands of the Bolsheviks, and the paper's main offices were moved to Moscow. *Izvestiya* grew rapidly to a circulation of 354,000 in 1924 and 1,500,000 by 1932. Restrictions during World War II and under Joseph Stalin slowed its growth, but under the editorship of Nikita Khrushchev's son-in-law, Alexei Adzhubei, *Izvestiya* was transformed into a lively, readable daily by introducing more photographs, bigger headlines, shorter and more interesting articles, and a generally high standard of design.

Izvestiya remained an instrument of the state for informing and educating the people in the light of Soviet government policies, and its extensive coverage of international relations made it the principal voice for Soviet foreign policy. Following the breakup of the Soviet Union in 1991, *Izvestiya* became an independent publication owned by its employees. Its liberal editorial policy often placed it at odds with both unreconstructed communists and Russian nationalists.

Izvolsky, Aleksandr, Count (Graf), in full COUNT ALEKSANDR PETROVICH IZVOLSKY (b. March 6 [March 18, New Style], 1856, Moscow, Russia—d. Aug. 16, 1919, Paris, France), diplomat who was responsible for a major Russian diplomatic defeat in the Balkans (1908–09) that increased tensions between Russia and Austria-Hungary prior to World War I.

Educated at the Imperial Lyceum in St. Petersburg, Izvolsky held numerous diplomatic posts throughout the world before becoming Russia's minister of foreign affairs in May 1906. In 1907 he resolved the Anglo-Russian rivalries in Iran, Tibet, and Afghanistan by concluding a treaty with Great Britain; he then directed his attention toward restoring the right of Russian warships to use the Dardanelles strait. In attempting to achieve this goal, he reached an agreement with Austria at Buchlau, Moravia (Sept. 15, 1908). But the terms of the agreement were confused, and although Russia reluctantly supported Austria's annexation of Bosnia and Hercegovina (Oct. 7, 1908), which not only precipitated a crisis in the Balkans but also generally improved the position of Austria there at Russia's expense, Austria declined to use its influence to bring about the opening of the strait. Izvolsky then attempted to balance Austrian influence in the Balkans by concluding an agreement with Italy (Racconigi Agreement; Oct. 24, 1909), in which the two promised to cooperate in preventing a single power from dominating the Balkans. Nevertheless, Izvolsky was dismissed in September 1910. He then served as ambassador to France until May 1917.

Izyum, also spelled IZIUM, city, Kharkiv *oblast* (province), eastern Ukraine. Izyum is located 75 miles (120 km) southeast of Kharkiv on the Donets River. The earliest historical mention of it dates as early as 1571; it has been a city since 1639. Izyum is linked with Kharkiv and Luhansk by rail and has a railroad repair shop. Other industries include a brickworks, a brewery, and optical equipment manufacture. Pop. (1991 est.) 64,800.

J. Paul Getty Trust (Los Angeles, Calif., U.S.): *see* Getty Trust.

J. Walter Thompson Co., American advertising agency that was long one of the largest such enterprises in the world. In 1980 it became a subsidiary of JWT Group Inc., a Delaware-based holding company.

The company grew out of one of the first advertising agencies, Carlton & Smith, established in 1864. Four years later William J. Carlton hired James Walter Thompson, age 20, as a bookkeeper. Thompson later became a solicitor of advertising and purchased the company from his employer in 1878. He renamed the agency after himself, and it was incorporated as J. Walter Thompson Co. in 1896. The agency soon became the exclusive buyer of advertising space in many American magazines and periodicals. This pioneering emphasis on magazine advertising proved highly profitable, and the company created the first "account executives" to supervise the advertising campaigns of specific customers. Under the leadership of Stanley Resor, who purchased the agency in 1916, J. Walter Thompson Co. pioneered a number of other advertising innovations, including the use of testimonials and fine photography in advertisements. The JWT Group was acquired by the WPP Group, a British marketing firm, in 1987.

Jabal Shammar, mountainous area, northwestern Saudi Arabia, bounded by the regions of Hejaz on the west and Ash-Sharqiyah on the east. The principal features of the region are the two great mountain ranges of Ajā' (granites) and Salmā (basalts) and the immense rolling sand dunes of An-Nafūd. The oasis town of Ḥā'il is situated on the southern flank of the Ajā', while an older capital, Fayd, lies in the midst of Salmā. Both towns were important stations on the pilgrim route to Medina from Iraq and Iran (Persia). But in modern times this traffic (by motor vehicle) is negligible, because the pilgrims prefer the

Characteristic desert pavement and topography in Jabal Shammar, Saudi Arabia
Walter Weiss—Ostman Agency

amenities of Riyadh, which is accessible by air and by rail.

The Jabal Shammar area has long been inhabited by the Shammar clan. An independent principality of the Ibn Rashīd dynasty from 1834 to 1921, Jabal Shammar was involved in constant strife among the eastern Sa'ūd dynasty, the Rashīd rulers, and the sharīfs ("nobles") of Mecca until the Kingdom of Saudi Arabia was formed in 1932.

Jabalpur, also spelled JUBBULPORE, city, central Madhya Pradesh state, central India. Jabalpur lies just north of the Narmada River in a rocky basin surrounded by low hills that are dotted with lakes and temples. On one of the hills stands the Madan Mahal, an old Gond castle. Garha, just west, was the chief city of the four independent Gond kingdoms that arose in the 14th century. Jabalpur was selected as Marāṭhā headquarters in 1781, and it later became the British commission headquarters of Saugor and Narmada territories. It was constituted a municipality in 1864.

One of the largest cities in the state, Jabalpur is located at a major road and rail junction. The city is a military headquarters, containing the central gun-carriage factory, an ordnance factory, and an ammunition depot. Its major industries include food processing, sawmilling, and varied manufactures. The city has the state high court and is the seat of the Jawaharlal Nehru Agricultural University (1964).

The surrounding region includes the Haveli, an extremely fertile wheat-growing area at the western end of the Narmada River valley. Rice, jowar (sorghum), gram, and oilseeds are other important crops. Iron-ore, limestone, bauxite, clay, fireclay, steatite, feldspar, manganese, and ocher deposits are extensively worked. The region also abounds in Buddhist, Hindu, and Jaina ruins. The Narmada River runs 11 miles (18 km) south-southwest of town. After forming the Dhuandhar waterfall, the river passes through the famous Marble Rocks, which are an attraction to tourists. Pop. (2001 prelim.) 951,469.

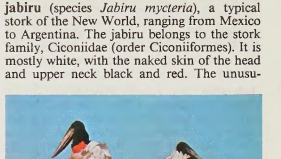
Jabavu, Davidson Don Tengo (b. Oct. 20, 1885, King William's Town, Cape Colony [now in Cape Province, S.Af.]—d. Aug. 3, 1959, East London, S.Af.), black educator and South African political leader.

The son of John Tengo Jabavu, editor of the first Bantu-language newspaper in South Africa, Davidson Jabavu was educated in South Africa, in Wales, and at the universities of London and Birmingham. In 1916 he began teaching at Fort Hare Native College (later University College) in Fort Hare, Cape Province. In December 1935 he founded the All-African National Convention (AANC), which led the opposition to a series of bills whose purpose was to disfranchise black Africans, prevent them from owning land, and keep them from selling their labour freely. The convention brought together the entire spectrum of opposition to the white government and was instrumental in creating and organizing black African awareness of growing white militancy.

Jabavu became the leader of the Cape Native Voters' Association at the first non-European conference held in South Africa. During the years 1945–47, the AANC became more militant, but by 1948 its membership had declined, and it disbanded. Jabavu retired from politics to devote his time to his post as professor of Latin and Bantu languages at University College, Fort Hare.

Jabavu was the author of *The Black Problem* (1920), *The Segregation Fallacy and Other Papers* (1928), *The Influence of English on Bantu Literature* (1943), and many volumes of poetry in the Xhosa language.

Jabbar, Kareem Abdul: *see* Abdul-Jabbar, Kareem.



Jābir ibn Ḥayyān, Abū Mūsā (b. *c.* 721, Ṭūs, Iran—d. *c.* 815, Kūfah, Iraq), alchemist known as the "father of Arab chemistry."

Shortly after Jābir was born, his father was beheaded for the part he played in a plot by the 'Abbāsids to depose the Umayyad dynasty. Jābir was sent to Arabia, where he became a member of the Shī'ite sect. Apparently, he studied most branches of learning, including medicine. After the 'Abbāsids defeated the Umayyads, Jābir became a court physician to the 'Abbāsid caliph Hārūn ar-Rashīd. Jābir was a close friend of the sixth Shī'ite imam, Ja'far ibn Muḥammad, whom he gave credit for many of his scientific ideas.

More than 2,000 works are attributed to Jābir. The Muslim Ismā'īlīyah sect published a large body of alchemical and mystical works under his name. In the 14th century a Spanish alchemist placed the name Geber (the Latinized form of Jābir) on his own manuscripts, possibly to attribute them to Jābir and thus gain greater authority.

From Jābir's own works, there is no evidence of any achievements that might justify the extraordinary esteem in which he was held by later alchemists. His reputation appears to rest mainly on the appeal of his metaphysical philosophy of nature and perhaps his unique style, emphasis, and development of the theory of matter. Jābir revised the ancient Greek belief that everything is composed of fire, earth, water, and air. He believed that these four elements combined to form mercury and sulfur and that all metals are formed from these two substances when combined in various proportions. Jābir was aware that when mercury and sulfur are combined, the red compound cinnabar (mercuric sulfide) is produced; but he felt that, if the ideal proportion could be found, gold would be the product. This theory was widely adopted; altered and spread, it had a great influence on early chemistry and eventually led to the belief in phlogiston.

jabiru (species *Jabiru mycteria*), a typical stork of the New World, ranging from Mexico to Argentina. The jabiru belongs to the stork family, Ciconiidae (order Ciconiiformes). It is mostly white, with the naked skin of the head and upper neck black and red. The unusually heavy bill is slightly upturned. The jabiru is one of the largest American flying birds, reaching a length of 140 cm (4.5 feet).

Jabiru (*Jabiru mycteria*)
M.P. Kahl

Another stork, *Xenorhyncus asiaticus,* which ranges from India through the islands to Australia, is also called jabiru.

Jablonec nad Nisou, German GABLONZ AN DER NEISSE, city, Severočeský *kraj* (region), Czech Republic. It lies about 1,600 feet (500 m) above sea level in the upper valley of the Nis (Neisse) River, in the Giant Mountains (Krkonoše). It was populated mainly by Germans between World Wars I and II, when it was known as Gablonz an der Neisse. The cradle of the famed Bohemian glass industry, it makes all types of glass products from high-quality wares to inexpensive imitation jewelry and ornaments. Glass manufacture is traditionally carried on in small units from cottage forges. Examples of glasswork are exhibited in the city's Museum of Glass and Jewelry. Pop. (2001 prelim.) 45,653.

Jablonski, Daniel Ernst, original name (until 1685) DANIEL ERNST FIGULUS (b. Nov. 20, 1660, Nassenhuben, near Danzig [now Gdańsk], Pol.—d. May 25, 1741, Berlin, Prussia [Germany]), Protestant theologian who worked for a unification of Lutherans and Calvinists.

Jablonski studied at Frankfurt an der Oder and at Oxford University and began preaching at Magdeburg in 1683. From 1686 to 1691 he headed the Moravian College at Lissa, becoming court preacher at Königsberg (1691) and

Berlin (1693). In 1699 he was consecrated a bishop of the Moravian church.

While in Berlin, Jablonski unsuccessfully worked for the union of German, English, and Swiss Lutherans and Calvinists, winning the support of court circles and of the philosopher Gottfried Wilhelm von Leibniz. He also attempted to reform the church of Prussia by introducing the episcopate and liturgy of the Church of England but again was unsuccessful. He cofounded the Berlin Academy of Sciences, which he headed in 1733. Correspondence between Jablonski and Leibniz was published in 1747 and 1799.

Jabneh (Hebrew: "God Builds"), Greek JAMNIA, modern YIBNA, also called YAVNE, ancient city of Palestine (now Israel) lying about 15 miles (24 km) south of Tel Aviv–Yafo and 4 miles (6 km) from the Mediterranean Sea. Settled by Philistines, Jabneh came into Jewish hands in the time of Uzziah in the 8th century BC. Judas Maccabeus (d. 161 BC) attacked the harbour of Jabneh in his anger at the inhabitants' hostility. On the destruction of the Temple of Jerusalem by the Romans in AD 70, the academy of Jabneh—established by Johanan ben Zakkai—became one of the most important centres of Jewish learning. At a meeting of rabbis held there about AD 100, the final canon of the Hebrew Bible was fixed. The crusaders built a fortress there in the 12th century.

Jaboatão, city, eastern Pernambuco *estado* ("state"), northeastern Brazil, on the Jaboatão River, 148 feet (45 m) above sea level and just west of Recife, the state capital. The site of two battles in the 17th-century war of the Portuguese against the Dutch, Jaboatão was elevated to city status in 1884. It is now the commercial centre of an agricultural region in which cotton, sugarcane, tobacco, and rice are cultivated. Pop. (2000 prelim.) city, 567,319.

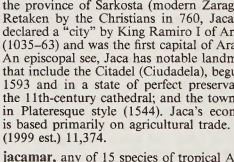
jaboticaba, also called JABOTICABEIRA, any of several trees of the genus *Myrciaria,* of the myrtle family (Myrtaceae), notably *M. cauliflora* and *M. jaboticaba,* native to southeastern Brazil. The trees have been introduced to other warm regions, including western and southern North America. The name is also applied to the edible fruit of these trees. The trees do not differ greatly among the species; they are dome-shaped and grow to about 11 to 12 m (35 to 40 feet) tall. The leaves vary from 2 to 8 cm (0.75 to 3 inches) long. They are opposite and are oval or lance-shaped, and they have smooth margins and smooth surfaces. The small flowers, which grow singly or in clusters, bear four white petals. The glossy, maroon-purplish fruit is round or slightly flattened at the ends and contains one to four seeds. The pulp, which is juicy and tasty, is translucent white or tinged with rose.

Jabotinsky, Vladimir (b. 1880, Odessa, Russian Empire [now in Ukraine]—d. Aug. 3, 1940, near Hunter, N.Y., U.S.), Zionist leader, journalist, orator, and man of letters who founded the militant Zionist Revisionist movement that played an important role in the establishment of the State of Israel.

Jabotinsky began his career in 1898 as a foreign correspondent, but his popularity as a journalist led to his recall to Odessa in 1901 as an editorial writer. By 1903 Jabotinsky began to expound Zionist views for the restoration and creation of a Jewish national state in Palestine both in his writings and in his oratory, of which he was a master. During the next decade, he continued to work as a journalist while traveling in Europe and crystallizing his Zionist views, which tended to be uncompromising and political, rather than cultural.

During World War I, he was convinced that the Ottoman Empire, then the ruling power in Palestine, would fall and that in this vacuum the Jews could colonize Palestine if they had demonstrated service to the Allies. He thus convinced the British government to allow military participation by Jewish refugees from the Ottoman Empire.

In 1920 Jabotinsky organized and led a Jewish self-defense movement (Haganah) against the Arabs in Palestine. The British, who then ruled the country, sentenced him to 15 years at hard labour, but this action provoked such an outcry that he was soon reprieved. In the 1920s he was active in many international Zionist organizations, including the World Union of Zionist Revisionists in 1925.



Testifying before the British Royal Commission on Palestine, Jabotinsky gave an impassioned expression of his Revisionist views. The source of Jewish suffering was not merely anti-Semitism, he said, but the Diaspora (dispersion) itself; the Jews were a stateless people. Assigning cultural Zionism a relatively low priority, he advocated the creation of a Palestinian Jewish state on both sides of the Jordan, with continued Jewish immigration to achieve a Jewish majority there, and employment of Jewish troops for self-defense as part of the permanent garrison. In 1940, while in the United States to visit Betar, the youth organization of the Zionist Revisionist Party, Jabotinsky died of a heart attack. His followers, who had already founded the Irgun Zvai Leumi terrorist group, active in Palestine in the 1940s, later founded the Israeli Ḥerut Party.

Jabrāʾīl (Muslim archangel): *see* Jibrīl.

Jac Glan-y-Gors: *see* Jones, John.

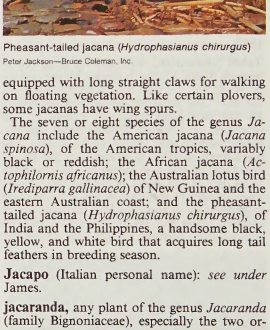
Jaca, city, Huesca *provincia,* in the *communidad autónoma* ("autonomous community") of Aragon, northeastern Spain, on the plateau on the southern bank of the Aragón River, just south of the French border. Of ancient origin, the city was captured by the Romans in 194 BC and surrounded by walls, which, with medieval additions, still partly stand. In 716 it was taken by the Moors and, under the name of Dyaka, was one of the principal cities of the province of Sarkosta (modern Zaragoza). Retaken by the Christians in 760, Jaca was declared a "city" by King Ramiro I of Aragon (1035–63) and was the first capital of Aragon. An episcopal see, Jaca has notable landmarks that include the Citadel (Ciudadela), begun in 1593 and in a state of perfect preservation; the 11th-century cathedral; and the town hall in Plateresque style (1544). Jaca's economy is based primarily on agricultural trade. Pop. (1999 est.) 11,374.

jacamar, any of 15 species of tropical American birds that constitute the family Galbulidae (order Piciformes). The jacamar has a glittering body, tapered from large head to, in most species, a long, graduated tail; some have square tails. Most are iridescently blue, green, or bronze on back and breast; males are white-throated, females brown-throated. The commonest species is the rufous-tailed jacamar (*Galbula ruficauda*), 25 cm (10 inches) long, found from southern Mexico to Argentina.

Rufous-tailed jacamar (*Galbula ruficauda*)
Painting by H. Jon Janosik

Jacamars sit, with the long, sharp bill tilted up, in trees along forest streams, then dash on whirring wings after a butterfly or dragonfly, which they catch with an audible snap of the bill and pound on the perch before eating. The egg chamber is dug into a bank or level ground.

jacana, also called LILY-TROTTER, or LOTUS BIRD, any of several species of water birds belonging to the family Jacanidae of the order Charadriiformes. Jacanas are uniquely



Pheasant-tailed jacana (*Hydrophasianus chirurgus*)
Peter Jackson—Bruce Coleman, Inc.

equipped with long straight claws for walking on floating vegetation. Like certain plovers, some jacanas have wing spurs.

The seven or eight species of the genus *Jacana* include the American jacana (*Jacana spinosa*), of the American tropics, variably black or reddish; the African jacana (*Actophilornis africanus*); the Australian lotus bird (*Irediparra gallinacea*) of New Guinea and the eastern Australian coast; and the pheasant-tailed jacana (*Hydrophasianus chirurgus*), of India and the Philippines, a handsome black, yellow, and white bird that acquires long tail feathers in breeding season.

Jacapo (Italian personal name): *see under* James.

jacaranda, any plant of the genus *Jacaranda* (family Bignoniaceae), especially the two ornamental trees *J. mimosifolia* and *J. cuspidifolia.* They are widely grown in warm parts of the world and in greenhouses for their showy blue or violet flowers and attractive, oppositely paired, compound leaves. The genus includes about 50 species native to Central and South America and to the West Indies.

Jacaranda acutifolia
Walter Dawn

The name jacaranda is also applied to several tree species of the genus *Machaerium* of the pea family (Leguminosae, or Fabaceae), from which some of the commercial rosewoods are obtained. Jacaranda cabinet wood

is a rosewood from the tree species *Dalbergia nigra,* also of the pea family.

Jacareí, city, southeastern São Paulo *estado* (state), Brazil, lying along the Paraíba do Sul River. It lies 45 miles (70 km) northeast of São Paulo. The settlement was granted town status in 1653 and was made the seat of a municipality in 1849. The local economy depends upon dairying, but coffee, rice, corn (maize), fruits, and *feijão* (beans) are also cultivated in the surrounding area. Important industries include distilling, chemical manufacturing, and paper and glass production. It also has an airfield. Pop. (2003 est.) 191,500.

Jáchymov, spa town, Karlovy Vary *kraj* (region), Czech Republic. It lies at the foot of Mount Klínovec, the highest summit in the Ore Mountains (Krušné hory). A silver-mining centre for the Holy Roman Empire, the town reached its peak in the 16th century, when its mines were owned by the counts of Šlik (German: Schlik). The German monetary unit taler, or thaler, from which the English word dollar is derived, refers to the Joachimsthaler, a coin first minted in Jáchymov in 1517.

The town lost heavily in wealth and population during the Thirty Years' War (1618–48), and in the mid-19th century it was ravaged by fire. The local mining of uranium began in 1908 and reached its peak immediately after World War II, but it has since ceased. Treatments at the town's spa are based on the use of radioactive thermal baths. Pop. (2001) 2,830.

Jacinto, António, byname of ANTÓNIO JACINTO DO AMARAL MARTINS, pseudonym ORLANDO TAVORA (b. Sept. 28, 1924, São Paulo de Luanda, Portuguese West Africa [now Luanda, Angola]—d. June 23, 1991, Lisbon, Port.), white Angolan poet, short-story writer, and cabinet minister in his country's first postwar government.

The son of Portuguese settlers in Angola, Jacinto became associated with militant movements against Portuguese colonial rule and was arrested in 1961. He was sent to São Paulo Prison in Luanda and then served 14 years in the notorious prison camp at Tarrafal in the Cape Verde Islands. His first poetry anthologies were published during this time, and, after Angola gained independence (1975), he joined in the government of Agostinho Neto, leader of the Marxist-oriented Popular Movement for the Liberation of Angola.

Jacinto's poetry addresses the oppression of the Angolan peoples at the hands of the Portuguese. Many of his poems were turned into songs that became part of the folklore of newly independent Angola. Since the publication of *Caleçonzinzi Poemas* in 1961, his poetry has appeared in virtually all anthologies of Lusophone African literature. His book *Sobrevivir em Tarrafal de Santiago* (1982; "Surviving in Tarrafal de Santiago") recounts his harsh imprisonment in the Cape Verde Islands.

jack, any of numerous species of fishes belonging to the family Carangidae (order Perciformes). The name jack is also applied collectively to the family. Representatives can be found in temperate and tropical portions of the Atlantic, Pacific, and Indian oceans and occasionally in fresh or brackish water. Although body size and shape vary greatly among jacks, many of the more than 150 species are characterized by laterally compressed bodies, rows of large, spiky scales along the side near the tailfin, small scales resulting in a smooth appearance, and a deeply forked tail. Many have a bluish green, silvery, or yellowish sheen on the body. Jacks are important commercially and are favoured sports fishes.

Some of the most popular marine game fishes are the amberjacks (genus *Seriola*), which are found worldwide. The greater amberjack (*S. dumerili*) of the tropical Atlantic is one of the largest members of the jack family, often attaining lengths of 1.8 m (6 feet). The genus *Caranx* includes several species of smaller but popular game fish, such as the crevalle jack (*C. hippos*) of warm Atlantic waters and the yellow jack (*C. bartholomaei*), which frequents warm Atlantic waters and is noted for its golden-yellow sides and fins.

jack, in practical mechanics, portable hand-operated device for raising heavy weights through short distances, exerting great pressures, or holding assembled work firmly in position, as in jacking up a building to prevent settling or keeping it in position while replacing a foundation. The jack's effectiveness stems from the ratio of the load, or weight of the object raised, to the amount of force applied to the handle of the jack. Though limited in capacity by the requirements of portability and ease of manual operation, a jack may be built to lift, or exert a force of, several tons. A familiar example of this device is the automobile jack, which is used to permit the changing of a tire.

Jack THE RIPPER, pseudonymous murderer of at least five women, all prostitutes, in or near the Whitechapel district of London's East End, from Aug. 7 to Nov. 10, 1888. It is one of the most famous unsolved mysteries of English crime.

All but one of Jack the Ripper's victims were killed while soliciting customers on the street. In each instance the victim's throat was cut, and the body was usually mutilated in a manner indicating that the murderer had at least some knowledge of human anatomy. On one occasion half of a human kidney, which may have been extracted from a murder victim, was mailed to the police. The authorities also received taunting notes from a person calling himself Jack the Ripper and purporting to be the murderer. Strenuous and sometimes curious efforts were made to identify and trap the killer, all to no avail. Public uproar over the failure to arrest the murderer led to the resignation of London's police commissioner.

The case has provided themes for numerous literary and dramatic works. Perhaps the most notable was the horror novel *The Lodger* (1913; motion-picture versions, 1926, 1932, and 1944), by Marie Adelaide Lowndes. More than 100 books about the case have been published, many of which offer conjectures as to the true identity of the murderer and the circumstances surrounding the crimes—including that the murders were part of an occult or Masonic plot and that the police were covering up for highly placed culprits, perhaps even members of the royal family. The most commonly cited suspects are Montague Druitt, a barrister and teacher who was said to be insane and who disappeared after the final murders; Michael Ostrog, a Russian criminal and physician who had been placed in an asylum because of his homicidal tendencies; and Aaron Kosminski, a Polish Jew and a resident of Whitechapel who was known to have a great hatred of women (particularly prostitutes). The murder sites are now the locus of a macabre tourist industry in London.

jack-in-the-pulpit, also called INDIAN TURNIP, BOG ONION, BROWN DRAGON, OF STARCHWORT (species *Arisaema triphyllum*), a North American plant of the arum family (Araceae), noted for the unusual shape of its flower. The plant is native to wet woodlands and thickets from Nova Scotia to Minnesota and southward to Florida and Texas. It is a stoutish perennial, 1 to 2.5 feet (0.3 to 0.8 m) high, and usually bears two long-stalked, three-parted leaves that overshadow the flower. The latter consists of a conspicuous green- and purple-striped structure called a spathe, which rises on a separate stalk between the leaves. The flowering spathe curves in a hood over a club-shaped structure called a spadix, near the base of which are borne the plant's minute flowers. The plant's fruit ripens in late summer into a cluster of brilliant red berries. The jack-in-the-pulpit is one of the best-known wildflowers of the eastern United States and Canada during the late spring.

Jack of Diamonds, also called KNAVE OF DIAMONDS, Russian BUBNOVY VALET, group of artists founded in Moscow in 1909, whose members were for the next few years the leading exponents of avant-garde art in Russia. The group's first exhibition, held in December 1910, included works by the French

"Red Furniture," oil painting by Robert Falk, a member of the Jack of Diamonds group; in the State Tretyakov Gallery, Moscow
Sovfoto

Cubists Albert Gleizes, Henri Le Fauconnier, and André Lhote; other paintings were exhibited by Wassily Kandinsky and Alexey von Jawlensky, both Russian artists then living in Germany. The Russian members of the group themselves—Robert Falk, Aristarkh Lentulov, Pyotr Konchalovsky, and Ilya Mashkov—displayed portraits and still lifes that were strongly influenced by the French artists Paul Cézanne and Henri Matisse. Other Russians participating in this first exhibition were Mikhail Larionov and Nathalie Goncharova, as well as Kazimir Malevich.

In succeeding Jack of Diamonds exhibitions, works by the German painters Ernst Ludwig Kirchner, Erich Heckel, and Max Pechstein were shown, as well as works by the French artist Fernand Léger. Also exhibiting with the group was Vladimir Tatlin, who later founded Russian Constructivism.

jack-o'-lantern, in American holiday custom, a hollowed-out-pumpkin lantern that is displayed on Halloween. The surface of the pumpkin is carved to resemble a face. Light

Jack-o'-lantern
Gretchen Garner

from a candle inserted inside can be seen flickering through the jack-o'-lantern's cutout eyes, nose, and usually grotesquely grinning mouth.

jack-o'-lantern, in meteorology, a mysterious light seen at night flickering over marshes; when approached, it advances, always out of reach. The phenomenon is also known as will-

o'-the-wisp and ignis fatuus (Latin: "foolish fire"). In popular legend it is considered ominous and is often purported to be the soul of one who has been rejected by hell carrying its own hell coal on its wanderings. The phenomenon is generally believed to be due to the spontaneous ignition of marsh gas, which consists mostly of methane and which is produced by the decomposition of dead plant matter.

jackal, any of several species of wolflike carnivores of the dog genus *Canis,* family Canidae, sharing with the hyena an exaggerated reputation for cowardice. Three species are usually recognized: the golden, or Asiatic, jackal (*C. aureus*), found from eastern Europe and northeast Africa to Southeast Asia, and the black-backed (*C. mesomelas*) and side-striped (*C. adustus*) jackals of southern and eastern Africa. Jackals grow to a length of about 85–95 cm (34–37 inches), including the 30–35-centimetre (12–14-inch) tail, and weigh about 7–11 kg (15–24 pounds). The golden jackal is yellowish; the black-backed jackal is rusty red with a black back; and the side-striped jackal is grayish with a white-tipped tail and an indistinct stripe on each side.

Black-backed jackal (*Canis mesomelas*)
Leonard Lee Rue III

Jackals inhabit open country. They are nocturnal animals that usually conceal themselves by day in brush or thickets and sally forth at dusk to hunt. They live alone, in pairs, or in packs and feed on whatever small animals, plant material, or carrion is available. They follow lions and other large cats in order to finish a carcass when the larger animal has eaten its fill. When hunting in packs, they are able to bring down prey as large as an antelope or sheep.

Like other members of the genus, jackals sing at evening; their cry is considered more dismaying to human ears than that of the hyena. They have an offensive odour caused by the secretion of a gland at the base of the tail. The young are born in burrows, the litters containing two to seven pups; gestation lasts 57 to 70 days. Like wolves and coyotes, jackals interbreed with domestic dogs.

The aardwolf (*q.v.*), family Hyaenidae, is sometimes called a maned, or gray, jackal. The South American fox (*q.v.*), *Dusicyon,* is sometimes referred to as a jackal.

jackdaw, also called DAW (species *Corvus monedula*), crowlike black bird with gray nape and pearly eyes of the family Corvidae (*q.v.*; order Passeriformes). Jackdaws, which are 33 cm (13 inches) long, breed in colonies in tree holes, cliffs, and tall buildings: their flocks fly in formation around the site. They lay four to six light, greenish blue eggs that are spotted and blotched. The bird's cry sounds like its name: "chak." The species ranges from the British Isles to central Asia; eastward it is replaced by the white-breasted, white-collared Daurian jackdaw (*C. dauuricus*).

Jackdaw (*Corvus monedula*)
John Markham

In the United States a species of grackle (*q.v.*) is sometimes called a jackdaw.

jackfruit (species *Artocarpus heterophyllus*), tree native to tropical Asia and widely grown throughout the wetland tropics for its large fruits and durable wood. Like its relative the breadfruit, it belongs to the mulberry family (Moraceae). The jackfruit is 15 to 20 m (50 to 70 feet) tall at maturity, has large stiff, glossy green leaves 15 to 20 cm (6 to 8 inches) long, and fruit up to 60 cm (about 2 feet) long and weighing up to 18 kg (about 40 pounds).

The greenish unripe fruit is cooked as a vegetable, and the brown ripened fruit is eaten fresh for the sweetly acid but insipid pulp surrounding the seeds. The seeds are also cooked and eaten locally.

Jackling, Daniel Cowan (b. Aug. 14, 1869, Appleton City, Mo., U.S.—d. March 13, 1956, San Francisco, Calif.), American mining engineer and metallurgist who developed methods for the profitable exploitation of low-grade porphyry copper ores and thus revolutionized copper mining.

A graduate of the Missouri School of Mines, Rolla, in 1892, Jackling taught chemistry and metallurgy there (1891–93) and then worked (1894–95) as a chemist and metallurgist in the Cripple Creek district of Colorado. While engaged in treating gold ores at Mercur, Utah, he was commissioned to make a report on a copper prospect at Bingham Canyon. His report led to the formation (1905) of the Utah Copper Company, for which he developed

Jackling
By courtesy of Kennecott Copper Corporation

methods of exploiting ores yielding only 25 pounds of copper per ton (equivalent to 12.5 kilograms per 1,000 kilograms).

Jackling was active in operating and executive positions in the Nevada Consolidated Copper Company; the Kennecott Copper Corporation, for which he directed western operations until his retirement in 1942; and the Mesabi Iron Company.

jackrabbit, common North American species of hare (*q.v.*).

jacks (game): *see* jackstones.

Jackson, city, seat (1832) of Jackson county, south-central Michigan, U.S. It lies along the Grand River, 73 miles (117 km) west of Detroit. Settled in 1829 at the meeting point of several Indian trails, it was named for President Andrew Jackson and was known successively as Jacksonburgh, Jacksonopolis, and finally Jackson in 1833. The Republican Party held its first convention on July 6, 1854, in Jackson. The city became an early leader in the production of automobiles. With the transfer of the auto industry to other cities, Jackson acquired allied industries (auto parts and tires) and other manufactures, including steel, air-conditioning equipment, and aircraft parts. Jackson Community College was established in 1928. The Michigan Space Center in the city is housed in a geodesic dome. The Illuminated Cascades (man-made waterfalls) are in the Sparks Foundation County Park. Inc. village, 1843; city, 1857. Pop. (2000) city, 36,316; Jackson MSA, 158,422.

Jackson, city, capital of Mississippi, U.S. It lies along the Pearl River, in the west-central part of the state. Jackson is also the coseat (with nearby Raymond) of Hinds county. Settled (1792) by Louis Le Fleur, a French-Canadian trader, and known as Le Fleur's Bluff,

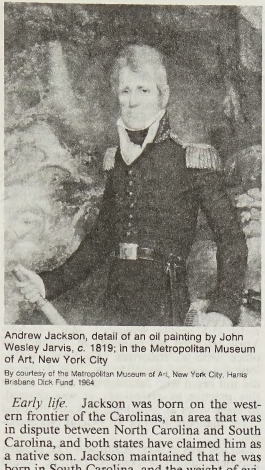
New capitol, Jackson, Miss.
Joel Brown—Shostal

it remained a trading post until the Treaty of Doak's Stand (Oct. 18, 1820) opened the territory to white settlement. Selected as the site for the state capital and named for General Andrew Jackson, it was laid out (April 1822) using Thomas Jefferson's checkerboard plan with alternate squares designated as parks. The state legislature first met there Dec. 23, 1822. The first railroad arrived in 1840.

During the Vicksburg campaigns of the American Civil War the city was occupied four times by Federal troops, and its reduction to ashes (July 7–16, 1863) by General William T. Sherman's forces caused it to be known as "Chimneyville." After the Civil War Jackson was troubled by a corrupt city government run by carpetbaggers, and its recovery was slow until the arrival of new railroads in the 1880s. The Old Capitol (1833–42; scene of the state Secession [1861] and Constitutional Convention [1890], and restored as a historical museum) was replaced by the New Capitol (1903) in gray stone. The Governor's Mansion (1842) served as headquarters for generals Ulysses S. Grant and Sherman. The discovery of nearby natural gas fields in the 1930s supplied cheaper fuel and stimulated industrial growth. Jackson progressed rapidly in the 20th century, becoming an important railroad, shipping, manufacturing, and educational centre with a well-diversified economy. The Pearl River Flood and Drainage Project (constructed in the 1960s and impounding Ross Barnett Reservoir) has provided industrial, agricultural, and recreational benefits.

The city is the home of Millsaps College (1890), Belhaven College (1883), Jackson State University (1877), University of Mississippi Medical Center (1955), and the Mississippi Universities Center (embracing programs of the three state universities). The Mississippi Arts Festival, State Fair, and State Horse Show are annual events. Inc. 1823. Pop. (2000) city, 184,256; Jackson MSA, 440,801.

Jackson city, seat (1821) of Madison county, western Tennessee, U.S. It lies 74 miles (119 km) northeast of Memphis. It was settled in the early 1820s as a port on the Forked Deer River and developed as a cotton depot and railroad junction. First called Alexandria, the community was renamed in 1822 to honour General (later President) Andrew Jackson. As a supply point it was occupied by both Confederate and Federal troops during the American Civil War. Jackson's growth was fostered by the establishment there of Union University (1825; controlled by the Southern Baptist Association), Lambuth College (1843; United Methodist), and Lane College (1882; Christian Methodist Episcopal Church). Jackson State Community College was opened in 1967. The city's economy is now well diversified, based on agriculture, industry, and its educational facilities. Products include textiles, wood and paper products, power tools, batteries, offset printing plates, and aluminum foil. Food processing and soft-drink bottling are also important.



John Luther ("Casey") Jones, the railroad engineer famed for his peculiar skill with a locomotive whistle, who was killed in a wreck (1900) on the Illinois Central's "Cannonball Express," is buried in Jackson's Calvary Cemetery; his home is now a railroad museum. In Pinson Mounds State Archaeological Park, 11 miles (18 km) south of the city, are prehistoric Indian mounds of the so-called Temple period. Shiloh National Military Park, the site of a bitter Civil War battle (April 6–7, 1862), is 42 miles (68 km) southwest of Jackson, near the Mississippi border. Inc. town, 1823; city, 1845. Pop. (2000) city, 59,643; Jackson MSA, 107,377.

Jackson, A.V. Williams, in full ABRAHAM VALENTINE WILLIAMS JACKSON (b. Feb. 9, 1862, New York, N.Y., U.S.—d. Aug. 8, 1937, New York), American scholar of the Indo-Iranian languages whose grammar of Avestan, the language of the sacred literature of Zoroastrianism, and *Avesta Reader* (1893) have served generations of students.

Jackson became an instructor at Columbia University soon after receiving his Ph.D. (1886). During a leave of absence in Europe, he continued to study Sanskrit, Prākrit, and Avestan, producing his noted work *An Avesta Grammar in Comparison with Sanskrit* (1892).

In 1895 Jackson began his 40 years as professor of Indo-Iranian languages at Columbia, where he became known as an authority on Iranian religion with the publication of *Zoroaster, the Prophet of Ancient Iran* (1899). In the course of four trips to India and Iran (1901–10), he scaled the cliff at Bīsitūn, Iran, to read and, for the first time (1903), to photograph the famed trilingual inscription of Darius I. His accounts of these travels, *Persia Past and Present* (1906) and *From Constantinople to the Home of Omar Khayyam* (1911), combine popular description and scholarly observation.

Jackson, Andrew, byname OLD HICKORY (b. March 15, 1767, Waxhaws region, S.C.—d. June 8, 1845, the Hermitage, near Nashville, Tenn., U.S.), U.S. military hero and seventh president of the United States (1829–37). He was the first U.S. president to come from the area west of the Appalachians and the first to gain office by a direct appeal to the mass of voters. His political movement has since been known as Jacksonian Democracy.

Andrew Jackson, detail of an oil painting by John Wesley Jarvis, *c.* 1819; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, Harris Brisbane Dick Fund, 1964

Early life. Jackson was born on the western frontier of the Carolinas, an area that was in dispute between North Carolina and South Carolina, and both states have claimed him as a native son. Jackson maintained that he was born in South Carolina, and the weight of evidence supports his assertion. The area offered little opportunity for formal education, and what schooling he received was interrupted by the British invasion of the western Carolinas in 1780–81. In the latter year he was captured by the British. Shortly after being imprisoned, he refused to shine the boots of a British officer and was struck across the face with a sabre. His mother and two brothers died during the closing years of the war, direct or indirect casualties of the invasion of the Carolinas. This sequence of tragic experiences fixed in Jackson's mind a lifelong hostility to Great Britain. After the end of the U.S. War of Independence, he studied law in an office in Salisbury, N.C., and was admitted to the bar of that state in 1787. In 1788 he went to the Cumberland region as prosecuting attorney of the western district of North Carolina—the region west of the Appalachians, soon to become the state of Tennessee.

When Jackson arrived in Nashville, the community was still a frontier settlement. As prosecuting attorney, Jackson was principally occupied with suits for the collection of debts. He was so successful in these litigations that he soon had a thriving private practice and had gained the friendship of landowners and creditors. For almost 30 years Jackson was allied with this group in Tennessee politics. Jackson boarded in the home of Colonel John Donelson, where he met and married the colonel's daughter, Mrs. Rachel Robards.

Tennessee politics. Jackson's interest in public affairs and in politics had always been keen. He had gone to Nashville as a political appointee, and in 1796 he became a member of the convention that drafted a constitution for the new state of Tennessee. In the same year he was elected as the first representative from Tennessee to the national House of Representatives. He refused to seek reelection and served only until March 4, 1797. Jackson returned to Tennessee, vowing never to enter public life again, but before the end of the year he was elected to the U.S. Senate. His willingness to accept the office reflects his emergence as an acknowledged leader of one of the two political factions contending for control of the state. Jackson resigned from the Senate in 1798 after an uneventful year, though. Soon after his return to Nashville he was appointed a judge of the Superior Court (in effect, the supreme court) of the state and served in that post until 1804. In 1802 Jackson had also been elected major general of the Tennessee militia, a position he still held when the War of 1812 opened the door to a command in the field and a hero's role.

Military feats. In March 1812, when it appeared that war with Great Britain was imminent, Jackson issued a call for 50,000 volunteers to be ready for an invasion of Canada. After the declaration of war, in June 1812, Jackson offered his services and those of his militia to the United States. The government was slow to accept this offer, and, when Jackson finally was given a command in the field, it was to fight against the Creek Indians, who were allied with the British and who were threatening the Southern frontier. In a campaign of about five months, in 1813–14, Jackson crushed the Creeks, the final victory coming in the Battle of Tohopeka (or Horseshoe Bend) in Alabama. The victory was so decisive that the Creeks never again menaced the frontier, and Jackson was established as the hero of the West.

In August 1814, Jackson moved his army south to Mobile. Though he was without specific instructions, his real objective was the Spanish post at Pensacola. The motive was to prepare the way for U.S. occupation of Florida, then a Spanish possession. Jackson's justification for this bold move was that Spain and Great Britain were allies in the wars in Europe. At Mobile, Jackson learned that an army of British regulars had landed at Pensacola. In the first week in November, he led his army into Florida and, on November 7, occupied that city just as the British evacuated it to go by sea to Louisiana. Jackson then marched his army overland to New Orleans, where he arrived early in December. A series of small skirmishes between detachments of the two armies culminated in the Battle of New Orleans (*q.v.*) on Jan. 8, 1815, in which Jackson's forces inflicted a decisive defeat upon the British army and forced it to withdraw. The news of this victory reached Washington at a time when morale was at a low point. A few days later, news of the signing of a peace treaty between the United States and Great Britain on Dec. 24, 1814, at Ghent reached the capital. The twin tidings brought joy and relief to the American people and made Jackson the hero not only of the West but of a substantial part of the country as well.

After the close of the war, Jackson was named commander of the southern district. He entrusted the command of the troops in the field to subordinates while he retired to his home at the Hermitage, near Nashville. He was ordered back to active service at the end of December 1817, when unrest along the border appeared to be reaching critical proportions. The instructions given Jackson were vague, and he ordered an invasion of Florida immediately after taking active command. He captured two Spanish posts and appointed one of his subordinates military governor of Florida. These bold actions brought an immediate and sharp protest from Spain and precipitated a Cabinet crisis in Washington. The staunch defense of Jackson by Secretary of State John Quincy Adams saved Jackson from censure and hastened the U.S. acquisition of Florida.

Presidential prospects. Jackson's military triumphs led to suggestions that he become a candidate for president, but he disavowed any interest, and political leaders in Washington assumed that the flurry of support for him would prove transitory. The campaign to make him president, however, was kept alive by his continued popularity and was carefully

nurtured by a small group of his friends in Nashville, who combined devotion to the General with a high degree of political astuteness. In 1822 these friends manoeuvred the Tennessee legislature into a formal nomination of their hero as a candidate for president. In the following year this same group persuaded the legislature to elect him to the U.S. Senate—a gesture designed to demonstrate the extent of his popularity in his home state.

In the election of 1824 four candidates received electoral votes. Jackson received the highest number, the others being John Quincy Adams, William H. Crawford, and Henry Clay. Since no one had a majority of the electoral votes, the House of Representatives was required to elect a president from the three with the highest number of votes. Crawford was critically ill and the actual choice was between Jackson and Adams. Clay, as speaker of the House, was in a strategic and perhaps decisive position to determine the outcome. Adams was elected on the first ballot. When he appointed Clay secretary of state, it seemed to admirers of Jackson to confirm rumours of a "corrupt bargain" between Adams and Clay. Jackson's friends persuaded him that the popular will had been thwarted by intrigues, and he thereupon determined to vindicate himself and his supporters by becoming a candidate again in 1828. He defeated Adams by an electoral vote of 178 to 83 after a campaign in which personalities and slander played a larger part than in any previous national election in the history of the United States. But Jackson's hour of triumph was soon overshadowed by personal tragedy—his wife died at the Hermitage on Dec. 22, 1828.

Jacksonian Democracy. The election of 1828 is commonly regarded as a turning point in the political history of the United States. Jackson was the first president from the area west of the Appalachians, but it was equally significant that the initiative in launching his candidacy and much of the leadership in the organization of his campaign also came from the West. The victory of Jackson indicated a westward movement of the centre of political power. He was also the first man to be elected president through a direct appeal to the mass of the voters rather than through the support of a recognized political organization. His victory was regarded by contemporaries and by historians as the triumph of political democracy.

Jackson was the beneficiary of a rising tide of democratic sentiment. The trend toward greater political democracy, aided by the admission of six new states to the union, five of which had manhood suffrage, along with the extension of the suffrage laws by many of the older states, weakened the power of the older political organizations and opened the way for the rise of new political leaders skilled in appealing to the mass of voters. Not the least remarkable triumph of the Jacksonian organization was its success in picturing its candidate as the embodiment of democracy, despite the fact that Jackson had been aligned with the conservative faction in Tennessee politics for 30 years and that in the financial crisis that swept the West after 1819 he had vigorously opposed legislation for the relief of debtors.

As the victory of Jackson reflected the emergence of new forces in U.S. politics, so Jackson himself brought to the presidency a new set of personal qualifications that were to become the standard by which presidential candidates would be judged for the remainder of the 19th century. He was the first president since Washington who had not served a long apprenticeship in public life and had no personal experience in the formulation or conduct of foreign policy. His brief periods of service in Congress provided no clue to his stand on the public issues of the day, except perhaps on the tariff.

Jackson approached the problems of the presidency as he had approached all other problems in life. He met each issue as it arose, and in the White House he exhibited the same vigour and determination in carrying out decisions that had characterized his conduct as commander of an army. He made it clear from the outset that he would be the master of his own administration, and, at times, he was so strong-willed and decisive that his enemies referred to him as "King Andrew I."

The first term. When Jackson was inaugurated on March 4, 1829, it was the first time in more than a quarter of a century that the advent of a new president reflected the repudiation of his predecessor. Hundreds who had worked for the election of Jackson hoped this would mean that incumbent officeholders would be replaced by friends of the new president, and within a few weeks the process of removing opponents of Jackson to make way for supporters had begun. Some years later, in the U.S. Senate, William L. Marcy of New York defended the principle of "rotation of office" with the aphorism, "To the victors belong the spoils." Rotation in office, however, did not begin with Jackson, nor did he utilize this practice as extensively as was charged. In eight years as president, Jackson removed fewer than one-fifth of all federal officeholders.

Jackson was in poor health when he became president, and few believed that he would have the strength or inclination to seek a second term. The question of the succession was, therefore, certain to attract early attention. One obvious candidate was Vice Pres. John C. Calhoun from Jackson's native state of South Carolina. Another was Martin Van Buren, Jackson's first secretary of state. The harmony of the new administration was marred from the outset by the rivalry between Calhoun and Van Buren. When Jackson learned, in 1830, that during the Cabinet debates in 1818 Calhoun had urged that he be censured for his invasion of Florida, he concluded that he could no longer trust Calhoun. From that time, Van Buren was generally recognized as the probable successor of Jackson as president.

The feud between Jackson and Calhoun assumed crucial importance in 1830 when Calhoun openly espoused the cause of South Carolina in its opposition to a high protective tariff. Feeling in South Carolina was so intense that there were covert threats that the state would attempt to prevent collection of the tariff within its borders. The issue of the tariff drifted unresolved, however, until 1832, when congressional leaders sought a compromise in the form of a moderate reduction of the tariff. South Carolina was not satisfied and in reply adopted a resolution declaring the tariffs of 1828 and 1832 null and void and prohibiting the enforcement of either within its boundaries after Feb. 1, 1833. Jackson accepted the challenge, denounced the theory of nullification, and asked Congress for authority to send troops into South Carolina to enforce the law. The President believed the tariff to be too high, however, and urged Congress to reduce the rates it had enacted a few months earlier. On March 1, 1833, Congress sent to the President two companion bills. One reduced tariff duties on many items. The other, commonly called the Force Bill, empowered the president to use the armed forces to enforce federal laws. South Carolina repealed its nullification ordinance, but at the same time it declared the Force Act null and void.

Whatever the motives, Jackson had preserved the integrity of the Union against the most serious threat it had yet faced. In contrast, he was remarkably complacent when Georgia defied the federal government. In 1829 Georgia extended its jurisdiction to about 9,000,000 acres of land that lay within its boundaries but was still occupied by Indians. The Indians' title to the land had been guaranteed by a treaty with the United States. The Indians appealed to the federal courts. In two separate cases, the Supreme Court ruled against Georgia, but Georgia ignored those decisions and continued to enforce its jurisdiction within the territory claimed by the Indians. In contrast to his strong reaction against South Carolina's defiance of federal authority, Jackson made no effort to restrain Georgia, and those close to him felt certain that he sympathized with the position taken by that state.

Reelection in 1832. In the meantime, Jackson acquiesced to the pressure of friends and sought a second term. As the election of 1832 approached, Jackson's opponents hoped to embarrass him by presenting him with a new dilemma. The charter of the Bank of the United States was due to expire in 1836. The President had not clearly defined his position, but he was increasingly uneasy about the bank as then organized. More significant in an election year was the fact that large blocs of voters who favoured Jackson were openly hostile to the bank. In the summer of 1832, Jackson's opponents rushed through Congress a bill to recharter the bank, thus forcing Jackson either to sign the measure and alienate many of his supporters or to veto it and appear as a foe of sound banking. Jackson's Cabinet was divided between friends and critics of the bank, but the obviously political motives of the recharter bill reconciled all of them to the necessity of a veto. The question before Jackson actually was whether the veto message should leave the door open to future compromise.

Few presidential vetoes have caused as much controversy in their own time or later as the one Jackson sent to Congress on July 10, 1832. The veto of the bill to recharter the bank was the prelude to a conflict over financial policy that continued through Jackson's second term. Efforts to persuade Congress to enact legislation limiting the circulation of bank notes failed, but there was one critical point at which Jackson was free to apply his theories. Nearly all purchasers of public lands paid with bank notes, many of which had to be discounted because of doubts as to the continuing solvency of the banks that issued them. Partly to protect federal revenues against loss and partly to advance his concept of a sound currency, Jackson issued the Specie Circular in July 1836, requiring payment in gold or silver for all public lands. This measure created a demand for specie that many of the banks could not meet; the effect of bank failures in the West spread to the East, and by the spring of 1837 the entire country was gripped by a financial panic. The panic did not come, however, until after Jackson had had the pleasure of seeing Van Buren inaugurated as president on March 4, 1837.

Jackson retired to his home, the Hermitage. He was virtually an invalid during the remaining eight years of his life, but he continued to have a lively interest in public affairs.

Jackson's influence. Jackson had left office more popular than when he entered. The widespread approval of his actions exercised a profound effect on the character of U.S. politics for half a century. The success of Jackson appeared to be a vindication of the new democracy. Powerful voices still questioned the wisdom and morality of democracy in 1829; there were few who would question it in 1837. Jackson had likewise established a pattern that future candidates for the presidency attempted to imitate. Birth in humble circumstances, experience on the frontier, evidence of being close to the mass of the people, a devotion to democracy, and, if possible, some military exploits were all valuable assets for any candidate.

The intensity of the political struggles from 1825 to 1837 led to the revival of the two-party system. Jackson never thought of him-

self as a master politician, but he and his associates proved themselves the most skillful political leaders of that generation. When Jackson was elected president in 1828, he was the candidate of a faction rather than of a party. When he retired from the presidency he left a vigorous and well-organized Democratic Party as a legacy. (H.W.Br./Ed.)

BIBLIOGRAPHY. Biographies of Jackson are Robert V. Remini, *Andrew Jackson and the Course of American Empire*, 3 vol. (1977–84), also available in a one-volume condensed and rev. ed., *The Life of Andrew Jackson* (1988); Burke Davis, *Old Hickory* (1977); James C. Curtis, *Andrew Jackson and the Search for Vindication* (1976); and Marquis James, *Andrew Jackson: The Border Captain* (1933, reprinted 1985), and *Andrew Jackson: Portrait of a President* (1937, reprinted 1983). Various aspects of Jackson's career and influence are presented in Robert V. Remini, *The Election of Andrew Jackson* (1963, reprinted 1980), and *The Legacy of Andrew Jackson: Essays on Democracy, Indian Removal, and Slavery* (1988); Richard P. McCormick, *The Second American Party System: Party Formation in the Jacksonian Era* (1966, reissued 1973); Richard B. Latner, *The Presidency of Andrew Jackson: White House Politics, 1829–1837* (1979); John M. Belohlavek, *Let the Eagle Soar!: The Foreign Policy of Andrew Jackson* (1985); and Michael Paul Rogin, *Fathers and Children: Andrew Jackson and the Subjugation of the American Indian* (1975, reissued 1991).

Jackson, Charles Thomas (b. June 21, 1805, Plymouth, Mass., U.S.—d. Aug. 28, 1880, Somerville, Mass.), American physician, chemist, and pioneer geologist and mineralogist.

Jackson received an M.D. degree from Harvard Medical School in 1829. He continued his medical studies at the University of Paris, also attending lectures on geology at the Royal School of Mines. He returned to Boston in 1832 and started a private medical practice but abandoned medicine in 1836 to establish a laboratory for the teaching of analytic chemistry. One of his students was a young dental surgeon, William Thomas Green Morton, with whom Jackson worked on chemical methods for painless dentistry.

In 1845 Morton learned from Horace Wells that ether could be applied externally as a local anesthetic, and he began to undertake his own experiments with ether. In September 1846 Morton sought Jackson's advice about ether inhalation for surgical anesthesia. Later, following Morton's successful demonstration of ether anesthesia at Massachusetts General Hospital on Oct. 16, 1846, Jackson claimed credit for the triumph and denounced Morton as a swindler and a forger; years of controversy and lawsuits resulted.

Jackson's contentiousness and propensity for controversy are illustrated in other incidents. Having met Samuel Morse in 1832, Jackson later declared that he himself had told Morse the basic principles of the telegraph, and he initiated litigation that continued for years. Jackson worked as a geologist in New England and was assigned by the U.S. Geological Survey to report on the Lake Superior region. His enduring scientific reputation rests mainly on his accomplishments as a geologist.

In 1873 Jackson was admitted to an asylum for the mentally ill, where he spent the remainder of his life.

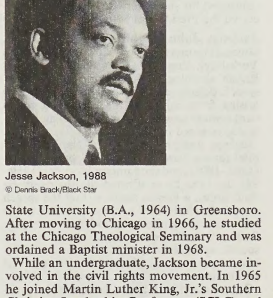
Jackson, Glenda (b. May 9, 1936, Birkenhead, Cheshire, Eng.), British stage and motion-picture actress noted for her tense portrayals of complex women.

The daughter of a bricklayer, Jackson quit school at age 16 to join an amateur theatre group and soon won a scholarship to the Royal Academy of Dramatic Art in London. After graduating she began working in repertory theatres as an actress and stage manager. She was discovered by Peter Brook for his Theatre of Cruelty revue, in which her career was established. In 1964 she had a stunning personal triumph when she portrayed Charlotte Corday in the London production of *The Persecution and Assassination of Jean-Paul Marat . . .*, better known as *Marat/Sade*. She repeated this role in the New York production of *Marat/Sade* in 1965 and in the film version (1967) of the play.

Jackson's performance in 1970 as Gudrun Brangwen in Ken Russell's film *Women in Love* gained her both international acclaim and the Academy Award (1971) for best actress. She followed this success up with leading roles in *The Music Lovers* (1971), *Sunday Bloody Sunday* (1971), and *A Touch of Class* (1973), winning another Academy Award for the latter film. Jackson's screen persona was typically that of a highly intelligent, rather ironic, aloof woman who combines strength of character with a disturbing eroticism.

Jackson portrayed Queen Elizabeth I both in the BBC television miniseries *Elizabeth R* (1971) and in the film *Mary, Queen of Scots* (1971). Her other film portrayals included the title role in *Hedda* (1975), a film adaptation of *Hedda Gabler; The Incredible Sarah* (1976); *Stevie* (1978); *The Return of the Soldier* (1982); and *Turtle Diary* (1985). Jackson won a seat in the House of Commons as a Labour Party candidate in 1992.

Jackson, Helen Hunt, in full HELEN MARIA HUNT JACKSON, *née* FISKE (b. Oct. 15, 1830, Amherst, Mass., U.S.—d. Aug. 12, 1885, San Francisco, Calif.), American poet and novelist best known for her novel *Ramona* (1884).



She was the daughter of Nathan Fiske, a professor at Amherst (Mass.) College. She lived the life of a young army wife, traveling from post to post, and after the deaths of her first husband, Captain Edward Hunt, and her two sons, in 1863 she turned to writing. She married William Jackson in 1875 and moved to Colorado. A prolific writer, she is remembered primarily for her efforts on behalf of the American Indians. *A Century of Dishonor* (1881) arraigned government Indian policy; her subsequent appointment to a federal commission investigating the plight of Indians on missions provided material for *Ramona*, which aroused public sentiment but has been admired chiefly for its romantic picture of old California.

Jackson, Howell E., in full HOWELL EDMUNDS JACKSON (b. April 8, 1832, Paris, Tenn., U.S.—d. Aug. 8, 1895, near Nashville, Tenn.), American lawyer and associate justice of the U.S. Supreme Court (1893–95).

Jackson practiced law in Jackson and Memphis, Tenn., until the outbreak of the American Civil War, during which he served the Confederacy as a receiver of sequestered property. He gained prominence in his practice and in 1880 was elected to the legislature as a Democrat. When factional disputes prevented the legislature from agreeing on any Democratic candidate for the U.S. Senate, Jackson's name was proposed by a Republican member, and he won on the first ballot. In 1886 he was appointed by President Grover Cleveland as a federal judge of the sixth circuit; and in 1891 he became the first presiding judge of the new Circuit Court of Appeals at Cincinnati, Ohio, where he served with great distinction. When a vacancy occurred on the U.S. Supreme Court in 1893, President Benjamin Harrison, certain that the incoming Democratic Senate would not confirm a Republican, named Jackson. Jackson developed tuberculosis shortly after being named and participated only slightly in the court's work.

Jackson, Jesse, original name JESSE LOUIS BURNS (b. Oct. 8, 1941, Greenville, S.C., U.S.), American civil rights leader, Baptist minister, and politician whose bids for the U.S. presidency in the 1980s were the most successful by an African American. His life has been marked by accomplishment and controversy.

Jesse, who took the last name of his stepfather at about age 15, attended the University of Illinois (1959–60) on a football scholarship before transferring to the predominantly black North Carolina Agricultural and Technical

State University (B.A., 1964) in Greensboro. After moving to Chicago in 1966, he studied at the Chicago Theological Seminary and was ordained a Baptist minister in 1968.

While an undergraduate, Jackson became involved in the civil rights movement. In 1965 he joined Martin Luther King, Jr.'s Southern Christian Leadership Conference (SCLC) and was in Memphis, Tenn., with King when the civil rights leader was assassinated on April 4, 1968. Accused of using the SCLC for personal gain, Jackson was suspended by the organization, whereupon he formally resigned in 1971.

Jackson had helped found the Chicago branch of Operation Breadbasket, the economic arm of the SCLC, in 1966, and from 1967 to 1971 he served as the organization's national director. In 1971 he founded Operation PUSH (People United to Save Humanity), a Chicago-based organization in which he advocated black self-help. In 1984 he established the National Rainbow Coalition, which sought equal rights for African Americans, women, and homosexuals; the organizations merged in 1996 to form the Rainbow/PUSH Coalition.

Jackson began traveling in the late 1970s to mediate or spotlight international problems and disputes. In 1979 he visited South Africa to speak out against apartheid and later journeyed to the Middle East, where he campaigned for a Palestinian state. While some frowned on these trips, Jackson won praise for negotiating the release of U.S. soldiers and civilians in such countries as Syria (1984), Iraq (1990), and Yugoslavia (1999).

In the 1980s Jackson became a leading national spokesman for African Americans. His voter-registration drive was a key factor in the election of Chicago's first African American mayor, Harold Washington, in 1983. The following year Jackson ran for the Democratic presidential nomination. During the campaign, he drew criticism for his relationship with Louis Farrakhan of the Nation of Islam and for making a disparaging remark about New York's Jewish community; he later apologized for his comments and distanced himself from Farrakhan. In the strongest showing ever by an African American, Jackson placed third in the primary voting. In 1988 he again sought the nomination and came in second to the party's eventual nominee, Michael Dukakis.

In 1989 Jackson took up residency in Washington, D.C., and in 1990 was elected a "statehood senator"—popularly called "shadow senator"—to lobby the U.S. Congress for statehood for the District of Columbia. In

1997 Pres. Bill Clinton named him a special envoy to Africa, where he promoted human rights and democracy.

At the start of the 21st century, Jackson was embroiled in several controversies. There were allegations of financial irregularities and questionable fund-raising tactics, and in 2001 it was revealed that he had fathered an out-of-wedlock child, which raised questions about his standing as a moral leader. However, he continued his social activism, and in 2000 received the Presidential Medal of Freedom.

Jackson, John Hughlings (b. April 4, 1835, Green Hammerton, Yorkshire [now in North Yorkshire], Eng.—d. Oct. 7, 1911, London), British neurologist whose studies of epilepsy, speech defects, and nervous-system disorders arising from injury to the brain and spinal cord remain among the most useful and highly documented in the field.

Jackson was physician to the National Hospital for the Paralyzed and Epileptic, London (1862–1906), and the London Hospital (1859–94). In 1864 he confirmed the discovery by Paul Broca, a French surgeon, that the speech centre of right-handed persons is located in the left cerebral hemisphere, and vice versa, by finding that, in most cases, he was able to associate aphasia (a speech disorder) in right-handed persons with disease of the left cerebral hemisphere.

One of the first to state that abnormal mental states may result from structural brain damage, he discovered (1863) epileptic convulsions, now known as Jacksonian epilepsy, that progress through the body in a series of spasms, and he traced them (1875) to lesions of the motor region of the cerebral cortex, or outer layer of the brain. Jackson's epilepsy studies initiated the development of modern methods of clinical localization of brain lesions and the investigation of localized brain functions. His definition (1873) of epilepsy as "a sudden, excessive, and rapid discharge" of brain cells has been confirmed by electroencephalography, a method of recording electric currents generated in the brain.

Jackson, Mahalia (b. Oct. 26, 1911, New Orleans, La., U.S.—d. Jan. 27, 1972, Evergreen Park, near Chicago, Ill.), American singer of religious songs, known as the "Queen of Gospel Song."

As a child, Jackson sang in the choir of the small New Orleans church in which her father was a Sunday preacher, and she grew up in a very strict religious environment. She learned sacred songs but also, in the homes of friends and neighbours, became acquainted with the recordings of such blues singers as Bessie Smith and Ida Cox. Their syncopation entered her religious singing. At age 16 she went to Chicago, where she worked at various odd jobs and, while singing with a touring quintet of gospel singers, saved enough money to open a beauty shop and then a flower shop and to invest in real estate.

The Bettmann Archive

Jackson's extraordinary voice first came to wide public attention in the 1930s, when she participated in a cross-country gospel tour singing such songs as "He's Got the Whole World in His Hands," "I Can Put My Trust in Jesus," and her first recording (1934), "God Gonna Separate the Wheat from the Tares." Later, Jackson's records sold in the millions, and with them came a recognition beyond the black communities. This brought about her first appearance at New York's Carnegie Hall on Oct. 4, 1950. Radio and television appearances were followed by tours at home and abroad, including an appearance at the 1958 Newport Jazz Festival, where she joined with Duke Ellington in his gospel interlude *Black, Brown, and Beige.*

Jackson was active in the black civil rights movement from 1955, when she went to Montgomery, Ala., to support Martin Luther King's bus boycott. In 1963 she sang at the Washington, D.C., rally at which King gave the eloquent oration "I have a dream."

Jackson, Peter (b. July 3, 1861, St. Croix, Virgin Islands—d. July 13, 1901, Roma, Queensland, Australia), one of the first outstanding black professional boxers. A victim of discrimination, he was denied a chance to fight for the world heavyweight championship while in his prime.

Jackson won the Australian heavyweight championship in 1886 and the British Empire title in 1892. On May 21, 1891, in San Francisco, he fought a 61-round draw with Gentleman Jim Corbett, who had not yet won his championship. On March 22, 1898, also in San Francisco, Jackson, who was 36 years old and, except for a few exhibition matches, had not fought for six years, was knocked out in three rounds by James J. Jeffries. As a consequence of this victory and his subsequent knockout of Bob Fitzsimmons (June 9, 1899), Jeffries is retrospectively considered by many to have been the first true world heavyweight champion under the Queensberry rules.

Jackson, Reggie, byname of REGINALD MARTINEZ JACKSON (b. May 18, 1946, Wynnecote, Pa., U.S.), professional American League baseball player.

Jackson became a star athlete at Cheltenham (Pa.) High School, excelling in track and football as well as baseball, in which he was a good pitcher as well as a hitter. He batted and threw left-handed. He continued his athletic career at Arizona State University (Tempe), but after two years he became a professional baseball player. He played with Kansas City Athletics farm teams (1967–68) and joined the Athletics in 1968 when the team moved to Oakland, Calif., remaining with the team through the 1975 season. He made his mark as a home-run hitter and was also an exceptional base runner and a good outfielder. He led the league in home runs (1973, 1975). Playing on the World Series-winning Athletics (1972–74), Jackson in the 1973 World Series batted .310, drove in all three runs as Oakland won the sixth game, and hit a two-run homer in the decisive seventh game.

In 1976 he was traded to the Baltimore Orioles, and in 1977 as a free agent he signed a five-year contract with the New York Yankees for nearly $3 million. He finished his career with the California Angels (1982–86). He led the league in home runs in 1980. In the final game of the 1977 World Series, he hit three consecutive home runs and drove in five runs as the Yankees won 8 to 4. In the 1978 World Series he hit .391 and two home runs. These World Series performances earned Jackson the sobriquet of "Mr. October."

Jackson was elected to the National Baseball Hall of Fame in Cooperstown, N.Y., in 1993.

Jackson, Robert H(oughwout) (b. Feb. 13, 1892, Spring Creek, Pa., U.S.—d. Oct. 9, 1954, Washington, D.C.), associate justice of the United States Supreme Court (1941–54).

An adept scholar, Jackson pleaded his first case by special permission while still a minor and was admitted to the bar at age 21. He was an active supporter of New York Governor Franklin D. Roosevelt, who appointed him to a commission to study the state's judicial system. After Roosevelt became president, Jackson was made general counsel to the Internal Revenue Bureau, where his notable accomplishment was the successful prosecution of financier Andrew Mellon for income-tax evasion. Roosevelt appointed him U.S. solicitor general in 1938 and attorney general in 1940. In all these assignments he was the chief legal exponent of New Deal legislation.

In 1941 Roosevelt named Jackson to the U.S. Supreme Court. His early opinions reflect his liberal and nationalistic views. In *Edwards* v. *California* (1941), which declared unconstitutional California's "Okie" law barring indigent migrants from entering the state, Jackson held that freedom of movement within the United States was guaranteed by citizenship. He also strongly defended the separation of church and state. His defense of 1st Amendment guarantees were, however, balanced by concern for maintaining public order and security, which led to his concurring with court findings against the Communist Party and in favour of the relocation of Japanese persons during World War II.

Jackson took a leave from the bench to serve as chief U.S. prosecutor in the Nürnberg trials of former German leaders. He was largely responsible for the legal basis of the International Military Tribunal as embodied in its charter and built for the prosecution a massive case from captured Nazi documents. In 1946 he returned to the bench.

Jackson, Shirley (Hardie) (b. Dec. 14, 1916, San Francisco, Calif., U.S.—d. Aug. 8, 1965, North Bennington, Vt.), American novelist and short-story writer best known for her unsettling story "The Lottery" (1948).

Jackson graduated from Syracuse University in 1940 and married the American literary critic Stanley Edgar Hyman. They settled in North Bennington in 1945. *Life Among the Savages* (1953) and *Raising Demons* (1957) are witty and humorous fictionalized memoirs about their life with their four children. Their light, comic tone contrasts sharply with the dark pessimism of Jackson's other works, whose general theme is the presence of evil and chaos just beneath the surface of ordinary, everyday life. "The Lottery," a chilling tale whose meaning has been much debated, provoked widespread public outrage when it was first published in *The New Yorker* in 1948. Jackson's six finished novels, especially *The Haunting of Hill House* (1959) and *We Have Always Lived in the Castle* (1962), further established her reputation as a master of gothic horror and psychological suspense.

Jackson, Shoeless Joe, byname of JOSEPH JEFFERSON JACKSON (b. July 16, 1887/88, Pickens County, S.C., U.S.—d. Dec. 5, 1951, Greenville), major league baseball player, by many accounts one of the greatest in the game, whose involvement in the 1919 Black Sox scandal led to his being banned from the game for life.

Born in extreme poverty, Jackson began work in a cotton mill when he was barely six and never went to school. He survived a sickly childhood caused by the lint-filled air in the mill, then grew tall and gangly with exceptionally long, strong arms. At 13 he was an extraordinary ballplayer, the youngest ever to play on a mill team. He acquired his nickname when nursing blistered feet from a new pair of spikes (baseball shoes). Playing without

them, he hit a base-clearing triple that provoked an opposing fan to cry out "You shoeless bastard, you!" Even his bat, Black Betsy, became part of his growing legend, a locally hewn piece of hickory 36 inches long and weighing 48 ounces (12 ounces heavier than most modern bats), stained by countless splatters of tobacco juice.

In 1908, Connie Mack, owner of the American League Philadelphia Athletics, bought his contract with the Greenville Spinners for $325, but the 19-year-old Shoeless Joe, homesick for his 15-year-old wife Katie and embarrassed by his hayseed illiteracy, got off the train at Richmond to catch the first train back to Greenville.

The following season Mack sent Jackson to Savannah, Ga., where he hit a league-leading .358. When recalled to the A's in Philadelphia, he was humiliated by the relentless hazing of veteran teammates. Mack offered to hire a tutor to teach him to read and write, but Shoeless Joe wanted none of it. In 1910, he was traded to Cleveland; in 1911 he hit an astonishing .408 in his first full season as a big league player there. He liked Cleveland, developing a taste for fine food and nice clothes. In an amusing irony, he loved expensive shoes. Fans liked his easy-going personality, his friendliness to children. Pitcher Walter Johnson called him "the greatest natural ballplayer I've ever seen." Ty Cobb, American League batting champion, acknowledged Jackson's superior abilities. Babe Ruth copied his feet-together batting stance, his power-stride into the pitch.

In 1915, Charles Comiskey, owner of the Chicago White Sox, bought Jackson for $65,000 and he became the star of the pennant-winning club. When America entered World War I in 1917 Jackson was not eligible for the draft because he was sole support of his wife and mother. When in 1918 he went to work in the shipyards for his war effort, he was labeled as a coward and a slacker.

America was different after the war, tainted by growing cynicism. In baseball, gamblers and fixers operated in big-league cities with impunity, while club owners swept all rumours of corrupted games under the rug lest the public lose faith in the national pastime.

The White Sox, though runaway pennant winners in 1919, were a team of disgruntled, underpaid players who were embittered by Comiskey's penuriousness, his failure to pay promised bonuses, and his high-handed refusal to discuss their grievances. It was also a team riddled with hostile cliques and dissention. The outcome was that eight of its ballplayers conspired with gamblers to throw the World Series to the Cincinnati Reds.

The Black Sox Scandal, as the fix came to be called, was a fiasco. The gamblers reneged on promised payments to the players, leaving the disorganized and demoralized eight caught in a morass of lies and betrayals. Jackson, who was promised $20,000 for his complicity in throwing the Series (more than three times his $6,000 annual salary), in the end received only $5,000. His role in the scandal, however, has always been uncertain at best. Although he never returned the bribe, he went on to hit an outstanding .375 for the Series while playing errorless ball in the field.

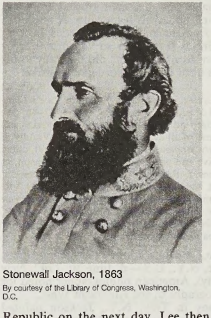
Jackson tried to meet with Comiskey after the Series but Comiskey refused to see him. Jackson had Katie write explanatory letters but received no reply. All reports concerning the fix were buried until a year later when the bubble finally burst. At the convening of the grand jury, Jackson confessed, attempting to make sense of what had made no sense to him. It was here, outside the grand jury room, that a young boy is claimed to have delivered the plaintive words that became part of American language: "Say it ain't so, Joe."

The eight ball players stood trial and were acquitted, but Judge Kenesaw Mountain Landis, newly appointed commissioner of baseball, banned them from ever playing professional baseball again.

Throughout the 1920s and '30s, Jackson played "outlaw" ball around the country under an assumed name—all efforts at reinstatement were denied. Jackson died of a heart attack shortly before he was scheduled to appear on *The Ed Sullivan Show* as part of yet another attempt at his reinstatement. At Cooperstown, N.Y., the National Baseball Hall of Fame Museum has Black Betsy, but there is, as yet, no plaque commemorating Shoeless Joe's admission to the Hall. (E.As.)

Jackson, Stonewall, byname of THOMAS JONATHAN JACKSON (b. Jan. 21, 1824, Clarksburg, Va., U.S.—d. May 10, 1863, Guiney's Station, Va.), Confederate general in the American Civil War, one of its most skillful tacticians, who gained his sobriquet "Stonewall" by his stand at the First Battle of Bull Run (called First Manassas by the South) in 1861.

Early life and career. The early death of his father, who left little support for the family, and his mother's subsequent death, caused Jackson to grow up in the homes of relatives. He had little opportunity for formal education in his early years, but he received an appointment, in 1842, to the U.S. Military Academy at West Point. After a slow start, he was graduated 17th in his class and was commissioned as a second lieutenant assigned to artillery. He joined his regiment in Mexico, where the United States was then at war. In the Mexican War he first met General Robert E. Lee, who later became the commanding general of the Confederate armies, and it was here that Jackson first exhibited the qualities for which he later became famous: resourcefulness, the ability to keep his head, and bravery in the face of enemy fire. At the end of the fighting, having been promoted to first lieutenant and to the brevet rank of major, he was assigned to the occupation forces in Mexico City.



Finding service in the peacetime army tedious, he resigned his commission and became professor of artillery tactics and natural philosophy at the Virginia Military Institute (VMI) in 1851. Though he worked hard at his new duties, he never became a popular or highly successful teacher. A stern and shy man, he earned a reputation for eccentricity that followed him to the end of his career. His strong sense of duty and moral righteousness, coupled with great devotion to the education of cadets, earned for him the derisive title "Deacon Jackson" and comparison with Oliver Cromwell.

Upon the outbreak of the Civil War he offered his services to his state of Virginia and was ordered to bring his VMI cadets from Lexington to Richmond. Soon after, he received a commission as colonel in the state forces of Virginia and was charged with organizing volunteers into an effective Confederate army brigade, a feat that rapidly gained him fame and promotion. His untimely death only two years later cut Jackson down at the height of an increasingly successful career, leaving unanswered the question of his capacity for independent command, which his rapid rise suggests he might have achieved.

Jackson's first assignment in the Confederate cause was the small command at Harpers Ferry, Va. (now West Virginia), where the Shenandoah River flows into the Potomac. His mission was to fortify the area and hold it if possible. When General Joseph E. Johnston took over the Confederate forces in the valley, with Jackson commanding one of the brigades, Jackson withdrew to a more defensible position at Winchester.

Battle of Manassas. In July 1861 the invasion of Virginia by Federal army troops began, and Jackson's brigade moved with others of Johnston's army to unite with General P.G.T. Beauregard on the field of Bull Run in time to meet the advance of General Irvin McDowell's Federal army. It was here that he stationed his brigade in a strong line, withholding the enemy against overwhelming odds and earning the sobriquet "Stonewall." The spring of 1862 found Jackson again in the Shenandoah Valley, where his diversionary tactics prevented reinforcements being sent to Federal army general George B. McClellan, who was waging the peninsular campaign against Richmond, the Confederate capital. Jackson's strategy possibly accounted for Lee's victory later in the Seven Days' Battles. Lee, then chief military adviser to Confederate president Jefferson Davis, suggested to Jackson that he use his troops to attack Federal troops in the valley and thus threaten Washington. By rapid movement, Jackson closed separately with several Federal units and defeated them. In April he struck in the mountains of western Virginia; then on May 24–25 he turned on General Nathaniel P. Banks and drove him out of Winchester and back to the Potomac.

He then quickly turned his attention to the southern end of the valley, defeating the Federals at Cross Keys, Va., on June 8, and at Port

Stonewall Jackson, 1863

Republic on the next day. Lee then brought Jackson's troops by to Richmond to envelop the right wing of McClellan's army. But Jackson arrived a day late, and his reputation lost some of its lustre, possibly because of his lack of experience in large-scale action; nevertheless, McClellan was beaten back and was ordered to evacuate the peninsula.

Lee at once joined Jackson against the Federal forces regrouping under General John Pope. He sent Jackson, by a wide encircling movement, to attack the rear of Pope's forces and bring on the Second Battle of Bull Run, in which Pope was soundly beaten. Lee next crossed the Potomac for the "liberation" of Maryland. To protect Richmond, Lee detached Jackson to capture Harpers Ferry, which he did in time (September 13–15) to rejoin Lee at Antietam. After his return to Virginia, Lee divided his army into two corps, General James Longstreet commanding the first and Jackson, now a lieutenant general, the second. At Fredericksburg, Va., in December, Jackson was in command of the Confederate right when Federal general Ambrose E. Burnside's rash attack was easily repulsed and he was crushingly defeated.

In April, General Joseph Hooker, Burnside's successor, attempted to turn the Confederate position on the Rappahannock River, south of Washington. There the seemingly invincible team of Lee and Jackson made its boldest move. Leaving a small detachment to meet Federal troops on the Rappahannock, Lee

moved his main body, including Jackson's corps, to meet Hooker's threatened envelopment in the woods of Chancellorsville. He then divided his army again, keeping only 10,000 men to demonstrate against Hooker's front, and he sent Jackson to move secretly around Hooker's right with his entire corps.

Death. The maneuver was completely successful. On the evening of May 2, Jackson rolled up the flank of the unsuspecting Federal forces. Then, in the moment of victory, tragedy struck. Jackson, who had ridden forward to organize the pursuit, was accidentally shot down by his own men when he returned at dusk and was seriously, but not mortally, wounded. Although his left arm was amputated successfully, pneumonia set in and he died a week later. Lee could not replace him; for while Jackson had lost his left arm, Lee had, indeed, lost his right arm.

That Jackson was the ablest of General Robert E. Lee's generals is rarely questioned. The qualities of the two men complemented each other, and Jackson cooperated most effectively. In him were combined a deep religious fervour and a fiercely aggressive fighting spirit. He was a stern disciplinarian, but his subordinates and his men trusted him and fought well under his leadership. A master of rapid movement and surprise tactics, he kept his intentions sometimes so veiled in secrecy that often his own officers did not fully know his plans until they were ordered to strike.

(C.W.T.)

BIBLIOGRAPHY. Douglas S. Freeman, *Lee's Lieutenants: A Study in Command,* 4 vol. (1942–46; rev. and abridged edition in 1 vol., 2001), makes exhaustive use of all available sources. F.E. Vandiver, *The Mighty Stonewall* (1957, reprinted 1989), offers an objective and penetrating analysis of Jackson, as does James I. Robertson, Jr., *Stonewall Jackson: The Man, the Soldier, the Legend* (1997). G.F.R. Henderson, *Stonewall Jackson and the American Civil War,* 2 vol. (1898; reprinted in 1 vol., 1994), was the classic life of Jackson and story of the war in Virginia until Freeman's work appeared.

Jackson, William Henry (b. April 4, 1843, Keesville, N.Y., U.S.—d. June 30, 1942, New York City), American photographer noted for his photographs of the American West.

As a boy in Troy, N.Y., Jackson painted landscapes on screens and did retouching for a photographic studio. After the Civil War he went west and some time later opened a studio in Omaha, Neb. He photographed local Indian tribes and the line of the Union Pacific Railroad. From 1870 to 1878 he was the official photographer for the U.S. Geological and Geographical Survey of the Territories. His photographs of the wonders of northwestern Wyoming, taken during the survey of 1871, were instrumental in the establishment of Yellowstone National Park in 1872. Jackson used wet-collodion negatives to photograph the Grand Tetons (now in the Grand Teton National Park) in 1872 and the cliff dwellings of Colorado (now Mesa Verde National Park) in 1874. In 1873 he experimented with panoramic views for the first time, a format that captured the grandeur of his subject matter, and two years later he used an enormous plate camera to create some of the largest photographic images ever produced. In 1879 he opened a studio in Denver, Colo.

In the late 1890s he became part-owner of a company in Detroit, Mich., that bought the rights to the new Photocrom process for printing photographs in colour. Although he retired after 1932, Jackson continued to take on occasional government commissions.

jacksonian epilepsy, also called JACKSONIAN FIT, OF PARTIAL EPILEPSY, localized seizure on one side of the body. It usually starts with twitching of the side of the face, the toes on one foot, or the fingers on one hand. The movements then spread to other muscles on the same side of the body. This type of seizure is associated with a lesion or defect in that part of the cerebral cortex that has to do with voluntary movement. *See also* epilepsy.

Jacksonville, city, Pulaski county, central Arkansas, U.S., 15 miles (24 km) northeast of Little Rock. It was settled before the American Civil War but did not develop until a local resident, Nicholas Jackson, offered land in the 1860s for a Cairo and Fulton (now Union Pacific) Railroad depot. The town, named for him in 1870, became a distribution point for farm produce. The economy diversified after World War II with the 1955 dedication of Little Rock Air Force Base. Manufactures include cookware, lasers, wood cabinets, and wallpaper. Inc. 1942. Pop. (2000) 29,916.

Jacksonville, city, seat (1822) of Duval county, northeastern Florida, U.S. It lies along the St. Johns River near its mouth on the Atlantic Ocean, about 25 miles (40 km) south of the Georgia border. Jacksonville consolidated (1968) with most of Duval county and thereby became one of the nation's largest cities in area (841 square miles [2,178 square km]). The city is the focus of one of the state's most populous urban areas.

The region was originally inhabited by Timucua peoples. Fort Caroline National Memorial marks the site of Florida's first European (French Huguenot) settlement (1564), which was destroyed by Spanish conquistador Pedro Menéndez de Avilés in 1565. The locality was originally known as Wacca Pilatka (derived from a Timucua term meaning "cows' crossing"), which was interpreted as Cowford during the English period (1763–83). The city was laid out in 1822 and named for Andrew Jackson, who was briefly governor of the territory. Industries such as lumber mills developed, but the city's growth was impeded by the Seminole Wars; it was occupied four times by Union troops during the American Civil War. During Reconstruction it developed as a winter resort and expanded its industry after improvements were made to the harbour. The waters off Jacksonville were the scene of much German U-boat activity during World War II, including the sinking of a tanker and a brief incursion of German saboteurs in 1942. The city was the nation's busiest military port during the Persian Gulf War (1990–91).

Jacksonville is an important deepwater port and the state's foremost transportation and commercial centre. It is a major point of wholesale distribution for the southeastern United States, with motor vehicles being one of the major cargoes. It has an extensive road and rail network and a busy international airport. Services, including insurance, health care, and banking, are also major economic factors, as is employment at the area's two U.S. naval base stations. Manufactures include contact lenses and paper products; shipbuilding, fishing, and tourism are also important.

Several beach communities are adjacent to Jacksonville (Mayport, Atlantic Beach, Neptune Beach, Jacksonville Beach, and Ponte Vedra Beach), and sport fishing is a popular tourist activity. Among the city's cultural institutions are the Cummer Museum of Art and Gardens, the Jacksonville Museum of Contemporary Art, Jacksonville Zoological Gardens, and the Museum of Science and History. The city has a National Football League team, the Jaguars. The Timucuan Ecological and Historic Preserve protects coastal wetlands north of the St. Johns River. Educational institutions include Edward Waters College (1866), Jacksonville University (1934), Florida Community College at Jacksonville (1966), University of North Florida (1965), and Jones College (1918). Inc. 1832. Pop. (2000) city, 735,617; Jacksonville MSA, 1,100,491.

Jacksonville, city, seat of Morgan county, west-central Illinois, U.S., about 35 miles (55 km) west of Springfield. Laid out in 1825 as the county seat and named for Andrew Jackson, it soon acquired a distinctive educational, institutional, and religious character, which it largely retains. Illinois College (1829; affiliated with the Presbyterian church and United Church of Christ) was the first in the state to graduate a college class. The Jacksonville Female Academy (1835) and the Athenaeum (1864) later became part of Illinois College. The Illinois Conference Female Academy, established in 1846 as a Methodist school, became MacMurray College for Women in 1930; the College for Men was added in 1955, and the institution is now MacMurray College. Jacksonville is also the home of the Illinois School for the Deaf (1839), the Jacksonville Developmental Center (1847), and the Illinois School for the Visually Impaired (1849). The city is a trading centre for a rich agricultural area, but food processing and bookbinding are important. Manufactures include amusement park rides, cassettes, and compact discs. Inc. 1867. Pop. (2000) 18,940.

Jacksonville, city, seat (1755) of Onslow county, southeastern North Carolina, U.S. It lies along the New River at the head of its estuary, about 50 miles (80 km) northeast of Wilmington. Originally settled as Wantland's Ferry (*c.* 1757), its name was changed to Onslow Courthouse and then Jacksonville in 1842 to honour President Andrew Jackson. It remained a small hunting and fishing resort until 1941, when the establishment of the U.S. Marine Corps New River Marine Base (now the Marine Corps Base Camp Lejeune and Air Station New River) to the southeast transformed its economy. Coastal Carolina Community College was founded in 1965. Inc. town, 1842; city, 1955. Pop. (2000) city, 66,715; Jacksonville MSA, 150,355.

jackstones, also called FIVESTONES, JACKS, or DIBS, game of great antiquity and worldwide distribution, now played with stones, bones, seeds, filled cloth bags, or metal or plastic counters (the jacks), with or without a ball. The name derives from "chackstones"—stones to be tossed. The knuckle, wrist, or ankle bones of goats, sheep, or other animals also have been used in play. Such objects have been found in prehistoric caves in Kiev, and pictures of the game are depicted on jars from ancient Greece.

In the classic game, five or more counters are thrown into the air with one hand, the object being to catch as many as possible either in the palm or on the back of that hand. In the United States and Canada, jacks is primarily a children's game, played with 6 to 12 or more six-pronged iron or plastic jacks and a small ball. After the jacks are strewn on the floor, the player tosses the ball into the air and tries with one hand to pick up the jacks and catch the ball, usually before it bounces. If the player fails in this, the turn passes to the next player. The game becomes increasingly difficult; first, one jack has to be picked up, then two at a time, next three, and, finally, all must be grasped before the ball is caught.

jackstraws, also called SPILLIKINS, or PICK-UP-STICKS, game of skill, played by both children and adults, with thin wooden or plastic sticks, or with straws or matches.

To begin the game, the jackstraws (20 to 50) are bunched in one hand and set vertically on a table or other smooth, flat surface, then released suddenly so that the straws fall in a jumble. Each player in turn attempts to remove a single jackstraw without disturbing any other. If he succeeds he may try again, but if another straw moves, he loses his turn.

The player with the most straws when the pile is totally reduced wins. Sometimes the

game is played with a retriever hook, either made as part of the set or improvised with a bent paper clip or a bent straight pin stuck in a match. Some sets have jackstraws shaped like saws, hoes, rakes, ladders, and other implements, thus making the game more difficult. The game is supposedly of great antiquity, perhaps originating with the Chinese.

Jacmel, town and port, on the southern coast of Haiti, 24 miles (39 km) southwest of Port-au-Prince across the Tiburon Peninsula. Situated on a hillside overlooking palm-fringed Jacmel Bay, the town flourished under the French as a port for transshipment of sugar, coffee, and cotton. It continues as a commercial centre for such products as bananas, cacao, and honey. After a good road was completed to Port-au-Prince about 1980, the bay became a tourist retreat with several small hotels. Pop. (1988 est.) 216,600.

Jacob, Hebrew YA'AQOV, Arabic YA'QŪB, also called ISRAEL, Hebrew YISRA'EL, Arabic ISRĀ'ĪL, Hebrew patriarch who was the grandson of Abraham, the son of Isaac and Rebekah, and the traditional ancestor of the people of Israel. Stories about Jacob in the Bible begin at Genesis 25:19.

According to the Old Testament, Jacob was the younger twin brother of Esau, who was the ancestor of Edom and the Edomites. The two are representatives of two different grades of social order, Jacob being a pastoralist and Esau a nomadic hunter. During her pregnancy, Rebekah was told by God that she would give birth to twins; each of them would found a great nation, and Esau, the elder, would serve his younger brother. As it turned out, Jacob, by means of an elaborate double deception, managed to obtain his older brother's birthright from their father. Jacob then fled his brother's wrath and went to take refuge with the Aramaean tribe of his ancestors at Haran in Mesopotamia.

Along his journey Jacob received a special revelation from God; God promised Jacob lands and numerous offspring that would prove to be the blessing of the entire Earth. Jacob named the place where he received his vision Bethel ("House of God"). Arriving at his uncle Laban's home in Haran, Jacob fell in love with his cousin Rachel. He worked for her father, Laban, for seven years to obtain Rachel's hand in marriage, but then Laban substituted his older daughter, Leah, for Rachel at the wedding ceremony. Unwittingly married to Leah, Jacob was thus compelled to serve Laban for another seven years so that he could take his beloved Rachel as his wife as well. Jacob then served Laban for another six years, during which he amassed a large amount of property; he then set out with his wives and children to return to Palestine. On the way Jacob wrestled with a mysterious stranger, a divine being, who changed Jacob's name to Israel. Jacob then met and was reconciled with Esau and settled in Canaan.

Jacob had 13 children, 10 of whom were founders of tribes of Israel. Leah bore him his only daughter, Dinah, and six sons—Reuben, Simeon, Levi (who did not found a tribe, but was the ancestor of the Levites), Judah (from whom a tribe and the Davidic monarchy were descended), Issachar, and Zebulun. Leah's maidservant, Zilpah, bore him Gad and Asher, and Rachel's maidservant, Bilhah, bore him Dan and Naphtali. Rachel's sons were Benjamin and Joseph (who did not found a tribe, but whose sons founded the tribes of Manasseh and Ephraim).

The story of Jacob's later years more properly belongs to the story of Joseph (*q.v.*). Late in his life, a famine prompted Jacob and his sons to migrate to Egypt, where he was reunited with his son Joseph, who had disappeared some years before. Israel died in Egypt at the age of 147 years and was buried in Canaan at Hebron.

The stories about Jacob's birth and his acquisition of the birthright (Genesis 25:19–34; 27) provide a thinly veiled apology for the relation between Edom (Esau) and Israel in Davidic times. Edom, the older nation, was made subject to Israel by David (2 Samuel 8:8ff.). The Jacob stories assume and emphasize that all things occur by divine design. The divine objective is of overriding significance; it is God's will that Esau (Edom) shall live in the desert and be subject to Israel.

Jacob (Congo): *see* Nkayi.

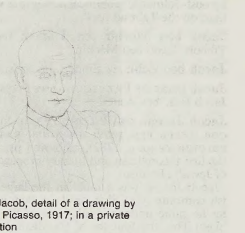
Jacob OF SERUGH, Serugh also spelled SARUG (b. 451, Curtam [now Qurṭmān], Syria—d. November 521, Baṭnan, Osroëne [now in Turkey]), Syriac writer described for his learning and holiness as "the flute of the Holy Spirit and the harp of the believing church."

Like his father, Jacob was ordained a priest, and by 503 he was episcopal visitor of Haura in Serugh. In 519 he was made bishop of Baṭnan in Serugh. By his contemporaries and by some moderns Jacob has been regarded as orthodox, but four of his letters prove his Monophysitism, the belief in the existence of one, divine nature of Christ. His prose writings include discourses, six festal homilies, and many letters. He is the reputed author of a liturgy and order of baptism. He also wrote 760 homiletic poems, mostly in dodecasyllabic metre, treating mainly of Old and New Testament incidents and persons.

Jacob, François (b. June 17, 1920, Nancy, Fr.), French biologist who, together with André Lwoff and Jacques Monod, was awarded the 1965 Nobel Prize for Physiology or Medicine for discoveries concerning regulatory activities in bacteria.

Jacob received his M.D. degree (1947) and a doctorate in science (1954) from the Faculty of Medicine and the Faculty of Science, respectively, in Paris. Most of the work of Jacob, Lwoff, and Monod was carried out at the Pasteur Institute (Paris), which Jacob had joined as a research assistant in 1950. In 1960 he became head of the department of cellular genetics at the institute, and from 1965 he was also professor of cellular genetics at the Collège de France. In 1977 he became a member of the Academy of Sciences.

With a coworker at the Pasteur Institute, Jacob discovered that the genes of a bacterium are arranged linearly in a ring and that the ring can be broken at almost any point. In 1958 Monod and Jacob began to collaborate in studies of the regulation of bacterial enzyme synthesis. One of their first major contributions was the discovery of regulator genes, so called because they control the activities of structural genes. The latter, in turn, not only transmit hereditary characteristics but also serve in the production of enzymes, other proteins, and ribonucleic acid (RNA).



Jacob and Monod also proposed the existence of an RNA messenger, a partial copy of the gene substance deoxyribonucleic acid (DNA), that carries genetic information to other parts of the cell. They also found that in a normal cell the balance between regulator and structural genes enables the cell to adapt to varying conditions. An interruption in this balance, however, can stimulate the production of new enzymes that can prove either beneficial or destructive to the cell.

Jacob, Georges (b. July 6, 1739, Cheny, Fr.—d. July 5, 1814, Paris), founder of a long line of French furniture makers. He was among the first cabinetmakers in France to use mahogany extensively and excelled at carved wood furniture, particularly chairs.

Born of a Burgundian peasant family, Jacob moved to Paris at 16 and is believed to have been apprenticed to Louis Delanois. He made chairs for Queen Marie-Antoinette and other members of the royal household but became better known after the Revolution, which nearly ruined him. With the help of the painter Jacques-Louis David, he was commissioned to make furniture for the revolutionary Committee of Public Safety. He retired in 1796, handing over the business to his two sons, Georges and François-Honoré, but seven years later, on the death of Georges, he returned to the firm, which was renamed Jacob Desmalter. Jacob's fame is mainly attached to pieces he made for the Bonapartes.

Jacob, Max (b. July 12, 1876, Quimper, Fr.—d. March 5, 1944, Drancy), French poet who played a decisive role in the new directions of modern poetry during the early part of the 20th century. His writing was the product of a complex amalgam of Jewish, Breton, Parisian, and Roman Catholic elements.

Jacob departed his native Brittany in 1894 to go to Paris, where he lived in extreme poverty but eventually became an important figure in Montmartre during the formative period of Cubism. He was a friend of the Cubist painters Pablo Picasso and Juan Gris and of the poet Guillaume Apollinaire. Jacob converted to Christianity in 1909 and became a Roman Catholic in 1915, but he nevertheless continued to oscillate between extravagant penitence and wild bohemianism until 1921, at which time he retired into semimonastic seclusion at Saint Benoît-sur-Loire. He lived there most of the time, supporting himself by

Max Jacob, detail of a drawing by Pablo Picasso, 1917; in a private collection
Giraudon—Art Resource/EB Inc.

painting, until World War II, when he was interned in the concentration camp at Drancy, near Paris, where he died.

Outstanding in his voluminous production are *Le Cornet à dés* (1917; "Dice Box"), a collection of prose poems in the Surrealist manner; *Le Laboratoire central* (1921), "stoppered phials" of lyrical poetry; and his Breton *Poèmes de Morvan le Gaélique* (1953). *La Défense de Tartufe* (1919), which with the novel *Saint Matorel* (1909) describes his religious experience; *Le Sacrifice impérial* (1929); and his *Correspondance* (1953–58) show his unrelenting self-examination, his fantasy, and his verbal clowning, which concealed the profound torment of a convert, fearful of damnation and longing for heaven. His "novels," mainly epistolary, are exercises in verbal mimicry, reproducing every nuance in the conversation of the petit-bourgeois, of whom he was a sardonic but affectionate observer. He influenced many of his contemporaries and toward the end of his life was surrounded by a devoted group of younger and older artists.

Jacob ben Asher (b. 1269?, Cologne? [Germany]—d. 1340?, Toledo, Castile [Spain]), Jewish scholar whose codification of Jewish law was considered standard until the publication in 1565 of the *Shulḥan ʿarukh* ("The Well-Laid Table") by Joseph Karo.

Little of certainty is known about Jacob's

life. In 1303 he immigrated to Spain with his brothers and father, the great codifier Asher ben Jehiel, who became chief rabbi of Toledo. Although Jacob was eminently qualified, he never became a rabbi. Instead, it is likely that he eked out an existence as a moneylender.

Jacob is best known for his code *Arba'a ṭurim* ("Four Rows"; first published in its entirety in 1475 and also known as *Ṭur*), which systematically divided all Jewish law into four "rows," or classes, a new arrangement that became classic. He is therefore called Ba'al ha-Ṭurim ("Master of the Rows"). His four divisions are: (1) *Oraḥ ḥayyim* ("Path of Life"), dealing with laws governing prayer and ritual; (2) *Yore de'a* ("Teacher of Knowledge"), setting forth the laws concerning things that are permitted or forbidden, such as dietary laws; (3) *Even ha-'ezer* ("Stone of Help"), containing the laws governing family relations, such as marriage and divorce; and (4) *Ḥoshen mishpaṭ* ("Breastplate of Judgment"), epitomizing civil and criminal law. Jacob eliminated all laws and customs that had been rendered obsolete by the destruction of the Second Temple (AD 70).

Revealing a marked indebtedness to his father's code, Jacob's austere digest became, after the Bible, the most popular work among 15th-century Jews and the usual basis for rabbinic decisions. It departed from his father's code and from that of Maimonides by basing the preponderance of its laws on decisions by post-Talmudic rabbinical authorities rather than on the Talmud itself.

Jacob Isaac OF PRZYSUCHA: *see* Przysucha, Jacob Isaac ben Asher.

Jacob Joseph OF POLONNOYE, in full JACOB JOSEPH BEN TZEVI HA-KOHEN KATZ OF POLONNOYE (d. *c.* 1782), rabbi and preacher, the first theoretician and literary propagandist of Jewish Ḥasidism.

Jacob Joseph was a rabbi in the large Jewish community at Shargorod, in Podolia; after he came under the influence of the Ba'al Shem Ṭov, the founder of Ḥasidism, he was expelled (*c.* 1748) from Shargorod. He was subsequently rabbi of Rashkov, Nemirov, and ultimately Polonnoye, where he remained until his death.

As a writer, he contributed significantly to the spread of Ḥasidism. His first and main work was the controversial *Toldot Ya'aqov Yosef* (1780; "History of Jacob Joseph"), which not only related the teachings of the Ba'al Shem Ṭov but also criticized traditional Jewish leadership and values. The work thus provoked anti-Ḥasidic sentiment and was burned by some opponents of the movement. Other works include homilies and commentary on books of the Bible, including *Ben Porat Yosef* (1781; "Joseph Is a Fruitful Vine") on Genesis; *Ẓefenat Pa'neaḥ* (1782) on Exodus; and *Ketonet Passim* ("Coat of Many Colours") on Leviticus and Numbers.

Jacoba OF BAVARIA, Dutch JACOBA VAN BEIEREN, French JACQUELINE DE BAVIÈRE (b. July 25, 1401, Le Quesnoy, Flanders [now in France]—d. Oct. 9, 1436, Teilingen, near Leiden [Netherlands]), duchess of Bavaria, countess of Holland, Zeeland, and Hainaut, whose forced cession of sovereignty in the three counties to Philip the Good, duke of Burgundy, in 1428, consolidated Burgundian dominion in the Low Countries.

Jacoba, the only daughter and heiress of William, count of Zeeland, Holland, and Hainaut, was married in 1415 to John of Touraine, who died two years later. Jacoba's claim to succeed her father, who also died in 1417, was not recognized by the German king Sigismund, who instead supported her paternal uncle John of Bavaria.

After marrying her cousin, John IV, duke of Brabant, in March 1418, Jacoba fought against John of Bavaria in Holland. Her uncle John the Fearless, duke of Burgundy, settled the dispute in 1419, but John of Bavaria gained

Jacoba, 15th-century painting by an unknown artist; in the Rijksmuseum, Amsterdam
By courtesy of the Rijksmuseum, Amsterdam

control of Holland and Zeeland the following year, when the counties were mortgaged to him by John of Brabant.

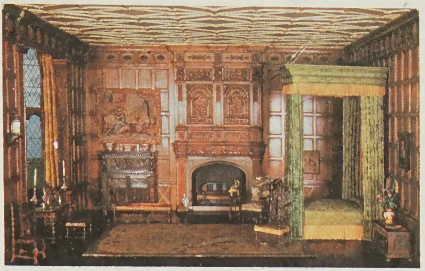
Disgusted by her husband's actions, Jacoba left for Hainaut and, after repudiating her marriage in 1421, went to England, where she was welcomed by Henry V. In 1422 she married Humphrey, Duke of Gloucester, whose intrusion into the Low Countries two years later destroyed the English-Burgundian alliance.

Jacoba returned to Hainaut in 1424 with Humphrey and an army, but Humphrey deserted to England in 1425. Jacoba was subsequently interned by her opponent, Philip III the Good, duke of Burgundy, at Ghent.

After Philip had gained possession of Holland and Zeeland (1425), Jacoba escaped and for the next three years contested Philip's power in the Netherlands. Her hopes dimmed, however, after the pope declared her marriage to Humphrey illegal (Jan. 9, 1428); she made a settlement with Philip on July 3, 1428, in the Treaty of Delft, which maintained Jacoba's title of countess but transferred administration of her three counties (Holland, Zeeland, and Hainaut) to Philip and stipulated that she was not to marry without his consent.

After Philip had mortgaged the revenues of Holland and Zeeland to three nobles of the Borselen family from Zeeland (1430), Jacoba secretly married one of them—Francis, lord of Zuilen and St. Maartensdijk—probably as part of a plot to overthrow Burgundian sovereignty in Holland. Philip then imprisoned Francis (October 1432) and forced Jacoba to abdicate her countship (1433). She later became duchess in Bavaria and countess of Ostrevant (in Bohemia) and was allowed to remarry Francis in 1434. She died childless.

Jacobābād, city, Sindh province, Pakistan. The city lies at a junction of the Pakistan Western Railway and main roads through Sindh. It was founded in 1847 on the site of the village of Khānghar by General John Jacob, the district's first deputy commissioner. Jacob, who laid out the modern city, is commemorated by monuments, and even his horse has been memorialized by a mud pyramid. The city was incorporated as a municipality in 1875. It is noted for its consistently high temperatures and holds the record for the highest temperature recorded in Pakistan, 126° F (52° C) in the shade.



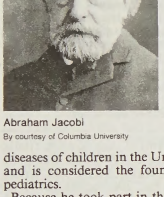
Manufactures include cotton carpets (*ghālīchah*), lacquered wooden toys and lamps, and embroidery. Grain markets and milling mark Jacobābād's position at the centre of a rice- and grain-cultivating region. The city has several public parks, Victoria clock tower (1887), a municipal broadcasting station, and government colleges affiliated with the University of Sindh (1947). Pop. (1981 prelim.) 80,000.

Jacobean age (from Latin *Jacobus*, "James"), period of visual and literary arts during the reign of James I of England (1603–25). The distinctions between the early Jacobean and the preceding Elizabethan styles are subtle ones, often merely a question of degree, for although the dynasty changed, there was no distinct stylistic transition.

In architecture the Jacobean age is characterized by a combination of motifs from the late Perpendicular Gothic period with clumsy and imperfectly understood classical details, in which the influence of Flanders was strong. The Tudor pointed arch is common, and in interior work there is considerable simple Tudor paneling and an occasional use of Perpendicular vaulting forms. Doorways, fireplaces, and the like are usually framed with classical forms, and both outside and inside there is a wide use of terms, pilasters, S-scrolls, and the type of pierced, flat ornament known as strapwork. Jacobean furniture pieces are usually of oak and are notable for their heavy forms and bulbous legs. It was during the Jacobean period, however, that the designer Inigo Jones introduced the first fully realized Renaissance classical style of architecture into England with his design of the Banqueting House, Whitehall (1619–22). Jones's style was based on the theories and works of Andrea Palladio, and Palladianism subsequently became a widely adopted architectural style in England.

During this period, painting and sculpture lagged behind architecture in accomplishments because there was no outstanding practitioner of either. The chief of the early Jacobean painters was the talented miniaturist Isaac Oliver. Most of the Jacobean portraitists, like the sculptors, were foreign-born or foreign-influenced—for example, Marcus Gheerhaerts the Younger, Paul van Somer, Cornelius Johnson, and Daniel Mytens. Their efforts were later surpassed by those of the Flemish painters Peter Paul Rubens and Anthony Van Dyck, who worked in England during the reign of Charles I.

In literature, too, many themes and patterns were carried over from the preceding Elizabethan era. Though rich, Jacobean literature is often darkly questioning. William Shakespeare's greatest tragedies were written between about 1601 and 1607. Other Jacobean dramatic writers became preoccupied with the problem of evil: the plays of John Webster, Cyril Tourneur, Thomas Middleton, and William Rowley induce all the terror of tragedy but little of its pity. Comedy was best represented by the acid satire of Ben Jonson and by the varied works of Francis Beaumont and John Fletcher. Another feature of drama at this time, however, was the development of the extravagant courtly entertainment known as the masque, which reached its literary peak in the works of Jonson and Inigo Jones. Jonson's comparatively lucid and graceful verse and the writings of his Cavalier successors constituted one of the two main streams of Jacobean poetry. The other poetic stream lay in the intellectual complexity of John Donne and the Metaphysical poets. In prose, Francis Bacon and Robert Burton were among the



Model of a Jacobean "withdrawing room" or bedroom, based upon an interior in Knole House, Kent, Eng.; in the Art Institute of Chicago

By courtesy of Thorne Rooms in Miniature, the Art Institute of Chicago

writers who displayed a new toughness and flexibility of style. The monumental prose achievement of the era was the great King James Version of the Bible, which first appeared in 1611.

Jacobi, Abraham (b. May 6, 1830, Hartum, Westphalia [Germany]—d. July 10, 1919, Bolton Landing, N.Y., U.S.), German-born physician who established the first clinic for

Abraham Jacobi

By courtesy of Columbia University

diseases of children in the United States (1860) and is considered the founder of American pediatrics.

Because he took part in the German revolutionary movement (1848), Jacobi was imprisoned in Berlin and Cologne during the year of his graduation in medicine (1851). In 1853 he began his medical practice in New York City and became professor of children's diseases at the New York Medical College in 1860, holding the first chair in the subject founded in the United States. He later held professorships at New York University (1865–70) and the College of Physicians and Surgeons of Columbia University (1870–1902).

Jacobi, Friedrich Heinrich (b. Jan. 25, 1743, Düsseldorf, duchy of Berg [Germany]—d. March 10, 1819, Munich, Bavaria), German philosopher, major exponent of the philosophy of feeling (*Gefühlsphilosophie*) and a prominent critic of rationalism, especially as espoused by Benedict de Spinoza.

Succeeding his father as head of a sugar factory in 1764, Jacobi joined the governing council of the duchies of Jülich and Berg (1772). With the German poet Christoph Wieland, he founded (1773) the periodical *Der Teutsche Mercur*, in which he published part of his philosophical novel *Eduard Allwills Briefsammlung* (1776; "Edward Allwill's Collected Letters") and part of another novel, *Woldemar: ein Seltenheit aus der Naturgeschichte* (1777; "Woldemar: A Rarity of Natural History"). In 1779 he became privy councillor at the Bavarian court and the following year met the German writer Gotthold Lessing.

After Lessing told him he knew only the philosophy of Spinoza, Jacobi began to study Spinozism. Finding its rationalistic approach repulsive, he denounced it in *Über die Lehre des Spinoza, in Briefen an den Herrn Moses Mendelssohn* (1785; "On the Teachings of Spinoza, in Letters to Moses Mendelssohn"). With other Enlightenment thinkers, Mendelssohn attacked Jacobi's notion of belief as obscurantist. Jacobi replied in *David Hume über den Glauben, oder Idealismus und Realismus* (1787; "David Hume on Belief, or Idealism and Realism"), showing his concept of belief to be no different from that held by such advanced philosophers as Hume.

To Jacobi, belief meant immediate conviction, not only of the reality of sense experience but also of truths present in the heart or in the spirit of man. Specifically disclaiming any intent to construct a philosophical system that would have necessitated the strict use of reason, Jacobi maintained that felt truths would be endangered by submitting them to mental processes.

In 1794 Jacobi moved from his home in Pempelfort to Hamburg in order to avoid the French Revolutionary armies, and in 1799 he detailed his theistic views in *Jacobi an Fichte.*

Friedrich Jacobi, engraving by N. Afinger

Three years later he strongly criticized Immanuel Kant in his *Über das Unternehmen des Kritizismus* ("On the Enterprise of Criticism"). Kant had created a dualism of sensibility and understanding that denied the possibility for the limited, sense-bound human mind to understand transcendent phenomena, but Jacobi defended an intellectual intuition that began in feeling and resulted in faith. Because he did not limit his concept of knowledge to the rational processes of the mind, he did not find it necessary to deny, as Kant did, the possibility of knowing God.

After traveling for four years, Jacobi settled in Munich (1805), where he served as president of the Bavarian Academy of Science (1807–12). A collected edition of his works, which he began, was completed by F. Koppens, 6 vol. (1812–25).

Jacobi, Karl Gustav Jacob (b. Dec. 10, 1804, Potsdam, Prussia [Germany]—d. Feb. 18, 1851, Berlin), German mathematician who, with Niels Henrik Abel of Norway, founded the theory of elliptic functions.

In 1827 Jacobi became extraordinary professor and in 1829 ordinary professor of mathematics at the University of Königsberg. He first became known through his work on number theory, which gained the admiration of Carl Gauss, the greatest mathematician of his day. Unaware of similar endeavours by Abel, Jacobi formulated a theory of elliptic functions based on four theta functions. The quotients of the theta functions yield the three Jacobian elliptic functions: sn z, cn z, and dn z. His results in elliptic functions were published in *Fundamenta Nova Theoriae Functionum Ellipticarum* (1829; "New Foundations of the Theory of Elliptic Functions"). In 1832 he demonstrated that just as elliptic functions can be obtained by inverting elliptic integrals, hyperelliptic functions can be obtained by inverting hyperelliptic integrals. This success led him to the formation of the theory of Abelian functions of p variables (where p is greater than or equal to 2).

Jacobi's *De Formatione et Proprietatibus Determinantium* (1841; "Concerning the Structure and Properties of Determinants") made pioneering contributions to the theory of determinants. He invented the functional determinant (formed from the n^2 differential coefficients of n given functions with n independent variables) that bears his name and has played an important part in many analytical investigations.

Jacobi carried out important research in partial differential equations of the first order and applied them to the differential equations of dynamics. His *Vorlesungen über Dynamik* (1866; "Lectures on Dynamics") relates his work with differential equations and dynamics. The Hamilton-Jacobi equation plays a significant role in the presentation of quantum mechanics. He also made important studies of Abelian transcendents and the applications of elliptic functions to the theory of numbers.

Jacobi, Lotte (Johanna) (b. Aug. 17, 1896, Thorn, Ger.—d. May 6, 1990, Concord, N.H., U.S.), German-American photographer noted for her portraits of famous figures.

Born into a family of photographers (her great-grandfather in 1840 began as a professional daguerreotyper), Jacobi studied art history and literature at the Academy of Posen (1912–16) and attended the Bavarian State Academy of Photography in Munich and the University of Munich (1925–27). She directed the family's photography business in Berlin (1927–35) but then fled Nazi Germany and settled in the United States, becoming a naturalized citizen in 1940. She maintained a studio in New York City from 1935 to 1955 and then settled and worked in rural Deering, N.H.

Jacobi's portraitures are noted for their natural, unpretentious, and often casual style. Her sitters have included Albert Einstein, Thomas Mann, Peter Lorre, Lotte Lenya, Marc Chagall, Pablo Casals, Alfred Stieglitz, Eleanor Roosevelt, Paul Tillich, J.D. Salinger, Marianne Moore, Robert Frost, and many others. She is also known for her abstract images (plays on light called "photogenics") and for landscapes.

Jacobi, Mary Putnam, *née* MARY CORINNA PUTNAM (b. Aug. 31, 1842, London, Eng.—d. June 10, 1906, New York, N.Y., U.S.), American physician, writer, and suffragette,

considered to be the foremost woman doctor of her era.

A daughter of the publisher G.P. Putnam, she graduated from the Female (later Woman's) College of Pennsylvania in 1864. After working at the New England Hospital for Women and Children in Boston, she became in 1868 the first woman admitted to the École de Médicine in Paris. On her return to the United States in 1871 she taught at the Woman's Medical College of the New York Infirmary for Women and Children. She was one of the first women admitted to the American Medical Association, and her concern with the inferior status of women doctors led her to organize the Association for the Advancement of the Medical Education of Women in 1872. In 1873 she married Abraham Jacobi, a physician.

An ardent suffragist and reformer, Jacobi published works that range from *"Common Sense" Applied to Woman Suffrage* (1894) to *Physiological Notes on Primary Education and the Study of Language* (1899). She wrote medical textbooks and more than 100 scientific articles on various topics, including physiology, pediatrics, neurology, pathology, and medical education.

Jacobin Club, byname JACOBINS, formally (1789–92) SOCIETY OF THE FRIENDS OF THE CONSTITUTION, or (1792–94) SOCIETY OF THE JACOBINS, FRIENDS OF LIBERTY AND EQUALITY, French CLUB DES JACOBINS, or SOCIÉTÉ DES AMIS DE LA CONSTITUTION, or SOCIÉTÉ DES JACOBINS, AMIS DE LA LIBERTÉ ET DE L'ÉGALITÉ, the most famous political group of the French Revolution, which became identified with extreme equalitarianism and violence and which led the Revolutionary government from mid-1793 to mid-1794.

The Jacobins originated as the Club Breton at Versailles, where the deputies from Brittany to the Estates-General (later the National Assembly) of 1789 met with deputies from other parts of France to concert their action. The group was reconstituted, probably in December 1789, after the National Assembly moved to Paris, under the name of Society of the Friends of the Constitution, but it was commonly called the Jacobin Club because its sessions were held in a former convent of the Dominicans, who were known in Paris as Jacobins. Its purpose was to protect the gains of the Revolution against a possible aristocratic reaction. The club soon admitted nondeputies—usually prosperous bourgeois and men of letters—and acquired affiliates throughout France. By July 1790 there were about 1,200 members in the Parisian club and 152 affiliate clubs.

In July 1791 the Jacobin Club split over a petition calling for the removal of Louis XVI after his unsuccessful attempt to flee France; many of the moderate deputies left to join the rival club of the Feuillants (*see* Feuillants, Club of the). Maximilien de Robespierre was one of the few deputies who remained, and he assumed a position of prominence in the club.

After the overthrow of the monarchy, in August 1792 (in which the Jacobin Club, still reluctant to declare itself republican, did not have a direct role), the club entered a new phase as one of major groups directing the Revolution. With the proclamation of the republic in September, the club changed its name to Society of the Jacobins, Friends of Liberty and Equality. It acquired a democratic character with the admission of the leftist Montagnard deputies in the National Convention (the new legislature) and also a more popular one as it responded to the demands of the Parisian working and artisan class. Through the early phase of the Convention, the club was a meeting place for the Montagnards, and it agitated for the execution of the king (January 1793) and for the overthrow of the moderate Girondins (June 1793).

With the establishment of the Revolutionary dictatorship, beginning in the summer of 1793, the local Jacobin clubs became instruments of the Reign of Terror. (In 1793 there were probably 5,000 to 8,000 clubs throughout France, with a nominal membership of 500,000.) The clubs, as part of the administrative machinery of government, had certain duties: they raised supplies for the army and policed local markets. Often local government officials were replaced with members of clubs. As centres of public virtue, the clubs watched over people whose opinions were suspect, led the dechristianizing movement, and organized Revolutionary festivals.

The Parisian club was increasingly associated with Robespierre, who dominated the Revolutionary government through his position on the Committee of Public Safety. It supported Robespierre in his attacks on the enemies of the Revolution and helped him resist the growing demands of the discontented workers for a controlled economy. After the fall of Robespierre on 9 Thermidor, year II (July 27, 1794), the Parisian club, now a symbol of dictatorship and terror, was temporarily closed. It reopened as a centre of opposition to the Thermidorian government, but it was permanently closed on 21 Brumaire (Nov. 11, 1794).

The Club du Panthéon in 1795 and Club du Manège of 1799 briefly revived the Jacobin spirit, while some local clubs lasted until the year VIII (1799–1800) despite their having been officially banned.

The name Jacobin was also applied to radicals in England and other countries in the period of the French Revolution.

Jacobite, in British history, a supporter of the exiled Stuart king James II (Latin Jacobus) and his descendants after the Revolution of 1688. The political importance of the Jacobite movement extended from 1688 to 1745. The Jacobites, especially under William III and Queen Anne, could offer a feasible alternative title to the crown, and the exiled court in France (and later in Italy) was often frequented by disgruntled soldiers and politicians. After 1714 the Whigs' monopoly of power led many Tories into intrigues with the Jacobites.

The movement was strong in Scotland and Wales, where support was primarily dynastic, and in Ireland, where it was mainly religious, Roman Catholics and Anglican Tories were natural Jacobites. The Tory Anglicans had doubts about the legality of the events of 1688–89, whereas the Roman Catholics had more to hope for from James II and James Edward, the Old Pretender, who were firm Roman Catholics, and Charles Edward, the Young Pretender, who vacillated for political reasons but was at least tolerant.

Within 60 years after the Revolution of 1688, five attempts at restoration were made in favour of the exiled Stuarts. In March 1689 James II himself landed in Ireland, and a parliament summoned to Dublin acknowledged him as king. But his Irish-French army was defeated by William III at the Battle of the Boyne (July 1, 1690), and he returned to France. A second French invasion misfired completely (1708).

The third attempt, the Fifteen Rebellion, was a serious affair. In the summer of 1715 John Erskine, 6th Earl of Mar, an embittered ex-supporter of the Revolution, raised the Jacobite clans and the Episcopal northeast for "James III and VIII" (James Edward, the Old Pretender). A hesitant leader, Mar advanced only as far as Perth and wasted a considerable amount of time before challenging the Duke of Argyll's smaller force; the result was the drawn Battle of Sheriffmuir (Nov. 13, 1715), and at the same time the hopes of a southern rising melted away at Preston. James arrived too late to do anything but lead the flight of his chief supporters to France. The fourth Jacobite effort was a west Scottish Highland rising, aided by Spain, which was quickly aborted at Glenshiel (1719).

The final rebellion, the Forty-five Rebellion, was, in retrospect, the most romanticized but also the most formidable. The outlook in 1745 seemed hopeless, for another French invasion, planned for the previous year, had miscarried and little help could be expected from that quarter. The number of Scottish Highlanders prepared to turn out was smaller than in 1715, and the Lowlands were apathetic or hostile; but the charm and daring of the young prince, Charles Edward (later called the Young Pretender), and the absence of the government troops (who were fighting on the Continent) produced a more dangerous rising. Within a few weeks Charles was master of Scotland and victor of Prestonpans (September 21); though utterly disappointed as regards an English rising, he marched south as far as Derby in England (December 4) and won another battle (Falkirk, Jan. 17, 1746) before retreating to the Highlands. The end came on April 16, when William Augustus, Duke of Cumberland, crushed the Jacobite army at the Battle of Culloden, near Inverness. About 80 of the rebels were executed; many more were hunted down and wantonly killed or driven into exile; and Charles, hounded for months by government searching parties, barely escaped to the Continent (September 20).

Jacobitism thereafter declined as a serious political force but remained as a sentiment. "The king over the water" gained a certain sentimental appeal, especially in the Scottish Highlands; and a whole body of Jacobite songs came into being. By the late 18th century the name had lost many of its political overtones; and George III even gave a pension to the last pretender, Henry Stuart, Cardinal York.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Jacobs, Helen Hull (b. Aug. 6, 1908, Globe, Ariz, U.S.—d. June 2, 1997, East Hampton, N.Y.), American tennis player and writer, who, in the 1920s and '30s, became known for her persistence and on-court rivalry with Helen Wills Moody.

Jacobs was the national junior tennis champion in 1924–25 and attended the University of California at Berkeley from 1926 to 1929. She was defeated by Moody in the 1928 finals at Forest Hills and in the Wimbledon finals in 1929 and 1932. Her first adult major championship came in 1932, when she won the U.S. title; and Jacobs dominated Forest Hills for the next four years, winning the women's singles each year through 1935 and winning the women's doubles in 1932, 1934, and 1935 and mixed doubles in 1934. Perhaps her most memorable tournament at Forest Hills was the 1933 U.S. championship, in which she defeated Moody on a default in the third set. With Jacobs winning the set 3–0 Moody complained about back pain and conceded. Jacobs won her first Wimbledon title in 1936. She played on the U.S. Wightman Cup team for 12 years and was elected to the International Tennis Hall of Fame in 1962.

During her career in tennis she became a writer, her first books being *Modern Tennis* (1933), *Improve Your Tennis* (1936), and *Beyond the Game: An Autobiography* (1936). Later she wrote fiction (*e.g., Storm Against the Wind* [1944]) as well as nonfiction, mainly about tennis and physical fitness.

Jacobs, Jane, *née* BUTZNER (b. May 4, 1916, Scranton, Pa., U.S.), Canadian urbanologist

noted for her clear and original observations on urban life and its problems.

After graduating from high school, she became a reporter on the *Scranton Tribune,* moving to New York City about a year later. While working as a free-lance writer, she met and married an architect, Robert Hyde Jacobs. Already keenly interested in city neighbourhoods and their vitality, both as a writer and—increasingly—as a community activist, she explored urban design and planning at length with her husband. In 1952 she became an associate editor of *Architectural Forum,* where she worked for a decade. Her first full-length book, *The Death and Life of Great American Cities* (1961), is a brash and passionate reinterpretation of the multiple needs of modern urban places. Translated into Japanese and several European languages, it established her as a force to be reckoned with by planners and economists. *The Economy of Cities* (1969) discussed the importance of diversity to a city's prosperity, and it, too, challenged much of the conventional wisdom on urban planning. Jacobs moved with her husband to Canada and later became a Canadian citizen. A later work is *Cities and the Wealth of Nations* (1984).

Jacobs, Joseph (b. Aug. 29, 1854, Sydney, N.S.W. [Australia]—d. Jan. 30, 1916, Yonkers, N.Y., U.S.), Australian-born English folklore scholar, one of the most popular 19th-century adapters of children's fairy tales. He was also a historian of pre-expulsion English Jewry (*The Jews of Angevin England,* 1893), a historian of Jewish culture (*Studies in Jewish Statistics,* 1891), and a literary scholar.

After attending primary school Sydney, Jacobs immigrated to England in 1872. A graduate (1876) of the University of Cambridge, Jacobs was secretary (1882–1900) of the Russo-Jewish Committee (London), formed to improve the wretched social and political conditions of Jews in Russia. He edited the journal *Folk-Lore* from 1889 to 1900. A prolific author, Jacobs is generally best known for such scholarly and popular works on folklore as *The Fables of Aesop* (1894), *English Fairy Tales* (1890), *Celtic Fairy Tales* (1892), *Indian Fairy Tales* (1892), *The Book of Wonder Voyages* (1896), and *Europa's Fairy Book* (1916). In 1900 he immigrated with his family to the United States, where he worked as revising editor of the *Jewish Encyclopedia.* He later taught literature at the Jewish Theological Seminary of America and edited the magazine *American Hebrew* (1906–16).

Jacobs, W(illiam) W(ymark) (b. Sept. 8, 1863, London—d. Sept. 1, 1943, London), English short-story writer best known for his classic horror story "The Monkey's Paw."

His early home was a house on a Thames River wharf, where his father was manager. A landsman himself, Jacobs drew on his boyhood memories of seafaring men and dockworkers to create the stories that were to establish him as a writer. His first volume, *Many Cargoes* (1896), had an immediate success and was followed by two others, *The Skipper's Wooing* (1897) and *Sea Urchins* (1898). Though his seamen are rarely at sea, their adventures or misadventures ashore provide many thrilling moments. "The Monkey's Paw" (1902), a tale of superstition and terror unfolding within a realistic, Dickensian setting of domestic warmth and coziness, is a felicitous example of Jacobs' ability to combine everyday life and gentle humour with exotic adventure and dread. Dramatized as a one-act play by Louis Napoleon Parker, it was first produced at the London Haymarket in 1903. An omnibus, *Snug Harbour,* containing some 17 volumes of Jacobs' work, was published in 1931.

Jacob's ladder, also called GREEK VALERIAN, any of about 25 species of the genus *Polemonium* of the family Polemoniaceae, native to temperate areas in North and South America and Eurasia. Many are valued as garden flowers and wildflowers. They have loose, spike-like clusters of drooping blue, violet, or white, funnel-shaped, five-petaled flowers and alternate, pinnately (featherlike) compound leaves.

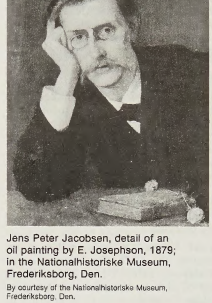
Jacob's ladder (*Polemonium caeruleum*)
A to Z Botanical Collection—EB Inc.

Polemonium caeruleum is native to European woodlands and mountains and widely grown as a garden flower. It can grow to 90 cm (3 feet) tall and has large blue or white flowers.

Jacobsen, Arne (b. Feb. 11, 1902, Copenhagen—d. March 24, 1971, Copenhagen), Danish architect and designer of many important buildings in an austere modern style; he is known internationally for his industrial design, particularly for his three-legged stacking chair (1952) and his "egg" chair (1959), the back and seat of which were formed of cloth-covered plastic.

Jacobsen received his diploma in 1928 from the Copenhagen Academy of Arts. His first buildings date from 1930, but his first major work was the Bellavista Housing Estate (1933) at Klampenborg, near Copenhagen, where each house offers a view of the sea.

Important Jacobsen works during the 1950s include a group of houses at Søholm (1950–55), the Jesperson Building (1955) in Copenhagen, Rødovre Town Hall (1954–56), and



Arne Jacobsen, 1960
By courtesy of the Royal Danish Ministry for Foreign Affairs

the SAS Building (1959), Copenhagen's first skyscraper, for which he did the interior design as well as the architecture.

Like many of Jacobsen's buildings, those designed for St. Catherine's College, Oxford University (1964), recall his theory that "economy plus function equals style." The starkly modern bell tower consists mainly of two tall planes. For St. Catherine's he also designed furnishings such as silverware and china, chairs, lamps, and door handles.

Jacobsen, Jens Peter (b. April 7, 1847, Thisted, Jutland, Den.—d. April 30, 1885, Thisted), Danish novelist and poet who inaugurated the naturalist movement in Denmark and was himself its most famous representative.

A student of the natural sciences, he became a follower of Charles Darwin and translated into Danish both *On the Origin of Species,* in 1871–73, and *The Descent of Man,* in 1874. His own literary work was limited to two novels, some short stories, and a few poems.

Jens Peter Jacobsen, detail of an oil painting by E. Josephson, 1879; in the Nationalhistoriske Museum, Frederiksborg, Den.
By courtesy of the Nationalhistoriske Museum, Frederiksborg, Den.

He struggled for his last 12 years with tuberculosis until it overcame him. During those years he produced almost all of his works in slow and painful daily stints. He was a master of description, attempting to portray all facets of reality as meticulously as he had observed them in nature.

While at the University of Copenhagen, he heard the lectures of Georg Brandes, an advocate of realism, naturalism, and socially conscious art. Jacobsen's story collection *Mogens* (1872; Eng. trans., 1921) is considered the first Naturalist writing in Danish literature and was greatly admired by Brandes, who hailed him as one of "the men of the modern breakthrough." Jacobsen's first novel, *Fru Marie Grubbe* (1876; Eng. trans., 1914, 1975), is a psychological study of a 17th-century woman whose natural instincts are stronger than her social instincts and result in her descent on the social scale from a viceroy's consort to the wife of a ferryman. The book was first attacked by the conservative press for its crass realism. *Niels Lyhne* (1880; Eng. trans., 1896), his second novel, is a contemporary story of a man's vain struggle to acquire a philosophy of life. His poems were collected and published posthumously in 1886 (Eng. trans., 1920).

jacobsite, manganese iron oxide mineral, a member of the magnetite (*q.v.*) series of spinels.

Jacobson, Dan (b. March 7, 1929, Johannesburg, S.Af.), South African-born novelist and short-story writer.

Jacobson was the son of eastern European Jewish immigrants. After graduation from the University of Witwatersrand (B.A., 1949), he worked in public relations and in the family

cattle-feed–milling business. He then lived and worked in Israel before going to live in England in 1954. In 1974 he became a lecturer and in 1979 a reader in English at University College, London.

In England, distanced from the South African experience, he wrote with both humour and pathos of his troubled land of birth. His first novels—*The Trap* (1955), *A Dance in the Sun* (1956), and *The Price of Diamonds* (1957)—form a complex mosaic that provides a peculiarly incisive view of racially divided South African society. Much of his best work is in the short stories, especially in the collections *The Zulu and the Zeide* (1959) and *Beggar My Neighbour* (1964).

With *The Beginners* (1966), a long generational novel paralleling his own family history, Jacobson began to withdraw from writing about South Africa. *The Rape of Tamar* (1970) is a biblical novel, and *The Confessions of Josef Baisz* (1977) is set in a country only "something like" South Africa. His later books, however, continue to utilize both his political consciousness and his gift for irony.

Jacobson's organ, also called VOMERONASAL ORGAN, region of chemically sensitive nerve endings in the oral cavity of many vertebrate animals (amphibians, lizards and snakes, some mammals). The nerve endings are located in a pair of pits that are continuous with the roof of the mouth. Jacobson's organ is most strongly developed in snakes, in which it is employed to supplement weak nasal chemoreceptors in evaluating airborne chemicals. Odours are sampled by flicking out the tongue and retracting it across the Jacobson's organ, where the molecules acquired by the tongue's moist surface are detected.

Jacobus DE VORAGINE, also called JACOB OF VORAGINE (b. 1228/30, Varazze, near Genoa [Italy]—d. July 13/14, 1298, Genoa), archbishop of Genoa, chronicler, and author of the *Golden Legend.*

Jacobus became a Dominican in 1244. After gaining a reputation throughout northern Italy as a preacher and theologian, he was provincial of Lombardy (1267–78 and 1281–86) and archbishop of the independent city of Genoa (1292) until his death. He was beatified in 1816 for his work as a peacemaker between Guelphs (pro-papal party) and Ghibellines (pro-imperial), and his feast day in the Dominican order is July 13.

His works include sermons on Gospel readings, saints' days, and the Virgin Mary; a chronicle of Genoa; and the *Legenda aurea* (*Golden Legend,* also known as the *Lombardica historia*). This book is a collection of saints' lives, of accounts of events in the lives of Christ and of the Virgin Mary, and of information about holy days and seasons, the whole arranged as readings (Latin: *legenda*) for the church year. Immensely popular in the Middle Ages, it was translated into all western European languages and gradually much enlarged. William Caxton's translation was one of the first books printed in English (1483). Medieval artists found the *Golden Legend* a storehouse of events and persons to be illustrated. But the miraculous stories it contains and its natural lack of historical perspective rendered the book unacceptable at the Reformation and after the rise of the new learning, so it then went completely out of fashion.

Jacopo DA LENTINI (Italian poet): *see* Giacomo da Lentini.

Jacopo DELLA QUERCIA (b. *c.* 1374, Siena [Italy]—d. Oct. 20, 1438, Bologna, Papal States), one of the most original Italian sculptors of the early 15th century.

About 1406 Jacopo carved the tomb of Ilaria del Carretto in the Cathedral of Lucca. The effigy and sarcophagus alone survive. In 1408, at Ferrara, he made the statue of the Virgin and Child, still existing in the Museo dell'Opera del Duomo, and a year later he received the commission for the Fonte Gaia in the Piazza del Campo at Siena, now replaced by a copy; the original is in the loggia of the Palazzo Pubblico. The scheme of this celebrated and highly original fountain seems to have been repeatedly modified, the most effective work being done between 1414 and 1419. At the same time, Jacopo was engaged on the statue of an apostle for the exterior of the cathedral at Lucca, the Trenta altar for the Church of San Frediano in Lucca, and

"The Creation of Eve," marble relief on the central portal of the facade of San Petronio, Bologna, by Jacopo della Quercia, begun 1424
Anderson—Alinari from Art Resource

tomb slabs for Lorenzo Trenta and his wife. In 1417 he undertook to do two gilt bronze reliefs for the baptismal font in San Giovanni in Siena. Being a dilatory artist, he completed only the "Zacharias in the Temple," the second being assigned to Donatello. His main work is the sculpture around the portal of San Petronio at Bologna. The 10 scenes from Genesis, 5 scenes from the early life of Christ, the reliefs of prophets, and the statues of the Virgin and Child with SS. Petronius and Ambrose give the sense of depth associated with the paintings of Masaccio.

In 1435 Jacopo was appointed superintending architect of Siena Cathedral, for which he was employed on the decoration (unfinished) of the Cappella Casini. Jacopo is a mysterious and ambivalent artist, but he carried Sienese sculpture to its height and influenced subsequent Sienese painters.

Jacopone DA TODI, original name JACOPO DEI BENEDETTI (b. *c.* 1230, Todi, duchy of Spoleto [now in Italy]—d. Dec. 25, 1306, Collazzone), Italian religious poet, author of more than 100 mystical poems of great power and originality, and probable author of the Latin poem *Stabat mater dolorosa.*

Born of a noble family and trained for the law, Jacopone practiced until his wife's sudden death at a party about 1268 precipitated his total conversion to an ascetic life. He disposed of his belongings, dedicated himself to God in absolute poverty, and became (1278) a lay brother of the Franciscan order. As a member of the Spiritual faction of his order, a group espousing uncompromising poverty, Jacopone wrote violent satirical verse against Pope Boniface VIII and then signed the manifesto (1297) that declared Boniface's election invalid. Boniface retaliated by first excommunicating and then (1298) imprisoning Jacopone for life. After Boniface died in 1303, Jacopone was released by the new pope, Benedict XI. Jacopone retired to the monastery at Collazzone, where he died three years later. His tomb is in the medieval Church of San Fortunato, Todi.

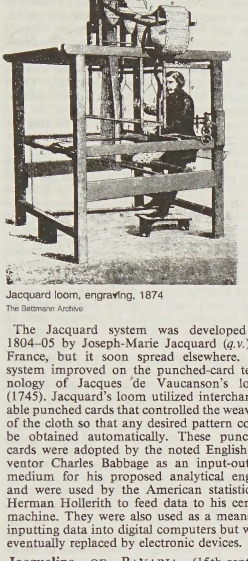
Most of Jacopone's poetic work is in the Italian vernacular. A notable exception is the Latin *Stabat mater dolorosa* that has long been attributed to him. That poem was added to the Roman liturgy in the 18th century and has been set to music by many composers, including Josquin des Prez, Giovanni Palestrina, Giovanni Battista Pergolesi, Gioacchino Rossini, and Antonín Dvořák. His many *laudi spirituali* ("spiritual canticles"), some written during his imprisonment, are vivid and original outpourings of many moods, ranging from bitter anger to mystical ecstasy.

BIBLIOGRAPHY. Evelyn Underhill, *Jacopone da Todi, Poet and Mystic—1228–1306: A Spiritual Biography* (1919); George T. Peck, *The Fool of God: Jacopone da Todi* (1980).

Jacotot, Jean-Joseph (b. March 4, 1770, Dijon, France—d. July 30, 1840, Paris), French pedagogue and innovator of a universal method of education.

Jacotot began his career as a teacher and mathematician and was appointed subdirector of the Polytechnic School in Dijon (1795), where he became, in succession, professor of the method of sciences, of Latin and Greek literature, and of Roman law. During the Napoleonic Wars he entered the army and rose to the rank of captain of artillery; he then became military secretary and director of the military École Normale and was elected a member of the Chamber of Deputies. In 1818 he became lecturer on French language and literature at the University of Louvain.

On the basis of his unusually diverse experience, Jacotot wrote *Enseignement universel* (1823; "Universal Teaching Method"), in which he advanced an egalitarian view of humanity in such maxims as "All human beings are equally capable of learning" and "Everybody can be proficient in anything to which he turns his attention." He also maintained that all knowledge is related, so that, knowing one thing well, one could apply it to other fields of knowledge.



Jacquard, Joseph-Marie (b. July 7, 1752, Lyon, France—d. Aug. 7, 1834, Oullins), French inventor of the Jacquard loom, which served as the impetus for the technological revolution of the textile industry and is the basis of the modern automatic loom.

Jacquard first formed the idea for his loom in 1790, but his work was cut short by the French Revolution, in which he fought on the side of the Revolutionaries in the defense of Lyon. In 1801 Jacquard demonstrated an improved drawloom, for which he was awarded a bronze medal. He continued his work, and in 1804–05 he introduced an attachment that has caused any loom that uses it to be called a Jacquard loom (*q.v.*). In 1806 the loom was declared public property, and Jacquard was rewarded with a pension and a royalty on each machine.

His machine aroused bitter hostility among the silk weavers, who feared that its labour-saving capabilities would deprive them of jobs. The weavers of Lyon not only burned machines that were put into production but attacked Jacquard as well. Eventually, the advantages of the loom brought about its general acceptance, and by 1812 there were 11,000 in use in France. In 1819 Jacquard was awarded a gold medal and the Cross of the Legion of Honour. The use of his loom spread to England in the 1820s and from there virtually worldwide.

Jacquard loom, also called JACQUARD ATTACHMENT, or JACQUARD MECHANISM, in weaving, device incorporated in special looms to control individual warp yarns. It enabled looms to produce fabrics having intricate wo-

ven patterns such as tapestry, brocade, and damask, and it has also been adapted to the production of patterned knitted fabrics.

Jacquard loom, engraving, 1874
The Bettmann Archive

The Jacquard system was developed in 1804–05 by Joseph-Marie Jacquard (*q.v.*) of France, but it soon spread elsewhere. His system improved on the punched-card technology of Jacques de Vaucanson's loom (1745). Jacquard's loom utilized interchangeable punched cards that controlled the weaving of the cloth so that any desired pattern could be obtained automatically. These punched cards were adopted by the noted English inventor Charles Babbage as an input-output medium for his proposed analytical engine and were used by the American statistician Herman Hollerith to feed data to his census machine. They were also used as a means of inputting data into digital computers but were eventually replaced by electronic devices.

Jacqueline OF BAVARIA (15th-century Dutch countess): *see* Jacoba of Bavaria.

Jacquerie, insurrection of peasants against the nobility in northeastern France in 1358—so named from the nobles' habit of referring contemptuously to any peasant as Jacques, or Jacques Bonhomme.

The Jacquerie occurred at a critical moment of the Hundred Years' War. The Battle of Poitiers (September 1356), in which King John II the Good was captured by the English, was the latest in a series of defeats that had brought discredit on the French nobility. It was followed by an Anglo-French truce that resulted in the pillage of the countryside by the "great companies" of mercenaries from the English forces, sometimes abetted by the nobles. The peasants were further enraged by the nobles' demands for heavier payments of dues and by the order of the dauphin Charles (the future Charles V) that the peasants refortify the castles of their aristocratic oppressors.

On May 21, 1358, an uprising began near Compiègne and spread quickly throughout the countryside. The peasants destroyed numerous castles and slaughtered their inhabitants. Under their captain general, Guillaume Cale, or Carle, they joined forces with Parisian rebels under Étienne Marcel. The Parisians were defeated at Meaux on June 9 by Gaston Phoebus of Foix and Jean III de Grailly. Charles II of Navarre routed Cale at Clermont-en-Beauvaisis on June 10. A massacre of the insurgents followed their defeat.

Jacuí River, Portuguese RIO JACUÍ, river, Rio Grande do Sul *estado* ("state"), southern Brazil. It rises in the hills east of Passo Fundo and flows southward and eastward for 280 miles (450 km), receiving the Taquari, Caí, Sinos, and Gravataí rivers near its mouth. There, at Pôrto Alegre, the state capital, on the Atlantic coast, it forms the Guaíba River, a shallow estuary emptying into the north end of the Patos Lagoon.

Navigable for rivercraft as far upstream as Cachoeira do Sul, it is one of the most heavily used river barge systems in Brazil, carrying large tonnages from the São Jerônimo coal basin to seaports and transporting rice and other crops cultivated in the rich agricultural lowland region that it drains. The Itaúba hydroelectric plant was built on the Jacuí River in the late 1970s.

jade, either of two tough, compact, typically green gemstones that take a high polish. Both minerals have been carved into jewelry, ornaments, small sculptures, and utilitarian objects from earliest recorded times. The more highly prized of the two jadestones is jadeite (*q.v.*); the other is nephrite (*q.v.*).

Jadeite and nephrite differ in both chemical composition and crystalline structure. Jadeite is a silicate of sodium and aluminum and is classed as a pyroxene. Nephrite is a silicate of calcium and magnesium belonging to the amphibole group of minerals and is properly regarded as a compact form of tremolite. In both types, the microscopic crystals are tightly interlocked to form a compact aggregate. Both jadestone types may be white or colourless, but colours such as red, green, and gray may occur owing to the presence of iron, chromium, or manganese impurities, respectively. The most highly prized variety is jadeite of an emerald-green hue.

Dragon among clouds, carved jade medallion or button, Ch'ing dynasty, probably late 18th century (reign of Ch'ien-lung); in the Victoria and Albert Museum, London
By courtesy of the board of trustees of the Victoria and Albert Museum, London, Wallis Legacy

The two different types of jade, when worked and polished, can usually be distinguished by their appearance alone. The fine lustre of polished nephrite is oily rather than vitreous (glassy), while that of jadeite is the reverse. Some colours are also peculiar to one stone or the other; for example, the popular apple- and emerald-green jewelry jades are invariably jadeite. There are also wide variations of translucency in both stones. The area around the city of Mogaung in northern Myanmar (Burma) has long been the main source of gem-quality jadeite. Occurrences of nephrite are more numerous and geographically more widespread.

Over the course of history, jade has been successively cut and shaped with sandstone, slate, and quartz sand (as an abrasive); by tools made of bronze; by tools of iron, using manually operated lathes; and finally, beginning in the 19th century, by machine-powered lathes, steel saws, and diamond-pointed drills. Carborundum and diamond dust have replaced crushed garnets and corundum (emery) as abrasives.

Both jadestones were worked into implements by Neolithic peoples in many parts of the world. The best-known finds are from the lake dwellings of Switzerland, western France, and China. Jade is hard, tough, and heavy, and it takes and keeps a good edge, while its fine colours and warm polish must have greatly appealed to Neolithic craftsmen. When the stone-based Neolithic cultures were succeeded by ones using bronze and iron, however, jade gradually lost its industrial value and fell from favour as a gemstone in all but a few regions.

Jade and jade carving are associated preeminently with China, since in no other region of the world has this obdurate material been worked with such skill in such a long and unbroken tradition. For millennia the jade carved by the Chinese consisted of nephrite from the region of Ho-t'ien (Khotan) and Yarkand in what is now Sinkiang. Jadeite does not appear to have been worked by them until the 18th century AD, when large quantities of that jadestone began entering the country from Myanmar via Yunnan province.

As early as the Neolithic period the Chinese were carving jade into tools and simple cult objects in the form of flat disks with circular orifices at their centre. (*See* Chinese jade.) During the Shang dynasty (18th–12th century BC), they began making small ornamental plaques with decorative designs of animals incised on them in low relief. From the later part of the Chou dynasty (about 500 BC), the introduction of iron tools made more accomplished carvings possible, and jade began to be made into a wide variety of utilitarian and luxury objects, such as belt hooks and ornaments, sword and scabbard accoutrements, hollow vessels, and, most importantly, sculpture in the round. The craft of jade carving in China attained maturity toward the close of the Chou dynasty in 255 BC, with designs of unsurpassed excellence and beauty, and the tradition continued for the next 2,000 years.

The reign (1735–96) of the great Ch'ing-dynasty emperor Ch'ien-lung was a particularly important period for jade carving. Under his patronage and in those times of exceptional prosperity and luxury, thousands of carved jades were added to the imperial collections, and the material was applied to countless new decorative, ceremonial, and religious uses in the Forbidden City at Peking and in the homes of nobles and officials. Greater quantities of jade were entering China than ever before, and emerald-green jadeite from Myanmar became as highly esteemed as the finest nephrite from Sinkiang. Fabulous prices were paid for high-quality carvings of people, animals, and plants; bottles, urns, vases, and other vessels; and all sorts of personal accessories.

The Aztecs, Mayas, and other Pre-Columbian Indian peoples of Mexico and Central America carved jadeite for use as ornaments, amulets, and badges of rank. Nearly all of these Meso-American jades are of various shades of green, with emerald green the most highly prized colour among the Aztecs; their jade carvings comprise plaques, figurines, small masks, pendants, and implements. The appreciation of jade died out in Meso-America after the Spanish conquest in the 16th century, however.

Until the landing of Europeans there in the 18th century, the Maoris of New Zealand were entirely ignorant of metals, and the most highly prized of their industrial stones was nephrite, from which they made axes, knives, chisels, adzes, and the short swords, or *mere,* of their chiefs. These jade swords served not only as weapons but as symbols of authority and were usually worked from stone of specially fine colour or distinctive marking.

Several varieties of the mineral serpentine

superficially resemble nephrite and are sometimes fraudulently sold as such, but they can be distinguished by their relative softness. Another deceptive practice is that of dyeing colourless pieces of jade green to simulate high-quality stone. The most successful imitations of jadeite are completely artificial and consist of a heavy lead glass that has been cleverly tinted to imitate jadeite's distinctive apple-green colour.

Jade Bay, German JADEBUSEN, bay, Lower Saxony *Land* (state), northwestern Germany. It is a broad inlet of the North Sea that covers an area of 73 square miles (190 square km). Formed for the most part by storm floods that occurred in 1219 and 1511, the generally shallow bay is fed by several small streams, including the Jade River. In springtime, the 13.5-foot (4.1-metre) difference between high and low tide is the greatest on the German North Sea coast. The bay serves the port of Wilhelmshaven on its northwest coast.

jadeite, gem-quality silicate mineral in the pyroxene family that is one of the two forms of jade (*q.v.*). The more prized of the two types of jade, jadeite (imperial jade) is usually found as transparent-to-opaque, compact, cryptocrystalline lenses, veins, or nodules. It may be distinguished from nephrite (mutton-

Uncut (left) and cut jadeite
Runk/Schoenberger—Grant Heilman

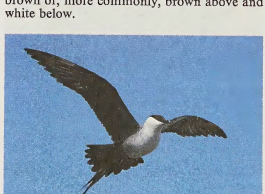
fat jade), jade's other form, by its granular fracture and glassy lustre; in addition, polished surfaces often show pitting caused by varying hardness. Jadeite, sodium aluminum silicate ($NaAlSi_2O_6$), may contain a number of impurities (often calcium) that give it a variety of colours: white, emerald green, apple green, red, brown, and blue. Deep green to greenish black varieties are called chloromelanite and are coloured by iron.

Jadeite occurs only in metamorphic rocks, most often in those that have been subjected to the high pressures deep below the Earth's surface. Jadeite is rare; its presence at the surface indicates great uplift of earlier buried regions and great amounts of erosion. The most important source is the large deposit near Tawmaw, Myanmar (Burma). Jadeite has also been found near Omi and Kotaki, Japan; in the Motagua River valley of Guatemala; in San Benito county, Calif.; and in Mexico, Celebes, and New Guinea.

For detailed physical properties of jadeite, *see* gemstone (table); pyroxene (table).

Jadida, el-, formerly (until *c.* 1960) MAZAGAN, Atlantic port city, north-central Morocco. The settlement developed after 1502 around a Portuguese fort and, as Mazagan, became the centre of Portuguese settlement and their last stronghold (1769) against the Filālī (Alaouite) sultans. As an infidel city it was deemed defiled for Muslim habitation and was finally resettled by Moroccan Jews in 1821. It was then named el-Brija el-Jadida ("The New Fort"). Some Portuguese town walls and churches still stand.

The port, which after 1912 was surpassed by Casablanca, is now used chiefly for coastal shipping of agricultural produce and is a seaside resort. Roads link it with Casablanca, Marrakech, and Safi. Pop. (1982) 81,455.



Jadotville (Zaire): *see* Likasi.

Jadwiga, original Hungarian HEDVIG, German HEDWIG (b. 1373/74—d. July 17, 1399, Kraków, Pol.), queen of Poland (1384–99), whose marriage to Jogaila, grand duke of Lithuania (Władysław II Jagiełło of Poland), founded the centuries-long union of Lithuania and Poland.

Jadwiga was the daughter of Louis I, king of both Hungary and Poland, and Elizabeth of Poland. After Louis died on Sept. 11, 1382, his elder daughter, Maria, was elected queen of Hungary; but the Poles opted to end the personal union between the two countries by choosing Jadwiga as their queen, though she was then but a child of nine years. On Oct. 15, 1384, she was crowned *rex,* "king," of Poland. The Polish magnates further promoted her marriage to Jogaila in order to produce a union of territories larger than the former one with Hungary and to open the way to the Christian conversion of the largely pagan Lithuanians. Jogaila was baptized in Kraków on Feb. 15, 1386, married to Jadwiga on February 18, and crowned on March 4.

Jadwiga was a patron of religion and scholarship, seeking to promote the religious development of the nations that she had united, founding a special college for Lithuanians in Prague, and financing the restoration of the university at Kraków, effected after her death and named the Jagiellonian University. Chiefly Jadwiga's work, the university was modeled after the University of Paris and became the centre of Polish civilization and influence.

jaeger (German and Dutch: "hunter"), any of three species of seabirds belonging to the genus *Stercorarius,* family Stercorariidae. They are rapacious birds resembling a dark gull with a forward-set black cap and projecting central tail feathers. Jaegers are called skuas in Britain, along with the great skua, a larger bird (*see* skua). Jaegers have two colour phases: all-brown or, more commonly, brown above and white below.

Long-tailed jaeger (*Stercorarius longicaudus*)
© Alan Williams/NHPA

Jaegers nest in Arctic tundra and then go to sea, many as far as Australia and New Zealand. At sea they catch fish on their own; but while nesting along coasts, they force terns and kittiwakes to disgorge their food, destroy the eggs and young of other seabirds, and capture land birds and rodents.

The largest species is the pomarine jaeger, or pomatorhine skua (*Stercorarius pomarinus*), 50 cm (20 inches) long. Smallest is the long-tailed jaeger (*S. longicaudus*), 35 cm long. Intermediate in body size is the parasitic jaeger (*S. parasiticus*).

Jæger, Hans Henrik (b. Sept. 2, 1854, Drammen, Nor.—d. Feb. 8, 1910, Kristiania [now Oslo]), novelist, ultranaturalist, and leader of the Norwegian "Bohème," a group of urban artists and writers in revolt against conventional morality. His role in Norwegian literature is based on the police suppression of his first novel.

Jæger went to sea in his youth and thereafter independently studied philosophy, notably that of G.W.F. Hegel, Johann Gottlieb Fichte, and Immanuel Kant. An advocate of sexual freedom, Jæger believed that the restrictions and frustrations of monogamy were a source of social evil. He made two unsuccessful attempts to express his ideas in a play. In 1885, however, he created a sensation with his novel *Fra Kristiania-Bohêmen* (1885; "From Bohemian Kristiania"), which was confiscated as pornography. The following year, he was sentenced to 60 days in prison for making the work public and 150 more for printing the volume in Sweden. He avoided part of the sentence by moving to Paris, where he spent most of the rest of his life. Although his novel was of no literary merit, it became a cause célèbre, dividing the Norwegian literary world between champions of freedom of speech and advocates of good taste and high standards.

Jaén, *provincia,* in the *comunidad autónoma* ("autonomous community") of Andalusia, south-central Spain. It is surrounded by the Sierra Morena (north), the Segura and Cazorla ranges (east), and Parapanda, Lucena, and Segura mountains (south). The western part of the province is composed of plains that lead to the fertile Guadalquivir River valley. There are several irrigation dams and hydroelectric plants on the Guadalquivir.

The economy is based on the cultivation of olives, followed in importance by grapes and cereals, and on mining (lead at Linares, iron, copper, uranium, and salt). Industries concentrated in the provincial capital, Jaén (*q.v.*), include the manufacture of automobiles, agricultural machinery, foodstuffs, chemicals, and ceramics. The chief towns, apart from Jaén, are Linares, Andújar, Ubeda, and Martos. Area 5,212 square miles (13,498 square km). Pop. (1992 est.) 654,376.

Jaén, city, capital of Jaén *provincia,* in the *comunidad autónoma* ("autonomous community") of Andalusia, southern Spain. It lies on the northern side of the Sierra Jabaleuz and north of Granada. Known to the Romans as Aurinx, the city was the centre of the Moorish principality of Jayyán and was reconquered by Ferdinand III of Castile and Leon in 1246. Buildings from these periods include the castle of Santa Catalina, mentioned by 12th-century Arab chroniclers, and the cathedral, begun in 1540 by Andrés de Vandelvira and completed in the 18th century. Jaén's economy is based primarily on the production of olive oil. Pop. (1992 est.) 104,235.

Jæren, lowland plain area, Rogaland *fylke* (county), southwestern Norway. Extending approximately 25 miles (40 km) northward from Eigersund and 10 to 15 miles (16 to 24 km) inland from the North Sea, the plain is bounded on the southeast by the Dalane Plateau. Composed of glacial deposits of sand and clay, it has fertile soil and is one of Norway's finest agricultural areas. Unlike most of the Norwegian coast, the plain is not protected by islands, but a dangerous reef, Jærens Rev, lies about 3 miles (5 km) offshore. Trees have been planted along the coast to prevent soil erosion. Dairying is important; Jæren is the principal supplier of milk to the city of Stavanger, just to the north. There are excellent bathing beaches along the coast, and ancient burial mounds and many runic inscriptions are found on the plain's glacial boulders.

Ja'far al-'Askari (Iraqi political leader): *see* 'Askari, Ja'far al-.

Ja'far ibn Muḥammad, also called JA'FAR AṢ-ṢĀDIQ (Arabic: "Ja'far the Trustworthy") (b. 699/700 or 702/703, Medina, Arabia [now

in Saudi Arabia]—d. 765, Medina), sixth imam, or spiritual successor to the Prophet Muḥammad, of the Shī'ite branch of Islām and the last to be recognized as imam by all the Shī'ite sects. Theologically, he advocated a limited predestination and proclaimed that Ḥadīth (traditional sayings of the Prophet), if contrary to the Qur'ān, should be rejected.

Ja'far was the son of Muḥammad al-Bāqir, the fifth imam, and great-grandson of the fourth caliph, 'Alī, who is considered to have been the first imam and founder of Shī'ism. On his mother's side, Ja'far was descended from the first caliph, Abū Bakr, whom Shī'ites usually consider a usurper. This may explain why he would never tolerate criticism of the first two caliphs.

There is some doubt whether the Shī'ite conception of an infallible religious leader, or imam, was really formulated before the 10th century, except possibly in some sort of "underground movement." But the Shī'ites certainly felt that the political leadership of Islām exercised by the caliph should belong to the direct descendants of 'Alī. Moreover, this political leadership was not clearly separated from religious leadership, and, to the end of the Umayyad regime, the caliphs sometimes preached in the mosque, using the sermon to reinforce their authority. Consequently, after his father's death, sometime between 731 and 743, Ja'far became a possible claimant to the caliphate and a potential danger to the Umayyads.

The Umayyad regime was already threatened by other hostile elements, including the Iranians, who resented Arab domination. The spread of Shī'ism throughout Iran from a mixture of religious, racial, and political motives compounded the opposition. The successful revolt of 749–750 that overthrew the Umayyads, however, was under the leadership of the 'Abbāsid family, descended from one of the Prophet's uncles, and they, not the family of 'Alī, founded the new ruling dynasty.

The new caliphs were, understandably, worried about Ja'far. Al-Manṣūr (reigned 754–775) wanted him in his new capital, Baghdad, where he could keep an eye on him. Ja'far preferred to stay in Medina and reportedly justified this by quoting a saying he ascribed to the Prophet that, though the man who leaves home to make a career may achieve success, he who remains at home will live longer. After the defeat and death of the 'Alid rebel Muḥammad ibn 'Abd Allāh in 762, however, Ja'far thought it prudent to obey the caliph's summons to Baghdad. After a short stay, however, he convinced al-Manṣūr that he was no threat and was allowed to return to Medina, where he died.

A just assessment of Ja'far is made difficult by later Shī'ite accounts, which depict every imam as a sort of superman. He undoubtedly was both politically astute and intellectually gifted, keeping out of politics and not openly claiming the imamate. He gathered around him learned pupils including Abū Ḥanīfah and Mālik ibn Anas, founders of two of the four recognized Islāmic legal schools, the Ḥanaīyah and Mālikīyah, and Wāṣil ibn 'Ata', founder of the Mu'tazilī school. Equally famous was Jābir ibn Hayyān, the alchemist known in Europe as Geber, who credited Ja'far with many of his scientific ideas and indeed suggested that some of his works are little more than records of Ja'far's teaching or summaries of hundreds of monographs written by him. As to the manuscripts of half a dozen religious works bearing Ja'far's name, scholars generally regard them as spurious. It seems likely that he was a teacher who left writing to others.

Various Muslim writers have ascribed three fundamental religious ideas to him. First, he adopted a middle road about the question of predestination, asserting that God decreed some things absolutely but left others to human agency—a compromise that was widely adopted. Second, in the science of Ḥadīth, he proclaimed the principle that what was contrary to the Qur'ān (Islāmic scripture) should be rejected, whatever other evidence might support it. Third, he described Muḥammad's prophetic mission as a ray of light, created before Adam and passed on from Muḥammad to his descendants.

Shī'ite divisions date from Ja'far's death. His eldest son, Ismā'īl, predeceased him, but the "Seveners," represented today chiefly by the Ismā'īlites (followers of Ismā'īl)—argued that Ismā'īl merely disappeared and would reappear one day. Three other sons also claimed the imamate; of these, Mūsā al-Kāẓim gained widest recognition. Shī'ite sects not recognizing Ismā'īl are mostly known as "Twelvers"; they trace the succession from Ja'far to the 12th imam, who disappeared and is expected to return at the Last Judgment. (J.A.H.)

Ja'far Pasha: *see* 'Askarī, Ja'far al-.

Jaffa (Israel): *see* Tel Aviv–Yafo.

Jaffna, historical monarchy in northern Ceylon (modern Sri Lanka), populated by Tamil-speaking people of South Indian origin. Well established by the 14th century, it survived as an independent entity until its subjugation by the Portuguese in the 17th century.

Almost from the beginning of Ceylon's recorded history, sporadic invasions by the Tamils of South India had been commonplace. One of the best-known quasi-historical incidents in Ceylon's history is the victory in the 2nd century BC of the Sinhalese king Duṭṭhagāmaṇī over the Tamil usurper Eḷāra. From the 12th century the Tamils made increasingly permanent inroads into the northern part of Ceylon and by the 14th century were solidly established there. Except for a short period of subjugation by the Sinhalese in the 15th century, the kingdom of Jaffna generally maintained its independence until the incursion of the Portuguese.

Jaffna, port, northern Sri Lanka (Ceylon). It is situated on a flat, dry peninsula at the island's northern tip. The trading centre for the agricultural produce of the peninsula and nearby islands, it is linked with the rest of the nation by road and a railway. Jaffna is no longer a major port but conducts some trade with southern India. Fishing is important in the economy.

Jaffna was the capital of a Tamil kingdom for centuries before it was conquered by Europeans, and the town still has many distinctive Tamil cultural characteristics. Jaffna fell under Portuguese rule in 1619 and was their last possession in Sri Lanka before its capture by the Dutch in 1658. The name Jaffna is a Portuguese adaptation of the Tamil for "port of the lyre." A fort and a church remain from the Dutch period, and near the fort is a famous Hindu temple, Kandaswamy Kovil. The British held Jaffna after 1795. From 1983 to 1995 Jaffna was a stronghold of a Tamil separatist guerrilla group; its capture by Sri Lankan government forces in 1995 left portions of the city in ruins. Pop. (1990 est.) 129,000.

Jagan, Cheddi, in full CHEDDI BERRET JAGAN (b. March 22, 1918, Plantation Port Mourant, British Guiana [now Guyana]—d. March 6, 1997, Washington, D.C., U.S.), politician and union activist who in 1953 became the first popularly elected prime minister of British Guiana (now Guyana). He headed the country's government again from 1957 to 1964 and from 1992 to 1997.

The son of a foreman on a sugarcane plantation, Jagan studied dentistry in the United States. When he returned to practice dentistry in British Guiana in 1943, he became active in union and political affairs and was elected to the British Guianan legislature in 1947.

In 1950 Jagan and his American-born wife established Guiana's first modern political party, the People's Progressive Party (PPP), with himself as its leader. In elections held under the new British-granted constitution of 1953, the PPP won a majority of the seats in the House of Assembly and Jagan became the country's prime minister. His subsequent program of radical socioeconomic reforms, however, along with the strikes and demonstrations encouraged by his party, prompted the British authorities in late 1953 to dismiss him from office, suspend the new constitution, and send in troops to prevent the consolidation of a government that they viewed as procommunist. Jagan practiced dentistry for the next four years, and in the meantime the PPP in 1955 split along racial lines, with most of its black members seceding under Forbes Burnham to form the People's National Congress (PNC) and its members of East Indian descent remaining in the ranks.

The PPP won the elections of 1957, and Jagan pursued moderate policies of socioeconomic reform as the new government's minister of trade and industry (there was no prime ministerial position). In the elections of 1961 the PPP emerged with a slim majority, and Jagan became British Guiana's prime minister in that year. He remained committed to establishing a socialist economy within a framework of parliamentary democracy and neutralism in foreign affairs, but his second term was marred by a long general strike and by serious rioting that once again compelled the stationing of British troops in Guiana (1961–64). Under a new system of proportional representation instituted by the British in 1964 to accurately reflect the relative voting strengths of blacks and East Indians, the PPP lost the general elections of 1964 to the PNC. Jagan served as leader of the parliamentary opposition from then on and was the PPP's general secretary from 1970. He became president of Guyana after the PPP won general elections in 1992 and stayed in power until his death.

Jagannātha (Sanskrit: "Lord of the World"), form under which the Hindu god Krishna is worshiped at Puri, Orissa, one of the most famous religious centres of India, and at Ballabhpur, a suburb of Shrīrāmpur, West Bengal. The 12th-century temple of Jagannātha in Puri towers above the town. In its sanctuary, roughhewn wooden images represent Jagannātha, his brother Balabhadra (Balarāma), and his sister Subhadrā. Some scholars suggest Buddhist influence in the threefold nature of the temple image. Modern representations made in Puri of the 10 avatars (incarnations) of Vishnu often show Jagannātha as one of the 10 in place of the more usually accepted Buddha.

The most important of the numerous yearly festivals is the Chariot Festival (Rathayātrā), which takes place on the second day of the bright fortnight of Āṣāḍha (June–July). The image is placed in a wagon so heavy that the efforts of hundreds of devotees are required to move it, and it is dragged through deep sand to the country house of the god. The journey takes several days, and thousands of pilgrims participate. Reports of these processions in the past have been much exaggerated, although accidents are common and occasionally a frenzied pilgrim attempts to throw himself under the wagon. The English word juggernaut, with its connotation of a force crushing whatever is in its path, is derived from this festival.

Jagdalpur, also called JAGADALPUR, city, Madhya Pradesh state, central India, just south of the Indrāvati River. Surrounded by dense forests, it is connected by road with Raipur and Kānker and is heavily engaged in agricultural trade. Sometimes called Bastar, it served as the capital of the former Bastar princely

state. There are two colleges affiliated with Ravishankar University. Pop. (1991) town, 66,154; metropolitan area, 84,578.

Jagello (Lithuanian duke): *see* Władysław II Jagiełło.

Jagersfontein, town, southwestern Orange Free State, South Africa, southwest of Bloemfontein. The town is historically known as a diamond-mining centre. A 50-carat diamond found on a farm in the area in 1870 led to the establishment of the town in 1882 and the opening of a diamond pipe mine six years later. The second and eighth largest rough diamonds ever discovered in the world were taken from this mine—the Excelsior of 995 carats (in 1893) and the Reitz of 650 carats (in 1895; later cut into the Jubilee). The Jagersfontein mine closed during the Great Depression, reopened after World War II, but closed once again in 1970. Sheep are raised in the semi-arid area surrounding the town. Pop. (1991) district, 6,353.

Jaghbūb, al-, also spelled GIARABUB, or JARABUB, oasis, northeastern Libya, near the Egyptian border. Located at the northern edge of the Libyan Desert on ancient pilgrim and caravan routes, it was the centre for the Sanūsī religious order (1856–95) because of its isolation from Turkish and European influence. The sect founded there a religious retreat and its Islāmic university and library. The walled town is dominated by the domed tomb of Sīdī Muḥammad ibn ʿAlī as-Sanūsī al-Kabīr (1791–1859), founder of the order. Its gardens produce dates. There is a road connection with Ṭubruq 180 mi (290 km) north.

Jagiello (Lithuanian duke): *see* Władysław II Jagiełło.

Jagiellon DYNASTY, family of monarchs of Poland-Lithuania, Bohemia, and Hungary

Land of the Jagiellon dynasty, 1490–1526

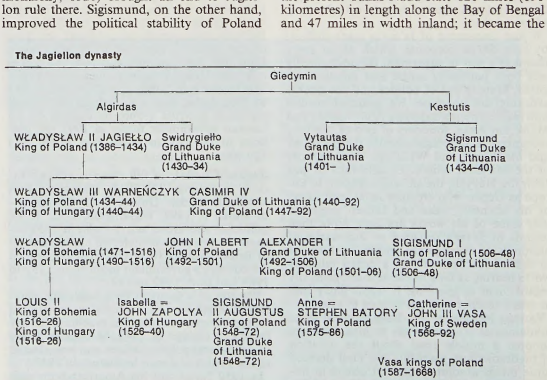
that became one of the most powerful in east central Europe in the 15th and 16th centuries. The dynasty was founded by Jogaila, the grand duke of Lithuania, who married Queen Jadwiga of Poland in 1386 and became King Władysław II Jagiełło of Poland. Thus both Poland and Lithuania were united in the person of their sovereign (who soon, however, appointed a grand duke to rule for him in Lithuania). Together they constituted a formidable power, which defeated their major common enemy, the Knights of the Teutonic Order, at the Battle of Tannenberg (Grünfelde; July 15, 1410).

The dynasty was threatened with division into separate houses and disruption of the federation after Władysław's brother Świdrygiełło was named to replace his cousin Vytautas (Witold) as grand prince of Lithuania (1430). But Vytautas' brother Sigismund defeated Świdrygiełło and became the grand duke (1434). Then, rather than become divided, the dynasty extended its power; Władysław III Warneńczyk, who succeeded his father as king of Poland in 1434, also assumed the throne of Hungary (as Ulászló I) in 1440. After Władysław was killed fighting the Turks at the Battle of Varna (1444), the Poles elected as their king his brother, Casimir IV, who had succeeded the assassinated Sigismund as grand duke of Lithuania in 1440.

Largely sympathetic to the Lithuanian desire for autonomy and determined to create a strong, central royal power, Casimir clashed with the Polish magnates, large landowners who had dominated the earlier Jagiellon reigns, by granting extensive and exclusive rights and privileges to the gentry in order to gain their political and financial support for his active foreign policy. As a result, Casimir was able not only to engage successfully in the Thirteen Years' War (1454–66) against the Teutonic Knights, by which he acquired a large portion of their territory, but also to place his son Władysław on the thrones of Bohemia (as Vladislav II; 1471) and Hungary (as Ulászló II; 1490) and to fight the Turks (1485–89), who had disrupted his kingdom's trade by seizing control of the mouths of the Dniester and Danube rivers.

During the reigns of Casimir's sons John Albert and Alexander I, however, the Jagiellon rulers lost a large degree of their power in Poland to the nobility (as did Władysław in Bohemia and Hungary); and, by weakening their realm, they exposed it to the aggression of the Teutonic Knights and the state of Muscovy, which expanded into Lithuanian territory.

When Sigismund I the Old succeeded his brother Alexander in 1506, the Polish–Lithuanian federation was seriously threatened by foreign invasion as well as by internal decay. Gradually strengthening his government (although not diminishing gentry power), Sigismund used diplomatic means to come to terms with the Holy Roman emperor Maximilian I, who had been encouraging the Teutonic Order and Muscovy to attack Poland and Lithuania. He defeated the Muscovite army at Orsha (1514) and successfully contended with the Teutonic Order so that in 1525 it converted its lands into the secular Duchy of Prussia, which became a Polish fief.

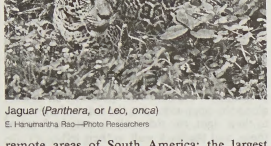


Sigismund's nephew Louis II succeeded Władysław as king of Bohemia and Hungary in 1516, but his death at the Battle of Mohács (at which the Turks destroyed the Hungarian monarchy; 1526) brought an end to Jagiellon rule there. Sigismund, on the other hand, improved the political stability of Poland and Lithuania, incorporated Mazovia into his realm (1526), and also promoted the development of Renaissance culture in Poland.

Nevertheless, the Polish monarchy continued to lose power to the magnates and gentry, which contended with each other for political dominance; and when Sigismund II Augustus ascended the throne (1548), he was obliged to manoeuvre between the magnates and the gentry while maintaining his father's policy of avoiding foreign conflict. But when Livonia sought his protection from Muscovy and incorporation into his realm (1561), he allied with the gentry to finance the major war against Muscovy, which he entered to secure his control over Livonia and the Baltic seacoast. Since Lithuania could not bear the major burden of the war, he tried to create a firmer union between Poland and Lithuania. In 1569 he arranged for the two countries to enter the Union of Lublin and form a Polish–Lithuanian commonwealth. Three years later Sigismund II Augustus died, leaving no heirs, thereby ending the Jagiellon dynasty.

jāgīrdār system (Persian *jāgīr:* "holding land"; and *dār* "official"), form of land tenancy developed in India during the time of Muslim rule (beginning in the early 13th century) in which the collection of the revenues of an estate and the power of governing it were made over to an official of the state. The bestowal of a *jāgīr* on a *jāgīrdār* could be either conditional or unconditional. A conditional *jāgīr* required in reciprocity from the beneficiary some form of public service such as the levying and maintaining of troops for the benefit of the realm. An assignment of land was usually made for life, and, on the death of the holder, the *jāgīr* would again revert to the state, though it was possible for the heir to renew it on payment of a fee.

The system was introduced by the early sultans of Delhi. Being feudalistic in character, it tended to enfeeble the central government by setting up quasi-independent baronies. The practice was slowed by Sultan Ghiyāṣ-ud-Dīn Balban (reigned 1266–87) and abolished by Sultan ʿAlāʾ-ud-Dīn Khaljī (1296–1316), only to be revived again by Sultan Fīrūz Shāh Tughluq (1351–88), from which time it continued. The early Mughal emperors (16th century) wished to abolish it, preferring to reward their officials with cash salaries, but it was reintroduced by the later Mughals and contributed greatly to the weakening of the state. The English East India Company was given a *jāgīr* by the nawab Muḥammad ʿAlī of Arcot in the present Tamil Nadu state 120 miles (190 kilometres) in length along the Bay of Bengal and 47 miles in width inland; it became the



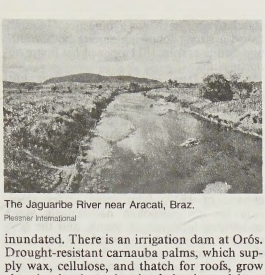
The Jagiellon dynasty

nucleus of the later Madras Presidency. Under the British the old *jāgīrdār* holdings were largely considered the properties of individual families, particularly in the area of Mahārāshtra. With Indian independence, legislative measures were taken to abolish the system of absentee landownership.

Jagoda, Genrikh Grigoryevich (Soviet leader): *see* Yagoda, Genrikh Grigoryevich.

jaguar (*Panthera,* or *Leo, onca*), largest New World member of the cat family (Felidae), found from the U.S.-Mexican border southward to Patagonia, Arg., usually in swamps, jungles, and other wooded regions. It is virtually extinct in the northern part of its range and survives in reduced numbers only in

Jaguar (*Panthera,* or *Leo, onca*)
E. Hanumantha Rao—Photo Researchers



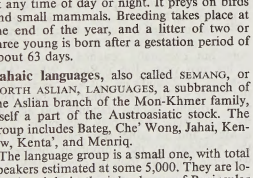
remote areas of South America; the largest known population exists in the Amazon rainforest. Also known as *el tigre* and *tigre Americano,* the jaguar is grouped with such felids as the lion and tiger as one of the big, or roaring, cats. It snarls, growls, and makes deep, hoarse grunts.

The jaguar resembles the leopard but is larger and more heavily built. The male jaguar, which is generally larger than the female, may attain a length of from 1.7 to 2.7 m (5.6 to 9 feet), including the 0.6–0.9-metre tail, with a shoulder height of 0.7–0.8 m; it weighs from 100 to 160 kg (220 to 350 pounds). The jaguars of South America are largest.

The ground colour of the jaguar varies greatly from white to black. The typical coloration is orange-tan with black spots arranged in rosettes with a black spot in the centre. The tail is irregularly marked with black; the nose and upper lip are light reddish brown. Except for its black spots in the rosettes, the coat pattern of the jaguar is similar to that of the leopard.

A solitary predator, the jaguar usually preys on such animals as deer, tapirs, capybaras, birds, and fish; but it will also take cattle, horses, and dogs. It is a savage fighter when cornered but does not normally molest humans. It is swift and agile, enters water freely, and appears to enjoy bathing. In the north it mates toward the end of the year, but in the tropics its mating activity seems not to be restricted to a particular breeding season. After a gestation period of about 100 days, the female bears one to four spotted cubs. The young are raised by the female and generally remain with their mother for approximately two years.

Jaguaribe River, river, Ceará *estado* ("state"), northeastern Brazil. It is formed by the junction of the Carapateiro and Trici rivers (originating in the Serra Grande) and flows northeastward for approximately 350 miles (560 km) to enter the Atlantic Ocean east of Maceió Point. Upstream from Limoeiro do Norte the river branches, converging again about 30 miles (48 km) from its mouth. The Jaguaribe's flow is erratic: long periods of drought during which much of the river is dry are followed by catastrophic floods in which the towns along its lower course are



The Jaguaribe River near Aracati, Braz.
Pleasner International

inundated. There is an irrigation dam at Orós. Drought-resistant carnauba palms, which supply wax, cellulose, and thatch for roofs, grow abundantly along the river's banks and have been used by the Brazilian government in reforestation programs in the northeast.

jaguarundi, also spelled JAGUARONDI (*Felis yagouaroundi*), small, unspotted New World cat (family Felidae), also known as the otter-cat because of its otterlike appearance and swimming ability. The jaguarundi is native to forested and brushy regions, especially those near water, from South America to the southwestern United States; it is, however, very rare north of Mexico.

A sleek, long-bodied animal, it has small ears, short legs, and a long tail. The adult measures from 90 to 130 cm (36 to 52 inches) in length, including the 30- to 60-centimetre tail; stands 25 to 30 cm at the shoulder; and weighs from 4.5 to 9 kg (10 to 20 pounds). There are two colour varieties of the jaguarundi: a reddish brown form, known as the eyra, and a gray form. Kittens of both varieties may appear in one litter.

Jaguarundi (*Felis yagouaroundi*)
Drawing by H. Douglas Pratt

The jaguarundi lives alone and may be active at any time of day or night. It preys on birds and small mammals. Breeding takes place at the end of the year, and a litter of two or three young is born after a gestation period of about 63 days.

Jahaic languages, also called SEMANG, or NORTH ASLIAN, LANGUAGES, a subbranch of the Aslian branch of the Mon-Khmer family, itself a part of the Austroasiatic stock. The group includes Bateg, Che' Wong, Jahai, Kensiw, Kenta', and Menriq.

The language group is a small one, with total speakers estimated at some 5,000. They are located mainly in the inland area of Peninsular Malaysia, though some extend into Thailand.

Jahān Shāh, Jahān also spelled JIHĀN (reigned *c.* 1438–67), leader of the Turkmen Kara Koyunlu (*q.v.,* Black Sheep) in Azerbaijan.

Under Jahān Shāh's rule the Kara Koyunlu extended their domain over Iraq, Fārs, and Eṣfahān (1453). In 1458 he invaded Khorāsān and seized Herāt from the Timurid Abū Sa'īd, but the growing power of the Ak Koyunlu (*q.v.,* White Sheep) under Uzun Hasan (*q.v.*) brought about an agreement between Abū Sa'īd and Jahān Shāh to divide Iran between them. Defeated by the Ottoman Turks in 1461, Uzun Hasan fought the Kara Koyunlu and defeated and killed Jahān Shāh in 1467.

Jahāngīr, also spelled JEHANGIR (b. Aug. 31, 1569, Fatehpur Sīkrī, India—d. Oct 28, 1627, en route to Lahore), Mughal emperor of India from 1605 to 1627.

Born Prince Salīm, Jahāngīr was early marked for the succession by his father, Akbar. Impatient for power, however, he revolted in 1599 while Akbar was engaged in the Deccan. Akbar on his deathbed confirmed Jahāngīr as his successor.

Jahāngīr continued his father's traditions. A war with the Rājput principality of Mewār was ended in 1614 on generous terms. Campaigns against Ahmadnagar, initiated under Akbar's rule, were continued fitfully, with Mughal arms and diplomacy often thwarted by the able Ḥabshī, Malīk 'Ambār. In 1617 and 1621, however, Prince Khurram (later Shāh Jahān; *q.v.*) concluded apparently victorious peaces. Jahāngīr, like his father, was not a strict Sunnite Muslim; he allowed, for example, the Jesuits to dispute publicly with Muslim ulama (theologians) and to make converts.

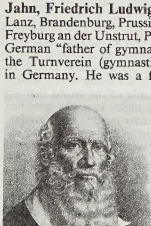
After 1611 Jahāngīr accepted the influence of his Persian wife, Mehr on-Nesā' (Nūr Jahān); her father, I'timād-ud-Dawlah; and her brother Āṣaf Khān. Together with Prince Khurram, this clique dominated politics until 1622. Thereafter, Jahāngīr's declining years were darkened by a breach between Nūr Jahān and Prince Khurram, who rebelled openly between 1622 and 1625. In 1626 Jahāngīr was temporarily placed under duress by Mahābat Khān, another rival of Nūr Jahān's group. Jahāngīr died while traveling from Kashmīr to Lahore.

A heavy drinker and opium eater (until excess taught him comparative moderation), Jahāngīr encouraged Persian culture in Mughal India. He possessed a sensitivity to nature, acute perception of human character, and artistic sensibility, which expressed itself in an unmatched patronage of painting.

Jahannam, Islāmic hell, described somewhat ambiguously in the Qur'ān and by Muḥammad. In one version, hell seems to be a fantastic monster that God can summon at will; in another description, it is a crater of concentric circles on the underside of the world that all souls must cross in order to enter paradise by way of a bridge, narrow as a razor's edge. (The Muslim theologian and philosopher al-Ghazālī considers the bridge in metaphoric terms as the straight path to God that every Muslim is expected to travel.) Punishment in hell is graded and varied according to offenses, and sinners are released only when God wills.

Muslim theologians have attempted to clarify the problems inherent in the Qur'ānic description of hell. Avicenna (Ibn Sīnā), for example, speaks of hell as a state in which souls retain sensual lusts but suffer because they have no bodies with which to fulfill their desires.

jāhiliyah, in Islām, the period preceding the revelation of the Qur'ān to the Prophet Muḥammad. In Arabic the word means "ignorance," or "barbarism," and indicates a negative Muslim evaluation of pre-Islāmic life and culture in Arabia as compared to the teachings and practices of Islām. The term has a positive connotation only in literature; pre-Islāmic Arabic poetry is esteemed by Muslims for its precise and rich vocabulary, sophisticated metrical structures, and fully developed systems of rhyme and thematic sequence.



Jāḥiẓ, al-, in full ABŪ 'UTHMĀN 'AMR IBN BAḤR IBN MAḤBŪB AL-JĀḤIẒ (b. *c.* 776, Basra, Iraq—d. 868/869, Basra), Islāmic theologian, intellectual, and littérateur known for his individual and masterful Arabic prose.

His family, possibly of Ethiopian origin, had only modest standing in Basra, but his intellect and wit gained him acceptance in scholarly circles and in society. During the reign of the 'Abbāsid caliph al-Ma'mūn, al-Jāḥiẓ moved to the regime's capital, Baghdad. He did not take a position at court but supported himself, at least in part, with contributions from patrons, often of high rank, in return for the dedications of his books. When the court moved to Sāmarrā', al-Jāḥiẓ journeyed there, but shortly before his death he retired to Basra.

Few of his treatises on theology and politics are extant; some are known only from quotations by other authors. His prose masterpieces, however, are available. These essays are at the same time anthologies in which poetry, jokes, and anecdotes, however obscure or daring, have been introduced by al-Jāḥiẓ to illustrate his points. His unfinished *Kitāb al-ḥayawān* ("Animals"), in seven volumes, is a bestiary drawing on Aristotle and also an anthology of Arabic literature with animal themes to which theological, sociological, and linguistic discussions have been added. *Kitāb al-bayān wa al-tabyīn* ("Elegance of Expression and Clarity of Exposition"), another long work, treats literary style and the effective use of language. *Kitāb al-bukhalā'* ("Book of Misers") is a collection of stories about the avaricious. Al-Jāḥiẓ, in effect, provides in his works an entire education in the humanities of his time.

Although noteworthy for his intellectual freedom, al-Jāḥiẓ often supported government policy in his writings. He was, for example, part of the rationalist Mu'tazilite school of theology supported by the caliph al-Ma'mūn and his successor. When Mu'tazilism was abandoned by the caliph al-Mutawakkil, al-Jāḥiẓ remained in favour by writing essays such as *Manāqib at-turk* (Eng. trans., "Exploits of the Turks," in *Journal of the Royal Asiatic Society*, 1915), a discussion of the military qualities of the Turkish soldiers, on whom government policy depended.

Jahn, Friedrich Ludwig (b. Aug. 11, 1778, Lanz, Brandenburg, Prussia—d. Oct. 15, 1852, Freyburg an der Unstrut, Prussian Saxony), the German "father of gymnastics" who founded the Turnverein (gymnastic club) movement in Germany. He was a fervent patriot who

Jahn, lithograph by Georg Engelbach
Historia-Photo

believed that physical education was the cornerstone of national health and strength and important in strengthening character and national identity.

Jahn studied theology, history, and philology (1796–1802) at the universities of Halle, Frankfort an der Oder, Göttingen, and Greifswald. He spent the next years tutoring, travelling, and attending classes at Jena and Göttingen. In 1809 he settled in Berlin, where he held several teaching positions at secondary schools. There he began a program of outdoor physical exercise for students. He invented the parallel bars, the rings, the balance beam, the horse, and the horizontal bar, which became standard equipment for gymnastics. He established a strong following among both youths and adults and in 1811 opened his first gymnastic club.

In 1813 Jahn joined the volunteer Lützow corps and commanded its third battalion until after the fall of Napoleon in 1815, returning then to Berlin and resuming work as a state teacher at his gymnastic club. *Deutsche Turnkunst zur Einrichtung der Turnplätze (A Treatise on Gymnastics*, 1828), written with Ernst Eiselen, was published in 1816. In the politically reactionary climate of 1819, Jahn came under suspicion for his outspoken nationalistic views and strong influence on youth, and the government arrested him, closed his gymnastic club, and imprisoned him for almost a year. After his release he was confined to the city of Kolberg until 1825, when he was given his freedom. He was forbidden, however, to live in a city with a university or a secondary school, and so he moved to Freyburg an der Unstrut, where he lived the rest of his life. Jahn was awarded the Iron Cross for military bravery in 1840. Two years later a national ban on gymnastics, which had been in effect since 1819, was lifted. He served in the national parliament (1848–49).

Jahn wrote a vigorous defense of cultural nationalism, based on his investigation of the German language and culture, *Das Deutsches Volkstum* ("German Nationality"; 1810).

Jahra, al-, town and *muḥāfaẓah* (governate) in central Kuwait. Located about 30 mi (50 km) west of Kuwait city, the oasis town is the capital of the *muḥāfaẓah*. It is the centre of the country's principal agricultural region, producing primarily fruits and vegetables. Al-Jahra *muḥāfaẓah* is 4,33 9 sq mi (11,176 sq km) in area. Although it comprises about two-thirds of the area of Kuwait, most of the *muḥāfaẓah* is sparsely populated desert. Pop. (1980), town, 67,311; *muḥāfaẓah*, 190,820.

jahrzeit (Judaism): *see* yahrzeit.

Jahwarid DYNASTY, Muslim Arab dynasty that ruled Córdoba, Spain, after the dissolution of the Umayyad caliphate of Córdoba (1031), one of the party kingdoms (*ṭā'ifahs*). Years of civil war following the breakdown of central caliphal authority in 1008 prompted the Cordoban council of notables, led by a prominent aristocrat, Abū al-Ḥazm Jahwar ibn Jahwar, to abolish the institution of the caliphate and proclaim Córdoba a republic. Jahwar was elected head and, as virtually an absolute sovereign ostensibly assisted by a council, restored peace and economic prosperity in his 12-year-reign (1031–43). His son Abū al-Walīd Muhammad ar-Rashīd (reigned 1043–58) managed through political chicanery to keep the 'Abbādids of Seville out of Córdoba but eventually resigned his authority to his own vizier, Ibn ar-Raqā. When 'Abd al-Malik, ar-Rashid's jealous son, assassinated the vizier in 1058, his father rewarded him with virtually caliphal standing and authority in the state. Extremely unpopular, 'Abd al-Malik and his father were handed over to the 'Abbādids by the Cordobans themselves when the Abbādids took the city in 1069.

jai alai, ball game of Basque origin played in a three-walled court with a hard rubber ball that is caught and thrown with a cesta, a long, curved wicker scoop strapped to one arm. Called *pelota vasca* in Spain, the Western Hemisphere name jai alai (Basque "merry festival") was given to the game when it was imported to Cuba in 1900.

History. Jai alai developed from a form of handball, and it is presumed that the availability of a lively ball made possible by the introduction of rubber to Europe from South America permitted players to speed up the game. The next step, it is thought, was the introduction of the *guante*, a simple leather glove worn on the right hand, which in turn led to the use of a flat wooden bat, or *pala*. A cartoon for a tapestry by Goya in the Prado museum, Madrid, "Juego de Pelota" (1777–90), depicts such a bat in use on a one-walled court. Later the *guante* developed into a catching and throwing device leading finally to the evolution of the cesta, at first a short implement but now about .76 metre (2.5 feet) long, gracefully curved and efficient, with which the player can catch the ball and hurl it with tremendous power and speed. Each cesta is custom-made of Pyrenees Mountain reeds woven over a light, ribbed frame of Spanish chestnut; a leather glove sewn to the outside holds the player's hand securely. The *pelota* (*q.v.*, Spanish "ball") is a little smaller than a baseball and harder and heavier than a golf ball. It is made of hand-wound virgin rubber with a few final turns of linen or nylon thread and covered with two layers of hardened goat skin, the outer layer of which can be replaced. In play, speeds of 240 kilometres (150 miles) per hour are not uncommon. Professional players have worn protective helmets in the United States since 1967.

The court and the fronton. The modern three-walled playing court, or cancha, averages about 53.3 m long by 15.2 m wide and is 12.2 m or more high. The walls and the floor are made of special material to withstand the pounding of the ball. The spectators sit in tiers along the open side with the front of the court to their right, the side wall directly in front of them, and the back wall to their left.

The entire plant is the fronton; some Basque frontons date from as early as 1785. The game is played professionally in 10 frontons in Spain: 5 in the Basque country, of which the one in Guernica is the finest; 2 in Barcelona; and one each in Palma de Mallorca, Zaragoza, and Madrid. It is also played in southern France and in Milan. In the Western Hemisphere it is popular in Mexico, where there are two frontons in Mexico City and one each in Acapulco and Tijuana. It was played in the United States in the 1920s and 1930s, first in Chicago and then in New Orleans, but in both places it was withdrawn after the gambling laws were changed to ban betting on the game; it was demonstrated without wagering in New York City in 1938. The Miami fronton, with 5,100 seats, the world's largest, was the only one in the United States when Florida adopted a law in 1935 permitting pari-mutuel wagering on the sport. Since that time professional courts have been established at Tampa, West Palm Beach, Daytona Beach, Orlando, and Dania (all in Florida) and in Hartford, Conn. The game was popular in Cuba before it was banned after the revolution in 1959, and there are two frontons in the Philippines. Except for the United States, where there are only two frontons for amateurs, it is a popular amateur sport wherever it is played professionally.

Players. First-class players traditionally have come from the Basque country. Outstanding contemporaries include Juan Cruz Bustinduy (playing name Juaristi) and Francisco Asis in the front court and Ramon Soroa and Tomás Cortajarena in the back court. Most players reach their top form in their late 20s or early 30s, but one of the greatest of all time was Erdoza Menor, who played until he was in his 50s; he dropped dead on the court of a heart attack. Management of the fronton in Miami supports training schools in Spain for the development of young players, the one at Guernica having graduated many of the world's greatest. There is also a school at Miami where promising young amateurs may receive four or five years of training for a professional career.

The game. The principles of the game are very simple. The ball is served against the front wall and must land in a designated serving zone; the opposing player in the case of

singles, or one of the opposing partners in doubles games, must catch and return the ball before it touches the floor more than once. The ball must be caught and thrown in one continuous motion. The object is to bounce the ball off the front wall with such speed and English (spin) that the opposition cannot return it and loses the point. Play continues until the ball is missed or goes out of bounds. The ball is out of bounds if it strikes the area clearly marked in red around the front wall, strikes the overhead screen above the court or any other area marked in red or outside the foul line. If a player stops his throw because another player is in front of him, interference may be called, and the point will be played over.

The basic game played outside the United States, *partidos*, is a match singles or doubles game to 10 to 40 points. Betting is on the eventual outcome of the game, at any time during the game. As the points fluctuate, so does the spread of the odds. The American game is adapted to the pari-mutuel system. Six to eight one- or two-member teams compete for five to seven points. Two players or teams play for one point, the losing side retiring from the court and the winning side continuing to play until it loses a point and is retired or wins enough points to win the game; playoffs determine second (place) and third (show) positions. Betting is the same as at horse races, each player being identified by a number that is called his "post position." Under the American Qualifying Point System eight post positions (players or teams) play for five points. Play follows the usual elimination system until three positions have made three points each; the three then play off for win, place, and show places. The popular quiniela wager, in which the bettor picks two players or teams to finish first and second, in either order, was originated for jai alai wagering in the 1930s by Richard I. Berenson, former president of the Miami fronton. The quiniela wager has since flourished at horse races, dog races, and other events throughout the world. The quiniela in jai alai wagering was followed by the perfecta, in which the bettor must pick first and second in that order. Horse racing's daily double, the selection of the winners in two different events, also became popular in jai alai; and a Big Q., picking the quiniela in two events, was later introduced. (L.S.B.)

Jaime (Spanish personal name): *see under* James.

Jaina canon, the sacred texts of Jainism, a religion of India, whose authenticity is disputed between sects. The Svetambara canon consists principally of 45 works divided as follows: (1) 11 Aṅgas, the main texts—a 12th has been lost for at least 14 centuries; (2) 12 Upāṅgas, or subsidiary texts; (3) 10 Prakīṛṇakas, or assorted texts; (4) 6 Cheda-sutras on the rules of ascetic life; (5) 2 Cūlikā-sutras on cognition and epistemology; and (6) 4 Mūla-sutras on miscellaneous topics. Svetambara, however, originally accepted a canon of 71 works said to derive from a 5th-century religious Council of Valabhī.

The Svetambara works cover a variety of topics, including a list of the Tirthankaras, or Jinas (Jaina saviours), exploits and teachings of these figures, and doctrines. Some of the Aṅgas contain supposed dialogues between Mahāvīra, the most recent Tirthankara, and his followers. Others are said to retain some of the earliest parts of the canon, which appears to have been preserved originally in oral form. The canon is written in the Prākrit dialect, though from the Gupta period (4th–6th century AD) Jaina writers have used Sanskrit for a wider audience.

The Digambara sect disputes the authenticity of the entire Svetambara canon. The Digambara believe that the original is lost but that the substance of Jaina doctrine has been preserved in a variety of religious and philosophic texts written by various leaders and scholars of the Jaina community over the centuries.

Jaina painting: *see* Western Indian painting.

Jaina vrata (Sanskrit *vrata,* "vow"), in Jainism, a religion of India, any of the vows that govern the activities of both monks and laymen. The *mahāvratas,* or five great vows, are undertaken for life only by ascetics. They are (1) noninjury, (2) abstention from lying, (3) nonstealing, (4) chastity, and (5) lack of all possessions.

The layman is not expected to be able to observe such vows strictly or perfectly while living the life of a householder. If he has passed through the preliminary stages of spiritual discipline (*guṇasthāna*), he may promise to observe 12 vows for a stated period of time and may if he wishes renew the pledge at the completion of that time.

The first five vows are called *aṇuvratas,* "partial (literally "tiny," as contrasted with *mahā,* "big") vows," and are more moderate versions of the *mahāvratas*: abstinence from gross violence, gross falsehood, and gross stealing; contentment with one's own wife; and limitation of one's possessions. The remaining vows are the three *guṇavratas* and the four *śikṣā-vratas,* which are intended to help and encourage in the observance of the *aṇuvratas.* Though the lists of these commands differ, they generally include retreat or restriction of the area of one's movements; retreat or abstention from harmful punishment; retreat from or limitation of the use of objects of enjoyment and comforts; the practice of equanimity; spending some time fasting in the fashion of a monk and observing diet control; giving offerings, gifts, and services to monks and others; and voluntarily dying by self-starvation (*sallekhanā*) when the observance of vows becomes physically impossible.

Consult the INDEX *first*

Jainism, a religion and philosophy of India, founded in about the 6th century BC by Vardhamāna, who is known as Mahāvīra ("Great Hero")—the 24th of the Tirthankaras ("Fordmakers"), Jinas ("Conquerors"; whence the name Jainism), the great religious figures on whose example the religion is centred—in protest against the orthodox Vedic (early Hindu) ritualistic cult of the period; its earliest proponents may have belonged to a sect that rebelled against the idea and practice of taking life prevalent in the Vedic animal sacrifice.

A brief treatment of Jainism follows. For full treatment, *see* MACROPAEDIA: Jainism.

Jainism, which does not espouse belief in a creator god, has as its ethical core the doctrine of ahiṃsa, or noninjury to all living creatures, and as its religious ideal the perfection of man's nature, to be achieved predominantly through the monastic and ascetic life.

History. According to Jains their faith is eternal and has been revealed through the successive ages of the world by the Tirthankaras, each of whom attained perfection and absolute freedom and then preached Jainism to the world. The first Tirthankara, Ṛṣabha, is thus the traditional founder of Jainism, but though his name occurs in the Vedas and the Purāṇas very little else is known of him; nor is there historical evidence of the other Tirthankaras until Pārśva, the 23rd in the line, who is thought to have died in the late 8th century BC.

The actual and historical founder of Jainism was Mahāvīra, who was born *c.* 599 BC near Patna in what is now Bihār state. His father was a ruling Kshatriya (the second of the four Hindu social classes), chief of the Nāta clan. Mahāvīra was an elder contemporary of Siddhārtha Gautama (the Buddha) and is referred to in Buddhist writings as Nātaputra ("Son of the Nāta"). When he was about 28 years of age he took up the life of an ascetic. After years of hardship and meditation he attained enlightenment; thereafter he preached Jainism for about 30 years and died at Pāvā (also in Bihār) in 527 BC. Pāvā has been, since then, one of the chief places of Jain pilgrimage; Dewali, the Hindu New Year festival, is a day of great pilgrimage for Mahāvīra.

Jainism has never been torn by philosophic dispute, but from the beginning it was subject to schismatic movements. In the 4th or 3rd century BC the Jains began to split into two sects on points of rules and regulations for monks, a rift which was complete at least by the end of the 1st century AD. The Digambaras ("Sky-clad"; *i.e.,* naked) hold that an adherent should own nothing, not even clothes. They also believe that salvation is not possible for women. The Svetambaras ("White-robed") differ from them on these points.

Literature. According to the Svetambaras, the sacred literature preserved orally since Mahāvīra was systematized and written down by a council convened about the end of the 4th century BC, but it is generally agreed that it was not given its present shape until some 800 years later (AD 454 or 467). The Svetambara canon (agama) consists of 45 texts: 11 Aṅgas ("Parts")—a 12th, the Dṛṣṭivāda, is not extant—12 Upāṅgas (subsidiary texts), 4 Mūla-sutras (basic texts), 6 Cheda-sutras (concerned with discipline), 2 Cūlikā-sutras (appendix texts), and 10 Prakīṛṇakas (mixed, assorted texts). Digambaras give canonical status to two principal works in Prākrit: the Karmaprabhṛta ("Chapters on *Karman*") and the Kaṣāyaprābhṛta ("Chapters on *Kaṣāyas*") and accord great respect to several other works and commentaries.

Philosophy. Jain metaphysics is a dualistic system dividing the universe into two ultimate and independent categories: soul or living substance (jiva), which permeates natural forces such as wind and fire as well as plants, animals, and human beings; and non-soul, or inanimate substance (ajiva), which includes space, time, and matter.

The next most important concept is that of karma, which, in contrast to the more abstract Hindu-Buddhist conception of the principle, is regarded in Jainism as a substance, subtle and invisible, yet material, which flows into and clogs the jiva, causing the bondage of life and transmigration. This inflow can be stopped by many lives of penance and disciplined conduct, resulting in the final moksha, or liberation, the ultimate goal of human endeavour. Souls are divided into those that have attained perfection and those still in bondage.

Ethics. The Jain ethic is a direct consequence of the philosophy of soul and karma. Since the individual's primary duty is the evolution and perfection of his soul and that of his fellow creatures, ahiṃsa, or the refraining from harming any living being, is the cardinal principle. Jains build asylums and rest houses for old and diseased animals, where they are kept and fed until they die a natural death. The three ideals of *samyagdarśana* ("right belief"), *samyagjñāna* ("right knowledge"), and *samyakcārita* ("right conduct") are known as the three jewels, or *ratnatraya.*

Mythology and cosmology. Lesser gods are classified into four main groups: *bhavanavāsīs* (gods of the house), *vyantaras* (intermediaries), *jyotiṣkas* (luminaries), and *vaimānikas* (astral gods). These are each subdivided into several groups. Besides these, certain other gods and goddesses are mentioned in various Jaina texts,

including several that suggest Hindu influence or borrowing from some common ancient Indian heritage. All these deities are assigned a position subordinate to the Tirthankaras and other liberated souls.

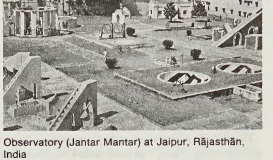
Time is conceived as eternal and formless. The world is infinite and was never created. Space (*ākāśa*), all-pervasive and formless, provides accommodation to all objects of the universe and is divided into the space of the universe (*lokākāśa*) and that of the non-universe (*a-lokākāśa*), the latter having no substance in it. Through the centre of the universe runs the region of mobile souls in which all living beings, including men, animals, gods, and devils, live. Above the central region is the upper world of two parts; below it lies the lower world subdivided into seven tiers.

The Jains have erected monumental stupas in honour of their saints, and the richness and quality of their architecture and carving in stone have few equals. Jaina temples generally contain a number of metal images of various types and metal plaques depicting auspicious symbols.

Jainism preaches universal tolerance, and its attitude toward other forms of religion is that of noncriticism. It is not competitive and has never cared for the spread of its faith. Among its followers are the traders and merchants of Gujarāt and Mahārāshtra states.

Jaintia, in Indian history, a state in Assam, in northeastern India, stretching from what is now the northern frontier between Bangladesh and India over the Jaintia Hills to the Kalong River in the Assam plain. The people were of Khāsi origin.

In 1824, when the Burmese invaded Assam, the Raja allied with the British, who annexed his territory in 1832. Bengali traders and European tea planters moved in, producing tension that led to a rebellion in 1862. This was suppressed in a campaign that led to criticism of severity of British authorities in India.



Jaintia Hills, physical region, eastern Meghālaya state, northeastern India. The sparsely populated mountainous region (part of the Meghālaya plateau) has an average elevation of more than 3,000 feet (900 m). It receives generally heavy rainfall and is densely forested. Fine woods are produced, but there is little industry. The Kopili River, which is the largest stream in the region, is rocky and swift and has many spectacular waterfalls. There are several species of rare wildlife.

The inhabitants of the Jaintia Hills are primarily tribal Jaintias, who, like the Khāsis to the west, are thought to be descendants of the first Mongolian migration to India. Until the 19th century, these people had a three-tiered system of administration. Under British rule, however, this system was broken down, and after independence it was replaced by a district council for tribal affairs and an Indian officer who administered other matters.

Partly because of their isolation, the Jaintias have largely maintained their matriarchal culture. They still practice shifting cultivation (potatoes are the main crop), though the Indian government attempted—with some success—to promote settled farming. Jaintias more than other tribal groups of the region have been influenced by Hinduism and Aryan ways, and thus settled farming was more readily accepted in the Jaintia Hills.

While the region remains isolated and less developed than much of India, British hegemony and its aftermath brought about a remarkable degree of unity among the peoples of the hill districts of Meghālaya.

Jaipur, city, capital of Rājasthān state, northwestern India. A walled town surrounded (except to the south) by hills, Jaipur was founded in 1727 by Maharaja Sawai Jai Singh to replace Amber as the capital of the princely state of Jaipur (founded by the Rājputs in the 12th century AD). Known for its beauty, the city is unique in its straight-line planning; its buildings are predominantly rose-coloured, and it is sometimes called the "pink city."

Observatory (Jantar Mantar) at Jaipur, Rājasthān, India
Harrison Forman

Jaipur has major road, rail, and air connections and is a commercial trade centre. Industries include engineering and metalworking, handloom weaving, distilling, and the manufacture of glass, hosiery, carpets, blankets, shoes, and drugs. Jaipur's famous arts and crafts include the making of jewelry, enamel, metalwork, and printed cloths, as well as stone, marble, and ivory carving.

The chief buildings are the city palace, an 18th-century open-air observatory (Jantar Mantar); Hawā Mahal (Hall of Winds); Rām Bāgh palace; and Nāhargarh, or Tiger Fort. Other public buildings include a museum and a library. Jaipur is the seat of the University of Rājasthān, founded in 1947.

The city is surrounded by fertile alluvial plains to the east and south and hill chains and desert areas to the north and west. Bajra (pearl millet), barley, gram (chick-pea), pulses, and cotton are the chief crops grown in this region; iron-ore, beryllium, mica, feldspar, marble, copper, and garnet deposits are worked. Pop. (2001 prelim.) city, 2,324,319.

Jaisalmer, city, western Rājasthān state, northwestern India. Connected by road with Jodhpur, Barmer, and Phalodi, the city is a major caravan centre, trading in wool, hides, salt, fuller's earth, camels, and sheep. Jaisalmer, noted for its buildings of yellowish-brown stone, was founded in 1156 by Rāwal Jaisal, a chief of the Rājputs (the warrior rulers of the historic region of Rājputāna). The fort, on a hill that overlooks the city, houses the royal palace, several ancient Jaina temples, and a library called the Gyāna Bhandār (A Store of Knowledge), which contains old Sanskrit and Prākrit manuscripts.

The surrounding region, once a princely state, consists almost entirely of sandy waste, forming part of the Great Indian (Thar) Desert. The Kakni, the only river, spreads over a large area, forming Bhij Lake. Bajra (pearl millet) and jowar (sorghum) are the chief crops. The breeding of goats, camels, sheep, and cattle is widespread, and limestone, fuller's earth, and gypsum deposits are worked.

In the 12th century Jaisalmer state reached the height of its power. After the sack of the capital by the Muslim Delhi emperor 'Alā'-ud-Dīn Khalji early in the 14th century, its fortunes declined. It subsequently became a Mughal fiefdom and entered into political relations with the British in 1818. In 1949 it joined the state of Rājasthān. Pop. (2001 prelim.) 58,286.

Jājau, Battle of (June 12, 1707), decisive engagement over succession to the Mughal throne of India, following the death of the emperor Aurangzeb, and fought at Jājau, a few miles south of Āgra on the Yamuna River. The crown passed to Aurangzeb's eldest surviving son, Bahādur Shāh.

After Aurangzeb died on March 3, 1707, the contest was between Bahādur Shāh, governor of Kābul in Afghanistan, and his next brother, 'Azam Shāh. Careful preparations and quick movements enabled Bahādur Shāh to reach Āgra on June 12 and to secure the imperial treasure. Both sides numbered more than 100,000 combatants, the exact numbers being uncertain, but Bahādur Shāh was stronger in artillery. This advantage, with the desertion of part of 'Azam Shāh's support and a shortage of water in intense heat, decided the day. Both 'Azam Shāh and his son Bīdār Bakht were killed.

Jajce, town in Bosnia and Hercegovina, 29 miles (47 km) south of Banja Luka, on the Vrbas River. The ancient capital of the Bosnian kings, it fell to the Turks in 1461, when the last king was executed. It was taken again, by Hungary, and was the centre of the banat of Jajce in 1463–1528. The Turks returned in 1528 and remained for 350 years. Austrian occupation began in 1878, and Jajce was the scene of local resistance. The town became part of Yugoslavia after World War I. During World War II it was the base of operations for the Communist resistance forces under Marshal Tito. Jajce was the site of the second session of the provisional parliament that drafted the postwar constitution and founded the Federal Republic of Yugoslavia on Nov. 29, 1943.

Jajce is a tourist attraction, noted for its much photographed and publicized Turkish wooden water mills on the rapids of the Pliva River. The falls of the Pliva into the Vrbas canyon are nearby. Two hydroelectric stations are on the Pliva and Vrbas rivers, and an electrochemical plant produces calcium carbide. Pop. (1991) 13,600.

jajmānī system, reciprocal social and economic arrangement between families of different castes within a village community in India, by which one family exclusively performs certain services for the other, such as ministering to the ritual, barbering, or providing agricultural labour. These relations continue from one generation to another, and payment is normally made in the form of a fixed share in the harvest (*e.g.*, a fixed amount of grain) rather than in cash. The patron family is called *jajmān* (from Sanskrit *yajamāna*, "sacrificial patron who employs priests for a ritual"); the client family is the *jajmānī*. The patron family itself can be the client of another whom it patronizes for certain services and by whom it is in turn patronized for other services. The hereditary character allows for certain forms of bond labour, since it is the family obligation to serve its hereditary patrons.

Consult the INDEX *first*

Jakarta, formerly (until 1949) BATAVIA, or (1949–72) DJAKARTA, largest city and the capital of the Republic of Indonesia. Located at the mouth of the Ciliwung (Liwung River) on the northwestern coast of the island of Java, the city is coextensive with the metropolitan district of Jakarta Raya and in 1966 was designated a special capital region (*daerah khusus ibukota*), a status approximating that of a state or province. Jakarta, long a major centre for trade and finance, has also developed into an important centre for industry and education.

A brief treatment of Jakarta follows. For full treatment (including a map), *see* MACROPAEDIA: Jakarta.

Jakarta occupies a low, flat alluvial plain

that is easily flooded during the rainy season. Its tropical climate is characterized by high temperatures and rainfall, together producing oppressive humidity that averages between 75 and 85 percent.

Jakarta has undergone tremendous growth and development since Indonesia reached independence in 1949. As the national capital and the chief centre of state planning, the city contains government ministries that are economically significant. It is also a major centre for trade: east of the city, Tanjungpriok, the largest port in Indonesia, handles exports from western Java and imports, many of which are transshipped to other Indonesian islands. Banking and commerce remain concentrated in the city centre, while new housing and industrial development are concentrated on the city's outskirts. Jakarta's manufacturing sector is minor compared to the city's service and trade functions. The chief industrial establishments are iron foundries, margarine and soap factories, and breweries.

A mixture of Western and Oriental architectural styles is everywhere apparent in Jakarta. The large public squares, such as Medan Merdeka (Freedom Field) and Lapangan Banteng (Place of the Gaur), are British and Dutch in character, whereas the Oriental style is evident in the city's types of houses, the wide, tree-lined streets, and the spacious gardens and house lots. The kampong (village) house, often built from wood or bamboo mats, is found in large concentrations throughout the city. Kampongs are often substandard, and housing in the city is generally overcrowded. Traffic jams occur during morning and evening rush hours, and the *betjak* (two-passenger tricycle taxi) is still common in local neighbourhoods. Large, modern stores in the main shopping areas contrast with the colourful markets and open-air shops.

The Kota (Fort), or Old City, remains the central business district and the financial capital of Indonesia. It also contains several buildings from the colonial period, notably the Old Portuguese Church and the old city hall, now a museum. In the present city centre, north of Medan Merdeka, is the Presidential Palace, also dating from colonial times, and the National Monument, which, at 360 feet (110 m), is one of the highest structures in Jakarta. The nearby Istiqlal Mosque was designed to be the largest in Indonesia. Other major architectural features include the 14-story Indonesia Sheraton (originally the Hotel Indonesia), the city's first high-rise building, and the Senayan Sports Complex.

Jakarta's cultural life is greatly enhanced by its many institutions of higher education. The largest and best-known is the Universitas Indonesia. Jakarta is an important centre for newspaper publishing, and the national radio and television networks broadcast programs from the city. Traditional arts, such as wayang dance and dramas, gamelan music, and wayang puppetry, are presented at the annual Jakarta Fair and at the Taman Ismail Marzuki centre.

Local transportation is provided by bus and rail services; railways and roads, radiating east, west, and south, connect Jakarta with the productive areas of eastern and central Java and with the major cities. Jakarta has two airports that operate domestic and international flights. Area 256 square miles (664 square km). Pop. (1995 est.) 9,112,652.

Jakarta Zoological Gardens: *see* Ragunan Zoological Gardens.

Jakob Thorarensen (Icelandic poet): *see* Thorarensen, Jakob.

Jakobshavn, Greenlandic ILULÍSSAT, town on the west coast of Greenland, near the mouth of Jakobshavn Fjord on Disko Bay. The town's first permanent houses were built by Danes in 1741 on the site of a Greenlandic (Eskimo) settlement. It was named in honour of Jakob Severin, who, in a 1739 naval battle, defeated four Dutch vessels in Disko Bay. Jakobshavn was the birthplace of the explorer Knud Rasmussen. The town has a number of 18th-century buildings, two small harbours, a shrimp canning plant, a memorial to Rasmussen, and a heliport. The town's Greenlandic name means "icebergs." Pop. (1999 est.) 4,629.

Jakobson, Roman, Russian ROMAN OSIPOVICH JAKOBSON (b. Oct. 11 [Sept. 29, Old Style], 1896, Moscow, Russia—d. July 18, 1982, Boston, Mass., U.S.), Russian born American linguist and Slavic-language scholar, a principal founder of the European movement in structural linguistics known as the Prague school. Jakobson extended the theoretical and practical concerns of the school into new areas of study.

In 1928 Jakobson, with his colleagues of the Prague school, including Nikolay Trubetskoy (*q.v.*), announced a radical departure from the classical structural position of the influential Swiss linguist Ferdinand de Saussure. They suggested that their methods of studying the function of speech sounds could be applied both synchronically, to a language as it exists, and diachronically, to a language as it changes. Among his earlier works were *Remarques sur l'évolution phonologique du russe comparée à celles des autres langues slaves* (1929; "Comments on Phonological Change in Russian Compared with That in Other Slavic Languages") and *Kharakteristichke yevrazi-yskogo yazykovogo soyuza* (1931; "Characteristics of the Eurasian Language Affinity").

Jakobson began his association with Masarykova University (now the Purkyně University) of Brno, Czech., in 1933, becoming professor of Russian philology (1934) and Czech medieval literature (1936) there. The European political situation, however, compelled him to flee successively to the universities of Copenhagen, Oslo, and Uppsala, Swed., where he served as visiting professor. In 1941 he reached New York City, where he taught at Columbia University (1943–49). He was professor of Slavic languages and literature and general linguistics at Harvard University (1949–67).

The titles of Jakobson's works indicate the expanding scope of his research—*e.g., Kindersprache* and *Aphasie und allgemeine Lautgesetze* (both 1941; *Studies in Child-Language* and *Aphasia*). Among his later works are *Preliminaries to Speech Analysis* (1952), a pioneering work in the distinctive feature analysis of speech sounds, written in collaboration with C. Gunnar, M. Fant, and Morris Halle, and *Fundamentals of Language* (1956; rev. ed. 1971), also with Halle. Jakobson's *Selected Writings,* 6 vol. (1967–71), are concerned with phonological studies, the word, language, poetry, grammar, Slavic epic studies, ties, and traditions. His *The Sound Shape of Language,* with Linda R. Waugh, was published in 1979.

Jakobstad (Finland): *see* Pietarsaari.

Jakpa, Sumalia Ndewura (fl. 17th century), African king who founded a dynasty in Gonja, in what is now northern Ghana, in the early 17th century.

Originally a Mande invader, Jakpa established a loosely knit federation of states that extended over the entire northern part of present-day Ghana and parts of Togo and Benin. Jakpa's invasion of Ghana was probably the result of a dispute within an Islāmic force (of which he himself was part) then attempting to convert nations in what are now Mali and Burkina Faso (formerly Upper Volta). His kingdom was of great influence in West Africa because of its strategic location on the east–west trade routes between Central Africa and the Islāmic African nations in the southern Sahara. The kingdom was reduced in size and influence in the 18th century.

The name Jakpa is itself a title, and there is some doubt whether the events attributed to this ruler are those of Sumalia Ndewura (the first Jakpa) alone or are the combined record of a series of rulers assuming this title. *See also* Guang.

Jakun, any member of an aboriginal people found in the interior eastern portions of the Malay Peninsula. The major Jakun subgroups include the Biduanda, Mantera, Orang Laut, Orang Kanak, and Orang Ulu. The combined population was about 20,000 in the late 20th century. Later invaders from the highly developed states of Sumatra occupied the coasts of Malaya and often amalgamated with the Jakun. Those natives who resisted the newcomers finally retired to the interior, and they still retain much of early Malayan culture. In physical type the Jakun are basically southern Mongoloids as distinguished from neighbouring peoples, the Senoi and Semang; their language is archaic Malay.

Jakun houses of bamboo and thatch stand in jungle clearings where dry-land rice, sweet potatoes, millet, and other crops are raised; these are supplemented by jungle products and game hunted with blowgun and poison darts. Several family clearings make up a settlement, each settlement having a headman who is the leader in raids and in the search for game.

In common with many other Malayan peoples, the Jakun believe in multiple souls for humans, other animals, plants, and even inanimate objects. It is held that souls may leave their hosts and that they may be enticed or coerced by magic. It is thought that the souls of the right-hand side of an individual go to an afterworld at death, but that those of the left side wander on earth. Religion is centred upon many superior beings and family ancestors, for whom ceremonies are conducted by mediums.

JAL: *see* Japan Air Lines Co., Ltd.

Jalāl ad-Dīn ar-Rūmī, also called by the honorific MAWLĀNĀ (b. *c.* Sept. 30, 1207, Balkh, Ghūrid empire [now in Afghanistan]—d. Dec. 17, 1273), the greatest Ṣūfī mystic and poet in the Persian language, famous for his lyrics and for his didactic epic *Maṯnavī-ye Maʿnavī* ("Spiritual Couplets"), which widely influenced Muslim mystical thought and literature. Rumi's influence on Turkish cultural life can scarcely be overstated. After his death, his disciples were organized as the Mawlawīyah order, called in the West the Whirling Dervishes.

Jalāl ad-Dīn's father, Bahāʾ ad-Dīn Walad, was a noted mystical theologian, author, and teacher. Mainly because of the threat of the approaching Mongols, Bahāʾ ad-Dīn and his family left their native town in about 1218. According to a legend, in Nīshāpūr, Iran, the family met Farīd od-Dīn ʿAṭṭār, a Persian author of mystical epics, who blessed young Jalāl ad-Dīn. After a pilgrimage to Mecca and journeys through the Middle East, Bahāʾ ad-Dīn and his family reached Anatolia (Rūm, hence the surname Rūmī), a region that enjoyed peace and prosperity under the rule of the Turkish Seljuq dynasty. After a short stay at Laranda (Karaman), where Jalāl ad-Dīn's mother died and his first son was born, they were called to the capital, Konya, in 1228. Here, Bahāʾ ad-Dīn Walad taught at one of the numerous madrasahs (religious schools); after his death in 1231 he was succeeded in this capacity by his son.

A year later, Burhān ad-Dīn Muḥaqqiq, one of Bahāʾ ad-Dīn's former disciples, arrived in Konya and acquainted Jalāl ad-Dīn more deeply with some mystical theories that

had developed in Iran. Burhān ad-Dīn, who contributed considerably to Jalāl ad-Dīn's spiritual formation, left Konya about 1240. Jalāl ad-Dīn is said to have undertaken one or two journeys to Syria (unless his contacts with Syrian Ṣūfī circles were already established before his family reached Anatolia); there he may have met Ibn al-'Arabī, the leading Islāmic theosophist whose interpreter and stepson, Ṣadr ad-Dīn al-Qunawī, was Rūmī's colleague and friend in Konya.

The decisive moment in Rūmī's life occurred on Nov. 30, 1244, when in the streets of Konya he met the wandering dervish—holy man—Shams ad-Dīn (Sun of Religion) of Tabriz, whom he may have first encountered in Syria. Shams ad-Dīn cannot be connected with any of the traditional mystical fraternities; his overwhelming personality, however, revealed to Jalāl ad-Dīn the mysteries of divine majesty and beauty. For months the two mystics lived closely together, and Rūmī neglected his disciples and family so that his scandalized entourage forced Shams to leave the town in February 1246. Jalāl ad-Dīn was heartbroken; his eldest son, Sulṭān Walad, eventually brought Shams back from Syria. The family, however, could not tolerate the close relation of Jalāl ad-Dīn with his beloved, and one night in 1247 Shams disappeared forever. It has recently been established that he was indeed murdered, not without the knowledge of Rūmī's sons, who hurriedly buried him close to a well that is still extant in Konya.

This experience of love, longing, and loss turned Rūmī into a poet. His mystical poems—about 30,000 verses and a large number of *rubā'iyāt* ("quatrains")—reflect the different stages of his love, until, as his son writes, "he found Shams in himself, radiant like the moon." The complete identification of lover and beloved is expressed by his inserting the name of Shams instead of his own pen name at the end of most of his lyrical poems. The *Dīvān-e Shams* (The collected Poetry of Shams) is a true translation of his experiences into poetry; its language, however, never becomes lost in lofty spiritual heights or nebulous speculation. The fresh language, propelled by its strong rhythms, sometimes assumes forms close to popular verses. There would seem to be cause for the belief, expressed by chroniclers, that most of this poetry was composed in a state of ecstasy, induced by the music of the flute or the drum, the hammering of the goldsmiths, the sound of the water mill in Meram, where Rūmī used to go with his disciples to enjoy nature. He found in nature the reflection of the radiant beauty of the Sun of Religion and felt flowers and birds partaking in his love. He often accompanied his verses by a whirling dance.

A few years after Shams ad-Dīn's death, Rūmī experienced a similar rapture in his acquaintance with an illiterate goldsmith, Ṣalāḥ ad-Dīn Zarkūb. It is said that one day, hearing the sound of a hammer in front of Ṣalāḥ ad-Dīn's shop in the bazaar of Konya, Rūmī began his dance. The shop owner had long been one of Rūmī's closest and most loyal disciples, and his daughter became the wife of Rūmī's eldest son. This love again inspired Jalāl ad-Dīn to write poetry. After Ṣalāḥ ad-Dīn's death, Ḥusām ad-Dīn Chelebi became his spiritual love and deputy. Rūmī's main work, the *Maṣnavī-ye Ma'navī*, was composed under his influence. Ḥusām ad-Dīn had asked him to follow the model of the poets 'Aṭṭār and Sanā'ī, who had laid down mystical teachings in long poems, interspersed with anecdotes, fables, stories, proverbs, and allegories. Their works were widely read by the mystics and by Rūmī's disciples. Jalāl ad-Dīn followed Ḥusām ad-Dīn's advice and composed nearly 26,000 couplets of the *Maṯnavī* during the following years. It is said that he would recite his verses even in the bath or on the roads, accompanied by Ḥusām ad-Dīn, who wrote them down. The *Maṯnavī*, which shows all the different aspects of Ṣūfism in the 13th century, often carries the reader away with loose associations of thought, so that one understands what subjects the master had in mind at a particular stage of his life. The work reflects the experience of divine love; both Ṣalāḥ ad-Dīn and Ḥusām ad-Dīn were, for Rūmī, renewed manifestations of Shams ad-Dīn, the all-embracing light. He called Ḥusām ad-Dīn, therefore, Ḍiyā' al-Ḥaqq (Light of the Truth); *ḍiyā'* is the Arabic term for sunlight.

Rūmī lived for a short while after completing the *Maṯnavī*. He always remained a respected member of Konya society, and his company was sought by the leading officials as well as by Christian monks. Ḥusām ad-Dīn was his successor and was in turn succeeded by Sulṭān Walad, who organized the loose fraternity of Rūmī's disciples into Mawlawiyah, known in the West as the Whirling Dervishes because of the mystical dance that constitutes their principal ritual. Sulṭān Walad's poetical accounts of his father's life are the most important source of knowledge of Rūmī's spiritual development.

Besides his poetry, Rūmī left a small collection of occasional talks as they were noted down by his friends; in the collection, known as *Fīhi mā fīhi* ("There is in it what is in it"), the main ideas of his poetry recur. There also exist some letters directed to different persons. It is impossible to systematize his ideas, which at times contradict each other; and changes in the use of symbols often puzzle the reader. His poetry is a most human expression of mystical experiences, in which each reader can find his own favorite ideas and feelings—from enthusiastic flights into the heavens to matter-of-fact descriptions of daily life. Rūmī's influence on Turkish cultural life can scarcely be overstated; his mausoleum, the Green Dome, today a museum in Konya, is still a place of pilgrimage for thousands.

(An.Sc.)

BIBLIOGRAPHY. Afzal Iqbal, *The Life and Thought of Mohammad Jalal-ud-din Rumi*, 2nd ed. rev. (1964), is the only English biography of Rūmī; unfortunately it is not critical. A full evaluation in a Western language is still lacking. Biographical notes are found in the numerous translations of Rūmī's works by R.A. Nicholson and A.J. Arberry, chiefly in the latter's *Discourses of Rūmī*, a translation of the *Fīhi mā fīhi* (1961). Other translations by Arberry included *Tales from the Maṯnavi* (1961), *More Tales from the Maṯnavi* (1963), *Mystical Poems of Rūmi* (1966), and *Mystical Poems of Rūmi: Second Selection* (1979). Nicholson's translations, more poetic than Arberry's literal ones, include *The Maṯnawí of Jalálu'ddín Rumí*, 8 vol. (1925–40) and *Rumi, Poet and Mystic* (1950, reprinted 1978).

Jalālābād, formerly JALĀLKOT, capital of Nangarhār *velāyat* (province), eastern Afghanistan, on the Kābul River, at an altitude of 1,940 ft (590 m). It lies on the route from Kābul, the Afghan capital (110 mi [177 km] north-northwest), via the Khyber Pass to Peshāwar, Pakistan, and handles much of Afghanistan's trade with Pakistan and India. The town stands at an important strategic position, commanding the entrances to the Laghmān and Konar (Kunar) valleys. It is a military centre, with an airfield.

The site of Jalālābād has been occupied since the 2nd century BC, and Akbar (1542–1605), regarded as the greatest Mughal ruler of India, started the modern town as early as the 1560s. It came under Afghan rule in 1834. During the First (1839–42) and Second (1879–80) Anglo-Afghan wars, Jalālābād was occupied by the British. After their military intervention in 1979, Soviet forces established a military command near Jalālābād and gained control of the town in early 1980. Afghan guerrillas maintained control of the province, and fighting continued intermittently. Several million Afghan refugees and the headquarters of several Afghan guerrilla groups were across the Pakistan border in nearby Peshāwar.

The town is surrounded by a large irrigated plain, producing fruit, almonds, rice, and grain. Light industries include a sugarcane refinery and handicraft shops. An urban modernization program to improve water systems and pave the roads has been undertaken. The University of Nangarhār, established in 1963, is located in Jalālābād. Pop. (1982 est.) 57,824, mainly Pashtuns.

Jalālkot (town, Afghanistan): *see* Jalālābād.

Jalapa, department, southeastern Guatemala, with an area of 797 sq mi (2,063 sq km). Its area includes the continental divide, and it is drained by the affluents of the Motagua and Ostua rivers. The climate is mild in the valleys but cool in the mountains. Most of the inhabitants are Indians, who grow corn (maize), wheat, beans, tobacco, and rice. Dairy cattle are raised for cheese production, and the dense forests yield lumber. Roads, all but one unpaved, cross the isolated plateaus, intersecting at the capital, Jalapa (*q.v.*), in the centre of the department. Pop. (2000 est.) 270,055.

Jalapa, capital, Jalapa department, southeastern Guatemala, in a picturesque valley of the central highlands at an elevation of 4,469 ft (1,362 m) above sea level. In addition to its administrative role, Jalapa functions as a commercial and manufacturing centre for the fertile agricultural and pastoral hinterland. Because of its isolation the town has retained much colonial architecture and culture. Jalapa is connected to the Pan-American Highway in the south by a paved road, and it is connected in the north to the highway leading to Guatemala City. Pop. (1994) town, 23,884; mun., 82,922.

Jalapa, in full JALAPA ENRÍQUEZ, city, capital of Veracruz state, east central Mexico, in the Sierra Madre Oriental, at 4,681 ft (1,427 m) above sea level. When Hernán Cortés marched through it in 1519, it was a thriving Indian village. The city is known for its climate, for its abundant flowers, and as a market for the coffee and tobacco produced nearby. It was famous in colonial days for its annual fair, held to dispose of the goods brought from Cádiz, in Spain, by the returning Spanish silver fleet. The massive Spanish-Moorish architecture of the city is reminiscent of viceregal days. Veracruzana University (1944) is located there. Pop. (2000 est.) city, 375,000; urban agglom., 430,000.

Jālaun, town and district, Uttar Pradesh state, northern India. The district occupies an area of 1,756 sq mi (4,549 sq km) on the Ganges alluvial plain and is bounded on the north by the Yamuna River. The Betwa Canal system provides irrigation water; crops include wheat, gram, and mustard. There are acacia tree plantations near the town of Kālpi. Orai, the administrative headquarters, is 65 mi (105 km) southwest of Kānpur, with which it is linked by road and rail. Orai is a trade centre for agricultural produce. Jālaun town, for which the district is named, is 12 mi northwest of Orai. Pop. (1991) town, 38,028; district, 1,219,377.

Jalāyirid, Mongol tribe that supported the Il-Khan Hülegü's rise to power and eventually provided the successors to the Il-Khan dynasty as rulers of Iraq and Azerbaijan. A Jalāyirid dynasty made its capital at Baghdad (1336–1432).

Ḥasan Buzurg, founder of the dynasty, had served as governor of Anatolia (Rūm) under the Il-Khan Abū Sa'īd (reigned 1317–35). Following the death of Abū Sa'īd, Ḥasan Buzurg competed for real control of the empire with his rival, the Chūpānid *amīr* Ḥasan Kūčūk

("the Small," so designated to distinguish him from Ḥasan Buzurg, "the Great"): they set up rival khanates. Soon afterward the empire broke down into local dynasties in Anatolia, Iran, Azerbaijan, Georgia, and Armenia.

Ḥasan Buzurg had, meanwhile, established his line in Baghdad, from which he conducted his agitation against the Chūpānids. His son Uways I (reigned 1356–74) enlarged Jalāyirid domains by seizing Azerbaijan (1360) and placing the Muẓaffarid principality of Fārs under his suzerainty (1361–64). The dynasty, however, was beset by the westward migrations and invasions of various Turkic and Mongol tribes. The khans of the Golden Horde, successors of Batu, unsuccessfully attempted the conquest of Azerbaijan in 1356–59, while the Timurids routed Aḥmad (reigned 1382), forcing him to leave Baghdad and seek the protection of the Mamlūks of Egypt until Timur's death in 1405. The Kara Koyunlu (*q.v.*) Turkmens, initially in Jalāyirid service, eventually overwhelmed Azerbaijan and western Iran, executed Aḥmad (1410), and captured Baghdad.

A subsidiary line of Jalāyirids maintained itself as vassals of the Timurids in lower Iraq until it was conquered by the Kara Koyunlu in 1432.

Jalāyirid school, school of miniature painting that flourished in Baghdad, Iraq, under the Jalāyirids, a local dynasty of governors in power from 1336 to 1432. Along with their contemporaries, the Muẓaffarids of southern Iran, the Jalāyirid school developed a system of perspective, though in a primitive form,

"Wedding Celebrations of Humāyūn" from the *Khamseh* of Khwājū Kermānī, Jalāyirid school miniature by Junayd, 1396 (British Library, London, MS. Add. 18113)

Reproduced by permission of the British Library

that had been suggested by Mongol Il-Khan paintings of the late 13th-century school of Tabrīz. Older Mesopotamian schools of painting had traditionally set figures along the bottom and drawn them to the top of the picture plane, thus destroying any suggestion of depth. Later Mongol painting in Iraq and Iran used a larger part of the picture for landscape and background. Figures and groups of figures could then be set on varying levels, one over the other, producing the illusion that one was behind the other.

The Jalāyirid school was influenced as well by the Baghdad school of the 13th century, which was noted for the depiction of expressive, individualized faces rather than facial types, for a sense of movement, and for attention to the details of everyday life. The Jalāyirids continued to develop these characteristics, trying especially to create individualized faces. The result was a successful blend of styles: subtle realism combined with a highly developed sense of colour and design. At the end of the 14th century, the emergence of a great painter, Ustād Junayd, heralded the arrival of the classic style of Persian miniature painting.

Jaldapāra Wild Life Sanctuary, wildlife preserve in West Bengal state, northeastern India. The preserve was established in 1941 mainly for the protection of the great Indian rhinoceros. It extends over an area of 84 square miles (217 square km) in the northern part of the state, near the Bhutan border, and is composed of forested flatlands dissected by the Torsa River and its tributaries. The forest cover consists mainly of scattered teak and tall grass. Also within the sanctuary are swamp deer, leopard, sambar, hog deer, barking deer, wild pig, jungle fowl, peafowl, quail, and an occasional elephant or tiger. There are riding elephants available in the preserve.

Jālgaon, city, northern Mahārāshtra state, western India. It lies along the Bombay-Nāgpur road and the Bombay-Allahābād railway. Although insignificant before the 19th century, it then attracted merchants and weavers so that it could boast of more than 400 handlooms by 1860. From the late 1800s it grew steadily, and it is now one of the chief commercial centres of the Khāndesh cotton-growing region. It also has colleges affiliated with the University of Poona.

The surrounding area occupies the Tāpti River valley on the northern rim of the Deccan Plateau. To the north lies the Sātpura Range of the Western Ghāts, with peaks rising to 3,500 feet (1,000 m). The hills descend steeply to the Tāpti River, the fast-flowing tributaries of which have deeply dissected the terrain, creating a typical badland landscape. South of the Tāpti, the land is gently undulating and rises gradually to the Ajanta Range, 600 feet (180 m) above the river basin. The region is important as a part of the Khāndesh cotton belt; millet and oilseeds are also grown. Irrigation projects on the Tāpti, Bori, and Girna rivers were begun in the mid-1970s to alleviate the pressures of a seasonal and scanty rainfall. Local industries include cotton mills and artificial silk, thread, and fireworks factories. Pop. (1991 prelim.) city, 241,603.

Jalīlī FAMILY, prominent Iraqi family that ruled the Ottoman *paṣalik* (province) of Mosul (in modern Iraq) in the period 1726–1834. Although the founder of the Jalīlī line, ʿAbd al-Jalīl, was a Christian slave, his son Ismāʿīl distinguished himself as a Muslim public official and became *wālī* (governor) of Mosul in 1726. Ḥājj Ḥusayn Pasha, who succeeded his father in 1730, became the central figure of the dynasty by successfully repulsing a siege of the city by the Iranian conqueror Nāder Shāh in 1743. Assorted members of the Jalīlī family held the office of *wālī* of Mosul as well as administrative positions in other Ottoman provinces until 1834, when the Ottoman Empire was reorganized under a centralized, modern form of government.

Jalingo, town, capital of Taraba state, eastern Nigeria. It became a state capital in 1991 after Gongola state was divided into Adamawa and Taraba states. Jalingo lies in the savanna-covered foothills of the Shebshi Mountains about 25 miles (40 km) southeast of the Benue River. It is a market town, has a government dairy farm, and is connected by road with Yola and Wukari.

Jalisco, *estado* ("state"), west-central Mexico. It is bounded by the states of Nayarit and Aguascalientes and Zacatecas (north), Guanajuato (east), Michoacán and Colima (south), and by the Pacific Ocean (west). Its capital is Guadalajara (*q.v.*). The Sierra Madre Occidental traverses the state, separating the narrow, heavily forested coastal plain from a high plateau region that is part of the great Anáhuac tableland and has an average elevation of about 5,000 feet (1,500 m). The coastal zone is tropical and humid, while the inland plateaus are generally drier. The sierra region is largely volcanic, and earthquakes are frequent. Among the many lakes is Chapala, Mexico's largest and a popular resort.

Jalisco was first invaded by Spaniards about 1526 and was incorporated into Nueva Galicia, which also included Aguascalientes and Zacatecas. In 1889 its area was much reduced by the separation of the territory of Tepic, now Nayarit state, from its coastal zone.

Jalisco's economy is based on a variety of crops: corn (maize), wheat, and beans on the uplands and sugarcane, cotton, rice, and tobacco in the warmer districts. Forest products are obtained along the coast, livestock are raised in the uplands, and silver, gold, mercury, copper, and various precious stones are mined. Among the state's varied industries are textile mills and cement and electric-power plants. Rail and highway networks in Jalisco are extensive, linking Guadalajara with Mazatlán, Mexico City, and other inland urban centres. The population includes a large percentage of Indians and mestizos. Area 31,211 square miles (80,836 square km). Pop. (1990) 5,302,689.

Consult the INDEX *first*

Jālor, also spelled JALORE, or JHALORE, city, southwestern Rājasthān state, northwestern India. It lies just south of the Sukri River, which is a tributary of the Lūni River. Jālor is connected by road with Jodhpur and is the agricultural market for the surrounding area. A medieval stronghold, Jālor was the 12th-century capital of the Cauhān Rājputs (the warrior rulers of the historic region of Rājputāna) and was captured about 1310 by the Delhi emperor ʿAlāʾ-ud-Dīn Khaljī. An 11th-century hill fort overlooks the city. Jālor has a government college affiliated with the University of Rājasthān.

The surrounding area comprises a semifertile region drained by the Lūni River and its tributaries. In the eastern portion are scattered outliers of the Arāvalli Range. Tube wells irrigate the region's bajra (pearl millet), oilseed, and sesame crops. Pop. (1991 prelim.) city, 33,651.

Jalpaiguri, city, northern West Bengal state, northeastern India, just west of the Tista River. The chief agricultural distributing centre of the state, the city is connected by road and rail with Darjeeling, Siliguri, and Saidpur (Bangladesh). Jute pressing, sawmilling, and match manufacture are the major industries; nearby are railway workshops. Jalpaiguri, constituted a municipality in 1885, has several colleges affiliated with the University of North Bengal.

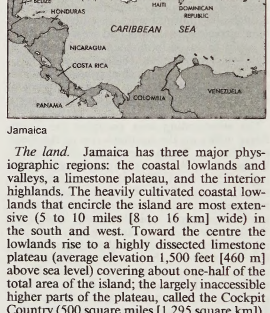
The area in which Jalpaiguri is situated comprises two distinct tracts separated by the Tista River. The region to the west is a level, densely populated expanse, growing rice, jute, and sugarcane; to the east is a submontane area called the Western Duārs, with six passes (*duārs,* "doors") through the Sinchula Hills into Bhutan. There are dense forests and extensive tea gardens; tobacco, jute, oilseed, and potato cultivation flourishes; and coal, copper ore, limestone, and dolomite deposits are worked. Pop. (1991 prelim.) city, 67,495.

Jalta (Ukraine): *see* Yalta.

Jaluit Atoll, coral formation in the Ralik (western) chain of the Republic of the Marshall Islands, situated in the west-central Pacific Ocean. The atoll has a total land area of 4.4 square miles (11.4 square km) and a lagoon that is easily accessible and provides a good anchorage. The first missionaries to the Marshall Islands landed on Jaluit in 1857. The atoll was also the site (1885) of Germany's formal declaration of a protectorate over the islands. Chosen as an administrative centre by Germany, it continued as such under the Japanese. Heavily fortified by the Japanese, Jaluit was devastated by U.S. bombing in World War II. Jabor, the chief settlement, grew after the war. Copra is exported and fishing is important. Pop. (1988) 1,709.

Jamaame, also spelled JAMAME, OF GIAMAME, former Italian MARGHERITA, town, southern Somalia, eastern Africa. Jamaame is situated on the eastern bank of the lower Jubba River, in the southeastern coastal lowlands near the Indian Ocean. The town is an important agricultural, commercial, and industrial centre. Bananas, the major crop, are exported through Kismaayo (Chisimayu), a port located 35 miles (56 km) to the south. Cotton, peanuts (groundnuts), and corn (maize) are also grown in the area. The National Plastic and Carton Company was established at Jamaame in collaboration with the Italian government in 1974. This industry was able to promote banana exports when it developed a local packing material to replace imported packing, thus reducing the price of Somali bananas in Europe. The town is connected by roads with Kismaayo and Mogadishu (Muqdisho). Pop. (latest census) 22,030.

Consult the INDEX *first*



Jama'are, also spelled JAMAARI, town and traditional emirate, Bauchi state, northern Nigeria. The town is situated along the Jamaari River, which is a tributary of the Katagum, and at the intersection of roads leading from Wudil, Azare, and Faggo. Traditionally founded in 1811 by Muhammadu Wabi I, a leader in the Fulani jihad (holy war) led by Usman dan Fodio, the emirate was not officially recognized until 1835, when Sambolei, the chief of the Jama'are Fulani, was rewarded with it for his aid against the Hausa rebels of Katsina by Muḥammad Bello, the *sarkin musulmi* ("commander of the faithful") and sultan of Sokoto. Emir Muhammadu Maude built the walls [20 feet [6 m] high with four gates) of Jama'are town in the 1850s, but the town barely survived attacks by the forces of Emir Buhari of Hadejia in the 1850s and 1860s. Jama'are's emir Muhammadu Wabi II submitted to the British after the fall of Kano city to the latter in 1903. Incorporated into the Katagum division of Kano province, Jama'are was transferred to Bauchi province in 1926 and became part of Bauchi state in 1976.

Most of the inhabitants of the emirate are members of the Fulani, Shirawa, Kanuri, or Hausa peoples. They cultivate peanuts (groundnuts), cotton, sorghum, millet, cowpeas, and vegetables, which they grow on the floodplain; they also keep goats, cattle, sheep, donkeys, and horses. The Hadejia–Jama'are River Basin Development Authority was created in the late 1970s to improve agricultural productivity in the area. Cotton weaving and dyeing, especially with indigo, are important local activities. Jama'are is headquarters of a local government council, and there are a primary teacher-training college, a general hospital, and a leprosy clinic in the town. Pop. town (1972 est.), 15,740.

Jamaica, island nation of the West Indies, situated 90 miles (145 km) south of Cuba at a crossroads of major sea trade routes in the middle of the Caribbean Sea. It covers an area of 4,244 square miles (10,991 square km) and is the third largest island in the Caribbean, after Cuba and Hispaniola. The capital is Kingston. The island is about 146 miles (235 km) long from east to west and about 35 miles (56 km) wide from north to south. The population in 1992 was estimated at 2,437,000.

A brief treatment of Jamaica follows. For full treatment, *see* MACROPAEDIA: West Indies.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Jamaica

The land. Jamaica has three major physiographic regions: the coastal lowlands and valleys, a limestone plateau, and the interior highlands. The heavily cultivated coastal lowlands that encircle the island are most extensive (5 to 10 miles [8 to 16 km] wide) in the south and west. Toward the centre the lowlands rise to a highly dissected limestone plateau (average elevation 1,500 feet [460 m] above sea level) covering about one-half of the total area of the island; the largely inaccessible higher parts of the plateau, called the Cockpit Country (500 square miles [1,295 square km]), have a karst topography, with sinkholes and underground caverns and streams. The interior of the island is dominated by the rugged and thickly forested highlands (5,000 to 7,000 feet [1,524 to 2,134 km] in elevation) with mountain ranges oriented east–west; the Blue Mountains in the east are the principal mountain system and culminate in Blue Mountain Peak (7,402 feet [2,256 m]), the highest point in the country. The Black River in the west is the longest (44 miles [71 km]) and the major river; it is navigable for 25 miles (40 km) in its lower reaches. Many of the smaller rivers disappear in the sinkholes of the karst region. There are several natural mineral springs.

Jamaica's maritime tropical climate has equable temperatures throughout the year. The mean temperature is about 75° F (24° C) in winter; it rises to about 80° F (27° C) in summer. The island's average annual rainfall of 82 inches (2,095 mm) is concentrated in two rainy seasons: May–June and September–November. Rainfall varies from more than 200 inches (5,080 mm) in the eastern mountains to about 30 inches (760 mm) in the southwestern coastal region. Hurricanes have occasionally struck the island, sometimes causing severe damage. The natural vegetation varies from dense bamboo, ebony, mahogany, and rosewood forests in the northeast and east to dry savanna vegetation with scattered dwarf trees and cacti in the southwest. Banana plantations are largely concentrated in the valleys and the foothills of the northeast, and sugarcane plantations occupy most of the level coastal plains. The island's wildlife is limited to wild pig, mongoose, lizard, bat, and several species of birds, including the streamertail hummingbird, which is the national bird.

The most important mineral resource is bauxite, found in the central part of the country. Other minerals include gypsum in the east, silica sand in the west, and limestone throughout the island.

The people. The population consists mostly of black and mulatto descendants of African slaves. Small minorities from the United Kingdom, India, China, Syria, Portugal, and Germany live in Jamaica. English is the official language, and a creole derived from English, a variety of African languages, Spanish, and French is widely spoken. The Church of England was the early established church, but today Pentecostal, Baptist, and other Christian denominations prevail. Jewish, Hindu, and Muslim communities are also represented. Syncretic revivalist sects based largely on Christianity and spirit possession include the Pocomania and Cumina sects, and the island is the home of the Rastafarian sect.

Jamaica's average annual population growth rate is relatively low for a developing country. Family-planning programs influenced the decline in the birth rate, reducing it by half between the 1960s and the late 1970s. Consequently, less than two-fifths of the population is younger than 15 years of age. Improved health-care programs have caused the death rate to decline also. Emigration is encouraged by the government to alleviate the effects of a growing population, and the United States and Canada are the chief destinations of Jamaican migrants.

Nearly half of Jamaica's population lives in urban areas. Significant rural-to-urban migration during the 1960s and '70s led to increased unemployment in urban areas. The government began agrarian-reform programs to improve neglected rural areas. The coastal lowlands are the most densely populated area of the country.

Economy. Jamaica has a developing, mixed economy largely based on tourism, alumina and bauxite exports, and sugarcane cultivation. The gross national product (GNP) has slowly declined, as has the GNP per capita, which remains relatively low by world standards.

Agriculture accounts for about one-twentieth of the GNP and employs approximately one-fourth of the work force. The main agricultural export is raw sugar, with molasses and rum as important by-products. Other export crops include bananas, cocoa beans, fruit juices, coffee, citrus fruits, and coconuts. Production of the main food crops of roots and tubers, corn (maize), rice, and copra does not keep pace with demand, and additional food must be imported. Although the output of some crops has increased, agricultural production in general has stagnated, as the sector has been neglected in favour of developing the mineral and tourist industries.

Jamaica is one of the world's largest producers of bauxite and alumina. The government maintains a degree of control over all mining operations and a share in total production. Bauxite and alumina account for almost half of the country's total exports.

Industry accounts for one-sixth of the GNP and employs one-tenth of the work force. The bauxite–alumina industries dominate, but local manufacturing has expanded and produces processed foods, cement, tobacco, textiles, and various consumer goods. Electricity is largely generated from imported fuels.

Services account for about one-half of the GNP and employ a comparable percentage of the work force. Tourism is Jamaica's largest earner of foreign exchange. Licensing is required of all enterprises and individuals operating in the tourism sector, and extensive

investment and training programs have been implemented to upgrade tourist services.

Jamaica's main trading partner is the United States. The United Kingdom, Canada, France, Norway, Germany, and Japan are also important. Jamaica participates in several trade organizations, including the Caribbean Community and Common Market (Caricom).

A hurricane in 1988 severely damaged Jamaica's railway network, contributing to the suspension of passenger services in the 1990s. Four railways transport bauxite from highland mines to coastal refineries and ports. Nearly three-fourths of the road network is paved. The principal ports include Kingston and Montego Bay, also the sites of the country's international airports.

Government and social conditions. Jamaica is an independent parliamentary state within the Commonwealth. Under its 1962 constitution, the British monarch, represented by the governor-general, is the head of state. The governor-general's role is largely ceremonial, however, and executive power is exercised by the Cabinet under the leadership of the prime minister, who is the leader of the majority party in parliament. The bicameral parliament is composed of a House of Representatives, with 60 directly elected members, and a Senate, with 21 members appointed by the governor-general, 13 with the advice of the prime minister and 8 with the advice of the leader of the opposition party. General elections are held at least once every five years. The Jamaica Labour Party and the People's National Party are the main political parties. The judicial system is headed by the Court of Appeals.

A government-operated insurance program provides retirement and other benefits. Major causes of death include circulatory diseases and cancer. Ghettoes such as Trench Town (in Kingston) are notorious for their high levels of poverty and crime.

The average life expectancy is about 75 years. Primary and secondary education are free and in some areas, compulsory between the ages of 6 and 11. Almost nine-tenths of Jamaicans are literate. The main branch of the University of the West Indies is located in Mona, a northeastern section of Kingston.

Cultural life. Jamaica's cultural development has been deeply influenced by British traditions and a search for roots in folk forms, which are based chiefly on the colourful, rhythmic intensity of its African heritage. Jamaican Creole faced decades of disapproval from critics and academics who favoured standard English, but the Panamanian-born author Andrew Salkey and poets such as Louise Bennett and Michael Smith have made the language an intrinsic part of the island's literary culture, emphasizing the oral and rhythmic nature of the language.

The National Dance Company, formed in 1962, has earned international recognition. In the latter part of the 20th century, Jamaican musicians developed the ska and reggae musical styles, as well as dancehall music, which focuses on a rapping, or "toasting," deejay.

History. The first inhabitants of Jamaica probably came from islands to the east about 5000 BC or earlier. The Arawak arrived about AD 600. Their economy, based on fishing and the production of corn (maize) and cassava, sustained as many as 60,000 people in villages.

Christopher Columbus reached the island in 1494. In 1509 the Spanish established a permanent settlement there, and in 1534 the capital was moved to Villa de la Vega, now known as Spanish Town. The Spanish forced the Arawak to labour in the gold mines and plantations of nearby islands. By the early 17th century nearly all of the indigenous peoples had died from European diseases and maltreatment.

In 1655 the island fell into British hands. During the 17th and 18th centuries the British were consistently harassed and attacked by the Maroons, armed and organized freed slaves who operated from the thick woods and mountains, including the Cockpit Country. British buccaneers operating from Port Royal on Jamaica attacked Spanish ships and outposts.

The slave trade, introduced by the Spanish, continued to flourish under British rule. It grew steadily in volume as the sugar produced by Jamaican slaves increased in quantity and value, and by the end of the 18th century Jamaica had become a prized colonial possession.

The plantation system collapsed with the abolition of slavery on Jamaica in the late 1830s. In 1866 Jamaica was made a crown colony. By the late 1930s, dissatisfaction with the crown-colony system increased with the consequences of the Great Depression, causing widespread rioting and, later, the formation of labour unions and a growing demand for self-determination.

A 1944 constitution provided for a bicameral legislature, ministerial government, and universal adult suffrage. Full internal self-government was obtained in 1959, and three years later Jamaica became an independent country within the Commonwealth. The Jamaica Labour Party (JLP) dominated the parliament in the early years of independence. In 1972 the People's National Party (PNP) won a landslide victory. Under its charismatic leader, Michael Manley, the government moved sharply to the left and nationalized a number of businesses. Manley was reelected in 1976, but in 1980 the JLP led by a moderate conservative, Edward Seaga, was returned to power. The PNP won again in 1989, restoring Manley to the head of government. However, Manley endorsed more conservative policies during his second term. He retired in March 1992 and was replaced by Percival J. Patterson, who stabilized the economy through austerity measures. The PNP retained power throughout the 1990s. Although the economy has remained volatile, the Jamaican tourist sector has continued to grow, particularly in such northern towns as Ocho Rios and Montego Bay.

Jamaica Bay, shallow inlet of the Atlantic Ocean, covering about 20 square miles (50 square km) on the southwestern shore of Long Island, in southeastern New York, U.S. Part of the Port of New York, the bay is sheltered on the south by Rockaway Peninsula and is traversed by the Cross Bay Boulevard. Dotted with marshy islands, Jamaica Bay connects with the ocean to its southwest by way of Rockaway Inlet, which is bridged. Near the entrance channel is Coney Island. On the northeast shore, at Idlewild, is John F. Kennedy International Airport. The islands in the bay and much of its shoreline make up the Gateway National Recreation Area, established in 1971.

Jamaican fruit bat (*Artibeus jamaicensis*), tailless fruit-eating bat, belonging to the family Phyllostomatidae, that inhabits neotropical regions. The bat's body is characterized by the presence of a very small flight membrane between the hind legs. This species feeds mainly on fruit and will fly as much as 10 km (6 miles) to a feeding site. From there it carries fruit to a feeding roost in a nearby tree. The Jamaican fruit bat also eats insects, catching flies that approach the roost by hooking them in its wing tips. Its preferred roosts are caves or hollow trees; males may hang in the nearby foliage. *A. jamaicensis* has an odour similar to that of a perfumed soap. The bat occasionally destroys fruit crops.

Jamaican sorrel (plant): *see* roselle.

Jamāl ad-Dīn al-Afghānī, in full JAMĀL AD-DĪN AL-AFGHĀNĪ AS-SAYYID MUḤAMMAD IBN ṢAFDAR AL-ḤUSAYN (b. 1838, Asadābād, Persia [now Iran]—d. March 9, 1897, Istanbul), Muslim politician, political agitator, and journalist whose belief in the potency of a revived Islāmic civilization in the face of European domination significantly influenced the development of Muslim thought in the 19th and early 20th centuries.

Very little is known about Afghānī's family or upbringing. Despite the appellation Afghānī, which he adopted and by which he is known, some scholars believe that he was not an Afghan but a Persian Shī'ite (*i.e.*, a member of one of the two major divisions of Islām), born in Asadābād near Hamadan in Persia. An appreciable part of Afghānī's activities took place in areas where Sunnism (the other major division of Islām) was predominant, and it was probably to hide his Persian and Shī'ite origin, which would have aroused suspicion among Sunnites, that he adopted the name Afghānī. As a young man he seems to have visited, perhaps in order to extend and perfect his theological and philosophical education, Karbalā' and an-Najaf, the Shī'ite centres in southern Mesopotamia, as well as India and perhaps Istanbul. The intellectual currents with which he came in contact made him early into a religious sceptic.

Only from about November 1866, when Afghānī appeared in Qandahār, Afg., can evidence be pieced together to form a consecutive and coherent picture of his life and activities. From the death in 1863 of the famous Dōst Moḥammad Khān, who had ruled for more than 20 years, Afghanistan had been the scene of civil wars occasioned by the quarrels of his sons over the succession. In 1866 one of these sons, Shīr 'Alī Khān, was established in the capital, Kābul, but two of his brothers, Moḥammad Afḍal Khān and Moḥammad A'ẓam Khān, were threatening his tenure. In January 1867 Shīr 'Alī was defeated and expelled from Kābul, where Afḍal and, upon his death shortly afterward, A'ẓam reigned successively in 1867–68. At the end of 1866 A'ẓam captured Qandahār, and Afghānī immediately became A'ẓam's confidential counselor, following him to Kābul. He remained in this position until A'ẓam was in turn deposed by Shīr 'Alī, who succeeded in regaining his throne in September 1868.

That a foreigner should have attained so quickly such a position was remarked upon in the contemporary accounts; some scholars speculate that Afghānī (who then called himself Istanbulī) was, or represented himself to be, a Russian emissary able to obtain for A'ẓam Russian money and political support against the British, with whom A'ẓam was on bad terms. When Shīr 'Alī regained the throne, he was naturally suspicious of Afghānī and expelled him in November 1868.

Afghānī next appeared in Istanbul in 1870, where he gave a lecture in which he likened the prophetic office to a human craft or skill. This view gave offense to the religious authorities, who denounced it as heretical. Afghānī had to leave Istanbul and in 1871 went to Cairo, where for the next few years he attracted a following of young writers and divines, among them Muḥammad 'Abduh, who was to become the leader of the modernist movement in Islām, and Sa'd Pasha Zaghlūl, founder of the Egyptian nationalist party, the Wafd. Again, a reputation of heresy and unbelief clung to Afghānī. The ruler of Egypt then was the khedive Ismā'īl, who was both ambitious and spendthrift. By the mid-1870s his financial mismanagement led to pressure by his European creditors and great discontent among all his subjects. In response to French and British pressure, Ismā'īl's suzerain, the Ottoman sultan, deposed him in June 1879. During this period of political effervescence, Afghānī attempted to gain and manipulate power by organizing his followers in a Masonic lodge, of which he became the leader, and by delivering fiery speeches against Ismā'īl. He seems to have hoped to attract the favour of Tawfīq,

Ismā'īl's son and successor, but the latter, reputedly fearing that Afghānī was propagating republicanism in Egypt, ordered his deportation in August 1879.

Afghānī then went to Hyderābād and later, via Calcutta, to Paris, where he arrived in January 1883; his stay there contributed greatly to his legend and posthumous influence as an Islāmic reformer and a fighter against European domination. In Paris, Afghānī, together with his former student 'Abduh, published an anti-British newspaper, *al-'Urwat al-wuthqā* ("The Indissoluble Link"), which claimed (falsely) to be in touch with and have influence over the Sudanese Mahdī, a messianic bearer of justice and equality expected by some Muslims in the last days. He also engaged Ernest Renan, the French historian and philosopher, in a famous debate concerning the position of Islām regarding science. He tried unsuccessfully to persuade the British government to use him as intermediary in negotiation with the Ottoman sultan, Abdülhamid II, and then went to Russia, where his presence is recorded in 1887, 1888, and 1889 and where the authorities seem to have employed him in anti-British agitation directed to India. Afghānī next appeared in Iran, where he again attempted to play a political role as the shah's counselor and was yet again suspected of heresy. The shah, Nāṣer od-Dīn Shāh, became very suspicious of him, and Afghānī began a campaign of overt and violent opposition to the Iranian ruler. Again, in 1892, his fate was deportation. For this, Afghānī revenged himself by instigating the shah's murder in 1896. It was his only successful political act.

From Iran, Afghānī went to London, where he stayed briefly, editing a newspaper attacking the shah and urging resistance to him and particularly to the tobacco concession that had been granted to a British subject. He then went to Istanbul, in response to an invitation made by an agent of the sultan. The sultan may have hoped to use him in pan-Islāmic propaganda, but Afghānī soon aroused suspicion and was kept inactive, at arm's length and under observation. He died in Istanbul. His burial place was kept secret, but in 1944 what was claimed to be his body, owing to the mistaken impression that he was an Afghan, was transferred to Kābul, where a mausoleum was erected for it. (E.Ke.)

Jamālpur, city, north-central Bangladesh, on the west bank of the Old Brahmaputra River. An important trade centre for rice, jute, oilseeds, sugarcane, and tobacco, it is connected by rail with Mymensingh, Jagannāthganj Ghāt, and Bāhādurābād Ghāt and by road with Mymensingh and Tangail and with Meghālaya, India. It has two colleges affiliated with the University of Dhākā.

The surrounding region is largely agricultural; chief crops are rice, jute, wheat, sugarcane, oilseeds, and pulses. Pop. (1991) 109,126.

Jamālpur, town, central Bihār state, northeastern India. It is situated at the foot of the Monghyr Ghāt (hills) near the Ganges River. The town was established in 1862 as a railway settlement and contains large locomotive engineering workshops, as well as major iron and steel foundries. Slate quarries are located to the southwest. Jamālpur has two colleges affiliated with Bhāgalpur University. It was constituted a municipality in 1883. Pop. (1991) 86,112.

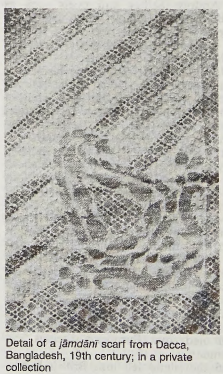
Jamalzadeh, Mohammad Ali, Persian MOḤAMMAD 'ALI JAMĀLZĀDEH, Jamalzadeh also transliterated JAMALZADA, JAMĀL-ZĀDEH, or JAMĀLZĀDAH (b. Jan. 13, 1892, Esfahān, Iran—d. Nov. 8, 1997, Geneva, Switz.), Iranian prose writer who became one of the most important figures in 20th-century Persian literature.

Although his father was a Muslim cleric, Jamalzadeh was educated by Jesuits in Beirut, Lebanon. After earning his law degree at the University of Dijon in France, he returned to Iran in 1915 and briefly fought with a Kurdish force against the Allies in World War I. He soon moved back to Europe, eventually settling in Berlin. There he joined a group of Iranian nationalists opposed to foreign intervention in Iran and wrote for the respected periodical *Kāva,* which published his early stories and historical pieces. His first successful story, "Farsī shakar ast" ("Persian Is Sugar"), was reprinted in 1921/22 in *Yakī būd yakī nabūd* (*Once Upon a Time*), a collection of his short stories that laid the foundation for modern Persian prose. *Yakī būd yakī nabūd* caused a great stir, not only because of its innovative prose style, modern diction, and its use of colloquial Persian but also for its satiric, outspoken criticism of society—which aroused the anger of conservative Iranians. In the introduction to this collection—a highly influential manifesto—Jamalzadeh argues the virtues of prose as a literary form, stating that prose is as vital as poetry to a nation's literature.

For the next 20 years Jamalzadeh pursued a nonliterary career. In 1931 he took a position in the International Labour Organisation in Geneva, a post he held for 25 years, during which time he made occasional visits to Iran. He also taught Persian at the University of Geneva. Most of Jamalzadeh's writing was done during and after World War II. His satiric novel *Dar al-Mājānīn* (1942; "The Madhouse") was followed by the novel *Qultashan-e dīvān* (1946; "The Custodian of the Divan"), a scathing attack on contemporary Iranian values and culture. Other important works include *Rāh-ye Āb-nāmeh* (1940; "The Story of the Water Channel") and memoirs of his early years in Esfahān, *Sar ū tah-ye yak karbās yā Esfahān-nāmeh* (1955; "The Beginning and End of a Web, or the Book of Esfahān"; Eng. trans. *Isfahan Is Half the World: Memories of a Persian Boyhood*). Jamalzadeh also translated many literary works from English, German, and French into Persian and wrote a number of historical, sociopolitical, and economic tracts.

Jambi, also spelled DJAMBI, *kotamadya* (city) and *propinsi* (province), southeastern Sumatra, Indonesia. The province is bounded by Bengkulu and Sumatera Selatan ("South Sumatra") provinces on the south, by Sumatera Barat ("West Sumatra") province on the west and northwest, by Riau province on the north, and by the Strait of Berhala on the east.

In the 7th century the area was part of the Buddhist Śrivijaya Empire of southern Sumatra and subsequently formed part of the Majapahit Empire of eastern Java. The rise of Islām in the Indonesia archipelago during the 16th century was accompanied by the formation of a separate Muslim state of Jambi. The ruler of Jambi participated in an alliance against Sultan Iskandar Muda (ruled 1607–36) of Aceh, later refused to accept suzerainty of the Mataram state of Java, and cooperated with the Dutch (who had entered the region in the early 17th century) against Mataram. Mohammad Fakhruddin, who ruled Jambi 1833–41, invaded Palembang in 1833 but was defeated by the Dutch and recognized Dutch suzerainty. Dutch colonial rule was firmly established by the first quarter of the 20th century. The Japanese occupied the province during World War II, and it was incorporated in the Republic of Indonesia in 1950.



Almost one-third of the province is covered by the Barisan Mountains in the west, whose spurs thrust eastward, forming deep ravines and valleys. The mountains are surmounted by volcanic cones, including Mount Masurai (9,623 feet [2,933 m]) and Mount Sumbing (8,228 feet). Mangroves are found in the estuaries and along the tidal rivers in the east. The principal waterway is the Batanghari River, which is navigable for deep-draft vessels from the city of Jambi to the sea (50 miles [80 km]). The western mountainous region is covered with temperate evergreen forests. Agriculture dominates the economy, and products include rubber, tobacco, palm oil, copra, rice, corn (maize), and resin. Industries produce carved wood, mats and baskets, processed tobacco, beverages, rubber goods, woven cloth, and milled rice. The majority of the population is Minangkabau and Batak peoples with an admixture of Chinese, Arabs, and Indians.

The city of Jambi, the provincial capital, lies on both sides of the Batanghari. It is a rubber-processing centre. Roads lead southward to Palembang and to the western coast; there is air service but no railroad.

Jambi was at one time (*c.* AD 1100) the centre of the empire of Śrivijaya. Later, as an independent sultanate, it became more and more entangled with Dutch financial and administrative affairs until, following an unsuccessful revolt in 1916–17, it was brought under direct Dutch rule. Area *propinsi,* 20,632 square miles (53,436 square km). Pop. (1995 est.) city, 385,201; province, 2,383,000.

Jambol (Bulgaria): *see* Yambol.

jāmdānī, type of figured muslin that is one of the greatest accomplishments of Indian weavers. The origins of figured muslin are not clear; it is first mentioned in Sanskrit literature of the Gupta period (4th–6th century AD). It is known, however, that in the Mughal period (1556–1707) the finest *jāmdānī*s were produced at Dacca (Dhākā), in the state of Bengal (now Bangladesh), the work being characterized by extremely elaborate designs. The weaving of *jāmdānī*s was introduced in Lucknow, Uttar Pradesh, under the nawabs of Oudh in the late 18th century and at-

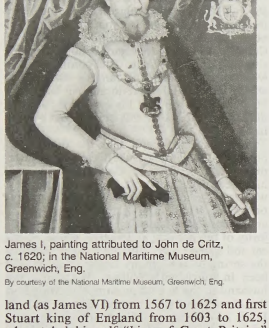
tained great excellence. Because these textiles required great skill in their manufacture, they were very costly and could be afforded only by the very rich.



A striking feature of *jāmdānī* muslins are the patterns of Persian derivation. The fabric is usually a gray cotton ornamented with brightly coloured cotton and gold and silver wire. In saris, the characteristic garment worn by Indian women, the corners are woven in patterns derived from shawls. The field is decorated with bunches of flowers suggestive of the jasmine or with diagonally arranged circles.

land (as James VI) from 1567 to 1625 and first Stuart king of England from 1603 to 1625, who styled himself "king of Great Britain." James was a strong advocate of royal absolutism, and his conflicts with an increasingly self-assertive Parliament set the stage for the rebellion against his successor, Charles I.

James was the only son of Mary, Queen of Scots, and her second husband, Henry Stewart, Lord Darnley. Eight months after James's birth his father died when his house was destroyed by an explosion. After her third marriage, to James Hepburn, Earl of Bothwell, Mary was defeated by rebel Scottish lords and abdicated the throne. James, one year old, became king of Scotland on July 24, 1567; Mary left the kingdom on May 16, 1568, and never saw her son again. During his minority James was surrounded by a small band of the great Scottish lords, from whom emerged the four successive regents, the earls of Moray, Lennox, Mar, and Morton. There did not exist in Scotland the great gulf between rulers and ruled that separated the Tudors and their subjects in England. For nine generations the Stuarts had in fact been merely the ruling family among many equals, and James all his life retained a feeling for those of the great Scottish lords who gained his confidence.

The young king was kept fairly isolated but was given a good education until the age of 14. He studied Greek, French, and Latin and made good use of a library of classical and religious writings that his tutors, George Buchanan and Peter Young, assembled for him. James's education aroused in him literary ambitions rarely found in princes but which also tended to make him a pedant.

Before James was 12 he had taken the government nominally into his own hands when the Earl of Morton was driven from the regency in 1578. For several years more, however, James remained the puppet of contending intriguers and faction leaders. After falling under the influence of the Duke of Lennox, a Roman Catholic who schemed to win back Scotland for the imprisoned Queen Mary, James was kidnapped by William Ruthven, 1st Earl of Gowrie, in 1582 and was forced to denounce Lennox. The following year James escaped from his Protestant captors and began to pursue his own policies as king. His chief purposes were to escape from subservience to Scottish factions and to establish his claim to succeed the childless Elizabeth I upon the throne of England. Realizing that more was to be gained by cultivating Elizabeth's goodwill than by allying himself with her enemies, James in 1585–86 concluded an alliance with England. Thenceforward, in his own unsteady fashion, he remained true to this policy, and even Elizabeth's execution of his mother in 1587 drew from him only formal protests.

In 1589 James was married to Anne, the daughter of Frederick II of Denmark, who, in 1594, gave birth to their first son, Prince Henry. James's rule of Scotland was basically successful. He was able to play off Protestant and Roman Catholic factions of Scottish nobles against each other, and through a group of commissioners known as the Octavians (1596–97), he was able to rule Scotland almost as absolutely as Elizabeth ruled England. The king was a convinced Presbyterian, but in 1584 he secured a series of acts that made him the head of the Presbyterian church in Scotland, with the power to appoint the church's bishops.

When James at length succeeded to the English throne on the death of Elizabeth I (March 24, 1603), he was already, as he told the English Parliament, "an old and experienced king" and one with a clearly defined theory of royal government. Unfortunately, neither his experience nor his theory equipped him to solve the new problems facing him; and he lacked the qualities of mind and character to supply the deficiency. James hardly understood the rights or the temper of the English Parliament, and he thus came into conflict with it. He had little contact with the English middle classes, and he suffered from the narrowness of his horizons. His 22-year-long reign over England was to prove almost as unfortunate for the Stuart dynasty as his years before 1603 had been fortunate.

There was admittedly much that was sensible in his policies, and the opening years of his reign as king of Great Britain were a time of material prosperity for both England and Scotland. For one thing, he established peace by speedily ending England's war with Spain in 1604. But the true test of his statesmanship lay in his handling of Parliament, which was claiming ever-wider rights to criticize and shape public policy. Moreover, Parliament's established monopoly of granting taxes made its assent necessary for the improvement of the crown's finances, which had been seriously undermined by the expense of the long war with Spain. James, who had so successfully divided and corrupted Scottish assemblies, never mastered the subtler art of managing an English Parliament. He kept few privy councillors in the House of Commons and thus allowed independent members there to seize the initiative. Moreover, his lavish creations of new peers and, later in his reign, his subservience to various recently ennobled favourites loosened his hold upon the House of Lords. His fondness for lecturing both houses of Parliament about his royal prerogatives offended them and drew forth such counterclaims as the Apology of the Commons (1604). To parliamentary statesmen used to Tudor dignity, James's shambling gait, restless garrulity, and dribbling mouth ill-befitted his exalted claims to power and privilege.

When Parliament refused to grant him a special fund to pay for his extravagances, James placed new customs duties on merchants without Parliament's consent, thereby threatening its control of governmental finance. Moreover, by getting the law courts to proclaim these actions as law (1608) after Parliament had refused to enact them, James struck at the houses' legislative supremacy. In four years of peace, James practically doubled the debt left by Elizabeth, and it was hardly surprising that when his chief minister, Robert Cecil, Earl of Salisbury, tried in 1610–11 to exchange the king's feudal revenues for a fixed annual sum from Parliament, the negotiations over this so-called Great Contract came to nothing. James dissolved Parliament in 1611.

The abortive Great Contract, and the death of Cecil in 1612, marked the turning point of James's reign; he was never to have another chief minister who was so experienced and so powerful. During the ensuing 10 years the king summoned only the brief Addled Parliament of 1614. Deprived of parliamentary grants, the crown was forced to adopt unpopular expedients, such as the sale of monoplies, to raise funds. Moreover, during these years the king succumbed to the influence of the incompetent Robert Carr, Earl of Somerset. Carr was succeeded as the king's favourite by George Villiers, 1st Duke of Buckingham, who showed more ability as chief minister but who was even more hated for his arrogance and his monopoly of royal favour.

In his later years the king's judgment faltered. He embarked on a foreign policy that fused discontent into a formidable opposition. The king felt a sympathy, which his countrymen found inexplicable, for the Spanish ambassador, Diego Sarmiento de Acuña, Count of Gondomar. When Sir Walter Raleigh, who had gone to Guiana in search of gold, came into conflict with the Spaniards, who were then at peace with England, Gondomar persuaded James to have Raleigh beheaded. With Gondomar's encouragement, James developed a plan to marry his second son and heir Charles to a Spanish princess, along with a concurrent plan to join with Spain in mediating the Thirty Years' War in Germany. The plan, though plausible in the abstract, showed an astonishing disregard for English public opinion, which solidly supported James's son-in-law, Frederick, the Protestant elector of the Palatinate, whose lands were then occupied by Spain. When James called a third Parliament in 1621 to raise funds for his designs, that body was bitterly critical of his attempts to ally England with Spain. James in a fury tore the record of the offending Protestations from the House of Commons' journal and dissolved the Parliament.

The Duke of Buckingham had begun in enmity with Prince Charles, who became the heir when his brother Prince Henry died in 1612, but in the course of time the two formed an alliance from which the king was quite excluded. James was now aging rapidly, and in the last 18 months of his reign he, in effect, exercised no power; Charles and Buckingham decided most issues. James died at his favourite country residence, Theobalds, in Hertfordshire.

Besides the political problems that he bequeathed to his son Charles, James left a body of writings which, though of mediocre quality as literature, entitle him to a unique place among English kings since the time of Alfred. Chief among these writings are two political

treatises, *The True Lawe of Free Monarchies* (1598) and *Basilikon Doron* (1599), in which he expounded his own views on the divine right of kings. *The Poems of James VI of Scotland,* 2 vol., were edited by James Craigie (1955–58). The 1616 edition of *The Political Works of James I* was edited by Charles Howard McIlwain (1918). (D.Ma./Ed.)

BIBLIOGRAPHY. A good though unflattering biography is D.H. Willson, *King James VI and I* (1956). Antonia Fraser, *King James VI of Scotland, I of England* (1974), argues for a reinterpretation in the light of new research. Maurice Lee, Jr., *Great Britain's Solomon. James VI and I in His Three Kingdoms* (1990), contains corrective essays on aspects of his life, personality, and career. David M. Bergeron, *Royal Family, Royal Lovers: King James of England and Scotland* (1991), examines his life and family relationships.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

•James II, also called (1634–85) DUKE OF YORK (b. Oct. 14, 1633, London, Eng.—d. Sept. 5/6 [Sept. 16/17, New Style], 1701, Saint-Germain, France), king of Great Britain from 1685 to 1688, and the last Stuart monarch in the direct male line. He was deposed in the Glorious Revolution of 1688 and replaced by William III and Mary II. That revolution,

James II, detail of a painting by Sir Godfrey Kneller, c. 1685; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

engendered by James's Roman Catholicism, permanently established Parliament as the ruling power of England.

James II was the second surviving son of Charles I and Henrietta Maria. He was created Duke of York in January 1634. During the English Civil Wars he lived at Oxford—from October 1642 until the city surrendered in June 1646. He was then removed by order of Parliament to St. James's Palace, from which he escaped to the Netherlands in April 1648. He rejoined his mother in France in early 1649. Joining the French army in April 1652, he served in four campaigns under the great French general Viscount de Turenne, who commended his courage and ability. When his brother, Charles II, concluded an alliance with Spain against France in 1656 he reluctantly changed sides, and he commanded the right wing of the Spanish army at the Battle of the Dunes in June 1658.

At the restoration of his brother Charles II to the English throne in 1660, James became lord high admiral and did much to maintain the efficiency and improve the organization of the navy. He also showed considerable interest in colonial ventures; it was on his initiative that New Amsterdam was seized from the Dutch in 1664 and renamed New York in his honour. He commanded the fleet in the opening campaigns of the Second and Third Dutch wars. This was to be his last taste of active military command until 1688. In politics he was a strong supporter of the Earl of Clarendon, whose daughter Anne he married in September 1660. Both before and after marriage he had the reputation of being as great a libertine as his brother. But in 1668 or 1669 he was admitted to the Roman Catholic church, though, on his brother's insistence, he continued to take the Anglican sacraments until 1672, and he attended Anglican services until 1676. Charles II also insisted that James's daughters, Mary and Anne, be raised in the Protestant faith.

James's conversion had little effect on his political views, which were already formed by his reverence for his dead father and his close association with the High Church party. James, in fact, was always more favourable to the Anglican church than was his Protestant brother. He welcomed the prospect of England's reentering the European war on the side of the Dutch; and he consented to the marriage of his elder daughter, Mary, to the Protestant William of Orange in 1677. For most of his life James was the spokesman of the conservative Anglican courtiers, who believed that his views on monarchy and Parliament coincided with theirs, who found his formal and humourless nature more congenial than Charles's slippery geniality, and who respected his frank acknowledgment of his religious beliefs.

In view of the queen's childlessness, however, the conversion of the heir presumptive to the throne roused great alarm in the general public. James resigned all of his offices in 1673 rather than take an anti-Catholic oath imposed by the so-called Test Act and thus made his position known publicly. Later that year, his first wife having died, he gave further offense by marrying a Roman Catholic princess, Mary of Modena. By 1678 James's Roman Catholicism had created a climate of hysteria in which the fabricated tale of a "Popish Plot" to assassinate Charles and put his brother on the throne was generally believed. From 1679 to 1681 three successive Parliaments strove to exclude James from the succession by statute. During this crisis James spent long periods in exile at Brussels and Edinburgh. But owing largely to his own tenacious defense of his rights, the exclusionists were defeated. In 1682 he returned to England and resumed the leadership of the Anglican Tories, whose power in local government was reestablished and increased by the "remodeling" of the borough corporations and the government of the counties in their favour. By 1684 James's influence on state policy was paramount, and when he finally came to the throne on Feb. 6, 1685, with very little overt opposition or even criticism, it seemed likely that the strong support of the Anglicans would make him one of the most powerful of the 17th-century British kings.

The new royalist Parliament that assembled in May 1685 voted James a large income, and there seemed to be no reason why he should not in time secure adequate toleration for his coreligionists. But unsuccessful rebellions led by the Duke of Monmouth in England and the Duke of Argyll in Scotland, in the summer of 1685, marked a turning point in his attitude. James's distrust of his subjects, conceived in the turbulent 1670s, was at once sharpened. The rebellions were put down with great ferocity, the army was considerably increased, and the new regiments were granted to Roman Catholic officers who had had military experience abroad and whose loyalty was undoubted. This last act of policy provoked a quarrel between king and Parliament, which was prorogued in November 1685, never to meet again. In 1686 the division between the king and his former allies, the Anglican Tories, deepened. After a number of them had been replaced, the judges of King's Bench in the collusive action *Godden* v. *Hales* found in favour of the king's power to excuse individuals from the Test Oath; Roman Catholics were admitted to the Privy Council and subsequently to the high offices of state. A commission for ecclesiastical causes was established to administer James's powers as supreme governor of the Anglican church, and its first act was to suspend Henry Compton, bishop of London, one of the most outspoken critics of royal policy.

In 1687 James intensified his Roman Catholic policy and dismissed his Anglican brothers-in-law the Earl of Clarendon and the Earl of Rochester. Magdalen College, Oxford, was given over for the use of Roman Catholics, and a papal nuncio was officially accredited to St. James's Palace. In April James issued the so-called Declaration of Indulgence suspending the laws against Roman Catholics and Protestant dissenters alike; in July he dissolved Parliament, and in September he launched an intensive campaign to win over the Protestant dissenters and with their aid secure a new Parliament more amenable to his wishes.

What those wishes were is still not clear: some of his utterances suggest a genuine belief in religious toleration as a matter of principle; others point to the establishment of Roman Catholicism as the dominant if not the exclusive religion of the state. This confusion may well reflect the state of James's own mind, which undoubtedly deteriorated in the years 1687–88, and some of his assertions, accusations, and threats at this time verge on the insane.

The unexpected news that the queen was pregnant (November 1687), establishing the prospect of a Roman Catholic succession, had great effect on most Protestants; while a wholesale "remodeling" of borough corporations, lord lieutenancies, deputy lieutenancies, and magistracies that winter inflamed the majority of the nobility and gentry, whose political and social power suffered by it. Ever since the spring of 1687 many English leaders had been in touch with William of Orange, the husband of the heiress presumptive Mary and the champion of Protestant Europe against Louis XIV of France. The spark was touched off by James himself, when he reissued his Declaration of Indulgence on April 27, 1688, and on May 4 ordered it to be read in the churches. The Archbishop of Canterbury and six of his bishops petitioned James to withdraw the order. Their petition was subsequently published, and James made the mistake of prosecuting its authors for seditious libel. Meanwhile, on June 10, in slightly mysterious circumstances, the queen gave birth to a son.

On June 30 the seven bishops were acquitted—a tremendous defeat for the government—and that same day seven leading Englishmen sent a letter inviting William of Orange to lead an army to England and call a free Parliament to arbitrate on the legitimacy of the Prince of Wales. By September William's intentions were obvious, but James declined Louis XIV's offer of assistance for fear of the reaction in England; in any case he was confident in the ability of his forces to repel invasion. William sailed under cover of the general war that had by then broken out in Europe, evaded the English fleet, and landed at Brixham on Tor Bay on Nov. 5 (Nov. 15, New Style), 1688. In the subsequent "campaign," James's Protestant officers deserted to the enemy in such large numbers that he dared not commit the army to a pitched battle. This, together with the defection of his daughter Anne, finally shattered his nerve. He attempted to flee to France but

was intercepted in Kent; 12 days later, on December 23, he was allowed to escape. On Feb. 12, 1689, the Convention Parliament declared that James had abdicated and next day offered the crown to William and Mary. The Scots Parliament followed suit in May.

In March 1689 James landed in Ireland, and a Parliament summoned to Dublin acknowledged him as king. But his Irish-French army was defeated by William at the Boyne (July 1 [July 11, New Style] 1690), and he returned to France. William's generals reconquered Ireland the following year. In Ireland James had shown none of his former military ability, and he now aged rapidly, falling increasingly under the influence of his pietistic wife. He became daily more absorbed in his devotions, and his more aggressive supporters soon came to regard him as something of a liability. The Treaty of Rijswijk between England and France (1697) removed his last hopes of restoration. (J.P.K.)

•James (III): *see* James Edward, the Old Pretender.

Scotland

•James I (b. 1394—d. Feb. 20/21, 1437, Perth, Perth, Scot.), king of Scots from 1406 to 1437. During the 13 years (1424–37) in which he had control of the government, he established the first strong monarchy the Scots had known in nearly a century.

James was the son and heir of King Robert III (reigned 1390–1406). In 1406 Robert decided to send him to France, presumably to keep him out of the reach of the powerful and treacherous Robert Stewart, Duke of Albany. On the way, James was captured by English sailors and taken as a prisoner to the royal court in London. Robert died shortly there-

after, and Albany, who became regent, had no desire to ransom young King James. Upon Albany's death in 1420, his son Murdac held the regency until James was released in 1424.

James immediately took harsh measures to break the power of the Scottish nobility. In 1425 he arrested many of the leading lords; a few—including Murdac and other members of his family—were executed. The king even attempted, with limited success, to assert his authority over the fiercely independent Highland lords. He acquired the resources that he needed to run his government by confiscating the estates of his enemies, by eliminating graft in the collection of customs, and by bringing the chief financial officers of the realm under his personal supervision. His attempts to prevent church revenues from being sent to Rome involved him in a long series of disputes with the papacy. The popularity that James enjoyed rested to a large extent on his improvements in the administration of justice for common people. Nevertheless, he was assassinated by a group of conspirators led by Walter, Earl of Atholl, who aspired to win the crown for himself. No general uprising followed the murder, and the king's widow quickly had the conspirators captured and executed. James was a highly cultured man; he is usually accepted as the author of the long vernacular poem *The Kingis Quair* ("The King's Book").

•James II (b. Oct. 16, 1430, Edinburgh, Scot.—d. Aug. 3, 1460, Roxburgh Castle, Roxburgh), king of Scots from 1437 to 1460. He survived the civil strife of the first half of his reign and eventually emerged as a masterful

James II, painting by an unknown artist; in the Scottish National Portrait Gallery, Edinburgh

ruler who consolidated his power throughout the kingdom.

The only surviving son of King James I, he succeeded to the throne at the age of six upon his father's assassination (February 1437). Because he was too young to take control of the government, the strong central authority that his father had established quickly collapsed. In the ensuing turmoil three rival families—the Crichtons, the Livingstons, and the Douglases—fought to gain control of the young king. James finally assumed his royal duties upon his marriage to Mary of Gueldres in 1449. His first task was the restoration of monarchical authority. He immediately seized the Livingston estates, but he maintained an uneasy peace with the powerful Douglas family until 1450, when he quarreled with William, 8th Earl of Douglas. In February 1452 he stabbed the earl to death. Three years later James demolished the Douglas castles and confiscated their vast estates. The revenues from these lands enabled him to set up a strong central government and make improvements in the administration of justice.

James then turned his attention to the English, who had renewed their claims to rule Scotland. He attacked English outposts in Scotland in 1456 and 1460. In the latter campaign he was killed during a siege of Roxburgh Castle.

•James III (b. May 1452—d. June 11, 1488, near Stirling, Stirling, Scot.), king of Scots from 1460 to 1488. A weak monarch, he was confronted with two major rebellions because he failed to win the respect of the nobility.

James received the crown at the age of eight upon the death of his father, King James II. Scotland was governed first by James's mother, Mary of Gueldres (d. 1463), and James Kennedy, bishop of St. Andrews (d. 1465), and then by a group of nobles headed by the Boyds of Kilmarnock, who seized the king in 1466. In 1469 James overthrew the Boyds and began to govern for himself. Unlike his father, he was, however, unable to restore strong central government after his long mi-

nority. He evidently offended his nobles by his interest in the arts and by taking artists for his favourites. In 1479 he arrested his brothers, Alexander, Duke of Albany, and John, Earl of Mar, on suspicion of treason. Albany escaped to England, and in 1482 English troops entered Scotland and forced James to restore Albany to his domains. During this invasion dissident Scottish nobles hanged James's favourites. By March 1483 the king had recovered enough power to expel Albany.

Nevertheless, even without English aid to his discontented subjects, James was unable to ward off revolts. In 1488 two powerful border families, the Homes and the Hepburns, raised a rebellion and won to their cause his 15-year-old son, the future king James IV. James III was captured and killed after his defeat at the Battle of Sauchieburn, Stirling, on June 11.

•James IV (b. March 17, 1473—d. Sept. 9, 1513, near Branxton, Northumberland, Eng.), king of Scotland from 1488 to 1513. An energetic and popular ruler, he unified Scot-

land under royal control, strengthened royal finances, and improved Scotland's position in European politics.

James succeeded to the throne after his father, James III, was killed in a battle against rebels on June 11, 1488. The 15-year-old monarch immediately began to take an active part in government. He extended his authority to the sparsely populated areas of western and

northern Scotland and by 1493 had humbled the last lord of the Isles.

Although his reign was internally peaceful, it was disturbed by wars with England. Breaking a truce with England in 1495, James prepared an invasion in support of Perkin Warbeck, a pretender to the English throne. The war was confined to a few border forays, and a seven-year peace was negotiated in December 1497, though border raids continued. Relations between England and Scotland were further stabilized in 1503, when James married Margaret Tudor, the eldest daughter of the English king Henry VII; this match resulted, a century later, in the accession of James's great-grandson, the Stuart monarch James VI of Scotland, to the English throne as King James I.

James IV's growing prestige enabled him to negotiate as an equal with the rulers of continental Europe, but his position was weakened as he came into conflict with King Henry VIII of England (ruled 1509–47). In 1512 James allied with France against England and the major continental powers. When Henry invaded France in 1513, James decided, against the counsel of his advisers, to aid his ally by advancing into England. He captured four castles in northern England in August 1513, but his army was disastrously defeated at the Battle of Flodden, near Branxton, on Sept. 9, 1513. The King was killed while fighting on foot, and most of his nobles perished. James left one legitimate child, his successor, James V (ruled 1513–42); in addition, he had many illegitimate children, several of whom became prominent figures in Scotland.

True to the ideal of the Renaissance prince, James strove to make his court a centre of refinement and learning. He patronized literature, licensed Scotland's first printers, and improved education. His career is recounted in R.L. Mackie's *King James IV of Scotland* (1958).

• **James V** (b. April 10, 1512, Linlithgow, West Lothian, Scot.—d. Dec. 14, 1542, Falkland, Fife), king of Scotland from 1513 to 1542.

During the period of his minority, which lasted throughout the first half of his reign, James was a pawn in the struggle between

James V, detail of a painting by an unknown artist, c. 1540; at Hardwick Hall, Derbyshire

By courtesy of the National Trust, Hardwick Hall (Duke of Devonshire Collection), Derbyshire

pro-French and pro-English factions; after he assumed personal control of the government, he upheld Roman Catholicism against the Protestant nobles and allied his country with France.

James was 17 months old when he succeeded to the throne of his father, James IV (ruled 1488–1513). In the power struggle that developed between the pro-French regent, John Stewart, duke of Albany, and the head of the English party, Archibald Douglas, earl of Angus, each side sought to gain possession of the young ruler. James's mother, Margaret Tudor, complicated events by shifting her allegiance from her husband, Angus, to Albany.

Albany retired to France in 1524, and Angus kept James in confinement from 1526 until 1528, when the King escaped and forced Angus to flee to England. By 1530 James had consolidated his power in Scotland. He signed a treaty with his uncle, King Henry VIII of England, in 1534, but in 1538 he married the French noblewoman Marie de Guise and thereafter allied with France against England. A cruel man, he instituted in his later years a near reign of terror in Scotland, and his financial exactions did not endear him to his subjects.

When Henry VIII's forces attacked Scotland in 1542, James's small army, weakened by the disaffection of the Protestant nobles, crossed into England and was easily routed near the border at Solway Moss on Nov. 24, 1542. The disaster caused the King to suffer a mental breakdown; he died on Dec. 14, 1542, a week after the birth of his daughter—his only surviving legitimate child—Mary Stuart (Mary, Queen of Scots). Among his several illegitimate children was James, earl of Moray (died 1570), who became regent of Scotland when Mary Stuart abdicated her throne in 1567.

Spain: Aragon

• **James I,** byname JAMES THE CONQUEROR, Spanish JAIME EL CONQUISTADOR (b. Feb. 2, 1208, Montpellier, County of Toulouse—d. July 27, 1276, Valencia, Valencia), the most renowned of the medieval kings of Aragon (1213–76), who added the Balearic Islands and Valencia to his realm and thus initiated the Catalan-Aragonese expansion in the Mediterranean that was to reach its zenith in the last decades of the 14th century.

James was the son of Peter II of Aragon and Mary of Montpellier. When Peter, allied with the Albigensian heretics, died fighting against the crusaders sent against them at the Battle of Muret, James was only five years old and was at Carcassonne, Fr., in the hands of the crusaders' leader, Simon de Montfort. James was released in April 1214 and recognized as sovereign in Aragon and Catalonia; placed under the protection of the Knights Templars at Monzón, he was cared for and educated by them. The regency was exercised by his great-uncle, Count Sancho of Roussillon (in Aragon, now in France), until 1218, when Sancho resigned in the face of opposition from some Aragonese and Catalonian nobles. The ensuing rebellions, during which the King often found himself in great danger, formed a hard school for the forging of his character. Fearless even as a youth, he fought an Aragonese noble in hand-to-hand combat, took part in the siege of the port of Castejón in 1222, and three years later tried to seize another port.

In 1227 James took over the effective government of his kingdoms and at once began the first of his great campaigns of reconquest—that of the Balearic Islands. Majorca was captured in December 1229, and the occupation was rounded off in 1235 by the conquest of Ibiza by the Bishop of Saragossa. Thenceforward, the islands were a bulwark to defend the Catalan coasts and a base from which trade

James I, detail of an illumination from the *Crónica de Jaime I*; in the University of Barcelona

Archivo Mas, Barcelona

and political expansion could be launched eastward.

In 1233 James began a second war of reconquest—against the Saracen rulers of the Kingdom of Valencia. The campaign lasted three long years and suffered various interruptions before the capital itself was captured in 1238. The occupation of the kingdom was completed later with the capture of other towns, and in 1244 a treaty was signed by which the boundaries of Aragon and Castile were delimited in the newly conquered areas.

James I married twice. In 1221 he married Leonor, daughter of Alfonso VIII of Castile, but he later divorced her and in 1235 married the daughter of Andrew II of Hungary, Yolande, by whom he had many children. In 1248 and 1262 he divided his realms among his sons but only succeeded in causing virulent civil strife. In the second division, his elder son, Peter, received Aragon, Valencia, and Catalonia, and his younger son, James, received the Balearic Islands, Roussillon, and other Pyrenean counties that he was to hold in fief from Peter. This division of realms among his heirs was not James's only political blunder. By the Treaty of Corbeil (1258) he renounced his claims to territories in the south of France, thus abandoning the traditional policy that the Catalan dynasty had hitherto pursued across the Pyrenees. He was, however, able to develop relations and promote trade with the states of North Africa; and, with a clear view of the future, he married his principal heir, Peter, to Constance of Sicily, thus making it easy for the latter kingdom to be added in later years to the crown of Aragon. Always a chivalrous soldier, James helped his son-in-law Alfonso X of Castile to suppress the rebellion of the Moors in the Kingdom of Murcia (1266); he also set out on a crusade to the Holy Land (1269), though this was a failure.

A soldier of extraordinary courage and great gifts of leadership, James was a stout man, strong and handsome; he has been criticized for his many love affairs that caused him to be described as an *home de fembres* ("lady's man"). On balance, his reign was very beneficial. The important code of maritime law called the *Llibre del consolat del mar* was compiled; the Kingdom of Valencia received its own legal system; various cities, including Barcelona, acquired their own civic administrations; and the Cortes—the representative assembly—came into being. The King protected men of letters, inspired the chronicle

that bears his name (though he did not himself write it), and brought his different peoples to a degree of political and cultural maturity that can reasonably be described as admirable. (E.Sa.)

• **James II,** byname JAMES THE JUST, Spanish JAIME EL JUSTO (b. *c.* 1264—d. Nov. 3, 1327, Barcelona, Aragon [Spain]), king of Aragon from 1295 to 1327 and king of Sicily (as James I) from 1285 to 1295.

At the death of his father, Peter III, on Nov. 11, 1285, James inherited Sicily, and his elder brother became Alfonso III of Aragon, Catalonia, and Valencia. When his brother died (1291) he inherited Aragon and resigned Sicily (1295), marrying Blanche, daughter of Charles II of Naples, in an endeavour to make peace with the Angevins. Sardinia and Corsica were assigned to him in compensation for Sicily, but he occupied Sardinia only (1324). He was succeeded by his son Alfonso IV.

James, SAINT, also called JAMES, SON OF ZEBEDEE, OF JAMES THE GREAT (b. Galilee, Palestine—d. *c.* AD 44, Jerusalem; feast day July 25), one of the Twelve Apostles, distinguished as being in Jesus' innermost circle and the only apostle whose martyrdom is recorded in the New Testament (Acts 12:2).

St. James, detail from a mural, 12th century; in the monastery of Eski Gümüs, Tur.
Sonia Halliday

James and his younger brother, the apostle St. John, are designated Boanerges (from the Greek *bouanerges*), or "sons of thunder" (Mark 3:17), perhaps because of their characteristic fiery zeal (Mark 9:38, Luke 9:54). With Saints Peter and Andrew, James and John were the first four disciples whom Jesus called (Mark 1:16–19) and whose question ("Tell us, when will this [the end of time] be, and what will be the sign when these things are all to be accomplished?") sparks Jesus' eschatological discourse in Mark 13.

James witnessed the raising of Jairus' daughter (Mark 5:37, Luke 8:51), the Transfiguration (Mark 9:2), and Jesus' agony in Gethsemane (Mark 14:33, Matthew 26:37). James and John asked Jesus to let them sit, one at his right and one at his left, in his future glory (Mark 10:35–40), a favour that Jesus said was not his to grant. James was beheaded by order of King Herod Agrippa I of Judaea; according to tradition, his body was taken to Santiago de Compostela, where his shrine attracts pilgrims from all over the world.

James, SAINT, also called JAMES, SON OF ALPHAEUS, OF JAMES THE LESS (fl. 1st century AD; Western feast day May 1; Eastern feast day October 9), one of the Twelve Apostles.

James may be he whose mother, Mary, is mentioned among the women at Jesus' crucifixion and tomb (Mark 15:40, 16:1; Matthew 27:56). He is not to be confused with the apostle St. James, son of Zebedee, or James, "the Lord's brother." Depending upon the Bible consulted, he is the brother (Revised Standard and New English) or father (Authorized and Douay) of the apostle St. Judas (Jude). Nothing further is known of him, and a legend of his martyrdom in Persia is spurious.

In the Western church, his identity with James, "the Lord's brother," was assumed in the feast of Saints Philip and James on May 1, the date of the dedication of the Church of the Holy Apostles, Rome, where supposed relics of these saints were brought about 560.

James, SAINT, also called JAMES, THE LORD'S BROTHER (d. *c.* AD 62, Jerusalem; Western feast day May 1), a Christian apostle, according to St. Paul, although not one of the original Twelve Apostles. He was leader of the Jerusalem Christians, who with Saints Peter and John the Evangelist is one of "the pillars of the church."

Confusion has arisen over his identity because he has often been mistaken for St. James, son of Alphaeus. Exactly what the biblical Galatians 1:19 means by designating him "the Lord's brother" is also uncertain, although he is mentioned elsewhere in the Gospels as one of Jesus' four brothers (Mark 6:3; Matthew 13:55). Hypotheses have been forwarded that James and Jesus were brothers (after Tertullian and Clement of Alexandria), stepbrothers (after Origen, among others), or cousins (after St. Jerome).

James was not a follower of Jesus during his public ministry. Paul attributes James's later conversion to the appearance of Christ resurrected (1 Corinthians 15:7). Three years after Paul's conversion, James was a leader in the Jerusalem church (Galatians 1:18–19), where he assumed more significance after King Herod Agrippa I of Judaea beheaded the Apostle St. James, son of Zebedee, and after Peter fled from Jerusalem (Acts 12:1–17). He was spokesman for the Jerusalem church at the Council of Jerusalem regarding Paul's mission to the Gentiles (Acts 15:13) and final visit to Jerusalem (Acts 21:18).

Later tradition records that James was called "the Just" and was noted for his fulfillment of Jewish law. Though opposing those Jewish Christians who required that Gentile Christians submit to Jewish Law, including circumcision, he believed Jewish Christians should continue loyalty to Jewish practice and piety, as he did himself. His piety and zeal for the Law had become a basis for various legends; thus, later traditions emphasize James's piety and popularity with Jews and Jewish Christians. This popularity is evident in the Jews' anger when priestly authorities had James put to death, reputedly either by stoning (after Flavius Josephus, historian of the Jews) or by being thrown from a Temple tower (after the early Christian writer St. Hegesippus). The early church designates him the first bishop of Jerusalem, though the title is not used in the New Testament. The tradition that he was the author of The Letter of James, a New Testament book of moral instructions, remains controversial. Scholars have debated the authorship of the letter without reaching a consensus.

Another controversy surrounds the ossuary (a box to hold the bones of the dead), made public in 2002, which bears the inscription "James, son of Joseph, brother of Jesus" and which appears to date to the 1st century. The box was believed by some to be the ossuary of James and the earliest known artifact to mention Jesus. Many scholars regarded the discovery skeptically, however, and in 2003 the Israeli Antiquities Authority declared the inscription to be a modern forgery.

James THE CONQUEROR: *see* James I *under* James (Spain: Aragon).

James, THE OLD PRETENDER: *see* James Edward, the Old Pretender.

James, Frank: *see* James, Jesse and Frank.

James, Harry (Haag) (b. March 15, 1916, Albany, Ga., U.S.—d. July 5, 1983, Las Vegas, Nev.), American trumpeter and bandleader who became a major figure of the swingtime Big Band era.

The son of circus performers, James learned to play drums at age 4 and the trumpet at 8; when he was 12 he led one of the circus bands. As a young man he played with various bands before becoming a member of Benny Goodman's orchestra in 1937, joining trumpeters Ziggy Elman and Chris Griffin to form the "powerhouse" trio, one of the most celebrated Big Band trumpet sections in jazz history. James, however, remained the number one soloist with the Goodman orchestra and soared to fame with his interpretations of such songs as "Ridin' High," "Sing Sing Sing," and "Life Goes to a Party."

James formed his own band in 1939, but not until 1941, when he introduced the song "You Made Me Love You," did his band become a sensation. Among his further successes were "I Cried for You," "I Had the Craziest Dream," and "Ciribiribin" (his theme song). At the height of his popularity in 1943 James married film actress Betty Grable, meanwhile appearing in a string of films himself, including *Springtime in the Rockies* (1942) and *Do You Love Me?* (1946). In the 1950s James went into semiretirement but occasionally led bands for the remainder of his life.

James, Henry (b. June 3, 1811, Albany, N.Y., U.S.—d. Dec. 18, 1882, Cambridge, Mass.), American philosophical theologian, the father of the novelist Henry James and the philosopher William James.

A graduate of Union College, Schenectady, N.Y. (1830), James worked in business and law and then studied at Princeton Theological Seminary (1835–37). Reared in a strict Presbyterian family, he was repelled by orthodox Protestantism and gave up adherence to institutional religion. He lived in Europe for several years, and while he was in England in 1844 he became acquainted with the teachings of Emanuel Swedenborg, which became the framework for his own philosophy. His best writings were compiled by William James in *The Literary Remains of Henry James* (1885).

James, Henry (b. April 15, 1843, New York, N.Y., U.S.—d. Feb. 28, 1916, London, Eng.), American novelist and, as a naturalized English citizen from 1915, a great figure in the transatlantic culture. His fundamental theme was the innocence and exuberance of the New World in clash with the corruption and wisdom of the Old, as illustrated in such works as *Daisy Miller* (1879), *The Portrait of a Lady* (1881), *The Bostonians* (1886), and *The Ambassadors* (1903).

Henry James, 1905
Smith College Archives

Early life and works. Henry James was named for his father, a prominent social theorist and lecturer, and was the younger brother of the pragmatist philosopher William James. The young Henry was a shy, book-addicted boy who assumed the role of quiet observer beside his active elder brother. They were taken abroad as infants, were schooled by tutors and governesses, and spent their preadolescent years in Manhattan. Returned to Geneva, Paris, and London during their teens, the James children acquired languages and an awareness of Europe vouchsafed to few Americans in their times. On the eve of the American Civil War, the James family settled at Newport, R.I., and there, and later in Boston, Henry came to know New England intimately. When he was 19 years of age he enrolled at the Harvard Law School, but he devoted his study time to reading Charles-Augustin Sainte-Beuve, Honoré de Balzac, and Nathaniel Hawthorne. His first story appeared anonymously two years later in the New York *Continental Monthly* and his first book reviews in the *North American Review.* When William Dean Howells became editor of *The Atlantic Monthly,* James found in him a friend and mentor who published him regularly. Between them, James and Howells inaugurated the era of American "realism."

By his mid-20s James was regarded as one of the most skillful writers of short stories in America. Critics, however, deplored his tendency to write of the life of the mind, rather than of action. The stories of these early years show the leisurely existence of the well-to-do at Newport and Saratoga. James's apprenticeship was thorough. He wrote stories, reviews, and articles for almost a decade before he attempted a full-length novel. There had to be also the traditional "grand tour," and James went abroad for his first adult encounter with Europe in 1869. His year's wandering in England, France, and Italy set the stage for a lifetime of travel in those countries. James never married. By nature he was friendly and even gregarious, but while he was an active observer and participant in society, he tended, until late middle age, to be "distant" in his relations with people and was careful to avoid "involvement."

Career—first phase. Recognizing the appeal of Europe, given his cosmopolitan upbringing, James made a deliberate effort to discover whether he could live and work in the United States. Two years in Boston, two years in Europe, mainly in Rome, and a winter of unremitting hackwork in New York City convinced him that he could write better and live more cheaply abroad. Thus began his long expatriation—heralded by publication in 1875 of the novel *Roderick Hudson,* the story of an American sculptor's struggle by the banks of the Tiber between his art and his passions; *Transatlantic Sketches,* his first collection of travel writings; and a collection of tales. With these three substantial books, he inaugurated a career that saw about 100 volumes through the press during the next 40 years.

During 1875–76 James lived in Paris, writing literary and topical letters for the *New York Tribune* and working on his novel *The American* (1877), the story of a self-made American millionaire whose guileless and forthright character contrasts with that of the arrogant and cunning family of French aristocrats whose daughter he unsuccessfully attempts to marry. In Paris James sought out the Russian novelist Ivan Turgenev, whose work appealed to him, and through Turgenev was brought into Gustave Flaubert's coterie, where he got to know Edmond de Goncourt, Émile Zola, Alphonse Daudet, and Guy de Maupassant. From Turgenev he received confirmation of his own view that a novelist need not worry about "story" and that, in focusing on character, he would arrive at the life experience of his protagonist.

Much as he liked France, James felt that he would be an eternal outsider there, and late in 1876 he crossed to London. There, in small rooms in Bolton Street off Piccadilly, he wrote the major fiction of his middle years. In 1878 he achieved international renown with his story of an American flirt in Rome, *Daisy Miller,* and further advanced his reputation with *The Europeans* that same year. In England he was promptly taken up by the leading Victorians and became a regular at Lord Houghton's breakfasts, where he consorted with Alfred Tennyson, William Gladstone, Robert Browning, and others. A great social lion, James dined out 140 times during 1878 and 1879 and visited in many of the great Victorian houses and country seats. He was elected to London clubs, published his stories simultaneously in English and American periodicals, and mingled with George Meredith, Robert Louis Stevenson, Edmund Gosse, and other writers, thus establishing himself as a significant figure in Anglo-American literary and artistic relations.

James's reputation was founded on his versatile studies of "the American girl." In a series of witty tales, he pictured the "self-made" young woman, the bold and brash American innocent who insists upon American standards in European society. James ended this first phase of his career by producing his masterpiece, *The Portrait of a Lady* (1881), a study of a young woman from Albany who brings to Europe her narrow provincialism and pretensions but also her sense of her own sovereignty, her "free spirit," her refusal to be treated, in the Victorian world, merely as a marriageable object. As a picture of Americans moving in the expatriate society of England and Italy, this novel has no equal in the history of modern fiction. It is a remarkable study of a band of egotists while at the same time offering a shrewd appraisal of the American character. James's understanding of power in personal relations was profound, as evinced in *Washington Square* (1881), the story of a young American heroine whose hopes for love and marriage are thwarted by her father's callous rejection of a somewhat opportunistic suitor.

Career—middle phase. In the 1880s James wrote two novels dealing with social reformers and revolutionaries, *The Bostonians* (1886) and *The Princess Casamassima* (1886). In the novel of Boston life, James analyzed the struggle between conservative masculinity embodied in a Southerner living in the North and an emancipated matriarchate. *The Bostonians* remains the fullest and most rounded American social novel of its time in its study of cranks, faddists, and "do-gooders." In *The Princess Casamassima* James exploited the anarchist violence of the decade and depicted the struggle of a man who toys with revolution and is destroyed by it. These novels were followed by *The Tragic Muse* (1890), in which James projected a study of the London and Paris art studios and the stage, the conflict between art and "the world."

The latter novel raised the curtain on his own "dramatic years," 1890–95, during which he tried to win success writing for the stage. His dramatization of *The American* in 1891 was a modest success, but an original play, *Guy Domville,* produced in 1895, was a failure, and James was booed at the end of the first performance. Crushed and feeling that he had lost his public, he spent several years seeking to adapt his dramatic experience to his fiction. The result was a complete change in his storytelling methods. In *The Spoils of Poynton* (1897), *What Maisie Knew* (1897), *The Turn of the Screw* and *In the Cage* (1898), and *The Awkward Age* (1899), James began to use the methods of alternating "picture" and dramatic scene, close adherence to a given angle of vision, a withholding of information from the reader, making available to him only that which the characters see. The subjects of this period are the developing consciousness and moral education of children—in reality James's old international theme of innocence in a corrupting world, transferred to the English setting.

Career—final phase. The experiments of this "transition" phase led James to the writing of three grandiose novels at the beginning of the new century, which represent his final—his "major"—phase, as it has been called. In these novels James pointed the way for the 20th-century novel. He had begun as a realist who describes minutely his crowded stage. He ended by leaving his stage comparatively bare, and showing a small group of characters in a tense situation, with a retrospective working out, through multiple angles of vision, of their drama. In addition to these technical devices he resorted to an increasingly allusive prose style, which became dense and charged with symbolic imagery. His late "manner" derived in part from his dictating directly to a typist and in part from his unremitting search for ways of projecting subjective experience in a flexible prose.

The first of the three novels was *The Ambassadors* (1903). This is a high comedy of manners, of a middle-aged American who goes to Paris to bring back to a Massachusetts industrial town a wealthy young man who, in the view of his affluent family, has lingered too long abroad. The "ambassador" in the end is captivated by civilized Parisian life. The novel is a study in the growth of perception and awareness in the elderly hero, and it balances the relaxed moral standards of the European continent against the parochial rigidities of New England. The second of this series of novels was *The Wings of the Dove,* published in 1902, before *The Ambassadors,* although written after it. This novel, dealing with a melodramatic subject of great pathos, that of an heiress doomed by illness to die, avoids its cliche subject by focusing upon the characters surrounding the unfortunate young woman. They intrigue to inherit her millions. Told in this way, and set in London and Venice, it becomes a powerful study of well-intentioned humans who, with dignity and reason, are at the same time also birds of prey. In its shifting points of view and avoidance of scenes that would end in melodrama, *The Wings of the Dove* demonstrated the mastery with which James could take a tawdry subject and invest it with grandeur. His final novel was *The Golden Bowl* (1904), a study of adultery, with four principal characters. The first part of the story is seen through the eyes of the aristocratic husband and the second through the developing awareness of the wife.

While many of James's short stories were potboilers written for the current magazines, he achieved high mastery in the ghostly form, notably in *The Turn of the Screw* (1898), and in such remarkable narratives as "The Aspern Papers" (1888) and "The Beast in the Jungle" (1903)—his prophetic picture of dissociated 20th-century man lost in an urban agglomeration. As a critic James tended to explore the character and personality of writers as revealed in their creations; his essays are a brilliant series of studies, moral portraits, of the most famous novelists of his century, from Balzac to the Edwardian realists. His travel writings, *English Hours* (1905), *Italian Hours* (1909), and *A Little Tour in France* (1884), portray the backgrounds James used for his fictions.

In his later years, James lived in retirement in an 18th-century house at Rye in Sussex, though on completion of *The Golden Bowl* he revisited the United States in 1904–05. James had lived abroad for 20 years, and in the interval America had become a great industrial and political power. His observation of the land and its people led him to write, on his return

to England, a poetic volume of rediscovery and discovery, *The American Scene* (1907), prophetic in its vision of urban doom, spoliation, and pollution of resources and filled with misgivings over the anomalies of a "melting pot" civilization. The materialism of American life deeply troubled James, and on his return to England he set to work to shore up his own writings, and his own career, against this ephemeral world. He devoted three years to rewriting and revising his principal novels and tales for the highly selective "New York Edition," published in 24 volumes. For this edition James wrote 18 significant prefaces, which contain both reminiscence and exposition of his theories of fiction.

Throwing his moral weight into Britain's struggle in World War I, James became a British subject in 1915 and received the Order of Merit from King George V.

Assessment. Henry James's career was one of the longest and most productive—and most influential—in American letters. A master of prose fiction from the first, he practiced it as a fertile innovator, enlarged the form, and placed upon it the stamp of a highly individual method and style. He wrote for 51 years—20 novels, 112 tales, 12 plays, several volumes of travel and criticism, and a great deal of literary journalism. He recognized and helped to fashion the myth of the American abroad and incorporated this myth in the "international novel," of which he was the acknowledged master. His fundamental theme was that of an innocent, exuberant, and democratic America confronting the worldly wisdom and corruption of Europe's older, aristocratic culture. In both his light comedies and his tragedies, James's sense of the human scene was sure and vivid; and, in spite of the mannerisms of his later style, he was one of the great prose writers and stylists of his century.

James's public remained limited during his lifetime, but, after a revival of interest in his work during the 1940s and '50s, he reached an ever-widening audience; his works were translated in many countries, and he was recognized in the late 20th century as one of the subtlest craftsmen who ever practiced the art of the novel. His rendering of the inner life of his characters made him a forerunner of the "stream-of-consciousness" movement in the 20th century. (L.Ed./Ed.)

BIBLIOGRAPHY. Leon Edel, *Henry James,* 5 vol. (1953–72), also available in a one-volume abridged ed. by the author, *Henry James, a Life* (1985), is a full-length biography of the novelist based on his unpublished correspondence, diaries, and other documents. Other biographies include F.W. Dupee, *Henry James* (1951, reissued 1973); Gordon Pirie, *Henry James* (1974); and Harry T. Moore, *Henry James* (also published as *Henry James and His World,* 1974). Aspects of James's works are examined in F.O. Matthiessen, *Henry James: The Major Phase* (1944, reprinted 1970); Frederick C. Crews, *The Tragedy of Manners: Moral Drama in the Later Novels of Henry James* (1957, reissued 1971); Peter Buitenhuis, *The Grasping Imagination: The American Writings of Henry James* (1970); Sarah B. Daugherty, *The Literary Criticism of Henry James* (1981); Vivien Jones, *James the Critic* (1985); Richard A. Hocks, *Henry James: A Study of the Short Fiction* (1990); and Philip Horne, *Henry James and Revision: The New York Edition* (1990). Roger Gard (ed.), *Henry James* (1968, reissued 1986), collects contemporary criticism.

James, Jesse; and James, Frank, in full JESSE WOODSON JAMES and ALEXANDER FRANKLIN JAMES (respectively b. Sept. 5, 1847, near Centerville [now Kearny], Mo., U.S.—d. April 3, 1882, St. Joseph, Mo.; b. Jan. 10, 1843, near Centerville—d. Feb. 18, 1915, near Kearny), two brothers who were among the most notorious outlaws of the American West, engaging in robberies that came to typify the hazards of the 19th-century frontier as it has been portrayed in motion-picture Westerns.

Reared on a Missouri farm, Jesse and Frank shared their family's sympathy with the Southern cause when the American Civil War broke out (1861). Frank joined William C. Quantrill's Confederate guerrillas, becoming friends with Cole Younger, a fellow member. Jesse followed suit by joining "Bloody" Bill Anderson's guerrilla band. At the end of the war the bands surrendered, but Jesse was reportedly shot and severely wounded by Federal soldiers while under a flag of truce. He

and Frank, joined by eight other men, then began their outlaw career by robbing a bank in Liberty, Mo., on Feb. 13, 1866. During the same year, Cole Younger joined the gang, with the other Younger brothers following his lead one by one during the next few years. The James gang robbed banks from Iowa to Alabama and Texas and began holding up trains in 1873. The bandits also preyed upon stagecoaches, stores, and individuals. Throughout their long career and afterward, their exploits were seized upon by writers who exaggerated and romanticized their deeds to meet the demands of Eastern readers for bloody Western tales of derring-do. To the Missouri Ozark people, Jesse James emerged as a romantic figure, hounded into a life of crime by authorities who never forgave his allegiance to the South. Jesse and Frank did, in fact, always seek to justify their banditry on grounds of persecution.

On Sept. 7, 1876, the James gang was nearly destroyed while trying to rob the First National Bank at Northfield, Minn. Of the eight bandits only the James brothers escaped death or capture. After gathering a new gang in 1879, the James brothers resumed robbing, and in 1881 Missouri governor Thomas T. Crittenden offered a $10,000 reward for their capture, dead or alive. While living at St. Joseph under the pseudonym of Thomas Howard, the unarmed Jesse was adjusting a picture on the wall in his home when he was shot in the back of the head and instantly killed by Robert Ford, a gang member, who claimed the reward. A few months later, Frank James gave himself up. He was tried for murder in Missouri and found not guilty, tried for robbery in Alabama and found not guilty, and finally tried for armed robbery in Missouri and again released. A free man, he retired to a quiet life on his family's farm, dying in 1915 in the room in which he was born.

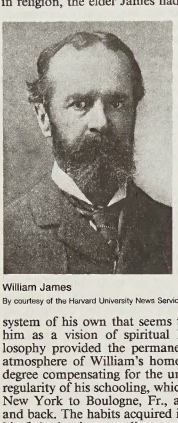
James, Liturgy of Saint, a eucharistic service based on the Antiochene Liturgy, said to be the most ancient Christian liturgy. Modified forms of the Liturgy of St. James are used by Catholic Syrians, Monophysite Syrians (Jacobites), Maronites, and the Orthodox of Zakynthos and Jerusalem. In most Eastern churches, Orthodox and Catholic, it has been superseded by the Byzantine liturgy of St. John Chrysostom.

The Liturgy of St. James has the following order of service: (1) readings from Scriptures, including the Old Testament, Epistles, Acts, and Gospels; (2) a sermon from the bishop; (3) a dismissal of the catechumens; (4) a prayer for the faithful; (5) the kiss of peace and words of greeting from the bishop; (6) the washing of hands; (7) the offering of gifts; (8) the Eucharist, including prayer, preface, Sanctus, words of institution, anamnesis (remembrance of the dead), epiclesis (invocation of the Holy Spirit), intercessory prayers for the church, for the living, and for the dead, preparatory prayers for communion, celebration of communion, and prayer of thanksgiving; and (9) the final blessings from the bishop.

James, P.D., byname of PHYLLIS DOROTHY JAMES, BARONESS JAMES, married name WHITE (b. Aug. 3, 1920, Oxford, Oxfordshire, Eng.), British mystery novelist best known for her fictional detective Adam Dalgliesh of Scotland Yard.

The daughter of a middle-grade civil servant, James grew up in the university town of Cambridge. Her formal education, however, ended at age 16 because of lack of funds, and she was thereafter self-educated. In 1941 she married a medical student and future physician, who came home from wartime service mentally deranged and spent much of the rest of his life in psychiatric hospitals. To support her family (which included two children), she took work in hospital administration and, after her husband's death in 1964, became a civil servant in the criminal section of the Department of Home Affairs. Her first mystery novel, *Cover Her Face,* appeared in 1962 and was followed by six more mysteries before she retired from government service in 1979 to devote full time to writing. A number of her stories were turned into television plays. She was named a life peer in 1991.

James's master detective, Dalgliesh, who rises in her novels from chief inspector to chief superintendant and then to commander, is a serious, introspective person, moralistic yet realistic. The novels in which he appears are peopled by fully rounded characters, civilized, genteel, and motivated.



James, Protevangelium of (biblical literature): *see* Protevangelium of James.

James, The Letter of, also called THE EPISTLE OF ST. JAMES THE APOSTLE, New Testament writing addressed to the early Christian churches ("to the twelve tribes in the dispersion") and attributed to James, a Christian Jew, whose identity is disputed. There is also wide disagreement as to the date of composition. The letter is moralistic rather than dogmatic and reflects early Jewish Christianity. The writer covers such topics as endurance under persecution, poverty and wealth, control of the tongue, care for orphans and widows, cursing, boasting, oaths, and prayer. The only New Testament reference to anointing of the sick (5:14) is cited, mostly by Roman Catholic and Eastern Orthodox theologians, as a probable reference to what they consider one of the seven sacraments.

James, William (b. Jan. 11, 1842, New York, N.Y., U.S.—d. Aug. 26, 1910, Chocorua, N.H.), American philosopher and psychologist, a leader of the philosophical movement of Pragmatism and of the psychological movement of functionalism.

Early life and education. James was the eldest son of Henry James, an idiosyncratic and voluble man whose philosophical interests attracted him to the theology of Emanuel Swedenborg. One of William's brothers was the novelist Henry James. The elder Henry James held an "antipathy to all ecclesiasticisms which he expressed with abounding scorn and irony throughout all his later years." Both his physical and his spiritual life were marked by restlessness and wanderings, largely in Europe, that affected the training of his children at school and their education at

home. Building upon the works of Swedenborg, which had been proffered as a revelation from God for a new age of truth and reason in religion, the elder James had constructed a

William James

system of his own that seems to have served him as a vision of spiritual life. This philosophy provided the permanent intellectual atmosphere of William's home life, to some degree compensating for the undisciplined irregularity of his schooling, which ranged from New York to Boulogne, Fr., and to Geneva and back. The habits acquired in dealing with his father's views at dinner and at tea carried over into the extraordinarily sympathetic yet critical manner that William displayed in dealing with anybody's views on any occasion.

When James was 18 years of age he tried his hand at studying art, under the tutelage of William M. Hunt, an American painter of religious subjects. But he soon tired of it and the following year entered the Lawrence Scientific School of Harvard University. From courses in chemistry, anatomy, and similar subjects there, he went to the study of medicine in the Harvard Medical School; but he interrupted this study in order to accompany the eminent naturalist Louis Agassiz, in the capacity of assistant, on an expedition to the Amazon. There James's health failed, and his duties irked him. He returned to the medical school for a term and then during 1867–68 went to Germany for courses with the physicist and physiologist Hermann von Helmholtz, who formulated the law of the conservation of energy; with Rudolf Virchow, a pathologist; with Claude Bernard, the foremost experimentalist of 19th-century medicine; and with others. At the same time he read widely in the psychology and philosophy then current, especially the writings of Charles Renouvier, a Kantian Idealist and relativist.

The acquaintance with Renouvier was a focal point in James's personal and intellectual history. He seems from adolescence to have been a delicate boy, always ailing, and at this period of his stay in Germany he suffered a breakdown, with thoughts of suicide. When he returned home in November 1868, after 18 months in Germany, he was still ill. Though he took the degree of M.D. at the Harvard Medical School in June 1869, he was unable to begin practice. Between that date and 1872 he lived in a state of semi-invalidism in his father's house, doing nothing but reading and writing an occasional review. Early in this period he experienced a sort of phobic panic, which persisted until the end of April 1870. It was relieved, according to his own statement, by the reading of Renouvier on free will and the decision that "my first act of free will shall be to believe in free will." The decision carried with it the abandonment of all determinisms—both the scientific kind that his training had established for him and that seems to have had some relation to his neurosis and the theological, metaphysical kind that he later opposed in the notion of "the block universe." His revolutionary discoveries in psychology and philosophy, his views concerning the methods of science, the qualities of men, and the nature of reality all seem to have received a definite propulsion from this resolution of his poignant personal problem.

Interest in Psychology. In 1872 James was appointed instructor in physiology at Harvard College, in which capacity he served until 1876. But he could not be diverted from his ruling passion, and the step from teaching physiology to teaching psychology—not the traditional "mental science" but physiological psychology—was as inevitable as it was revolutionary. It meant a challenge to the vested interests of the mind, mainly theological, that were entrenched in the colleges and universities of the United States; and it meant a definite break with what Santayana called "the genteel tradition." Psychology ceased to be mental philosophy and became a laboratory science. Philosophy ceased to be an exercise in the grammar of assent and became an adventure in methodological invention and metaphysical discovery.

With his marriage in 1878, to Alice H. Gibbens of Cambridge, Mass., a new life began for James. The old neurasthenia practically disappeared. He went at his tasks with a zest and an energy of which his earlier record had given no hint. It was as if some deeper level of his being had been tapped: his life as an originative thinker began in earnest. He contracted to produce a textbook of psychology by 1880. But the work grew under his hand, and when it finally appeared in 1890, as *The Principles of Psychology,* it was not a textbook but a monumental work in two great volumes, from which the textbook was condensed two years later.

The *Principles,* which was recognized at once as both definitive and innovating in its field, established the functional point of view in psychology. It assimilated mental science to the biological disciplines and treated thinking and knowledge as instruments in the struggle to live. At one and the same time it made the fullest use of principles of psychophysics (the study of the effect of physical processes upon the mental processes of an organism) and defended, without embracing, free will.

Interest in religion. The *Principles* completed, James seems to have lost interest in the subject. Creator of the first U.S. demonstrational psychological laboratory, he disliked laboratory work and did not feel himself fitted for it. He liked best the adventure of free observation and reflection. Compared with the problems of philosophy and religion, psychology seemed to him "a nasty little subject" that he was glad to have done with. His studies, which were now of the natun and existence of God, the immortality of the soul, free will and determinism, the values of life, were empirical, not dialectical; James went directly to religious experience for the nature of God, to psychical research for survival after death, to fields of belief and action for free will and determinism. He was searching out these things, not arguing foregone conclusions. Having begun to teach ethics and religion in the late 1880s, his collaboration with the psychical researchers dated even earlier. Survival after death he ultimately concluded to be unproved; but the existence of divinity he held to be established by the record of the religious experience, viewing it as a plurality of saving powers, "a more of the same quality" as oneself, with which, in a crisis, one's personality can make saving contact. Freedom he found to be a certain looseness in the conjunction of things, so that what the future will be is not made inevitable by past history and present form; freedom, or chance, corresponds to Darwin's "spontaneous variations." These views were set forth in the period between 1893 and 1903 in various essays and lectures, afterward collected into works, of which the most notable is *The Will to Believe and Other Essays in Popular Philosophy* (1897). During this decade, which may be correctly described as James's religious period, all of his studies were concerned with one aspect or another of the religious question.

His natural interest in religion was reinforced by the practical stimulus of an invitation to give the Gifford Lectures on natural religion at the University of Edinburgh. He was not able to deliver them until 1901–02, and their preparation focussed his labours for a number of years. His disability, involving his heart, was caused by prolonged effort and exposure during a vacation in the Adirondacks in 1898. A trip to Europe, which was to have taken up a sabbatical year away from university duties, turned into two years of invalidism. The Gifford Lectures were prepared during this distressful period. Published as *The Varieties of Religious Experience* (1902), they had an even greater acclaim as a book than as articles. Cautious and tentative though it was, the rich concreteness of the material and the final summary of the evidence—that the varieties of religious experience point to the existence of specific and various reservoirs of consciousness-like energies with which we can make specific contact in times of trouble—touched something fundamental in the minds of religionists and at least provided them with apologetic material not in conflict with science and scientific method. The book was the culmination of James's interest in the psychology of religion.

Career in philosophy. James now explicitly turned his attention to the ultimate philosophic problems that had been at least marginally present along with his other interests. Already in 1898, in a lecture at the University of California on philosophical conceptions and practical results, he had formulated the theory of method known as Pragmatism. Originating in the strict analysis of the logic of the sciences that had been made in the middle 1870s by Charles Sanders Peirce, the theory underwent in James's hands a transforming generalization. He showed how the meaning of any idea whatsoever—scientific, religious, philosophical, political, social, personal—can be found ultimately in nothing save in the succession of experiential consequences that it leads through and to; that truth and error, if they are within the reach of the mind at all, are identical with these consequences. Having made use of the pragmatic rule in his study of religious experience, he now turned it upon the ideas of change and chance, of freedom, variety, pluralism, and novelty, which, from the time he had read Renouvier, it had been his preoccupation to establish. He used the pragmatic rule in his polemic against monism and the "block universe," which held that all of reality is of one piece (cemented, as it were, together); and he used this rule against internal relations (*i.e.,* the notion that you cannot have one thing without having everything), against all finalities, staticisms, and completenesses. His classes rang with the polemic against absolutes, and a new vitality flowed into the veins of American philosophers. Indeed, the historic controversy over Pragmatism saved the profession from iteration and dullness.

Meanwhile (1906), James had been asked to lecture at Stanford University, in California, and he experienced there the earthquake that nearly destroyed San Francisco. The same year he delivered the Lowell Lectures in Boston, afterward published as *Pragmatism: A New Name for Old Ways of Thinking* (1907). Various studies appeared—"Does Consciousness Exist?" "The Thing and Its Relations,"

"The Experience of Activity"—chiefly in *The Journal of Philosophy;* these were essays in the extension of the empirical and pragmatic method, which were collected after James's death and published as *Essays in Radical Empiricism* (1912). The fundamental point of these writings is that the relations between things, holding them together or separating them, are at least as real as the things themselves; that their function is real; and that no hidden substrata are necessary to account for the clashes and coherences of the world. The Empiricism was radical because until this time even Empiricists believed in a metaphysical ground like the hidden turtle of Hindu mythology on whose back the cosmic elephant rode.

James was now the centre of a new life for philosophy in the English-speaking world. The continentals did not "get" Pragmatism; if its German opponents altogether misunderstood it, its Italian adherents—among them, of all people, the critic and devastating iconoclast Giovanni Papini—travestied it. In England it was championed by F.C.S. Schiller, in the United States by John Dewey and his school, in China by Hu Shih. In 1907 James gave his last course at Harvard. In the spring he repeated the lectures on Pragmatism at Columbia University. It was as if a new prophet had come; the lecture halls were as crowded on the last day as on the first, with people standing outside the door. Shortly afterward came an invitation to give the Hibbert Lectures at Manchester College, Oxford. These lectures, published in 1909 as *A Pluralistic Universe,* state, in a more systematic and less technical way than the *Essays,* the same essential positions. They present, in addition, certain religious overbeliefs of James's, which further thinking—if the implications of the posthumous *Some Problems of Philosophy* may be trusted—was to mitigate. These overbeliefs involve a panpsychistic interpretation of experience (one that ascribes a psychic aspect to all of nature) that goes beyond radical Empiricism and the pragmatic rule into conventional metaphysics.

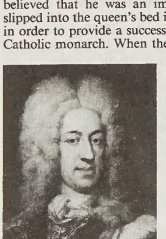
Home again, James found himself working, against growing physical trouble, upon the material that was partially published after his death as *Some Problems of Philosophy* (1911). He also collected his occasional pieces in the controversy over Pragmatism and published them as *The Meaning of Truth* (1909). Finally, his physical discomfort exceeded even his remarkable voluntary endurance. After a fruitless trip to Europe in search of a cure, he returned, going straight to the country home in New Hampshire, where he died in 1910.

Significance and influence. In psychology, James's work is of course dated, but it is dated as is Galileo's in physics or Charles Darwin's in biology because it is the originative matrix of the great variety of new developments that are the current vogue. In philosophy, his positive work is still prophetic. The world he argued for was soon reflected in the new physics, as diversely interpreted, with its resonances from Charles Peirce, particularly by Albert Einstein, Bertrand Russell, and the Danish quantum physicist Niels Bohr—a world of events connected with one another by kinds of next-to-next relations, a world various, manifold, changeful, originating in chance, perpetuated by habits (that the scientist calls laws), and transformed by breaks, spontaneities, and freedoms. In human nature, James believed, these visible traits of the world are equally manifest. The real specific event is the individual, whose intervention in history gives it in each case a new and unexpected turn. But in history, as in nature, the continuous flux of change and chance transforms every being, invalidates every law, and alters every ideal.

James lived his philosophy. It entered into the texture and rhythms of his rich and vivid literary style. It determined his attitude toward scientifically unaccepted therapies, such as Christian Science or mind cure, and repugnant ideals, such as militarism. It made him an anti-imperialist, a defender of the small, the variant, the unprecedented, the weak, wherever and whenever they appeared. His philosophy is too viable and subtle, too hedged, experiential, and tentative to have become the dogma of a school. It has functioned rather to implant the germs of new thought in others than to serve as a standard old system for others to repeat. (H.M.K.)

BIBLIOGRAPHY. The best and most comprehensive biography, richly documented, is still Ralph Barton Perry, *The Thought and Character of William James,* 2 vol. (1935, reprinted 1974). Other works of biography and criticism include Gay Wilson Allen, *William James* (1967), a sympathetic popularization; Jacques Barzun, *A Stroll with William James* (1983), an appreciation; Daniel W. Bjork, *The Compromised Scientist: William James in the Development of American Psychology* (1983); Gerald E. Myers, *William James: His Life and Thought* (1986); Daniel W. Bjork, *William James: The Center of His Vision* (1988), including a lengthy bibliographic essay; and R.W.B. Lewis, *The Jameses* (1991), a study of the family.

James Bay, shallow southern extension of Hudson Bay, located between northern Ontario and Quebec, Canada. Generally less than 200 feet (60 m) deep, the bay is 275 miles (443 km) long and 135 miles (217 km) wide and contains numerous islands, all of which are administered by the Northwest Territories. Akimiski, the largest island, has an area of 1,159 square miles (3,002 square km). The many rivers that flow into James Bay, including La Grande, Eastmain, Rupert, Broadback, Nottaway, Harricana, Moose, Albany, Attawapiskat, and Ekwan, are responsible for its low salinity. Among the chief settlements on the bay's forested shores are the trading posts of Fort-George, Nouveau-Comptoir, Eastmain, Fort-Rupert, Lake River, Attawapiskat, Fort Albany, Moose Factory, and Moosonee (the northern terminus of the Ontario Northland Railway). Visited in 1610 by the English navigator Henry Hudson, the bay was named after Captain Thomas James, who explored it in 1631.



James Edward, THE OLD PRETENDER, in full JAMES FRANCIS EDWARD STUART (b. June 10, 1688, London, Eng.—d. Jan. 1, 1766, Rome, Papal States [Italy]), son of the deposed Roman Catholic monarch James II of England and claimant to the English and Scottish thrones. Styled James III of England and James VIII of Scotland by his supporters, he made several halfhearted efforts to gain his crown.

At his birth it was widely and erroneously believed that he was an impostor who was slipped into the queen's bed in a warming pan in order to provide a successor to the Roman Catholic monarch. When the Protestant ruler William of Orange, stadtholder of Holland, deposed James II in 1688, the infant prince was taken to France, where his father set up a court in exile. Upon the death of James II in 1701, the French king Louis XIV proclaimed James king of England. James's adherence to Roman Catholicism caused the English Parliament to pass a bill of attainder against him in 1701.

In 1708 the Pretender set out in French ships to invade Scotland, but he was driven away by the British before he could land. He distinguished himself fighting in the French army in the War of the Spanish Succession (1701–14). In 1714 he refused to accept suggestions by Robert Harley and Viscount Bolingbroke that he renounce Roman Catholicism and become an Anglican in order to be designated Queen Anne's heir to the throne of England.

John Erskine, 6th Earl of Mar, raised a Jacobite (from the Latin equivalent of the name James) rebellion in Scotland in 1715, and the Pretender landed at Peterhead, Aberdeen, on December 22. By Feb. 10, 1716, the uprising had collapsed and James had returned to France. He passed the remainder of his life in or near Rome.

In 1719 James married Maria Clementina Sobieska, a granddaughter of John III Sobieski of Poland. They produced two sons, Charles Edward, called the Young Pretender, and Henry, later the cardinal duke of York. Charles Edward precipitated one last, futile Jacobite rebellion in Britain in 1745.

James Island (Galápagos Islands): *see* San Salvador Island.

James River, also called JIM RIVER, or DAKOTA RIVER, river rising in Wells county, central North Dakota, U.S., and flowing in a generally south-southeasterly direction across South Dakota, to join the Missouri River about 5 miles (8 km) below Yankton after a course of 710 miles (1,140 km). Major cities along the river are Jamestown, N.D., and Huron and Mitchell, S.D. A number of dams have been constructed on the James River for recreation and water-supply purposes. A dam near Jamestown provides flood protection and water for irrigation. The river's drainage basin covers 22,000 square miles (56,980 square km).

James River, river in Virginia, U.S., formed by the junction of the Jackson and Cowpasture rivers and cutting across the Great Appalachian Valley in northern Botetourt county. It flows in an easterly direction, crossing the Blue Ridge Mountains near Lynchburg and continuing past Richmond, which marks the fall line and head of tidewater, about 100 miles (160 km) above its mouth. The river then meanders in a southeasterly direction to enter Hampton Roads through a 5-mile-(8-kilometre-) wide estuary at Newport News after a course of 340 miles (550 km). As the James River flows through a gorge in the Blue Ridge, it drops in the Balcony Falls and again in a 3-mile (5-kilometre) series of rapids (an 84-foot [26-metre] drop) above Richmond, where the river has been impounded by the Boshon Dam. The Appomattox and Chickahominy rivers are the chief tributaries. The James is navigable for deep drafts to Richmond. A 4.5-mile (7-kilometre) bridge spans the river above Newport News. Jamestown Island, on the river's lower course, was the site of the first permanent English settlement (1607) in America. During the American Civil War, Union troops used the James in their attempt to capture Richmond and dug the Dutch Gap Canal during their siege.

Jameson, Sir Leander Starr, BARONET (b. Feb. 9, 1853, Edinburgh—d. Nov. 26, 1917, London), southern African statesman who,

as friend and collaborator of Cecil Rhodes, was notorious for his abortive raid into the Transvaal to overthrow the Boer government of Paul Kruger in 1895.

After studying medicine at University College, London, Jameson seemed destined for a great future as a physician in Britain, but poor health and a strong sense of adventure led him in 1878 to the diamond mines in Kimberley, Griqualand West, in southern Africa. There he met Rhodes. They became fast friends and shared a dream to extend British rule from the Cape of Good Hope to Cairo.

On Rhodes's behalf, Jameson undertook missions in 1889 and 1890 to charm Lobengula, king of the Ndebele (sometimes called Matabele), into confirming mineral concessions in present-day Zimbabwe for the British South Africa Company. In 1891 Jameson, again as Rhodes's representative, explored the area between inland Salisbury and coastal Beira (now in Mozambique) and gained concessions from local chiefs. Later that year he was made administrator of Mashonaland, thereby establishing the first settled government. At the conclusion of the Matabele War (1893), the lands of Lobengula were incorporated under Jameson's authority to create the embryo colony of Rhodesia.

The Boer government of the Transvaal Republic was the chief obstacle to Rhodes's plans for the federation of all South Africa under the British. Thus, he plotted with Jameson and with Uitlander (Afrikaans: "foreigner"; *i.e.,* British) leaders to overthrow it. "Dr. Jim" was to raise a force and move against Johannesburg to support an Uitlander uprising.

Internal Uitlander disputes caused Rhodes to postpone the action, but the impetuous Jameson decided to force the issue and invaded the Transvaal on Dec. 29, 1895, with 500 mounted men. The raid was a disaster: Jameson and his men were defeated and captured; Rhodes's political career was ruined; and Jameson was sent to England, tried, and sentenced to 15 months' imprisonment. He was released after a few months because of severe illness.

Jameson returned to South Africa and was elected to represent Kimberley in the Cape Colony Parliament (1900). When Rhodes died in 1902, Jameson took over leadership of the Progressive Party and became prime minister (1904–08) of the Cape Colony. After helping to promote the Union of South Africa, he founded the Unionist Party (1910) and led the opposition to the governing South African Party in the Union Parliament until he was forced to retire to England in 1912 because of his health. A baronetcy was conferred on him in 1911 (it lapsed upon his death). Though he died in England, his body was taken to the Matopo Hills in Rhodesia (now Zimbabwe) and buried near that of Rhodes.

Jamestown, seaport town and capital of St. Helena, a British island in the South Atlantic Ocean. The town was founded in 1659, when the British East India Company built a fort and established a garrison at the site on James Bay, naming it after the Duke of York (later James II). Jamestown, consisting of little more than a single street, runs up a narrow, deep-sided valley for a mile to a height of 500 feet (150 m). The main sources of revenue are customs duties, wharfage, and the sale of postage stamps to philatelists. Plantation House (governor's residence) and the Cathedral of St. Paul's are south of the town. Longwood, where Napoleon was exiled and died in 1821, is 2.5 miles (4 km) southwest and is in the custody of France. Pop. (latest est.) 1,332.

Jamestown, city, Chautauqua county, southwestern New York, U.S. It lies at the south end of Lake Chautauqua, 70 miles (113 km) southwest of Buffalo. It was named for James Prendergast, who in 1811 purchased 1,000 acres (400 hectares) of land there and built a mill; a settlement developed, and furniture and textiles were early manufactures. Abundant waterpower, the opening of the Erie Canal (1825), and the arrival of the Erie Railroad in the 1850s encouraged industrial development. Jamestown's manufactures include precision bearings, furniture, diesel engines, vehicular cooling systems, brass furniture hardware, and refractory products. Many dairy farms are in the vicinity, and the city is a base for the nearby resort areas of Lake Chautauqua and the Alleghenies. Jamestown Community College was founded in 1950. Inc. village, 1827; city, 1886. Pop. (2003 est.) city, 30,726; (2000) Jamestown MSA, 139,750.

Jamestown, city, seat (1874) of Stutsman county, southeast-central North Dakota, U.S., at the confluence of the James River and Pipestem Creek, halfway between Bismarck (west) and Fargo (east). The site was settled in 1871 by construction crews of the Northern Pacific Railway. The garrison at Fort Seward guarded the railroad workers from 1872 until the fort was abandoned in 1877. Jamestown was named by a railroad official for its location on the James River and for the Virginia city of the same name. The modern economy is based on manufacturing (including farm and construction equipment and aircraft parts and equipment), food processing, and agriculture (livestock, dairy products, wheat, barley, rye, oats, flaxseed, and sunflowers). Jamestown College was founded in 1883. Frontier Village at the city's southeastern edge includes reconstructed pioneer buildings and a huge 26-foot- (8-metre-) high concrete statue of the American bison. The adjacent National Buffalo Museum has its own bison herd, including a rare albino bison born in 1996. Jamestown Dam, just north on the James River, provides flood protection, water for irrigation, and recreation opportunities. Arrowwood National Wildlife Refuge is about 30 miles (48 km) northeast. Inc. 1883. Pop. (2003 est.) 15,158.

Jamestown, town (township), Newport county, southern Rhode Island, U.S., 25 miles (40 km) south of Providence and 1 mile (1.6 km) west of Newport. The town is coextensive with Conanicut Island, one of the three main islands in Narragansett Bay. Bridges connect Jamestown to Newport (east) and the mainland (west). Settled about 1672 and incorporated in 1678, it was named for King James II. Beavertail Lighthouse (1856) is located at the southern tip of the island. The Old Windmill (1787; restored to working order) is headquarters for the Jamestown Historical Society. Parts of the Revolutionary War-era Conanicut Battery remain. Jamestown, including Jamestown village, is a residential community and summer resort. Pop. (2000) 5,622.

Jamestown, site of the first permanent British settlement in North America. It was founded on May 14, 1607, and was located on a peninsula (later Jamestown Island) in the James River in Virginia. Named in honour of King James I, the colony initiated the cultivation of tobacco, established the first representative government on the continent (1619), brought the first African slaves to the colonies, and built the first Anglican church in America.

Situated in an unhealthful marshy area, the colony always had a small population because of a high death rate from disease. In 1608 Jamestown was accidentally burned, and two years later it was about to be abandoned when Thomas West, 12th Baron De La Warr, arrived with new energy and new supplies. Other fires occurred in 1676 and 1698. Jamestown fell into decay when the seat of government of Virginia was moved in 1699 to the Middle Plantation (later Williamsburg).

By the mid-19th century the peninsula had become an island. Conservation efforts halted the erosion of the site, and excavations uncovered invaluable artifacts and structural traces of the original fort. In 1936 the island was incorporated into the Colonial National Historical Park, and replicas have re-created the 17th-century colonial atmosphere.

Jāmī, in full MOWLANĀ NŪR OD-DĪN ʿABD OR-RAḤMĀN EBN AḤMAD (b. Nov. 7, 1414, district of Jam—d. Nov. 9, 1492, Herāt, Timurid Afghanistan), Persian scholar, mystic, and poet who is often regarded as the last great mystical poet of Iran.

Jāmī spent his life in Herāt, except for two brief pilgrimages to Meshed (Iran) and the Hejaz. During his lifetime his fame as a scholar resulted in numerous offers of patronage by many of the contemporary Islāmic rulers. He declined most of these offers, preferring the simple life of a mystic and scholar to that of a court poet. His work is notably devoid of panegyrics. His prose deals with a variety of subjects ranging from Qurʾānic commentaries to treatises on Ṣūfism (Islāmic mysticism) and music. Perhaps the most famous is his mystical treatise *Lavaʾiḥ* (*Flashes of Light*), a clear and precise exposition of the Ṣūfī doctrines of *waḥdat al-wujūd* (the existential unity of Being), together with a commentary on the experiences of other famous mystics.

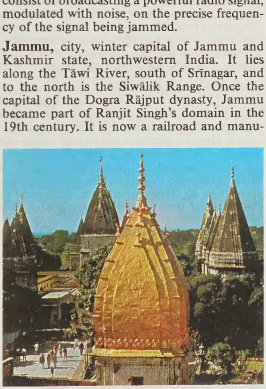
Jāmī's poetical works express his ethical and philosophical doctrines. His poetry is fresh and graceful and is not marred by unduly esoteric language. His most famous collection of poetry is a seven-part compendium entitled *Haft Awrang* ("The Seven Thrones," or "Ursa Major"), which includes *Salmān o-Absāl* and *Yūsof o-Zalīkhā.* Although this collection is modeled on the works of the 13th-century romantic poet Neẓāmī, it bears Jāmī's unmistakable mark of originality and intellectual vigour.

jāmiʿ (Islām): *see* mosque.

Jamison, Judith (b. May 10, 1943, Philadelphia, Pa., U.S.), American modern dancer who became artistic director of the Alvin Ailey American Dance Theater in 1989.

Jamison began taking dance lessons at age six at the Judimar School of Dance. She left her studies at Fisk University to attend the Philadelphia Dance Academy (now the University of the Arts). Discovered by choreographer Agnes de Mille, Jamison made her New York City debut with the American Ballet Theatre. She made her debut with the Alvin Ailey Dance Company (now the Alvin Ailey American Dance Theater [AAADT]) in *Conga Tango Palace* in 1965. In addition to her dancing, her height (5 feet 10 inches) and elegant, striking presence made her an immediate success. In 1971 Ailey choreographed *Cry* for Jamison; a 15-minute solo depicting the struggles of black women, it became her signature piece. She performed extensively both in the United States and abroad.

In 1972 Jamison married Miguel Godreau, a former member of the AAADT. She left the Ailey company in 1980 to star in the Broadway musical hit *Sophisticated Ladies.* She also began to choreograph, and the AAADT premiered her first work, *Divining,* in 1984. Among her other works are *Just Call Me Dance* (1984), *Into the Life* (1987), *Hymn* (1993), and *Sweet Release* (1996). In 1988 she established her own 12-member troupe, the Jamison Project, but, after Ailey's death in 1989, Jamison became artistic director of the Ailey troupe and its school. In doing so, she became the first African-American woman to direct a major modern dance company. Jamison's autobiography, *Dancing Spirit,* written with Howard Kaplan, was published in 1993. The recipient of numerous honours, she received a Kennedy Center Honor in 1999 and the National Medal of Arts in 2001.



Jamm, Al- (Tunisia): *see* Thysdrus.

Jammes, Francis (b. Dec. 2, 1868, Tournay, Fr.—d. Nov. 1, 1938, Hasparren, near Bayonne), French poet and novelist whose simple rustic themes were a contrast to the decadent element in French literature of the turn of the century.

A timid provincial clerk, Jammes was befriended by the Symbolist poet Stéphane Mallarmé and the novelist André Gide. His poetry reacted against Symbolism and followed a new poetic trend known as Naturism. It urged a return to nature, to the small daily happenings of life, to a childlike simplicity. He first attracted attention with *De l'Angélus de l'aube à l'Angélus du soir* (1898; "From the Morning Angelus to the Evening Angelus"). His conversion to Roman Catholicism (1905), under the guidance of the poet Paul Claudel, led him to a growing piety. *Les Géorgiques chrétiennes,* 3 vol. (1911–12; "The Christian Georgics"), is the saga of a religious peasant family told in everyday language. Jammes was content, despite his fame, to remain in the country, sharing the daily life of the villagers. Short stories, novels, and his memoirs (1923) complete his literary production in the same pastoral and intimate tone. He had reached the stature of a patriarch for the young poets of the pre-World War II generation when he died.

jamming, in electronics, broadcasting a strong signal that overrides or obscures a target signal. Jamming of radio and television stations broadcasting from beyond borders may be carried out by a country that does not wish its citizens to receive programs from abroad. In military activities, jamming is frequently employed to confuse enemy radar or communications. The techniques of jamming are many and varied, but most of them simply consist of broadcasting a powerful radio signal, modulated with noise, on the precise frequency of the signal being jammed.

Jammu, city, winter capital of Jammu and Kashmir state, northwestern India. It lies along the Tāwi River, south of Srīnagar, and to the north is the Siwālik Range. Once the capital of the Dogra Rājput dynasty, Jammu became part of Ranjit Singh's domain in the 19th century. It is now a railroad and manufacturing centre. The city is the seat of the University of Jammu (1969). Pop. (2001 prelim.) city, 378,431; metropolitan area, 607,642.

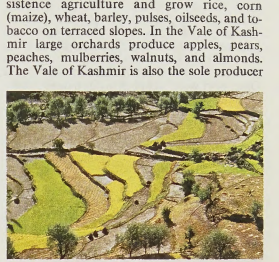
Raghuvir temples, Jammu, Jammu and Kashmir state, India
Vidyavrata

Jammu and Kashmir, state in northwestern India. It is part of a larger geographic region of Kashmir—often also called Jammu and Kashmir—that has been claimed in part or as a whole by India, Pakistan, and China since the partition of India in 1947. The Indian state is bounded to the west and north by the Pakistani-administered portions of Kashmir, to the northeast by those sections administered by China, and to the southeast and south by the Indian states of Himāchal Pradesh and Punab. The Indian state of Jammu and Kashmir encompasses the southern half of this disputed region and holds three-fourths of the region's population and the majority of its arable land. Its summer capital is Srīnagar, and its winter capital is the city of Jammu.

A brief treatment of the Indian state of Jammu and Kashmir follows. For full treatment, *see* MACROPAEDIA: India.

According to legend, an ascetic named Kaśyapa reclaimed the land of Kashmir from a vast lake, and the reclaimed land came to be known as Kaśyapamar and, later, Kashmir. Buddhism was introduced by Aśoka (*c.* 265–238 BC), and later the region gained prominence as a centre of Hindu culture. A succession of Hindu dynasties ruled over Kashmir until 1346, when it came under Muslim rule; it was annexed to the Sikh kingdom of the Punjab in 1819 and to the Dogra kingdom of Jammu in 1846. The (Hindu) Dogra dynasty ruled the region until 1947, when British India was partitioned into a Hindu India and a Muslim Pakistan.

When Indian troops entered Kashmir in 1947 to counter the Pathan tribesmen who had invaded the Bāramūlla district, Hari Singh, the maharaja of Kashmir, acceded to union with India. Pakistan has consistently opposed the accession of Kashmir to India and has continued to insist on a plebiscite, which Pakistan is confident would be in its favour because of the large proportion of Muslims in the population of Kashmir. China wrested part of the Ladākh area of eastern Kashmir from India during its victory in the Sino-Indian war of 1962.



Warfare over the joint boundary occurred between Pakistan and India in 1965, and in 1971 renewed fighting eventually brought about the Simla (Shimla) Agreement and the establishment of a "line of control," a temporary demarcation that both sides pledged to respect. But the border area in particular remained a matter of contention and civil strife was a regular occurrence. In the 1990s Muslim Kashmiri separatists began guerrilla actions against Indian civil authorities and troops. These acts of violence grew more indiscriminate at the turn of the 21st century and involved civilian casualties.

More than 90 percent of the state is mountainous. Physiographically the state comprises (southwest to northeast) the fertile and relatively low-lying Jammu and Pūnch plains, the thickly forested (coniferous) Himalayan foothills (2,000 to 7,000 feet [600 to 2,100 m]), the heavily glaciated Pīr Panjāl Range (12,500 feet [3,800 m]), the Vale of Kashmir at an elevation of 5,300 feet (1,600 m), the complex central Himalayan ranges (more than 20,000 feet [6,100 m]), the upper Indus River valley (11,000 feet [3,350 m]), the Ladākh plateau, and the Karakoram Range (more than 25,000 feet [7,600 m]). The Indus, Jhelum, Chenāb, and Tāwi are the principal rivers; Dal and Wular are the major lakes.

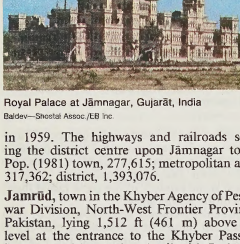
The climate varies from alpine in the northeast to subtropical in the southwest. Annual average precipitation ranges from 3 inches (75 mm) in the north to 45 inches (1,150 mm) in the southwest.

With less than 1 percent of the total population of India, Jammu and Kashmir is the only Indian state with a two-thirds Muslim majority. Hindus make up about 30 percent of the population, and there are smaller minorities of Sikhs and Buddhists. Urdu is the official language. The two largest cities are Srīnagar and Jammu. The people in the Jammu area are mostly Dogri-speaking Hindus with close cultural links to those in neighbouring Punjab state. To the northwest, Muslims form the majority in the Pūnch region. The inhabitants of the Vale of Kashmir are overwhelmingly Muslim and speak either Urdu or Kashmiri.

The majority of the population pursue subsistence agriculture and grow rice, corn (maize), wheat, barley, pulses, oilseeds, and tobacco on terraced slopes. In the Vale of Kashmir large orchards produce apples, pears, peaches, mulberries, walnuts, and almonds. The Vale of Kashmir is also the sole producer of saffron in the Indian subcontinent. Transhumance of sheep, goats, yaks, and ponies is practiced by Gūjar and Gaddi nomads; the well-known cashmere (pashmina) of commerce is the product of the goats raised there. Sericulture is widespread.

Terraced rice fields in the Vale of Kashmir, Jammu and Kashmir state, India
Christina Gascoigne

The state's economy is characterized by such handicraft industries as handloom weaving of local silk and wool, carpet and rug weaving, wood carving, and papier-mâché. Precision instruments, metalware, sporting goods, furniture, matches, and resin and turpentine are the major industrial products. Tourism is one of the oldest industries. Transportation remains a vital problem in this rugged and forested region. Jammu is the terminus of the Northern Railway of India.



Jammu and Kashmir state retains a special status with the national government as defined by the Indian constitution. While the rest of India's states follow this constitution, Jammu and Kashmir has its own constitution (adopted in 1956). Nevertheless, India's national (union) government possesses direct legislative powers in defense, external affairs, and communications in the state and indirectly deals with citizenship, Supreme Court jurisdiction, and emergency powers. The state has a governor who is appointed by the president of India. Executive power is vested in the elected chief minister and the Council of Ministers, and there is also a bicameral legislature.

There are three universities in the state: the University of Jammu (1969) at Jammu and the University of Kashmir (1969) and Sher-e-Kashmir University of Agricultural Sciences & Technology (1982) at Srīnagar. Area: 39,145 square miles (101,387 square km). Pop. (2001 prelim.) 10,069,917.

Jāmnagar, town, southwestern Gujarāt state, west-central India. Jāmnagar is situated on the Kāthiāwār Peninsula, southeast of Bedi, its port on the Gulf of Kutch of the Arabian Sea. Founded in 1540, it was the capital of former Nawānagar state. Its historic temples and palaces contrast with modern factories, hospitals, and residential districts. Cement, pottery, textiles, and salt are the main industrial products, and the town is famous for its *bāndhanī* (tie-dyeing work), gold embroidery, and metalware. Jāmnagar is served by highways, railways, and an airport.

Jāmnagar district, in western Kāthiāwār Peninsula, fronts the Gulf of Kutch (north) and the Arabian Sea (west). Formerly known

as Halar district, it is composed mainly of the old princely states of Nawānagar and Dhol Devani. Most of the district is flat, although parts of the Barda Hills lie within its boundaries. Mangrove stands on the shores of the Gulf of Kutch provide firewood and pasture. The principal crops are grains, cotton, and potatoes. Handloomed cloth and silk are the chief manufactures, and fishing is important. Dwārka, with its famous Hindu temples, and Okha port were included in Jāmnagar district

in 1959. The highways and railroads serving the district centre upon Jāmnagar town. Pop. (1981) town, 277,615; metropolitan area, 317,362; district, 1,393,076.

Jamrūd, town in the Khyber Agency of Peshāwar Division, North-West Frontier Province, Pakistan, lying 1,512 ft (461 m) above sea level at the entrance to the Khyber Pass. It is connected by road and rail with Peshāwar and with Landi Kotal through the pass by the Afghan border. Noted for its fort built with 10-ft (3-m) thick walls *c.* 1836 by the Sikh Hari Singh Nalwa, one of Ranjit Singh's generals, it was originally named Fatehgarh to commemorate the Sikh victory over the disunited tribes. The fort gained importance as a British frontier outpost in the Second Afghan War (1878–79) and was their base of operations during the Tirāh campaign (1897–98) when the Pashtun Afrīdī rose in a religious war. A collecting station for the Khyber tolls, Jamrūd also has several marble quarries.

Jamshedpur, town, Singhbhūm district, Bihār state, northeastern India, at the junction of the Subarnarekhā and Kharkai rivers. Sometimes called Tatanagar, the city was founded by the industrialist Dorabji Jamsetji Tata in 1907 and rapidly grew in importance. The second largest town in the state, it is a major rail and road junction. Industries include India's principal ironworks and steelworks, a vehicle assembly plant, and the manufacture of agricultural implements, enamelled ironware, and locomotive engine parts. It houses the National Metallurgical Laboratory and eight colleges affiliated with Rānchi University. Pop. (1981) town, 457,061; metropolitan area, 669,580.

Jämtland, *län* (county) of western Sweden, on the Norwegian border. Its land area of 19,273 sq mi (49,917 sq km) takes in the traditional *landskap* (provinces) of Jämtland and Härjedalen. The land rises in the west to 5,780 ft (1,762 m) but falls to below 1,500 ft in the east. It is drained by the rivers Ljungan, Indalsälven, Angermanälven, and Ljusnan; Storsjön is the largest of its many lakes. The region around Storsjön has been settled since pre-Christian times.

Frösön, an island in Storsjön, was the ancient capital, as well as the site of a sacrificial temple. The northernmost rune stone in Sweden was erected near the lakeshore in about 1050. Except for a brief period (1563–70), Jämtland was part of Denmark's Norwegian domains until 1645.

The core of Jämtland is a relatively fertile lowland that lends itself to agriculture. Dairying is a chief occupation, together with lumbering and quarrying. The beautiful lake scenery and wild mountains with many waterfalls also make the *län* a tourist area. Östersund is the capital, and Åre is a popular resort. Pop. (1984 est.) 134,946.

Jamuna (Asia): *see* Brahmaputra River.

Jan (Czech, Dutch, Polish, etc., personal name): *see under* John.

Jan Mayen, island, part of the Kingdom of Norway, in the Greenland Sea of the Arctic Ocean, about 300 mi (500 km) east of Greenland. It is approximately 35 mi long and 9 mi across at its widest point, with an area of 144 sq mi (373 sq km). It is the peak of a submarine volcanic ridge, and Beerenberg volcano (7,470 ft [2,277 m]), the last major eruption of which was in 1732, forms the Nord-Jan, the northeastern region of the island. The remainder, Sør-Jan, the southern region, is low and hilly. There are no harbours. The island is bleak and desolate, and its climate is foggy and stormy, with temperatures ranging from −25° F (−32° C) in December to 50° F (10° C) in July. There is a little tundra, on which a few foxes subsist.

The island was possibly first sighted in 1607 by Henry Hudson, who called it Hudson's Tutches (Touches). In 1614 a Dutch sea captain, Jan May, claimed territorial rights to the island for his company and Holland. It was early used as a whaling base, but by 1642 the whales had been exterminated from the surrounding waters. It was frequently visited, but the first to winter on the island were the personnel of an Austrian weather station established there during the First International Polar Year (1882–83). A Norwegian meteorological observatory and a radio station were built in 1921, and on May 8, 1929, Norway annexed Jan Mayen. During World War II the U.S. armed forces maintained a weather station there. In 1958–59 an airstrip and a radio and navigation station were erected on the island by the NATO (North Atlantic Treaty Organization) allies. This equipment was extended with a console navigation system in 1970. Apart from the station personnel, the island is uninhabited.

Janáček, Leoš (b. July 3, 1854, Hukvaldy, Moravia, Austrian Empire—d. Aug. 12, 1928, Ostrava, Czech.), composer, one of the most important exponents of musical nationalism of the 20th century.

Janáček was a choirboy at Brno and studied at the Prague, Leipzig, and Vienna conservatories. In 1881 he founded a college of organists at Brno, which he directed until 1920. He directed the Czech Philharmonic Orchestra from 1881 to 1888 and in 1919 became professor of composition at the Prague Conservatory. Deeply interested in folk music, he collected folk songs with František Bartoš and between 1884 and 1888 published the journal *Hudební Listy* (*Musical Pages*). His first opera, *Šárka* (1887–88; produced 1925), was a Romantic work in the spirit of Wagner and Smetana. In his later operas he developed a distinctly Czech style intimately connected with the inflections of his native speech and, like his purely instrumental music, making use of the scales and melodic characteristics of Moravian folk music. His most important operas were *Jenůfa* (original title, *Její pastorkyňa*, 1904; *Her Foster Daughter*), which established Janáček's international reputation; *Věc Makropulos* (1926; *The Makropulos Case*), *Z mrtvého domu* (1930; *From the House of the Dead*), the two one-act satirical operas *Výlet pana Broučka do Měsíce* (*Mr. Brouček's Excursion to the Moon*) and *Výlet pana Broučka do XV stol* (*Mr. Brouček's Excursion to the 15th Century*), both performed in Prague in 1920,

Janáček
Eastfoto

and the comic opera *Příhody Lišky Bystroušky* (1924; *The Cunning Little Vixen*). His operas are marked by a skilled use of music to heighten dramatic impact.

His choral works also show his manner of modelling the writing for voices on the inflections of his native language, most significantly the *Glagolská mše* (1926; *Glagolitic Mass*), also called the *Slavonic* or *Festival Mass*. It is written in the liturgical language Old Slavonic, but because it uses instruments it cannot be performed in the Orthodox Church service. His song cycles *Zápisník zmizelého* (1917–19; *Diary of One Who Vanished*) and *Říkadla* (1925–27; *Nursery Rhymes*) are also notable.

Janáček visited Russia three times and developed an interest in Russian language and literature. Works arising from this interest include the opera *Káťa Kabanová* (1921) and the orchestral rhapsody *Taras Bulba* (1918).

Janáček also wrote a number of instrumental chamber works in which, as in his vocal works, he manipulates blocks of strong harmonies and repetitive melodies influenced by the contours of his native folk music. His use of elements of folk music and his attention to speech inflection mark him as a 20th-century counterpart of Mussorgsky. Although some influence of the French musical Impressionists appears in his later works, Janáček's style remained highly individual and original.

Jane SEYMOUR (b. 1509?, England—d. Oct. 24, 1537, Hampton Court, London), third wife of King Henry VIII of England and mother of King Edward VI. She succeeded—where Henry's previous wives had failed—in providing a legitimate male heir to the throne.

Jane's father was Sir John Seymour of Wolf Hall, Savernake, Wiltshire. She became a lady in waiting to Henry's first wife, Catherine of Aragon, and then to Anne Boleyn, who mar-

Jane Seymour, portrait by Hans Holbein the Younger, 1536; in the Kunsthistorisches Museum, Vienna
By courtesy of the Kunsthistorisches Museum, Vienna

ried the King in 1533. Henry probably became attracted to Jane in 1535, when he visited her father at Wolf Hall, but, though willing to marry him, she refused to be his mistress. That determination undoubtedly helped bring about Anne Boleyn's downfall and execution (May 19, 1536). On May 30, 1536, Henry and Jane were married privately.

During the remaining 17 months of her life Jane managed to restore Mary, Henry's daughter by Catherine of Aragon, to the King's favour. Mary was a Roman Catholic, and some scholars have interpreted Jane's intercession to mean that she had little sympathy with the English Reformation. The future Edward VI was born on Oct. 12, 1537, but, to Henry's genuine sorrow, Jane died 12 days later.

Jane's family enjoyed Henry's favour until the end of his reign. On the accession of Edward VI to the throne, Jane's brother, Edward Seymour, earl of Hertford, became regent as lord protector with the title duke of Somerset. Another brother, Thomas Seymour of Sudeley, was lord high admiral from 1547 to 1549.

Janenz, Theodor Friedrich Emil (actor): *see* Jannings, Emil.

Janequin, Clément, also spelled JANNEQUIN (b. *c.* 1485, Châtellerault, Fr.—d. 1558, Paris), a leading 16th-century French composer of chansons, famous for his program chansons, part-songs in which sounds of nature, of battles, and of the streets are imitated.

He worked in Bordeaux in the service of Lancelot du Fau, who became bishop of Luçon, and later for the bishop of Bordeaux. He entered the priesthood and in 1525 became canon of St. Emilion. Variously employed after 1529, when the bishop died, he was at times a student and settled in Paris in 1549. From about 1555 he was singer, and later composer, to Henry II, although not a full-time servant of the King. He died a pauper.

Although he set psalms and composed two masses and a motet, Clément's fame lies in his 286 chansons. His program chansons include "La Bataille de Marignan" ("La Guerre"), imitating sounds of battle; "Voulez ouir les cris de Paris," with Paris street cries; and "Le Chant des oiseaux," with the sounds of birds. His style shows fine formal balance and subtle handling of texts. He is rare among great composers in that he never held an important and regular position as musician or composer to a nobleman or a bishop or archbishop.

Janesville, city, seat (1839) of Rock county, southern Wisconsin, U.S., on the Rock River, 37 mi (60 km) southeast of Madison. Settled in 1835 and named for a pioneer, Henry F. Janes (who later moved west to found Janesville, Minn., and Janesville, Iowa), it developed as a trading centre for a dairying, grain, and logging region. In 1919 General Motors Corporation opened a tractor factory, which became a Fisher Body and Chevrolet plant (1922); it, with the Parker Pen Company, now leads the city's diversified industries. Janesville was the birthplace (1862) of Carrie Jacobs Bond, composer of sentimental songs, and a monument marks the site where she wrote "I Love You Truly." The Tallman Restorations include two 19th-century houses. The nearby Milton House Museum, a Civil War landmark, was a station on the Underground Railroad for runaway slaves. A University of Wisconsin centre was established in 1966 in Janesville, and the Blackhawk Technical Institute opened there in 1968. Inc. 1853. Pop. (1990) city, 52,133; Janesville-Beloit MSA, 139,510.

Janet: *see* Clouet, Jean.

Janet, Pierre(-Marie-Félix) (b. May 30, 1859, Paris—d. Feb. 24, 1947, Paris), psychologist and neurologist influential in bringing about in France and the United States a connection between academic psychology and the clinical treatment of mental illnesses. He stressed psychological factors in hypnosis and contributed to the modern concept of mental and emotional disorders involving anxiety, phobias, and other abnormal behaviour.

Janet's report (1882) of an unusual case of hypnosis and clairvoyance gained him the attention of neurologist Jean Charcot. As a Ph.D. candidate at the University of Paris, Janet studied automatic acts and in his thesis (1889), which went into many editions, introduced but did not amplify the concept of the unconscious. This situation engendered a later dispute with Sigmund Freud over priority. At Charcot's invitation he became director of the psychological laboratory at the largest Paris mental institution, the Salpêtrière Hospital (1889). There he completed his work for his M.D., which he received for the thesis *L'état mental des hystériques* (1892; *The Mental State of Hystericals,* 1901), in which he attempted to classify forms of the hysteria neurosis. Charcot, in his introduction to the thesis, concurred with Janet's plea to unite the efforts of psychology and medicine.

Appointed lecturer in psychology at the Sorbonne (1898) and professor at the Collège de France (1902–36), Janet was also a practicing physician specializing in nervous and mental disorders. He wrote and lectured on a wide range of subjects, including impairment of the ability to act independently, hysteria, obsession, amnesia, and personality.

Janīn, also spelled JENĪN, town, northern Samaria, central Palestine. Contained within mandated Palestine during 1923–48, it was in the area annexed by Jordan in 1950 following the Arab–Israeli War of 1948–49; since the Six-Day War of 1967 it has been in the West Bank territory under Israeli administration.

The original ancient settlement is mentioned in the Amarna Letters, a series of 14th-century-BC diplomatic documents found at Tell el-Amarna, Egypt. Some authorities identify it with the biblical Levitical city of Engannim (Hebrew: Gardens' Spring; Levitical cities were allocated because the Levites were not participants in the territorial division of the Holy Land among the tribes). In the Middle Ages the town was taken by the crusaders, who called it Le Grand Gerin. Janīn was a Turkish-German base in World War I; a memorial to fallen German aviators remains. It was an important centre for Jordanian and Iraqi forces in 1948; though much of the strategic territory in the vicinity was taken by Israel, Janīn remained in Arab hands. In 1949–67 it was the northern apex of "the triangle" (Janīn, Ṭūl Karm, Nābulus), a staging area for Arab guerrilla activity against Israel.

Lying in a well-settled Arab agricultural region, Janīn has long been the chief marketing centre of northern Samaria; wheat, olives, dates, carobs, and figs are grown in the vicinity. Ruins of an interesting Byzantine church have been excavated in the town. Pop. (1984 est.) 25,000.

Janina (Greece): *see* Ioánnina.

Janissary, also spelled JANIZARY, Turkish YENIÇERI (New Soldier, or Troop), member of an elite corps in the standing army of the Ottoman Empire from the late 14th century to 1826. Highly respected for their military prowess in the 15th and 16th centuries, the Janissaries became a powerful political force within the Ottoman state. The Janissary corps was originally staffed by Christian youths from the Balkan provinces who were converted to Islām on being drafted into the Ottoman service. Subject to strict rules, including celibacy, they were organized into three unequal divisions (*cemaat, bölükhalkı, segban*) and commanded by an *ağā.* In the late 16th century the celibacy rule and other restrictions were relaxed, and by the early 18th century the original method of recruitment was abandoned.

Janissary, detail of a Turkish miniature from *A Briefe relation of the Turkes, their Kings, Emperors or Grand-Signeurs*; in the British Library (Ms. Add 23880)

Reproduced by permission of the British Library

The Janissaries frequently engineered palace coups in the 17th and 18th centuries, and in the early 19th century they resisted the adoption of European reforms by the army. Their end came in June 1826 in the so-called Auspicious Incident. On learning of the formation of new, westernized troops, the Janissaries revolted. Sultan Mahmud II declared war on the rebels and, on their refusal to surrender, had cannon fire directed on their barracks. Most of the Janissaries were killed, and those who were taken prisoner were executed.

Janissary music: *see* Turkish music.

Janmāṣṭamī, Hindu festival celebrating the birth (*janma*) of the god Krishna (Kṛṣṇa) on the eighth (*aṣṭami*) day of the dark fortnight of the month of Bhādrapada (August–September). The eighth also has significance in the Krishna legend that he is the 8th of the 10 usually enumerated avatars (incarnations) of Lord Vishnu and the eighth child of his mother, Devakī.

The occasion is observed with particular splendour in Mathura and Vrindāvanā (Brindāban), the scenes of Krishna's childhood and early youth. The preceding day devotees keep a vigil and fast until midnight, the traditional hour of his birth. Then the image of Krishna is bathed in water and milk, dressed in new clothes, and worshipped. Temples and household shrines are decorated with leaves and flowers; sweetmeats are first offered to the god and then distributed as *prasāda* (the god's favour) to all the members of the household. The devotees of Krishna commemorate the events of his birth by preparing elaborate representations of Mathura, where he was born, the Yamuna River, over which he was trans-

ported to safety, and Gokul (ancient Vraja), the scene of his childhood, using small images of the god, the other participants, and the animals and birds of the forest. Pots of milk are hung from tall poles in the streets, and men form human pyramids to reach and break the pots—this in imitation of Krishna's childhood play with the cowherd boys, when they stole the curds hung out of reach by their mothers. The festival is also a time for group singing and dancing, in both the folk and the classical traditions.

Jannings, Emil, original name THEODOR FRIEDRICH EMIL JANENZ (b. July 23, 1884, Rorschach, Switz.—d. Jan. 2, 1950, Strobl, near Salzburg, Austria), internationally known German actor famous for his tragic roles in motion pictures.

Jannings was reared in Görlitz, Austria, where he began his stage career. He joined a traveling stock company and in 1906 began acting for Max Reinhardt, the leading German theatrical director, in Berlin. He started appearing in motion pictures in about 1915. In 1924 the film *The Last Laugh,* directed by F.W. Murnau, brought him his best-remembered role as an aging hotel doorman demoted to the position of washroom attendant; in *Variety* (1925) he was a married sideshow operator deceived by a woman trapeze artist; and in *The Blue Angel* (1930), which introduced the sultry leading lady Marlene Dietrich, he was an aging professor hopelessly in love with a young nightclub singer. Critics acclaimed Jannings as one of the finest actors in the world on the basis of these three motion pictures.

In 1929 Jannings won the first Academy Award for acting for his performances in the American-made films *The Way of All Flesh* (1928), in which he played an embittered family man, and *The Last Command* (1928), in which he was an exiled Russian general reduced to playing bit parts in war films.

Returning to Germany, Jannings continued to work in films during the Nazi regime and afterward.

János (Hungarian personal name): *see under* John.

Janowitz, Morris (b. Oct. 22, 1919, Paterson, N.J., U.S.—d. Nov. 7, 1988, Chicago), innovative American sociologist and political scientist who made major contributions to sociological theory and wrote accurate historical studies of the social sciences. His work as a political scientist concentrated mainly on civil-military affairs, based on data gathered since World War II.

After earning his B.A. at New York University (1941) and his Ph.D. at the University of Chicago (1948), he was research assistant for War Community Research, Library of Congress (1941), and senior propaganda analyst, Organization and Propaganda Section, the U.S. Department of Justice (1941–43), before teaching at the University of Chicago. He started as an instructor in sociology (1947–48), rising through academic ranks there and at the University of Michigan, Ann Arbor, until he became chairman of the department of sociology at the University of Chicago (1961–72). He collaborated with Bruno Bettelheim on *Dynamics of Prejudice* (1950), a psychological and sociological study of veterans. *Sociology and the Military Establishment* (1959; revised 1965), *The Professional Soldier* (1960), and *Social Change and Prejudice* (with Bettelheim, 1964) follow the basic study, developing new theory through social change.

Janowitz served as Pitt professor and distinguished professor at the University of Cambridge (1972–73) and as Kimpton distinguished-service professor in the department of sociology at the University of Chicago. He also wrote *The Last Half Century; Societal Change and Politics in America* (1978), a major synthesis of ideas on social control.

Jansen, Cornelius Otto (b. Oct. 28, 1585, Acquoi, near Leerdam, Holland—d. May 6, 1638, Ypres, Flanders, Spanish Netherlands [now in Belgium]), Flemish leader of the Roman Catholic reform movement known as Jansenism. He wrote biblical commentaries and pamphlets against the Protestants. His

Jansen, engraving by Jean Morin

major work was *Augustinus,* published by his friends in 1640. Although condemned by Pope Urban VIII in 1642, it was of critical importance in the Jansenist movement.

Education. Jansen entered the University of Louvain, in the Spanish Netherlands in 1602 to study theology. According to the custom adopted by the humanists of the Renaissance, Jansen Latinized his name to Cornelius Jansenius. His teacher, Jacques Janson, taught the doctrine of the theologian Michael Baius (Michel de Bay), who had died at Louvain in 1589. According to the latter, man is affected from his birth by the sin of Adam, his ancestor. His instincts lead him necessarily to evil. He can be saved only by the grace of Christ, accorded to a small number of the elect who have been chosen in advance and destined to enter the Kingdom of Heaven. This doctrine, inspired by certain writings of St. Augustine, attracted Jansen and another student who had come to study at Louvain, a Frenchman named Jean Duvergier de Hauranne, who was to become a leader of the Jansenist movement. The two young men became friends in Paris, where Jansen went in 1604. They decided to revive theology, which they believed the theologians of the Sorbonne had reduced to subtle and vain discussions among Scholastics. Jansen and Duvergier thought that it was necessary to render to God the homage owed by men and that the pride of the Renaissance savants had alienated Christians from the Jesus who loved the simple and the humble.

In 1611 Jansen followed Duvergier to the home of the latter's parents, located in the outskirts of Bayonne. The bishop of the city entrusted to Jansen the direction of the episcopal college there from 1612 to 1614. For three years afterward the young Dutchman, with Duvergier, dedicated himself to the study of the writings of the early Church Fathers.

Return to Louvain: the Augustinus. In 1617 Jansen returned to Louvain, where he directed the college of Sainte-Pulchérie, created for Dutch students. A violent dispute had arisen at Louvain between the disciples of Baius and the Jesuits, who considered as dangerous the doctrines of this theologian, who had been condemned by Pope Pius V in 1567. Jansen then undertook a thorough study of the works of Augustine by which Baius had been inspired. He read them, he declared, 10 times consecutively. But he devoted himself most particularly to the texts drafted by Augustine to combat the doctrine of Pelagius, who had held that, in spite of the fault committed by Adam, man continues to be entirely free to do good and to obtain salvation by means of his own merits. Jansen then began his great work, the *Augustinus.* For him, the divine grace that alone can save man is not due at all to his good actions. It is, he claimed, a gratuitous gift by means of which Christ leads the elect to eternal life, but the multitude, "the mass of perdition," is doomed to damnation. Thus, men are predestined to obtain grace or to suffer condemnation. In reality, Augustine had not envisaged the fate of human beings with such great rigour. He had even proclaimed the power of man's free will at the time when he was engaged in the struggle against the Manichaeans. But Augustine had then been constrained to enclose the liberty of man within strict limits, in order to refute the affirmations of Pelagius, who had radically reduced the value of the divine grace obtained by Jesus on the cross.

Jansen was so fascinated by Augustine's treatise against the Pelagians that he apparently lost sight of Augustine's works against the Manichaeans.

Jansen also wrote commentaries on the evangelists and on the Old Testament—notably on the Pentateuch—as well as a "Discourse on the Reformation of the Inner Man." He was likewise the author of pamphlets directed against the Protestants.

Last years. Having acquired the degree of doctor in theology at Louvain, Jansen became the rector of that university in 1635, and in 1636 he became bishop of Ypres. The Jesuit scholar René Rapin asserted in his book *Histoire du Jansénisme* (1861) that Jansen had obtained his mitre as a result of the personal intervention of the king of Spain, Philip IV. This sovereign had recognized him for having published a pamphlet entitled *Mars Gallicus,* in which he strongly criticized the policy of the French cardinal and prime minister, Richelieu, who had contracted an alliance with the Dutch Protestants against Spain. In 1638, a short time after his elevation to the episcopate, Jansen died of the plague. In 1640 his friends published at Louvain the work he had dedicated to St. Augustine, under the title *Augustinus Cornelii Jansenii, Episcopi, seu Doctrina Sancti Augustini de Humanae Naturae, Sanitate, Aegritudine, Medicina adversus Pelagianos et Massilienses* ("The Augustine of Cornelius Jansen, Bishop, or On the Doctrines of St. Augustine Concerning Human Nature, Health, Grief, and Cure Against the Pelagians and Massilians").

This book had cost its author 22 years of effort. In the epilogue Jansen declared: "I leave my work to the judgment of the Roman Church. . . . I retract all that she will decide that I ought to (must) retract."

Condemnation of Jansen's teachings. In a bull of 1642, Pope Urban VIII forbade the reading of the *Augustinus,* which had been published without the authorization of the Holy See and was based on the doctrine of Baius, already condemned. Five propositions in the *Augustinus* were condemned by Pope Innocent X in 1653, and by his successor, Alexander VII. The bishops of France were required to make all of the priests, monks, and nuns sign a formulary conforming to the pontifical decisions. But Duvergier de Hauranne, who had become the abbé of Saint-Cyran, had taught the doctrine of Jansen to the nuns of the abbey of Port-Royal. This convent became a focus of resistance against the Jesuits, who, having obtained the pontifical decisions in their favour, intended to impose them. From that time, a conflict began between the Jesuits

and Antoine Arnauld, a disciple of "Monsieur de Saint-Cyran" (Duvergier de Hauranne) who called himself an Augustinian. The Jesuits, however, called him a Jansenist. According to them, the doctrine of Arnauld was that of Jansen and not of St. Augustine. Blaise Pascal wrote *Les Provinciales* ("Provincial Letters") in 1656 and 1657 to defend Antoine Arnauld. The latter was condemned by the Faculty of Theology at the Sorbonne.

Although Louis XIV was determined to eliminate the Jansenists as a threat to the unity of his kingdom, there was a temporary peace after Clement IX became pope in 1667, and the conflict ceased to be a major concern when the papacy and the French Roman Catholic church clashed on Gallicanism. But after the controversy between the papacy and the monarchy was settled, Louis XIV obtained from Clement XI in 1705 the bull *Vineam Domini,* which renewed the earlier condemnations. In 1709 Louis XIV ordered the dispersal of the nuns of Port-Royal into diverse convents, and he had the abbey destroyed in 1710. He then obtained in 1713 the bull *Unigenitus Dei Filius,* which condemned 101 propositions of Quesnel. The promulgation of *Unigenitus* as French law in 1730 finally caused the decline in strength of the Jansenist party.

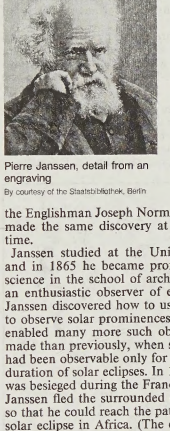
In 1723 followers of Jansen's views established an autonomous Jansenist church at Utrecht, Holland, which still exists in the present day. Jansenism also spread to Italy, where in 1786 the Synod of Pistoia, which was later condemned, propounded extreme Jansenist doctrines. (M.M.E.)

BIBLIOGRAPHY. Alexander Sedgwick, *Jansenism in Seventeenth-century France* (1977), is an introduction to Jansenist theology and philosophy. Marc Escholier, *Port-Royal: The Drama of the Jansenists* (1968), explains the relationship between Jansen and Saint-Cyran and discusses the theological theses supported in Jansen's *Augustinus.*

Jansky, Karl (Guthe) (b. Oct. 22, 1905, Norman, Okla., U.S.—d. Feb. 14, 1950, Red Bank, N.J.), American engineer whose discovery of radio waves from an extraterrestrial source inaugurated the development of radio astronomy, a new science that from the mid-20th century greatly extended the range of astronomical observations.

In 1928 Jansky joined the Bell Telephone Laboratories in New Jersey, where his assignment was to track down and identify the various forms of interference that were plaguing telephone communications. He built a linear, directional antenna by which he was able to identify all the sources of interference except one. After months of study he discovered in 1931 that the source of the unidentified radio interference came from the stars. By the following spring he concluded that the source lay in the direction of the constellation Sagittarius, which Harlow Shapley and Jan H. Oort had established as the direction of the centre of the Milky Way Galaxy.

Jansky published his findings in late 1932 but did not pursue the further development of radio astronomy, a task performed by the American engineer and amateur astronomer Grote Reber. In honour of Jansky's epoch-making discovery, the unit of radio-wave emission strength was named the jansky.



Janson, Cornelius, also spelled JANSSEN: *see* Johnson, Cornelius.

Janssen, Johannes (b. April 10, 1829, Xanten, Prussia [Germany]—d. Dec. 24, 1891, Frankfurt am Main, Ger.), Roman Catholic German historian who wrote a highly controversial history of the German people, covering the period leading to and through the Reformation.

Reared in a staunchly Catholic home, he attended local schools and then studied at Münster, the University of Louvain (1850–51), and the University of Bonn (1851–53). After completing his dissertation at Bonn, he moved to Frankfurt in 1854, where he continued to study and also taught at the Catholic Gymnasium.

In 1857 Janssen decided to write his *Geschichte des deutschen Volkes seit dem Ausgang des Mittelalters,* 8 vol. (1876–94; "History of the German People from the Close of the Middle Ages"). His work, which ended on the eve of the Thirty Years' War (1618), was based on the thesis that the harmonious relations between church and state during the European Middle Ages had raised Germany to a position of political and moral prominence that attained its height during the 14th and 15th centuries. Henceforth, Janssen concluded, the effect of the Reformation under the leadership of Martin Luther was a progressive weakening of the German social structure that gradually led to chaos and national deterioration. Janssen's work was enthusiastically received by German Roman Catholics but was bitterly criticized by Protestant historians for its extremely partisan viewpoint. Nevertheless, his stress on social and cultural history was extremely important in the development of German *Kulturgeschichte* ("history of civilization") and is valuable for its detailed contribution to studies on the 15th century.

Janssen, Pierre (-Jules-César) (b. Feb. 22, 1824, Paris, Fr.—d. Dec. 23, 1907, Meudon), French astronomer who in 1868 discovered how to observe solar prominences without an eclipse. His work was independent of that of

Pierre Janssen, detail from an engraving
By courtesy of the Staatsbibliothek, Berlin

the Englishman Joseph Norman Lockyer, who made the same discovery at about the same time.

Janssen studied at the University of Paris, and in 1865 he became professor of general science in the school of architecture. He was an enthusiastic observer of eclipses. In 1868 Janssen discovered how to use a spectroscope to observe solar prominences in daylight; this enabled many more such observations to be made than previously, when such phenomena had been observable only for the few minutes' duration of solar eclipses. In 1870, when Paris was besieged during the Franco-German War, Janssen fled the surrounded city in a balloon so that he could reach the path of totality of a solar eclipse in Africa. (The eclipse, however, was obscured by clouds.) In 1876 he was appointed the first director of the Meudon Observatory, near Paris. In 1893, using observations from the meteorological observatory he had established on Mont Blanc, he proved that strong oxygen lines appearing in the solar spectrum were caused by oxygen in the Earth's atmosphere. He was the first to regularly use photographs to study the Sun; in 1904 Janssen published his great *Atlas des photographies solaires,* containing more than 6,000 solar pictures. A crater on the Moon is named for him.

Jansson, Tove (Marika) (b. Aug. 9, 1914, Helsinki, Fin., Russian Empire—d. June 27, 2001, Helsinki, Fin.), Finnish artist and writer-illustrator of children's books (in Swedish). In her books she created the fantastic self-contained world of Moomintrolls, popular especially in northern and central Europe, although translations in more than 30 languages have provided a worldwide audience.

Jansson's illustrations began appearing in children's magazines when she was a teenager. She had her first exhibition in 1943 and worked for a time as a children's book illustrator. In *Småtrollen och den stora översvämningen* (1945; "The Moomins and the Great Flood") she introduced her hippopotamus-like creatures. The work was praised for its individualistic characters, complicated plots, and sophisticated humour; eight other Moomin books followed. Jansson also created the comic strip "Moomin," which ran in the *Evening News* in London from 1953 to 1960. She won numerous awards, including the Selma Lagerlöf Medal (1953) and the International Hans Christian Andersen Medal (1966). Jansson also wrote an autobiography, *Bildhuggarens dotter* (1968; *Sculptor's Daughter*), short stories, plays, and adult fiction.

Januarius, SAINT, Italian SAN GENERO (d. 305?, Pozzuoli, Italy; feast day September 19), bishop of Benevento and patron saint of Naples. He is believed to have been martyred during the persecution under the Roman emperor Diocletian in 305. His fame rests on the relic, allegedly his blood, which is kept in a glass vial in the Naples Cathedral. Of solid substance, it liquefies 18 times each year. While no natural explanation has been given, the phenomenon has been tested frequently and seems genuine.

January, first month of the Gregorian calendar. *See* month.

January Insurrection (1863–64), Polish rebellion against Russian rule in Poland; it was unsuccessful and resulted in the imposition of tighter Russian control over Poland.

After Alexander II became emperor of Russia and king of Poland in 1855, the strict and repressive regime that had been imposed on Poland after the November Insurrection (1830–31) was substantially relaxed. Nevertheless, conspiratorial societies that opposed any form of Russian rule in Poland remained active and gained support, particularly among students and other groups of urban youth. When those groups sponsored patriotic demonstrations in the early 1860s, the moderate reformer Count Aleksander Wielopolski, who had become the virtual head of government in Poland, devised a plan to recruit all the radical youths into the Russian army. But those designated for conscription secretly fled from Warsaw (Jan. 14–15, 1863), sought refuge in the nearby woodlands, and on January 22 issued a manifesto calling for a national insurrection. Although they were greatly outnumbered, poorly equipped, and successful in only a few engagements, the rebels gained support among the artisan, worker, lower gentry, and official classes in the cities and stimulated peasant revolts in rural areas.

Establishing an underground government in Warsaw, the rebels waged a guerrilla war with small units of badly trained troops against the regular Russian army of 300,000 men. The insurrection spread beyond Poland into Lithuania and a section of Belorussia and attracted volunteers from the portions of Poland under Prussian and Austrian rule. But the rebels, although managing to convince sympathetic foreign powers to send protests to Alexander, failed to obtain vitally needed military assistance from them; and, as moderates assumed dominance in the insurgent government (by July) and delayed the enactment of promised

peasant reforms, they lost mass peasant support for the rebellion.

By the time Romuald Traugutt emerged to provide strong leadership for the revolutionary movement (mid-October), the rebellion had lost its dynamism. The Lithuanian insurrection had been brutally crushed by the "hangman of Vilnius," Mikhail Nikolayevich Muravyov; the new viceroy in Poland, Teodor Berg, similarly imposed a harsh regime in Warsaw; and Russian efforts (begun in the summer of 1863) to win the peasants' loyalty by granting reforms provided added incentive for the peasantry to abandon the rebels. Although the insurgent army survived the winter of 1863–64 in southern Poland, Traugutt and the other leaders of the rebellion who had not already fled the country were arrested in April 1864; their execution in August marked the end of the January Insurrection.

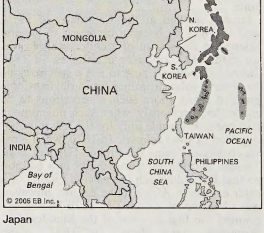
Janūb Sīnāʾ, formerly SĪNĀʾ AL-JANŪBĪYAH (Arabic: "Southern Sinai"), *muḥāfaẓah* (governorate), southern part of Sinai Peninsula, Egypt. The governorate was created out of Sīnāʾ *muḥāfaẓah* in late 1978, after the first stages of the Israeli withdrawal from the peninsula were initiated. The northern boundary of the governorate roughly follows the old pilgrim track (Darb al-Ḥājj) from Suez city to Elat in Israel.

The topography of the governorate is rugged, consisting in the south of granite and sandstone mountains cut by steep-walled wadis (seasonal watercourses). The highest peak is the historic Mount Katrīnah (Catherine), 8,668 feet (2,642 m). Scattered over the governorate is a modest Bedouin population that lives mainly by growing dates, barley, and some fruits and by raising livestock (camels, goats, donkeys, and sheep). The city of Aṭ-Ṭūr, capital of the *muḥāfaẓah*, is their principal settlement.

Fishing is of some importance along the Gulf of Suez, with the main catching and storage centre at Aṭ-Ṭūr. The governorate's main resource is mineral wealth, of which petroleum is the most important. Oil was first discovered at Mount Tanakah in 1910, and new fields have multiplied, especially since the return of the western Sinai to Egypt. The Gulf of Suez fields are the richest oil-producing deposits in Egypt. Aṭ-Ṭūr is the centre for the Sinai oil industry.

Tourism has become a significant component of the governorate's economy. St. Catherine's (*q.v.*), built by the Byzantine emperor Justinian (527–565) on the traditional site of the burning bush encountered by Moses near Mount Sinai, remains an active Greek Orthodox monastic community and is the seat of an autocephalous archbishop. It is also a pilgrimage and tourist site. The governorate contains several other Christian monastic sites of historic interest. Area 12,796 square miles (33,140 square km). Pop. (2004 est.) 63,800.

Janus, in Roman religion, the animistic spirit of doorways (*januae*) and archways (*jani*). The worship of Janus traditionally dated back to Romulus and a period even before the actual founding of the city of Rome. There were many *jani* (*i.e.,* ceremonial gateways) in Rome; these were usually freestanding structures that were used for symbolically auspicious entrances or exits. Particular superstition was attached to the departure of a Roman army, for which there were lucky and unlucky ways to march through a *janus.* The most famous *janus* in Rome was the Janus Geminus, which was actually a shrine of Janus at the north side of the Forum. It was a simple rectangular bronze structure with double doors at each end. Traditionally, the doors of this shrine were left open in time of war and were kept closed when Rome was at peace. Accord-



The god Janus, beardless, Roman coin; in the Bibliothèque Nationale, Paris
Larousse

ing to the Roman historian Livy, the gates were closed only twice in all the long period between Numa Pompilius (7th century BC) and Augustus (1st century BC).

Some scholars regard Janus as the god of all beginnings and believe that his association with doorways is derivative. He was invoked as the first of any gods in regular liturgies. The beginning of the day, month, and year, both calendrical and agricultural, were sacred to him. The month of January is named for him, and his festival took place on January 9, the Agonium. There were several important temples erected to Janus, and it is assumed that there was also an early cult on the Janiculum, which the ancients took to mean "the city of Janus."

Janus was represented by a double-faced head, and he was represented in art either with or without a beard. Occasionally he was depicted as four-faced—as the spirit of the four-way arch.

Japan, Japanese NIHON, or NIPPON, island country lying off the east coast of Asia. Its capital, Tokyo, is one of the most populous cities in the world. Japan's four main islands—Hokkaido, Honshu, Shikoku, and Kyushu—

Japan

and numerous smaller ones stretch about 1,500 miles (2,400 km) from northern Hokkaido in the northeast to the Ryukyu (Nansei) Islands (south of Kyushu) in the southwest. Japan is separated from China to the southwest by the East China Sea; from South Korea, North Korea, and Russia to the west and northwest by the Sea of Japan (East Sea); and from the Russian islands of Sakhalin and the Kurils to the north and northeast, respectively, by La Perouse (Sōya) Strait, the Sea of Okhotsk, and Nemuro Strait. The Pacific Ocean constitutes the entire eastern coastal boundary. Area 145,898 square miles (377,873 square km). Pop. (2003 est.) 127,546,000.

A brief treatment of Japan follows. For full treatment, *see* MACROPAEDIA: Japan.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Japan's islands are composed of several mountain arcs, which largely are the outcome of geologically recent orogenic, (mountain-building) forces. These mountain ranges cover more than four-fifths of Japan's land surface and divide the country's four main islands—Hokkaido (in the northeast), Honshu (in the centre; the largest and most populous), Shikoku, and Kyushu (both situated southwest of Honshu)—into four major regions. Each region is composed of interior highlands of volcanic origin encircled by narrow coastal lowlands, widening at places to form habitable plains. The northeasternmost of these regions encompasses most of Hokkaido, including the Kitami Mountains in the north and the Hidaka Range in the south. The second region embraces southwestern Hokkaido and northern Honshu, coincides with a southerly arc of mountains, and culminates in the Sendai Plain of northeastern Honshu. The third region includes Japan's most rugged country, from the Hida Range (part of the Japanese Alps) in the north to Mount Fuji in the south, the highest mountain in the country at 12,388 feet (3,776 m); its plains are those of the relatively large Kantō of central Honshu where Tokyo lies, and Nōbi to the southwest, centred on Nagoya. The fourth region ranges from the Chūgoku Mountains of southwestern Honshu southwestward across the Inland Sea and Shikoku and westward to north-central Kyushu. The Ryukyu Islands, including Okinawa, arc to the south and west of Kyushu.

Japan is situated within one of the Earth's most geologically active zones, the result of the movement of tectonic plates near the archipelago. The country thus experiences violent volcanic eruptions—at least 60 volcanoes have been active within historic times—and almost perpetual earthquake activity—about 1,000 per year, most minor but a few devastating. Tsunamis (huge sea waves) often accompany offshore tremors and may cause severe damage along the Pacific coast.

Japan's five largest river basins are the Tone on Honshu; the Ishikari on Hokkaido; and the Kitakami, the Shinano, and the Kiso also on Honshu. Lake Biwa in central Honshu is Japan's largest lake; all other major lakes are in the northeast. Rivers tend to be swift and to drain small areas, resulting in considerable variations in streamflow. The engineering difficulties involved in such fluctuation have not prevented the development of large-scale irrigation; about two-thirds of the country's agricultural area is irrigated. Hydroelectric plants abound, and flood-control projects are numerous. Nevertheless, during typhoons and periods of heavy rainfall flooding remains a major problem.

Japan's temperatures are generally mild because of the warming effects of the Kuroshio (Japan Current) and the Tsushima Current. Winter and summer temperatures vary widely from north to south; Asahikawa in central Hokkaido has a mean temperature in January, the coldest month, of 16° F (−9° C) and a mean temperature in August, the hottest month, of 70° F (21° C); comparable readings at Kagoshima in southern Kyushu are 45° F (7° C) and 81° F (27° C). Average annual precipitation for the whole country exceeds 60 inches (1,500 mm), and few locations receive less than 40 inches (1,000 mm). The winter monsoon, from late September to late March, deposits rain and snow on the side of the country facing the Sea of Japan and brings dry, windy weather to the Pacific side. The summer monsoon, from mid-April to early September, brings rain to the Pacific coast;

destructive typhoons often occur in late summer and early fall.

About one-eighth of the country's land area is arable. Forests occupy two-thirds of the land. There are semitropical rainforests in the Ryukyu and Bonin (Ogasawara) islands of southern Japan. Broad-leaved evergreen forests, consisting primarily of camphor, pasania, oak, and holly trees, extend from Kyushu to Honshu's northern lowlands. The evergreen-deciduous demarcation descends gradually from above 3,300 feet (1,000 m) in Kyushu to sea level in northern Honshu. Representative deciduous trees are beech, katsura (Judas tree), maple, oak, and birch. Coniferous trees predominate in the north and on the eastern periphery of Hokkaido up to elevations of 2,300 feet (700 m).

Bears, foxes, deer, wild boars, raccoon dogs (*tanuki*), antelope, hares, and Japanese macaques inhabit the country's remote, heavily forested mountain regions. More than a third of the country's birds are waterbirds. Japanese waters contain whales, dolphins, porpoises, and a wide variety of commercially valuable fish.

The people. The Japanese overwhelmingly are a single ethnic group. There are three significant minority groups: ethnic Japanese called *burakumin*, Koreans (most of them Japanese-born), and Okinawans. In addition, an indigenous people, the Ainu, survive in limited numbers on Hokkaido. The official language is Japanese, the use of which coincides with the territory of Japan. Although there are two major dialects and a number of subdialects, standard Japanese, based on the dialect spoken in Tokyo, is understood throughout the country.

In Japan, Shintō (an indigenous folk religion), various sects of Buddhism, and Christianity coexist. There are also a variety of "new religions," of which the Sōka-Gakkai, based on a sect of Buddhism, has one of the largest followings. No one religion is dominant, and each is affected by the others. Buddhism is classified into 12 major sects and almost 60 branches. Chief among them are the Nichiren, True (Shin) Pure Land, Shingon, Pure Land, Zen, and Tendai sects. A small proportion of the population is Christian.

Although Japan's population density is relatively high, the increase of the population has been exceeded by economic growth, and the standard of living now is among the world's highest. The nation's population is concentrated within the limited spaces of the plains and coastal lowlands, however, and less than one-fourth of the total population is rural. During the 20th century most of the increase in population has been absorbed into the ever-expanding urban areas, while neighbouring rural districts have remained constant or declined in population. More remote rural areas have experienced marked population decline. Adult males migrate to the Pacific coast, and many of those who stay behind leave home periodically for jobs as temporary labourers; thus there is a constant outflow of population from the mountainous areas and isolated islands to the cities. A striking demographic feature since World War II is the decline of birth and death rates in response to improvement in birth control measures and health conditions. Thus, the population is growing slowly and has a high life expectancy.

Economy. Japan has a prosperous and well-developed economy largely based on manufacturing and services. A market economy predominates, although the government exercises effective administrative guidance in the private sector. Japan's gross national product (GNP) per capita is among the highest in the world, despite the recession that has gripped the country since the early 1990s.

Agriculture accounts for less than 2 percent of the gross domestic product (GDP) and continues to decline in importance. Land reform after World War II greatly increased production, but the fragmentation of holdings remains a deterrent to extensive modernization. Japan is not self-sufficient in agriculture and imports approximately one-fourth of its food requirements. Rice is the leading staple and constitutes more than one-third of the country's agricultural production. Other important crops include potatoes, sugar beets, mandarin oranges, cabbages, sweet potatoes, Chinese cabbages, onions, cucumbers, and apples.

Most of Japan's forested area is distributed among a large number of small private holdings. The remainder, which is publicly owned, has undergone large-scale reforestation. Production levels are low, however, because much of the forestland is located in inaccessible mountain areas, and domestic production is unequal to demand; timber is a major import commodity.

The marine fishing industry in Japan has one

*Reign dates for the first 28 sovereigns and the regent Jingū Kōgō (given in italics) are taken from the *Nihon shoki* ("Chronicles of Japan"). The first 14 sovereigns are considered legendary; and while the latter 14 are known to have existed, their exact reign dates have not been verified historically. When the year of actual accession and year of formal coronation are different, the latter is placed in parentheses after the former. If the two events took place in the same year, no special notation is used. If only the coronation year is known, it is placed in parenthesis. †Antoku's reign overlaps that of Go-Toba. Go-Toba was placed on the throne by the Minamoto clan after the rival Taira clan had fled Kyōto with Antoku.

of the largest outputs of any in the world. The establishment by many nations of economic zones extending 200 nautical miles (370 km) offshore has hampered Japanese fishing in foreign waters, and it has been necessary for the Japanese to diversify their seafood sources and rely more on aquaculture.

Mining is an unimportant and declining industry in Japan. Virtually all of Japan's requirements for metallic and nonmetallic minerals and fossil fuels are met by imports. About two-thirds of Japan's electricity is generated from petroleum and other imported fuels, about one-fourth by nuclear-power plants, and the remainder by hydroelectric plants.

Manufacturing and construction together account for one-third of the GDP and employ some one-third of the workforce. Japanese manufacturing has undergone tremendous growth since 1950. Japan, one of the top industrial nations in the world, is a leading producer of ships, automobiles, television receivers, synthetic fibres, paper, cement, synthetic resins, and steel. Machinery production has expanded to meet a growing domestic demand, but the electronics industry has grown at a much faster pace as Japanese technology has become increasingly competitive on the world market. Services account for roughly three-fifths of the GDP and employ a comparable fraction of the workforce.

Japan's high labour productivity can be attributed in part to a disciplined workforce and high rates of investment in plant equipment. Unemployment rates are generally low. Trade unions typically are organized by enterprise, then by federations, nearly all of which are members of the Japanese Trade Union Confederation (Rengō).

An important characteristic of the Japanese financial system is the high degree of interdependence between the central bank (the Bank of Japan), the commercial banks, and industry. Industry relies on commercial banks for a substantial part of its fund requirements, and the commercial banks in turn rely on large-scale borrowing from the Bank of Japan. Thus, the Bank of Japan, wholly financed by the government, is in a strong position to adjust the volume of credit. The government's involvement in banking strengthens its advisory role in the private sector, and its constant consultation with business during the formulation of economic policy results in unique cooperation and understanding between the public and private sectors.

About three-fourths of Japan's road network, which includes expressways between major cities, is paved. Railways play an extremely important role in transporting passengers between and within urban areas. Japan is noted for its high-speed Shinkansen passenger trains. It is also one of the world's principal seagoing nations, with major ports at Yokohama, near Tokyo, and at Kōbe, near Ōsaka and Kyōto. Tokyo and Ōsaka are the nation's major hubs for air transport.

Japan has maintained an overall balance-of-payments surplus since 1976 and accounts for a major share of the world export market. High labour productivity and government policy have kept export prices low, and the variety of industrial output, the shift to products with relatively high added value, and advanced sales-promotion techniques have enhanced export performance. Japan's major exports include electrical machinery, motor vehicles, chemicals, scientific and optical equipment, and iron and steel products. Machinery and transport equipment, foodstuffs, crude petroleum, textiles, chemicals, and metal ores and scrap are the main imports. The United States is Japan's main trade partner, receiving more than one-fourth of Japanese exports and supplying more than one-fifth of Japanese imports. Other significant export markets include Hong Kong, South Korea, Taiwan, Singapore, China, and Germany. Principal suppliers after the United States include China, Australia, South Korea, Indonesia, Germany, and Taiwan. The United States and several European countries have large deficits in bilateral trade with Japan. As a result, Japan has come under increasing pressure to open its domestic market to more foreign imports.

Government and social conditions. Japan is a constitutional monarchy with a parliamentary political system. The constitution, adopted in 1947, designates the emperor as the symbolic head of state. The highest organ of state power is the Diet (Kokkai), a bicameral legislative body. It consists of a House of Representatives, with 511 members elected to four-year terms, and a House of Councillors, with 252 members elected to six-year terms. In the lawmaking process, the House of Representatives takes precedence over the House of Councillors, which has only limited power to delay legislation. Executive power rests with the cabinet, consisting of the prime minister and the ministers of state. The prime minister is appointed by the emperor on the Diet's recommendation. The House of Representatives may dismiss the cabinet with a vote of no confidence. The judicial system, headed by the Supreme Court, includes high, district, family, and summary courts.

The Liberal-Democratic Party (LDP) ruled Japan from the mid-1950s until August 1993. A new government was formed based on a coalition of opposition parties. After less than a year the LDP returned to power in a coalition with smaller parties and since then has managed to stay in power through a series of shifting coalitions with various parties. At the beginning of the 21st century the major parties were the LDP, Democratic Party of Japan, New Komeito, Liberal Party, Japanese Communist Party, Social Democratic Party of Japan, and the New Conservative Party.

Japan's social-welfare system, consisting of both public and private health and welfare programs, covers virtually the entire population. The system provides benefits for unemployment, work injury, disability, sickness, maternity, and old age.

Health conditions in Japan reflect those of an economically advanced nation, with low inci-

dences of infectious diseases and infant mortality. The two leading causes of death are cancer and heart disease. Life expectancy in Japan is among the highest in the world, at 78 years for men and 85 years for women.

Japan provides a thorough education for its people. Six years of elementary and three years of junior high school are compulsory, and nearly all junior high graduates attend high school for three years. Upon graduation, students may enroll in a two- or three-year junior college, a four-year university, or a five-year technical college. Adult literacy is virtually universal.

The news media are free from government censorship. The press had a reputation for being pro-establishment until the late 1970s, when investigative reporting increased.

Cultural life. Japan's culture is characterized by a mixture of Japanese aesthetic traditions with introduced and adapted elements of Chinese and, later, of Western cultures. Such highly stylized and refined cultural and art forms as flower arranging, the tea ceremony, nō theatre, and garden design reflect an emphasis on understated simplicity, elegance, and grace. Conversely, contemporary Japanese society embraces Western-style, media-driven popular culture. Japanese cinema, somewhat in between these extremes, has a large international following, with most interest being focused on the works of Kurosawa Akira, Ozu Yasujiro, and Mizoguchi Kenji. Japan has a long and vibrant literary tradition, its modern representatives including Kawabata Yasunari, Mishima Yukio, and Tanizaki Jun'ichiro.

History. Evidence of stone tools 10,000 to 30,000 years old has been found in Japan, but no firm date can be given for the appearance of the first human settlements. Though Japanese tradition places the country's beginnings in 660 BC, with the accession of the legendary first emperor, Jimmu, historical records date the first unified Japanese state, ruled by the Yamato court, to the late 4th or early 5th century AD. During the Yamato period, Buddhism arrived in Japan by way of Korea. For several centuries the Japanese borrowed heavily from Chinese culture, especially in their adoption of the Chinese writing system to write the Japanese language. Imperial courts on Chinese models appeared at Nara and at Kyōto in the 8th century. By the 9th century, however, Japan had begun to sever its links with the mainland and to adapt what it had acquired, including Buddhism.

Politically, the emperors became increasingly subordinated to powerful noble families. One such family, the Fujiwara, held power through the 11th century. At the same time, however, powerful warrior families were emerging in the provinces, leading to the development of a military class, the samurai, that assumed increasingly exclusive political authority in local affairs. In 1192 Minamoto Yoritomo defeated a rival and established Japan's first military government, called a *bakufu,* or shogunate (*q.v.*), at Kamakura; this form of government persisted (with intermittent periods of internal warfare) until 1867.

During the Kamakura period (1192–1333), Mongol invasions launched at Japan from Korea in 1274 and 1281 were defeated by sudden typhoons, dubbed *kamikaze* ("divine wind"). The cost of preparing a defense against these invasions led to the collapse of the Kamakura shogunate. The succeeding Muromachi period under the Ashikaga shoguns (1338–1573) was marked by warfare between powerful families and the existence from time to time of more than one emperor. Political unification was initiated by Oda Nobunaga and achieved by Toyotomi Hideyoshi in 1590. The complete unification of the country did not occur, however, until after Hideyoshi's death (1598), when Tokugawa Ieyasu, one of Hideyoshi's supporters, decisively defeated his principal rivals in the Battle of Sekigahara (1600).

During the Tokugawa period (1603–1867), the government imposed a policy of isolation that resulted in the persecution of most of the Christians converted since the arrival of the Jesuit Francis Xavier in 1549, in the expulsion of all foreigners (except for limited trade with Koreans and a few Chinese and Dutch traders at Nagasaki), and in the proscription of Japanese travel abroad. Political stability brought peace to Japan for the first time in centuries. This seclusion gave rise to a flourishing culture, but it also tended to stagnate society. Many sections of the population, particularly the rising merchant class, began to chafe under the limitations. By the mid-19th century the Tokugawa shogunate could no longer keep the European and American traders away, and its popular support collapsed.

In 1868, with the accession of the emperor Meiji, it was proclaimed that imperial power had been restored. Actual political control, however, was in the hands of a group of young, far-seeing leaders from southwestern Japan. These leaders, later called the genrō (elder statesmen), undertook the remarkable modernization work of the Meiji period (1868–1912), sending fact-finding missions throughout the Western world for new ideas and technology. Japan's economy and political and social institutions were systematically modernized along Western lines; this process culminated in the promulgation of a constitution in 1889. Japan then embarked on an imperialist drive that led to war with China (1894–95) and Russia (1904–05) and to the annexation of Korea (1910); additional territorial and trade demands were made on China in succeeding decades.

The global economic troubles of the early 1930s contributed to military domination of the government at home and aggression abroad. The Japanese seized control of Manchuria in 1931, renaming it Manchukuo; allied with Nazi Germany as the Tokyo-Berlin Axis; and in December 1941 attacked U.S. forces in Hawaii and the Philippines and occupied European colonial possessions in Southeast Asia. After experiencing early successes on every front, the Japanese forces were gradually forced back by U.S. and other Allied troops. In August 1945 the United States dropped atomic bombs on Hiroshima and Nagasaki, destroying those cities; shortly thereafter the Japanese surrendered.

The Allied postwar occupation of Japan led to a new constitution (1947); the occupation itself ended in 1952. In rebuilding Japan's ruined economy, new technology was used in every major industry. A tremendous economic recovery followed, bringing general prosperity. A far-sighted trade policy resulted in larger shares for Japanese manufacturers in all foreign markets, including those of the United States and other Western industrial powers. By the 1980s Japan's large annual trade surpluses were causing tensions with these countries, a situation that continued into the 21st century. The Japanese economy was the world's second largest by 1990, surpassed only by that of the United States. Japan's export-driven economy is vulnerable to price fluctuations in vital raw-material imports (notably oil) and to worldwide economic downturns. However, the most significant factor affecting the country's slower economic growth since 1990 has been a sustained recession that began in the early 1990s. Concurrent with that has been considerable political instability, which has produced a succession of short-lived governments.

japan (varnish): *see* black varnish; japanning.

Japan, Sea of, Japanese NIHON-KAI, Russian YAPONSKOYE MORE, also called EAST SEA, Korean TONGHAE, marginal sea of the western Pacific Ocean that is bounded by Japan and the Russian island of Sakhalin to the east and by Russia and Korea on the Asian mainland to the west.

A brief treatment of the Sea of Japan follows. For full treatment, *see* MACROPAEDIA: Pacific Ocean.

The sea lies in a deep basin and is separated from the East China Sea to the south by the Tsushima Strait and Korea Strait and from the Sea of Okhotsk to the north by the La Perouse (or Sōya) Strait and Tatar Strait. To the east it is also connected with Japan's Inland Sea by the Kanmon Strait.

The Sea of Japan covers a surface area of approximately 377,600 square miles (978,000 square km). It has a mean depth of 5,748 feet (1,752 m) and a maximum depth of 12,276 feet (3,742 m). The underwater relief of the sea is subdivided into three parts: the Japan Basin, the deepest section, in the north; the Yamato Basin in the southeast; and the Tsushima Basin, the shallowest waters, in the southwest. The continental shelves are wide on the Japanese side of the sea, but those along the fringes of Siberia and the Korean Peninsula are narrow, with an average width of about 19 miles (30 km). The Sea of Japan contributes greatly to the mild climate of Japan because of the ameliorating effect exerted by its relatively warm waters. Fisheries and mineral deposits, including magnetite sands as well as natural-gas and petroleum deposits off Japan, form the main economic resources. The sea is also increasingly being used as a commercial waterway as trade between East Asian countries grows.

Japan Air Lines Co., Ltd. (JAL), Japanese NIHON KŌKŪ, Japanese airline that is one of the largest air carriers in the world. The airline was founded in 1951. It was originally a private company but was reorganized in 1953 as a semigovernmental public corporation. The airline was again privatized in the late 1980s. It is headquartered in Tokyo.

Japan Air Lines was at first a domestic carrier, but it became an international airline in 1954, when it inaugurated flights to San Francisco. In the next 10 years it expanded its service to Southeast Asia, other cities in the United States, Europe, India, the Middle East, and Australia. In the late 1960s JAL began round-the-world service, and in 1970 it became the first non-Soviet airline to fly a regular route over Siberia. In the 1980s its route network was extended to cover several cities in China. JAL also has affiliates that operate hotels. In 1987 the Japanese government decided to sell off its shares in JAL, thus releasing the airline from government control.

Japan Communist Party (JCP), Japanese NIHON (or NIPPON) KYŌSANTŌ, leftist Japanese political party founded in 1922. Initially outlawed, it operated clandestinely until freedom of political association was restored in Japan; it was established legally in October 1945.

In 1949 the JCP won 35 seats in the House of Representatives and nearly 10 percent of the vote, but external and internal pressures so shattered the party that it lost all its seats in the elections of 1952. In 1955 the party reorganized and began a steady ascent in membership and seats in the Diet (legislature), which peaked when it won 39 House seats in 1979. In the 1980s the JCP averaged between 5 and 10 percent of the vote and held on average about 30 House seats. Reduced to only 15 seats in 1993, it later became a more traditional democratic socialist party. Though it raised its seats to 26 in 1996, its support eroded in subsequent elections. It has taken an increasingly nationalist stance. In the 1960s the JCP broke with the Soviet and Chinese parties, causing a schism with its more radical members; it restored relations with the Chinese Communist Party in 1998. Its daily paper *Akahata* ("Red Flag") has a large national circulation.

Japan Current (Pacific Ocean): *see* Kuroshio.

Japan New Party, Japanese NIHON (or NIPPON) SHINTŌ, right-centre Japanese political party established in 1992 by dissident members of the Liberal-Democratic Party (LDP). In 1993–94 its founder, Hosokawa Morihiro, served as Japan's first non-LDP prime minister since 1955.

Japan Railways Group, Japanese NIHON (or NIPPON) TETSUDŌ GURŪPU, byname JR GROUP, formerly JAPANESE NATIONAL RAILWAYS, principal rail network of Japan, consisting of 12 corporations created by the privatization of the government-owned Japanese National Railways (JNR) in 1987.

The first railroad in Japan, built by British engineers, opened in 1872, between Tokyo and Yokohama. After some initial opposition to foreign influence, Japanese engineers began building railroads at a rapid rate, and the railways' expansion was promoted as part of national policy. In 1906 the state began buying up private lines, and out of these efforts emerged the JNR in 1949. By the mid-1980s JNR's rail lines provided passenger and freight service over more than three-fourths of Japan's track mileage. The remainder was operated by a number of privately owned intercity passenger railway companies.

In 1964 the first section of the Shinkansen, a high-speed passenger line, was opened between the cities of Tokyo and Ōsaka, and the line was later extended until it became one of the mainstays of the railway's operations. It was also in 1964, however, that JNR first began to lose money on its operations, and these losses continued over the next two decades until the corporation had amassed a huge long-term debt. In response, it was decided in 1987 that the JNR would be privatized and broken up into 12 interdependent companies: 6 regional railways, the Shinkansen lines, a nationwide cargo railway corporation, and four other companies. The JR Group has a total route length of about 12,500 miles (20,100 km), of which about half is electrified.

Japan Renewal Party, Japanese SHINSEITŌ, conservative Japanese political party formed in 1993 by dissident members of the Liberal-Democratic Party. One of the party's founding leaders, Hata Tsutomu, was prime minister in April–June 1994.

Japan Series, Japanese NIHON (or NIPPON) SHIRIZU, in baseball, a seven-game play-off between champions of the two professional major-league divisions in Japan, the Central League and the Pacific League. Baseball in Japan was established on a professional basis in 1934. By 1936 seven professional teams had been organized. A system of two leagues composed of six teams each was instituted in 1950. Each 130-game season culminates in the Japan Series. For the results of the Japan Series, *see* Sporting Record: *Baseball.*

Japan Socialist Party: *see* Social Democratic Party of Japan.

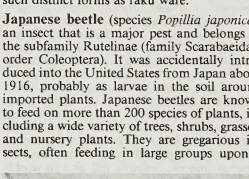
Japan Trench, deep submarine trench lying east of the Japanese islands, in the floor of the western North Pacific Ocean. It is one of a series of depressions stretching south from the Kuril Trench and the Bonin Trench to the Mariana Trench. The 27,929-foot (8,513-metre) Tuscarora Deep (north) was once considered the deepest point in the world (subsequently found to be in the Mariana Trench).

Japanese Alps, Japanese NIHON (or NIPPON) ARUPUSU, mountains, central Honshu, Japan. The term Japanese Alps was first applied to the Hida Range in the late 19th century but now also includes the Kiso and Akaishi ranges to the south.

The ranges are a popular skiing and mountain-climbing area. The Hida Range is included within Chūbu-Sangaku National Park, which stretches over Gifu, Toyama, Nagano, and Niigata prefectures and contains Mount Hotaka (10,466 feet [3,190 m]). Minami Alps National Park encompasses the Akaishi Range and contains Mount Shirane (10,472 feet [3,192 m]).

Japanese art, the painting, calligraphy, sculpture, architecture, and other fine or decorative art forms produced in Japan.

A brief treatment of Japanese art follows. The arts in Japan are treated in a number of articles in the MACROPAEDIA. For a unified treatment of Japanese fine and decorative arts, *see* East Asian Arts. For individual treatments of Japanese pottery, metalwork, enamelwork, and lacquerwork, *see* Decorative Arts and Furnishings. For a treatment of Japanese calligraphy, *see* Writing.



Japanese visual arts are characterized by their vibrancy, life, and colour. They have been strongly influenced by three elements: Chinese visual arts, indigenous themes and traditions (notably nature and literary works), and Buddhist iconography. Also characteristic is an emphasis on decorative effect and a tendency to combine fine and decorative art forms.

The Chinese style of ink-monochrome painting and calligraphy played a significant role in the development of Japanese painting. Japanese artists assimilated this tradition, introducing the use of colour about the 6th century AD. A more Japanese form, called Yamato-e, emerged in the 12th and 13th centuries and is typified by long, narrative *emaki* ("picture scrolls"). The Japanese fascination with abstraction from nature is best seen in the screen and panel paintings of the 16th–18th century. Also appearing about that time was the woodblock print, which evolved into the popular polychrome ukiyo-e form.

The earliest examples of Japanese sculpture were small clay figures called *haniwa.* Buddhist subjects came to dominate following that religion's introduction, with the most notable examples being carved wooden statues. The Chinese post-and-lintel architectural style overshadowed more indigenous forms from the 8th century, although Japanese concepts of asymmetry often were incorporated.

The Japanese are renowned for their decorative arts, especially pottery, cloisonné, and laquerwork forms. Pottery styles exhibit considerable continental influence, particularly from the Korean peninsula, although numerous indigenous modifications have produced such distinct forms as raku ware.

Japanese beetle (species *Popillia japonica*), an insect that is a major pest and belongs to the subfamily Rutelinae (family Scarabaeidae, order Coleoptera). It was accidentally introduced into the United States from Japan about 1916, probably as larvae in the soil around imported plants. Japanese beetles are known to feed on more than 200 species of plants, including a wide variety of trees, shrubs, grasses, and nursery plants. They are gregarious insects, often feeding in large groups upon a single tree. A swarm of Japanese beetles can denude a peach tree in 15 minutes, leaving nothing but bare branches and the fruit pits.

Japanese beetle (*Popillia japonica*)
William E. Ferguson

Female beetles burrow from 25 to 100 mm (1 to 4 inches) below the surface of the soil to deposit their eggs, which hatch in about 14 days. The larvae live the entire winter below the surface of the ground in this stage, feeding on the tender roots of plants. During May the larvae transform to prepupa and then to pupa stages, the adult beetles emerging in June or July. The beetles range from Maine to South Carolina, and infestations have been noted in other parts of North America.

The adult beetle, about 10 mm (0.4 inch) long, is bright metallic green in colour with coppery-brown wing covers (elytra), five patches of white spots on each side, and two prominent white tufts on top of the exposed tip of the abdomen. Unlike the larva, the adult feeds on the flowers, fruit, and foliage of the plant.

Efforts are being made to control the spread of this pest. Poisonous sprays control the adult beetles but differ in the length of their protection against reinfestation. Several of the beetle's natural enemies—species of parasitic wasps and flies that in Japan were found to prey on the larvae—have been imported into the United States, where some of them have become established. Of even greater promise as a biological control is a disease-inducing bacterium, *Bacillus popilliae,* which causes milky disease in larvae; its use has reduced Japanese beetle infestations in some areas.

Japanese cedar, also called JAPANESE REDWOOD, or PEACOCK PINE (species *Cryptomeria japonica*), a coniferous evergreen timber tree and only species of the genus *Cryptomeria* of the family Cupressaceae (sometimes classified in the so-called deciduous cypress family Taxodiaceae), native to eastern Asia. The tree may attain 45 m (150 feet) or more in height and a circumference of 4.5 to 7.5 m (15 to 25 feet). It is pyramidal, with dense, spreading branches in whorls about the trunk.

The Japanese cedar often is used in eastern Asia for reforestation and for garden and avenue plantings. The fragrant, reddish brown wood is used to build ships, houses, bridges, furniture, and vats and for ornamental carving. Incense is made from the leaves.

Japanese Chin: *see* Japanese spaniel.

Japanese Civil Code, Japanese MIMPŌ, body of private law adopted in 1896 that, with post-World War II modifications, remains in effect in present-day Japan. The code was the result of various movements for modernization following the Meiji Restoration of 1868. A legal code was required that would fill the needs of the new free-enterprise system that predominated with the dissolution of feudal landholdings. At the same time, the Japanese desired to present themselves to the world as a more modern nation in hope of renegotiating certain unfavourably balanced and often even humiliating treaties with Western nations. The resulting code was modeled on the first draft of the German Civil Code, itself very Roman in structure and substance.

The code is divided into five books. Those on family and succession retain certain vestiges of the old patriarchal family system that was the basis of Japanese feudalism. It was in these sections that most of the postwar revisions were made. At that time it was considered no longer necessary or desirable to pay such homage to the past, and the sections dealing with family law and succession were brought closer to European civil law.

The writing of the code provoked considerable disagreement among segments of the Japanese legal and commercial communities, largely over how much Japanese custom should be included. There was also disagreement as to whether the code should be based on

the French or the English system of law. This disagreement arose from the rather strange position of both those systems in Japanese law schools and courts. After the restoration, law schools had been set up that gave courses in both English and French law. Because of the way the courses and examinations were constructed, it was possible to become a lawyer or judge by knowing only one system of law. In their courtrooms, some judges administered only French law and others only English.

After the first Japanese Civil Code had been adopted in 1890, with very little debate, a storm of criticism arose from the legal community. This code had been the work of a French jurist, Gustave-Emil Boissonade, who also had written the criminal and penal codes of 1882. Opponents argued that, if the civil code were to be based upon French law, then Japanese lawyers trained in the French system would have an advantage over those trained in the English. Further, the proposed commercial code was based on German laws, and there were many lawyers and persons engaged in commerce who felt there would be confusion if the two codes were based upon different laws.

The code was made into a political issue by those wishing to preserve the old feudalism, who charged that the old customs, particularly the patriarchal family system, had been ignored in the individualistic code of Boissonade. A revised code was produced, based on the first draft of the German Civil Code but giving considerable weight to the old customs, particularly in family and inheritance law. The final German-based code was very similar in most respects to that of Boissonade, both including strong protection for landed property. The code was promulgated in 1896 and went into effect in 1898.

Japanese crab: *see* king crab.

Japanese deer, hoofed mammal, a subspecies of sika (*q.v.*).

Japanese ivy: *see* Boston ivy.

Japanese language, language spoken by about 124,000,000 people in the islands of Japan, including the Ryukyus. Some 1,000,000 people of Japanese descent who live in other parts of the world also speak Japanese with some degree of proficiency.

A brief treatment of the Japanese language follows. For full treatment, *see* MACROPAEDIA: Languages of the World.

Japanese is composed of a large number of dialects, some of which are mutually unintelligible. Mainland dialects are divisible into three or four groupings of related dialects, but the greatest differences in dialects are to be found between mainland dialects and those of the Ryukyu Islands. Especially since World War II, strong forces have been homogenizing the language. The rapid spread of literacy and elementary education that occurred after the Meiji Restoration (1868) established a common written language that was derived from the dialect of residential Tokyo. Aside from their own dialect, many people throughout Japan now speak this common tongue, though with their own accents. The large postwar rural-to-urban migration and the impact of the electronic media have accelerated this process of assimilation. As a consequence, local dialects have been fading faster than previously.

Japanese is a polysyllabic language. It uses 5 vowels *a, i, u, e, o,* and 15 consonants *p, t, k, b, d, g, ts (ch), s (sh), z (j), m, n, r, h, y* and *w.* Most Japanese dialects use pitch accents. Stress accents are never used. Nouns are inflected, and verbs and adjectives conjugate with endings. The personal-pronoun system is complex and reflects an intricate system of social hierarchy.

The filiation of Japanese with other languages is not clear, though it is probably related to Korean and possibly to the Altaic languages. There are two hypothesis on the origin of Japanese. It could be that a Proto-Japanese-speaking people on the Asian continent gave Japan the ancestor tongue by way of the Yayoi culture in northern Kyushu 2,000 years ago. This protolanguage was then eclipsed on the continent by other languages. The stronger hypothesis has Proto-Japanese dialects developing from Korean 5,000 years ago and slowly squeezing out competing contemporaneous dialects. Some evidence for this exists from 8th-century recordings of non-Proto-Japanese features of certain Eastern dialects that have since largely disappeared.

The history of the language is usually divided into four periods: Old Japanese (to the 8th century); Late Old Japanese (9th–11th century); Middle Japanese (12th–16th century); and Modern Japanese (from the 17th century). In this evolution the syntax has not varied much, but there has been considerable change in phonology, morphology, and vocabulary. Principal among the sound changes is the shift of initial *p-* to *h-*, the loss of the vowels *ë* and *ö*, and the disappearance of vestigial vowel harmony. There has also been the replacement of older "finite" forms of verbs and adjectives with noun-modifying forms.

Though the vocabulary is largely indigenous, Chinese from the 6th to the 9th century played an important role in the development of the language. A large percentage of Japanese words derive from Chinese loan elements, much as English has borrowed extensively from Greek, Latin, and French. The adoption of Chinese characters for writing had far-reaching consequences on written and spoken Japanese. This adoption is traceable to the 3rd century, but the earliest extant records longer than a few words are from the 8th century. Originally the characters were used to write Chinese, but then they came to symbolize native Japanese words similar in meaning to that of the Chinese. In this process most of the characters were simplified and made more cursive to the point that in many cases little or nothing is left of their original shape.

Every Chinese character, or *kanji,* has acquired a twofold reading. It can represent a Japanese word that imitates the sound and meaning of the original Chinese, known as the *on* reading, or it can represent a native word of similar meaning, known as the *kun* reading. It is this latter reading that is the accustomed meaning of the character when it is used by itself. Furthermore, every character has a third use in which its *on* or *kun* sound can be used phonetically to represent a Japanese syllable while abstracting from its *on* or *kun* meaning. A *kanji* used as a phonogram is called a *kana.*

Syllabic writing is traceable to the 6th century, when *kanji* were used as phonograms, but it was not until the 9th century that standardized systems of *kana* began to develop. Eventually two different systems of phonetic representation emerged, both based on *kanji.* One system, called *hiragana,* or "common *kana,*" was formulated by simplifying and stylizing the cursive *kanji* that had been used as phonograms in the 8th-century imperial anthology of poetry, the *Man'yōshū.* The use of *hiragana* was given impetus through the writing of poetry, diaries, and novels by court women of the Heian period (794–1185). At that time *hiragana* was known as *onnade,* or "letters of women," as men generally continued to write in *kanji.* The other system is called *katakana,* or "partial *kana.*" It developed from diverse systems of priestly shorthand that aided the reading of Chinese texts and Buddhist scriptures by supplying, in the form of abbreviated *kanji* strokes, Japanese particles and endings missing in the Chinese. *Katakana* was at first highly individualized and specific to every sect and sometimes even to every individual, but in the 10th century common elements began to appear as popularity normalized its use.

Until the 15th century Japanese was written with a mixture of *kanji* and *katakana.* At that time the *hiragana* symbols became the popular and literary medium, with *katakana* being used for scholarly and practical texts. In modern Japanese *katakana* is used only in machine-printed telegrams and memoranda of offices and companies or for foreign loanwords, onomatopoetic words, and the names of flora and fauna. Present writing is in *kanji* and *hiragana,* the orthography of which has been reformed since World War II. In these reforms the unrestricted use of thousands of *kanji* characters was limited to a list of 1,850 symbols for official and daily use, and their shapes and strokes were greatly simplified. In the early 1980s the number of characters on the list was increased to 1,945, and additional character simplifications were adopted. *Kana* spellings are now based on contemporary pronunciation, in contrast to the prior retention of spellings based on the sound of Late Old Japanese.

Japanese law, the law as it has developed in Japan as a consequence of a meld of two cultural and legal traditions, one indigenous Japanese, the other Western. Before Japan's isolation from the West was ended in the mid-19th century, Japanese law developed independently of Western influences. Conciliation was emphasized in response to social pressures exerted through an expanded family unit and a close-knit community. Few rules prescribed how disputes should be resolved. The closest counterpart to the Western lawyer was the *kujishi,* an innkeeper who developed a counseling function. Remarkably little law in the modern sense existed; a static society, which officially discouraged commercial activity, apparently neither desired nor needed a developed legal order.

Fundamental changes inevitably followed Japan's sudden involvement with the Western world after the Meiji Restoration of 1868. Japan sought to construct an economic, political, and legal structure capable of commanding respect internationally, ending extraterritoriality, and preserving national independence. The introduction of Western law was one element in a wholesale importation of things Western.

In legal matters the Japanese took for models the systems of continental Europe, especially the German. The drafters of the Japanese Civil Code (*q.v.*) of 1896 surveyed many legal systems, including the French, Swiss, and common laws, taking something from each. Their final product is, however, best characterized as following the first draft of the German Civil Code. In its subsequent development the Japanese legal system remained true to these sources. The 1947 revisions of the code provisions dealing with relatives and succession, which had reflected traditional Japanese attitudes, completed the transition of Japanese civil law to the continental European family of laws.

On some points, however, Japanese law is closer to that of the United States than to European models, largely as a result of the post-World War II occupation and of later contacts with U.S. legal thinking and education. The examination of witnesses in civil cases is now (at least theoretically) modeled on U.S. procedure. The absence of a special hierarchy of administrative courts is consistent with U.S. ideas. Many aspects of labour and corporation law are U.S.-inspired.

Nevertheless, in its rules and institutions, the Japanese legal system is closer to the civil law of Europe than to the common law. In many ways, moreover, the Japanese legal order dif-

fers markedly from all Western legal orders. Most importantly, law in Japan plays a far less pervasive role in resolving disputes and creating and adjusting rules regulating conduct. The paucity of Japanese decisions involving automobile accidents, manufacturer's liability for defective products, and nuisance may be surprising to Westerners, who also may note the small size of the Japanese bar and the persistence of extralegal methods of resolving disputes. Local police stations provide conciliation rooms. Elders act as go-betweens. For many purposes a family transcending the nuclear family still exists. The notion that a business is analogous to a family unit persists and typically influences labour relations, especially in small- and middle-sized firms. In the relatively homogeneous Japanese society, social status carries heavy obligations, and community pressure is extremely powerful.

Now that Japan has become a dominant world economic power and has increased its global geopolitical presence, law may come to play a role there more akin to its role in the West. In addition, the sociological supports essential to the continued vitality of the Japanese conception of law are being undercut by the shift from a rural, agricultural economy to an urban, mechanized society.

Japanese literature, the body of written works produced by Japanese authors in Japanese or, in its earliest beginnings, in the Chinese classical language, since Japan at that time had no written language. Since the two countries did not speak the same language, this made for great difficulty in writing: the Chinese characters were used by early writers in the Japanese language for their phonetic value rather than their meanings, which resulted in complications that makes comprehension by modern readers extremely difficult.

A brief treatment of Japanese literature follows. For full treatment, *see* MACROPAEDIA: Japanese Literature.

The earliest extant Japanese literature dates from the 7th century. Although it is one of the richest and most rewarding literatures in the world, it often has been restricted by style. This is exemplified in such poetic forms as the *tanka* (short poem) and such devices as the *makura-kotoba* ("pillow word") that resulted in poetry honed so fine as to be beyond reach of the populace, thus restricting the literature to court circles or scholars. Throughout its existence, however, there has never been a "dark age" when no literature was produced, and when literature did begin to acquire a popular base, appreciation of the "classics" of court poetry became widespread.

The great literary monument of the Nara period (AD 710–784) is also the first great milestone of Japanese literature: the *Man'yōshū* (after 759; "Collection of Ten Thousand Leaves"), a magnificent anthology of poetry. This contained about 4,500 works, including many *tanka* and 260 *chōka* (long poems) that frequently ended with one or more *hanka* ("envoys"). A good number of the works were composed outside the court, by common people who had little access to literature. The *Kojiki* (712; "Records of Ancient Matters") and *Nihon-gi*, or *Nihon shoki* (720; "Chronicles of Japan"), which are the earliest collections of myths in Japan, were also compiled during this time. Mythological themes can be found throughout Japanese literature, but these two collections have been the most influential and remain the subject of much study and debate. While in other cultures mythology developed into literature (most notably in Greece), in Japan the primary purpose of the myths was political. The *Kojiki* and *Nihon-gi* were written to give greater authority to the power of the ruling class by tracing back the genealogy of the imperial family to the beginning of the world.

During the Heian period (794–1185) the first lengthy work of fiction in Japanese literature—and perhaps in the world—*Utsubo monogatari* (*c.* 970–983; "The Tale of the Hollow Tree"), was written, but it was crude and uneven in comparison to a somewhat later novel of the period, *Genji monogatari* (*The Tale of Genji*). Completed by Murasaki Shikibu by about 1010, *The Tale of Genji* is considered by many to be the finest work in all Japanese literature and perhaps the first important novel written in any language. It embodies the best of the feminine sensitivities that are characteristic of early Japanese literature, deriving from the fact that much of the early poetry was written by ladies of the court. So profound was the influence of the adventures of Prince Genji that derivative works continued to be written for centuries.

The supreme accomplishment in the *tanka* poetry tradition came about 1205, during the Kamakura period (1192–1333), when Fujiwara Sadaie completed the anthology the *Shin kokinshū* ("The New Kokinshū"). By that time the samurai had come to power and established military discipline. Although there were far fewer women writers of distinction, the vigour of the court poets remained undiminished—the *Shin kokinshū* exemplified the best poetry of several centuries. Another literary genre of the period was the war story. The *Heike monogatari* (*c.* 1220; *The Tale of the Heike*), the greatest of these works, employed imported Chinese words in order to convey contrasting sounds lacking in Japanese. It is considered to be the foremost classic of the Japanese style.

For nearly 250 years in the Tokugawa period (1603–1867) Japan was virtually isolated from the rest of the world by government decree. While this resulted in a flowering of indigenous forms of literature, it also stultified Japan's literary energies by depriving the Japanese of any of the revitalizing influences of foreign writings. Perhaps the most important development was the emergence of the *haiku*, an exceedingly brief form of poetry that has continued to be popular. The origin of the *haiku*—composed of 17 syllables arranged in lines of five, seven, and five syllables—is in the first verse of *renga* (linked-verse) poetry, which had been popular since the Muromachi period (1338–1573). Serious *haiku* poetry was at first opposed by such groups as the Danrin school, which held that rapid and impromptu composition had far more meaning than the polishing of one perfect sequence. Ihara Saikaku, one of the leaders of this latter movement, once composed the extraordinary total of 23,500 verses in a day and a night. The persistence of Matsuo Bushō and his disciples, however, established *haiku* as an accepted poetic form.

When Commodore Matthew Perry's fleet opened Japan to the Western world, there was at first little effect on Japanese literature. The writers of *gesaku* fiction, the "playful composition" that was typical of the closing years of the Tokugawa period, had brought Japanese literature to its lowest ebb, but it had also brought reading within the reach of a wide population that now became susceptible to influences of foreign translations. These introduced the use of ordinary speech in both poetry and prose, a rarity in Japanese writing. Gradually, Western influences began to infiltrate, bringing entirely new forms as well as methods of self-expression. During the Meiji period (1868–1912) and in the early 20th century, the novel became the dominant form of prose literature.

The end of World War II and the democratization of the country resulted in a new wave of powerful poetry, drama, fiction, and the "I novel" (*shishōsetsu*), the autobiographic form best exemplified by the writings of Shiga Naoya. Tanizaki Jun'ichirō, Kawabata Yasunari (who was awarded the Nobel Prize for Literature in 1968), Abe Kōbō, and Oe Kenzaburō produced powerful novels that were translated and were received well in the West. Mishima Yukio, however, was the first Japanese writer to become internationally known and praised; he paved the way for others who have helped give Japanese literature a wider international audience.

Japanese music, a form of East Asian music derived in large part from Chinese and Korean sources but also containing remnants of its indigenous northern (Ainu) culture. In later years Japan's isolation as an island nation permitted its music to develop without further foreign influence of great consequence.

A brief treatment of Japanese music follows. For full treatment, *see* MACROPAEDIA: East Asian Arts.

Stone whistles of the Jōmon culture (3rd millennium BC) are the earliest evidence of musical instruments in Japan. In the Yayoi period (3rd century BC to 3rd century AD) bronze bells were being made. Excavated tombs of the Tumulus period (*c.* 250–*c.* 500), when the Yamato people became dominant in Japan, reveal figurines (*haniwa*) depicting musicians and musical instruments, among them the barrel drum, four- and five-stringed zithers, and croatal bells. In 453 a Korean emperor sent 80 musicians to the funeral of a Japanese ruler, and in the 6th century Japan accepted Buddhism and began sending select converts to China for training in the traditional rituals, including the use of music. By the 8th century the documented history of Japanese music had been established.

During the Heian period (794–1185) the various kinds of music, imported and indigenous, were arranged in an order that remained unchanged until modern times. The general term *To-gaku* (T'ang music) embraced all music from China and South and Central Asia and the standardized instrumentation consisting of bamboo flutes (*ōteki*) and short bamboo double-reed instruments (*hichiriki*) played in unison, mouth organ (*shō*), three percussion instruments providing repeated patterns—gong (*shōko*), small double-side drum (*kakko*), barrel-shaped drum (*taiko*)—and two stringed instruments supplying a drone (*koto, biwa*). All Korean, northeast Asian, and Manchurian music was incorporated into *Koma-gaku*, the instrumentation consisting of a Korean flute (*Koma-bue*) and *hichiriki* in unison and three percussion instruments (*taiko, shōko,* and the hourglass-shaped drum *san-no-tsuzumi*). The term *mikagura* was used for the music of the imperial Shintō rites and some song dances of the earliest times, accompanied by a low-pitched flute (*kagura-bue*), *hichiriki,* and the six-stringed zither *wagon*. Two new types of composition were incorporated in court music: *saibara,* songs of provincial pack-horse drovers, heard with Chinese instrumentation, and *rōei,* poems in the Chinese style chanted in a sophisticated manner and accompanied only by flute, *hichiriki,* and mouth organ.

During the 12th and 13th centuries Buddhist religious music was reformed. Hymns in the vernacular (*shōmyō*), flexible and expressive in character, were added to the old liturgical chants (*bombai*). In the military-dominated Kamakura (1192–1333) and Muromachi (1338–1573) periods, the Nō theatre rose to prominence. *Kure-gaku* and *Tō-sangaku,* earlier popular types of music, had survived in rural dance pantomimes (*dengaku*), and popular acrobatic performances (*sarugaku-nō*) were gradually absorbed into the tradition. During the centuries of feudal government, itinerant Zen Buddhist monks, the *komusō*, played the bamboo end-blown flute (*shakuhachi*), and wandering bards, or *heike-biwa,* recited tales to the accompaniment of the four-stringed lute (*biwa*).

The century of transition from the feudal era to the Tokugawa regime (1603–1868) was a time of a strong Western influence exerted by Spanish and Portuguese missionaries. In the mission schools Christian hymns, Gregorian litanies, and secular European music were taught, and this influence and the knowledge of Western melody and musical expression merged with folk song and the various types of entertainment music of the period. With the growth of cities and the increasing wealth of the merchant class, the puppet theatre (*bunraku; jōruri*) became popular, as did the kabuki theatre. The *samisen*—a long-necked, three-stringed instrument played with a plectrum—became the principal instrument of kabuki accompaniments. Secular concert music (solo songs and chorus in alternation, accompanied by percussion instruments, *samisen,* and *koto* groups) was of three schools: Naga-uta, Tokiwazu, and Kyomoto. Instrumental solo music for the 13-stringed *koto* was greatly favoured, as were the many variants of geisha songs and chamber music for voice, *koto,* and *shakuhachi*.

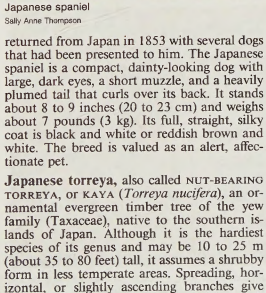
The modern period dates from the opening of the country after the Meiji Restoration of 1868. French military music had already been introduced by some independent feudal lords (daimyo), and in the 1870s the imperial court pressed for the immediate introduction of Western music. Under the baton of the Englishman William Fenton, the imperial musicians were the first to perform an all-Western orchestral concert (1877). In public education Japanese melody and music theory were abolished, and Western nomenclature, notation, harmony, and melody were imposed. After the establishment of the Imperial Academy of Music in Tokyo (1878), Western music made rapid headway. Most cities by the mid-20th century had one or several modern orchestras, and Japanese music of former times survived only in closed guilds, in the various Buddhist and Shintō sects, and in nō and kabuki theatre.

Japanese National Railways: *see* Japan Railways Group.

Japanese Orthodox church, autonomous body of the Eastern Orthodox church, in canonical relation with the patriarchate of Moscow, which confirms the election of the metropolitan of Tokyo. The Japanese Orthodox church was created by the efforts of an outstanding missionary, Nikolay Kasatkin (1836–1912), who became the first Orthodox archbishop of Japan and was canonized a saint in 1970.

Since the beginning of the mission (1872), the church was never dependent upon foreign missionary personnel. Japanese priests are ordained for being trained in a seminary in Tokyo, and an assembly of clergy and laity is in full control of the affairs of the church. This indigenous character of Japanese Orthodoxy permitted it to survive several political trials and periods of isolation, such as the Russo-Japanese War and the two World Wars. Between 1945 and 1970 the church was under the ecclesiastical jurisdiction of the Russian metropolitanate of America. In 1970 it received a permanent autonomous statute from the patriarchate of Moscow, its mother church. The Orthodox cathedral of Tokyo—called Nikolay Cathedral, for its founder, Nikolay Kasatkin—is one of the largest religious buildings in the Japanese capital. The church, numbering about 30,000 members, has dioceses in Tokyo, Kyōto, and Sendai.

Japanese philosophy, the conceptual expression of Japanese culture since the turn of the 6th century AD. The term philosophy has been considered somewhat misleading in reference to Japanese thought, since Japanese premodern thinking tended to be directed more toward the realm of existence than toward that of essence. Japanese philosophy is not generally indigenous; Japanese thinkers have always freely appropriated foreign philosophical systems and insights to express their own understanding of the meaning of life and the world. The Japanese have skillfully assimilated alien philosophical categories in developing their own systems.



Historically, before the Meiji period (beginning in 1868), one of the two principal schools of Japanese thought arose from Buddhism and was highly tinged with a religious and often somewhat metaphysical character; the second school arose from Confucianism and was essentially a system of moral philosophy. From the 18th century on, there were some independent thinkers who were critical of these two major schools, but their ideas were limited to a small circle, and they left little influence.

Since the Meiji Restoration, Western philosophy has been liberally and abundantly introduced into Japan. At first, British and American philosophies predominated; but in the course of the 20th century the influence of German philosophy became increasingly strong. Leading Japanese philosophers were especially influenced by German idealism, phenomenology, and existentialism. By the end of the century, philosophy in the Western sense of the term was taught as a compulsory subject in most Japanese colleges and universities; and Eastern thought, under the name of Indian or Chinese philosophy, was relegated to specialized courses. In order to distinguish Western philosophy from Buddhist and Chinese thought, a new term, *tetsugaku* ("wise learning"), was coined and has come into common use.

Japanese raisin tree: *see* raisin tree.

Japanese redwood: *see* Japanese cedar.

Japanese spaniel, also called JAPANESE CHIN, breed of toy dog that originated in China and was introduced to Japan, where it was kept by royalty. The breed became known in the West when Commodore Matthew Perry

Japanese spaniel
Sally Anne Thompson

returned from Japan in 1853 with several dogs that had been presented to him. The Japanese spaniel is a compact, dainty-looking dog with large, dark eyes, a short muzzle, and a heavily plumed tail that curls over its back. It stands about 8 to 9 inches (20 to 23 cm) and weighs about 7 pounds (3 kg). Its full, straight, silky coat is black and white or reddish brown and white. The breed is valued as an alert, affectionate pet.

Japanese torreya, also called NUT-BEARING TORREYA, or KAYA (*Torreya nucifera*), an ornamental evergreen timber tree of the yew family (Taxaceae), native to the southern islands of Japan. Although it is the hardiest species of its genus and may be 10 to 25 m (about 35 to 80 feet) tall, it assumes a shrubby form in less temperate areas. Spreading, horizontal, or slightly ascending branches give the tree a compact ovoid or pyramidal head. The bark is smooth and red but on old trees may become brownish and flaky. The curved, lance-shaped leaves are rigid, spiny pointed, and dark glossy green on the upper side; they emit a pungent, disagreeable odour when bruised. The seeds, 2 to 2.5 cm (about 0.75 inch to 1 inch) long, are used for food in Japan; they contain an oil used in cooking.

Japanese torreya (*Torreya nucifera*)
Shunji Watari

The fleshy seed covering, or aril, is light green in colour, sometimes tinged with purple. The yellowish, durable wood is used for furniture, cabinetry, carving, and articles of turnery.

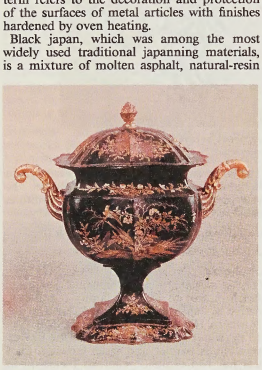
Japanese varnish tree: *see* varnish tree.

Japanese writing system: *see* kana.

Japanese yew, also called SPREADING YEW (*Taxus cuspidata*), an ornamental evergreen shrub or tree of the yew family (Taxaceae), native to Japan and widely cultivated in the Northern Hemisphere. Rising to a height of 16 m (about 52 feet), it resembles the English yew but is hardier and faster-growing. Each leaf has two distinct, yellowish bands on its underside. There are many horticultural varieties of Japanese yew. Plants propagated from cuttings of lateral branches tend to be prostrate and shrubby, while cuttings from leader shoots are erect and symmetrically conical. Several hybrids have been obtained by crossing the Japanese yew with the English yew;

Japanese yew (*Taxus cuspidata*)
Grant Heilman

the most common, *Taxus x media,* has about 10 varieties.



Japanism, also spelled JAPONISM, French JAPONISME, aesthetic cult that had a major impact on Impressionist painting. Japanism began in the mid-19th century, just after Japanese trade with the West was opened, and lasted for a generation in France and England. Japanism depended upon the careful study of

imported works of Japanese art, usually recent popular prints (*Ukiyo-e*) rather than important older paintings.

The prints were collected by such painters as Édouard Manet, Edgar Degas, Claude Monet, and other artists. The clarity of line, spaciousness of composition, and boldness and flatness of colour and light in Japanese prints had a direct impact on their work and on that of their followers. Less important and more ephemeral was an attempt in France to emulate Japanese interior design, following the display of Japanese decorative arts at the 1867 Universal Exposition in Paris.

japanning, in the decorative arts, process popular in 18th-century Europe for finishing and ornamenting wood, leather, tin, and papier-mâché in imitation of the celebrated lacquerwork of the Japanese. In modern industry, the term refers to the decoration and protection of the surfaces of metal articles with finishes hardened by oven heating.

Black japan, which was among the most widely used traditional japanning materials, is a mixture of molten asphalt, natural-resin

Japanned urn, Pontypool ware, *c.* 1795; in the National Museum of Wales, Cardiff, Wales

By courtesy of the National Museum of Wales, Cardiff, Wales

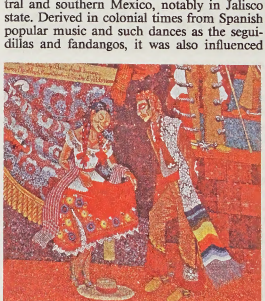
varnishes, drying oils, and turpentine having a clear, brownish undertone. The japans have largely been displaced by modern baking enamels: these are tough, durable coatings composed of pigments ground in synthetic-resin varnishes. The word japan survives more actively in an altogether different product—japan colours. These are quick-drying, lustreless paints miscible with turpentine and universally sold in tubes and cans for sign painting and decorative work.

Japonism (art history): *see* Japanism.

Japurá River, Portuguese RIO YAPURÁ, Spanish RÍO YUPURU, river that rises as the Caquetá River east of Pasto, Colombia, in the Colombian Cordillera Central. It meanders generally east-southeastward through the tropical rain forest of southeastern Colombia. After receiving the Apaporis River at the Brazilian border, it takes the name Japurá and flows eastward to join the stretch of the Amazon known as the Solimões River, above Tefé. Its total length, including the Caquetá, is about 1,750 miles (2,820 km). At its mouth it forms a network of channels and large islands, with seasonal lakes. The river, which has a strong current, is navigable for small boats in Brazil.

Jaques-Dalcroze, Émile (b. July 6, 1865, Vienna, Austria—d. July 1, 1950, Geneva, Switz.), Swiss music teacher and composer who originated the eurythmics system of musical instruction.

Jaques-Dalcroze



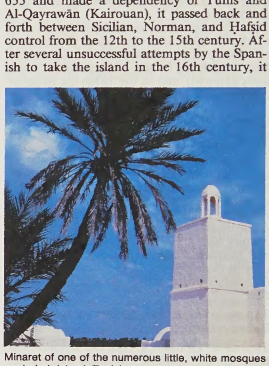
H. Roger-Viollet

In his youth Jaques-Dalcroze studied composition and by 1892 was professor of harmony at the Geneva Conservatory. Convinced that current methods of training professional musicians needed reform, he revised the teaching of harmony and developed his system of rhythmic education, in which bodily movements are used to represent musical rhythms. About 1905 he applied eurythmics to elementary school children and later demonstrated his controversial methods in England and on the European continent. In 1910 he founded the first school for eurythmic instruction at Hellerau, Ger., and in 1914 established a central school in Geneva, which he headed until his death.

Eurythmics was designed to deepen awareness of musical rhythms and aimed "to create by the help of rhythm a rapid and regular current of communication between brain and body." His pupils were taught to indicate note values by movements of the feet and body and time values by movements of the arms. The Dalcroze method (or a modified version of it) was frequently used to give plastic expression to fugues, symphonies, and operas. Eurythmics also influenced the development of 20th-century dance through the contributions of such students as Rudolf Laban, Mary Wigman, Hanya Holm, Marie Rambert, Kurt Jooss, and Uday Shankar.

Jaques-Dalcroze, who had studied with Anton Bruckner and Robert Fuchs in Vienna and with Léo Delibes in Paris, wrote three string quartets and two violin concerti, as well as numerous pieces for the piano. His arrangements of popular songs, children's rounds, and chansons de geste were used for the teaching of eurythmics in schools. He also published the *Méthode Jaques-Dalcroze* (5 parts, 1907–14), *Eurythmics, Art and Education* (1930), and *Rhythm, Music and Education* (1922).

jarabe, folk dance for couples, popular in central and southern Mexico, notably in Jalisco state. Derived in colonial times from Spanish popular music and such dances as the seguidillas and fandangos, it was also influenced



Jarabe, detail from a mosaic by Diego Rivera, on the Teatro des los Insurgentes, Mexico City

Shostal

by native Mexican couple dances imitating the courtship of doves. The jarabe is a dance of flirtation, the man vigorous and attentive, the woman coy. In some versions she dances around the edge of the sombrero he tosses to the floor. Jarabe melodies are traditional medleys of earlier popular tunes. One, the *jarabe tapatío* (a *tapatío* is a person from Guadalajara), became popularized outside Mexico as the Mexican hat dance. Other jarabes include the *jarabe tehuano* and the *jarabe tlaxcalteco.*

Jarabub (Libya): *see* Jaghbūb, Al-.

Jarbah, French DJERBA, or JERBA, island in the Gulf of Gabes, Mediterranean Sea, off the Tunisian mainland, to which it is connected by a causeway. Jarbah island is about 17 miles (27 km) long by 16 miles (26 km) wide and has an area of 197 square miles (510 square km). The island was known to ancient geographers as the "land of the lotus eaters" and was originally settled by the Romans. After being conquered by the Arabs in 655 and made a dependency of Tunis and Al-Qayrawān (Kairouan), it passed back and forth between Sicilian, Norman, and Ḥafṣid control from the 12th to the 15th century. After several unsuccessful attempts by the Spanish to take the island in the 16th century, it

Minaret of one of the numerous little, white mosques on Jarbah island, Tunisia

Alpha—The Image Works

passed under Ottoman control. Now a part of Tunisia, Jarbah island is noted for its orchards (especially dates and olives), fishing (sponges and oysters), and woolens and blankets. Its fine beaches and international airport have also made it a popular tourist resort. Ḥawmat as-Sūq (Houmet es-Souk) is the principal town and chief market centre, and Ajīm is the main port. Pop. (1984) 92,269.

jardin anglais: *see* English garden.

Jardin Botanique National de Belgique: *see* National Botanical Garden of Belgium.

Jardin des Plantes, officially MUSÉUM NATIONAL D'HISTOIRE NATURELLE, English BOTANICAL GARDEN, OR NATIONAL MUSEUM OF NATURAL HISTORY, one of the world's foremost botanical gardens, located in Paris. It was founded in 1626 as a royal garden of medicinal plants and was first opened to the public in 1650. Under the superintendence of G.-L.L. Buffon (1739–88) the garden was greatly expanded, and it developed into a centre of scientific study associated with such prominent figures of early French botany and zoology as the Jussieu brothers, Georges Cuvier, and Jean-Baptiste Lamarck. During the early 19th century it supported expeditions to many distant parts of the world, which led to the acquisition of large numbers of plants that had been previously unknown to Western science.

Still located at its original site, the Jardin des Plantes covers 28 hectares (68 acres), on

which are situated 6 greenhouses for display and 22 for service functions. Approximately 23,500 species of plants are cultivated in these greenhouses and in outdoor plots. The garden features cacti, grasses, bromeliads, orchids, ferns, aroids, Australian flora, alpine plants, iris, cannas, and conifers. The herbarium maintained at the garden is one of the world's finest and consists of more than 6 million dried reference specimens. A botanical library, a small zoo, a labyrinth, and various natural-history exhibits are also part of the garden-museum complex.

Jari River, also spelled JARY, river, northern Brazil, rising on the southern slopes of the Tumuc-Humac Mountains and flowing in a generally southeasterly direction for about 350 miles (560 km) to join the Amazon River at Bôca do Jari, opposite Grande de Gurupá Island. The Jari forms the border between Pará and Amapá states, and its lower course is navigable. An American entrepreneur, Daniel Ludwig, began large-scale development of the Jari River valley in the late 1960s to exploit its potential for lumber production. As part of the development project, in the late 1970s the Japanese built a floating cellulose factory on the Jari River. After the project ran into financial difficulties in the early 1980s, the Brazilian government took it over.

Jarīd (Tunisia): *see* Tawzar.

Jarīd, Shaṭṭ Al-, also spelled CHOTT DJERID, large saline lake in southwestern Tunisia, occupying a salt-flat basin of about 1,900 square miles (4,900 square km). The lake is covered with water only in the lowest areas, except after periods of heavy rains. The lake forms, together with Shaṭṭ Al-Fijāi (Fedjadj) and Shaṭṭ Al-Gharsah (Rharsa) in Tunisia and Chotts Melrhir and Merouane in Algeria, a depression that was formerly an arm of the sea and that extends nearly 250 miles (400 km) westward from the Gulf of Gabes. This depression's floor reaches 52 feet (16 m) and 69 feet (21 m) below sea level in Jarīd and Gharsah lakes, respectively. The extensive salt flats of Shaṭṭ Al-Jarīd have been an important source of phosphates since discovery of the mineral there in 1949. Tawzar (Tozeur) and Naftah (Nefta), the main oases towns on the lake's periphery, are noted for their date-palm production.

Jarīr, in full JARĪR IBN ʿAṬIYAH IBN AL-KHAṬAFĀ (b. *c.* 650, Uthayfiyah, Yamāmah region, Arabia [now in Saudi Arabia]—d. *c.* 729, Yamāmah), one of the greatest Arab poets of the Umayyad period, whose career and poetry show the continued vitality of the pre-Islāmic Bedouin tradition.

Jarīr's special skill lay in poems insulting personal rivals or the enemies of his patrons. After sharp verbal clashes in Arabia in defense of Kulayb, his tribe, Jarīr moved to Iraq. There he won the favour of the governor, al-Ḥajjāj, and wrote a number of poems in his praise. He also met the poet al-Farazdaq, with whom he had already begun a battle of poems that is said to have lasted 40 years. The results were collected in the following century as *naqāʾid* ("slanging-matches on parallel themes"). The governor's goodwill earned Jarīr entry at the Umayyad court in Damascus. Jarīr was not able, however, to dislodge the poet al-Akhṭal from the esteem of the caliph ʿAbd al-Malik, and another poetic battle ensued, also producing *naqāʾid.* Of the caliphs who succeeded ʿAbd al-Malik, only the pious ʿUmar II seems to have favoured Jarīr, and much of Jarīr's life was spent away from court in his native Yamāmah.

Many of Jarīr's satires and panegyrics are in the conventional qasida ("ode") form, usually a travel account sandwiched between a love-poem as prologue and a panegyric as conclusion. Jarīr also wrote elegies, wisdom poetry, and epigrams.

Jarmo, also called QALAT JARMO, prehistoric archaeological site located east of Kirkūk, in northeastern Iraq. The site is important for revealing traces of one of the world's first village-farming communities. The approximately dozen layers of architectural building and renovation yield evidence of domesticated wheats and barley and of the dog and goat, suggesting the achievement of a settled agricultural way of life. Other artifacts found at Jarmo, such as flint sickle blades, milling stones, and—in the uppermost layers only—pottery, hint at the technological innovations made in response to the new way of food production. The original occupation of the site is estimated to have occurred at about 7000 BC.

Jarnach, Philipp (b. July 26, 1892, Noisy, Fr.—d. Dec. 17, 1982, Börnsen, W.Ger.), German composer who was a follower of the pianist-composer Ferruccio Busoni.

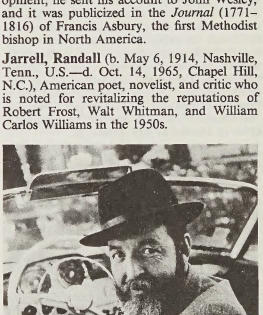
The son of a noted Spanish sculptor, Jarnach studied piano under Edouard Risler and harmony under Albert Lavignac in Paris. In 1915 at Zürich he met Busoni, whose operas *Arlecchino* and *Turandot* he arranged for piano and under whose influence he wrote his *String Quintet,* Opus 10. In 1927 he was appointed professor of composition at the Cologne conservatory. He took German citizenship in 1931, and in 1949 he became director of the Hamburg conservatory. Among his chamber works, which show an affinity with the music of Paul Hindemith, are two sonatas for unaccompanied violin and the *String Quartet,* Opus 16 (1924), which established his reputation in Germany as a composer. His orchestral works include *Musik mit Mozart* and *Morgenklangspiel.* He completed Busoni's opera *Doktor Faust* after the composer's death.

Consult the INDEX *first*

Järnefelt, Armas, in full EDVARD ARMAS JÄRNEFELT (b. Aug. 14, 1869, Viipuri, Fin.—d. June 23, 1958, Stockholm, Swed.), composer and conductor who introduced Richard Wagner's operas into Finland and who is known for his works for small orchestra.

Järnefelt studied under the composer Ferruccio Busoni at Helsinki and Jules Massenet at Paris. He conducted at Viipuri (1893–1903), and as director of the Helsinki Opera (1903–07) he gave the first performances of Wagner's operas in Finland (1904). He became conductor of the Royal Opera in Stockholm in 1907 and in 1910 became a naturalized Swedish citizen. In 1932 he returned to Finland as director of the Helsinki Opera. He was known as a conductor of the works of Ludwig van Beethoven and Wagner and of his brother-in-law, Jean Sibelius. He wrote songs and choral, orchestral, and piano music but became known chiefly for his *Berceuse* (1904) and *Praeludium* for small orchestra.

Jarnés, Benjamín, in full BENJAMÍN JARNÉS Y MILLÁN (b. Oct. 7, 1888, Codo, Spain—d. Aug. 11, 1949, Madrid), Spanish novelist and biographer.



In 1910 Jarnés joined the army and began studies at the Zaragoza Normal School. In 1920 he resigned from the army and settled in Madrid. His first novel was *Mosén Pedro* (1924), but his reputation was established by his second, *El profesor inútil* (1926; "The Useless Professor"), a series of episodes with little narrative action that point out a professor's ineptitude and inability to tell reality from unreality. Similar motifs occur in *El convidado de papel* (1928; "The Paper Guest"), in which erotic pictures and writings smuggled into a seminary come to life. In 1929 Jarnés joined the editorial board of *La Gaceta Literaria* ("The Literary Gazette") and began to write biographies. He continued to write novels, such as the surrealistic *Teoría del zumbel* (1930; "Theory of the Top-Spinning String"). He was an officer in the medical corps of the Spanish Republic during the Civil War. After the Republic fell, he fled to Mexico. There, working as an editor and teacher, he continued to write fiction but devoted increasing attention to biographies, as of Stefan Zweig, Miguel de Cervantes, and Mexican literary figures. In 1948 he returned to Spain and found himself less known there than in Mexico. His literary reputation in Spain has since improved.

Jarratt, Devereux (b. Jan. 17, 1733, Kent county, Va. [U.S.]—d. Jan. 29, 1801, Dinwiddie county, Va., U.S.), American Anglican clergyman and preacher who emulated the Methodism of John Wesley and initiated a religious revival throughout North Carolina and southern Virginia.

Jarratt received little formal education but was fond of reading and eventually became a tutor. In 1762 he went to England, where he was ordained as both a deacon and priest in the Anglican church. Returning to Virginia in 1763, he was installed in a parish in Virginia, and he eventually extended his ministry over many counties in Virginia and North Carolina. When the first Methodist preachers appeared, Jarratt was one of the few Anglican clergymen who gave them full cooperation, even administering the sacraments to their new converts. But when the American Methodists separated from the Anglicans in 1784 and formed the Methodist Episcopal Church, Jarratt became alienated from them. He also opposed the Methodists' strict condemnation of slavery.

Jarratt's chronicle of the American Methodist revival is the primary account of that development; he sent his account to John Wesley, and it was publicized in the *Journal* (1771–1816) of Francis Asbury, the first Methodist bishop in North America.

Jarrell, Randall (b. May 6, 1914, Nashville, Tenn., U.S.—d. Oct. 14, 1965, Chapel Hill, N.C.), American poet, novelist, and critic who is noted for revitalizing the reputations of Robert Frost, Walt Whitman, and William Carlos Williams in the 1950s.

Jarrell
© Philippe Halsman

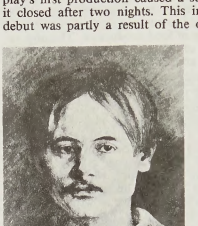
Childhood was one of the major themes of Jarrell's verse, and he wrote about his own extensively in *The Lost World* (1965). With an M.A. from Vanderbilt University (1938), he began his career as a teacher. In 1942 he joined the U.S. Air Force, and his first book of verse, *Blood for a Stranger,* appeared. Many of his best poems appeared in *Little Friend, Little Friend* (1945) and *Losses* (1948), both of which dwell on his wartime experiences.

Jarrell taught at Sarah Lawrence College, Bronxville, N.Y. (1946–47), and his only novel, the sharply satirical *Pictures from an*

Institution (1954), is about a similar progressive women's college. He was a teacher at the University of North Carolina at Greensboro from 1947 until his death in a road accident.

Jarrell's criticism has been collected in *Poetry and the Age* (1953), *A Sad Heart at the Supermarket* (1962), and *The Third Book of Criticism* (1969). Jarrell's later poetry—*The Seven-League Crutches* (1951), *The Woman at the Washington Zoo* (1960), and *The Lost World*—restored an openness to emotion (some called it sentimentality) rarely found in works of "academic" poets of the period. His *Complete Poems* appeared in 1969.

Jarrett, Keith (b. May 8, 1945, Allentown, Pa., U.S.), American jazz pianist, composer, and saxophonist considered to be one of the most original and prolific jazz musicians of the late 20th century. He was also a noted classical pianist.



Jarrett performed with the groups of drummer Art Blakey and saxophonist Charles Lloyd in the late 1960s and with trumpeter Miles Davis during the early 1970s. Jarrett led his own group during the 1970s with saxophonist Dewey Redman, bassist Charlie Haden, and drummer Paul Motian. He toured and recorded with the Norwegian saxophonist Jan Garbarek. He explored a vast array of tonal and structural devices that were previously more common to non-Western music than to jazz. With a virtuoso command of the keyboard, Jarrett made several albums of unaccompanied piano improvisations, through which he attained the status of concert artist in the manner of classical recital pianists. Jarrett also composed pieces for brass, string orchestra, and other nonjazz instrumentations in the manner of symphonic composers. By the 1980s his public performance had turned mainly to classical recitals, featuring the works of such various composers as Johann Sebastian Bach, Domenico Scarlatti, Ludwig van Beethoven, and Dmitry Shostakovich. In later years, accompanied by bassist Gary Peacock and drummer Jack DeJohnette, he recorded a series of albums of jazz standards.

Jarrow, North Sea port, South Tyneside district, metropolitan area of Tyne and Wear, England. It lies along the south bank of the River Tyne. Jarrow's St. Paul's Church (dedicated AD 685) is situated close to a ruined monastery that was begun in 681. The monastery was a religious centre in the Anglo-Saxon period and was the home of the Venerable Bede. In the mid-19th century the town developed around coal pits and the shipyards established by Sir Charles Palmer. Since the economic depression and high unemployment of the 1930s, when the community lent its name to a famous series of "hunger marches" that were made across England to London, Jarrow's industrial base has been expanded to include oil installations and ship-repair yards. The Tyne Tunnel (opened in 1967) runs under the River Tyne to connect Jarrow with Willington. Pop. (1981) 31,213.

Jarry, Alfred (b. Sept. 8, 1873, Laval, France—d. Nov. 1, 1907, Paris), French writer mainly known as the creator of the grotesque and wild satirical farce *Ubu roi* (1896; "King Ubu"), which was a forerunner of the Theatre of the Absurd.

A brilliant youth who had come to Paris at 18 to live on a small family inheritance, Jarry frequented the literary salons and began to write. His fortune was soon dissipated, and he lapsed into a chaotic and anarchic existence in which he met the demands of day-to-day life with self-conscious buffoonery. He died in a state of utter destitution and alcoholism.

On Dec. 10, 1896, at the Théâtre de l'Oeuvre, the director A.-F.-M. Lugné-Poe presented *Ubu roi,* a dramatic sketch that was first conceived by Jarry at the age of 15, with some schoolmates, to caricature a pompous schoolmaster. The play's principal character is Père Ubu, a grotesque and repulsive character who becomes the king of Poland. Ubu symbolizes the crass stupidity and avarice of the bourgeoisie as his lust for power drives him to abuse his authority and commit acts of cruelty in the name of questionable principles. The play's first production caused a scandal, and it closed after two nights. This inauspicious debut was partly a result of the outrage felt

Jarry, drawing by F.A. Cazals, 1897
H. Roger-Viollet

by the audience at Ubu's speech, which was purposely deformed and vulgar, riddled with malapropisms and derisive absurdities. Jarry's sequels to *Ubu roi* included *Ubu enchaîné* (1900; *Ubu Enchained*) and *Ubu sur la butte* (1901; "Ubu on the Mound"). The three plays were performed by Jean Vilar at the Théâtre National Populaire in 1958. Jean-Louis Barrault directed a composite production drawn from his works, *Jarry sur la butte* ("Jarry on the Mound"), in 1970.

Jarry also published stories, novels, and poems, but the brilliant imagery and wit of these works usually lapse into incoherence and a meaningless and often scatological symbolism. Jarry invented a logic of the absurd that he christened "*pataphysique*"; he presented this eccentric metaphysical scheme in *Gestes et opinions du docteur Faustroll, pataphysicien* (published 1911; "Deeds and Opinions of Doctor Faustroll, Pataphysician").

BIBLIOGRAPHY. Keith Beaumont, *Alfred Jarry: A Critical and Biographical Study* (1984); Linda Klieger Stillman, *Alfred Jarry* (1983); Maurice Marc LaBelle, *Alfred Jarry: Nihilism and the Theater of the Absurd* (1980).

Jars, Plain of, French PLAIN DES JARRES, Laotian THÔNG HAIHIN, dissected inner region of the Xiangkhoang Plateau in north-central Laos. Drained principally by the Ngum River, a southward-flowing tributary of the Mekong River, the plain is characterized by narrow river valleys and limestone and sandstone hills ranging from 3,000 to 3,600 feet (900 to 1,100 m) in elevation. The plain's name is derived from several hundred huge and ancient carved stone jars that were discovered in the region in the 19th century by the French. In the 1960s the region assumed international strategic importance as a base of operations in the Laotian civil war. Several airfields were established there to support the Laotian government's military operations against Pathet Lao communist insurgents. In 1969 the Plain of Jars was a major battlefield between the North Vietnamese and Royal Lao government and was subjected to heavy bombing by the United States. It is now the site of a major Laotian military airfield. Of little economic or agricultural value, the Plain of Jars has grassy or scrub-covered hills and valleys that support subsistence agriculture by Khmu and Miao (Hmong) peoples.

Järta, Hans, original name HANS HIERTA (b. Feb. 11, 1774, Husby, Sweden—d. April 6, 1847, Uppsala), Swedish political activist, administrator, and publicist who was a leader of the 1809 coup d'état that overthrew Gustav IV, king of Sweden. He was the main author of Sweden's constitution (1809).

In the 1790s Hans Hierta began his career as a publicist and a left-wing member of the noble estate of the Riksdag (estates general). In sympathy with the French Revolution and in protest against the absolutist Swedish regime, he changed his name to Järta and renounced his title in 1800. Järta conspired with other "men of 1809" to engineer the coup that succeeded on March 13, 1809. By this time, however, his radicalism had already been moderated. As the chairman of the new constitution committee, Järta coauthored a document (still in force, though much modified) that preserved a strong monarchy and certain noble privileges while ignoring the disenfranchised rural and urban workers. The constitution did, however, restore the power of the Riksdag. He continued to move to the right as governor of Kopparberg (1812–22), as a publicist in the 1820s, and as an administrator of the state archives (1837–44). Järta ended his career as a leading spokesman of conservatism.

Jaruzelski, Wojciech Witold (b. July 6, 1923, Kurow, Pol.), army general and communist leader of Poland, chief of state from 1981 to 1989 and president from 1989 to 1990.

When World War II broke out, the young Jaruzelski and his family were trapped by the invading Red Army, and he was deported to the Soviet Union. In 1943 he joined the Polish army formed in the Soviet Union and eventually joined the fight against Germany. After the war Jaruzelski graduated from the Polish Higher Infantry School and later from the General Staff Academy. He joined Poland's communist party (later renamed the Polish United Workers' Party [PUWP]) in 1947 and steadily rose through the ranks of party and army, becoming minister of defense in 1968. He was elected a member of the party's Central Committee in 1964 and became a member of the Politburo in 1971.

As Poland came under increasing pressure from the Solidarity movement, Jaruzelski was elected premier on Feb. 11, 1981, and first secretary of the party on Oct. 18, 1981, while retaining his post as minister of defense. In an effort to crush the Solidarity movement and restore economic stability, he declared martial law in Poland on Dec. 13, 1981; the move was accompanied by mass arrests of Solidarity leaders and political dissidents. With Solidarity suppressed, Jaruzelski lifted martial law in July 1983 but remained firmly in control of both the Polish government and the PUWP. In 1985 he relinquished the post of premier, simultaneously assuming the position of president of the Council of State.

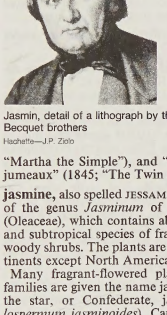
Though adept at suppressing the political opposition, Jaruzelski proved less successful in his efforts to restore Poland's stagnant economy. In 1988 Jaruzelski changed course and approved negotiations between the government and the outlawed Solidarity movement. These talks culminated in April 1989 in an agreement providing for far-reaching reforms in Poland's political system, notably the legalization of Solidarity, the holding of free elections to a restructured Parliament, and the conversion of the hitherto largely ceremonial post of president into an office carrying strong executive powers. Jaruzelski was elected president by the Parliament in July 1989 and then resigned all his high posts in the PUWP. In December 1990, after Lech Walesa was elected president, Jaruzelski relinquished the last degree of communist power to the opposition.

Jarvis, Charles (painter): *see* Jervas, Charles.

Jarvis, John Wesley (b. 1781, South Shields, Durham, Eng.—d. Jan. 14, 1840, New York City), U.S. painter considered the leading portraitist of his time in New York City.

Growing up in Philadelphia, where he gained some knowledge of art from sign makers, Jarvis was apprenticed (1800) in New York City to an engraver named Edward Savage; later, in partnership with Joseph Wood, he painted profiles and miniatures. He travelled to major cities, such as Baltimore and Charleston, S.C., for commissions while maintaining headquarters in New York City, where, in 1815, he profitted from exhibiting Adolf Ulrik Wertmüller's controversial painting, "Danaë." While in Louisiana, he established an important studio, collaborating with, among others, Henry Inman, who had served Jarvis for seven years as apprentice and assistant, and John Quidor. By the time John James Audubon met him in 1821 at New Orleans, Jarvis was in his prime and had become a dandy of exotic bohemian proportions. After the War of 1812, the Common Council commissioned him to paint huge republican portraits for City Hall, New York City; among these is the famous "Oliver H. Perry."

Jarvis Island, formerly BUNKER ISLAND, VOLUNTEER ISLAND, JERVIS ISLAND, or BROOK ISLAND, coral atoll, unincorporated territory of the U.S., in the Northern Line Islands, in the west central Pacific Ocean, 1,400 miles (1,600 km) southwest of Honolulu. The atoll has an area of 1.6 sq miles (4.1 square km). Sighted in 1821 by a Captain Brown in the British ship "Eliza Francis," the island was claimed in 1856 by the U.S. under the Guano Act, and the guano deposits were worked from 1857 to 1879. Britain annexed Jarvis in 1889 but did not exploit it. Claimed by the U.S. in 1935, it came under the jurisdiction of the U.S. Department of the Interior in 1936. Researchers visited the atoll during the International Geophysical Year (1957–58). There are no permanent inhabitants.



Jary River (South America): *see* Jari River.

Jashar, Book of, ancient Israelite collection of poems quoted in various books of the Old Testament. Of uncertain etymology, Jashar may mean "victorious" or "upright." The victory hymn that describes how the Sun and Moon stood still when the Israelites defeated the Amorites (Josh. 10:12–13) is ascribed to the *Book of Jashar,* as is the Israelite king David's lament over the deaths of the former king Saul and his son Jonathan (II Sam. 1:17–27). King Solomon's Temple dedication poem (I Kings 8:12–13) and the "Song of Deborah," a 12th-century-BC Israelite judge (Judg. 5), may be parts of the *Book of Jashar.*

Jashpur Pāts, physical region of eastern Chattīshgarh state, central India, extending over Jashpur Tahsīl (northeastern Raigarh district) and forming part of the Chota Nāgpur Plateau. The pāts is a complex of small, flat-topped plateaus and hills, separated from each other by fault scarps and river valleys. To the north, the Upper Pāts (known locally as Upārghāt) have an elevation of from about 2,500 feet (750 m) to 3,300 feet; to the south, the Lower Pāts (known locally as Nichghāt) have an elevation of from about 900 feet to 1,650 feet. The Jashpur Pāts form a divide between the Ganges and the Mahānadi drainage systems. The tops of the pāts are generally barren or covered with grasslands, and the slopes are forested with sal (*Shorea*), ebony, teak, and bamboo. Gash Pahār (3,241 feet) and Laki Hill (3,323 feet) are two of the higher peaks in the Jashpur Pāts. The Maini, Ib, Mānd, and Kuskal rivers have cut narrow, rock-strewn valleys. Cotton, rice, corn (maize), sugarcane, peanuts (groundnuts), rape and mustard seeds, millet, and fruits are grown. Bauxite, sandstone, building materials, clay, limestone, and dolomite are worked. Industries include the milling of rice, flour, and oilseeds; sawmills and timber seasoning; iron, brass, and aluminum tools and utensils; and shellac and tussur silk production. The Oraon, Kawar, Gond, and Korwa peoples comprise most of the population; in the uplands, they are clustered in the few forest clearings. Roads are the primary means of access in the uplands except for a few railway trunk routes. Jashpurnagar is the only important town.

Jasmin, Jacques, pseudonym of JACQUES BOÉ (b. March 6, 1798, Agen, Fr.—d. Oct 4, 1864, Agen), French dialect poet who achieved popular fame for his touching verse portraits of humble people and places.

His father was a poor tailor, and Jasmin himself spent most of his life as a barber and wigmaker in his native part of southern France. His first collection of poems, *Charivari* (1825; "Tin-Kettle Music"), was followed, beginning in 1835, by 4 volumes of *Papillotos* ("Curlpapers"); in addition to a few poems written cautiously in French, they contained his better work, written in his native dialect, *la langue d'oc.* Included in this collection was a poem of great pathos—"L'Abuglo de Castel-Culié" ("The Blind Girl of Casterculier")—which captured the public imagination after Jasmin began public readings and singings in Toulouse and Bordeaux. Some of his major poems include "Souvenirs" (1835), "Franconnette" (1840), "Martha la folle" (1844;

Jasmin, detail of a lithograph by the Becquet brothers
Hachette—J.P. Zizlo

"Martha the Simple"), and "Les Deux Frères jumeaux" (1845; "The Twin Brothers").

jasmine, also spelled JESSAMINE, any member of the genus *Jasminum* of the olive family (Oleaceae), which contains about 300 tropical and subtropical species of fragrant, flowering, woody shrubs. The plants are native to all continents except North America.

Many fragrant-flowered plants from other families are given the name jasmine, including the star, or Confederate, jasmine (*Trachelospermum jasminoides*), Cape jasmine (*Gardenia jasminoides*), Madagascar jasmine (*Stephanotis floribunda*), jasmine tobacco (*Nicotiana alata*), Carolina jasmine (*Gelsemium sempervirens*), Chilean jasmine (*Mandevillea suaveolens*), orange jasmine (various species of the genus *Murraya*), night or day jasmine (various species of *Cestrum*), and the nonfragrant pandorea jasmine (*Pandorea jasminoides*).

Most true jasmines have climbing branches without tendrils. The white, yellow, or rarely pink flowers are tubular with a flaring, lobed, pinwheel-like form. The leaves usually are composed of two or more leaflets, although some species have only one. The fruit in most species is a two-lobed black berry.

Common jasmine, or poet's jasmine (*J. officinale*), native to Iran, produces fragrant white flowers that are the source of attar of jasmine used in perfumery. It is widely cultivated for its shining leaves and clusters of flowers that bloom in summer. Winter jasmine (*J. nudiflorum*), a Chinese species with solitary yellow flowers, is used as a cover plant on hillsides. Primrose jasmine (*J. mesnyi*) is a similar plant

Winter jasmine (*Jasminum nudiflorum*)
Valerie Finnis

with larger flowers that bloom during the winter. Italian jasmine (*J. humile*), a vinelike shrub with yellow flowers, has many cultivated varieties. The fragrant dried flowers of Arabian jasmine (*J. sambac*) are used to make jasmine tea.

Jason, in Greek mythology, leader of the Argonauts and son of Aeson, king of Iolcos in Thessaly. His father's half-brother Pelias seized Iolcos, and thus for safety Jason was sent away to the Centaur Chiron. Returning as a young man, Jason was promised his inheritance if he fetched the Golden Fleece for Pelias, a seemingly impossible task. After many adventures Jason abstracted the fleece with the help of the enchantress Medea, whom he married. On their return Medea murdered Pelias, but she and Jason were driven out by Pelias' son and had to take refuge with King Creon of Corinth. Later Jason deserted Medea for Creon's daughter; this desertion and its consequences formed the subject of Euripides' *Medea.*

Jason (Greek), Hebrew JOSHUA (fl. 2nd century BC), Hellenistic Jewish high priest (175–172 BC) in Jerusalem under the Seleucid king Antiochus IV Epiphanes. By promising greater tribute to Antiochus, he obtained the high priesthood and, scorning the traditional Jewish monotheism of the Pharasaic party, promoted Greek culture and religion throughout Judaea in Palestine. When Antiochus retired to Jerusalem after his expulsion from Egypt by the Romans and began a violent purge of all Judaic practices, Jason was displaced by Menelaus, another Hellenizing Jew. After an unsuccessful attempt to regain the high priesthood by capturing Jerusalem (*c.* 170 BC), Jason was forced to flee to Asia Minor.

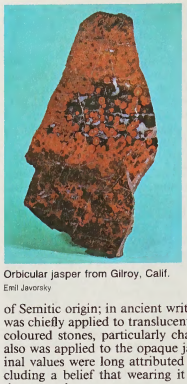
Jaspar, Henri (b. July 28, 1870, Schaerbeek, Belg.—d. Feb. 15, 1939, Brussels), Belgian statesman and one of his country's chief negotiators in the peace conferences following World War I. As prime minister (1926–31), he resolved a serious financial crisis at the outset of his ministry.

Jaspar entered politics in the Catholic Party, was appointed minister for economic affairs in 1918, and helped to organize reconstruction of Belgian industries after World War I. As foreign minister (1920–24), he facilitated Belgium's entry into the League of Nations and also the country's representation at the Permanent Court of International Justice at The Hague. He helped create the customs union

of Belgium and Luxembourg in 1921, and in 1924 he took part in the Dawes Plan negotiations, which enabled Germany to resume reparations payments to the Allies.

Jaspar became prime minister of a coalition government in 1926 and implemented a series of financial policies designed by his finance minister, Émile Francqui, to remedy the economic crisis; these measures included devaluation of the currency, creation of new taxes, conversion of the public debt, nationalization of the railroads, and financing of public works. These measures revitalized the Belgian economy, although it declined again after the onset of the Great Depression in 1929. Jaspar served as finance minister (1932–34) and

Jaspar, marble bust by Victor Rousseau; in the Chambre des Représentants, Brussels
© A.C.L., Brussels



foreign affairs minister (1934). He was asked to form a new government in 1939 but died soon thereafter.

Jasper, unincorporated place, western Alberta, Canada. It lies at the confluence of the Athabasca and Miette rivers, near the British Columbia border, and is the headquarters of Jasper National Park. Jasper Hawes of the North West Company established a fur-trading post on nearby Jasper Lake about 1801. Since the conservation of the area (1907) as a national park and the building of the Jasper Park Lodge (1922) and the Jasper-Banff highway, the locality, overlooked by spectacular peaks, has become a popular Canadian Rocky Mountain resort. Maligne and Pyramid lakes, Miette Hotsprings, and the Columbia Icefield are among the local attractions. Jasper is also a divisional point on the Canadian National Railway. Pop. (1981) 3,269.

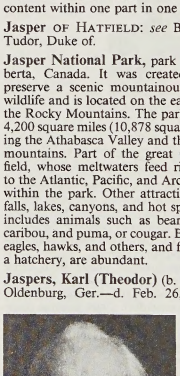
Jasper, city, seat (1824) of Walker county, in northwestern Alabama, U.S. Settled in 1822, it was named for Sergeant William Jasper, a defender of Fort Moultrie during the Revolutionary War. It developed after the arrival of the Kansas City, Memphis and Birmingham Railroad in 1886. Coal, agriculture, and light manufacturing are its economic assets. William B. Bankhead, speaker of the U.S. House of Representatives (1936–40), and his actress-daughter, Tallulah, lived in Jasper. The William B. Bankhead National Forest is 15 miles (24 km) north. Jasper is the seat of Walker (junior) College (1938). Inc. 1840. Pop. (1992 est.) 13,872.

jasper, opaque, fine-grained or dense variety of the silica mineral chert that exhibits various colours, but chiefly brick red to brownish red. It owes its colour to admixed hematite; but when it occurs with clay admixed, the colour is a yellowish white or gray, or with goethite, a brown or yellow. Jasper, long used for jewelry and ornamentation, has a dull lustre but takes a fine polish; its hardness and other physical properties are those of quartz (*see* silica mineral [table]).

The name jasper is from the Greek *iaspis,*

Orbicular jasper from Gilroy, Calif.
Emil Javorsky

of Semitic origin; in ancient writings the term was chiefly applied to translucent and brightly coloured stones, particularly chalcedony, but also was applied to the opaque jasper. Medicinal values were long attributed to jasper, including a belief that wearing it strengthened the stomach.



Jasper is common and widely distributed, occurring chiefly as veinlets, concretions, and replacements in sedimentary and metamorphic rocks, as in the Urals, North Africa, Sicily, Germany, and elsewhere. Some varieties are colour-banded, and beautiful examples of jasperized fossil wood are found in Arizona, U.S. Jasper is also common as detrital pebbles.

For thousands of years, black jasper (and also black slate) was used to test gold-silver alloys for their gold content. Rubbing the alloys on the stone, called a touchstone, produces a streak the colour of which determines the gold content within one part in one hundred.

Jasper OF HATFIELD: *see* Bedford, Jasper Tudor, Duke of.

Jasper National Park, park in western Alberta, Canada. It was created in 1907 to preserve a scenic mountainous area and its wildlife and is located on the eastern slopes of the Rocky Mountains. The park encompasses 4,200 square miles (10,878 square km), including the Athabasca Valley and the surrounding mountains. Part of the great Columbia Icefield, whose meltwaters feed rivers that flow to the Atlantic, Pacific, and Arctic oceans, lies within the park. Other attractions are waterfalls, lakes, canyons, and hot springs. Wildlife includes animals such as bears, elk, moose, caribou, and puma, or cougar. Birds, including eagles, hawks, and others, and fish, stocked by a hatchery, are abundant.

Jaspers, Karl (Theodor) (b. Feb. 23, 1883, Oldenburg, Ger.—d. Feb. 26, 1969, Basel, Switz.), German philosopher, one of the most important Existentialists in Germany, who approached the subject from man's direct concern with his own existence. In his later work, as a reaction to the disruptions of Nazi rule in Germany and World War II, he searched for a new unity of thinking that he called world philosophy.

Jaspers, 1968
Horst Tappe

Early life and education. Jaspers was the oldest of the three children of Karl Wilhelm Jaspers and Henriette Tantzen. His ancestors on both sides were peasants, merchants, and pastors who had lived in northern Germany for generations. His father, a lawyer, was a high constable of the district and eventually a director of a bank.

Jaspers was delicate and sickly in his childhood. As a consequence of his numerous childhood diseases, he developed bronchiectasis (a chronic dilation of the bronchial tubes) during his adolescent years, and this condition led to cardiac decompensation (the inability of the heart to maintain adequate circulation). These ailments were a severe handicap throughout his adult life.

Jaspers entered the University of Heidelberg in 1901, enrolling in the faculty of law; in the following year he moved to Munich, where he continued his studies of law, but without much enthusiasm. He spent the next six years studying medicine at the Universities of Berlin, Göttingen, and Heidelberg. After he completed his state examination to practice medicine in 1908, he wrote his dissertation *Heimweh und Verbrechen* ("Nostalgia and Crime"). In February 1909 he was registered as a doctor. He had already become acquainted with his future wife, Gertrud Mayer, during his student years, and he married her in 1910.

Research in clinical psychiatry. In 1909 Jaspers became a volunteer research assistant at the University of Heidelberg psychiatric clinic, a position he held until 1915. The clinic was headed by the renowned neuropathologist Franz Nissl, who had assembled under him an excellent team of assistants. Because of his desire to learn psychiatry in his own way without being regimented into any particular pattern of thought by his teachers, Jaspers elected to work in his own time, at his own pace, and with patients in whom he was particularly interested. This was granted to him only because he agreed to work without a salary.

When Jaspers started his research work, clinical psychiatry was considered to be empirically based but lacking any underlying systematic framework of knowledge. It dealt with different aspects of the human organism as they might affect the behaviour of human beings suffering from mental illness. These aspects ranged from anatomical, physiological, and genetic to neurological, psychological, and sociological influences. A study of these aspects opened the way to an understanding and explanation of human behaviour. Diagnosis was of paramount importance; therapy was largely neglected. Aware of this situation, Jaspers realized the conditions that were required in order to establish psychopathology as a science: a language had to be found that, on the basis of previously conducted research, was capable of describing the symptoms of disease well enough to facilitate positive recognition in other cases; and various methods appropriate to the different spheres of psychiatry had to be worked out.

Jaspers tried to bring the methods of Phenomenology—the direct investigation and description of phenomena as consciously experienced, without theories about their causal explanation—into the field of clinical psychiatry. These efforts soon bore fruit, and his reputation as a researcher in the forefront of new developments in psychiatry was established. In 1911, when he was only 28 years old, he was requested by Ferdinand Springer,

a well-known publisher, to write a textbook on psychopathology; he completed the *Allgemeine Psychopathologie* (*General Psychopathology,* 1965) two years later. The work was distinguished by its critical approach to the various methods available for the study of psychiatry and by its attempt to synthesize these methods into a cohesive whole.

Transition to philosophy. In 1913 Jaspers, by virtue of his status in the field of psychology, entered the philosophical faculty—which included a department of psychology—of the University of Heidelberg. His academic advance in the university was rapid. In 1916 he was appointed assistant professor in psychology; in 1920 assistant professor in philosophy; in 1921 professor in philosophy; and in 1922 he took over the second chair in that field. The transition from medicine to philosophy was due in part to the fact that, while the medical faculty was fully staffed, the philosophical faculty needed an empirical psychologist. But the transition also corresponded to Jaspers' intellectual development.

In 1919 Jaspers published some of his lectures, entitled *Psychologie der Weltanschauungen* ("Psychology of World Views"). He did not intend to present a philosophical work but rather one aimed at demarcating the limits of a psychological understanding of man. Nevertheless, the work touched on the border of philosophy. In it were foreshadowed all of the basic themes that were fully developed later in Jaspers' major philosophical works. By investigating the legitimate boundaries of philosophical knowledge, Jaspers tried to clarify the relationship of philosophy to science. Science appeared to him as knowledge of facts that are obtained by means of scholarly methodological principles and that are apodictically certain and universally valid. Following Max Weber, a sociologist and historian, he asserted that scientific principles also applied to both the social and humanistic sciences. In contrast to science, Jaspers considered philosophy to be a subjective interpretation of Being, which—although prophetically inspired—attempted to postulate norms of value and principles of life as universally valid. As Jaspers' understanding of philosophy deepened, he gradually discarded his belief in the role of a prophetic vision in philosophy. He bent all his energies toward the development of a philosophy that would be independent of science but that would become a substitute for religious beliefs. Though the resulting system presupposed science, it passed beyond the boundaries of science in an effort to illuminate the totality of man's existence. For Jaspers man's existence meant not mere being-in-the-world but rather man's freedom of being. The idea of being oneself signified for Jaspers the potentiality to realize one's freedom of being in the world. Thus, the task of philosophy was to appeal to the freedom of the individual as the subject who thinks and exists and to focus on man's existence as the centre of all reality.

The elaboration of these germinal ideas occupied Jasper's thought from 1920 to 1930. During this decade his brother-in-law, Ernst Mayer, himself a philosopher of repute, worked with him. During these years he also enjoyed the friendship of Martin Heidegger. Somewhat later, this friendship broke up because of Heidegger's entry into the National Socialist Party.

In the early years of the 1930s the fruits of his intellectual labour became evident: in 1931 *Die geistige Situation der Zeit* (*Man in the Modern Age,* 1933) was published; in 1932 the three volumes of *Philosophie* (*Philosophy,* 1969) appeared—perhaps the most systematic presentation of Existential philosophy in the German language. A book on Max Weber also appeared in 1932.

Conflict with the Nazi authorities. When Hitler came into power in 1933, Jaspers was taken by surprise, as he had not taken National Socialism seriously. He thought that this movement would destroy itself from within, thus leading to a reorganization and liberation by the other political forces active at the time. These expectations, however, did not materialize. Because his wife was Jewish, Jaspers qualified as an enemy of the state. From 1933 he was excluded from the higher councils of the university but was allowed to teach and publish. In 1935 the first part of his future work on logic, entitled *Vernunft und Existenz* (*Reason and Existenz,* 1955), appeared; in 1936 a book on Nietzsche; in 1937 an essay on Descartes; in 1938 a further work preliminary to his logic, entitled *Existenzphilosophie* (*Philosophy of Existence,* 1971). Unlike many other famous intellectuals of that time, he was not prepared to make any concessions to the doctrines of National Socialism. Consequently, a series of decrees were promulgated against him, including removal from his professorship and a total ban on any further publication. These measures effectively barred him from carrying on his work in Germany.

Friends tried to assist him to emigrate to another country. Permission was finally granted to him in 1942 to go to Switzerland, but a condition was imposed by the Nazis that required his wife to remain behind in Germany. He refused to accept this condition and decided to stay with his wife, notwithstanding the dangers. It became necessary for his friends to hide his wife. Both of them had decided, in case of an arrest, to commit suicide. In 1945 he was told by a reliable source that his deportation was scheduled to take place on April 14. On March 30, however, Heidelberg was occupied by the Americans.

Disillusioned by the events of these years, Jaspers withdrew more and more into himself. He revised the *General Psychopathology* in an effort to make it represent the high point of a free but responsible search for knowledge of man, as distinct from science, which had betrayed man. He also completed his work on logic, *Von der Wahrheit* ("Of Truth"), the first part of which was intended to throw the light of reason on the irrational teachings of the times. These works appeared in print in 1946 and 1947.

Postwar development of thought. After the capitulation of Germany, Jaspers saw himself confronted with the tasks of rebuilding the university and helping to bring about a moral and political rebirth of the people. He dedicated all of his energies in the postwar years toward the accomplishment of these two tasks. He also represented the interests of the university to the military powers. He gathered his thoughts on how the universities could best be rebuilt in his work *Die Idee der Universität* (1946; *The Idea of the University,* 1959). He called for a complete de-Nazification of the teaching staff, but this proved to be impossible because the number of professors who had never compromised with the Nazis was too small. It was only gradually that the autonomous university of the pre-Nazi years could once again assert itself in Germany. Jaspers felt that an acknowledgment of national guilt was a necessary condition for the moral and political rebirth of Germany. In one of his best political works, *Die Schuldfrage* (1946; *The Question of German Guilt,* 1947), he stated that whoever had participated actively in the preparation or execution of war crimes and crimes against humanity was morally guilty. Those, however, who passively tolerated these happenings because they did not want to become victims of Nazism were only politically responsible. In this respect, all survivors of this era bore the same responsibility and shared a collective guilt. He felt that the fact that no one could escape this collective guilt and responsibility might enable the German people to transform their society from its state of collapse into a more highly developed and morally responsible democracy. The fact that these ideas attracted hardly any attention was a further disappointment to Jaspers. In the spring of 1948 he accepted a professorship in philosophy in Basel, Switz. In spite of the apparent neglect of Jaspers' ideas of a moral regeneration of the German people, his departure for Basel was regarded as a betrayal by many of the German people. Jaspers himself hoped to find there a peace of mind that might enable him to work through and revise once again his whole approach to the entire field of philosophy.

This revision was guided mainly by the conviction that modern technology in the sphere of communication and warfare had made it imperative for mankind to strive for world unity. This new development in his thinking was defined by him as world philosophy, and its primary task was the creation of a mode of thinking that could contribute to the possibility of a free world order. The transition from existence philosophy to world philosophy was based on his belief that a different kind of logic would make it possible for free communication to exist among all mankind. His thought was expressed in *Der philosophische Glaube* (1948; *The Perennial Scope of Philosophy,* 1949) and *Der philosophische Glaube angesichts der Offenbarung* (1962; *Philosophical Faith and Revelation,* 1967). Since all thought in its essence rests on beliefs, he reasoned, the task confronting man is to free philosophical thinking from all attachments to the transient objects of this world. To replace previous objectifications of all metaphysical and religious systems, Jaspers introduced the concept of the cipher. This was a philosophical abstraction that could represent all systems, provided that they entered into communication with one another by means of the cipher. In other words, the concept of the cipher enabled a common ground to be shared by all of the various systems of thought, thus leading to a far greater tolerance than had ever before been possible. A world history of philosophy, entitled *Die grossen Philosophen* (1957; *The Great Philosophers,* 2 vol., 1962, 1966), had as its aim to investigate to what extent all past thought could become communicable.

Jaspers also undertook to write a universal history of the world, called *Vom Ursprung und Zeit der Geschichte* (1949; *The Origin and Goal of History,* 1953). At the centre of history is the axial period (from 800 to 200 BC), during which time all the fundamental creations that underlie man's current civilization came into being. Following from the insights that came to him in preparing this work, he was led to realize the possibility of a political unity of the world in a 1958 work called *Die Atombombe und die Zukunft des Menschen* (*The Future of Mankind,* 1961). The aim of this political world union would not be absolute sovereignty but rather world confederation, in which the various entities could live and communicate in freedom and peace.

Under the influence of these ideas, Jaspers closely observed, during the latter years of his life, both world politics and politics of Germany. When the efforts toward democracy in Germany appeared to him to turn more and more into a national oligarchy of parties, he wrote a bitter attack on these tendencies in *Wohin treibt die Bundesrepublik?* (1966; *The Future of Germany,* 1967). This book caused much annoyance among West German politicians of all shades. Jaspers, in turn, reacted to their unfair reception by returning his German passport in 1967 and taking out Swiss citizenship.

At the time of his death in 1969, Jaspers had published 30 books. In addition, he had left 30,000 handwritten pages, as well as a large and important correspondence. (Ha.S.)

BIBLIOGRAPHY. Studies include Paul Arthur Schilpp (ed.), *The Philosophy of Karl Jaspers*, augmented ed. (1981), containing 24 critical contributions on different aspects of Jaspers' work—the most important publication in English, Charles F. Wallraff, *Karl Jaspers: An Introduction to His Philosophy* (1970), including a bibliography of Jaspers' writings; Adolph Lichtigfeld, *Aspects of Jaspers' Philosophy*, 2nd enlarged ed. (1971); Oswald O. Schrag, *Existence, Existenz, and Transcendence: An Introduction to the Philosophy of Karl Jaspers* (1971); Sebastian Samay, *Reason Revisited: The Philosophy of Karl Jaspers* (1971); Leonard H. Ehrlich, *Karl Jaspers: Philosophy as Faith* (1975); and Elisabeth Young-Bruehl, *Freedom and Karl Jaspers's Philosophy* (1981).

jasperware, type of fine-grained, unglazed stoneware introduced by the English potter Josiah Wedgwood in 1775 as the result of a long series of experiments aimed at discovering the techniques of porcelain manufacture. Its name derives from the fact that it resembles the natural stone jasper in its hardness. Jasper is white in its natural state and is stained with metallic oxide colouring agents. The most common shade is pale blue, but dark blue, lilac, sage green, black, and yellow were also used. The earliest jasper was stained throughout and was known as "solid," whereas the later varieties were coloured only on the surface and were known as "dip." Decorations, in the Neoclassical style and usually white,

Wedgwood jasperware vase, Staffordshire, England, *c.* 1785; in the Victoria and Albert Museum, London

were made in separate molds and applied to the body of the piece. Objects made of jasper were varied and included vases, plaques, tableware, cameos, furniture mounts, and portrait medallions. The finest examples of the medallions were modeled by the English sculptor John Flaxman and by Wedgwood's principal modeler, William Hackwood. Outstanding are Wedgwood's 1790 reproductions in jasper of the Portland Vase (excavated from a tomb outside Rome in the early 17th century), one of which is now in the British Museum, London. Jasperware is still produced today.

Jassy (Romania): *see* Iaşi.

Jassy, Treaty of (Jan. 9, 1792), pact signed at Jassy in Moldavia (modern Iaşi, Romania), at the conclusion of the Russo-Turkish War of 1787–92; it confirmed Russian dominance in the Black Sea.

The Russian empress Catherine II the Great had entered the war envisioning a partition of the Ottoman Empire between Russia and Austria and a revival of the (Greek) Byzantine Empire in Istanbul. Her plan failed, however, because of Austria's withdrawal from the war (Peace of Sistova, August 1791) and a lack of organized and massive support from Balkan Christians. The Treaty of Jassy confirmed the earlier Treaty of Küçük Kaynarca (1774) between the two states; it advanced the Russian frontier to the Dniester River, including the fortress of Ochakov, and restored Bessarabia, Moldavia, and Walachia to the Ottomans.

Jastrun, Mieczysław (b. Oct. 29, 1903, Korolówka, near Tarnopol, Austria-Hungary [now in Ukraine]—d. Feb. 23, 1983, Warsaw, Pol.), Polish poet and essayist.

Jastrun received his doctorate in Polish literature at the Jagiellonian University of Kraków. The dozen volumes of poems that he published between the two world wars show his growth from an imitator of the poets of the Skamander group to an independent and mature poet with a mastery of form. He survived World War II by remaining in hiding in Warsaw. His wartime poems were published in 1944 under the title *Godzina strzeżona* ("A Curfew Hour"), but his best poems were written after the "thaw" of 1956, as, for instance, *Gorący popiół* (1956; "Hot Ashes") and *Genezy* (1959; "Genesis"). He was also the author of popular biographical novels on such great Polish poets as Adam Mickiewicz (1949) and Jan Kochanowski (1954).

Jastrzębie-Zdrój, city, Katowice *województwo* (province), south-central Poland. With the cities of Racibórz, Rybnik, and Katowice, Jastrzębie-Zdrój constitutes a secondary industrial zone within Poland's Upper Silesian agglomeration bordering on the Czech industrial region of Ostrava. Jastrzębie-Zdrój became popular in the 1860s as a thermal spa whose iodobromide waters were used to treat nervous disorders, rheumatism, and heart diseases. When it received city rights in 1963 its population was 3,000. The discovery of large coking-coal deposits near the city caused a dramatic surge in population within the decade. Pop. (1998 est.) 102,294.

Jász-Nagykun-Szolnok, formerly SZOLNOK, *megye* (county), east-central Hungary. Situated in the Great Hungarian Plain, the county is drained from north to south by the Tisza River. In the northwest the Zagyva River flows across the Jászság, a marginal depression of the plain, which extends into Pest county and produces vegetables, fruit, and poultry for the Budapest market. East of the Tisza is the Nagykunság, which is a loess plain covered with a high-grade chernozem (black) soil. It is mostly farmland, with high yields of wheat and corn (maize), while in the irrigated areas along the rivers there is rice farming. Apart from Szolnok town, the county seat, principal communities are Jászberény, Mezőtúr, Karcag, and Törökszentmiklós. Area 2,165 square miles (5,607 square km). Pop. (2000 est.) 412,000.

Jászberény, city, located in the Jászberény *járás* (district), but administratively separate from Jász-Nagykun-Szolnok *megye* (county), central Hungary. A market centre, it lies on the Zagyva River, a tributary of the Tisza. It has long been the cultural, economic, and administrative centre of the Jász (or Jazygen) peoples, a steppe tribe that settled there in the early 13th century and mixed with the Kipchaks. (Ten major settlements in the area carry the prefix "Jász"; the area itself is known as Jászság.) For their military services the Jász received special privileges from Béla IV (king of Hungary 1235–70), which were temporarily suspended in 1702 by Leopold I, Holy Roman emperor, who sold the land to the Teutonic Knights. But a few decades later, the Jász and Kipchaks paid a large ransom in gold gulden to redeem their territory, and the privileges continued until 1876. Jászberény preserves two interesting legends. There is a tradition that it was the seat of Attila, king of the Huns (d. 453), and that his gold, silver, and iron coffin is sunk in the Zagyva River bed. Jászberény is located about 40 miles (64 km) east of Budapest. The city's industries include production of machine tools, refrigerators, metals, furniture, textiles, and food processing. Pop. (2000 est.) 27,963.

Jāṭ, peasant caste of northern India and Pakistan. In the 1960s the Jāṭ constituted about 20 percent of the population of Punjab, nearly 10 percent of the population of Baluchistān, Rājasthān, and Delhi, and from 2 to 5 percent of the populations of Sindh, Northwest Frontier, and Uttar Pradesh. The 4 million Jāṭ of Pakistan are mainly Muslim by faith; the nearly 6 million Jāṭ of India are mostly divided into two large castes of about equal strength: one Sikh, concentrated in Punjab, the other Hindu.

The Muslim Jāṭ in the western regions are organized in hundreds of groups tracing their descent through paternal lines; they are mostly camel herders or labourers. Those of India and of the Punjabi areas of Pakistan are more often peasant proprietors. The Jāṭ first emerged politically in the 17th century and afterward, having military kingdoms such as Mursān in Uttar Pradesh, Bharatpur in Rājasthān, and Patiāla in Punjab.

Jataí, town, southwestern Goiás *estado* ("state"), south-central Brazil. It lies at the confluence of the Claro and São Pedro rivers at 2,323 feet (708 m) above sea level. Livestock raising is the principal source of income, and agriculture (especially rice and coffee) is also important. Jataí is linked by highway to Goiânia, the state capital (180 miles [290 km] northeast), and to other cities in Goiás and neighbouring Mato Grosso and Minas Gerais states. Pop. (2000 prelim.) 68,776.

Jātaka (Pāli and Sanskrit: "Birth"), any of the extremely popular stories of former lives of the Buddha that are preserved in all branches of Buddhism. Some *Jātaka* tales are scattered in various sections of the Pāli canon, including a group of 35 that were collected for didactic purposes. These 35 constitute the last book,

Mṛga ("deer") *Jātaka* showing the bodhisattva (Buddha-to-be) as a deer, stone bas-relief from Bhārhut, 2nd century BC; in the Indian Museum, Calcutta

By courtesy of the Indian Museum, Calcutta

the *Cariyā Piṭaka* ("Basket of Conduct"), of the *Khuddaka Nikāya* ("Short Collection"). Beyond this, a Sinhalese commentary of the 5th century that is questionably attributed to Buddhagosa and called the *Jātakaṭṭhavaṇṇanā*, or *Jātakaṭṭhakathā*, gathers together 547 *Jātaka* stories, some of which are quite brief while others are as long as novelettes.

Each tale begins by noting the occasion that

prompted its telling and ends with the Buddha disclosing his identity in the present lives of the characters in the narrative. There is humour in these stories and considerable variety. The future Buddha may appear in them as a king, an outcast, a god, an elephant—but, in whatever form, he exhibits some virtue that the tale thereby inculcates.

Many *Jātaka*s have parallels in the *Mahābhārata* ("Great Epic of the Bhārata Dynasty"), the *Pañca-tantra* (animal fables), the *Purāṇa*s (collections of legends), and elsewhere in non-Buddhist Indian literature. Some turn up again in such places as Aesop's fables. The *Jātaka* stories have also been illustrated frequently in sculpture and painting throughout the Buddhist world.

jāti, also spelled JĀT, caste, in Hindu society. The term is derived from the Sanskrit *jāta,* "born" or "brought into existence," and indicates a form of existence determined by birth. In Indian philosophy *jāti* (genus) describes any group of things that have generic characteristics in common. Sociologically, *jāti* has come to be used universally to indicate a caste group among Hindus.

Although the lawgivers of the traditional Hindu codes (*Dharma-śāstra*) themselves tend to treat *jāti*s as varnas (social classes) and try to account on either occasions for *jāti*s as products of alliances between the four varnas (Brahmans, Kshatriyas, Vaisyas, and Sudras) and their descendants, a sharp distinction should be made between *jāti,* as a limited regional endogamous group of families, and varna, as a universal all-Indian model of social class. The official Hindu view gives second place to *jāti* as an aberration of varna.

In different parts of India, certain caste groups have sought respectability within the varna system by claiming membership in a particular varna. Typical and most successful was the claim of the Rājputs that they were the Kshatriyas, or nobles, of the second varna, and, to reinforce their claim, they invented a new lineage (Agnikula, the dynasty of Fire) to coexist side-by-side with the Solar and Lunar lineages of ancient times. Untouchables have adopted caste habits of conduct and sought the status of Sudra (the lowest class, or varna) to escape from their pitiable condition.

The very notion of *jāti* has been under attack by reform-minded Indians. They do not always ask for total abolition but frequently advocate a purification of the system by the reabsorption of the *jāti*s into the original, complementarily functioning varnas. *See also* varna.

Jatki language: *see* Lahnda language.

jatropha (genus *Jatropha*), member of the spurge family (Euphorbiaceae), native in both New World and Old World tropics and containing about 125 species of milky-juiced herbs, shrubs, and trees, some useful for their oils or as ornamental plants in tropical gardens.

Peregrina (*Jatropha integerrima*)
Walter Dawn

A garden curiosity is tartogo, or gouty jatropha (*J. podagrica*), from Guatemala and Honduras; it has a short trunk that is swollen at the base, erect red clusters of small flowers borne most of the year, and three- to five-lobed palmate (fanlike) leaves. The coral plant (*J. multifida*) from South America is outstanding for its huge, deeply cut, 11-lobed leaves on plants, 3 m (10 feet) tall, bearing small, coral-red clusters of flowers.

The peregrina (*J. integerrima*) from Cuba, about 5 m tall with spadelike leaves sharply lobed at the base, bears crimson flower clusters the year round. *J. berlandieri,* a perennial 30 cm (12 inches) tall distributed from Texas to Central America, is characterized by long-stalked, purple flowers.

The barbados nut (*J. curcas*), with yellow-green flowers and three- to five-lobed leaves on trees 6 m tall from Mexico and Central America, produces seeds from which cooking oil, soap, and a strong purgative are obtained. The seeds themselves are eaten if thoroughly roasted to remove the poison. The lac (a resinous substance) produced by a scale insect that feeds on the leaves is used to make a fine varnish for guitars.

The closely related genus *Cnidosculos* is distinguished from *Jatropha* by the absence of petals in the flowers, though the sepals form a corolla-like bloom.

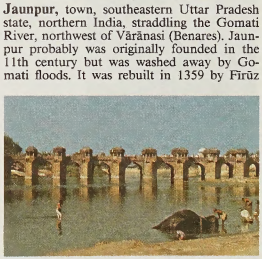
Jaú, city, central São Paulo *estado* ("state"), Brazil, on the Jaú River, a tributary of the Tietê River, at an elevation of 1,775 feet (541 m) above sea level. It was given town status and made the seat of a municipality in 1866. Coffee, *feijão* (beans), cotton, rice, sugarcane, and a variety of fruits are grown locally. Jaú processes these crops, distills liquor, and also manufactures shoes, ceramics, and electrical appliances. Goods are transported to São Paulo city, the state capital, 168 miles (270 km) southeast, and to neighbouring cities by rail, road, and air. Pop. (1985 est.) mun., 92,-547.

Jauf, Al- (Yemen): *see* Jawf, Al-.

Jaunde (people): *see* Yaunde.

jaundice, excess of bile pigments in the bloodstream and bodily tissues. There is a yellow to orange and, sometimes, even greenish discoloration of the skin, the whites of the eyes, and the mucous membranes. Jaundice is best seen in natural daylight and may not be apparent under artificial lighting. The degree of coloration depends on the concentration of bile pigment (bilirubin) in the blood, its rate of tissue diffusion, and the absorption and binding of bilirubin by the tissue. Bilirubin enters the tissue fluids and is absorbed more readily at sites of inflammation and edema (abnormal accumulation of fluids in the tissues). These pigments also seem to favour localization in elastic tissue fibres.

The most common mechanisms causing jaundice are an overproduction of bile by the liver, so that more is in the body than can be readily excreted; congenital defects, which may impair the removal of bile pigments or cause an overproduction; inability of liver cells to remove bile pigments from the blood because of liver disease; leakage of bilirubin removed by the liver back into the bloodstream (regurgitation); or obstruction of the bile ducts. Because the normal liver is capable of removing enormous quantities of bilirubin from the blood, a liver's inability to remove bilirubin indicates severe malfunction.



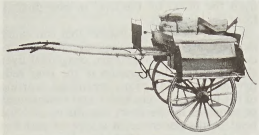
Jaundice is usually classified as either retention jaundice or regurgitation jaundice. In retention jaundice, the pigments are retained in the bloodstream because of some removal problem. Usually this can be clinically diagnosed by finding increased amounts of pigments in the fecal matter but finding none in the urine. With regurgitation jaundice, there is an abnormal leak of bilirubin back into the bloodstream, either after it has been removed from the blood by the liver or else directly from the bile ducts.

Some of the various diseases that can cause jaundice are anemia, congestion in the circulatory system, pneumonia, congenital liver abnormalities, degeneration of the liver cells by poisons or infectious organisms, scarring of the liver tissue (cirrhosis), and obstructions or tumours in the liver, bile ducts, and the head of the pancreas. In a type of jaundice of unknown cause, called idiopathic jaundice, there seems to be a metabolic error in the body. The liver cannot chemically transform bilirubin in the proper manner, resulting in a much darker pigmentation of the liver and body.

In most cases, jaundice is an important symptom of some inherent bodily disturbance, but the retention of bilirubin itself does not usually cause any greater damage than skin discoloration that lasts until the systemic problem is corrected. Regurgitation jaundice, on the other hand, can produce profound secondary disorders. This is generally due to the failure of bile salts to reach the intestinal tract. The bleeding that occurs in the intestines is directly related to the absence of bile salts, for without them the fat-soluble vitamin K cannot be absorbed by the body properly. Without this vitamin, blood clotting is impaired, so that there is a greater tendency for bleeding to occur.

jaundice, infectious: *see* leptospirosis.

Jaunpur, town, southeastern Uttar Pradesh state, northern India, straddling the Gomati River, northwest of Vārānasi (Benares). Jaunpur probably was originally founded in the 11th century but was washed away by Gomati floods. It was rebuilt in 1359 by Fīrūz



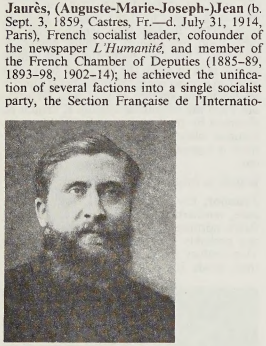
Shāhī Bridge over the Gomati River at Jaunpur, Uttar Pradesh, India
Christina Gascoigne

Shāh Tughluq, whose fort still stands. The city was the capital of the independent Muslim kingdom of the Sharqī dynasty (1394–1479). It was conquered by Akbar in 1559 and fell under British rule in 1775. Jaunpur contains several old mosques, including the Aṭalā Mosque (1408) and the Jāmiʿ Mosque (1478). A splendid bridge, built in the 16th century, spans the Gomati.

An important road and rail junction, it is an agricultural market with more than half of its own area devoted to gardening. Almost the entire alluvial plain around the town is under cultivation, much of it irrigated. Crops include rice, corn (maize), barley, and sugarcane. The area has suffered greatly from floods and droughts. Perfume is the principal industrial product. The town houses numerous colleges of Gorakhpur University. Pop. (1981) 105,140.

jaunting car, also called JAUNTY CAR, or SIDECAR, two-wheeled, open vehicle, popular in Ireland from the early 19th century. It was

unusual in having lengthwise, back-to-back or face-to-face passenger seats. The light, horse-drawn cart carried four passengers (although



Jaunting car, early 19th century; in the Science Museum, London

the earliest versions carried more). It usually had a narrow, forward-facing driver's seat.

Jauregg, Julius Wagner, Ritter von (knight of): *see* Wagner-Jauregg, Julius.

Jaurès, (Auguste-Marie-Joseph-)Jean (b. Sept. 3, 1859, Castres, Fr.—d. July 31, 1914, Paris), French socialist leader, cofounder of the newspaper *L'Humanité*, and member of the French Chamber of Deputies (1885–89, 1893–98, 1902–14); he achieved the unification of several factions into a single socialist party, the Section Française de l'Internationale Ouvrière. During the war fever of July 1914, he was assassinated by a young fanatic who believed that Jaurès's pacifism was playing into the hands of imperial Germany.

Jaurès

H. Roger-Viollet

Jaurès was born into a lower middle-class family that had been impoverished by business failures. He excelled in secondary school and was given a scholarship to attend the École Normale Supérieure in Paris. After passing his qualifying examination, Jaurès taught at the lycée of Albi from 1881 to 1883, and from 1883 to 1885 he was a lecturer at the University of Toulouse.

A convinced republican and a brilliant orator, Jaurès was more attracted to politics than to teaching and in 1885 was elected deputy from the Tarn. As he did not yet belong to any party, he took his seat in the centre of the Chamber. His election prompted the parents of the girl he loved, Louise Bois, to consent to their marriage. Madame Jaurès received as her dowry a handsome rural estate of 91 acres (37 hectares). Because his own political creed disclaimed the ownership of private property, Jaurès was often reproached for his possession of this estate.

Jaurès's untidy personal appearance provided his enemies with much material for ridicule. Short and obese, he was described as having the appearance of "a teacher who does not exercise or a fat merchant who overeats." Yet no one ever accused him of vulgarity.

Defeated in the 1889 elections, Jaurès returned to teaching at the University of Toulouse, and in 1891 he received his doctorate of philosophy. In 1892 he supported the striking miners of Carmaux, and that constituency elected him deputy to the Chamber in 1893. By this time he had become a socialist, though without accepting all of Karl Marx's ideas. Rather, of the five schools of French socialism, he chose the least revolutionary, the Independent Socialists, led by Alexandre Millerand.

During the campaign on behalf of Captain Alfred Dreyfus, who had been convicted of treason and given a life sentence at hard labour on the basis of what later turned out to be forged evidence, Jaurès joined those demanding a revision of the trial. His position was not approved by the Marxist socialists, who did not believe that a socialist should defend a man who was both an officer and a member of the middle class. His book *Les Preuves*, asking for Dreyfus' retrial and rehabilitation, caused his defeat in the elections of 1898. Temporarily retired from national politics, Jaurès began to compile his monumental *Histoire socialiste de la Révolution française* (1901–07; "Socialist History of the French Revolution"). This work, written "under the triple inspiration of Marx, Plutarch and Michelet," gave new impetus to studies on France's revolutionary period.

In spite of their dispute over the Dreyfus affair, the different socialist factions became reconciled and held their first joint congress in 1899. But, after Millerand agreed to join the leftist government dedicated to securing the republic headed by René Waldeck-Rousseau, the socialists divided into two groups: those who refused to cooperate with the government and advocated class war founded the Socialist Party of France (Parti Socialiste de France), and those who preached reconciliation with the state, headed by Jaurès, formed the French Socialist Party (Parti Socialiste Français). At this time Jaurès wrote many articles supporting Waldeck-Rousseau's policy of reform. After his reelection in 1902, he continued to support the leftist bloc within the Chamber of Deputies.

In 1904 Jaurès was cofounder of the newspaper *L'Humanité*, in which he continued to espouse the principles of democratic socialism. That same year, the congress of the Second International, held in Amsterdam, condemned socialist participation in bourgeois governments, thus rejecting Jaurès's position. He acquiesced in the decision, and in 1905 the two French socialist parties joined together to form the Section Française de l'Internationale Ouvrière (SFIO). This party remained in opposition to the government, with the result that the reform policies originally advocated by Waldeck-Rousseau were not carried out. Jaurès's authority continued to grow within the party, though, and, on the eve of World War I, the majority of the SFIO were won over to his reformist ideas.

He fought the supremacy of the German Social Democratic Party in the Second International and, in order to deprive it of its revolutionary reputation, confronted it at the Congress of Stuttgart in 1907 with his formula "insurrection rather than war." This statement, though, did not completely summarize the whole of his political thought; he strove for the adoption of a system that would ensure "peace through arbitration" and recommended a prudent policy of "limitation of conflicts." He therefore opposed colonial expansion, such as the French invasion of Morocco, because it provided a source of international conflicts.

Hostile to the Franco-Russian alliance and suspicious of the Franco-British alliance because it seemed to be directed solely against Germany, Jaurès became the champion of Franco-German rapprochement; as Germany was France's traditional enemy, his position earned him the hatred of French nationalists. His passion for reconciliation ultimately led to his tragic death. Up to the last moment, however, he was actively exhorting the European governments to avert a world war and to settle peacefully the conflict that followed the archduke Ferdinand's assassination at Sarajevo in June 1914. On the very day of his own assassination, Jaurès was considering an appeal to President Woodrow Wilson of the United States for help in solving this crisis.

Jaurès was a man of enormous literary, philosophical, and historical erudition, as well as of great eloquence. His capacity for self-sacrifice enabled him to put aside his own political beliefs in order to achieve the unification of factions into a single socialist party.

Aside from his gifts as a political organizer, Jaurès was well known for his personal generosity, intelligence, and tenacity of purpose. An excellent scholar and polemicist, he wrote throughout his entire career. Apart from *La Guerre franco-allemande 1870–1871* (1908; "The Franco-German War"), *L'Armée nouvelle* (1910; "The New Army"), which set forth an effective plan for organizing an armed nation and contained a famous study of the concept of the fatherland, and his two doctoral theses, the remainder of Jaurès's works are collections of articles and speeches.

(C.H.)

BIBLIOGRAPHY. Harold R. Weinstein, *Jean Jaurès: A Story of Patriotism in the French Socialist Movement* (1936, reissued 1973), is a concise survey of his life, career, political beliefs, and attitudes. A later, more detailed and better balanced biography is offered in Harvey Goldberg, *The Life of Jean Jaurès* (1962). There are many comprehensive biographies in French, such as Max Gallo, *Le Grand Jaurès* (1984).

Java, also spelled DJAWA, or JAWA, Indonesian island lying southeast of Malaysia and Sumatra, south of Borneo (Kalimantan), and west of Bali. Java is only the fourth largest island in the Republic of Indonesia but contains more than half of the nation's population and dominates it politically and economically. Java's area, including offshore Madura Island, is 51,038 square miles (132,187 square km). The capital of Java and of the republic is Jakarta (formerly Batavia), which is also Indonesia's largest city.

Administratively, Java is composed of three *provinsi* (provinces)—Jawa Barat (West Java), Jawa Tengah (Central Java), and Jawa Timur (East Java)—as well as Jakarta Raya (Greater Jakarta) *daerah khusus Ibukota* (special capital district) and Yogyakarta *daerah istimewa*

Terraced rice fields on the island of Java, Indon.

Waldo E. Austin—Black Star

(special district), both of which are administratively considered as provinces.

History. The site of Trinil on Java is famous for the discovery there in 1891 of fossilized remains of *Homo erectus,* or "Java man," and indicates that the island was the site of human activity as early as 800,000 years ago. The colonization of Java apparently took place from mainland Southeast Asia, and domestic agriculture is known to have been practiced there as early as 2500 BC. Indian traders began arriving in Java from about the 1st century AD, and the resulting Hindu Indian influence developed and flowered in the kingdom of Mataram in the 8th century AD. The Mataram kingdom was centred in south-central Java and was ruled by the Shailendra dynasty. Although originally followers of Śaivite Hinduism, the Mataram dynasty's later kings accepted Mahāyāna Buddhism. From this era, in the late 9th and early 10th centuries, date the great Buddhist monuments constructed at Borobudur, Mendut, and many other sites in Java.

As the power of Mataram declined, a state in eastern Java briefly gained prominence until it came into conflict with the powerful Śrivijaya empire of the island of Sumatra and was thus destroyed in 1006. The king Erlangga managed to reunite and reinvigorate this state during his reign (f019–49), however. During Erlangga's reign, literature and the arts flourished, and the Hindu epics were translated from Sanskrit into Javanese for the first time, thus opening the way for the diffusion of Hindu thought among the common people. Erlangga divided his kingdom between his two sons, of whom the ruler of Kediri (along the Brantas River) became the more powerful. This area remained the centre of Javanese culture until the 13th century (while western Java remained under Śrivijaya rule). The Kediri kingdom became an entrepôt for the spice trade, and Muslim traders from India as well as Chinese merchants visited its ports.

The political centre of Java then moved to the kingdom of Singhasāri, in the Malang Highlands of eastern Java. The greatest king of this dynasty was Kertanagara (*q.v.;* reigned 1268–92), who unified Java and extended his power to southern Borneo, Bali, and other eastern islands. Upon Kertanagara's inopportune death, his kingdom collapsed and was succeeded by the Majapahit empire of eastern Java, which was founded in 1293. The Majapahit dynasty gained control of most of the Indonesian archipelago, including even the former Śrivijayan territories in Sumatra. The architect of this mighty empire was the prime minister Gajah Mada (*q.v.;* reigned 1331–64). The Majapahit dynasty began to decline in the late 14th century, however, and it most likely fell early in the 16th century, when the last vestige of Indo-Javanese rule was destroyed by the followers of Islām.

Muslim traders had visited the Indonesian archipelago for centuries, but it was only in the 15th century that the Majapahit kingdom was seriously affected by competition from them. As the Muslim international trade network in the region grew, the coastal Javanese faced the choice of fighting or joining the Muslims, and many eventually did the latter. A number of Javanese ports in eastern Java thus broke away completely from the moribund Majapahit empire in the early 16th century. Several Muslim kingdoms were also established in central and western Java, in part because the Sundanese in western Java, less influenced by Hindu colonization in earlier times, adapted Islām more rapidly. Padjang, Mataram, Preanger, Cheribon, and Bantam all became independent Muslim states in Java in the 16th century. One of these states, Mataram, the last great Javanese kingdom, achieved dominance over eastern and central Java in the 1580s.

Dutch ships first visited Java in 1596, and the Dutch East India Company soon established trading posts on the coast, along with a headquarters at the town of Batavia (Jakarta), which came under Dutch control in 1619. Beginning in the 1670s, the Dutch East India Company began to assert its control over Java's various Muslim kingdoms; the states of western Java recognized the company's sovereignty in the last quarter of the 17th century, and the north-central and northeastern districts followed suit in 1743. In 1755, what remained of the Mataram kingdom was broken up into two Dutch vassal states, Surakarta and Jogjakarta. Java's peasantry grew rice, indigo, sugar, pepper, and coffee under a system of forced deliveries that the Dutch levied on the native aristocracy.

The Dutch East India Company ceased to exist in 1799, and the Dutch government took over the administration of Java. After a brief period of British rule in 1811–16, the island returned to Dutch rule. A serious Javanese revolt in 1825–30 against the Dutch was suppressed at great expense. Throughout the 19th century, Java was the most intensively developed and closely governed of all the islands of the Dutch East Indies, and it quite naturally became the focus of Indonesian nationalism in the early 20th century. Beginning in 1903, the Javanese were admitted to a steadily increasing part in local government, and in 1925 Indonesians were given a majority in the *volksraad* (people's council). Java was occupied by the Japanese from 1942 to 1945 during World War II. Java became part of the newly independent Republic of Indonesia in 1950.

The land. Java is 661 miles (1,064 km) long from east to west and ranges in width from about 60 miles (100 km) at its centre to more than 100 miles (160 km) near each end. A longitudinal mountain chain, surmounted by many volcanoes, runs east to west along the island's spine and is flanked by limestone ridges and lowlands. Java is highly volcanic, yet serious eruptions are few; only 35 of its 112 volcanoes are active. In the west the volcanic peaks are clustered together, becoming more widely spaced in the central and eastern parts of the island. The highest volcano is Mount Semeru, at 12,060 feet (3,676 m). A series of discontinuous plateaus lies south of the volcanic belt and reaches an elevation of about 1,000 feet (300 m).

Most rivers in Java run northward, since the central mountains that form their watershed lie somewhat closer to the southern than to the northern coast. Some rivers do run southward, however. The largest rivers on the island are the Solo and the Brantas, in Java's eastern portion. These and many smaller rivers are a source of water for irrigation but are navigable only in the wet season, and then only by small boats.

Java's climate is generally hot and humid throughout the year. Maximum temperatures are found in the plains along the northern coast, but in the mountains it is much cooler. The high humidity often makes the climate debilitating. The northwest monsoon season, from November to March, is rainy and cloudy, while the southeast monsoon, from April to October, brings some rain but generally is sunny. Annual rainfall at Jakarta averages about 69 inches (1,760 mm). The average daily maximum temperature at Jakarta is 86° F (30° C), and the minimum is 74° F (23° C). At Tosari (elevation 5,692 feet [1,735 m]) in the interior highlands, the highs and lows average 72° F (22° C) and 47° F (8° C). Java's soils are very fertile because of periodic enrichment by volcanic ash.

Java's rich vegetation is southern Asian, with Australian affinities; more than 5,000 species of plants are known. Dense rain forests abound on the damp slopes of the mountains, while thick bamboo woods occur in the west. The island's fruit trees include banana, mango, and various Asian species. Teak, rasamala, and casuarina trees and bamboo occur in forest stands, together with sago palms and banyan trees. Teakwood is one of Java's major exports.

Among the island's fauna are the one-horned rhinoceros, tiger, and banteng (wild ox), though these species are now restricted to the more remote areas. The island is also home to monkeys, wild pigs, and crocodiles; about 400 species of birds; 100 species of snakes; 500 species of butterflies; and many types of insects.

The people. Java's inhabitants belong to the oceanic, or southern, branch of the Mongoloid geographic race. The island is inhabited by three major ethnic groups, the dominant Javanese, the Sundanese, and the Madurese, and by two smaller groups, the Tenggerese and the Badui. The Javanese constitute approximately 70 percent of Java's population and live primarily in the central and eastern portions of the island. The Sundanese live mainly in the west, while the Madurese live in the east and on Madura Island. All three groups speak Malay languages, and most are Muslims.

Java is one of the world's most densely populated areas. The island averages nearly 2,000 persons per square mile (770 per square km) and has the majority of Indonesia's population on only 7 percent of the total land area of the republic. Java's rate of population growth has been and remains quite high; from an estimated 5 million people in 1815, the population had grown to about 100 million in the late 20th century. Most of Java's population remains rural, but its cities have nevertheless grown at a rapid rate. The chief cities are Jakarta, Bandung, Semarang, Surabaya, Surakarta, and Yogyakarta. The rural population density is highest in the south-central plains and the northern plain.

The economy. More than two-thirds of the island's land area is under cultivation, and the primary food crop is wet rice. An elaborate irrigation network of canals, dams, aqueducts, and reservoirs has greatly contributed to the island's rice-growing capacity over the centuries. Other crops, also mostly grown in lowland areas on small peasant landholdings, are corn (maize), cassava, peanuts (groundnuts), soybeans, and sweet potatoes. Terraced hillslopes and irrigated rice paddies are familiar features of the landscape. Kapok, sesame, vegetables, bananas, mangoes, durian fruits, citrus fruits, and vegetable oils are produced for local consumption. Tea, coffee, tobacco, rubber, and cinchona (the source of quinine, and grown in the highlands of western Java); sugarcane and kapok (raised in the eastern part of the island); and coconuts are exported. Several of these cash crops at a time are usually grown on large family estates. Livestock, especially water buffalo, is raised primarily for use as draft animals. Salted and dried fish are imported, and fish farming is carried on in ponds and rice fields of central and western Java. Java produces most of the world's supply of quinine.

Oil is drilled mainly in the Arjuna fields off the northwestern coast; a natural-gas pipeline links these fields with Cilegon. There are petroleum refineries at Cilacap, Jepu, and Surabaya; there is also limited mining of manganese, sulfur, phosphate, gold, and silver. Small-scale manufactures include batik printing, iron founding, silverwork, agricultural tools, tanning, and the production of tiles and other ceramics. Larger industries consist of textiles, rubber manufacturing, auto assembly, brewing, and factories producing shoes, paper, soap, cement, and cigarettes. The Jatiluhur Dam near Purwakarta is the largest in Indonesia. A well-developed rail and highway network links the principal cities. A govern-

ment-owned radio network is headquartered in Jakarta, which is also the site of an international airport. Surabaya and Tanjungpriuk (near Jakarta) are the principal ports.

Cultural heritage. Indo-Javanese architecture, which extends from the 3rd to the 16th century, includes such monuments as the gigantic stupa of Borobudur (*c.* 800) and the temple of Mendut; the Buddhist temple Sewu (9th century); the magnificent Siva temple Prambanan (9th century); the holy bathing places of Jalatunda (late 10th century) and Belahan (mid-11th century); and the round Hindu temple of Jabung (*c.* 10th century). Pop. (1988 est.) 105,560,200.

Java man, extinct hominid known from fossil remains found in Java. The skullcap and thighbone, discovered by E. Dubois in 1891 at Trinil, by the Solo River, were the first known fossils of the species *Homo erectus.* Dubois, however, originally classified his find as *Pithecanthropus erectus.* Other fossils from Sangiran and the remains of an infant from Modjokerto (found 1936) indicate that *H. erectus* occupied Java during the middle Pleistocene Epoch (about 1,000,000 to 500,000 years ago). Java man was characterized by a cranial capacity averaging 900 cubic centimetres (which is lower than those of later specimens of *H. erectus*), a skull flat in profile with little forehead, a sagittal ridge on top of the head for attachment of powerful jaw muscles, an occipital torus, very thick skull bones, heavy browridges, a large palate, and a massive jaw with no chin. The teeth are essentially human although with some simian characters, such as large, partly overlapping canines. Thighbones show that Java man walked fully erect, like modern man, and attained a height of about 5 feet 8 inches (1.72 m). The Modjokerto infant skull (age at death about five years) already shows large browridges and a retreating forehead. Java man predates Peking man (*q.v.*) and is usually considered somewhat more primitive.

Java Sea, Indonesian LAUT JAWA, portion of the western Pacific Ocean between the islands of Java and Borneo. It is bordered by Borneo (Kalimantan) on the north, the southern end of Makassar Strait on the northeast, Celebes and the Flores and Bali seas on the east, Java on the south, the Sunda Straits to the Indian Ocean on the southwest, Sumatra on the west, and the islands of Bangka and Billiton (bordering the South China Sea) on the northwest. The sea measures about 900 miles (1,450 km) east-west by 260 miles (420 km) north-south and occupies a total surface area of 167,000 square miles (433,000 square km). It covers the southern section of the 690,000-square-mile (1,790,000-square-kilometre) Sunda Shelf. A shallow sea, it has a mean depth of 151 feet (46 m). The almost uniform flatness of the sea bottom and the presence of drainage channels (traceable to the mouths of island rivers) indicate that the Sunda Shelf was once a stable, dry, low-relief land area (peneplain) above which were left standing a few monadnocks (granite hills that by virtue of their resistance to erosion form the present islands). During the glacial stages of low sea levels, at least parts of the shelf were exposed above the sea to serve as land bridges for Asiatic fauna to migrate into western Indonesia. From September through May surface currents in the sea flow west. For the rest of the year they trend eastward. The large discharge from rivers on the surrounding islands tends to lower salinity levels in the sea.

The southern section of the sea floor has long been considered to have geologic similarities with northern Java, in which oil fields occur. Successful exploratory wells have proved that these fields extend under the sea. Prospects are also favourable for oil fields in the waters off southeast Kalimantan.

The sea was the scene of a battle of World War II between the Allies and the Japanese. Fought on Feb. 27, 1942, the encounter resulted in a serious defeat for Allied naval forces; they lost five ships in the battle, and the next day Japanese forces were able to begin their invasion of the island of Java.

Java sparrow, also called RICEBIRD (species *Padda oryzivora*), bird of the mannikin group in the family Estrildidae (order Passeriformes), one of the best-known cage birds. It is an attractive pet that chirps and trills. Native to

Java sparrow (*Padda oryzivora*)
Horst Bielfeld—Bavaria-Verlag

Java and Bali, it has become established in the wild elsewhere in Asia. Also called paddy bird, it may form large flocks that damage grain. It is 14 cm (5.5 inches) long and mostly gray, with pinkish underparts, a large white ear patch, and a stout, red bill.

Java Trench, also called SUNDA DOUBLE TRENCH, deep submarine depression in the eastern Indian Ocean, located generally 190 miles (305 km) off the southwestern coasts of the islands of Sumatra and Java, Indonesia. The trench extends for more than 1,600 miles (2,600 km) from northwest to southeast. Its slopes exceed 10° and descend to a maximum depth of 24,440 feet (7,450 m), the deepest point in the Indian Ocean. Much of the Java Trench is at least partially filled by sediments, particularly the section paralleling the Sunda Island arc, a group of islands in an active volcanic zone. For about one-half its length, south of Sumatra, the trench is divided into two parallel troughs by an underwater ridge. To the northwest the Java Trench merges with a system of islands and continental shelves that eventually extend into the Ganges River delta.

Javacheff, Christo: *see* Christo (Javacheff).

Javādi Hills, range of hills, one of the larger of the Eastern Ghāts, northern Tamil Nādu state, southeastern India. About 50 miles (80 km) wide and 20 miles (32 km) long, they are bisected into eastern and western sections by the Cheyyār and Agaram rivers, tributaries of the Pālār. They consist of bluish gray granites, with peaks averaging 3,600–3,800 feet (1,100–1,150 m). Their steep southeastern flanks are forested with sandalwood. The hills are sparsely populated; grains, legumes, and oilseeds are the chief crops.

Javanese, Indonesian ORANG DJAWA, largest ethnic group on the island of Java, Indonesia. Their language, spoken by more than 71 million people, belongs to the Austronesian (Malayo-Polynesian) family, as do those of neighbouring but different groups such as the Sundanese of southwest Java and the Madurese of northeast Java. The Javanese are Muslim, though Hindu traditions of an earlier era are still evident and relatively few Javanese carefully observe Muslim precepts. Belief in spirits is widespread.

Traditional Javanese social organization varied in structure from relatively egalitarian villages to the highly stratified society of the cities, with their complex court life. These differences found linguistic expression in styles of speech that vary according to status differences between the persons speaking: an informal style, a polite style, an extremely polite style, and several others. These styles are more elaborate in Javanese than in other languages of the area and are used habitually.

The growth of large cities in Java has produced an urban proletariat, mostly of rural origin, who live in makeshift huts in enclosed neighbourhoods called *kampongs.* Javanese villages are compact groups of single-family houses, generally built of bamboo, surrounding a central square. Though rice is the main food crop, a variety of others are produced, including corn (maize), cassava, peanuts (groundnuts), and soybeans.

Javanese woman embroidering cloth
Carl Purcell

The Javanese family is typically composed of parents and dependent children, though it may include other close relatives. Most first marriages are arranged by the parents; but divorce is easy, and women are relatively free to leave their husbands.

Javanese language, member of the Western, or Indonesian, branch of the Austronesian (Malayo-Polynesian) language family, spoken as a native language by more than 68 million persons living primarily on the island of Java. The largest of the Austronesian languages in number of speakers, Javanese has several regional dialects and a number of clearly distinct status styles. Of the latter the greatest difference is between the *ngoko* (informal) and the *krama* (deferential) styles. When neither of these is suitable, the *madya* (middle) style is used; other styles, less often used, are the *krama inggil* (highly deferential) and the *basa kedaton* (palace language).

Javanese has a written tradition dating from about 750, influenced by Indian and Islāmic literatures and in turn influencing Malay, Balinese, and other Indonesian literatures. It is written in an alphabet derived from the southern Pallava script. Little has been published in Javanese because of efforts to develop literature in Bahasa Indonesia (Malay), after its

adoption as the national language of the Republic of Indonesia, of which Java is a part.

Javanthropus, original genus name assigned to Solo man, now widely considered a subspecies of *Homo erectus. See* Solo man.

Javari River, Portuguese RIO JAVARI, Spanish RÍO YAVARÍ, river that rises on the border between Amazonas state, Brazil, and Loreto department, Peru. It flows northeast for 540 miles (870 km) to join the Amazon River near the Brazilian outpost of Benjamin Constant. The river follows a winding course through unbroken tropical rainforest in which there are only a few very small riverbank clearings. It is navigable for launches almost to its source. The old Brazilian spelling was Javary.

javelin, also called JAVELINA (mammal): *see* peccary.

javelin throw, in athletics, or track-and-field, sport of throwing a spear for distance, included in the ancient Greek Olympic Games as one of five events of the pentathlon competition.

The javelin that is used in modern international men's competition is a spear of wood or metal with a sharp metal point. It is constructed in accordance with specifications published by the International Amateur Athletic Federation. Its overall length must be at least 260 cm

1999 world javelin throw champion Aki Parviainen of Finland
Shaun Botterill—All Sport

(8 feet 6.25 inches) and its weight at least 800 g (1 pound 12.25 ounces). The women's javelin is somewhat shorter and lighter—a minimum 220 cm (7 feet) long and 600 g (1 pound 5 ounces) in weight.

After a short run, the javelin is thrown directly forward with an over-the-shoulder motion into a 29° sector marked on the field. It must land point first. The thrower's body may not rotate a full turn (360°) before the javelin is released, and he may not step on or beyond a line at the end of the runway.

Scandinavian athletes dominated the first 50 years of men's javelin competition. Sweden conducted the first national championship in the event in 1896, and Swedish and Finnish athletes held the most world records until 1953. A women's javelin event was added to the Olympic program in 1932. In 1964 Terje Pedersen (Norway) became the first man to exceed 91 m (300 feet), and Elvira Ozolina (U.S.S.R.) the first woman to exceed 61 m (200 feet). *See* Sporting Record: *Athletics. See also* Olympic Games.

Javorníky, mountain range on the western fringe of the Carpathian Mountains that forms the northern segment of the boundary between Moravia (Czech Republic) and Slovakia. The ridge of the Javorníky peaks—ranging up to 3,514 feet (1,071 m)—divides the Bečva-Oder river systems to the north and west from the Váh River to the east. Sheep are raised, and winter sports thrive throughout the region.

jaw, either of a pair of bones that form the framework of the mouth of vertebrate animals, usually containing teeth and including a movable lower jaw (mandible) and fixed upper jaw (maxilla). Jaws function by moving in opposition to each other and are used for biting, chewing, and the handling of food.

The mandible consists of a horizontal arch, which holds the teeth and contains blood vessels and nerves. Two vertical portions (rami) form movable hinge joints on either side of the head, articulating with the glenoid cavity of the temporal bone of the skull. The rami also provide attachment for muscles important in chewing. The centre front of the arch is thickened and buttressed to form a chin, a development unique to man and some of his recent ancestors; the great apes and other animals lack chins.

The upper jaw is firmly attached to the nasal bones at the bridge of the nose; to the frontal, lacrimal, ethmoid, and zygomatic bones within the eye socket; to the palatine and sphenoid bones in the roof of the mouth; and at the side, by an extension, to the zygomatic bone (cheekbone), with which it forms the anterior portion of the zygomatic arch. The arched lower part of the maxilla contains the upper teeth. Inside the body of the bone is the large maxillary sinus.

In the human fetus and infant both the upper and lower jaws have two halves; these fuse at the midline a few months after birth.

Among the invertebrates, arthropods often have modified limbs that function in jaw action. In the subphylum Chelicerata (*e.g.,* pycnogonids, arachnids), the pincers (chelicerae) may be used as jaws and are sometimes aided by pedipalps, which are also modified appendages. In the subphylum Mandibulata (crustaceans, insects, and myriapods), the jaw limbs are the mandibles and, to some extent, the maxillae. Such limbs may be modified for other purposes, especially in insects. Horseshoe crabs (and perhaps the extinct trilobites) can chew food with toothed projections (gnathobases) at the bases of the walking legs, but these are not considered true jaws.

Other important examples of invertebrate jaw structures are: in rotifers, the mastax of the pharynx; in polychaete worms, the jaws of the proboscis; in brittle stars, the five triangular oral jaws; in leeches of the order Gnathobdellida, the three toothed plates in the pharynx; and in cephalopods (*e.g.,* octopuses), strong, horny, parrotlike beaks. For a depiction of the human jaw, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

Jawa Barat, English WEST JAVA, *propinsi* (province), western Java, Indonesia. It is bounded by Jawa Tengah (Central Java) province to the east, the Indian Ocean to the south, the Java Sea to the north, and the metropolitan capital district of Jakarta Raya to the northwest. The provincial capital of Jawa Barat is Bandung. In 2000 the western portion of the province was split off to form the new province of Banten, with its capital at Sarang.

The landscape of Jawa Barat is dominated by a chain of volcanoes, both active and extinct, that runs west to east includes Mounts Sanggabuwana, Gede, Pangrango, Kendang, and Tjereme. The highest of these peaks rise to elevations of about 10,000 feet (3,000 m). A series of these volcanoes cluster together to form a great tangle of upland that also includes the Priangar Plateau, which has an elevation of about 1,000 feet (300 m) and consists of almost horizontal, gently folded limestone. The plateau extends for more than 100 miles (160 km) along the southern coast and fronts a relatively narrow strip of coastal lowlands. Along the northern shore of the province is a wider coastal plain of fertile alluvial soils developed from weathered lava and ash; much of the province's population is concentrated there. The northern coastal lowlands are drained by the Manuk, Bekasi, and Berang rivers flowing into the Java Sea, and the southern coastal lowlands by the Wulan, Laki, Sadea, and Letuh rivers flowing into the Indian Ocean. Jawa Barat's original lowland forests have been removed, leaving farmlands and patches of grassland, village woodlots, and scattered trees. The mountains and uplands have a dense growth of tropical rainforests comprising teak, sal, eucalyptus, rhododendron, juniper, banyan, oak, ash, maple, and ironwood.

Agriculture dominates the economy of the province, and cultivated lands are extensively irrigated and double cropped. Rice, sugarcane, corn (maize), cassava, peanuts (groundnuts), quinine (from cinchona bark), and tea are produced; rubber is grown at elevations of 300 to 1,500 feet (90 to 460 m). The province's industrial products include textiles, processed food, wood carvings and furniture, paper, tanned goods, printing, chemicals, and machinery. A network of roads and railways links Bandung with Sukabumi, Bogor, and Cirebon as well as Jakarta and Serang. The Javanese are the largest ethnic group, followed by Sundanese and Badui, and almost all are Muslims. Ujung Kulon National Park, in southwestern Banten, is the last refuge of the endangered one-horned Java rhinoceros; it was designated a World Heritage site in 1991. Area Jawa Barat, 13,492 square miles (34,945 square km); Banten, 3,178 square miles (8,232 square km). Pop. (2000) Jawa Barat, 35,729,537; Banten, 8,098,780.

Jawa Tengah, English CENTRAL JAVA, *propinsi* (province), central Java, Indonesia. It is bounded by Jawa Barat (West Java) province on the west, the Java Sea on the north, Jawa Timur (East Java) province on the east, the Indian Ocean on the south, and Yogyakarta *daerah istimewa* (special district) on the southeast. It covers an area of 12,567 square miles (32,549 square km) and includes the Karimunjawa Islands in the Java Sea.

A chain of volcanic mountains runs west to east through the central part of the province and is surmounted by volcanic peaks including Mounts Sundoro, Sumbing, Merbabu, and Slamat (11,247 feet [3,428 m]), the highest. A discontinuous series of plateaus flanks the widely spaced peaks and merges with the foothills and coastal lowlands (the latter up to 20 miles [30 km] wide) to the north and south. The major streams include the Bodri, Serang, and Luri, flowing northward into the Java Sea, and the Seraju, Bogowonto, Elo, and Progo, flowing southward into the Indian Ocean. The hilly region has a luxuriant growth of casuarina, teak, pine, oak, maple, and ironwood. The broad valleys are covered with tropical rainforests of palm, sal, and pandanus, together with orchids, mosses, and ferns.

The principal means of livelihood in Jawa Tengah is agriculture; rice, tobacco, sugarcane, corn (maize), rubber, tea, coffee, cinchona bark, sweet potatoes, and fruits and vegetables are grown or collected. Industries produce textiles, ceramics, footwear, tires, electric bulbs, processed food, beverages, nonmetallic mineral products, transport equipment, and paper. There are also printing, shipbuilding, and car-assembly plants. Roads and railways run parallel to the northern and southern seacoasts and connect Semarang, the provincial capital, with Tegal, Pekalongan, Magelang, Cilacap, and Surakarta. Muslim Javanese and Sundanese are the principal ethnic groups, and there also are many Indians and Chinese. Archaeological and historical remains, including

temples, stupas, monasteries, and sanctuaries of the early Buddhist and Hindu periods, are located at Kalasan, Dieng, Borabudur, Sewu, Sukuh, Sari, Plaosan, Pawon, and Mendut. Pop. (1995 est.) 29,653,266.

Jawa Timur, English EAST JAVA, *provinsi* (province), eastern Java, Indonesia. It is bounded by the province of Jawa Tengah ("Central Java") on the west, the Java Sea on the north, the Indian Ocean on the south, and the Bali Strait on the east. It includes the Madura, Kangean, Sapudi, Raas, Sepanjang, Bawean, and Masalembo-Besar islands in the Java Sea.

A series of great volcanic cones, including the highest one, Mount Arjuno, rising to 10,955 feet (3,339 m), runs lengthwise through Jawa Timur from west to east. The cones constitute an upland zone that acts as a barrier to communication. Broad valleys, roughly one every 20–30 miles (30–50 km) and mostly covered with volcanic debris, separate the volcanic peaks. Repeated replenishment of the fertility of the soil with lava and ash has occurred in the Surakarta, Madiun, Kediri, and Malang basins, which as a result are heavily populated and intensively cultivated. A discontinuous series of plateaus flanks the volcanic belt in the south, extends for more than 100 miles (160 km) along the coast, and becomes progressively more barren toward the drier east. The northern flank of the volcanic belt comprises the Kapur Utara Mountains; these limestone highlands extend eastward into Madura Island and stand in contrast to the province's highly fertile northern coastal plain.

Faulting and folding have caused most of the streams to drain northward toward the sheltered inner Java Sea. The Solo and Brantas rivers have extended their drainage basins deep into the southern uplands. The other major streams include the Baru, Puger, Madiun, Geneng, and Sampean. The uplands (barring their eastern margin) and the valley slopes are covered with teak, ebony, catechu, pine, oak, maple, and ironwood. The river basins are bordered by a dense growth of bamboo thickets, and the coastal lowlands are dotted with casuarina and herbaceous plants.

Agriculture is the main source of livelihood for most of the population. The main crop, rice, is grown on terraced slopes. Other crops, including tea, coffee, rubber, corn (maize), spices, tobacco, sugarcane, copra, cassava, and natural fibres, are raised on unterraced slopes and in coastal lowlands. Kapok and cinchona are grown on the highlands. The province's industries include shipbuilding, automobile assembly, textile milling, metalworking, petroleum, and the manufacture of machinery, glass, chemicals, leather and rubber goods, transport equipment, paper, processed food, and beverages. An oil refinery is located in Wonokromo, and a fertilizer plant is at Gresik. There is a network of roads and railways linking Surabaya (capital of the province), Pasuruan, Mojonerto, Kediri, Blitar, and Malang. The Javanese and Madurese are the province's major ethnic groups and are Muslims. There are also a considerable number of Balinese, Indians, and Chinese. Early Hindu and Buddhist bathing places, cave hermitages, temples, and images of gods are located at various sites in the province. Area 18,502 square miles (47,921 square km). Pop. (1995 est.) 33,844,002.

Jawara, Sir Dawda Kairaba (b. May 16, 1924, Barajally, MacCarthy Island, The Gambia), politician and veterinarian who was The Gambia's prime minister from 1962 to 1970 and its president from 1970 until he was overthrown in 1994.

The son of a Mande trader, Jawara was educated at a Methodist boys' school, studied veterinary medicine at the University of Glasgow in Scotland, and qualified as a veterinary surgeon in 1953. Returning to The Gambia, he became principal veterinary officer of that British colony in 1957. Jawara had become interested in politics, and in 1959 he joined the Protectorate People's Party. He changed its name to the People's Progressive Party and became its leader. In the elections of 1960 he won a seat in the Gambian legislature and was appointed minister of education in the government. He resigned his ministerial post in 1961 when the British government picked a rival Gambian leader to serve as the country's interim prime minister preparatory to new elections.

The People's Progressive Party won the general elections of 1962, and Jawara became The Gambia's prime minister. He led his country into independence from Great Britain three years later. Under his leadership, the tiny nation of The Gambia became one of Africa's few successful parliamentary democracies; Jawara's ruling People's Progressive Party won six successive elections (1966, 1972, 1977, 1982, 1987, 1992) under completely free conditions after independence in 1965. He was knighted in 1966. Jawara served as president from 1970, when a republican constitution was adopted to replace the former monarchy under the British sovereign. Jawara survived an attempted coup in 1981 with help from neighbouring Senegal, with which Gambia joined in a confederation called Senegambia from 1981 to 1989. Jawara was overthrown in a military coup in July 1994.

Jawf, al-, town and oasis, northern Saudi Arabia. It lies at the northern edge of an-Nafūd desert near the source of the Wadi as-Sirḥān. Formerly considered a part of the Jabal Shammar region, the oasis now lies within the northern reaches of the Hejaz. The town is strategically located on an ancient caravan route between the Mediterranean Sea and the Indian Ocean, and it has long been an important caravan stop between the Syrian Desert and the Arabian Peninsula. It is also an agricultural centre, producing dates, cereals, fruits, and vegetables.

Jawf, al-, also spelled AL-JAUF, oasis region, western Yemen. It is bordered by the far-southwest extension of the Rub' al-Khali, the great sandy desert of the Arabian Peninsula. The Wadi al-Jawf, an intermittent stream with headwaters in the mountains of the Yemen Highlands, crosses the area; its western and southern branches are small perennial streams.

Al-Jawf was the core area of one of the most ancient of the South Arabian kingdoms, the state of Ma'īn (*c.* 1000 BC–2nd century BC). From their capital, Qarnaw, the Minaeans of Ma'īn ruled over large sections of the southern Arabian Peninsula. The oases of al-Jawf were a fertile and densely populated area, with many towns. After the conquest of Yemen by the 'Abbāsids in the 9th century AD, however, the power centres of Yemeni civilization moved to the west, and the region was neglected. In modern times al-Jawf was one of the last areas to remain under royalist control in the Yemeni civil war of 1962–70. The oases, now only sparsely settled, support nomadic tribes; camel raising and the pasturing of sheep and goats are the chief economic activities. Al-Jawf was once renowned for fine purebred Arabian horses. Pop. (1994) 157,096.

Jawlensky, Alexey von (b. March 13, 1864, Torzhok, Russia—d. March 15, 1941, Wiesbaden, Ger.), Russian painter noted for his Expressionistic portraits and the mystical tone of his late paintings of abstract faces.

In 1889 Jawlensky gave up an established career in the Russian Imperial Guard to study painting under the Russian historical painter Ilya Repin. In 1896, disenchanted with realism, he moved to Munich, where he met the painter Wassily Kandinsky, who remained a lifelong influence. While in France in 1905, he worked with the Fauvist painter Henri Matisse, whose flat areas of vibrant colour exerted a further influence on his work.

Back in Munich, Jawlensky joined the Neue Künstlervereinigung ("New Artists' Association," known as the NKV), a loose affiliation of Expressionist artists. He was more sympathetic, however, to the NKV's splinter group,

"Portrait of a Girl," oil painting by Alexey von Jawlensky, 1909; in the Kunstmuseum, Düsseldorf, Ger.

Der Blaue Reiter ("The Blue Rider"), led by Kandinsky. Jawlensky's association with Der Blaue Reiter led to such works as his "Mme. Turandot" (1912), in which flat areas of vibrant Fauve colour are outlined with simple, thickened contours to produce rich and daring colour harmonies.

During World War I Jawlensky painted his "Variations," numerous paintings of the view from his window, which exhibit a new calm, meditative mood that culminates in the semi-abstract faces he began to paint in 1917. A devout man, Jawlensky imbued these frontally viewed faces, such as his "Looking Within Night" (1923), with a mystical intensity that has led them to be compared to the icons of the Russian Orthodox church.

In 1924 Jawlensky joined Kandinsky, Paul Klee, and Lyonel Feininger in forming a short-lived association called Der Blaue Vier ("The Blue Four"). He exhibited with them for some years, but in the 1930s crippling arthritis forced him to abandon painting.

jawless fish, any of numerous primitive, fish-like, jawless vertebrates comprising the class Agnatha, which includes the lampreys, hagfishes, and some extinct groups. *See* hagfish; lamprey.

Jaworski, Leon (b. Sept. 19, 1905, Waco, Texas, U.S.—d. Dec. 9, 1982, Wimberly, Texas), American lawyer who rose to national prominence on Nov. 5, 1973, when he was sworn in as Watergate special prosecutor and made constitutional history when he convinced the U.S. Supreme Court that President Richard M. Nixon was bound to obey a subpoena and turn over 64 White House tapes needed for testimony in the trial of Watergate defendants. (*See* Watergate Scandal.) The release of the tapes revealed to the U.S. Senate investigators Nixon's long-standing involvement in the cover-up of the 1972 burglary at Democratic national headquarters by members of his reelection staff and led to Nixon's resignation.

The son of a Polish immigrant father and an Austrian immigrant mother, Jaworski graduated from high school at 15 and, on a scholarship, attended Baylor University, from which he took a law degree in 1925. In that year he became the youngest person ever to be admitted to the Texas bar, and over the years he became a prominent Texas attorney.

He served the government as a prosecutor in the 1945–46 Nürnberg trials of Nazi war criminals. In 1960 he handled the litigation that allowed Lyndon B. Johnson to run simultaneously for the Senate and the vice presidency. The highlight of Jaworski's career, however, was as the dauntless Watergate special prosecutor who resolutely pursued Nixon. Jaworski's controversial decision not to prosecute Nixon, however, angered much of the public and some members of the White House staff. Jaworski explained, if the "court asked me if I believed Nixon could receive a prompt, fair trial . . . I would have to answer, as an officer of the court, in the negative." Jaworski resigned as special prosecutor on Oct. 25, 1974, and never argued another court case after the landmark *United States* v. *Nixon.* He did, however, act as counsel to the government in the 1977–78 House investigation of the "Koreagate" bribery scandal.

Jaworzno, city, Katowice *województwo* (province), south-central Poland. It was founded in the 18th century when rich deposits of zinc and lead ore and beds of coal were discovered nearby. It is an important coal-mining and industrial city in eastern Upper Silesia, with large chemical factories and several massive electricity-generating stations, as well as a ceramic kiln and cement plant. Pop. (1987 est.) 96,800.

jaw's harp: *see* Jew's harp.

jay, any of about 35 to 40 bird species belonging to the family Corvidae (order Passeriformes) that inhabits woodlands and is known for its bold, raucous manner. Most are found in the New World, but several are Eurasian. Jays are nearly omnivorous; some are egg-stealers, and many store seeds and nuts for winter use. They make a twiggy, cuplike nest in a tree. After breeding, most species are gregarious.

The 30-centimetre (12-inch) blue jay (*Cyanocitta cristata*), blue and white with a narrow black neckline, is found in North America east of the Rockies; westward it is replaced by the dark-blue, black-crested Steller's jay (*C. stelleri*). Another conspicuous and abundant jay, found throughout western North America and in Florida, is the scrub jay (*Aphelocoma coerulescens*), locally called "blue jay" but lacking a crest. The Eurasian jay (*Garrulus glandarius*) occurs over most of the continental Old World except sub-Saharan Africa; about 33 cm (13 inches) long, it is pinkish brown, with blue-and-black-barred shoulders,

white rump, and white wing-patches. Among brightly coloured forms in tropical America is the green jay (*Cyanocorax,* sometimes *Xanthoura, yncas*).

For the "blue jay" of southern Asia, *see* roller.

Jay, John (b. Dec. 12, 1745, New York City—d. May 17, 1829, Bedford, N.Y., U.S.), a founding father of the United States who served the new nation in both law and diplomacy. He established important judicial precedents as first chief justice of the Supreme Court (1789–95) and negotiated the Jay Treaty of 1794, which settled major grievances with Great Britain and promoted commercial prosperity.

A successful New York attorney, Jay deplored the growing estrangement between the colonies and the mother country, fearing that independence might stir up violence and mob rule. Nevertheless, once the revolution was launched, he became one of its staunchest supporters. As a delegate to the First Continental Congress (1774) in Philadelphia, he drafted *The Address to the People of Great Britain,* stating the claims of colonists. He helped assure the approval of the Declaration of Independence (1776) in New York, where he was a member of the provincial Congress. The following year he helped draft New York's first constitution, was elected the state's first chief justice, and in 1778 was chosen president of the Continental Congress.

In 1779 Jay was appointed minister plenipotentiary to Spain, which had joined France in openly supporting the revolutionaries against Britain. His mission—to borrow money and to gain access to the Mississippi River—proved abortive, and he was sent in May 1782 to join Benjamin Franklin in Paris as

Jay, oil painting on wood by John Trumbull, 1793; in the Yale University Art Gallery
By courtesy of the Yale University Art Gallery

joint negotiator for peace with Great Britain. In undercover talks with the British he won surprisingly liberal terms, which were later included essentially intact in the Treaty of Paris (Sept. 3, 1783), which concluded the war.

On his return from abroad, Jay found that Congress had elected him secretary for foreign affairs (1784–90). Frustrated by the limitations on his powers in that office, he became convinced that the nation needed a more strongly centralized government than was provided for by the Articles of Confederation, and he plunged into the fight for ratification of the new federal Constitution, framed in 1787. Using the pseudonym Publius, he collaborated with Alexander Hamilton and James Madison by writing five essays for *The Federalist*—the classic defense of the new governmental structure. In 1789 President George Washington appointed Jay the country's first chief justice, in which capacity he was instrumental in shaping Supreme Court procedures in its formative years. His most notable case was *Chisholm* v. *Georgia,* in which Jay and the court affirmed the subordination of the states to the federal government. Unfavourable reaction to the decision led to adoption of the Eleventh Amendment, denying federal courts authority in suits by citizens against a state.

In 1794 Washington sent Jay as a special envoy to Great Britain to help avert war over accumulated grievances. The commercial agreement, called the Jay Treaty (November 19), aroused a storm of protest among the Jeffersonian Republicans, who denounced it as a sellout by pro-British Federalists. Mobs burned Jay in effigy, and opponents denounced him as a traitor. Before the negotiations, Jay at one time had been considered a leading candidate to succeed Washington, but the unpopular treaty ruined whatever chances he had for the presidency. New York Federalists, however, elected him governor (1795–1801), an office from which he retired to spend 27 years uneventfully on his farm.

BIBLIOGRAPHY. Frank Monaghan, *John Jay* (1935, reissued 1972), is a well-written biography. Richard B. Morris, *Witnesses at the Creation: Hamilton, Madison, Jay, and the Constitution* (1985), characterizes the three men and analyzes the events surrounding the writing of the *Federalist* papers.

jay-thrush (bird): *see* laughing thrush.

Jay Treaty (Nov. 19, 1794), agreement that assuaged antagonisms between the United States and Great Britain, established a base upon which America could build a sound national economy, and assured its commercial prosperity.

Negotiations were undertaken because of the fears of Federalist leaders that disputes with Great Britain would lead to war. In the treaty Britain, conceding to primary American grievances, agreed to evacuate the Northwest Territory by June 1, 1796; to compensate for its depredations against American shipping; to end discrimination against American commerce; and to grant the U.S. trading privileges in England and the British East Indies. Signed in London by Lord Grenville, the British foreign minister, and John Jay, U.S. chief justice and envoy extraordinary, the treaty also declared the Mississippi River open to both countries; prohibited the outfitting of privateers by Britain's enemies in U.S. ports; provided for payment of debts incurred by Americans to British merchants before the American Revolution; and established joint commissions to determine the boundaries between the U.S. and British North America in the Northwest and Northeast.

By February 1796 the treaty, with the exception of the article dealing with West Indian trade, had been ratified by the U.S. and Great

Britain. France, then at war with England, interpreted the treaty as a violation of its own commercial treaty of 1778 with the U.S. This resentment led to French maritime attacks on the U.S. and between 1798 and 1800 to an undeclared naval war. Finally, the commissions provided for by the Jay Treaty gave such an impetus to the principle of arbitration that modern international arbitration has been generally dated from the treaty's ratification.

Jaya Peak, also called MOUNT JAYA, Indonesian PUNCAK JAYA, formerly MOUNT SUKARNO, or MOUNT CARSTENSZ, highest peak on the island of New Guinea. It rises in the Sudirman Range in the west-central highlands. Located in the Indonesian part of New Guinea, known as Papua (formerly Irian Jaya), the 16,502-foot (5,030-m) Mount Pulu summit is the highest in Indonesia and the tallest island peak in the world. It marks the terminus of a glacier-capped ridge 8 miles (13 km) long that extends eastward from Mount Pilimsit (formerly Mount Idenburg). The ridge, which falls sheer for some 10,000 feet (3,000 m) on its northern and southern slopes, presents great walls of ice. Although the snowfield of Jaya Peak was reached as early as 1909 by a Dutch explorer, Hendrik A. Lorentz, the summit was not climbed until 1962, by an expedition led by Austrian mountaineer Heinrich Harrer.

Jayadeva (fl. late 12th century, Bengal, India), Indian author of the celebrated Sanskrit poem *Gītagovinda* ("Song of the Cowherd"), which helped to popularize devotional Hinduism.

Born in the village of Kenduli, he was the son of Bhojadeva, a Brahmin, and married to Padmāvatī. He was attached to the court of King Lakṣmaṇasena (reigned *c.* 1178–*c.* 1205) at Navadvīpa.

The *Gītagovinda* describes the love of Krishna, the divine cowherd, for Rādhā, his favourite among the *gopīs* (wives and daughters of the cowherds). The poem presents in dramatic form the lovers' attraction, estrangement, yearning, and final reconciliation through the help of a *sakhī* (female confidant). The poem blends recitative stanzas with 24 short songs and leans heavily on alliteration, lyricism, and grace of image for its effect.

Jayadeva has for several centuries been honoured at an annual festival at his birthplace, during which his poem is recited. Songs from the *Gītagovinda* also continue to be sung in temples, during festivals, and at *kīrtanas* (communal worship through song).

Jayapura, also spelled DJAJAPURA, formerly SUKARNAPURA, or HOLLANDIA, city and capital of Papua *propinsi* (province), eastern Indonesia, on the northern coast of the island of New Guinea. It is a port on Jos Sudarso (Humboldt) Bay at the foot of Mount Cycloop (7,087 feet [2,160 m]). During World War II the Japanese established an air base there; Allied forces took the area in 1944, and Hollandia became the headquarters of General Douglas MacArthur. Industries now produce furniture, textiles, beverages, chemicals, and transport equipment. It has an airport and is the site of the University of Cenderawasih (founded 1962). Pop. (2000) 155,548.

Jayavarman II, posthumous name PARAMESVARA (literally, Supreme Lord) (b. *c.* 770—d. 850, Hariharalaya, Cambodia), founder of the Khmer, or Cambodian, Empire and outstanding member of the series of rulers of the Angkor period (802–1431). Among Jayavarman II's accomplishments were the deification of the Cambodian monarchy, the establishment of the *devarāja* cult as the official state religion, and the reunification of the old kingdom of Chenla, which he expanded and formed into the Khmer Empire.

Possibly of Khmer descent, Jayavarman II came from Java, where he had been in captivity or exile, to succeed to the throne as Java's vassal around 800. An unwilling puppet, he defied the Javanese and asserted Khmer independence in 802, when he also was installed under Hindu rites as *devarāja* (*q.v.*), or god-king. He established a series of capitals, first at Indrapura, on the lower Mekong River east of Kāmpóng (Kompong) Cham; then, moving northwards, at Hariharalaya, southeast of present-day Siĕmréab (Siem Reap); and then at Mahendraparvata, in the region just north of the Tonle Sap (Great Lake), not far from Angkor, the next seat of the Khmer Empire, which remained its capital for 600 years.

Consult the INDEX *first*

Jayavarman VII (b. *c.* 1120/25—d. *c.* 1215/19), one of the most forceful and productive kings of the Khmer (Cambodian) Empire of Angkor (reigning 1181–*c.* 1215). He expanded the empire to its greatest territorial extent and engaged in a building program that yielded numerous temples (including Angkor Thom), highways, rest houses, and hospitals.

Early life. Jayavarman was born into the royal family of Angkor. He married a very religious and strong-minded princess named

Jayavarman VII, sandstone sculpture found at Preah Khan, Kampong Svay, Cambodia, 12th century; in the Musée National, Phnom Penh

Jayarajadevi, who exerted an important influence on him, both before he gained the throne and during the early years of his reign. Following her death he married her older sister, a very pious and learned woman whom he had previously installed as the head professor in an important Buddhist monastery.

Though practically nothing is known of Jayavarman's childhood and youth, it is clear that during his late 30s and early 40s he settled in the neighbouring kingdom of Champa, in what is now the central region of Vietnam. At the time of the death of his father, King Dharanindravarman II (ruled 1150–60), Jayavarman was engaged in a military campaign in Champa, and, after the accession of his brother (or possibly his cousin), Yasovarman II (ruled 1160–66), he chose to remain there, returning to Cambodia only when he received word that a palace rebellion was in progress. Although Jayavarman arrived at Angkor too late to prevent the murder of Yasovarman and the accession of the rebel Tribhuvanadityavarman (ruled 1166–77), he decided to remain in his homeland and to await an opportunity to assert his own claim to the throne.

Some 12 years later, when Jayavarman was in his late 50s, that opportunity came as a result of a Cham invasion, which brought about the demise of Tribhuvanadityavarman, the sacking of Angkor, and its subjection to foreign rule. In this situation Jayavarman organized a struggle for independence and in less than five years' time succeeded in driving out the invaders and establishing his hegemony over all his Cambodian rivals. Finally in 1181, at the age of 61, he was crowned king of a reconstituted Khmer Empire and began a brilliant reign of more than 30 years, during which he brought the empire to its zenith, both in terms of territorial expansion and of royal architecture and construction.

Jayavarman's building program. During his reign Jayavarman continued his military activities, bringing Champa, southern Laos, and portions of the Malay Peninsula and Burma under his control. But increasingly he devoted his energies and organizational capacities to the kind of religious and religio-political construction projects that had been carried on by his royal predecessors. He built a large number of awesome new temples, including the Bayon, a distinctively Mahāyāna Buddhist central pyramid temple designed to serve as the primary locus of the royal cult and also as his own personal mausoleum; personal funerary temples of the Mahāyāna type, which were dedicated to his mother and father; and a series of provincial temples, which housed reduced replicas of the Royal Buddha—*i.e.*, Jayavarman represented with the attributes of the Buddha, the original of which had been set up in the Bayon. He rebuilt the city of Angkor, now known as Angkor Thom, and rebuilt and extended the system of highways, which radiated outward from the Bayon and the royal palace and reached far into the provinces. In addition, he constructed more than 100 rest houses along these roads and built more than 100 hospitals, which he dispersed throughout his kingdom and placed under the protection of Baiṣajyaguru Vaiḍūryaprabhā, the Great Buddha of Healing.

Jayavarman seems to have been obsessed with the need for rapid and extensive construction. For example, the less than careful workmanship evident in the temples attributed to Jayavarman's reign vividly points to the great haste with which they were built. Some scholars have suggested that the almost frantic sense of urgency associated with Jayavarman's works derived from the fact that, having begun his reign at a relatively advanced age, he felt that his time was short and had to be utilized to the fullest. Others have suggested that Jayavarman's concern to carry through such a vast program of largely Buddhist-oriented construction was greatly encouraged by Jayarajadevi and her sister, both of whom dedicated a tremendous amount of energy toward gaining support for Buddhism and specifically for building Buddhist temples. And finally, if scholars are correct in their surmise that Jayavarman suffered from the dread disease of leprosy, his concern to mitigate his sin and suffering through the accumulation of great merit may have given a still further impetus to his piety and zealousness. Whatever his true motivations, Jayavarman succeeded during his lifetime in creating a legacy that few monarchs in history (Khmer or otherwise) have been able to equal; he was more than 90 years old when he died.

Modern reputation. Despite the importance of Jayavarman VII in the history of the Angkor kingdom, no memory of him was preserved in the later Cambodian chronicles. In modern times, however, as archaeological studies generated popular interest in his reign, Jayavarman VII became a kind of paradigmatic national hero, who was credited not only with establishing the full greatness of the Cambodian nation but also with bringing into being a welfare state that was motivated by Buddhism and dedicated to serving both the spiritual and the physical needs of the

Cambodian people. Scholars, however, have sought to maintain a more balanced view of Jayavarman, recognizing the obvious immensity of his accomplishments but also taking account of the fact that the overweening demands that he placed on the material and human resources of his kingdom were a major factor in its subsequent loss of creativity and its eventual demise. (F.E.R.)

Jayawijaya Mountains, Indonesian PEGUNUNGAN JAYAWIJAYA, or PEGUNUNGAN DJAJAWIDJAJA, formerly ORANGE RANGE, eastern section of the Maoke Mountains (*q.v.*), part of the central highlands of New Guinea. Located in the Indonesian part (Irian Jaya) of New Guinea, the range extends for 230 miles (370 km) east of the Sudirman Range to the Star Mountains and the border with Papua New Guinea. The range's highest point is Trikora Peak (15,580 feet [4,750 m]).

Jayewardene, J.R., in full JUNIUS RICHARD JAYEWARDENE, Jayewardene also spelled JAYAWARDENE (b. Sept. 17, 1906, Colombo, Ceylon [now Sri Lanka]—d. Nov. 1, 1996, Colombo, Sri Lanka), lawyer and public official who served as president of Sri Lanka from 1978 to 1989.

The son of a Supreme Court judge, Jayewardene graduated from Ceylon Law College in Colombo in 1932 and practiced as a barrister until 1943. He joined the Ceylon National Congress party and in 1943 won election to the State Council. In 1948, when Ceylon won independence from British rule, Jayewardene became minister of finance in the postindependence government formed by the moderate United National Party (UNP). He became the party's second-ranking leader under D.S. Senanayake and then under his son, Dudley Senanayake, and held such high posts as minister of finance (1948–53, 1960), minister of food and agriculture (1953–56), and minister of state (1965–70). Upon the death of the younger Senanayake in 1973, Jayewardene became the leader of the UNP and in 1977 led his party to a sweeping victory at the polls.

As prime minister, Jayewardene amended the constitution to give Sri Lanka an executive (rather than a ceremonial) presidency, and he took office as the first elected president in 1978. As president he reversed the country's drift into socialism by drastically cutting the government bureaucracy and revitalizing the private sector by such means as the establishment of a free-trade zone north of Colombo. He was reelected to a second six-year term as president in 1982.

Jayewardene had meanwhile failed to pay sufficient attention to the long-simmering hostility between Sri Lanka's Sinhalese Buddhist majority and its Hindu Tamil minority. In the early 1980s several Tamil groups began a guerrilla insurgency in support of their demands for a separate Tamil state. Jayewardene opposed Tamil separatism and used both military force and negotiations in unsuccessful efforts to end the insurgency. He retired in 1989 after his second term as president.

Jazeera, al-, Arabic-language cable news television network founded by the emir of Qatar in 1996. It was transmitted from Doha, Qatar, and from bureaus around the world, beginning continuous programming in 1999. Al-Jazeera provided a mix of news, talk shows, and educational programs, and its editorial freedom was unique in the Middle East. The network's detractors maintained that it fulminated rather than informed, and its broadcasts were sometimes blocked by other Arab countries. Proponents pointed out that it was the only form of free press in the region and that it gave news to the Arab audience not offered by state-run media.

Jazīrah, Al- (Arabic: "Island"), the northern reaches of Mesopotamia, now making up part of northern Iraq and extending into eastern Turkey and extreme northeastern Syria. The region lies between the Euphrates and Tigris rivers and is bounded on the south by a line running between Takrīt and Anbar. It consists of a rolling and irregular plateau 800–1,500 feet (240–460 m) above sea level.

Al-Jazīrah was important in ancient and medieval times as a crossroads linking Iraq, Anatolia, Syria, Armenia, and Iran. It was also valued for its agricultural products. There were already numerous towns and markets along both rivers at the beginning of the Christian era, when Al-Jazīrah was divided between the Byzantine and Persian empires. During the Umayyad and ʿAbbāsid periods, Al-Jazīrah was a centre of conflict and uprisings, and such groups as the Shīʿites and the Khārijites fought the authorities in Damascus or Baghdad from the region. Late in the 9th century it even attained semiautonomy, but it was retaken by the ʿAbbāsids in 892. In the 10th century Al-Jazīrah came under the rule of a succession of independent dynasties: the Ḥamdānids of Mosul (905–991); the Būyids of Baghdad (977–983); the Marwānids in Diyār Bakr (983–1085); and the ʿUqaylids in Mosul (*c.* 992–1096). After a brief period as part of the Seljuq empire (1085–92), the region's various districts pursued separate existences.

The history of the largest district, Diyār Rabīʿah in eastern Al-Jazīrah, henceforth became identical with that of its capital, Mosul. The Zangids, the Mamlūks, the Persian Il-Khans, the Jalāyirids, the Turkmen Kara Koyunlu and Ak Koyunlu, and the Persian Ṣafavids ruled the area in succession until it was finally absorbed into the Ottoman Empire in 1637. With the dissolution of the empire in 1918, Diyār Rabīʿah was divided between Syria and Iraq.

Diyār Muḍar, a frontier region in the west, briefly separated into two kingdoms late in the 11th century: the crusader Armenian state at Edessa (now Şanlıurfa, Turkey) in the north and the Turkish Muslim kingdom at Harran in the south. Zangī's capture of Edessa in 1144 returned Diyār Muḍar to Muslim control. In the 15th century Turkmen tribes made increasing inroads into Diyār Muḍar, and the Ak Koyunlu finally took it about 1402. The district became part of the Ottoman Empire early in the 17th century and since 1918 has been divided between Turkey and Syria.

The chaotic state of the Seljuq empire in 1092 afforded several Turkmen tribes the chance to set themselves up in Diyār Bakr, the northernmost district. Diyār Bakr came under Ottoman rule in 1516, and its capital, Āmida (modern Diyarbakır, Turkey), flourished as a literary and scholarly centre. Upon the collapse of the Ottoman Empire, the northern district became part of Turkey.

Jazīrah, Al-, also spelled EL-GEZIRA, region, east-central Sudan that lies just southeast of the confluence of the Blue and White Nile rivers.

Al-Jazīrah is the site of one of the largest irrigation projects in the world. Begun by the British in 1925, the Jazīrah (Gezira) scheme distributes the waters of the Blue Nile through a 2,700-mile (4,300-kilometre) network of canals and ditches to irrigate fields growing cotton and other cash crops. This scheme has made Al-Jazīrah the most productive agricultural area of The Sudan. Water for the scheme is supplied from the Sennār and ar-Ruṣayriṣ dams upstream on the Blue Nile.

Most of the population engages in agriculture, and crops include cotton, cereals, oilseeds, peanuts (groundnuts), wheat, sesame, durra (sorghum), dukhn (millet), and vegetables. A hydroelectric plant is located at Wad Madanī. Industries produce ginned cotton, sesame and peanut oils, cigarettes, leather goods, soap, and processed foods. Wad Madanī is the chief city. Most of the people are Arabs; the Nuba are the only significant minority.

jazz, musical form, often improvisational, developed by Afro-Americans and influenced by both European harmonic structure and African rhythmic complexity. It also is often characterized by its use of blues and speech intonations.

A brief treatment of jazz follows. For full treatment, *see* MACROPAEDIA: Musical Forms and Genres.

Although it is not known exactly when jazz emerged, there were plantation brass bands as early as 1835, and minstrel troupes were touring by the 1840s. Ragtime, a syncopated music that took its formal structure from the march, developed in the 1890s and is considered the forerunner of jazz. Composed piano rags by Scott Joplin and others achieved wide popularity. (The "stride" style of pianists such as James P. Johnson and Fats Waller was a later East Coast development of ragtime.) The earliest jazz band style developed in New Orleans, a city with a long, racially mixed cultural tradition. Starting in the late 1890s, Charles "Buddy" Bolden's band is thought to have played ragtime with improvised embellishments, and by the turn of the century many New Orleans bands were playing in a collective improvisational style. That music was copied by the Original Dixieland Jass Band, a white group that was the first to record (1917).

Leading early 1920s groups included the New Orleans Rhythm Kings and the Jelly Roll Morton and King Oliver bands, whose highly contrapuntal music was more smoothly flowing than ragtime. It included improvised solos, which in the playing of Louis Armstrong (trumpet) and others led to the development of the Chicago style in the later 1920s. Larger ensembles, often using written orchestrations, then appeared. Groups led by Fletcher Henderson (with scores by Don Redman), Paul Whiteman (with cornetist Bix Beiderbecke), Chick Webb, Jimmie Lunceford, and Benny Moten developed swing, characterized by a regular rhythm and the contrasting sounds of the sections of the band. Swing culminated in the music of groups led by Count Basie, Benny Goodman, Artie Shaw, and the Dorsey brothers. Through the activities of such men as Art Tatum (piano), Roy Eldridge (trumpet), and Lester Young (tenor saxophone), solo improvisation grew in influence during this period, which also produced Billie Holiday, generally considered to be the greatest singer in the history of jazz.

One of the most important of the late swing musicians was Duke Ellington, who, like Morton in the New Orleans style, shaped his musicians' improvisations on his original themes into strongly coloured, finely balanced compositions. The tradition of composing continued through later phases of jazz, in the work of Thelonious Monk, John Lewis, George Russell, and others.

Bebop, or bop, was the first important postwar style. Its principal developers were Charlie Parker (alto saxophone) and John Birks "Dizzy" Gillespie (trumpet), whose improvisations on chord changes, played against unpredictable accents and complex cross-rhythms, had a new intensity. Cool jazz, some of which, like the playing of Stan Getz (tenor saxophone) and the ensembles of Gerry Mulligan (saxophone), arose out of Young's music, developed partially as a reaction against bebop. Other post-bop developments included the music of Lennie Tristano (piano), the Modern Jazz Quartet, Gil Evans, who wrote orchestrations for the Claude Thornhill band, Miles Davis (trumpet), and the West Coast school. A less formal type of group interaction was evident in such bands as those of Horace Silver and Art Blakey, together with a stronger emphasis on the blues and greater prominence for the drums, in a music that was called hard bop.

Following initiatives by Russell, Tristano, and Charles Mingus, Davis introduced modal jazz in his recording *Kind of Blue* (1959). In the late 1950s and '60s Ornette Coleman (alto saxophone), John Coltrane and Albert Ayler (tenor saxophone), and others developed a new emotional intensity in their playing, rejecting conventional jazz harmonies and melodies in favour of screeches, wails, and soaring cascades of notes played against irregular but driving rhythmic accompaniments. This highly influential style became known as free jazz. In moving away from European influences, jazz attained—with Don Cherry, Don Ellis, and others—fusions with music of other cultures, especially the music of India and the Arab world.

A countertendency during the 1970s was the use of devices, particularly rhythmic ones, taken from rock. This led jazz musicians to experiment with electronic instruments, most successfully in one of Miles Davis' later bands and in the groups Weather Report and the Mahavishnu Orchestra. A different trend was unaccompanied improvisation by melody instruments. The tradition of the free jazz of the 1960s was carried on by pianist Cecil Taylor and by groups such as the Art Ensemble of Chicago into the 1980s.

jazz dance, any dance to jazz accompaniments, composed of a profusion of forms. Jazz dance paralleled the birth and spread of jazz itself from roots in black American society and was popularized in ballrooms by the big bands of the swing era (1930s and '40s). It radically altered the style of American and European stage and social dance in the 20th century. The term is sometimes used more narrowly to describe (1) popular stage dance (except tap dance) and (2) jazz-derived or jazz-influenced forms of modern dance. It excludes social dances lacking jazz accompaniment—*e.g.,* the rumba and other Latin-American dances.

Jazz dance developed from both 19th- and 20th-century stage dance and traditional black social dances and their white ballroom offshoots. On the stage, minstrel show performers in the 19th century developed tap dancing from a combination of Irish jigging, English clog dancing, and African rhythmic stamping. Tap dance and such social dances as the cakewalk and shuffle became popular vaudeville acts and appeared in Broadway revues and musical comedies as these replaced vaudeville early in the 20th century. In addition, comedy, specialty, and character dances to jazz rhythms became standard stage routines. By the 1940s elements of jazz dance had appeared in modern dance and in motion picture choreography.

Although the stage popularized certain social dances, many others were transmitted mainly in social gatherings. The dances that gave rise to social forms of jazz dance developed from rural slave dances. In both early dances and 20th-century jazz dances, there is a noticeable continuity of dance elements and motions. The eagle rock and the slow drag (late 19th century) as well as the Charleston and the jitterbug have elements in common with certain Caribbean and African dances. In addition, the slow drag contributed to the fish of the 1950s; the ring shout, which survived from the 18th into the 20th century, in isolated areas, influenced the cakewalk.

About 1900 the cakewalk, popularized through stage shows, became a craze in European and American ballrooms. In its wake appeared other social dances such as the Charleston (1920s), the jitterbug (1930s and '40s), the twist (1960s), and disco dancing (1970s). Some, like the fox-trot, borrowed European dance steps and fitted them to jazz rhythms. The growth of radio, television, and recording, which popularized black music among wide audiences, greatly aided the diffusion of these dances. Fusing ballet with jazz has led in recent years to the formation of such troupes as Canada's Les Ballets Jazz.

BIBLIOGRAPHY. The history of jazz dance is treated in Marshall Stearns and Jean Stearns, *Jazz Dance* (1968, reissued 1994); and in Gus Giordano, *Anthology of American Jazz Dance* (1975), which also includes a graded system of jazz dance, a dictionary of terms, and information on recognized teachers and choreographers.

jazz-rock, also called FUSION, a popular form of jazz beginning in the 1970s, in which modern jazz solo improvisation is accompanied by the bass lines, drumming styles, and instrumentation of rock music with a strong emphasis on electronic instruments and dance rhythms. Although various jazz musicians began to include at least some jazz-rock in their performances and recordings—no matter what their basic style—a few who made significant contributions before the 1970s also created original styles within jazz-rock as well, notably former Miles Davis associates pianist-composers Herbie Hancock, Chick Corea, and Joe Zawinul; saxophonist-composer Wayne Shorter; and guitarist John McLaughlin.

The style gained one of the largest jazz audiences since the swing era ended in the mid-1940s. As with swing-era big bands, those jazz-rock groups presenting the least improvisation tended to enjoy the most acclaim. The style was also known as "cross over" because sales of the music crossed over from the jazz market to the popular music market. Jazz-rock provided a new musical vocabulary stemming in part from that offered by John Coltrane and sometimes from modern concert music as well as rock.

Jean (French personal name): *see under* John, except as below.

Jean DE MEUN, de Meun also spelled DE MEUNG (b. *c.* 1240, Meung-sur-Loire, France—d. before 1305), French poet famous for his continuation of the *Roman de la rose* (*q.v.*), an allegorical poem in the courtly love tradition begun by Guillaume de Lorris about 1230.

De Meun's original name was Clopinel, or Chopinel, but he became known by the name of his birthplace. He probably owned a home in Paris and may have been archdeacon of the Beauce, a region between Paris and Orléans. Little is known of his life.

His poems are satiric, coarse, at times immoral, but fearless and outspoken in attacking the abuses of the age. His strong antifeminism and censures on the vices of the church were bitterly resented.

De Meun used the plot of the *Roman de la rose* (*c.* 1280) as a means of conveying a mass of encyclopaedic information and opinions on every topic likely to interest his contemporaries, especially the increasingly important bourgeois class. At various times he relates the history of classical heroes, attacks the hoarding of money, and theorizes about astronomy and about the duty of mankind to increase and multiply. Many of his views were hotly contested, but they held the attention of the age. The allegory itself was of little importance to him; the famous "Confession" of Nature (one of the characters in the poem) digressed from the narrative for some 3,500 verses, yet it was such digressions that secured the poem's fame and success. Nearly a century later Geoffrey Chaucer translated a segment of the poem, and some scholars have maintained that it influenced his work more than any other French or Italian poetry in the vernacular.

Jean LE BEL (b. *c.* 1290, Flanders [now in Belgium]—d. Feb. 15, 1370, Liège, Lower Lorraine), the forerunner of the great medieval Flemish chroniclers and one of the first to abandon Latin for French.

A soldier and the constant companion of Jean, Count de Beaumont, with whom he went to England and Scotland in 1327, Le Bel wrote his *Vrayes Chroniques* ("True Chronicles"), recounting the events of the reign of Edward III, at his request. Later he retired to Liège, where he had held a canonry at the cathedral since the age of about 23. His work was known only in fragments until 1861, and a complete edition was not published until 1863. Jean's value as a chronicler was to present events that he had witnessed with intelligence, accuracy, life, and colour. He was the first to use the technique of interviews as a basis for establishing historical fact. His methods were developed by Jean Froissart, who acknowledged his debt to Jean and often borrowed from his text.

Jean Bernard, the world's deepest known cave, located in the Alps near the town of Samoëns, Haute-Savoie *département,* Rhône-Alpes *région,* southeastern France. The highest of the limestone cave's eight entrances is located above Samoëns at an elevation of 7,428 feet (2,264 m). The original entrance was discovered by the Groupe Vulcain (from Lyon, France) in 1964. The later discovery of higher entrances and successive cave dives that penetrated past water sumps resulted in a total depth for the cave of 5,036 feet (1,535 m). The total length of Jean Bernard is 11.1 miles (17.9 km).

Jean de Paris: *see* Perréal, Jean.

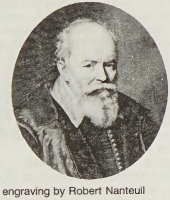
Jean Paul, pseudonym of JOHANN PAUL FRIEDRICH RICHTER (b. March 21, 1763, Wunsiedel, Principality of Bayreuth [Germany]—d. Nov. 14, 1825, Bayreuth, Bavaria), German novelist and humorist whose works were immensely popular in the first 20 years of the 19th century. His pen name, Jean Paul, reflected his admiration for the French writer Jean-Jacques Rousseau. Jean Paul's writing bridged the shift in literature from the formal ideals of Weimar Classicism to the intuitive transcendentalism of early Romanticism.

Jean Paul, the son of a poor teacher and pastor, studied theology at Leipzig but soon gave up his studies for freelance writing. He published two collections of satiric essays in the style of Jonathan Swift, *Grönländische Prozesse* (1783; *The Greenland Lawsuits*) and *Auswahl aus des Teufels Papieren* (1789; "Selection from the Devil's Papers"), but these were unsuccessful, and he was forced to support himself as a private tutor (1787–90) and schoolmaster (1790–94). About 1790 a personal crisis prompted him to forsake bitter satire for sentimental humour in his writings, and Laurence Sterne replaced Swift as his model. His reputation began with the sentimental novel *Die unsichtbare Loge,* 2 parts (1793; *The Invisible Lodge*), and was established by *Hesperus* (1795). He became a celebrity and was lionized by the critic Johann Herder and by a patron, Frau von Kalb, who brought him to Weimar. In 1801 he married Karoline Mayer and in 1804 settled in Bayreuth, his home for the rest of his life.

The second period in Jean Paul's work is marked by his attempts to reconcile the comic satirist and the sentimental enthusiast in himself. The novels of this period include *Blumen-, Frucht-, und Dornenstücke,* 3 vol. (1796; *Flower, Fruit and Thorn Pieces*), commonly known as *Siebenkäs,* for its hero; *Leben des Quintus Fixlein* (1796; "Life of Quintus Fixlein"); *Titan,* 4 vol. (1800–03), which he considered his classical masterpiece; and the unfinished *Flegeljahre,* 4 vol. (1804–05; "Adolescence," Eng. trans. *Walt and Vult*).

The novels of his third period mirror his disillusionment with both Classicism and Romanticism. But his idyllic novels, always marked by humour, treat his predicament in a comic style. The forced figurative style of his earliest books had become second nature by this

time; he thought, talked, and wrote wittily. *Dr. Katzenbergers Badereise,* 2 vol. (1809; "Dr. Katzenberger's Journey to the Spa"), and *Des Feldpredigers Schmelzle Reise nach Flätz* (1809; *Army Chaplain Schmelzle's Journey to Flätz*) were the last of his extremely popular novels. In 1808 he received a pension from Prince Karl Theodore von Dalberg, later paid by the Bavarian government, which guaranteed him financial security. He continued to write novels and treatises on education and aesthetics.



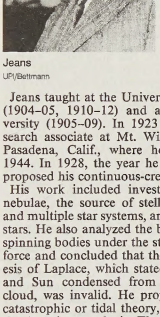
Jean Paul's novels are peculiar combinations of sentiment, irony, and humour expressed in a highly subjective and involuted prose style that is marked by rapid transitions of mood. His books are formless, lacking in action, and studded with whimsical digressions, but to some extent they are redeemed by the author's profuse imagination and equal capacity for realistic detail and dreamlike fantasy. One favourite theme is the tragicomic clash between the soul's infinite aspirations and the trivial restrictions of everyday life. Jean Paul greatly influenced his contemporaries by his simple piety, humanity and warmth, his religious attitude toward nature, and his beguiling mixture of sentimentality, fantasy, and humour. After the mid-19th century the unevenness and undisciplined form of his novels began to detract rather than add to his reputation, but the deep humanity of his finest works has preserved them from oblivion.

Jeanne (French personal name): *see under* Joan.

Jeanneret, Charles-Édouard (architect): *see* Corbusier, Le.

Jeannin, Pierre (b. *c.* 1540, Autun, Burgundy, France—d. 1622, Paris), statesman who served as one of King Henry IV's most influential advisers in the years after the French civil wars (ended 1598).

A pupil of the humanist legal scholar Jacques Cujas at Bourges, Jeannin became an advocate in the Parlement (high court) of Burgundy in 1569 and its president in 1579. He opposed in vain the extension into his province of the massacre of Protestants begun



Jeannin, engraving by Robert Nanteuil
By courtesy of the Bibliotheque Nationale, Paris

on St. Bartholomew's Day, 1572. As a Roman Catholic, he supported Charles of Lorraine against Henry of Navarre (later Henry IV of France) and even went to Spain as an envoy for the Catholic League (1591). He worked, however, for the reconciliation of Charles and Henry, and he transferred his loyalty to Henry after the victory of Fontaine-Française (1595). By this time Henry, rightful king of France since 1589, had also abjured Protestantism, making Jeannin's switch easier. A member of the Council of State, he took a leading role in the politics of the new regime; for example, in negotiating the Treaty of Lyon with Savoy (1601) and as ambassador to the United Provinces (1607–09). After the assassination of Henry IV (1610), he was controller-general of finances for Marie de Médicis and regent for her son, King Louis XIII, until his dismissal in 1616. He was recalled to the government after the disgrace of Marie de Médicis (1617).

jeans, also called BLUE JEANS, DUNGAREES, DENIMS, or LEVI'S, trousers originally designed in the United States by Levi Strauss in the mid-19th century as durable work clothes, with the seams and other points of stress reinforced with small copper rivets. They were eventually adopted by workingmen throughout the United States and then worldwide.

Jeans are particularly identified as a standard item of "Western" apparel worn by the American cowboy. After the mid-20th century, various adaptations became internationally a characteristic part of clothing for both men and women. *See also* denim; Levi Strauss & Co.

Jeans, Sir James, in full SIR JAMES HOPWOOD JEANS (b. Sept. 11, 1877, London, Eng.—d. Sept. 16, 1946, Dorking, Surrey), English physicist and mathematician who was the first to propose that matter is continuously created throughout the universe. He made other innovations in astronomical theory but is perhaps best known as a writer of popular books about astronomy.

Jeans
UPI/Bettmann

Jeans taught at the University of Cambridge (1904–05, 1910–12) and at Princeton University (1905–09). In 1923 he became a research associate at Mt. Wilson Observatory, Pasadena, Calif., where he remained until 1944. In 1928, the year he was knighted, he proposed his continuous-creation theory.

His work included investigations of spiral nebulae, the source of stellar energy, binary and multiple star systems, and giant and dwarf stars. He also analyzed the breakup of rapidly spinning bodies under the stress of centrifugal force and concluded that the nebular hypothesis of Laplace, which stated that the planets and Sun condensed from a single gaseous cloud, was invalid. He proposed instead the catastrophic or tidal theory, first suggested by the American geologist Thomas C. Chamberlin. According to this theory, a star narrowly missed colliding with the Sun and, in its passing, drew away from the Sun stellar debris that condensed to form the planets.

Jeans applied mathematics to problems in thermodynamics and radiant heat and wrote on other aspects of radiation. Among his many popular books, perhaps his best were *The Universe Around Us* (1929) and *Through Space and Time* (1934). His important technical works include *The Dynamical Theory of Gases* (1904), *Theoretical Mechanics* (1906), *The Mathematical Theory of Electricity and Magnetism* (1908), and *Introduction to the Kinetic Theory of Gases* (1940).

Jebavý, Václav: *see* Březina, Otakar.

Jebb, John (b. Feb. 16, 1736, Ireland—d. March 2, 1786, London, Eng.), British political, religious, and social reformer who championed humanitarian and constitutional causes far in advance of his time.

Educated at Trinity College, Dublin, and Peterhouse, Cambridge, he was ordained in 1763 and thereafter lectured on mathematics at Cambridge. His lectures on the Greek New Testament, begun in 1768, became controversial when he developed Unitarian views. His religious differences subsequently broadened to include opposition to mandatory clerical and university subscription to the Thirty-nine Articles and the Anglican liturgy and support for rational religion and religious toleration. His proposals in 1773–74 for annual public examinations of undergraduates were narrowly rejected at Cambridge. Following the resignation of his ecclesiastical livings on conscientious grounds in 1775, Jebb studied medicine, receiving the M.D. from St. Andrews and membership in the London College of Physicians in 1777.

In politics Jebb advocated a reform program that embraced universal suffrage, the secret ballot, equal single-member constituencies, and salaries but no property qualifications for members of Parliament. He began working actively for political reform in 1779, joining the Westminster Committee and helping establish the Society for Constitutional Information in 1780. His concern for prison reform is reflected in his *Thoughts on the Construction and Polity of Prisons* (1786). Jebb also championed the use of juries in libel cases, female equality, and medical education for laymen.

Jebba, town, Kwara state, western Nigeria. It lies on the south bank and at the natural head of navigation of the Niger River, 550 miles (885 km) from the sea. It is populated by the predominantly Muslim Nupe people, whose kingdom, refounded by Tsoede, flourished in the region in the early 16th century. From this period date the noted Jebba bronzes. The island of Jebba in the Niger River still retains a traditional Nupe settlement.

The town was reached by the Scottish explorer Mungo Park, who was shipwrecked and drowned in the Bussa Rapids north of Jebba about 1806 and whose monument now stands on Jebba Island. From 1886 to 1900 Jebba was the northern limit of the territory governed by the Royal Niger Company. From 1898 to 1902 it served as headquarters for Sir Frederick Lugard's West African Frontier Force and was thus the first capital of the British protectorate of Northern Nigeria from 1900 to 1902.

The Lagos-Ibadan railway was extended to Jebba in 1909 and was linked with the Kano-Baro line by the construction of a two-section railway bridge (with a total span of 1,795 feet [547 m]) over the Niger River in 1915. This new rail link fostered the development of Jebba as a trade and transport centre. Yams, corn (maize), cassava, sorghum, rice, shea nuts, and cattle are now the town's main agricultural products. Sugarcane is grown on the Bacita sugar estate (10 miles downriver) and refined at the nearby sugar factory. Jebba's local handicrafts include cotton weaving and pottery manufacture. There is also a pulp and paper factory located in the town. In 1984 a dam and hydroelectric power plant were completed at Jebba as part of the Niger Dams Project, which includes Kainji Dam and provides much of Nigeria's hydroelectric power. A four-lane highway bridge was constructed in the late 1970s to carry the south–north trunk highway from Lagos. Pop. (latest est.) 7,674.

Jebeil (Lebanon): *see* Byblos.

Jedburgh, royal burgh, Roxburgh district, Borders region, Scotland. It is situated on Jed Water, a tributary of the River Teviot, within 10 miles (16 km) of the English border. In the 9th century a church was built on the site of the present abbey. In 1118 the future king David I of Scotland founded a priory for Augustinian monks from Beauvais in France and elevated it in 1147 to the status of an abbey. The settlement was repeatedly damaged in border warfare with the English;

it was burned in 1523 and ruined again in 1544. The abbey was suppressed in 1559 and eventually purchased in 1637 by the 3rd earl of Lothian. In 1913 it was taken over by the National Monuments Commission.

Jedburgh Castle stood above the river at the southern end of the burgh. Also erected by David I, it was one of five fortresses ceded to England in 1174. It occasionally served as a royal residence but was so often captured by the English that it became a menace rather than a protection and was demolished in 1409. The site was occupied by the county prison, a Georgian building still known as the Castle.

In October 1566 Mary, Queen of Scots, stayed at a house in Queen Street which is now arranged as a museum, with many relics relating to the Queen. The proverbial "Jeddart justice," according to which a man was hanged first and tried afterward, seems to have been a hasty generalization from the solitary summary execution of a gang of rogues. The present town is a prosperous textile manufacturing centre, with electrical engineering industries, corn milling, tanning, and glove making. Pop. (1991) 4,118.

Jeddah (Saudi Arabia): *see* Jidda.

jeep, outstanding light vehicle of World War II. It was developed by the U.S. Army Quartermaster Corps and was an important item in lend-lease shipments to the Soviet Union and other allies. The jeep weighed 1¼ tons, was powered by a four-cylinder engine, and was classed as a quarter-ton truck in carrying capacity. Exceptionally sturdy, it was capable of operating on rough terrain thanks to its high clearance and four-wheel drive, climbing 60 percent grades and fording shallow streams.

On the road the jeep had a top speed of 65 miles (105 kilometres) per hour. It had a great variety of military uses, as a command car; reconnaissance car; light weapons, ammunition, and personnel carrier; and for many other purposes. It was sometimes armoured for combat missions (weasel) and was produced with a waterproof hull and propeller, giving it amphibious capabilities. Its name came from its military designation: vehicle, G.P. (general purpose). After World War II the jeep found wide applications in civilian life.

Jeffara (Africa): *see* Jifaah, al-.

Jefferies, Richard, in full JOHN RICHARD JEFFRIES (b. Nov. 6, 1848, near Swindon, Wiltshire, Eng.—d. Aug. 14, 1887, Goring-by-Sea, Sussex), English naturalist, novelist, and essayist whose prophetic vision was unappreciated in his own Victorian age but has been increasingly recognized and admired since his death. By combining detailed observation with a mystic apprehension of nature, he was a master both of a straightforward descriptive style and of a sensuous, poetic prose.

The son of a yeoman farmer, Jefferies in 1866 became a reporter on the *North Wilts Herald,* seeking escape whenever possible in the open space of the Wiltshire Downs. From these experiences came *Hodge and His Masters* (1880), a classic record of Victorian countrymen, from the landowner to the labourer. In 1872 he became famous for a 4,000-word letter to *The Times* about the Wiltshire agricultural labourer and his lot, containing such arresting detail that the London newspaper published it in full. Soon periodicals and papers (notably the *Pall Mall Gazette*) were publishing his sketches and articles.

In 1874 Jefferies married and in 1877 moved nearer to London—by this time supporting his wife and two children by writing. The years 1882 to his death in 1887 were his most creative, though he was both ill and poor. Outstanding are *Bevis: The Story of a Boy* (1882), one of the best boys' books in English, which includes memories of Coate Farm, his birthplace (now Richard Jefferies Museum), and its surrounding countryside; and *The Story of My Heart* (1883), his autobiography, which tells his dream of a fairer way of life than that he had seen in the slums of Swindon and London. In this late period also he wrote some moving essays in an introspective style, collected in *The Life of the Fields* (1884), *The Open Air* (1885), and *Field and Hedgerow* (1889). Earlier novels by Jefferies include *Dewy Morn,* 2 vol. (1884), and *Green Ferne Farm* (1880).

Jeffers, Robinson, in full JOHN ROBINSON JEFFERS (b. Jan. 10, 1887, Pittsburgh—d. Jan. 20, 1962, Carmel, Calif., U.S.), controversial U.S. poet of the 20th century, for whom all things except his pantheistically conceived God are transient and human life is a frantic, often contemptible struggle within a net of passions.

Educated in English literature, medicine, and forestry, Jeffers inherited money that allowed

Jeffers
By courtesy of Occidental College, Los Angeles

him to write poetry. His third book, *Tamar and Other Poems* (1924), which brought him immediate fame, revealed the unique style and eccentric ideas developed in such later volumes as *Cawdor* (1928), *Thurso's Landing* (1932), and *Be Angry at the Sun* (1941). The shorter lyrics as well as his sprawling narrative poems celebrate the coastal scenery near Carmel, where Jeffers and his wife moved in 1916. He made a brilliant adaptation of Euripides' *Medea* (produced in 1946).

BIBLIOGRAPHY. Melba Berry Bennett, *The Stone Mason of Tor House* (1966); and James Karman, *Robinson Jeffers,* rev. ed. (1995), are biographies.

Jefferson, Blind Lemon, byname of LEMON JEFFERSON (b. September 1893, Couchman, Texas, U.S.—d. December 1929, Chicago), U.S. country blues singer, guitarist, and songwriter, one of the earliest black folk-blues singers to achieve popular success.

Blind from early childhood and the youngest of seven children, Jefferson became an itinerant entertainer in his teens, learning a repertoire of prison songs, blues, moans, spirituals, and dance numbers. He worked in the streets and in brothels, saloons, and parties in Texas, Louisiana, Mississippi, Alabama, and Virginia. In the 1920s he went to Chicago.

Jefferson's high voice, shouting style, and advanced guitar technique, which used melodic lead lines, bent notes, and imitative effects, as well as his lyrics and themes, became staples of the blues through such disciples as Leadbelly (Huddie Ledbetter), who worked with Jefferson for a time, and through his recordings for the Paramount label (1925–29). Jefferson also recorded spiritual songs, using the pseudonym Deacon LJ Bates. Information on his death (in Chicago on an undetermined date in late December 1929) is vague; varying accounts suggest that he may have frozen to death, suffered a heart attack, or been the victim of robbery and murder.

Jefferson's remains lay in an unmarked plot in the Wortham (Texas) Negro Cemetery until a metal marker was placed there in 1967; it was replaced by a granite headstone on Feb. 6, 1997. During fundraising for the permanent marker, research conducted into Jefferson's life determined that his more likely date of birth was in September 1893, rather than July 1897, as had been reported in all previous sources.

Jefferson, Joseph (b. Feb. 20, 1829, Philadelphia—d. April 23, 1905, Palm Beach, Fla., U.S.), U.S. actor who became identified with the character of Rip Van Winkle.

The third actor of this name in a family of actors and managers, Jefferson completely eclipsed his forebears. He made his stage debut at the age of three in Kotzebue's *Pizarro,* and, after years of struggle as a travelling actor and manager, Jefferson achieved his first important success in Tom Taylor's *Our American Cousin* (1858), a play that was the turning point in his career. Other plays acted by Jefferson in those years included Dion Boucicault's *Octoroon* (1859), but his Bob Acres in *The Rivals* by Richard Sheridan, although very successful, was more Jefferson's creation than the author's.

In 1859 Jefferson made a stage adaptation of Washington Irving's *Rip Van Winkle,* which was only moderately successful. While in England in 1865 he commissioned Boucicault to write another version, and this, along with minor improvements incorporated over the years, was the final one. As Rip, Jefferson delighted London audiences for 170 consecutive nights, and he brought the play to America in 1866. After 1865 he created no new roles, as his public never tired of the delightful and sensitive characterization of Rip. He did, however, revive earlier plays in which he had appeared. Through the late 19th century Jefferson remained at a peak of popularity.

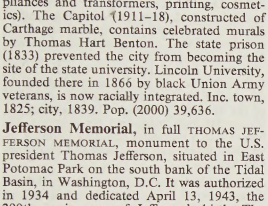
The friend of many leading figures in politics, art, and literature, Jefferson brought dignity to the stage. Jefferson's *Autobiography* (1890) is written with spirit and humour, and its judgments with regard to the art of the actor and the playwright place it beside Colley Cibber's *Apology.*

Jefferson, Thomas (b. April 13 [April 2, Old Style], 1743, Shadwell, Va.—d. July 4, 1826, Monticello, Va., U.S.), third president of the United States (1801–09) and first secretary of state (1789–94), who was the principal author of the Declaration of Independence and an influential political leader and philosopher.

A brief account of the life and works of Thomas Jefferson follows; for a full biography, *see* MACROPAEDIA: Jefferson.

Jefferson, a wealthy Virginia planter, began his political career as a member of the House of Burgesses (1769). He was sent to Philadelphia as a member of the Virginia delegation to the Second Continental Congress (1775) and in the following year was called on to draft the Declaration of Independence.

Returning to the Virginia legislature (1776), he instituted democratic reforms of the state's laws. He served as governor of Virginia (1779–81); published his only book, *Notes on Virginia,* and returned to the Continental Congress (1782); and served on diplomatic missions in Europe (1784–89). Jefferson became U.S. secretary of state and was embroiled in a political controversy with Alexander Hamilton. Assuming the office of the presidency in 1801, he acquired Louisiana for the United States (1803) and sought to avoid involvement in the Napoleonic Wars. Jefferson retired to his plantation, "Monticello," in 1809 and devoted himself to the establishment of the University of Virginia (1819). He was an extraordinarily learned man whose interests in the arts and sciences were wide-ranging. His relationship with one of his slaves, Sally Hemings, became the subject of controversy in 1998.



Jefferson City, capital of Missouri, U.S., and seat of Cole County, on the Missouri River, near the geographical centre of the state. The site for the state capital was selected in 1821. The land had been donated under an act of

Governor's mansion, Jefferson City, Mo.
Alan Pitcairn from Grant Heilman

the U.S. Congress that specified it be within 40 miles (64 km) of the mouth of the Osage River. Named for President Thomas Jefferson, it was laid out by Daniel M. Boone, son of the Kentucky frontiersman. Loyalties were divided during the American Civil War, but the city remained in the Union. Jefferson City is the trading centre for surrounding farmlands and has diversified manufacturing (electric appliances and transformers, printing, cosmetics). The Capitol (1911–18), constructed of Carthage marble, contains celebrated murals by Thomas Hart Benton. The state prison (1833) prevented the city from becoming the site of the state university. Lincoln University, founded there in 1866 by black Union Army veterans, is now racially integrated. Inc. town, 1825; city, 1839. Pop. (2000) 39,636.

Jefferson Memorial, in full THOMAS JEFFERSON MEMORIAL, monument to the U.S. president Thomas Jefferson, situated in East Potomac Park on the south bank of the Tidal Basin, in Washington, D.C. It was authorized in 1934 and dedicated April 13, 1943, the 200th anniversary of Jefferson's birth. The

Jefferson Memorial, Washington, D.C.
David W. Corson from A. Devaney, New York

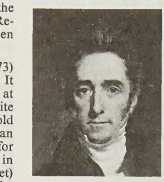
memorial, set in 18 acres (7 hectares), is a unit of the National Capital Parks and is sited on a line with the south axis of the White House. The circular-colonnaded structure, designed by John R. Pope, Otto R. Eggers, and Daniel P. Higgins, was built in the classical style that Jefferson preferred. The pediment over the portico depicts Jefferson reading his draft of the Declaration of Independence. In the centre of the domed, marble-lined interior is a heroic bronze figure of Jefferson sculpted by Rudulph Evans; inscriptions of Jefferson's writings appear on the four interior panels and frieze.

The memorial appears in its most picturesque setting in early spring when the Oriental cherry trees, encircling the Tidal Basin, are in bloom.

Jefferson River, river, most westerly of the Missouri River's three headstreams, rising in the Gravelly Range in southwestern Montana, U.S., near the Continental Divide and Yellowstone National Park (where it is known as Red Rock River). It flows west through Red Rock Pass and Upper and Lower Red Rock lakes, then north past Dillon (where it becomes the Beaverhead River) to Twin Bridges, where it is joined by the Big Hole and Ruby rivers; it then continues northeast as the Jefferson River. After a course of 225 miles (362 km) to a point just northeast of Three Forks, the Jefferson joins the Madison and Gallatin rivers to form the Missouri River. It was named for President Thomas Jefferson.

Jeffersonian Republican, member of the early U.S. political party known as the Republican Party (*q.v.*), active mainly between 1801 and 1825.

Jeffersonville, city, seat (1802–10; 1873) of Clark county, southern Indiana, U.S. It lies along the Ohio River (there bridged) at the head of the Falls of the Ohio, opposite Louisville, Ky. Built on land occupied by old Fort Steuben, it was laid out in 1802 on a plan suggested by President Thomas Jefferson, for whom it was named. The city prospered in the 19th century as a steamboat (river packet) building centre, turning out many paddle-wheelers, including the renowned *Natchez* and *J.M. White,* but in 1937 it was inundated by river floodwaters. Located in an industrial and agricultural (grain, strawberries, tobacco) area, Jeffersonville is a barge terminal for river transportation and has shipyards. Fifty years after the last of the packet boats was built, Jeffersonville produced the largest river steamboat ever made, the 382-foot (116-metre) *Mississippi Queen,* commissioned in 1976 for luxury overnight cruises. The city also has foundries, chemical and aluminum plants, and a soap factory. Louisville Slugger baseball bats are made there. It is the site of the Howard Steamboat Museum. Inc. town, 1815; city, 1830. Pop. (2000) 27,362.



Jeffrey, Edward Charles (b. May 21, 1866, St. Catherines, Ont., Can.—d. April 19, 1952, Cambridge, Mass., U.S.), Canadian-American botanist who worked on the morphology and phylogeny of vascular plants.

While a lecturer at the University of Toronto (1892–1902), Jeffrey established his reputation with a series of articles published from 1899 to 1905 on the comparative anatomy and phylogeny of different vascular plant groups. Taking a leave of absence from Toronto, Jeffrey received his Ph.D. from Harvard University (1899), where he would later serve as professor of plant morphology (1907–33).

Charles Darwin's *Origin of Species* led Jeffrey to interpret the form and structure of plants historically and to use comparative morphology and anatomy to provide evidence of specific evolutions. In 1899 Jeffrey reclassified all vascular plants into Lycopsida and Pteropsida; while later classifications have refined plant groupings, these two divisions remain as two of the four classes of vascular plants. His work on lycopsids furthered the investigation of the morphology and evolutionary trends in primitive vascular plants. Jeffrey's *The Anatomy of Woody Plants* (1917), an anatomical evolutionary overview, was an important work in its field. In *Coal and Civilization* (1925) he demonstrated that coal has a vegetable origin.

Jeffrey, Francis Jeffrey, Lord (b. Oct. 23, 1773, Edinburgh, Scot.—d. Jan. 26, 1850, Edinburgh), literary critic and Scottish judge, best known as the editor of *The Edinburgh Review,* a quarterly that was the preeminent organ of British political and literary criticism in the early 19th century.

Educated at the universities of Glasgow and Edinburgh, from 1791 to 1792 he attended Queen's College, Oxford. Admitted in 1794 to the Scottish bar, he discovered that his liberal Whig politics hampered his professional advancement. In 1802, still struggling for success in law, Jeffrey joined with Sydney Smith and other friends to establish a liberal critical periodical, *The Edinburgh Review.* Jeffrey served as editor from 1803 until 1829, after which he continued to contribute essays on criticism, biography, politics, and ethics. Jeffrey's personal bias against Romanticism was evident in his sarcastic critical attacks on William Wordsworth, the other Lake poets, and Lord Byron. In 1830 the Whig Party, which *The*

Jeffrey, detail of an oil painting by Colvin Smith, *c.* 1830, in the Scottish National Portrait Gallery, Edinburgh
By courtesy of the Scottish National Portrait Gallery, Edinburgh

Edinburgh Review had powerfully supported, came into office; and Jeffrey, who had built up a reputation as an advocate, was appointed lord advocate. As a member of the House of Commons, he introduced the Scottish Reform Bill in 1831. In 1834 he was made a judge and assumed the title of Lord Jeffrey.

Jeffreys, Sir Harold (b. April 22, 1891, Fatfield, Durham, Eng.—d. March 18, 1989), British astronomer and geophysicist noted for his wide variety of scientific contributions.

Jeffreys was educated at Armstrong College, Newcastle-upon-Tyne (D.Sc., 1917), and St. John's College, Cambridge (M.A., 1917), and was a fellow at St. John's from 1914. He served in the Meteorological Office (1917–22), lectured in mathematics at Cambridge (1923–32), was reader in geophysics at Cambridge (1932–46), and was the university's Plumian professor of astronomy (1945–58). He was knighted in 1953.

Sir Harold Jeffreys
Camera Press

In his work in astronomy, Jeffreys established that the four large outer planets (Jupiter, Saturn, Uranus, and Neptune) are very cold and devised early models of their planetary structure. His other astronomical work includes research into the origin of the solar system and the theory of the variation of latitude.

In geophysics he investigated the thermal history of the Earth, was coauthor (1940) of the standard tables of travel times for earthquake waves, and was the first to hypothesize that the Earth's core is liquid. He explained the origin of monsoons and sea breezes and showed how cyclones are vital to the general circulation of the atmosphere. Jeffreys also worked on probability theory and on methods of general mathematical physics.

Jeffreys' honours included the Gold Medal of the Royal Astronomical Society (1937) and the Royal Medal of the Royal Society of London (1948). Among his principal works are

The Earth: Its Origin, History and Physical Constitution (1924, 6th ed. 1976), *Scientific Inference* (1931, 2nd ed. 1957), *Earthquakes and Mountains* (1935, 2nd ed. 1950), and *Methods of Mathematical Physics,* with Bertha S. Jeffreys (1946, 3rd ed. 1962). The *Collected Papers of Sir Harold Jeffreys* was published in six volumes from 1971 to 1977.

Jeffreys (of Wem), George Jeffreys, 1st Baron (b. May 15, 1645?, Acton, Denbighshire, Wales—d. April 18, 1689, London), English judge notorious for his cruelty and corruption. He presided over the "Bloody Assizes" of 1685 following the failure of the

George Jeffreys, detail of an oil painting attributed to H. Claret; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Duke of Monmouth's rebellion and was in charge of executing the unpopular religious policy of the Roman Catholic king James II.

Born into the Welsh gentry, Jeffreys was admitted to the bar in 1668, and in 1677 he obtained an appointment as solicitor general to Charles II's Roman Catholic brother James, duke of York (later James II). During the panic that followed Titus Oates's fabricated revelations (1678) of a popish plot against the government, Jeffreys served as a prosecuting counsel or judge in many of the trials of suspected Catholic conspirators. He earned notoriety by savagely ridiculing and bullying the defendants.

Despite his Protestantism and his role as a prosecutor of Catholics, Jeffreys became increasingly prominent in the court party of Charles and James. In 1680 he fought against the Exclusion Bill, which would have prevented James from succeeding to the throne, and in 1683 he became lord chief justice. Meanwhile, he served as prosecutor and judge, respectively, in the treason trials of Lord William Russell and Algernon Sidney. Although the evidence against these two Whig defendants was flimsy, Jeffreys had them convicted and executed. He sentenced Titus Oates to a severe flogging and imprisonment in May 1685, and in the same month James II made him Baron Jeffreys of Wem.

During the "Bloody Assizes" that followed the collapse (July 1685) of the insurrection of James Scott, duke of Monmouth, Jeffreys prosecuted the rebels with ferocity, executing perhaps 150 to 200 persons and ordering hundreds of others sold into slavery in the colonies. At the same time, he profited by extorting money from the victims. Nevertheless, James II made him lord chancellor in September 1685. As one of the most influential royal advisers, Jeffreys took charge of the ecclesiastical commission that forced the Church of England to accept James's pro-Catholic policies. When William of Orange, stadholder of Holland (later King William III), overthrew James's government in December 1688, Jeffreys tried to escape from the country disguised as a sailor, but he was arrested and died four months later in the Tower of London. G.W. Keeton's *Lord Chancellor Jeffreys* was published in 1965.

Jeffries, James Jackson, byname THE BOILERMAKER (b. April 15, 1875, Carroll, Ohio, U.S.—d. March 3, 1953, Burbank, Calif.), world heavyweight boxing champion from June 9, 1899, when he knocked out Robert Fitzsimmons in 11 rounds at Coney Island, New York City, until 1905, when he retired undefeated. He was 6 feet, 2½ inches tall and his fighting weight was 220 pounds. Among his six successful title defenses were two knockouts of former champion James J. Corbett and a second victory over Fitzsimmons. After several years in retirement, Jeffries as "The Great White Hope" attempted to regain the championship, but was knocked out by Jack Johnson in 15 rounds at Reno, Nev., July 4, 1910.

Jegorjevsk (Russia): *see* Yegoryevsk.

jehad (Islām): *see* jihād.

Jehangir (emperor of India): *see* Jahāngīr.

Jehoahaz (king of Judah): *see* Ahaz.

Jehoiachin, also spelled JOACHIN, Hebrew JOIACHIN, in the Old Testament (II Kings 24), son of King Jehoiakim and king of Judah. He came to the throne at the age of 18 in the midst of the Chaldean invasion of Judah and reigned three months. He was forced to surrender to Nebuchadrezzar II and was taken to Babylon (597 BC), along with 10,000 of his subjects. Nearly 40 years later Nebuchadrezzar died, and his successor released Jehoiachin.

Jehoiakim, also spelled JOAKIM, in the Old Testament (II Kings 23:34–24:17; Jer. 22:13–19; II Chron. 36:4–8), son of King Josiah and king of Judah (*c.* 609–598 BC). When Josiah died at Megiddo, his younger son, Jehoahaz (or Shallum), was chosen king by the Judahites, but the Egyptian conqueror Necho took Jehoahaz to Egypt and made Jehoiakim king. Jehoiakim reigned under the protection of Necho for some time and paid heavy tribute. When the new Chaldean Empire under Nebuchadrezzar II defeated Egypt at the Battle of Carchemish (605), however, Jehoiakim changed his allegiance from the Egyptian king to Nebuchadrezzar. He remained loyal for three years and then revolted against Nebuchadrezzar. After several battles and invasions, Nebuchadrezzar led the decisive invasion against Judah and besieged Jerusalem (598). Jehoiakim died at this time, but the circumstances of his death remain uncertain.

Jehol Uplands, Wade–Giles romanization CH'ENG-TE P'ING-YÜAN, Pinyin CHENGDE PINGYUAN, region of extremely complex and rugged topography in southwestern Liaoning and northeastern Hopeh provinces, China. The area is mostly composed of Precambrian granites, gneiss, and crystalline shales, with some later, Mesozoic, sedimentary rocks. Extensively folded along a northeast to southwest axis, the area is also extensively faulted along the same general structural lines, resulting in relatively recent outpourings of basalts and lavas, particularly in the upper part of the region. Generally, the upland descends in steplike formations from the high plateau area near Wei-ch'ang (Hopeh) and from the ranges forming the watershed of the interior drainage areas of the Inner Mongolian Autonomous Region (which reach altitudes of some 5,900–6,500 ft [1,800–2,000 m]), down to the Chien-sheng and Nu-lu-erh-hu mountain ranges (about 3,950 ft in height), and finally to the Sung Ling (range), running parallel to the coast of the Gulf of Chihli (Po Hai) at an average height of 1,600–1,700 ft. This general structure is complicated, especially in the southwest, by a number of minor ranges with a northwest to southeast orientation, and the whole area is deeply dissected by a complex river system. The topography is extremely rugged. Apart from the coastal region, the area falls into the drainage area either of the Luan Ho (river) or of the western tributaries (the Liao Ho, the Lao-ha Ho, and the Ta-ling Ho). Originally the area, which is rather dry, especially in the northwest, had a cover of mixed deciduous and coniferous forest gradually merging into steppe (grassy plains) in the northwest. Most of the forest cover, however, was long ago destroyed, leaving a barren landscape of grassland and scrub.

Jehoram, also called JORAM, Hebrew YEHORAM, or YORAM, one of two contemporary Old Testament kings.

Jehoram, the son of Ahab and Jezebel and king (*c.* 853–*c.* 842 BC) of Israel, maintained close relations with Judah. Together with Jehoshaphat, king of Judah, Jehoram unsuccessfully attempted to subdue a revolt of Moab against Israel. As had his father, Jehoram later endeavoured to recover Ramoth-gilead from Hazael, king of Damascus. In this matter he was aided by his nephew Ahaziah, then king of Judah. Wounded during the fighting at Ramoth-gilead, Jehoram retired to Jezreel in Judah. During his convalescence a revolution took place and Jehu was anointed king at Ramoth-gilead. Jehu then put to death all the members of Ahab's family including Jehoram, Jezebel, and Ahaziah.

Jehoram, son of Jehoshaphat and king (*c.* 850–*c.* 843 BC) of Judah, married Athaliah, daughter of Ahab, and was thus brother-in-law of the Jehoram of Israel. On ascending the throne Jehoram massacred his kinsmen. He had to face a successful revolt by Edom, a revolt by Libnak, and an invasion of Philistines and Arabs.

Jehoshaphat, also called JOSAPHAT, Hebrew YEHOSHAPHAT, king (*c.* 874–*c.* 850 BC) of Judah during the reigns in Israel of Ahab, Ahaziah, and Jehoram, with whom he maintained close political and economic alliances. Jehoshaphat aided Ahab in his unsuccessful attempt to recapture the city of Ramoth-gilead, joined Ahaziah in extending maritime trade, helped Jehoram in his battle with Moab, and married his son and successor, Jehoram, to Athaliah, a daughter of Ahab. In Judah he reorganized the army and attempted to centralize political power through a series of religious and legal reforms.

Jehovah, Judeo-Christian name for God, derived from Yahweh (*q.v.*).

Jehovah's Witnesses, a millennialist group that developed within the larger 19th-century Adventist movement in the United States and has since spread worldwide. It is an outgrowth of the International Bible Students Association, incorporated in 1872 in Pittsburgh, Pa., by Charles Taze Russell, who adopted a non-Trinitarian theology that denied the divinity of Jesus. He also taught that the millennial kingdom would be established in 1914.

The name Jehovah's Witnesses was adopted in 1931 by Russell's successor, Joseph Franklin Rutherford (Judge Rutherford; 1869–1942), who sought to reaffirm Jehovah (*see* Yahweh) as the true God and to identify those who witness in this name as God's specially accredited followers. Rutherford equipped members with portable phonographs to play his "sermonettes" on the front porches and in the living rooms of prospective converts. Under his leadership, the democratic polity devised by Russell was replaced by a theocratic system directed from the society's headquarters in Brooklyn, N.Y.

Rutherford's policies were continued under his successor, Nathan Homer Knorr (1905–77), who established the Watch Tower Bible School of Gilead (South Lansing, N.Y.) to train missionaries and leaders, decreed that all the society's books and articles be pub-

lished anonymously, and set up adult education programs to train Witnesses to deliver their own apologetical talks. Under Knorr's direction a group of Witnesses produced a new translation of the Bible. Knorr was succeeded by Frederick W. Franz (1893–1992) and then by Milton G. Henschel as president of the group.

The Witnesses have little or no association with other denominations and maintain complete separation from all secular governments on biblical grounds. They do not salute the flag of any nation (believing this to be an act of false worship) and refuse to perform military service or participate in public elections—policies that have brought them under government scrutiny. During World War I, the U.S. government imprisoned Rutherford and other Watch Tower leaders for sedition. In Germany prior to World War II, the Nazis placed members in concentration camps, and even Allied countries persecuted Witnesses. After the war, however, Witnesses brought lawsuits that resulted in 59 U.S. Supreme Court rulings in favour of religious freedom. Nonetheless, they continue to be persecuted for their refusal to serve in the military and are often derided for their door-to-door evangelism.

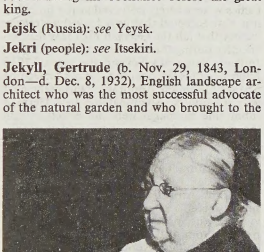
The Witnesses' distrust of contemporary institutions also has led the movement to distance itself from other religious groups and to disavow terms like *minister* and *church*. Moreover, because of the scriptural prohibition against drinking blood (Genesis 9:3, 4; Leviticus 17:14; Acts 15:28, 29), the movement opposes the modern medical practice of blood transfusions, a source of further controversy, especially in cases involving children.

Witnesses hold a number of traditional Christian views but also many that are unique. While they affirm the primacy of God (Jehovah) and that salvation is offered through God's agent, Jesus Christ, Witnesses further believe that humanity is experiencing the Last Days. They look forward to the imminent establishment of God's kingdom on Earth, which will be ruled by Christ and jointly administered by 144,000 humans (Revelation 7:4). According to the movement's doctrine, those who acknowledge Jehovah in this life will become members of this millennial kingdom; those who reject him will not go to a literal hell but will face extinction. New members are baptized by immersion and expected to live by a strict moral code of conduct. Marriage is considered a holy covenant and divorce is disapproved except in cases of adultery.

Most members of a local congregation, or "company," are kingdom publishers, who are expected to spend five hours a week at meetings in a Kingdom Hall and spend as much time as circumstances permit in doorstep preaching. Pioneer publishers hold part-time secular jobs and try to devote 100 hours a month to religious service. Special pioneers are full-time, salaried employees of the society who should spend at least 150 hours a month in this work. Each Kingdom Hall has an assigned territory and each Witness a particular neighbourhood to canvass. The group takes great pains to keep records of the number of visits, back calls, Bible classes, and books and magazines distributed.

Publishing activities include books, tracts, recordings, and periodicals, chief among which are a semimonthly magazine, the *Watchtower*, and its companion publication, *Awake!*, which are translated into more than 80 languages. Work is carried out in more than 230 countries by approximately six million Witnesses.

Of the three corporations that direct the activities of Jehovah's Witnesses, the most powerful is the Watch Tower Bible and Tract Society of Pennsylvania founded by Russell in 1884. The other two corporations are the Watch Tower Bible and Tract Society, Inc., of New York and the International Bible Students Association.



Jehu, Hebrew YEHU, king (*c.* 842–815 BC) of Israel. He was a commander of chariots for the king of Israel, Ahab, and his son Jehoram, on Israel's frontier facing Damascus and Assyria. Ahab, son of King Omri, was eventually killed in a war with Assyria; during Jehoram's rule, Jehu accepted the invitation of the prophet Elisha, Elijah's successor, to lead a coup to overthrow the dynasty of Omri (II Kings 9–10). The prophetic party, headed by Elisha, was an old adversary of the royal house, as shown by the stories of Ahab and Elijah (I Kings 17–19). King Omri had built Samaria, and, thanks to an alliance with the Phoenicians, he and Ahab had brought the northern kingdom to the peak of its economic, political, and military strength. These advances came, however, at a price of religious syncretism and socioeconomic polarization the prophets considered fatal for the community's religious and human future.

Jehu's revolt, which extinguished the dynasty of Omri (including Jehoram and Ahab's wife, Jezebel), took place at a time when the dynasty was already in decline. The narrator in II Kings is clearly in favour of Jehu; his enthusiastic recital of the gruesome details of Jezebel's death (9:30–37) mirror the élan of a holy war. Within a century the prophet Hosea would cite the bloodbath in Jezreel, capital of the northern kingdom of Israel, as reason for the imminent end of the kingdom (1:4–5). Jehu's success ended the Phoenician alliance, and the spirit of fanaticism made its renewal impossible. Israel alone was no match for the incursions of Shalmeneser III, king of Assyria, who moved westward in 841 BC, investing Damascus and exacting tribute both from Jezebel's city of Sidon and from Jehu. The second scene in the famous Black Obelisk in the British Museum shows Jehu making his obeisance before the great king.

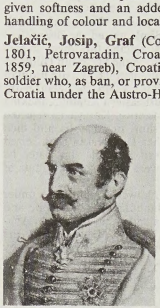
Jekyll, Gertrude (b. Nov. 29, 1843, London—d. Dec. 8, 1932), English landscape architect who was the most successful advocate of the natural garden and who brought to the



Gertrude Jekyll, oil painting by Sir William Nicholson, 1920; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

theories of her colleague William Robinson a cultivated sensibility he lacked.

Born of a prosperous family, Jekyll was educated in music and painting and travelled in the Greek islands, where she studied architecture and history. Her chief interest was in painting until 1891, when her sight gave her trouble, and she applied herself wholeheartedly to gardening instead. Her taste was for the simplicity and orderly disorder of cottage gardens. She worked journalistically with Robinson and wrote a number of successful books, but her great contribution to the art was in the gardens she designed in association with the architect Sir Edwin Lutyens. Together they produced a new type of architectural garden in which the skeleton planned by Lutyens was given softness and an added rhythm by her handling of colour and local forms.

Jelačić, Josip, Graf (Count) (b. Oct. 16, 1801, Petrovaradin, Croatia—d. May 19, 1859, near Zagreb), Croatian politician and soldier who, as ban, or provincial governor, of Croatia under the Austro-Hungarian Empire,

Jelačić, lithograph by Josef Kriehuber, 1849
By courtesy of the Bild-Archiv, Österreichische Nationalbibliothek, Vienna

helped crush the Hungarian nationalist revolt against the empire in 1848.

As a young Austrian officer he served in Italy and Bosnia. In March 1848, when the nationalists were taking control of Hungary, the imperial government promoted Jelačić lieutenant general and appointed him ban and military commander in chief of Croatia. He immediately occupied the major Croatian port, Rijeka (Fiume). At his insistence, in support of the imperial government, the Croatian Diet proclaimed Croatia's independence from the nationalist government of Hungary. This separatism was condemned by the Austrian government, however, and on June 19 Jelačić was dismissed from office. As the imperial government gained power against the Hungarian nationalists, the emperor Ferdinand reinstated him, and Jelačić led imperial troops into Hungary in September. At Schwechat (now in Austria) in October 1848, the Ban defeated Artúr Görgey, leader of the nationalist troops, contributing much to putting down the revolution.

Jelačić was created count in 1855. He remained governor of Croatia, docilely accepting Habsburg absolutism.

Jelālī Revolts, Jelālī also spelled CELĀLI, rebellions in Anatolia against the Ottoman Empire in the 16th and 17th centuries. The first revolt occurred (1519) near Tokat under the leadership of Celâl, a preacher of Shī'ah Islām. Major revolts later occurred in 1526–28, 1595–1610, 1654–55, and 1658–59.

The major uprisings involved the *sekbans* (irregular troops of musketeers) and *sipahis* (cavalrymen maintained by land grants). The rebellions were not attempts to overthrow the Ottoman government but were reactions to a social and economic crisis stemming from a number of factors: a depreciation of the currency, heavy taxation, a decline in the *devşirme* system (levy of Christian boys), admission of Muslims into the army, and an increase in the number and dominance of the Janissaries (elite troops) both in Istanbul and in the provinces.

With a decline of the *sipahi* cavalry the *sekban* troops, recruited from the Anatolian peasantry, formed the main provincial army. During wartime the *sekbans* served the provincial governors and drew regular pay. In peacetime, however, they were not paid, and they resorted to banditry, in which case

they were called Jelālīs. They were joined by *sipahis*, who had lost their land grants to court favourites, and by overtaxed peasants and Turkmen and Kurdish nomads.

In 1598 a *sekban* leader, Karayazici Abdülhalim ('Abd al-Ḥalīm), united the dissatisfied groups in Anatolia, forcing the towns to pay tribute and dominating the Sivas and Dulkadir provinces in central Anatolia. When Ottoman forces were sent against them, the Jelālīs withdrew to Urfa in southeastern Anatolia, making it the centre of resistance. Karayazici rejected offers of governorships in Anatolia and died in 1602. His brother Deli Hasan then seized Kutahya, in western Anatolia, but later he and his followers were won over by grants of governorships.

The Jelālī unrest, however, continued under the leadership of Janbuladoğlu in Aleppo and Yusuf Paşa and Kalenderoğlu in western Anatolia. They were finally suppressed by the grand vizier Kuyucu Murad Paşa, who by 1610 had eliminated a large number of Jelālīs.

During the rest of the 17th and the 18th century, Jelālīs continued their periodic depredations in Anatolia, representing a provincial reaction against the increasing power of the Janissaries.

Jelenia Góra, former (1975–98) *województwo* (province), southwestern Poland, now part of Dolnośląskie (*q.v.*) province.

Jelenia Góra, German HIRSCHBERG, city, Dolnośląskie *województwo* (province), southwestern Poland. It lies in the Sudeten (Sudety) mountains near the Czech border, at the confluence of the Bóbr and Kamienna rivers.

Archaeological data indicate that the site was occupied by an ancient Slavic tribe. Permanent settlement was begun in the 11th century by Jelnik, a knight who built the castle Nowy Dwór. The surrounding settlement was known as Jelenia Góra. The town reached its economic zenith, mainly because of its weaving industry, in the 15th and 16th centuries but was devastated by the Thirty Years' War (1618–48) and, in 1640, by the plague. Rebuilt, it became the Baroque showplace of Silesia, only to wither again under 18th-century Prussian domination. Railroads made it a popular Silesian tourist centre in the 19th century, and interest in the nearby Karkonosze (Giant) mountain range as a resort area again revitalized the town in the second half of the 20th century.

The modern city has cellulose and synthetic-fibre industries, engineering facilities, and timber production, as well as its traditional textile industry. There are also pharmaceutical, optical, and clothing factories. Parts of the town walls (built 13th and 16th centuries) remain, as does a 14th-century parish church. Pop. (2002) 89,339.

Jelep La, English JELEP PASS, mountain pass on the border of the Indian state of Sikkim and Tibet at an elevation of about 14,390 ft (4,386 m), in the Dongkya Range of the eastern Himalayas.

The pass (*la*), with its gentle gradient, was a crucial link in the main trade route from India to Tibet until the border was closed in 1962. It is connected by an all-weather road via Gangtok, Sikkim (16 mi [26 km] southwest), to Dārjiling and Siliguri in West Bengal, and a spur road leads north to another important pass, Natu La.

Jelgava, German (formerly) MITAU, Russian (formerly) MITAVA, city, Latvia, on the Lielupe River southwest of Riga.

There in 1226 the Brothers of the Sword built the castle of Mitau; town status was conferred on the settlement in 1376. In 1561, when the Brothers of the Sword were dissolved, it became the capital of the dukes of Courland, and in 1795 it passed to Russia in the Third Partition of Poland. The city suffered severe damage in fighting in both 1919 and 1944.

Modern Jelgava is an important railway junction and industrial city, manufacturing agricultural and other machinery, locks, and linen and processing sugar, vegetables, and other foodstuffs. Pop. (2000) 63,652.

Jellicoe, John Rushworth Jellicoe, 1st Earl, VISCOUNT JELLICOE OF SCAPA, VISCOUNT BROCAS OF SOUTHAMPTON (b. Dec. 5, 1859, Southampton, Hampshire, Eng.—d. Nov. 20, 1935, Kensington, London), British admiral of the fleet who commanded at the crucial Battle of Jutland (May 31, 1916) during World War I.

The son of a captain in the mercantile marine, Jellicoe was educated at Rottingdean and entered the Royal Navy as a naval cadet in 1872. He joined the Royal Naval College in 1883 and became a gunnery expert, and in 1888 he was appointed to the Admiralty as an assistant to the director of naval ordnance. In 1891 he was promoted to commander and shortly afterward was appointed to HMS *Victoria* of the Mediterranean fleet. In 1898 he was appointed to the command of HMS *Centurion,* of the China station, and took part in the expedition to relieve the legations in Peking during the Boxer Rebellion in 1900. From 1902 to 1914 he held a variety of posts in the Admiralty and in the fleet, during which time he improved and systematized the Royal Navy's methods for aiming the big guns of its warships.

On the eve of World War I, Jellicoe was sent to join the home fleet at Scapa as second in command under Admiral Sir George Callaghan and was soon appointed commander in chief with acting rank of admiral. He was confirmed in his rank in March 1915 and for two years organized and trained the grand fleet and kept it ready for action. His command was put to the test at the Battle of Jutland. His tactics were severely criticized at the time, but it is now accepted that he achieved a strategic victory that left the German high seas fleet ineffective during the remainder of the war. (*See* Jutland, Battle of.) Toward the end of 1916 Jellicoe left his last command afloat to become first sea lord of the Admiralty. During the next year his efforts to combat the new German submarine campaign were not effective until the convoy system was adopted at the insistence of the prime minister, David Lloyd George, who was responsible for Jellicoe's retirement from the Admiralty at the end of 1917.

After the Armistice, Jellicoe was sent on a special mission to visit the dominions and advise on the postwar organization of their navies. Promoted to admiral of the fleet in 1919, he became governor of New Zealand in 1920.

For his services in World War I, he was raised to the peerage as Viscount Jellicoe of Scapa in 1918. On his return from New Zealand and in recognition of his services as governor, he was created an earl and Viscount Brocas of Southampton in 1925. He published *The Grand Fleet, 1914–16, Its Creation, Development and Work* (1919) and *The Crisis of the Naval War* (1921).

Jellinek, Adolf (b. June 26, 1821, Drslavice, Moravia, Austrian Empire [now in Czech Republic]—d. Dec. 29, 1893, Vienna, Austria), rabbi and scholar who was considered to be the most forceful Jewish preacher of his time in central Europe.

From 1845 to 1856 Jellinek preached in Leipzig and from 1856 to 1893 in Vienna. Because of his skillful incorporation into his sermons of those Midrashim (rabbinic commentaries on the Scriptures) that deal with Jewish lore, Jellinek was also an unusually appealing speaker. More than 200 of his sermons were published at various times (three volumes, 1862–66, and nine smaller collections, 1847–82), and these works measurably affected the development of the art of Jewish preaching.

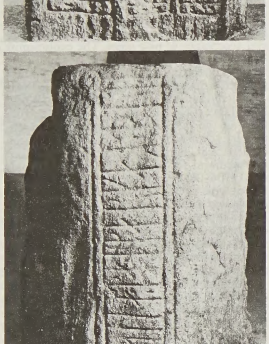
Jellinek's scholarly activities chiefly comprised studies of the Kabbala (the highly influential body of Jewish mystical writings) and Midrashic literature. He was a prominent exponent of *Wissenschaft des Judentums* ("science of Judaism"), the analysis of Jewish literature and culture with the tools of modern scholarly research. He was the first to compare the *Sefer ha-Zohar,* the fundamental text of the Kabbalists, with the Hebrew texts of the 13th-century mystic Moses de León. Based on his deduction that Moses de León was the principal author of the *Zohar,* Jellinek also postulated that the *Zohar* was an attempt by Moses de León to counteract the rationalist trend among his educated contemporaries. In the Midrashic field, he edited hitherto unpublished treatises on ancient and medieval homilies and documents of messianic and apocalyptic thinking, such as *Bet ha-Midrash* (1853–77; "The House of Study").

Jellinek, Elvin M(orton) (b. Aug. 15, 1890, New York, N.Y., U.S.—d. Oct. 22, 1963, Palo Alto, Calif.), American physiologist who was a pioneer in the scientific study of alcoholism.

Jellinek studied at several European universities and received his master's degree in 1914 from the University of Leipzig. He became a biometrician (*i.e.,* one concerned with the statistics of biological studies) and worked for various institutions and organizations in Budapest (1914–20), Sierra Leone (1920–25), Honduras (1925–30), and at the Worcester State Hospital, Mass. (1931–39). In 1939 he began directing that hospital's studies on the effects of alcohol, and in 1941 he became an associate professor of applied physiology at Yale University, where he directed the Yale University School of Alcohol Studies from 1941 to 1950. From 1962 until his death he taught and conducted research at the Institute for the Study of Human Problems at Stanford University.

Jellinek was a pioneer in research having to do with the nature and causes of alcoholism and in descriptions of its symptomatology. He was an early proponent of the disease theory of alcoholism, arguing with great persuasiveness that alcoholics should be treated as sick people. Jellinek gathered and summarized his own research and that of others in the important and authoritative works *Alcohol Explored* (1942) and *The Disease Concept of Alcoholism* (1960).

"De," "la," and similar components of a name when followed by a space, are alphabetized as separate words (e.g., *De Forest, Lee*). *When they are joined to the following part of a name, the combination is treated as a single word* (e.g., *DeForest, John William*).



Jellinek, Georg (b. June 16, 1851, Leipzig [Germany]—d. Jan. 12, 1911, Heidelberg, Ger.), German legal and political philosopher who, in his book *Die sozialethische Bedeutung von Recht, Unrecht und Strafe* (1878; 2nd ed., 1908; "The Social-Ethical Significance of Right, Wrong, and Punishment"), defined the law as an ethical minimum—*i.e.,* as a body of normative principles essential to civilized existence. Differing from the influential school of legal positivists, Jellinek insisted that popular approval was necessary to convert social and psychological facts into juristic norms.

Jellinek, the son of the rabbinic scholar Adolf

Jellinek, became a convert to Christianity. At the universities of Vienna (1879–89), Basel (1890–91), and Heidelberg (1891–1911), he was a capable classroom teacher as well as a distinguished scholar. Internationally, probably his best-known book is *Die Erklärung der Menschen- und Bürgerrechte* (1895; *The Declaration of the Rights of Man and of Citizens*), in which he hypothesized that the French Revolutionary declaration (approved by the Constituent Assembly on Aug. 26, 1789) was derived not so much from the writings of Jean-Jacques Rousseau, as had been generally believed, but chiefly from Anglo-American political and legal history—especially from the theories invoked to support the U.S. struggle for independence. Jellinek synthesized his views in *Allgemeine Staatslehre* (1900; "General Theory of the State").

Jelling stones, two 10th-century royal gravestones found in Jutland, best known of all Danish runic inscriptions. The earlier stone, a memorial honouring Queen Thyre, was commissioned by her husband, King Gorm the

Jelling stones

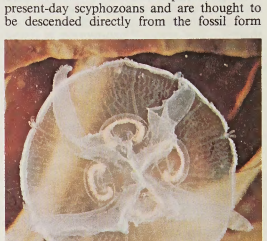
By courtesy of the Royal Danish Ministry for Foreign Affairs, Copenhagen

Old, last pagan king of Denmark. The other, erected in memory of his parents by Harald Bluetooth, son of Gorm and Thyre, ruler of Denmark and Norway, and Christianizer of Denmark, is a three-sided pyramid, two sides bearing pictures and the third, an inscription. Its carvings depict ornamental animal forms, sophisticated interlacing linear patterns, and a Christian theme (the Crucifixion).

jelly, a semitransparent confection consisting of the strained juice of various fruits or vegetables, singly or in combination, sweetened, boiled, slowly simmered, and congealed, often with the aid of pectin, gelatin, or a similar substance.

The juices of most fruits and berries and many vegetables are suitable for processing into jelly. Juices high in pectin, such as those of citrus fruits and apples, congeal readily after cooking with sugar and may be added to the juices of low-pectin fruits, vegetables, and herbs, such as blueberries, green peppers, or mint, to promote gelling. Preserves, jams, conserves, and marmalades differ from jellies in their inclusion of whole fruit or fruit pulp.

In the United States and elsewhere, fruit and berry jellies are eaten on breakfast breads and in the perennially popular peanut butter and jelly sandwich. Jams and preserves are a ubiquitous accompaniment to the scones and other baked goods of the British tea meal. Vegetable and herb jellies, such as those cooked from peppers, tomatoes, or mint, traditionally complement lamb and other meat dishes.



The stiff, chewy consistency of the popular gumdrop and jelly bean candies is imparted by various grain starches. Jellies made from the seaweed extract agar-agar, valued for their clarity and body, are used to coat various candy centres or to make colourful simulated fruit slices.

jellyfish, any planktonic marine member of the class Scyphozoa (phylum Cnidaria), a group of invertebrate animals composed of about 200 described species, or of the class Cubozoa, which was formerly considered an order of Scyphozoa. The term is also frequently applied to certain other cnidarians that have a medusoid (bell- or saucer-shaped) body form, as, for example, the hydromedusae and the siphonophores (including the Portuguese man-of-war), as well as to such unrelated forms as comb jellies and salps. Scyphozoan jellyfish can be divided into two types, those that are free-swimming medusae and those that are sessile (*i.e.*, stem animals that are attached to seaweed and other objects by a stalk). The sessile polyplike forms constitute the order Stauromedusae.

Free-swimming Scyphozoan jellyfish occur in all oceans and include the familiar disk-shaped animals that are often found drifting along the shoreline. Most live for only a few weeks, but some are known to survive a year or longer. The bodies of most range in size from about 2 to 40 cm (1 to 16 inches) in diameter; some species are considerably larger, however, with diameters of up to 2 m (6.6 feet). Scyphozoan medusae consist of almost 99 percent water as a result of the composition of the jelly that forms the bulk in nearly all species. Most feed on small animals that they catch in their tentacles, which have stinging cells (nematocysts). Some, however, simply filter feed, extracting minute animals and plants from the water. Like all cnidarians, their bodies are made up of two cellular layers, the ectoderm and the endoderm, between which lies the mesoglea, a layer of connective tissue composed of a gelatinous substance. In jellyfish the mesoglea is much enlarged to form the buoyant, transparent jelly.

The life cycle of free-swimming Scyphozoan jellyfish typically consists of three stages. A sessile polyp (scyphistoma) stage asexually buds off young medusae from its upper end, with each such ephyra larva growing into an adult. The adults are either male or female, but in some species they frequently change their sex. In many species, normal fusion of egg and sperm results in an embryo that is brooded in the gut of the adult until it becomes a planula larva; but in some this development takes place in the sea. After the planula larva leaves its parent, it settles, passing briefly through a so-called hydratuba stage until it grows into a new scyphistoma. Such a life cycle is characteristic of the order Semaeostomeae, which contains some 50 described species of mainly coastal-water jellyfish, several of which have very wide geographic ranges. Included among these are members of the genera *Aurelia* and *Chrysaora* (*qq.v.*).

The order Coronatae includes about 30 described species of mostly deep-sea jellyfish, often maroon in colour. A deep circular groove delimits the central part of the bell-shaped body from the periphery, which is divided into broad flaps, or lappets. The marginal tentacles are large and solid. Some species are known to have a scyphistoma stage, but the life cycle of most of the forms is unknown. The Coronatae are the most primitive of the present-day scyphozoans and are thought to be descended directly from the fossil form

(Top) *Aurelia;* (centre) *Cassiopea;* (bottom) *Chrysaora*

(Top) James H. Fraser; (centre) Douglas Faulkner; (bottom) William H. Amos—Helen Wohlberg, Inc.

Conulata, which flourished between about 180 and 600 million years ago. Some of the known sessile stages form branched colonies, which were once separately identified under the name *Stephanoscyphus*.

The order Rhizostomeae includes some 80 described species. In these jellyfish the frilly projections called mouth, or oral, arms that extend down from the underside of the body are fused, obliterating the mouth and forming a spongy area used in filter feeding. Marginal tentacles are lacking, and the gelatinous bell is firm and warty. In species whose life cycles are known, there is a typical benthic (bottom-dwelling) scyphistoma stage. Most members of the order are vigorous swimmers. Species of *Cassiopea* (*q.v.*), however, swim infrequently and sit inverted in tropical shallows, exposing their photosynthetic symbiotic algae to sunlight. The group Rhizostomeae is found mainly in shallow tropical to subtropical seas in the Indo-Pacific region, but the genus *Rhizostoma*, also called football jellyfish, often inhabits cooler waters, and *Cotylorhiza* is common in the Mediterranean.

The fourth order, Stauromedusae, formerly called Lucernariida, comprises some 30 described species of nonswimming, stalked jellies. These species occur chiefly in cooler waters. They are goblet-shaped and fixed by a basal stalk; the mouth is situated at the upper end. Ranging from 1 to 10 cm (0.4 to 4 inches) in diameter, the body has a tetradiate design and typically bears eight clusters of tentacles. Some species can detach and resettle. Stauromedusae usually feed on small marine animals and live for several years. Development is direct from a larva into an adult. The polyp stage, which it resembles, is suppressed.

The class Cubozoa contains only one order, Cubomedusae, which some biologists still place under the class Scyphozoa. Cubomedusae comprises about 50 described species. Although some reach a diameter of 25 cm (10 inches), most range between 2 to 4 cm (1 to 2 inches). The jelly is rather spherical but squared off along the edges, giving rise to the common name of box jellies. The genera *Chironex* and *Chiropsalmus*, commonly called sea wasps, occur widely from Queensland northward to about Malaya. These forms are dangerously venomous; a moderate sting can cause death within a few minutes. In all the box jellies so far studied, the polyp stage does not bud off but metamorphoses (*i.e.*, develops completely) into a single adult.

See also cnidarian; hydroid; medusa; Portuguese man-of-war.

Jemaa, town, Kaduna state, central Nigeria, near the Darroro Hills and on a road from Jos to Jagindi. A 2,000-year-old terra-cotta head discovered at Jemaa in 1944 proved to be vital to an understanding of the Nok culture, a civilization that probably flourished in the area between 900 BC and AD 200. Additional Nok sculptures were found in the 1960s at Jemaa and at Nok, the village 24 miles (39 km) northwest, where tin mining in the early 1930s led to the first Nok discoveries, which are now housed in the museum at Jos (48 miles [77 km] northeast).

The modern town originated about 1810, when Malam Usman, a Muslim preacher, assumed the leadership of Fulani herdsmen who had fled from Kajuru (75 miles [121 km] northwest) and founded the settlement of Jema'an-Darroro ("Followers of a Learned Man from Darroro"). He made Jemaa an emirate and a vassal state of the emir of Zaria. Although Usman (emir until 1833) and his son Musa (emir 1837–46 and 1849–50) enlarged the domain by conquering the Ayu, Kaje, Mora, Gwandara, Kagoro, and Kagoma peoples, Jemaa continued to pay tribute to Zaria until 1902, when it was incorporated by the British as a division of Nasarawa province. When Plateau province was created in 1926, the emirate's headquarters was moved from Jema'an-Darroro (now known as Old Jemaa) to Jema'an-Sarari; and in 1933 Emir Muhammadu selected Kafanchan, 11 miles [18 km] north-northwest, as the emirate capital. In 1959 Jemaa emirate was joined with Kagoro, Jaba, and Moroa to form the Jemaa Federation. Although the traditional ruler belonged to a Fulani family, the majority of its inhabitants are neither Fulanis nor Muslims.

Tin mining remains an important activity, but most of Jemaa's inhabitants are farmers, who cultivate cotton, peanuts (groundnuts), and ginger as cash crops and sorghum and millet for daily subsistence. A government dispensary serves the town. Pop. (1991 prelim.) local government area, 215,749.

Jember, also spelled DJEMBER, city and *kabupaten* (regency), Jawa Timur *provinsi* ("province"), Java, Indonesia, located at the foot of Mount Argopuro, 95 miles (153 km) southeast of Surabaya, the provincial capital. Roads and railway link it with Banyuwangi to the east, Probolinggo to the northwest, and Bondowoso and Situbondo to the northeast. Jember is an intermediary centre of trade for agricultural commodities produced in the surrounding area, including sugar, tobacco, corn (maize), and peanuts (groundnuts). Industries include lumber mills and machine shops; processed food, beverages, and textiles are also produced. Crafts are wood carving, metalworking, plaiting, and mat and basket weaving. Most of the population is Javanese with an admixture of Tenggarese. Islām is the major religion. Jember University was founded in 1957. Pop. (1990) city, 218,529.

jen, in Confucian philosophy, one of the most fundamental of all virtues, variously translated as humaneness, warmheartedness, or benevolence. Before Confucius' time jen was understood as the kindness of rulers to their subjects. It was gradually broadened to mean benevolence, still a particular virtue but no longer restricted to rulers. Confucius changed it to connote perfect virtue, which includes all particular virtues and applies to all men. Mencius and the *Doctrine of the Mean* went on to say that "*jen* is *jen*"—that is, jen is the distinguishing characteristic of man. During the Han period, it was generally interpreted as love, and Han Yü in the T'ang period stressed it as love for all mankind.

Under the influence of Buddhism, which extended its compassion to include all things, the Neo-Confucianists of the Sung and Ming dynasties similarly extended jen to mean "forming one body with Heaven, Earth, and all things." This thought was common to both the rationalistic Ch'eng-Chu and the idealistic Lu-Wang schools. Some Sung Neo-Confucianists, however, took jen to be a state of consciousness. Chu Hsi called it "the character of the mind and the principle of love," and Wang Yang-ming equated it with the "clear character" of innate knowledge.

All these were too quietistic and too Buddhistic for the 17th- and 18th-century Neo-Confucianists, who went back to an early Han commentary on an ancient classic that defines jen as "people living together." The new emphasis was on the social and active aspects of jen. All Neo-Confucianists agreed, however, that jen, or humanity, is a moral quality imparted by Heaven, and, since the "great characteristic" of Heaven and Earth is to produce and to reproduce, so jen is characterized by production and reproduction; that is to say, it is life-affirming and life-giving, not only active but creative. Under the influence of Western science in the late 19th and early 20th centuries, modern Confucianists likened jen to electricity and ether, a dynamic force and an all-pervasive substance.

jen-min kung-she (Chinese agricultural unit): *see* commune.

Jen Tsung, Pinyin REN ZONG (temple name, or *miao-hao*), personal name (*hsing-ming*) CHAO CHEN (b. 1010, China—d. 1063, China), fourth emperor (reigned 1022–63) of the Sung dynasty of China, one of the most able and humane rulers in Chinese history. Under him the Sung government is generally believed to have come closer than ever before to reaching the Confucian ideal of just government.

During his reign, two political and philosophical groups developed into factions that bitterly disputed each other's policies as well as interpretations of the Confucian Classics. This led to the great disputes in later reigns between the conservatives and the reformers and prevented the development of solutions to the vast problems that began to confront the Sung after Jen Tsung.

Jen Tsung (1760–1820): *see* Chia-ch'ing.

Jena, city, Thuringia *Land* (state), east-central Germany, on the Saale River, east of Weimar. First mentioned in the 9th century as Jani, it was chartered in 1230 and belonged to the margraves of Meissen from the mid-14th century. The house of Wettin, which held the margraviate and (after 1423) the electorate of Saxony, was divided in 1485, and Jena fell to the dukes of the Ernestine branch. From 1672 to 1690 it was the centre of the duchy of Saxe-Jena, and it remained a ducal residence until 1918. Napoleon scored a notable victory over the Prussian army on the heights north of Jena in 1806.

The city's university, the Friedrich-Schiller University, was founded by the elector John Frederick the Magnanimous in 1548 as an academy and raised to university status in 1577. Its most brilliant period was under the duke Charles Augustus, patron of Johann Wolfgang von Goethe, from 1787 to 1806, when the philosophers Johann Fichte, Georg Hegel, and Friedrich von Schelling and the writers August von Schlegel and Friedrich Schiller were on its teaching staff. It was long in the forefront of German universities in liberal acceptance of new ideas. The evolutionist Ernst Haeckel was prominent there in the mid-19th century, and from there Karl Marx received a doctor's degree in absentia in 1841.

The city suffered severe damage in World War II, but it has been restored. Notable structures are the old university buildings, the 14th-century town hall, and St. Michael's Church (1438–1528). Numerous towers remain from the medieval fortifications. University buildings (1906–08) occupy the site of the old ducal palace where Goethe wrote his novel *Hermann und Dorothea*. There are several other higher-educational institutions, botanical gardens, civic and university museums, an optical school, meteorological institute, observatory, central institute for earthquake research, and a planetarium.

A rail junction, Jena is the home of the old, established Zeiss optical and precision instrument firm and the Schott glassworks. There is also a significant pharmaceutical industry. Pop. (1998 est.) 99,273.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Jena, Battle of, also called BATTLE OF JENA-AUERSTÄDT (Oct. 14, 1806), military engagement of the Napoleonic Wars, fought between 122,000 French troops and 114,000 Prussians and Saxons, at Jena and Auerstädt, in Saxony (modern Germany). In the battle, Napoleon smashed the outdated Prussian army inherited from Frederick II the Great, which resulted in the reduction of Prussia to half its former size at the Treaty of Tilsit in July 1807.

Frederick William III of Prussia prepared

for war after signing a secret alliance with Russia in July 1806. In early October the Prussian-Saxon army, under Charles William Ferdinand, duke of Brunswick, moved slowly westward through Saxony in an attempt to threaten Napoleon's communications to the west. Napoleon advanced northward rapidly through the eastern end of the Thuringian Forest to cut the Prussians off from the Elbe River and engage them before their Russian allies could join them. The Prussians had to face about to meet this attack from their rear. Frederick William III placed 63,000 men under Duke Charles William Ferdinand at Auerstädt and about 51,000 under Prince Friedrich Ludwig of Hohenlohe-Ingelfingen on a 15-mile (24-km) front between Weimar and Jena.

Shortly after dawn on October 14, Napoleon, employing only about 54,000 of his 96,000 troops, struck Friedrich Ludwig's 38,000 troops at Jena. By 3 PM he had swept them and 13,000 reinforcements from the field. About 13 miles (21 km) to the north, at Auerstädt, the secondary French force of 26,000, under Louis-Nicolas Davout, encountered Charles William Ferdinand's main Prussian army. The duke dissipated his vastly superior strength in piecemeal attacks, enabling Davout to stand firm for six hours. After the duke was mortally wounded, Frederick William III took command. The Prussians' attack slackened when they heard the news of the French victory at Jena. Davout moved up his artillery to rake the entire Prussian line, and by 4 PM the Prussian army had disintegrated. Davout was later made duke d'Auerstädt for his extraordinary victory. The double victory of the French cost them about 12,000 casualties compared with about 24,000 Prussian and Saxon casualties and about 20,000 more captured. Napoleon completed his conquest of Prussia within six weeks, before Russia could act to aid its ally.

Jena glass, German JENAER GLAS, fine-quality glass with improved resistance to heat and shock, suited for chemical ware. It was developed for thermometers and measuring vessels, optical ware, and scientific and industrial uses.

Jena glass was first produced by the German glass chemist Friedrich Otto Schott, who, with Ernst Abbe and Carl Zeiss, founded a glassworks in Jena, Ger., in 1884. The early Jena glass—a sodium–magnesium–aluminum–zinc borosilicate containing some boron trioxide in place of part of the silica of older glasses—foreshadowed later borosilicates, which include Pyrex.

Jena Romanticism, German JENAER ROMANTIK, a first phase of Romanticism in German literature, centred in Jena from about 1798 to 1804. The group was led by the versatile writer Ludwig Tieck. Two members of the group, the brothers August Wilhelm and Friedrich von Schlegel, who laid down the theoretical basis for Romanticism in the circle's organ, the *Athenäum,* maintained that the first duty of criticism was to understand and appreciate the right of genius to follow its natural bent.

The greatest imaginative achievement of this circle is to be found in the lyrics and fragmentary novels of Friedrich Leopold von Hardenberg. The works of Johann Gottlieb Fichte and Friedrich von Schelling expounded the Romantic doctrine in philosophy, whereas the theologian Friedrich Schleiermacher demonstrated the necessity of individualism in religious thought. By 1804 the circle at Jena had dispersed. A second phase of Romanticism was initiated two years later in Heidelberg.

Jenakijevo (Ukraine): *see* Yenakiyevo.

Jenatsch, Georg (b. 1596, Samaden, Grisons, Switz.—d. Jan. 24, 1639, Chur), Swiss political and military leader of the Grisons (now Graubünden, the most easterly of Swiss cantons) during the complex struggles of the Thirty Years' War.

The son of the Protestant vicar of Samaden, Jenatsch became vicar of Scharans in 1617. Ambition and thirst for action led him into politics. The Grisons were loosely attached to the Swiss Confederation and at that time controlled the Valtellina with its roads and passes, a region over which the Spaniards (from their duchy of Milan), the Austrian Habsburgs,

Jenatsch, detail from a portrait by an unknown artist, 1636; in a private collection
Archiv fur Kunst und Geschichte, Berlin

France, and Venice all sought paramount influence. Opposing the Spaniards, he narrowly escaped the bloodbath of July 19–23, 1620, in which over 300 Protestants perished. He left the priesthood, murdered (Feb. 25, 1621) the head of the Spanish party, Pompeius Planta, and had to flee abroad. In 1624 he achieved a French-Grisons alliance, which led to the expulsion of the Spaniards and Austrians from the Grisons. After the Franco-Spanish Treaty of Mozon (1626), however, the Valtellina was virtually abandoned to Spain; Jenatsch took service with Venice, while the Austrians reconquered the Grisons (1629–31). In 1631 Jenatsch successfully assisted Henri, duke de Rohan, who had been dispatched to the Grisons by Cardinal de Richelieu; but then Jenatsch negotiated with Austria and Spain (he had turned Roman Catholic in 1635) and established himself as a ruthless dictator in the Grisons. He turned to the French when the Spaniards refused to cede the Valtellina. Suspected by all, he fell victim to a vendetta of the Planta family and was assassinated.

Jenkin, (Henry Charles) Fleeming (b. March 25, 1833, near Dungeness, Kent, Eng.—d. June 12, 1885, Edinburgh, Scot.), British engineer noted for his work in establishing units of electrical measurement.

Jenkin earned an M.A. from the University of Genoa in 1851 and worked for the next 10 years with engineering firms engaged in the design and manufacture of submarine telegraph cables and equipment for laying them. In 1861 his friend William Thomson (later Lord Kelvin) procured Jenkin's appointment as reporter for the Committee of Electrical Standards of the British Association for the Advancement of Science. He helped compile and publish reports that established the ohm as the absolute unit of electrical resistance and described methods for precise resistance measurements. Jenkin was also professor of engineering at University College, London, and the University of Edinburgh.

Jenkins, Roy (Harris), BARON JENKINS OF HILLHEAD (b. Nov. 11, 1920, Abersychan, Monmouthshire, Eng.), British politician, a strong supporter of the North Atlantic Treaty Organization and the European Community. Formerly a Labourite, he was the first leader of the Social Democratic Party (1982–83) and later (from 1988) leader of the Social and Liberal Democratic Peers.

Educated at Balliol College, Oxford, from which he graduated in 1941, he served in the Royal Artillery in World War II and first entered Parliament in 1948. He could claim family roots in the Labour movement: his father had been a miners' union official, a member of Parliament, and parliamentary private secretary to the Labourite prime minister Clement Attlee. Jenkins at one time considered giving up politics for writing, but in the formation of the 1964 government of Harold Wilson he joined the cabinet as air minister (1964–65); he then became home secretary (1965–67) and chancellor of the Exchequer (1967–70). In 1972 he resigned from the Labour Party in protest of its decision to support a referendum on whether Britain should remain in the Common Market. He reentered the shadow cabinet in 1973 as shadow home secretary and became home secretary after Labour's victory in 1974. In 1976 he resigned from the cabinet and Parliament to become president of the executive branch of the European Community and remained in that post until 1981. In 1981 he and other dissidents from the increasingly leftist Labour Party formed the Social Democratic Party, of which he was briefly leader. In 1987 he accepted a life peerage and moved from the House of Commons to the House of Lords, where he was a leader of the new Social and Liberal Democratic Party.

Jenkins wrote a number of books, including biographies such as *Asquith: Portrait of a Man and an Era* (1964), *Baldwin* (1987), *Gladstone* (1995), and *Churchill* (2001), and political works such as *Mr. Balfour's Poodle: Peers vs. People* (1954), *The Labour Case* (1959), and *Afternoon on the Potomac?: A British View of America's Changing Position in the World* (1972). *A Life at the Centre: Memoirs of a Radical Reformer* (1991) recounts Jenkins's own political career.

Jenkins' Ear, War of, war between Great Britain and Spain that began in October 1739 and eventually merged into the War of the Austrian Succession (1740–48). It was precipitated by an incident that took place in 1738 when Captain Robert Jenkins appeared before a committee of the House of Commons and exhibited what he alleged to be his own amputated ear, cut off in April 1731 in the West Indies by Spanish coast guards, who had boarded his ship, pillaged it, and then set it adrift. Public opinion had already been aroused by other Spanish outrages on British ships, and the Jenkins episode was swiftly exploited by members of Parliament who were in opposition to the government of Robert Walpole.

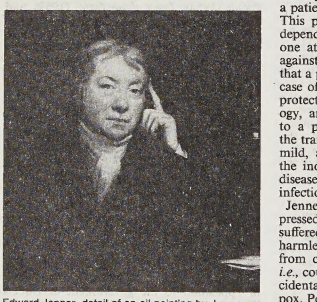
Jenner, Bruce (b. Oct. 28, 1949, Mount Kisco, N.Y., U.S.), American decathlete who won a gold medal at the 1976 Olympic Games in Montreal with a record score of 8,618 points, subsequently broken in 1980 by Daley Thompson of the United Kingdom (8,622 points) and by Guido Kratschmer of West Germany (8,649 points).

Jenner began his athletic career at Newton (Connecticut) High School, where he was a letterman in football, basketball, and track, and on his own took up waterskiing, becoming East Coast all-over champion in 1966, 1969, and 1971. He entered Graceland College (Lamoni, Iowa) in 1969 on a football scholar-

ship, but an injury to his knee restricted him to basketball and track. He competed in his first decathlon in 1971 and finished 10th in the decathlon at the 1972 Olympic Games at Munich, Ger.



Shortly thereafter he moved to California, where he trained with individual-event stars in the San Jose area rather than with other decathlon athletes.

After his Olympic triumph, Jenner became active as a network television sports commentator and made television commercials, lectured, and performed in films. Jenner's *Decathlon Challenge: Bruce Jenner's Story,* written with Phillip Finch, was published in 1977. Other books include *Bruce Jenner's Guide to the Olympics* (1979, with Marc Abraham) and *The Olympics and Me* (1980, with R. Smith Kiliper). Jenner won the James E. Sullivan Trophy for athlete of the year (1976) in 1977.

Consult the INDEX *first*

Jenner, Edward (b. May 17, 1749, Berkeley, Gloucestershire, Eng.—d. Jan. 26, 1823, Berkeley), English surgeon and discoverer of vaccination for smallpox.

Jenner was born at a time when the patterns of British medical practice and education were undergoing gradual change. Slowly the division between the Oxford- or Cambridge-trained physicians and the apothecaries or surgeons—who were much less educated and who acquired their medical knowledge through apprenticeship rather than through

Edward Jenner, detail of an oil painting by J. Northcote, 1803; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

academic work—was becoming less sharp and hospital work was becoming much more important.

Jenner was a country youth, the son of a clergyman. Because Edward was only five when his father died, he was brought up by an older brother who was also a clergyman. Edward acquired a love of nature that remained with him all his life. He attended grammar school and at the age of 13 was apprenticed to a nearby surgeon. In the following eight years Jenner acquired a sound knowledge of medical and surgical practice. On completing his apprenticeship at the age of 21, he went to London and became the house pupil of John Hunter, who was on the staff of St. George's Hospital and was soon to become one of the most prominent surgeons in London. Even more important, however, he was an anatomist, biologist, and experimentalist of the first rank; not only did he collect biological specimens but he also concerned himself with problems of physiology and function.

The firm friendship that grew between the two men lasted until the death of Hunter in 1793. From no one else could Jenner have received the stimuli that so confirmed his natural bent—a catholic interest in biological phenomena, disciplined powers of observation, sharpening of critical faculties, and a reliance on experimental investigation. From Hunter Jenner received the characteristic advice, "Why think, [*i.e.,* speculate]—why not try the experiment?"

In addition to his training and experience in biology, Jenner made progress in clinical surgery. At the end of two years in London he returned, in 1773, to country practice in Berkeley and enjoyed substantial success. He was capable, skillful, and popular. In addition to practicing medicine, he joined two medical groups for the promotion of medical knowledge and wrote occasional medical papers. He played the violin in a musical club, wrote light verse, and, as a naturalist, made many observations, particularly on the nesting habits of the cuckoo and on bird migration. He also collected specimens for John Hunter; many of Hunter's letters to Jenner have been preserved, but Jenner's letters to Hunter have unfortunately been lost. After one disappointment in love in 1778, Jenner married in 1788.

Smallpox was widespread in the 18th century, and occasional outbreaks of special intensity resulted in a very high death rate. The disease, a leading cause of death at the time, respected no social class, and disfigurement was not uncommon in patients who recovered. The only means of combating the disease was the so-called inoculation—intentionally infecting a healthy person with the "matter" taken from a patient sick with a mild attack of smallpox. This practice, which originated in the East, depended on two distinct concepts: first, that one attack of smallpox effectively protected against any subsequent exposure; and second, that a person deliberately infected with a mild case of the disease would safely acquire such protection. It was, in present-day terminology, an "elective" infection—*i.e.,* one given to a person in good health. Unfortunately, the transmitted disease did not always remain mild, and mortality occurred. Furthermore, the inoculated person could disseminate the disease to others and thus act as a focus of infection.

Jenner, even as an apprentice, had been impressed by the fact that a person who had suffered an attack of cowpox—a relatively harmless disease that could be contracted from cattle—could not take the smallpox—*i.e.,* could not become infected whether by accidental or intentional exposure to the smallpox. Pondering this phenomenon Jenner concluded that cowpox not only protected against smallpox but could be transmitted from one person to another as a deliberate mechanism of protection.

The story of the great breakthrough is well known. In May 1796 Jenner found a young dairymaid, Sarah Nelmes, who had fresh cowpox lesions on her finger. On May 14, using matter from Sarah's lesions, he inoculated an eight-year-old boy, James Phipps, who promptly developed a slight fever and a low-grade lesion. On July 1 Jenner inoculated the boy again, this time with smallpox matter. No disease developed; protection was complete. Jenner, in 1797, sent to the Royal Society a short paper describing his results, but the paper was refused. Then Jenner, in 1798, having added further cases, published privately a slender book entitled *An Inquiry into the Causes and Effects of the Variolae Vaccinae, a Disease Known by the Name of Cow Pox.*

The reaction to the publication was not immediately favourable. Jenner went to London seeking volunteers for vaccination but, in a stay of three months, was not successful. In London, vaccination became popularized through the activities of others, particularly the surgeon Henry Cline, to whom Jenner had given some of the inoculant, and doctors George Pearson and William Woodville. Difficulties arose, some of them quite unpleasant; Pearson tried to take credit away from Jenner, and Woodville, a physician in a smallpox hospital, contaminated the cowpox matter with smallpox virus.

The procedure rapidly proved its value, however, and Jenner became intensely active, promoting the cause of vaccination. The procedure spread rapidly to the European continent, then to America, and soon was carried around the world.

Complications were many. Vaccination seemed simple, but the vast number of persons who practiced it did not necessarily follow the procedure that Jenner had recommended, and deliberate or unconscious innovations often impaired the effectiveness. Pure cowpox vaccine was not always easy to obtain, nor was it easy to preserve or transmit. Furthermore, the biological factors that produce immunity were not yet understood; much information had to be gathered and a great many mistakes made before a fully effective procedure could be developed, even on an empirical basis.

Despite errors and occasional chicanery, the process of vaccination spread rapidly and the death rate from smallpox plunged. Jenner, although he received worldwide recognition and many honours, made no attempt to enrich himself through his discovery and actually devoted so much time to the cause of vaccination that his private practice and his personal affairs suffered severely. In 1802 Parliament voted him a sum of £10,000 and in 1806 a further sum of £20,000.

Jenner not only received honours but also aroused opposition and found himself subjected to attacks and calumnies, despite which he continued his activities in behalf of vaccination. His wife, ill with tuberculosis, died in 1815, and Jenner retired from public life.

(L.S.K.)

BIBLIOGRAPHY. William LeFanu, *A Bibliography of Edward Jenner,* 2nd ed. (1985), is the definitive study of his writings. Sound and popularly written biographies include F. Dawtrey Drewitt, *The Life of Edward Jenner,* 2nd ed. (1933); Dorothy Fisk, *Dr. Jenner of Berkeley* (1959); and Paul Saunders, *Edward Jenner: The Cheltenham Years, 1795–1823* (1982). The general medical background of the 18th century is explored in Lester S. King, *The Medical World of the Eighteenth Century* (1958, reissued 1971). Derrick Baxby, *Jenner's Smallpox Vaccine: The Riddle of Vaccinia Virus and Its Origin* (1981), explores the biology of the virus in a clearly written fashion.

Jenney, William Le Baron (b. Sept. 25, 1832, Fairhaven, Mass., U.S.—d. June 15, 1907, Los Angeles, Calif.), American civil engineer and architect whose technical innovations were of primary importance in the development of the skyscraper.

Jenney designed the Home Insurance Company Building, Chicago (1884–85; enlarged 1891; demolished 1931), generally considered to be the world's first tall building supported by an internal frame, or skeleton, of iron and steel rather than by load-bearing walls and the first to incorporate steel as a structural material. The Home Insurance Company Building also set the pace for the Chicago School, many of whose chief exponents—including Louis Sullivan, Daniel Burnham, John Root, and William Holabird—served at one time in Jenney's office.

After studying architecture in Paris (1859–61), Jenney served in the American Civil War (1861–65) as an engineering officer. Having left the Federal army with the rank of major, he practiced engineering and architecture in Chicago (1868–1905) and taught architecture

Home Insurance Company Building, Chicago, designed by Jenney, 1884–85
Chicago Architectural Photographing Co.

at the University of Michigan, Ann Arbor (1876–80).

In Jenney's design for the Leiter Building, Chicago (1879; enlarged 1888; later demolished), he made a tentative approach to skeleton construction, and the facade was prophetic of the glass curtain wall that became common in the 20th century. Among his other buildings in Chicago are the Manhattan Building (1889–90), said to be the first 16-story structure in the world and the first in which wind bracing was a principal aspect of the design; the Ludington Building (1891); the Fair Store (1891–92; later remodeled as the Loop store of Montgomery Ward); and the second Leiter Building (1889–90), which became Sears, Roebuck and Co.'s Loop store.

Jennings, Elizabeth (Joan) (b. July 18, 1926, Boston, Lincolnshire, Eng.—d. Oct. 26, 2001, Bampton, Oxfordshire), English poet whose works relate intensely personal matters in a plainspoken, traditional, and objective style and whose verse frequently reflects her devout Roman Catholicism and her love of Italy.

Jennings was educated at Oxford High School and St. Anne's College, Oxford. Her first pamphlet, *Poems,* appeared in 1953, followed by *A Way of Looking* (1955), which won her a Somerset Maugham Award and enabled her to visit Italy. *Song for a Birth or a Death* (1961) marked a new development, with its confessional tone and more savage view of love. Some of the best of her later poems concern her nervous breakdown and its aftermath, such as those collected in *Recoveries* (1964) and *The Mind Has Mountains* (1966). Other works include *The Animals' Arrival* (1969), *Lucidities* (1970), *Relationships* (1972), *Extending the Territory* (1985), and *Familiar Spirits* (1994). A translation, *The Sonnets of Michelangelo* (1961), was revised in 1969. She also published poetry for children. In 1992 Jennings was made a Commander of the British Empire.

Jennings, Herbert Spencer (b. April 8, 1868, Tonica, Ill., U.S.—d. April 14, 1947, Santa Monica, Calif.), American zoologist, the first scientist to study the behaviour of individual microorganisms and one of the first to experiment with genetic variations in single-celled organisms.

Jennings graduated from Harvard University (1896). He wrote his doctoral thesis on the morphogenesis of rotiferans (microscopic aquatic organisms), an area of scientific interest he pursued for the next 10 years. The culmination of his research and his primary contribution to zoology was his *Behaviour of the Lower Organisms* (1906). In this study of the reactions of individual organisms and individual response to stimuli, Jennings reported new experimental evidence of the similarity of activity and reactivity in all animals, from protozoans to man. For the next 40 years Jennings studied the mechanisms of inheritance and variation in single-celled organisms. His works include *Life and Death, Heredity and Evolution* (1920), *Genetics* (1935), and *The Biological Basis of Human Nature* (1930).

Jenolan Caves, series of caves constituting one of Australia's best-known tourist attractions, in east central New South Wales, 70 mi (113 km) west of Sydney. They comprise a series of tunnels and caverns formed by two converging streams in a thick bed of limestone at an elevation of 2,600 ft (800 m) on the western margin of the Blue Mountains. The caves are on different levels and contain unique limestone formations, particularly stalactites. They were once used by Aboriginals, and James McKeown, a bushranger (outlaw), is said to have been the first European to visit them in the 1830s. They have been a government reserve since 1866. Twelve of the caves are open to the public, attracting more than 150,000 visitors annually.

Jensen, Georg (b. Aug. 31, 1866, Raadvad, Den.—d. Oct. 2, 1935), Danish silversmith and designer who achieved international prominence for his commercial application of modern metal design. The simple elegance of his works and their emphasis on fine craftsmanship, hallmarks of Jensen's products, are recognized around the world.

Jensen was apprenticed to a goldsmith at age 14. His artistic talents were briefly focused on sculpture, but he returned to metalwork, primarily jewelery and silver pieces, produced in the workshop he opened in Copenhagen in 1904. Jensen exhibited his works at several major foreign exhibitions (winning a gold medal at the Brussels Exhibition of 1910) and quickly built a reputation as an outstanding and highly original silversmith. He moved to a larger workshop in 1912 and acquired his first factory building in 1919.

Jensen's silverware achieved immediate popularity and commercial success. He was, in fact, the first silvermaker to realize a profit from the manufacture of modern silver. Until Jensen's time virtually all successful silverware producers had relied on a standard repertory of popular traditional designs. Jensen, however, found that the market for his sleek, simple pieces was larger than anyone had predicted. His firm grew rapidly, expanding throughout Europe and opening branches in London and New York City. Jensen's work set trends for contemporary tableware. He was among the first designers to fashion steel—formerly considered fit only for low-quality, inexpensive flatware—into handsome, serviceable cutlery.

By 1935 the firm had branches all over the world and carried more than 3,000 patterns in open stock. Out of fairness to his customers, Jensen refused to discontinue old patterns, a practice common among manufacturers of fine silver and tableware. After his death the business was carried on by his son, Søren Georg Jensen.

Jensen, Gerrit, English GERRARD JOHNSON (b. Low Countries?; fl. 1680–1715, London), royal cabinetmaker of Louis XIV-style furniture, who became one of the most fashionable and foremost designers and craftsmen of his time. Apparently the first cabinetmaker to earn individual distinction in England, he became famous for his technique of metal-inlaid furniture and is therefore sometimes called the English Boulle, after the renowned contemporary French cabinetmaker André-Charles Boulle, who had developed a distinctive style of inlay work.

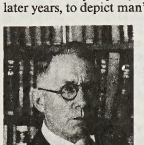
Jensen settled in London before 1680, in which year he created furniture for King Charles II for a royal gift to the ruler of Morocco. The crown employed him considerably after 1688. Although the furniture he made for Charles is no longer extant, many of his creations for William and Mary have survived. A document of about 1689 confirms his position as royal cabinetmaker. For Queen Anne he supplied several pieces of furniture that were decorated with lacquer rather than with the more costly metal marquetry. Some of Jensen's greatest work was made about 1701 for the state drawing room at Windsor Castle.

Jensen, J(ohannes) Hans D(aniel) (b. June 25, 1907, Hamburg, Ger.—d. Feb. 11, 1973, Heidelberg, W.Ger.), German physicist who shared half of the 1963 Nobel Prize for Physics with Maria Goeppert Mayer for their proposal of the shell nuclear model. (The other half of the prize was awarded to Eugene P. Wigner for unrelated work.)

J. Hans D. Jensen, 1968
Bavaria Verlag

After obtaining a Ph.D. at the University of Hamburg in 1932, Jensen served on the faculties of Hamburg, the Institute of Technology in Hannover, and the University of Heidelberg. He and Mayer proposed the shell model independently of each other in 1949. The shell nuclear model holds that an atomic nucleus should be thought of not as a random aggregation of neutrons and protons but rather as a structure of shells, or spherical layers, of differing radii, each of which is filled with neutrons and protons. Jensen collaborated with Mayer in writing *Elementary Theory of Nuclear Shell Structure* (1955).

Jensen, Jens (b. Sept. 13, 1860, Dybbøl, Den.—d. Oct. 1, 1951, Ellison Bay, Wis., U.S.), highly original landscape architect whose public and private works, mostly in the U.S. Midwest, are marked by harmonious use of natural terrain and native flora.



Jensen went to the U.S. in 1884 and settled in Chicago, where he was employed by the municipal West Side Park System (1890–1900, 1906–20). His most successful major park projects in Chicago were the redesigned Humboldt Park and the new Columbus Park. He was chiefly responsible for the establishment of the Cook County Forest Preserve, the most extensive system of nature parks instituted by any U.S. city or metropolitan area. In addition, he laid out the public park system in Racine, Wis., and the Lincoln Memorial Garden in Springfield, Ill. (1936–49).

Among Jensen's private clients were Avery Coonley, Riverside, Ill. (1907–09; house by Frank Lloyd Wright); Henry Babson, Riverside (1909–11; house by Louis Sullivan and

George Elmslie); and Henry Ford, Dearborn, Mich. (1916–20). From the middle 1930s he maintained an art colony, The Clearing, at Ellison Bay, Wis.

Leonard K. Eaton, *Landscape Artist in America: The Life and Work of Jens Jensen,* was published in 1964.

Jensen, Johannes V(ilhelm) (b. Jan. 20, 1873, Farsø, Den.—d. Nov. 25, 1950, Copenhagen), Danish novelist, poet, essayist, and writer of many myths, whose attempt, in his later years, to depict man's development in the

Johannes V. Jensen
Nordisk Pressefoto

light of an idealized Darwinian theory caused his work to be much debated. He received the Nobel Prize for Literature in 1944.

Of old peasant stock and the son of a veterinarian, Jensen went to Copenhagen to study medicine but turned to writing. He first made an impression as a writer of tales. These works fall into three groups: tales from the Himmerland, tales from Jensen's travels in the Far East (for which he was called Denmark's Kipling), and more than 100 tales published under the recurrent title *Myter* ("Myths"). His early writings also include a historical trilogy, *Kongens Fald* (1900–01; *The Fall of the King,* 1933), a fictional biography of King Christian II of Denmark. Shortly thereafter, as a result of his travels in the United States, came his *Madame d'Ora* (1904) and *Hjulet* (1905; "The Wheel"). In 1906 he published a volume of poems, and late in life he returned to poetry, his *Digte, 1901–43* being the result.

Jensen then worked on the six novels that are his best known work; they bear the common title *Den lange rejse,* 6 vol. (1908–22; *The Long Journey,* 3 vol., 1922–24). This story of the rise of man from the most primitive times to the discovery of America by Columbus exhibits both his imagination and his skill as an amateur anthropologist.

Jenson, Nicolas (b. *c.* 1420, Sommevoire, Champagne—d. 1480, Rome), publisher and printer who developed the roman-style typeface.

Apprenticed as a cutter of dies for coinage, Jenson later became master of the royal mint at Tours. In 1458 he went to Mainz to study printing under Johannes Gutenberg. In 1470 he opened a printing shop in Venice, and, in the first work he produced, the printed roman lowercase letter took on the proportions, shapes, and arrangements that marked its transition from an imitation of handwriting to the style that has remained in use throughout subsequent centuries of printing. Jenson also designed Greek-style type and black-letter type.

Although he composed his types in a meticulously even style, he did not always print them with the accuracy they deserved. Nonetheless, he published more than 150 titles, soundly edited by scholars of authority.

jeopardy, double (law): *see* double jeopardy.

Jephthah, a judge or regent (often a hero figure) of Israel who dominates a narrative in the Book of Judges, where he is presented as an exemplar of faith for Israel in its monotheistic commitment to Yahweh. Of the Israelite tribe in Gilead (present northwest Jordan), he was banished from his home and became the head of a powerful band of brigands. Oppressed by the rapacity of the non-Israelite peoples of Hauran and Ammon, the Gileadites implored Jephthah to avenge the injustice. He successfully overcame the enemy but at the cost, according to the story, of having to sacrifice his daughter to Yahweh in fulfillment of a vow setting the price of victory, a possible mythological basis for dedicating certain Israelite women to virginity. An incident in which Jephthah led the slaughter of the aggressor Israelite tribe of Ephraim (who were detected by their inability to pronounce the sound *sh* in the Hebrew word *shibboleth*) rests on weak historical grounds. Biblical scholars interpret the story of Jephthah as an expression of the Book of Judges' theological significance; *viz.*, Israel's fortunes fluctuated depending on the degree of their fidelity to Yahweh.

Jequié, city, southeastern Bahia state, northeastern Brazil, on the Arroio das Contas, at 653 ft (199 m) above sea level. It was elevated to city status in 1910. Jequié is the trade centre for a zone yielding mainly cacao and livestock. Goods are transported by railroad, highway, and air to other urban centres in Bahia and to Rio de Janeiro. Pop. (2000 prelim.) 130,207.

jequirity bean, also called ROSARY PEA, or INDIAN LICORICE (*Abrus precatorius*), plant of the pea family (Fabaceae), found in tropical regions. The hard, red and black seeds are attractive and are strung into necklaces and rosaries in India and other tropical areas, though they are highly poisonous. The seeds are also used as a unit of weight (*ratti*), equivalent to about one or two grains Troy, in India.

Jequitinhonha River, Portuguese RIO JEQUITINHONHA, river, eastern Brazil, rising in the Serra do Espinhaço, south of Diamantina, Minas Gerais state, and flowing northward and then east-northeastward across the uplands. At Salto da Divisa, it is interrupted by the Cachoeira (falls) do Salto Grande (140 ft [43 m] high). It descends to the coastal plain at the city of Jequitinhonha (beyond which it is also called Rio Grande do Belmonte) and empties into the Atlantic Ocean at Belmonte in Bahia state after a course of approximately 680 mi (1,090 km). The river is navigable in parts.

Jerba, Île de (island, Tunisia): *see* Jarbah, Jazīrat.

jerboa, any of the long-tailed, leaping rodents that constitute the family Dipodidae (order Rodentia). Jerboas inhabit deserts and dry plains in Asia and northern Africa. They are large-eyed animals with soft, sand-coloured

Egyptian jerboa (*Jaculus jaculus*)
By courtesy of the New York Zoological Society

fur, and are 5 to 15 centimetres (2 to 6 inches) long, excluding the 7- to 20-cm (3- to 8-in.) tail. They vary in certain features, such as size of ears (small to long and slender) and number of hind toes (three to five), but all have short forelegs, extremely long hind legs, and long, hairy, often tufted tails.

Jerboas usually travel only on their hind legs, using their tails to prop themselves up and to balance themselves when leaping. They are swift in flight and can cover up to 3 metres (10 feet) at a bound. They rest by day in burrows and emerge at night to forage for seeds, herbs, grasses, and insects. Some species keep the burrow entrances plugged with earth. Most hibernate over the winter. Jerboas breed one or more times a year; females bear about three young per litter.

There are 10 genera and about 25 species of jerboas. Better known forms include the hairy-footed jerboa (*Dipus sagitta*) of central and eastern Asia; the desert jerboas (*Jaculus*) of northern Africa, the Near East, and southwestern Asia; and the four- and five-toed jerboas (*Allactaga*) of Egypt and Asia.

Jeremiah, Hebrew YIRMEYAHU, Latin Vulgate JEREMIAS (b. probably after 650 BC, Anathoth, Judah—d. *c.* 570 BC, Egypt), Hebrew prophet, reformer, and author of an Old Testament book that bears his name. He

Jeremiah, detail from a fresco by Michelangelo in the Sistine Chapel, Rome, *c.* 1512
Alinari—Art Resource/EB Inc.

was closely involved in the political and religious events of a crucial era in the history of the ancient Near East; his spiritual leadership helped his fellow countrymen survive disasters that included the capture of Jerusalem by the Babylonians in 586 BC and the exile of many Judaeans to Babylonia.

Life and times. Jeremiah was born and grew up in the village of Anathoth, a few miles northeast of Jerusalem, in a priestly family. In his childhood he must have learned some of the traditions of his people, particularly the prophecies of Hosea, whose influence can be seen in his early messages.

The era in which Jeremiah lived was one of transition for the ancient Near East. The Assyrian Empire, which had been dominant for two centuries, declined and fell. Its capital, Nineveh, was captured in 612 by the Babylonians and Medes. Egypt had a brief period of resurgence under the 26th dynasty (664–525) but did not prove strong enough to establish an empire. The new world power was the Neo-Babylonian Empire, ruled by a Chaldean dynasty whose best known king was Nebuchadrezzar. The small and comparatively insignificant state of Judah had been a vassal of Assyria and, when Assyria declined, asserted its independence for a short time. Subsequently, Judah vacillated in its allegiance between Babylonia and Egypt and ultimately became a province of the Neo-Babylonian Empire.

According to the biblical Book of Jeremiah, he began his prophetic career in 627/626—the 13th year of King Josiah's reign. It is told there that he responded to Yahweh's (God's) call to prophesy by protesting "I do not know how to speak, for I am only a youth," but he received Yahweh's assurance that he would put his own words into Jeremiah's mouth and make him a "prophet to the nations." A few scholars believe that after his call Jeremiah served as an official prophet in the Temple, but most believe that this is unlikely in view of his sharp criticism of priests, prophets, and the Temple cult.

Jeremiah's early messages to the people were condemnations of them for their false worship and social injustice, with summons to repentance. He proclaimed the coming of a foe from the north, symbolized by a boiling pot facing from the north in one of his visions, that would cause great destruction. This foe has often been identified with the Scythians, nomads from southern Russia who supposedly descended into western Asia in the 7th century and attacked Palestine. Some scholars have identified the northern foe with the Medes, the Assyrians, or the Chaldeans (Babylonians); others have interpreted his message as vague eschatological predictions, not concerning a specific people.

In 621 King Josiah instituted far-reaching reforms based upon a book discovered in the Temple of Jerusalem in the course of building repairs, which was probably Deuteronomy or some part of it. Josiah's reforms included the purification of worship from pagan practices, the centralization of all sacrificial rites in the Temple of Jerusalem, and perhaps an effort to establish social justice following principles of earlier prophets (this program constituted what has been called "the Deuteronomic reforms").

Jeremiah's attitude toward these reforms is difficult to assess. Clearly, he would have found much in them with which to agree; a passage in chapter 11 of Jeremiah, in which he is called on by Yahweh to urge adherence to the ancient Covenant upon "the men of Judah and the inhabitants of Jerusalem," is frequently interpreted as indicating that the prophet travelled around Jerusalem and the villages of Judah exhorting the people to follow the reforms. If this was the case, Jeremiah later became disillusioned with the reforms because they dealt too largely with the externals of religion and not with the inner spirit and ethical conduct of the people. He may have relapsed into a period of silence for several years because of the indifferent success of the reforms and the failure of his prophecies concerning the foe from the north to materialize.

Some scholars doubt that Jeremiah's career actually began as early as 627/626 BC and question the accuracy of the dates in the biblical account. This view arises from the difficulty of identifying the foe from the north, which seems likely to have been the Babylonians of a later time, as well as the difficulty of determining the prophet's attitude toward the Deuteronomic reforms and of assigning messages of Jeremiah to the reign of Josiah. In the opinion of such scholars, Jeremiah began to prophesy toward the end of the reign of Josiah or at the beginning of the reign of Jehoiakim (609–598).

Early in the reign of Jehoiakim, Jeremiah delivered his famous "Temple sermon," of which there are two versions, one in Jeremiah, chapter 7, verses 1 to 15, the other in chapter 26, verses 1 to 24. He denounced the people for their dependence on the Temple for security and called on them to effect genuine ethical reform. He predicted that God would destroy the Temple of Jerusalem, as he had earlier destroyed that of Shiloh, if they continued in their present path. Jeremiah was immediately arrested and tried on a capital charge. He was acquitted but may have been forbidden to preach again in the Temple.

The reign of Jehoiakim was an active and difficult period in Jeremiah's life. That king was very different from his father, the reforming Josiah, whom Jeremiah commended for doing justice and righteousness. Jeremiah denounced Jehoiakim harshly for his selfishness, materialism, and practice of social injustice.

Near the time of the Battle of Carchemish, in 605, when the Babylonians decisively defeated the Egyptians and the remnant of the Assyrians, Jeremiah delivered an oracle against Egypt. Realizing that this battle made a great difference in the world situation, Jeremiah soon dictated to his scribe, Baruch, a scroll containing all of the messages he had delivered to this time. The scroll was read by Baruch in the Temple. Subsequently it was read before King Jehoiakim, who cut it into pieces and burned it. Jeremiah went into hiding and dictated another scroll, with additions.

When Jehoiakim withheld tribute from the Babylonians (about 601), Jeremiah began to warn the Judaeans that they would be destroyed at the hands of those who had previously been their friends. When the King persisted in resisting Babylonia, Nebuchadrezzar sent an army to besiege Jerusalem. King Jehoiakim died before the siege began and was succeeded by his son, Jehoiachin, who surrendered the capital to the Babylonians on March 16, 597, and was taken to Babylonia with many of his subjects.

The Babylonians placed on the throne of Judah a king favourable to them, Zedekiah (597–586 BC), who was more inclined to follow Jeremiah's counsel than Jehoiakim had been but was weak and vacillating and whose court was torn by conflict between pro-Babylonian and pro-Egyptian parties. After paying Babylonia tribute for nearly 10 years, the King made an alliance with Egypt. A second time Nebuchadrezzar sent an army to Jerusalem, which he captured in August 586.

Early in Zedekiah's reign, Jeremiah wrote a letter to the exiles in Babylonia, advising them not to expect to return immediately to their homeland, as false prophets were encouraging them to believe, but to settle peaceably in their place of exile and seek the welfare of their captors. When emissaries from surrounding states came to Judah in 594 to enlist Judah's support in rebellion against Babylonia, Jeremiah put a yoke upon his neck and went around proclaiming that Judah and the surrounding states should submit to the yoke of Babylonia, for it was Yahweh who had given them into the hand of the King of Babylonia. Even to the time of the fall of Jerusalem, Jeremiah's message remained the same: submit to the yoke of Babylonia.

When the siege of Jerusalem was temporarily lifted at the approach of an Egyptian force, Jeremiah started to leave Jerusalem to go to the land of the tribe of Benjamin. He was arrested on a charge of desertion and placed in prison. Subsequently he was placed in an abandoned cistern, where he would have died had it not been for the prompt action of an Ethiopian eunuch, Ebed-melech, who rescued the prophet with the King's permission and put him in a less confining place. King Zedekiah summoned him from prison twice for secret interviews, and both times Jeremiah advised him to surrender to Babylonia.

When Jerusalem finally fell, Jeremiah was released from prison by the Babylonians and offered safe conduct to Babylonia, but he preferred to remain with his own people. So he was entrusted to Gedaliah, a Judaean from a prominent family whom the Babylonians appointed as governor of the province of Judah. The prophet continued to oppose those who wanted to rebel against Babylonia and promised the people a bright and joyful future.

After Gedaliah was assassinated, Jeremiah was taken against his will to Egypt by some of the Jews who feared reprisal from the Babylonians. Even in Egypt he continued to rebuke his fellow exiles. Jeremiah probably died in about 570 BC. According to a tradition that is preserved in extrabiblical sources, he was stoned to death by his exasperated fellow countrymen in Egypt.

Prophetic vocation and message. This sketch of Jeremiah's life portrays him as a courageous and persistent prophet who often had to endure physical suffering for his fidelity to the prophetic call. He also suffered inner doubts and conflicts, as his own words reveal, especially those passages that are usually called his "confessions" (Jer. 11:18–12:6; 15:10–21; 17:9–10, 14–18; 18:18–23; 20:7–12, 14–18). They reveal a strong conflict between Jeremiah's natural inclinations and his deep sense of vocation to deliver Yahweh's message to the people. Jeremiah was by nature sensitive, introspective, and perhaps shy. He was denied participation in the ordinary joys and sorrows of his fellowmen and did not marry. He thus could say, "I sat alone," with God's hand upon him. Jeremiah had periods of despondency when he expressed the wish that he had never been born or that he might run away and live alone in the desert. He reached the point of calling God "a deceitful brook, . . . waters that fail" and even accused God of deceiving and overpowering him. Yet there were times of exaltation when he could say to God: "Thy words became to me a joy and the delight of my heart"; and he could speak of Yahweh as "a dread warrior" fighting by his side.

As a prophet Jeremiah pronounced God's judgment upon the people of his time for their wickedness. He was concerned especially with false and insincere worship and failure to trust Yahweh in national affairs. He denounced social injustices but not so much as some previous prophets, such as Amos and Micah. He found the source of sin to be in the weakness and corruption of the hearts of men—in what he often called "the stubbornness of the evil heart." He considered sin to be unnatural; he emphasized that some foreign nations were more loyal to their pagan (false) deities than Judah was to Yahweh (the real God), and he often contrasted nature's obedience to law with man's disobedience to God.

Jeremiah had more to say about repentance than any other prophet. He called upon men to turn away from their wicked ways and dependence upon idols and false gods and return to their early covenantal loyalty to Yahweh. Repentance thus had a strong ethical colouring, since it meant living in obedience to Yahweh's will for the individual and the nation.

In the latter part of his career Jeremiah had to struggle against the despair of his people and give them hope for the future. He expressed his own hope vividly by an action that he undertook when the Babylonians were besieging Jerusalem and he was in prison. He bought, from a cousin, a field in Anathoth, his native town. In the presence of witnesses he weighed out the money and made the contracts and said, "Thus says the Lord of hosts, the God of Israel: Houses and fields and vineyards shall again be bought in this land." In this and other ways he expressed his hope for a bright future for Israel in its own land.

Jeremiah's most important prophecy concerning the future is one regarding the New Covenant (Jer. 31:31–34). While the present literary form of the passage is probably not Jeremiah's, the thought is essentially his. He prophesied of a time when Yahweh would make a covenant with Israel, superseding the old Mosaic Covenant; Yahweh would write his law upon the hearts of men (rather than on tables of stone), and all would know God directly and receive his forgiveness. This New Covenant prophecy was very influential in

New Testament times. It is quoted in the Letter to the Hebrews and lies behind words attributed to Jesus at the Last Supper: "This cup is the new covenant in my blood."

(J.P.Hy./Ed.)

BIBLIOGRAPHY. J. Philip Hyatt, *Jeremiah: Prophet of Courage and Hope* (1958), is a relatively brief survey. John Skinner, *Prophecy and Religion: Studies in the Life of Jeremiah* (1922, reissued 1963), is one of the best interpretations of the prophet. Sheldon H. Blank, *Jeremiah: Man and Prophet* (1961), is an excellent study, especially of Jeremiah's personality and his prayer life. Three good full-scale commentaries on the Book of Jeremiah are John Bright (ed. and trans.), *Jeremiah* (1965); J.A. Thompson, *The Book of Jeremiah* (1980); and Robert P. Carroll, *Jeremiah* (1986).

Jeremiah, The Book of, also called THE PROPHECY OF JEREMIAS, one of the major prophetical writings of the Old Testament. Jeremiah, a Judaean prophet whose activity spanned four of the most tumultuous decades in his country's history, appears to have received his call to be a prophet in the 13th year of the reign of King Josiah (627/626 BC) and continued his ministry until after the siege and capture of Jerusalem by the Babylonians in 586 BC. Many of his oracles concerned the turbulent events of his times.

The major parts of the book are usually delineated as follows: prophecies against Judah and Jerusalem (chapters 1–25), narratives about Jeremiah (chapters 26–45), prophecies against foreign nations (chapters 46–51), and a historical appendix (chapter 52). The prophecies in the first part of the book derive mostly from Jeremiah himself. The second part, which is mostly prose and usually speaks of Jeremiah in the third person, probably owes its composition to Baruch, the scribe who, according to chapter 36, wrote the prophecies against Israel and Judah and all the nations from Jeremiah's dictation. The prophecies against foreign nations may derive in part from Jeremiah; the appendix was largely taken from 2 Kings 24:18–25:30.

An unusual feature of this book is the "confessions" of Jeremiah, a group of individual laments reflecting the personal struggles precipitated by the prophet's role as the spokesman of a message so unpopular that it evoked imprisonments and threats to his life. These confessions make the personal history of Jeremiah more accessible than that of any other Old Testament prophet.

The literary history of the book is long and complex. Its basic stratum consists of Jeremiah's oracles against Judah and Jerusalem, some of which are probably identical with the words that Baruch wrote on the scroll from Jeremiah's dictation. Other collections of sayings and reports concerning Jeremiah (especially in chapters 26–45) were probably compiled by Baruch somewhat later. To these two blocks of material were added material from the latest period of Jeremiah's activity as well as from other sources (especially in chapters 46–51). The book, therefore, is the product of a long process of growth, with several redactors responsible for the inclusion and arrangement of materials.

Jeremiah, The Lamentations of (biblical literature): *see* Lamentations of Jeremiah, The.

Jeremiah, The Letter of, also called THE EPISTLE OF JEREMIAS, apocryphal book of the Old Testament, in the Roman canon appended as a sixth chapter to the book of Baruch (itself apocryphal in the Jewish and Protestant canons).

The work is supposedly a letter sent by Jeremiah to Jews exiled to Babylon by King Nebuchadrezzar in 597 BC, but it is not a letter, nor was it written by Jeremiah. It is a polemic against the worship of idols, developed around a verse in The Book of Jeremiah (10:11), stating that false gods shall perish. Possibly composed about 300 BC by a Jew living in Babylonia, the text suggests by its intensity that idolatry threatened fidelity to the God of Israel. The author's primary target was probably the Babylonian deity Tammuz, an agricultural god whose cult was associated with orgiastic fertility rites. Although the letter is extant only in Greek, certain linguistic and stylistic elements point to an original composition in Hebrew or Aramaic.

Jeremias: *see* Jeremiah.

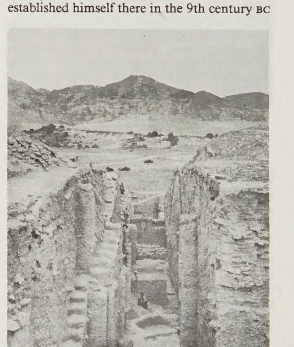
Jeremias II (b. *c.* 1530, Anchialos, Ottoman Empire [now Pomorie, Bulg.]—d. 1595, Constantinople [now Istanbul]), patriarch of Constantinople and one of the most capable leaders of the Greek Orthodox church.

Elected patriarch in 1572 by popular acclaim, Jeremias immediately instituted a reform by disciplining the clergy and prosecuting simony (the sale and purchase of ecclesiastical offices). Having irritated the Holy Synod, the council of bishops, by his zeal, he was deposed in 1579. Public clamour, however, returned him to office after nine months. In 1584 he was again deposed; but once again, after two years, his popularity, backed by the goodwill of the Ottoman sultan, secured his return, and he reigned until his death.

To collect funds for a new patriarchate (the Turks had transformed the patriarchal church into a mosque), Jeremias traveled to Poland and Russia, the first such trip by a reigning patriarch of Constantinople. In the Polish-dominated Ukraine he gave the support of his authority to the Orthodox resistance against Latin and Uniate pressures. In Moscow in 1589 he consecrated Job, metropolitan of Moscow, as the first Russian patriarch. Upon his return, having received generous contributions, he held a council (1593), which confirmed the erection of the Moscow patriarchate and organized a Patriarchal Academy in Constantinople that was to serve as an intellectual centre for Orthodoxy and to raise the educational level of the clergy.

From 1572 to 1581 Jeremias corresponded with German Lutheran theologians who sought Orthodox support for the Lutheran articles of faith contained in the 1530 Confession of Augsburg. Although he expressed some agreement with certain articles of the Lutheran creed, Jeremias repudiated the Lutheran beliefs on grace and sacramental worship. The proceedings of this Lutheran-Orthodox dialogue were published at Wittenberg, Ger., as *Acta et Scripta Theologorum Wirtembergensium et Patriarchae Constantinopolitani, D. Hieremiae* (1584; "Acts and Writings of the Württemberg Theologians and His Lordship Jeremias, Patriarch of Constantinople"). Jeremias' anti-Western spirit caused him even to reject the Gregorian calendar, the new style of chronological computation instituted in March 1582 by Pope Gregory XIII.

Jérémie, town, southwestern Haiti, on the far northwestern coast of the long Tiburon Peninsula. Situated on the Gulf of Gonaïves, it lies 120 miles (190 km) west of Port-au-Prince but is difficult to reach because of the condition of the mostly gravel roads. The main town of the area, Jérémie is an active port for local trade, especially in cacao, coffee, sugarcane, bananas, and timber. There is some tourism and fishing. Pop. (1997 est.) 26,803.



Jerevan (Armenia): *see* Yerevan.

Jerez de García Salinas, city, south-central Zacatecas *estado* ("state"), north-central Mexico. Formerly known simply as Jerez, the city is on the Jerez River, 6,650 feet (2,027 m) above sea level and southwest of Zacatecas, the state capital. It is the commercial and manufacturing centre for an agricultural and pastoral hinterland in which beans, quince, and apples are the principal crops and horses, pigs, sheep, and cattle are the principal livestock. Tin and mercury are mined in the vicinity. Pop. (1990) city, 34,300; mun., 58,000.

Jerez de la Frontera, city, Cádiz *provincia,* in the *comunidad autónoma* ("autonomous community") of Andalusia, southwestern Spain. It lies northeast of Cádiz city and near the north bank of the Guadalete River. Of obscure origin but probably identical with the Roman Asido Caesariana, the city was occupied by the Moors from the 8th century until it was captured by King Alfonso X of Castile in 1264. Several towns on the border near the Moorish territories were called *de la frontera* ("of the frontier"). Notable landmarks in the city include the 11th-century Moorish Alcázar (fortress palace), the Baroque 17th-century Colegiata (Collegiate Church), and the medieval Gothic churches of Santiago and San Miguel. The English word *sherry* comes from the 16th-century pronunciation of the name *Jerez.* The maturing of sherry wine in bodegas (wine sheds) is the city's chief occupation; sherry is produced for both domestic and export markets. Jerez horses, of mixed Arab, Spanish, and English stocks, are highly valued. Pop. (1999 est.) 182,660.

Jericho, Arabic ARĪḤĀ, town in the disputed West Bank area occupied by Israel since 1967, on the west side of the Jordan River valley. It is one of the earliest continuous settlements in the world, dating perhaps from about 9000 BC.

Jericho is famous in biblical history as the first town attacked by the Israelites under Joshua after they crossed the Jordan River (Joshua 6). After its destruction by the Israelites it was, according to the biblical account, abandoned until Hiel the Bethelite established himself there in the 9th century BC

Excavation of the Tall As-Sulṭān, Jericho
By courtesy of the Jericho Excavation Fund

(1 Kings 16:34). Jericho is mentioned several other times in the Old and New Testaments. Herod the Great established a winter residence there, and he died there in 4 BC. The site of the Roman and New Testament Jericho is approximately 1 mile (1.6 km) south of that of the Old Testament town.

Old Testament Jericho has been identified in the mound known as Tall As-Sulṭān (at the source of the copious spring 'As-Sulṭān), which rises 70 feet (21 m) above the surrounding plain. A number of major archaeological expeditions have worked at the site, notably in 1952–58 under Kathleen M. Kenyon, director of the British School of Archaeology

in Jerusalem; one of the main objectives has been to establish the date of the town's destruction by the Israelites—a matter of importance for the chronology of the Israelite entry into Canaan. Evidence of this destruction was thought to have been found but proved to be erroneous. Most of the town of the period, including the whole circuit of the town walls, has been removed by erosion; enough survives to show only that there was a town of the period. This may have been destroyed in the second half of the 14th century BC, but evidence is too scanty for precision. The site was then abandoned until the Iron Age. Little trace has been found of the 9th-century-BC occupation attributed to Hiel, but there was a sizable settlement in the 7th century BC, ending perhaps at the time of the second Babylonian Exile in 586 BC. The site was then finally abandoned, and the later Jerichos grew up elsewhere.

Excavations have shown, however, that Jericho had a very long history before the biblical period, and the site's great importance is that it gives evidence of the first development of permanent settlements and thus of the first steps toward civilization. Traces have been found of visits of Mesolithic hunters, dated by carbon-14 to about 9000 BC, and of a long period of settlement by their descendants. By about 8000 BC the inhabitants had grown into an organized community capable of building a massive stone wall around the settlement, strengthened at one point at least by a massive stone tower. The size of this settlement justifies the use of the term town and suggests a population of some 2,000–3,000 persons. Thus, this 1,000 years had seen movement from a hunting way of life to full settlement. The development of agriculture can be inferred from this, and grains of cultivated types of wheat and barley have been found. Jericho is thus one of the places providing evidence of the development of agriculture. It is highly probable that, to provide enough land for cultivation, irrigation had been invented. This first Neolithic culture of Palestine was a purely indigenous development. These occupants were succeeded about 7000 BC by a second group, bringing a culture that was still Neolithic and still not manufacturing pottery, though it was not indigenous. This occupation probably indicates the arrival of newcomers from one of the other centres, possibly in northern Syria, in which the Neolithic way of life based on agriculture had developed.

This second Neolithic stage ended about 6000 BC. For the next 1,000 years there is little evidence of occupation at Jericho. Only about 5000 BC did Jericho show the influences of developments that had been taking place in the north, where an ever-increasing number of villages had appeared, still Neolithic but marked by the use of pottery. The first pottery users of Jericho were, however, primitive compared with their predecessors on the site, living in simple huts sunk in the ground. They were probably mainly pastoralists. Over the next 2,000 years, occupation was sparse and possibly intermittent.

At the end of the 4th millennium BC, an urban culture once more appeared in Jericho, as in the rest of Palestine. Jericho became a walled town again, with its walls many times rebuilt.

About 2300 BC there was once more a break in urban life. The nomadic newcomers, consisting of a number of different groups, were probably the Amorites. Their successors, about 1900 BC, were the Canaanites, sharing a culture found the whole length of the Mediterranean littoral. The Canaanites reintroduced town life, and excavations have provided evidence both of their houses and of their domestic furniture, which was found in their tombs as equipment of the dead in the afterlife. These discoveries have indicated the nature of the culture that the Israelites found when they infiltrated into Canaan and which they largely adopted.

Excavations in 1950–51 revealed something of Herodian Jericho. A magnificent facade along the Wadi al-Qulṭ, a mile south of Old Testament Jericho, is probably part of Herod's palace; and its style, completely Italian, illustrates Herod's devotion to Rome. Traces of other fine buildings can be seen in this area, which became the centre of Roman Jericho.

Jericho of the Crusader period was on yet a third site, a mile east of the Old Testament site, and here the modern town grew up. An insignificant village in Turkish times, it became a winter resort after the British mandate over Palestine was established (1923). Its major expansion, however, came after its incorporation into Jordan in 1949. The establishment in the neighbourhood of two enormous camps of Arab refugees from Israel brought great activity to the town, which was largely rebuilt; the area of the oasis was expanded by irrigation. The Arab-Israeli War of June 1967, however, resulted in the dispersal of much of the refugee population. Modern Jericho is an Arab town that retains its character of an oasis where bananas, dates, and oranges are grown. Pop. (1987 est.) 12,528. (K.M.K./Ed.)

Jermyn, Henry: *see* Saint Albans, Henry Jermyn, Earl of.

Jernberg, Sixten (b. Feb. 6, 1929, Sweden), Swedish skier, an outstanding athlete in the Nordic events (cross country and jumping).

Originally a lumberjack by trade, Jernberg first came to prominence as a skier in 1954. He won four Winter Olympic Games gold medals: for the 50-kilometre race (1956, 1964) and the 30-kilometre race (1960) and as a member of the Swedish 4 × 10 kilometre relay race (1964). He also won three silver and two bronze medals, and seven consecutive Swedish Nordic titles (1954–60). Jernberg retired after the Winter Olympic Games of 1964 and was proclaimed a Swedish national hero.

Jerne, Niels K., in full NIELS KAJ JERNE (b. Dec. 23, 1911, London, Eng.—d. Oct. 7, 1994, Castillon-du-Gard, France), British-Danish immunologist who in 1984, with César Milstein and Georges Köhler, received the Nobel Prize for Physiology or Medicine.

Jerne was born of Danish parents and grew up in Denmark. After his graduation from the University of Leiden, Neth., he worked at the Danish State Serum Institute from 1943 to 1956. He received his medical degree from the University of Copenhagen in 1951, and in 1956 he was appointed chief medical officer of the World Health Organization, a position he held until 1962. During the 1960s he taught at the universities of Geneva and Pittsburgh (Penn.) and was professor of experimental therapy at J.W. Goethe University in Frankfurt am Main, Ger. He helped to establish the Basel Institute for Immunology and served as its director from 1969 to 1980. After teaching for a year at the Pasteur Institute, Paris, Jerne retired to Gard, France.

Jerne was the first to suggest the now generally accepted explanation of the way in which the immune system produces antibodies to match any possible bacterium, virus, or other type of antigen (invading body). He also offered a comprehensive theory of the development of the immune system as a whole, and in 1974 he presented the so-called network theory, in which he detailed the complex system of interactions whereby the immune system is activated to respond to and counteract disease and then is shut down when it is not needed.

Jerobaal (biblical hero): *see* Gideon.

Jérôme (king of Westphalia): *see* Bonaparte, Jérôme.

Jerome, SAINT, Latin in full EUSEBIUS HIERONYMUS, pseudonym SOPHRONIUS (b. *c.* 347, Stridon, Dalmatia—d. 419/420, Bethlehem, Palestine; feast day September 30), biblical translator and monastic leader, traditionally regarded as the most learned of the Latin Fathers. He lived for a time as a hermit, became a priest, served as secretary to Pope Damasus, and about 389 established a monastery at Bethlehem. His numerous biblical, ascetical, monastic, and theological works profoundly influenced the early Middle Ages. He is known particularly for his Latin translation of the Bible, the Vulgate.

Early life. Jerome was born of well-to-do Christian parents at Stridon, probably near the modern Ljubljana, Slovenia. His education, begun at home, was continued in Rome when he was about 12. There he studied grammar, rhetoric, and philosophy. A serious scholar, enamoured of Latin literature, he frequented the catacombs and near the end of his Roman education was baptized (*c.* 366), probably by Pope Liberius.

He spent the next 20 years in travel and impermanent residences. At Treveris (now Trier), he was profoundly attracted to monasticism. Possibly as early as 369 he was back in the vicinity of Stridon. In Aquileia (Italy) he was linked with an ascetic elite—including Rufinus, a writer and scholar, who translated the 3rd-century Alexandrian theologian Origen—grouped around Bishop Valerianus. When the group disbanded (*c.* 373), Jerome decided to go on a trip through the East. On reaching Antioch in 374, fatigued by travel and by inner conflict, he rested as guest of the priest Evagrius of Antioch and there may have composed his earliest known work, *De septies percussa* ("Concerning Seven Beatings"). There also, in mid-Lent 375, during a near-fatal illness, he had a celebrated dream. In that dream, in which he was dragged before a tribunal of the Lord, he was accused of being a Ciceronian—a follower of the 1st-century-BC Roman philosopher—rather than a Christian, and he was severely lashed; he vowed never again to read or possess pagan literature.

Long afterward, in controversy with Rufinus, Jerome minimized the dream's importance, but for years it prevented him from reading the classics for pleasure, and at the time it was the cause of a genuine spiritual crisis. One result of his dream was his first exegetical (critical interpretive) work, an allegorical commentary on the biblical book Obadiah, which he disowned 21 years later as a youthful production of fervent ignorance.

In 375 Jerome began a two-year search for inner peace as a hermit in the desert of Chalcis. The experience was not altogether successful. A novice in spiritual life, he had no expert guide; speaking only Latin, he was confronted with Syriac and Greek; lonely, he begged for letters; a gourmet with a weak stomach, he found desert food a penance; desperate for peace, he was racked by passion. Yet, he claimed that he was genuinely happy. His response to temptation was incessant prayer and fasting; he learned Hebrew from a Jewish convert, studied Greek, had manuscripts copied for his library and his friends, and carried on a brisk correspondence.

The crisis arrived when Chalcis became involved with ecclesiastical and theological controversies centring on episcopal succession and Trinitarian (on the nature of the relationship of the Father, Son, and Holy Spirit) and christological (on the nature of Christ) disputes. Suspected of harbouring heretical views (*i.e.,* Sabellianism, which emphasized God's unity at the expense of the distinct persons), Jerome insisted that the answer to ecclesiastical and theological problems resided in oneness with the Roman bishop. Pope Damasus did not respond, and Jerome quit the desert for Antioch.

In Antioch his host, Evagrius, won Jerome

over to the party of Bishop Paulinus, who was opposed by Basil, the great orthodox bishop of Caesarea and one of the three Cappadocian Fathers—the others being Gregory of Nazianzus and Gregory of Nyssa. Recognizing his importance—since Jerome was by now known as a scholar and a monastic figure of significance—Paulinus decided to ordain him. Jerome accepted (378) on two conditions: his monastic aspirations would not be prejudiced, and priestly functions would not be forced on him. He attended the exegetical lectures of Apollinaris of Laodicea and visited the Nazarenes (Jewish Christians) of Beroea to examine their copy of a Hebrew gospel purporting to be the original Gospel of Matthew.

Jerome spent almost three years (379–382) continuing his pursuit of scriptural studies. An enthusiastic disciple of Gregory of Nazianzus, Jerome also came to know Gregory of Nyssa and the theologian Amphilochius of Iconium at the Council of Constantinople (381). Under such influences he improved his knowledge of Greek and developed an admiration for Origen's exegesis. He translated 14 of Origen's homilies (sermons) on Old Testament books into Latin. Here too he translated the church historian Eusebius' *Chronicon* (*Chronicles*) and continued it to the year 378.

But the most decisive influence on Jerome's later life was his return to Rome (382–385) as secretary to Pope Damasus. There he pursued his scholarly work on the Bible and propagated the ascetic life. On Damasus' urging he wrote some short exegetical tracts and translated two sermons of Origen on the Song of Solomon. More importantly, he revised the Old Latin version of the Gospels on the basis of the best Greek manuscripts at his command, and made his first, somewhat unsuccessful, revision of the Old Latin Psalter based on a few Septuagint (Greek translation of the Old Testament) manuscripts. He held classes for a monastic-minded circle of noble Roman widows and virgins (*e.g.*, Marcella, Paula, and her daughters Blesilla and Eustochium). He taught them the Hebrew text of the Psalms, orally and in letters, he answered their biblical problems, and he was their master in spirituality as well. Under these conditions, he wrote a defense of the perpetual virginity of Mary, Jesus' mother (383), and attacked the view of those who espoused the equality of virginity and marriage. But his preaching in support of the monastic life and his relationship with the ascetic coterie, his castigation of Roman clergy, lax monks, and hypocritical virgins, and his correction of the gospel text provoked such a storm of criticism and calumny, especially after Damasus' death, in December 384, that in August 385 he left "Babylon" (Rome) in bitter indignation and made his way to the Holy Land.

In company with virgins led by Paula, Jerome made a religious and archaeological pilgrimage through all of Palestine and to the monastic centres of Egypt; he spent almost a month with the famed exegete Didymus in Alexandria.

The summer of 386 found him settled in Bethlehem. There, by 389, Paula finished a monastery for men under Jerome's direction, three cloisters for women (forming one convent) under her own supervision, and a hostel for pilgrims. Here Jerome lived, except for brief journeys, until his death.

Later literary works. The literary legacy of Jerome's last 34 years (in Palestine) is the outgrowth of contemporary controversies, Jerome's passion for Scripture, and his involvement in monastic life. The controversies were varied. An anti-Origen movement in the east, fanned by the anti-heretical bishop Epiphanius, turned Jerome not only against the views of Origen—whose 39 sermons on Luke he had translated *c.* 389–392—but against his friends Bishop John of Jerusalem and Rufinus. His petulance in early correspondence with St. Augustine, stemming from the African's strictures on Jerome's biblical efforts, imperilled their mutual respect. His catalog of Christian authors, *De viris illustribus* ("Concerning Illustrious Men"), was written in 392/393 to counter pagan pride in pagan culture. Against the monk Jovinian, who asserted the equality of virginity and marriage, he wrote a polemical diatribe *Adversus Jovinianum* (393) that was frequently brilliant but needlessly crude, excessively influenced by the 2nd- and 3rd-century theologian Tertullian, whose writings were at times unnecessarily harsh toward marriage. Against the priest Vigilantius, Jerome dictated in one night a defense of monasticism, clerical celibacy, and certain practices connected with the cult of martyrs (*Contra Vigilantium,* 406). The Pelagian problem—named for the heretical British monk Pelagius, who minimized the role of divine grace in man's salvation—was transplanted to Palestine from Rome with the personal appearance of the author of this heresy, and it called forth Jerome's finest controversial work, *Dialogi contra Pelagianos* (three books, 415), in which his use of fictitious interlocutors makes his arguments uncommonly impersonal.

Jerome's biblical production in Bethlehem includes two introductory works helpful to biblical scholars: *Liber locorum* ("Book of Places"), a useful translation and adaptation of Eusebius' work on Palestinian place-names; and *Liber interpretationis Hebraicorum nominum* ("Book of Interpretation of Hebrew Names"), an alphabetical list, with quite fanciful etymologies or origins, of Hebrew proper names in the Bible. Continuing his revision of the Old Latin version of the Septuagint based on Origen's *Hexapla* (an edition with the Hebrew text in Hebrew and Greek characters, and four different Greek versions arranged in six parallel columns), he revised Ecclesiastes, Proverbs, the Song of Solomon, Chronicles, and Job, and to his Roman revision of the Psalms added Origen's diacritical notes. Between 391 and 406 he produced a Latin translation of the Old Testament on the basis of the original text, a remarkable effort considering the slender instruments at his disposal and the opposition his project provoked. Jerome's Bethlehem commentaries suffer at times from hasty composition, excessive dependence on his predecessors, and a predilection for allegorical interpretation. The *Liber Hebraicarum quaestionum in Genesim* ("Book of Hebrew Questions on Genesis") gives an important place to geography, etymology, and rabbinic tradition (post-biblical Jewish scholarly views). He wrote short glosses (interpretations) on the Psalter and more scientific explanations of Psalms 10–16. His commentary on Ecclesiastes (*c.* 387) is a milestone in exegesis, because it is the first original Latin commentary that takes advantage of the Hebrew text. Perhaps Jerome's best commentaries are on the minor and major prophets of the Old Testament. As for the New Testament, he explained Matthew, accenting the literal sense; he interpreted four of the Apostle Paul's letters (Philemon, Galatians, Ephesians, Titus), with the stress on the allegorical interpretation; he recast the chiliastic commentary (on the view that Christ would return again and his followers would reign for 1,000 years) of Bishop Victorinus of Pettau (Austria), a Latin exegete martyred *c.* 304, on the Revelation to John. Many of his letters are tracts on exegetical problems, and he wrote homilies to monks under his direction on texts of Scripture.

Jerome's ascetical interests at Bethlehem are mirrored not only in his controversies but in his life of Malchus, the monk captured by Bedouins; a biography of Hilarion, with its miracles and journeyings; a translation of Coptic ascetical works (*e.g.*, the Rule of Pachomius); homilies to monks; and a significant segment of his correspondence.

Influence. Jerome is remembered for his extensive erudition, especially his understanding of the classics, the Bible, and Christian tradition. He was a learned scholar rather than a deep thinker, a sound traditionalist and not a speculative theologian, more competent as editor than as exegete. His career was a turbulent combination of scholarship and asceticism, and his correspondence is an exciting source for the historian, Scripture student, and theologian. His influence has been far-reaching and profound, on the early Middle Ages in particular: primarily through the Vulgate (the Latin version that he had translated), but importantly also through his work as an exegete and humanist and because he transmitted much of Greek thought to the West. (W.J.Bu.)

Jerome OF PRAGUE (b. *c.* 1365, Prague—d. May 30, 1416, Constance), Czech philosopher and theologian whose advocacy of sweeping religious reform in the Western Church made him one of the first Reformation leaders in central Europe.

A student at the Charles University of Prague, Jerome came under the influence of the Czech Reformer Jan Hus, with whom he collaborated in criticizing the Roman Catholic Church and in debating theological issues throughout Bohemia, Poland, and Germany. After obtaining the bachelor's degree in 1398, he continued his studies at Oxford and adopted the philosophical theology of the English Reformer John Wycliffe. He returned to Prague in 1401 and, as a university professor, began spreading Wycliffe's teaching.

The Christian Church, according to Jerome's views, is the community of those chosen by God for salvation and is not defined in legal terms devised by a rigid, ministerial structure. He advocated, moreover, the need for poverty in the church and called for the expropriation of church lands. In the order of worship he insisted that the wine of Holy Communion be extended to the laity, as practiced by the early church, and asked for more freedom in preaching.

Continuing to propagate reform doctrine at various academic centres throughout Europe, Jerome taught at the Sorbonne (1405) and

at the universities of Heidelberg and Cologne (1406) but was forced to leave by ecclesiastical authorities in each city. Returning to Prague, he and Hus resumed public debates and proposed to reform the structure and customs of the church through a general council.

Extending his dissent to traditional sacramental theology and liturgy, Jerome was forced to leave Vienna in 1410 and was expelled from Poland after King Władysław II had invited him to reorganize the University of Kraków. Again at Prague, in 1412, he joined Hus in a famed public disputation in which he maintained that the faithful are not bound to obey papal commands that conflict with the laws of Christ. He then led a procession through the city, climaxed by burning Antipope John XXIII's decree authorizing the sale of indulgences (pardon from punishment for sin).

In April 1415, against the advice of his followers, Jerome went secretly to the Council of Constance in an unsuccessful attempt to defend the teaching of the imprisoned Hus. As he was leaving Constance, he was arrested and imprisoned. Confined for more than a year and ill, he disavowed the condemned doctrine of Wycliffe and Hus, after repeated interrogation by the conciliar tribunal. Accused of ambiguity and insincerity at his final appearance before the council (May 26, 1416), he then withdrew all earlier retractions of reform views and declared that his confession of Roman Catholic orthodoxy had come out of fear and weakness. Accordingly, he was judged a relapsed heretic and sentenced to burn at the stake. The Bohemian Hussite Church considers Jerome (with Hus) the first martyr for the Protestant Reformation.

Of Jerome's writings, all that remain are his university lectures and disputations and two treatises, *Positio de universalibus* ("A Position on Universals") and *Quaestio de universalibus* ("The Question of Universals").

Jerome, Chauncey (b. June 10, 1793, Canaan, Conn., U.S.—d. April 20, 1868, New Haven, Conn.), American inventor and clockmaker whose products enjoyed widespread popularity in the mid-19th century.

Learning the carpenter's trade early in life, Jerome spent his leisure time making dials for grandfather clocks and was employed in 1816 by a clockmaker at Plymouth, Conn. Later, he started his own business peddling clocks from farmhouse to farmhouse. The bronze looking-glass clock he designed in 1824 became popular; he then formed a company that soon became the leader in clock production, with branches in Virginia and South Carolina in addition to the main plant at Bristol, Conn.

About 1838 Jerome invented the one-day brass movement, an improvement over the wood clock. Applying the mass-production techniques of American inventor Eli Whitney, Jerome flooded the United States with low-priced brass clocks. His clocks quickly spread to Europe and so astonished the English that "Yankee ingenuity" became a byword.

In the 1850s Jerome became associated with unethical businessmen, and his company failed; he died in poverty.

Jerome, Jerome K(lapka) (b. May 2, 1859, Walsall, Staffordshire, Eng.—d. June 14, 1927, Northampton, Northamptonshire), English novelist and playwright whose humour—warm, unsatirical, and unintellectual—won him wide following.

Jerome left school at the age of 14, working first as a railway clerk, then as a schoolteacher, an actor, and a journalist. His first book, *On the Stage—and Off,* was published in 1885, but it was with the publication of his next books, *The Idle Thoughts of an Idle Fellow* (1886) and *Three Men in a Boat* (1889), that he achieved great success; both books were widely translated. From 1892 to 1897 he was a coeditor (with Robert Barr and George Brown Burgin) of *The Idler,* a monthly magazine that he had helped found, which featured contributions by writers such as Eden Phillpotts, Mark Twain, and Bret Harte.

Jerome's many other works include *Three Men on the Bummel* (1900) and *Paul Kelver* (1902), an autobiographical novel. He also wrote a number of plays. A book of Jerome's memoirs, *My Life and Times,* was published in 1926 and a biography by J. Connolly in 1982.

Jerrold, Douglas William (b. Jan. 3, 1803, London—d. June 8, 1857, London), English playwright, journalist, and humorist.

Jerrold achieved success in the theatre with *Black-Eyed Susan* (1829), a nautical melodrama based on an 18th-century ballad by John Gay. He also mastered a special brand of Victorian humour in a series of articles called "Mrs. Caudle's Curtain Lectures" (1845) for *Punch* magazine, to which he was a regular contributor. More plays with a nautical theme followed *Black-Eyed Susan,* but Jerrold was ambitious to write high comedy, at which he was less successful. A prolific journalist, he wrote much that is bitter and personal, in sharp contrast to the geniality of his "Curtain Lectures," which appeared in book form (1846) and were regularly reprinted.

Jersey, largest and southernmost of the Channel Islands, 12 miles (19 km) west of the Cotentin peninsula of France; its capital, St. Helier (*q.v.*), is 100 miles south of Weymouth, Eng. Jersey is about 10 miles across and 5 miles from north to south and has an area of 44 square miles (115 square km). The Ecrehous rocks (6 miles northwest) and Les Minquiers (12 miles south) are in the Bailiwick of Jersey (area 45 square miles [116 square km]).

The island is largely a plateau mantled with loess, with deeply incised valleys sloping from north to south. Picturesque cliffs reaching 485 feet (148 m) in height line the northern coast; elsewhere, rocky headlands enclose sandy bays bordered by infilled lagoons. Coasts are reef-strewn, but a breakwater in St. Aubin's Bay protects St. Helier harbour from southwest gales. Blown sand forms dunes at the northern and southern ends of St. Ouen's Bay on the western coast. The climate is less maritime and more sunny than Guernsey's. Mean annual temperature is 52° F (11° C). Frost is rare, but cold air spreading from France in spring occasionally damages the potato crop.

Prehistoric remains of Paleolithic man have been found at La Cotte de St. Brelade, and there is abundant evidence of the Neolithic and Bronze ages. The island was known to the Romans as Caesarea. Documents (11th century) show 12 parishes as part of the diocese of Coutances. In the 12th century, Norman landowners dominated the island, which was divided into three units for the collection of the king-duke's revenue.

Separation from Normandy in 1204 made reorganization necessary. Jersey kept its Norman law and local customs but, with the other islands, was administered for the king by a warden and sometimes by a lord. By the end of the 15th century, Jersey had its own captain, later called governor, an office abolished in 1854, when the duties devolved upon a lieutenant governor, who still performs them. In 1617 it was ruled that justice and civil affairs were affairs of the bailiff. The Royal Court, as it came to be called, took the same form as Guernsey's; the surviving court still reveals its medieval origin. The States of Jersey were separated from the Royal Court (1771) and assumed the court's residual powers of legislation. Parish deputies were first elected in 1857.

In the 17th century the De Carterets, seigneurs of St. Ouen, dominated the island, holding it for the king from 1643 to 1651. In the 18th and 19th centuries the island was torn by feuds—Magots versus Charlots, Laurels versus Roses—but it also prospered from the Newfoundland fisheries, privateering, and smuggling, and, later, from cattle, potatoes, and the tourist trade.

Jersey is now governed under the British monarch in council by the Assembly of the States, in which the royally appointed bailiff presides over 12 senators, 12 constables (connétables), and 29 deputies, all popularly elected. The lieutenant governor and crown officers have seats and may speak but not vote. The Royal Court consists of the bailiff as chief magistrate and 12 jurats chosen by an electoral college. Judicial and legislative functions of jurats were not separated until 1948, when other reforms excluded from the States the rectors of the 12 parishes. The proceedings are conducted in French, the official language, though English is everywhere understood.

The inhabitants are mainly of Norman descent with an admixture of Breton, although there was an influx of English after 1830, of political refugees from Europe after 1848, and, after World War I, of men seeking to avoid taxation. St. Helier, the adjoining parishes of St. Saviour and St. Clement, Gorey, and St. Aubin are the main population centres.

Farming concentrates on dairying (with ancillary cropping) and on breeding for export of Jersey milk cattle, the only breed allowed on the island since 1789. Many small farms grow early potatoes and outdoor tomatoes for export. Greenhouse production of flowers, tomatoes, and vegetables is significant. Soil is fertilized with vraic (French *varec,* "wrack," or "seaweed") fertilizer. The tourist trade is well established. Knitting of the traditional woolen jerseys has declined. Passenger and cargo ships connect Jersey with Guernsey and Weymouth, Eng., and with Saint-Malo, Fr., via the ports of St. Helier and Gorey; and there are cargo services to London and Liverpool. Air links are extensive. Jersey Zoological Park was founded in 1959 in Trinity Parish by Gerald Durrell, the naturalist and writer, to protect animals in danger of extinction. Pop. (1981) 72,970.

Jersey, breed of small short-horned dairy cattle originating on Jersey, one of the Channel Islands; it is believed to have descended from French cattle. The colour of the Jersey is usually a shade of fawn or cream, but darker shades are common. In the late 18th century measures were passed prohibiting the importation of cattle into Jersey except for immediate slaughter, and by the early 19th century the indigenous breed came to be recognized as pure. Jersey cattle have been introduced in large numbers into England, one of the earliest herds being formed in 1811. The first exportation of registered Jerseys to the United States was in 1850.

The Jersey is adaptable to a wide range of conditions, and its distribution is worldwide. Jersey milk is remarkably rich in butterfat, and for that reason animals of this breed are in demand for crossing with native stock to improve the butterfat percentage in milk. Jerseys are of great importance where butter is a major product, as in New Zealand and Denmark. Because of their small size and lack of muscular development as well as the yellow colour of body fat, Jerseys have lower beef value than the other major breeds. Their principal capacity lies in their efficient production of milk high in butterfat and milk solids.

Jersey Act, also called JERSEY LAW, resolution passed in 1913 by the English Jockey Club and named after its sponsor, Victor Albert George, 7th Earl of Jersey, one of the club stewards. It declared that the only horses and mares acceptable for registration in the General Stud Book would be those that could be traced in all their lines to sires and dams already registered therein. The Act effectively

disqualified as Thoroughbreds many horses bred outside England or Ireland, including the majority of North American horses. With the shutdown in 1911 and 1912 of racing in New York, an invasion of American bloodstock into England became a threat, and the Act was ostensibly intended to protect the British Thoroughbred from infusions of American blood. The resulting complications of recognizing outstanding horses, however, caused ill feeling among American and French breeders. In 1949, following a rash of victories in prestigious English races by French horses with "impure" American blood, the Law was modified to qualify animals on which eight or nine crosses of pure blood could be traced for at least a century and for which turf performances of the immediate family could be shown as a warrant of blood purity. Not all American Thoroughbreds then became qualified for registration in the General Stud Book, but the ill feeling was eliminated.

Jersey City, city, seat (1840) of Hudson county, northeastern New Jersey, U.S. It is situated on a peninsula between the Hudson and Hackensack rivers, opposite Manhattan Island, New York City, with which it is connected by the Holland Tunnel and the Port Authority Trans-Hudson rapid transit system. Its site, first visited by Henry Hudson in 1609, was settled by Dutch trappers in 1618 and became known as Paulus Hook (renamed Jersey City in 1820). Michael Pauw purchased it from the Delaware Indians about 1630, and by 1660 a permanent settlement had been established. In 1664 the British seized it briefly, returned it to the Dutch, and then regained it in 1674. The town, held by the British during the American Revolution, was the site of a daring raid on August 19, 1779, by Henry ("Light-Horse Harry") Lee who stormed the British fortifications and forced a British retreat.

Jersey City's emergence as a transportation centre, sharing a communications complex with New York City, began with its dockside facilities (now part of the Port of New York complex) and the completion of railroads and the old Morris Canal in the 1830s. The city is now highly industrialized, its diversified manufactures including chemicals, containers, cosmetics, plastics, furniture, pharmaceuticals, automobile parts, and paper products. It is the seat of Jersey City State College (1927) and St. Peter's College (1872). Inc. town, 1804; city, 1820. Pop. (2000) 240,055.

Jersey Zoological Park, zoo on the island of Jersey, in the British Isles, primarily devoted to keeping and breeding endangered species, especially island forms and small mammals and reptiles. The zoo, situated on 14 hectares (35 acres) of rolling hills, was founded in 1959 by the British author Gerald Durrell. Its management was turned over to the Jersey Wildlife Preservation Trust in 1963. More than two-thirds of the zoo's 1,500 specimens, which represent about 100 species, were bred on the park grounds. The zoo does not maintain a monopoly of any rare species it breeds; all surplus animals are sent to other institutions to provide breeding stock if illness or disaster strikes a particular colony.

The Jersey Zoological Park breeds rare primates, including marmosets, Mayotte brown lemurs, colobus monkeys, and gorillas. Other rare mammals bred there are spectacled bears, tenrecs, and Rodrigues fruit bats, the rarest species of bat in the world.

Jerusalem, Hebrew YERUSHALAYIM, Arabic BAYT AL-MUQADDAS, or AL-QUDS, ancient city of the Middle East that since 1967 has been wholly in the possession of Israel. Since 1949 the city has been claimed by Israel as its capital. Jerusalem has been inhabited since 1800 BC and is one of the principal holy places of the three major monotheistic faiths of Judaism, Christianity, and Islām. After the 1948 Arab-Israeli war Jerusalem was divided between Transjordan (later Jordan), which annexed the Old City and the rest of East Jerusalem, and Israel, which held West Jerusalem. East Jerusalem was taken by Israel in the Six-Day War of 1967. Israel has declared Jerusalem to be its eternal and indivisible capital, and the status of the city has been a major point of contention in negotiations between the Jewish state and Palestinians. East Jerusalem is claimed as the capital of any Palestinian state.

A brief treatment of Jerusalem follows. For full treatment, *see* MACROPAEDIA: Jerusalem.

Jerusalem is located near the centre of Israel, about 15 miles (24 km) west of the Dead Sea and 35 miles (56 km) east of the Mediterranean Sea, in the watershed between the Mediterranean coastal plain and the valley of the Jordan River. The city has a mixed subtropical, semiarid climate with warm, dry summers and cool, rainy winters.

For Jews, Jerusalem is the repository of the holiest of memories, the focus of religious reverence and nationhood; for Christians, the scene of their Saviour's agony and triumph; and for Muslims, the goal of their Prophet's mystic night journey and the site of the third-most sacred shrine in Islām. The city was the capital of the ancient Hebrews and of their Jewish descendants until the 1st century AD, when the city witnessed the ministry and crucifixion of Jesus Christ. The Prophet Muḥammad is believed by Muslims to have ascended to heaven from Jerusalem.

The main source of employment in modern-day Jerusalem is government and public service. The city is also a centre of banking, finance, and insurance. There is little heavy industry; the dominant light industries are diamond cutting and polishing, as well as printing and publishing.

Jerusalem's cultural climate is richly diverse. The Old City, still surrounded by a massive town wall from antiquity, contains Muslim, Jewish, Christian, and Armenian quarters. The Old City is dominated by the raised platform of the Herodian Temple Compound, the site of the First and Second Temples of the Hebrews and Jews; the compound includes the Islāmic holy places of the Dome of the Rock and al-Aqṣā Mosque. Its Western (Wailing) Wall is the most sacred of Jewish places. The Old City is distinguished by its many churches and mosques and by the ancient synagogues and study houses of the Jewish Quarter. The modern portion of Jerusalem includes residential neighbourhoods, commercial and governmental buildings, and several educational institutions.

Archeological excavations caused considerable controversy in the late 1990s. Muslims feared the opening of a tunnel exit along the Western Wall by Israelis could undermine Islāmic structures, and rioting ensued. Likewise, Jews maintained that Muslim renovations on the Temple Mount were an attempt to destroy Jewish cultural artifacts.

The Hebrew University of Jerusalem (1918) is Israel's foremost institution of higher learning. The Hadassah Medical Centre is renowned for medical research and health care. Extensive archaeological research in the region has contributed material to the Near Eastern archaeology and ethnology collections of the Israel, Rockefeller, and Islāmic museums in the city.

The Old City is ringed by major avenues. Access roads link Jerusalem with Tel Aviv–Yafo and Lod Airport to the west; Nābulus and Jerusalem (International) Airport to the north; Amman, Jordan, to the east; and Beersheba, Hebron, and Bethlehem to the south. A rail line runs from Jerusalem to the coast at Tel Aviv–Yafo. Area city, 42 square miles (109 square km). Pop. (2001 est.) 657,500.

Jerusalem, Assizes of, French ASSISES DE JÉRUSALEM, a law code based on a series of customs and practices that developed in the Latin crusader kingdom of Jerusalem in the 12th century. It stands as one of the most complete monuments of feudal law.

The basis for the assizes was laid by Godfrey of Bouillon (d. 1100), first ruler of the kingdom. He asked his leading men to query crusaders regarding customs and practices prevalent in the West. The customs that were adopted were primarily French and were intended to govern and guard a population surrounded by enemies and dependent upon military service to maintain itself. Deposited in the Church of the Holy Sepulchre in Jerusalem, the code was referred to as *Lettres du Sepulchre* ("Letters of the Sepulchre").

The assizes provided for such things as the king's officers, administration of justice, collection of taxes, granting of fiefs, provisions for military service, and regulation of trade. The original *Lettres du Sepulchre* perished at the capture of Jerusalem in 1187, but another compilation was made in the 13th century by a group of lawyers in the kingdom of Cyprus, where remnants of Frankish society in the Latin East settled after the Muslim reconquest of the Holy Land. Though the assizes were revised over the subsequent 300 years, they still elucidate the nature of the feudal state in the European Middle Ages.

Jerusalem, Council of, a conference of the Christian Apostles in Jerusalem in about AD 50 which decreed that Gentile Christians did not have to observe the Mosaic Law of the Jews. It was occasioned by the insistence of certain Judaic Christians from Jerusalem that Gentile Christians from Antioch in Syria obey the Mosaic custom of circumcision. A delegation, led by the apostle Paul and his companion Barnabas, was appointed to confer with the elders of the church in Jerusalem.

The ensuing apostolic conference (noted in Acts 15:2–35), led by the apostle Peter and James, "the Lord's brother," decided the issue in favour of Paul and the Gentile Christians. From this time onward Gentile Christians were not bound by the Levitical ceremonial regulations of the Jews, except for the provisions of the so-called apostolic decree: abstention "from what has been sacrificed to idols and from blood and from what is strangled and from unchastity" (Acts 15:29). The Council of Jerusalem thus demonstrated the willingness of apostolic leaders to make compromises on certain secondary issues in order to maintain peace and unity in the church.

Jerusalem, Kingdom of, a state formed in 1099 from territory in Palestine wrested from the Muslims by European Christians during the First Crusade and lasting until 1291, when the two surviving cities of the kingdom succumbed to attacks by Muslim armies.

The rulers of the neighbouring crusader states of Antioch, Edessa, and Tripoli were the king of Jerusalem's vassals; in return for their loyalty and military service, he provided them with aid and protection. The kingdom proper, which corresponded roughly to present Israel, southern Lebanon, and southwestern Jordan, included four great baronies: the county of Jaffa and Ascalon, the lordship of Krak or Montréal, the principality of Galilee, and the lordship of Sidon. Jerusalem and its surrounding territory plus the cities of Tyre (Ṣūr, Leb.) and Acre (Akko, Israel) composed the royal domain. Though fiefs tended to become hereditary, kings often had to intervene to settle succession disputes and to enforce the Assizes of Jerusalem.

Economically, the kingdom was not wealthy, depending on trade with the Muslims, banking activities, and taxes on pilgrims to keep the government operating and to provide for defense. Though there were some fertile dis-

tricts, much was barren, and in bad years grain had to be imported from Syria to feed the Christians.

The early kings of Jerusalem, Baldwin I (reigned 1100–18) and Baldwin II (1118–31), secured the kingdom by capturing the coastal towns and building new fortifications to safeguard the interior of Palestine and the northern territories. Subsequently, the kings tried to expand into the south, abandoning the earlier policy and indirectly contributing to the Muslim conquest of Edessa (1144). When the Second Crusade (1147) failed, the Muslims began to strengthen their position. King Amalric I (reigned 1163–74) directed attacks against Egypt, and his failures contributed to the rise of the Muslim leader Saladin (reigned 1169–93), who succeeded in uniting the previously divided Muslim world in a massive attack on the Holy Land. Saladin's armies overran the city of Jerusalem in 1187, and, despite some territorial recovery made by the Third Crusade (late 12th century), the city remained in Muslim hands. With the fall of Jerusalem, the kings made Acre the capital of their kingdom, and there they watched the slow erosion of their territory throughout the 13th century, despite the efforts of new expeditions from Europe to regain lost ground.

Driven from the Asian mainland in 1291, the ruling house of Lusignan retreated to the island of Cyprus, which its members ruled until the late 15th century, still claiming the title king of Jerusalem.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Jerusalem, Synod of (1672), council of the Eastern Orthodox church convened by Dositheos, patriarch of Jerusalem, in order to reject the *Confession of Orthodox Faith* (1629), by Cyril Lucaris, which professed most of the major Calvinist doctrines. The synod rejected unconditional predestination (the doctrine that God has eternally chosen those whom he intends to save) and justification by faith alone, while it affirmed the essentially Roman doctrines of transubstantiation (the change of bread and wine into the body and blood of Christ in the mass) and of purgatory. Against Rome, however, it continued to affirm that the Holy Spirit proceeds from the Father alone. The synod also decreed that the church and Scripture are equally infallible, that there are seven sacraments, and that the books of Tobit, Judith, Ecclesiasticus, and Wisdom of Solomon are canonical books of the Bible.

Jerusalem, Temple of, either of two temples that were the centre of worship and national identity in ancient Israel.

In the early years of the Israelite kingdom, the Ark of the Covenant was periodically moved about among several sanctuaries, especially those of Shechem and Shiloh. After King David's capture of Jerusalem, however, the Ark was moved to that city. This action joined Israel's major religious object with the monarchy and the city itself into a central symbol of union of the Israelite tribes. As the site for a future temple, David chose Mount Moriah, or the Temple Mount, where it was believed Abraham had built the altar on which to sacrifice his son Isaac.

The First Temple was constructed during the reign of David's son, Solomon, and completed in 957 BC. Other sanctuaries retained their religious functions, however, until Josiah (reigned *c.* 640–609 BC) abolished them and established the Temple of Jerusalem as the only place of sacrifice in the Kingdom of Judah.

The First Temple was built as an abode for the Ark and as a place of assembly for the entire people. The building itself, therefore, was not large, but the courtyard was extensive. The Temple building faced eastward. It was oblong and consisted of three rooms of equal width: the porch, or vestibule (*'ulam*); the main room of religious service, or Holy Place (*hekhal*); and the Holy of Holies (*devir*), the sacred room in which the Ark rested. A storehouse (*yazi'a*) surrounded the Temple except on its front (east) side.

The First Temple contained five altars: one at the entrance of the Holy of Holies, two others within the building, a large bronze one before the porch, and a large tiered altar in the courtyard. A huge bronze bowl, or "sea," in the courtyard was used for the priests' ablutions. Within the Holy of Holies, two cherubim of olive wood stood with the Ark; this innermost sanctuary was considered the dwelling place of the Divine Presence (Shekhina) and could be entered only by the high priest and only on the Day of Atonement (Yom Kippur).

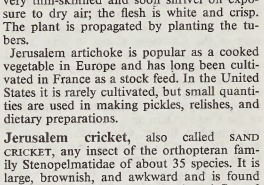
The Temple suffered at the hands of Nebuchadrezzar II of Babylonia, who removed the Temple treasures in 604 BC and 597 BC and totally destroyed the building in 587/586. This destruction and the deportations of Jews to Babylonia in 586 and 582 were seen as fulfillments of prophecy and, therefore, strengthened Judaic religious beliefs and awakened the hope for the reestablishment of the independent Jewish state.

Cyrus II, founder of the Achaemenian dynasty of Persia and conqueror of Babylonia, in 538 BC issued an order allowing exiled Jews to return to Jerusalem and rebuild the Temple. Work was completed in 515 BC. There is no known detailed plan of the Second Temple, which was constructed as a modest version of the original building. It was surrounded by two courtyards with chambers, gates, and a public square. It did not include the ritual objects of the First Temple; of special significance was the loss of the Ark itself. Ritual, however, was elaborate and was conducted by well-organized families of priests and Levites.

During the Persian and Hellenistic (4th–3rd century BC) periods, the Temple generally was respected, and in part subsidized, by Judaea's foreign rulers. Antiochus IV Epiphanes, however, plundered it in 169 BC and desecrated it in 167 BC by commanding that sacrifices be made to Zeus on an altar built for him. This final act touched off the Hasmonean revolt, during which Judas Maccabaeus cleansed and rededicated the Temple; the event is celebrated in the annual festival of Hanukka.

During the Roman conquest, Pompey entered (63 BC) the Holy of Holies but left the Temple intact. In 54 BC, however, Crassus plundered the Temple treasury. Of major importance was the rebuilding of the Second Temple begun by Herod the Great, king (37 BC–AD 4) of Judaea.

Construction began in 20 BC and lasted for 46 years. The area of the Temple Mount was doubled and surrounded by a wall with gates. The Temple was raised, enlarged, and faced with white stone. The new Temple square served as a gathering place, and its porticoes sheltered merchants and money changers. A stone fence (*soreg*) and a rampart (*hel*) surrounded the consecrated area forbidden to Gentiles. The Temple proper began, on the east, with the Court of Women, each side of which had a gate and each corner of which had a chamber. This court was named for a surrounding balcony on which women observed the annual celebration of Sukkot. The western gate of the court, approached by a semicircular staircase, led to the Court of the Israelites, that portion of the Court of Priests open to all male Jews. Surrounding the inner sanctuary, the Court of Priests contained the sacrificial altar and a copper laver for priestly ablutions. This court was itself surrounded by a wall broken with gates and chambers. The Temple sanctuary building was wider in front than in the rear; its eastern facade had two pillars on either side of the gate to the entrance hall. Within the hall, a great gate led to the sanctuary, at the western end of which was the Holy of Holies.



The Herodian Temple was again the centre of Israelite life. It was not only the focus of religious ritual but also the repository of the Holy Scriptures and other national literature and the meeting place of the Sanhedrin, the highest court of Jewish law during the Roman period. The rebellion against Rome that began in AD 66 soon focused on the Temple and effectively ended with the Temple's destruction on the 9th/10th of Av, AD 70.

All that remained of the Second Temple was a portion of the Western Wall (*q.v.*; also called the Wailing Wall), which continues to be the focus of Jewish aspirations and pilgrimage. Made part of the wall surrounding the Muslim Dome of the Rock and Al-Aqsā Mosque in AD 691, it returned to Jewish control in 1967.

Jerusalem artichoke, also called GIRASOLE, sunflower (*Helianthus tuberosus*) of the Asteraceae family, native to North America, noted for its edible tubers. The aboveground part of the plant is a coarse, usually multibranched, frost-tender perennial, 2 to 3 m (7 to 10 feet) tall. The numerous showy flowerheads, appearing in late summer or early autumn, have yellow ray flowers and yellow, brownish, or purplish disk flowers. The underground tubers vary from oblong to much-elongated, from regular to rough and branched, and from very small to 4 ounces (about 110 grams). Skin colours range from light buff, through yellowish, to brown, red, and purple. The tubers are very thin-skinned and soon shrivel on exposure to dry air; the flesh is white and crisp. The plant is propagated by planting the tubers.

Jerusalem artichoke is popular as a cooked vegetable in Europe and has long been cultivated in France as a stock feed. In the United States it is rarely cultivated, but small quantities are used in making pickles, relishes, and dietary preparations.

Jerusalem cricket, also called SAND CRICKET, any insect of the orthopteran family Stenopelmatidae of about 35 species. It is large, brownish, and awkward and is found in Asia, South Africa, and North and Central America.

Jerusalem cricket (*Stenopelmatus intermedius*)
E.S. Ross

The Jerusalem cricket is active at night and spends the day beneath rocks or sand. Its thick, heavily armoured front legs are used for digging.

Jerusalem Post, Israeli English-language daily newspaper established in 1932 as the *Palestine Post*. It adopted its current name in 1950. It is the largest English-language daily in the country. A morning paper appearing daily except Saturday, the *Post* has traditionally stressed foreign news, giving particular attention to Arab-Israeli relations. In the mid-1990s its circulation was about 60,000 daily and 100,000 for its big Friday edition. The weekend edition is the basis for

an international edition called the *Jerusalem Post Weekly*, with a worldwide circulation of 50,000. Essentially independent in its editorial policies, the *Jerusalem Post* has combined spare writing with economical headlines and careful editing to build a reputation for informative, objective, and thorough coverage. The paper carries little advertising.

Jervis, John Bloomfield (b. Dec. 14, 1795, Huntington, N.Y., U.S.—d. Jan. 12, 1885, Rome, N.Y.), American civil engineer who made outstanding contributions in construction of U.S. canals, railroads, and water-supply systems.

Jervis worked as an axman on the survey for the Erie Canal and earned rapid promotion on that project thereafter, serving as chief engineer from 1821 to 1825. In 1827 he became chief engineer for the Delaware & Hudson Canal project, which was designed to carry coal from Pennsylvania to the Hudson River and thence to New York City. This project consisted of a 108-mile- (174-kilometre-) long canal and a 16-mile- (26-kilometre-) long railway and involved the construction of numerous bridges and inclines in the mountains. Jervis planned and designed every facet of the railway and drew up the specifications for its locomotive, the *Stourbridge Lion*, which was the first functioning locomotive in the United States. He next became chief engineer of the Mohawk & Hudson Railway, New York state's first railroad. In this post he designed the *Experiment* (1832), the first locomotive to have four of its six wheels mounted on a swiveling truck. This radical innovation enabled the *Experiment* to travel at speeds of up to 60 miles per hour (96 km/h), making it the fastest locomotive in the world.

From 1833 to 1836 Jervis was chief engineer of the Chenango Canal in New York, which was the first canal to use artificial reservoirs as part of its water supply. In 1836 he took charge of construction of the Croton Aqueduct, New York City's first water-supply system, and directed the construction of the Croton Dam and Reservoir as well as the Aqueduct Bridge, which was built on 15 stone arches and crossed the Harlem River. From 1846 until his retirement in 1864 Jervis directed the construction of three more railroads in New York state and the Midwest.

Jervis Bay, inlet of the Tasman Sea, southeastern New South Wales, Australia. A broad bay, 10 miles (16 km) by 6 miles (10 km), it is partly enclosed by Point Perpendicular on Beecroft Head on the northeast and by Governor Head on the southwest. It was discovered in 1770 and named Long Nose by Captain James Cook but was renamed in 1791 for the naval hero Admiral John Jervis, Earl of St. Vincent. One of Australia's finest natural harbours, the bay and some adjacent shoreland were transferred in 1915 from the jurisdiction of New South Wales to the Australian Commonwealth to accord with the Seat of Government Act of 1908, which stipulated that the Australian Capital Territory (ACT) 110 miles (177 km) west-southwest should have access to the sea. The proposed development of a commercial port and railroad from the bay to Canberra (ACT) has never been realized. The bay has, however, become a resort area served by such towns as Jervis Bay, Huskisson, and Sussex Inlet. The Royal Australian Naval College was established there in 1915.

Jervis Island (Galápagos Islands): *see* Rábida Island.

Jervis Island: *see* Jarvis Island.

Jeseník Mountains, German ALTVATERGEBIRGE, mountain range that forms the eastern section of the Sudeten mountain system in the northern Czech Republic. The range lies in northern Moravia, bordering the Polish frontier. The Hrubý (High) Jeseník, also known as Vysoký Jeseník, reaches the highest point at Praděd (4,892 feet [1,491 m]). The Nízký (Low) Jeseník, just to the east, has a lower profile. The Králický Sněžník Massif is northwest of the Hrubý Jeseník group and extends into Poland. The Jeseník Mountains are broken remnants of an ancient uplifted crystalline massif. The mountains are dotted with abandoned mines, principally for iron. Šumperk, Jeseník, and Karlova Studánka are focal points for tourists, while Dolní Lipová has a health resort.

Jesi, also spelled IESI, Latin AESIS, town and episcopal see, Ancona *provincia*, Marche *regione*, east-central Italy. Jesi lies along the Esino River, just southwest of Ancona. The Roman colony of Aesis from 247 BC, it was destroyed by the Goths and Lombards and formed part of the Frankish king Pepin III's gift to the church in 756. In the early medieval conflicts between the Holy Roman emperors and the papacy, it supported the former until the Battle of Benevento (1266), after which it passed to the church. Jesi was the birthplace of Emperor Frederick II and of the 18th-century composer Giovanni Batista Pergolesi. The old quarter of the town is completely enclosed by 14th-century walls. The Palazzo della Signoria (1486–98) houses the town hall, library, and art gallery.

An agricultural centre, Jesi manufactures agricultural machinery, soap, matches, silk, wool, and paper. Pop. (1991 prelim.) mun., 40,556.

Jespersen, Otto, in full JENS OTTO HARRY JESPERSEN (b. July 16, 1860, Randers, Den.—d. April 30, 1943, Roskilde), Danish linguist and a foremost authority on English grammar. He helped to revolutionize language teaching in Europe, contributed greatly to the advancement of phonetics, linguistic theory, and the history of English, and originated an international language, Novial (*q.v.*).

As a boy Jespersen was inspired by the accomplishments of the famed Danish linguist Rasmus Rask, whose grammars he used to begin a study of Icelandic, Italian, and Spanish. He decided to explore language studies at a time when phonetics and reform in language teaching were prime concerns. In 1886, the year before receiving his master's degree in French from Copenhagen University, he published his first important paper, on phonetic laws, and helped to establish a Scandinavian association for the reform of language education. As professor of English at Copenhagen (1893–1925), he led a movement for basing foreign-language teaching on the use of conversational speech rather than on textbook study of grammar and vocabulary, and he wrote a number of textbooks used in Denmark and other countries. He presented theoretical considerations of language teaching in *Sprogundervisning* (1901; *How to Teach a Foreign Language*). Jespersen published extensively on English; one of his most vital works, *Growth and Structure of the English Language* (1905), was reprinted in 1969. His great work in this area was the encyclopaedic *Modern English Grammar*, 7 vol. (1909–49).

Jespersen gave particular consideration to the relationship between sound and sense in language. Another major concern, linguistic progress, was influenced by Charles Darwin's evolutionary theories and early reflected in *Progress in Language, with Special Reference to English* (1894). His *Fonetik* (1897–99; "Phonetics") long remained the best scientific treatment of general phonetics. Jespersen made a highly original contribution to grammatical theory in *Sprogets logik* (1913; "The Logic of Language"). His principal work on linguistic evolution, and also probably his most brilliant achievement, was *Language: Its*

Jespersen

Nature, Development, and Origin (1922). His belief in the efficiency of linguistic change was evidenced in *The Philosophy of Grammar* (1924). Long interested in international auxiliary languages, he helped to elaborate Ido, but his main achievement in this area was devising Novial, which he presented in *International Language* (1928). A Novial lexicon followed in 1930.

jessamine (shrub): *see* jasmine.

Jesse, also spelled ISAI, in the Old Testament, the father of King David. Jesse was the son of Obed, and the grandson of Boaz and Ruth. He was a farmer and sheep breeder in Bethlehem. David was the youngest of Jesse's eight sons. The appellation "son of Jesse" served as a synonym for David both at Saul's court and, subsequently, when David became king. It became a standard poetic metaphor in the Bible. Phrases such as "root of Jesse" and "stump of Jesse" (Isaiah 11:1,10) expand the metaphor. All evoke the figure of David. That the family of David would endure forever was an article of faith in monarchic circles (2 Samuel 7), supported by the fact that his dynasty had occupied the throne on Mount Zion in unbroken succession for over four centuries.

Because Jesus Christ belonged to one of the family branches descended from King David, it became customary for medieval artists to visually depict Jesus' genealogy as beginning with Jesse in such works as the stained-glass windows known as Jesse windows.

Jessel, Sir George (b. Feb. 13, 1824, London, Eng.—d. March 21, 1883, London), jurist considered one of the greatest English trial judges in equity. It is said that Jessel, as solicitor general (1871–73), was the first professing Jew to hold important governmental office in England. (Benjamin Disraeli, who had become prime minister in 1868, was born into Judaism but was baptized a Christian at the age of 12.)

Jessel, detail of an engraving
By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

The son of a London merchant, Jessel attended University College, London, and studied law at Lincoln's Inn. Called to the bar in 1847, Jessel was appointed a queen's counsel in 1865 and was elected to the House of Commons as a Liberal in 1868. From 1873 he was master of the rolls, originally sitting

both as a judge of first instance in the Rolls Court and as a member of the Court of Appeal. Later, however, after statutes of 1875 and 1876 had made the master of the rolls the president of the Court of Appeal, he was exclusively an appellate judge.

Jessel's rapid and efficient work as a trial judge in equity contrasted sharply with the traditionally dilatory nature of English chancery proceedings (bitterly satirized by Charles Dickens in his novel *Bleak House,* 1852–53). The clarity of his judgments made them exceptionally useful as precedents; they were seldom appealed and very rarely reversed. He helped to effect the fusion of law and equity under the Supreme Court of Judicature acts (1873 *et seq.*).

Jessel, George (Albert) (b. April 3, 1898, New York City—d. May 24, 1981, Los Angeles), American comedian, actor, writer, composer, and producer, whose skill as a dinner speaker earned him the honorary title of Toastmaster General of the United States.

Jessel began his career at the age of nine, after his father's death. He toured vaudeville and variety theatres in the United States and England, developing a popular act that combined comedy, nostalgia, and sentimental songs. During the 1920s and '30s he concentrated on a stage career as a composer, writer, and producer and as the star of several plays, including the original 1925 production of *The Jazz Singer, The War Song* (1928), *Joseph* (1930), and *High Kickers* (1941), the last of which he coauthored with Bert Kalmar and Harry Ruby. In 1943 he moved to California, and for the next 10 years he produced Hollywood motion pictures, among them the musicals *The Dolly Sisters* (1945) and *Wait Till the Sun Shines, Nellie* (1952).

Although he appeared frequently on television in the '50s, Jessel devoted most of the remainder of his life to delivering eulogies and to serving as master of ceremonies and dinner speaker for numerous political and social causes. In 1970 he received a special Academy Award for his humanitarian work. Jessel's books include an autobiography, *So Help Me* (1943), several anecdotal memoirs, and guides to public speaking.

Jessentuki (Russia): *see* Yessentuki.

Jessner, Leopold (b. March 3, 1878, Königsberg, Ger.—d. Oct. 30, 1945, Los Angeles), theatrical producer and director associated with the German Expressionist theatre; his bold innovations in the 1920s gained him an international reputation.

Jessner worked as a touring actor in his youth. The first play he directed was Molière's *Tartuffe* in 1911. As director of the Berlin State Theatre (1919–25), he produced classic and contemporary plays on a bare, denaturalized stage on which graduated levels and flights of steps served in the place of scene changes as platforms for different actions. Memorable performances were Schiller's *Wilhelm Tell,* Shakespeare's *Richard III,* and a *Hamlet* in modern dress slanted to be a criticism of the Germany of the 1920s. He trained his actors to adopt an oversimplified, antinaturalistic manner, which was especially effective for interpretations of the possessed and frenzied characters in the plays of the early Expressionist Frank Wedekind. His most famous production, Wedekind's *Marquis von Keith* (1920), was performed at double speed. A Socialist and a Jew, Jessner was an active innovator in the theatre until 1933, when he emigrated from Nazi Germany to Hollywood, where he engaged anonymously in film work until his death.

Jessore, city, southwestern Bangladesh, on the Bhairab River. According to tradition its name is a corruption of *yaśohara* ("glory depriving"), as the town is said to have robbed Vikramāditya's 17th-century capital of Gaur of its preeminence. Ancient buildings include the Rajbāri of Chanchra and the shrines of the Muslim saints Bahrām Shāh and Gharib Shāh. Constituted a municipality in 1864, Jessore contains a stadium, a library, and four government colleges affiliated with the University of Rājshāhi.

The surrounding region occupies the central portion of the Gangetic Delta between the Hooghly (India) and Meghna estuaries. It consists of an alluvial plain intersected by watercourses that to the south spread out into large marshes. The chief crops of this region are rice, sugarcane, and dates. Pop. (1981) 148,927.

jester (comic entertainer): *see* fool.

Jesuit, member of SOCIETY OF JESUS (S.J.), a Roman Catholic order of religious men, founded by St. Ignatius of Loyola, noted for its educational, missionary, and charitable works, once regarded by many as the principal agent of the Counter-Reformation and later a leading force in modernizing the church. The Jesuits have always been a controversial group regarded by some as a society to be feared and condemned and by others as the most laudable and esteemed religious order in the Catholic Church.

The order grew out of the activity of Ignatius, a Spanish soldier who experienced a religious conversion during a period of convalescence from a wound received in battle. After a period of intense prayer, he composed the *Spiritual Exercises,* a guidebook to convert the heart and mind to a closer following of Christ. On Aug. 15, 1534, at Paris, six young men who had met him at the University of Paris and made a retreat according to the *Spiritual Exercises* joined him in binding themselves by vows to poverty, chastity, and a pilgrimage to Jerusalem. If this last promise did not prove possible, as it did not, they vowed to accept any apostolic work requested by the pope. In 1539 Ignatius drafted the first outline of the order's organization, which Pope Paul III approved on Sept. 27, 1540.

The society introduced several innovations in the form of the religious life. Among these were the discontinuance of many medieval practices—such as regular penances or fasts obligatory on all, a common uniform, and the choral recitation of the liturgical office—in the interest of greater mobility and adaptability. Other innovations included a highly centralized form of authority with life tenure for the head of the order; probation lasting many years before final vows; gradation of members; and lack of a female branch. Particular emphasis was laid upon the virtue of obedience, including special obedience to the pope. Emphasis was also placed upon flexibility, a condition that allowed Jesuits to become involved in a great variety of ministries in all parts of the world.

The society grew rapidly, and it quickly assumed a prominent role in the Counter-Reformation defense and revival of Catholicism. Almost from the beginning, education and scholarship became the principal work. The early Jesuits, however, also produced preachers and catechists who devoted themselves to the care of the young, the sick, prisoners, prostitutes, and soldiers; and they were often called upon to undertake the controversial task of confessor to many of the royal and ruling families of Europe. The society entered the foreign mission field within months of its founding as Ignatius sent Francis Xavier, his most gifted companion, and three others to the East. More Jesuits were to be involved in missionary work than in any other activity, save education. By the time of Ignatius' death in 1556, about 1,000 Jesuits were already working throughout Europe and in Asia, Africa, and the New World. By 1626 the number of Jesuits was 15,544; and in 1749 the total was 22,589.

The preeminent position of the Jesuits among the religious orders and their championship of the pope exposed them to hostility. By the middle of the 18th century a variety of adversaries, both lay and clerical, were seeking to destroy the society. The opposition can be traced to several reasons, primarily, perhaps, to the anticlerical and anti-papal spirit of the times. In 1773 Pope Clement XIV, under pressure especially from the governments of France, Spain, and Portugal, issued a decree abolishing the order. The society's corporate existence was maintained in Russia, where political circumstances—notably the opposition of Catherine II the Great—prevented the canonical execution of the suppression. The demand that the Jesuits take up their former work, especially in the field of education and in the missions, became so insistent that in 1814 Pope Pius VII reestablished the society.

After the restoration, the order grew to be the largest order of male religious. Work in education on all levels continued to involve more Jesuits than any other activity; but the number of Jesuits working in the mission fields, especially in Asia and Africa, exceeded that of any other religious order. They were also involved in a broad and complex list of activities, including work in the field of communications, in social work, in ecumenical groups, and even in politics.

Jesuit drama, program of theatre developed for educational and propagandist purposes in the colleges of the Society of Jesus during the 16th, 17th, and 18th centuries. Cultivated as a medium for disseminating Roman Catholic doctrine, drama flourished in the Jesuit schools for more than 200 years, evolving from modest student exercises to elaborate productions that often rivaled the contemporary public stage in polish and technical skill.

The earliest recorded performance of a Jesuit play was in 1551, at the newly founded Collegio Mamertino at Messina, in Sicily. In less than 20 years, plays were being performed at more than a dozen of the new Jesuit colleges springing up in cities across the Continent, including Rome, Seville, Córdoba, Innsbruck, Munich, and Vienna. By the mid-17th century there were nearly 300 Jesuit colleges in Europe, and in almost every one at least one play was given each year.

Originally plays were to be pious in nature, expressing true religious and moral doctrines; they were to be acted in Latin, decorously, and with little elaboration; and no female characters or costumes were to appear. All these rules were relaxed or revised as Jesuit drama evolved. Favourite subjects came from biblical histories, the lives of saints and martyrs, and incidents in the life of Christ, but Jesuit playwrights also drew upon material from pagan mythology, ancient history, and contemporary events, all reinterpreted in terms of Catholic doctrine. Dramas were frequently performed in the national languages or with vernacular prologues that explained the Latin text. Jesuit plays became increasingly elaborate, and their stagecraft kept pace with all the newest technical developments of European theatre.

Music was an important element in most of the plays, ranging from simple songs to works that called for a large orchestra and chorus. The elaborate musical productions of Austria and southern Germany reflected the influence of Italian opera as well as the long tradition of music in the church. The colleges of France even included ballet in their performances.

The extravagance and luxury of many of the Jesuit productions came under heavy attack. Many of the productions were enormously

expensive, and it was charged that students in some colleges did little more than prepare and perform plays. Opponents of the Jesuit order seized upon such charges and made them part of the wave of anti-Jesuit feeling that grew in the mid-18th century. Dramatic performances were prohibited or limited in many areas, and they ceased altogether in 1773, when the Society of Jesus was temporarily suppressed.

Jesuit Estates controversy, in Canadian history, dispute that arose between Protestants and Roman Catholics after the re-establishment of the Jesuit order.

When the Society of Jesus (the Jesuit order) was suppressed by the papacy in 1773, its extensive landholdings in Canada were transferred to the British government, with any revenues derived from them to be applied to educational programs. Popular demand for the educational and missionary services of the Jesuits forced Pope Pius VII to restore the order in 1814. In 1842 a number of Jesuits returned to Canada. The idea of granting them restitution was discussed for many years; finally the Jesuits' Estates Act of 1888 was passed, and they were given $400,000 in compensation for the loss of their estates.

The restitutionary measures aroused anti-Catholic feeling among Protestants in neighbouring Ontario, where in 1889 a motion was introduced into the House of Commons urging the Dominion government to disallow the measure on the grounds that its endowment of the Society of Jesus was a threat to civil and religious liberties. This motion and subsequent attempts were defeated.

Jesuit ware, Chinese porcelain decorated with European subject matter and made during the Ch'ing dynasty in the reign of Ch'ienlung (1736–96) for export to the West. The sources for the decoration were mainly European engravings brought to China by Jesuit missionaries. The most commonly used illustrations were of Christian subjects such as the Crucifixion, though mythological subjects and, occasionally, Masonic designs were used.

The designs were painted onto the white ware in black or sometimes sepia monochrome, to which thin gilding was often added. Coloured decoration is rare. Most surviving pieces date from 1730 to 1750. Despite the careful copying, the drawing can almost always be identified as Chinese; sometimes the contrast of Chinese brushwork with European subject matter creates an almost comic incongruity.

Jesus, Little Brothers and Little Sisters of: *see* Little Brothers of Jesus and Little Sisters of Jesus.

Jesus, Society of (religious order): *see* Jesuit.

Jesus Christ, also called JESUS OF GALILEE, or JESUS OF NAZARETH (b. *c.* 6 BC, Judaea—d. *c.* AD 30, Jerusalem), founder of Christianity, whose deeds and message are recorded in the New Testament.

A brief treatment of Jesus Christ follows. For full treatment, *see* MACROPAEDIA: Jesus.

According to the biblical Gospel accounts, miraculous events surrounded the conception and birth of Jesus. He was legally the son of Joseph, a carpenter of Nazareth, but is believed by his followers to have been miraculously conceived by his mother, Mary. Tradition has it that he was born in Bethlehem. He grew up in Nazareth and as a young man followed his father's trade. Only a few isolated incidents are recorded of the years that intervened before his public ministry. During his lifetime Palestine was experiencing great distress under the rule of three sons of Herod and oppressive Roman procurators. Jesus was baptized by John the Baptist. Wandering through settlements in Galilee and the neighbouring countryside in the company of 12 disciples, Jesus preached a message of religious reform and divine love. He was received with enthusiasm by common people because of his extraordinary healing powers, his effective teaching by parables, and his message of the redeeming love of God for every person. Many miracles were attributed to him. His teaching was strongly opposed by the Pharisees (a Jewish society of scholars and pietists) and the privileged classes because of his attacks on hypocrisy and his interest in the poor. His growing influence alarmed Jewish and Roman authorities alike; regarded by some of his followers as the long-expected Messiah, he was suspected by the Jewish and Roman authorities of having revolutionary aims. After a brief ministry in Galilee, Jesus went with his disciples to Jerusalem to observe Passover. There he taught in the Temple and drove out the money changers, arousing the ire of the priestly class. After the Last Supper with his disciples, he was betrayed by one of them, Judas Iscariot, and was arrested by Roman soldiers. Examined by the high priests and the Sanhedrin (a Jewish council with religious, political, and judicial functions), Jesus was condemned as a blasphemer deserving death. He was brought before Pontius Pilate, the Roman procurator, and then was sent to Herod Antipas, who sent him back to Pilate. Under Roman law he was crucified at Golgotha as a political rebel and was buried in the tomb of Joseph of Arimathea. Belief in his Resurrection from the dead became the focus of the religion that developed around his teachings.

The term Jesus Christ designates not only a historical person who lived in Palestine during the reigns of the Roman emperors Augustus and Tiberius but also one who has been the object of Christian faith and worship for almost 20 centuries. These two designations may be distinguished, but they cannot be separated, for almost everything known about the historical person comes from the reports of those who were his followers. It is therefore impossible to construct a life of Jesus in the conventional sense of biography. Rather, he can be described chiefly on the basis of the way he was remembered by the believing community that took his name.

Jesus Only, movement of believers within Pentecostalism who hold that true Baptism can only be "in the name of Jesus" rather than in the name of the Trinity. It began at a Pentecostal camp meeting in California in 1913 when one of the participants, John G. Scheppe, experienced the power of the name of Jesus. Many accepted his revelation, and they found support for their belief in "Jesus Only" Baptism in John 3:5 and Acts 2:38. This led to the denial of the traditional doctrine of the Trinity and to the assertion that Jesus is the one Person in the Godhead. The theological controversy split the Pentecostals and led to the establishment of new churches. *See also* Pentecostal Assemblies of the World, Inc.; United Pentecostal Church, Inc.

Jesus prayer, in Eastern Christianity, a mental invocation of the name of Jesus Christ, considered most efficacious when repeated continuously. The most widely accepted form of the prayer is "Lord Jesus Christ, Son of God, have mercy on me." It reflects the biblical idea that the name of God is sacred and that its invocation implies a direct meeting with the divine.

The tradition of the Jesus prayer goes back to the "prayer of the mind," recommended by the ancient monks of the Egyptian desert, particularly Evagrius Ponticus (d. 339). It was continued as the "prayer of the heart" in Byzantine Hesychasm, a monastic system that seeks to achieve divine quietness. Since the 13th century, mental prayer was frequently connected with psychosomatic methods, such as a discipline of breathing. In modern times the practice of the Jesus prayer was popularized by the publication of the *Philokalia* (1782), an anthology of texts by various authors on mental prayer.

jet engine, any of a class of internal-combustion engines that propel aircraft by means of the rearward discharge of a jet of fluid, usually hot exhaust gases generated by burning fuel with air drawn in from the atmosphere.

A brief treatment of jet engines follows. For full treatment, *see* MACROPAEDIA: Energy Conversion.

The only practical means of propulsion so far devised is to take advantage of Newton's third law of motion. In its simplest form, this law states that action and reaction are equal and opposite. It is observed in nature that forces (*e.g.*, "pushes" or "pulls") never occur singly but always in equal or opposite pairs. Thus the existence of a force on a body requires the coexistence of an equal and opposite force. If a pair of forces acts between two separate bodies (and provided that no other forces act), the bodies will be impelled to separate or come together depending on whether the force pair is repulsive (a push) or attractive (a pull). The combination of Newton's second and third laws shows that the resulting motion of the two bodies can be expressed by the statement that the change in momentum of the two bodies is equal and opposite and along the line of action of the force pair. Momentum is the product of mass and velocity, and, because (at aircraft velocities) the mass of any body remains constant, a force pair acting between two bodies produces a change in the velocity of each. It is clear that in order to propel a body it is necessary to find something to push against. All aircraft-propulsion devices push against the air itself. If the air is used as the propelling medium, it must experience a change in momentum—*i.e.*, it has to be accelerated toward the rear of the aircraft and discharged rearward with enough velocity that the reaction produces an appreciable thrust in the opposite direction.

From 1903 to the late 1930s the reciprocating internal-combustion engine with a propeller was the sole means used to propel aircraft. The first jet-powered airplane was finally introduced in 1939 in Germany. The jet engine, consisting of a gas-turbine system, significantly simplified the propulsion process and thereby opened the way to substantial increases in aircraft speed, size, and operating altitudes. Over the years, several types of jet engines have been developed. The principal varieties are (1) turbojets, (2) turbofans, (3) turboprops, (4) turboshafts, and (5) ramjets.

Turbojets. The basic idea of the turbojet engine is simple. Air taken in from an opening in the front of the engine is compressed to 3 to 12 times its original pressure in a centrifugal or axial compressor. Sufficient fuel is added to the air and burned in a combustion chamber to raise the temperature of the fluid mixture to about 600° to 700° C (1,100° to 1,300° F). The resulting hot air is passed through a turbine, the sole function of which is to drive the compressor. If the turbine and compressor are efficient, the pressure at the turbine discharge will be nearly twice atmospheric, and this excess pressure is utilized in a propelling nozzle to produce a high-velocity stream of gas and hence thrust.

Substantial increases in thrust can be obtained by employing an afterburner. This device capitalizes on the fact that less than one-third of the oxygen in the atmospheric air is consumed in the turbojet engine. It is a second combustion chamber positioned after the turbine and before the propelling nozzle. By means of this device the temperature of the gas ahead of the propelling nozzle can be increased considerably. The result of this increase in temperature is an increase of about

40 percent in thrust at take-off or a much larger percentage at high speeds.

Turbofans. In a turbojet all the air entering the intake passes through the gas generator, which is composed of the compressor, combustion chamber, and turbine. In a turbofan engine, by contrast, only a portion of the incoming air does so. The remainder passes through a fan, or low-pressure compressor, and is ejected directly as a "cold" jet or mixed with the gas-generator exhaust to produce a "hot" jet. The objective of this sort of bypass system is to increase thrust without increasing fuel consumption. It achieves this by increasing the total air-mass flow and reducing the velocity within the same total energy supply. The fan is commonly placed at the front of the engine, and its size is determined by the bypass ratio. For large ratios only one or two fan stages are needed, but for smaller ratios a higher jet velocity and more compression are required.

Turboprops. Like the turbojet, the turboprop engine consists of a compressor, combustion chamber, and turbine, but in this case nearly the full pressure drop is used to run the turbine, which thus develops more than enough power to drive the compressor. The excess power is utilized to drive a propeller through reduction gearing. Compared with a turbojet engine, the turboprop has better propulsive efficiency at flight speeds below about 800 km per hour (500 miles per hour). Modern turboprop engines are equipped with propellers that have a smaller diameter but a larger number of blades for efficient operation at much higher flight speeds than previously achieved. To accommodate the higher rotative and flight speeds, the blades are scimitar-shaped with swept-back leading edges at the blade tips. Engines featuring such propellers are called propfans.

Turboshafts. This is another form of gas-turbine engine that operates much like a turboprop system; however, instead of driving a propeller, it powers a helicopter rotor. The turboshaft engine is so designed that the speed of the helicopter rotor is independent of the rotative speed of the gas generator. This permits the rotor speed to be kept constant even when the speed of the generator is varied to modulate the amount of power produced.

Ramjets. The simplest of all aircraft propulsive devices is the ramjet. It is essentially a turbojet in which rotating machinery has been omitted. Its application is restricted by the fact that its compression ratio depends wholly on forward speed. The ramjet develops no static thrust and very little thrust in general below the speed of sound. As a consequence, a ramjet vehicle requires some form of assisted take-off, such as another aircraft. It has been used primarily in guided-missile systems.

jet stream, any of several long, narrow high-speed air currents that flow eastward in a generally horizontal zone in the stratosphere or upper troposphere. Jet streams are characterized by wind motions that generate strong vertical shearing action, which is thought to be largely responsible for the clear air turbulence so hazardous to aircraft. They also are associated with certain types of atmospheric disturbances and so have an effect on weather.

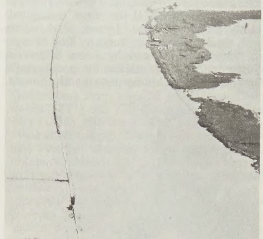
A brief treatment of jet streams follows. For full treatment, *see* MACROPAEDIA: Climate and Weather.

First discovered by airmen during World War II, the jet streams have speeds of up to 500 km per hour (310 miles per hour) along thousands of kilometres at their centres, but velocities fall off very sharply both laterally and vertically, so that the high speeds are limited to very narrow bands at heights between 10 and 50 km (32,800 and 164,100 feet), generally lying at breaks in the tropopause, where it changes suddenly in height. The kinetic energy contained in jet streams is the result of heat transport from the equator to the poles being deflected by the Coriolis force.

Jet streams encircle the Earth in meandering paths, shifting position as well as speed with the seasons. During the winter their positions are nearer the equator and their speeds higher than during the summer. There are often two, sometimes three jet-stream systems in each hemisphere. One is related to the discontinuous Polar Front, lying in mid-latitudes where the air-mass contrasts (the fronts) promote the formation of squalls, storms, and cyclones. The other distinct system, the Subtropical Jet Stream, lies above the subtropical high-pressure belt and is usually associated with fair weather. During summer a third system occurs over Southeast Asia, India, the Arabian Sea, and tropical Africa. This tropical jet stream affects the formation and duration of Indian and African summer monsoons.

jeté (French *jeté*: "thrown"), ballet leap in which the weight of the dancer is transferred from one foot to the other. The dancer "throws" one leg to the front, side, or back and holds the other leg in any desired position upon landing. Among the commonly seen forms of this step are the *jeté battu*, in which the legs are crossed in the air before the descent; the *grand jeté*, a broad, high leap with one leg stretched forward and the other back like a "split" in the air; and the *jeté en tournant*, or tour jeté ("flung turn"), in which

Grand jeté executed by Patricia Neary
Martha Swope



the dancer executes a half-turn in the air away from the forward leg before landing on it.

Jethro, also called REUEL, or HOBAB, in the Old Testament, priest of Midian of the Kenite clan, with whom Moses took refuge after he killed an Egyptian and whose daughter Moses married (Exodus 3:1).

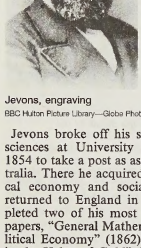
After the Exodus, Jethro visited the Hebrews encamped at the "mountain of God" and brought with him Moses' wife and sons. There he officiated at a sacrifice to God that was attended by Aaron and the elders of Israel. He also suggested that Moses appoint able men to assist him in judging his people, thus founding the Hebrew judiciary (Exodus 18). Jethro's Kenite descendants settled in Judaean territory in the Negev and were on friendly terms with the Hebrews in the time of Deborah, Saul, and David.

On the basis of Exodus 18, some scholars have suggested that Yahweh was the god of the Kenites and was introduced to Moses and the Israelites by Jethro.

jetty, any of a variety of engineering structures connected with river, harbour, and coastal works designed to influence the current or tide or to protect a harbour or beach from waves (breakwater). The two principal kinds of jetties are those constructed at river mouths and other coastal entrances and those used for the berthing of ships in harbours and offshore where harbour facilities are not available. Jettylike structures may be built out at intervals from the banks of rivers where a wide channel must be narrowed to concentrate the current and thus help maintain a navigable channel. These structures—variously termed spurs, spur dikes, and groins—may also be projected from the concave side of a river to retard bank erosion.

The South Pass jetties at the mouth of the Mississippi River
By courtesy of the U.S. Army Engineers, District New Orleans

Jetties of open-pile or impervious-masonry construction may be built on each side of a navigation channel immediately outside the entrances to docks that must be entered through locks. These structures, sometimes called lead-in jetties, form a funnel-shaped entrance to or exit from the lock. They serve to protect vessels from river or tidal currents and to provide temporary mooring facilities; if of solid construction, they may serve also as breakwaters.



Entrance jetties are built at bay inlets, at entrances to harbours of the lagoon type, and at the mouths of rivers. They are also referred to as training jetties, because they "train," or confine and direct, the currents so as to maintain the channel by promoting scour and extend farther into deep water where currents slacken and deposit silt and other transported material; they also protect such entrances from the disturbing effects of littoral currents, sand drift, and wave action. Entrance jetties are usually constructed in pairs, either parallel or converging toward the seaward ends, and are of several structural types.

Jeune Afrique, in full JEUNE AFRIQUE, L'HEBDOMADAIRE INTERNATIONALE DE L'AFRIQUE (French: "Young Africa, International Weekly of Africa"), weekly news magazine in the French language that presents news and interpretative and editorial commentary on Africa, especially French-speaking Africa. It is published in Paris and is the preeminent news magazine covering African affairs in French and perhaps in any language. It was founded in 1960. *Jeune Afrique,* whose format resembles that of popular U.S. weekly news magazines, treats both domestic and foreign events in the countries it covers. The publisher also issues an encyclopaedia, *Jeune Afrique, ad seriatim,* in fascicles.

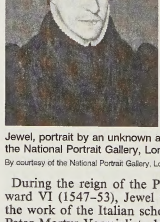
Jeune Belgique, La ("Young Belgium"), influential review (1881–97), edited by poet and novelist Max Waller; it gave its name to a literary movement (though never a formal "school") that aimed to express a genuinely Belgian consciousness and to free the litera-

ture of Belgium from outworn Romanticism. Among writers associated with the movement were Maurice Maeterlinck, Émile Verhaeren, and Max Elskamp—all poets of international stature.

Jevons, William Stanley (b. Sept. 1, 1835, Liverpool, Eng.—d. Aug. 13, 1882, near Hastings, Sussex), English logician and economist who expounded in his book *The Theory of Political Economy* (1871) the "final" (marginal) utility theory of value. Jevons' work, along with similar discoveries made by Karl Menger in Vienna (1871) and by Léon Walras in Switzerland (1874), marked the opening of a new period in the history of economic thought.

Jevons, engraving
BBC Hulton Picture Library—Globa Photos

Jevons broke off his studies of the natural sciences at University College, London, in 1854 to take a post as assayer in Sydney, Australia. There he acquired an interest in political economy and social studies. When he returned to England in 1859, he soon completed two of his most original and seminal papers, "General Mathematical Theory of Political Economy" (1862) and "A Serious Fall in the Value of Gold" (1863). In the first he outlined what subsequently came to be known as the marginal utility theory of value. This theory suggests that the utility or value to a consumer of an additional unit of a product is (at least beyond some critical quantity) inversely related to the number of units of that product he already owns. In the second he set out to measure the rise in prices in the period following the Californian and Australian gold discoveries and made one of the greatest contributions to the theory of index numbers ever published. But it was not until the publication of *The Coal Question* (1865), in which he called attention to the gradual exhaustion of Britain's coal supplies, that he received public recognition.



In 1866 Jevons was appointed to a chair of political economy at Owens College, Manchester. He moved to University College, London, in 1876. Of his works on logic and scientific methods, the most important is his *Principles of Science* (1874). His other notable works include *The Theory of Political Economy* (1871) and *The State in Relation to Labour* (1882).

Jew, Hebrew YĔHŪDHĪ, or YEHUDI, any person whose religion is Judaism (*q.v.*). In the broader sense of the term, a Jew is any person belonging to the worldwide group that constitutes, through descent or conversion, a continuation of the ancient Jewish people, who were themselves descendants of the Hebrews of the Old Testament. In ancient times, a Yĕhūdhī was originally a member of Judah—*i.e.,* either of the tribe of Judah (one of the 12 tribes that took possession of the Promised Land) or of the subsequent Kingdom of Judah (in contrast to the rival Kingdom of Israel to the north). The Jewish people as a whole, initially called Hebrews (Ivrim), were known as Israelites (Yisre'elim) from the time of their entrance into the Holy Land to the end of the Babylonian Exile (538 BC). Thereafter, the term Yĕhūdhī (Latin: Judaeus; French: Juif; German: Jude; and English: Jew) was used to signify all adherents of Judaism, because the survivors of the Exile (former inhabitants of the Kingdom of Judah) were the only Israelites who had retained their distinctive identity. (The 10 tribes of the northern kingdom of Israel had been dispersed after the Assyrian conquest of 721 BC and were gradually assimilated by other peoples). The term *Jew* is thus derived through the Latin *Judaeus* and the Greek *Ioudaios* from the Hebrew *Yĕhūdhī*. The latter term is an adjective occurring only in the later parts of the Old Testament and signifying a descendant of Yehudhah (Judah), the fourth son of Jacob, whose tribe, together with that of his half brother Benjamin, constituted the Kingdom of Judah.

In the modern world, a definition of Jew that would be satisfactory to all is virtually impossible to construct, for it involves ethnic and religious issues that are both complex and controversial. In daily life, for example, those who consider themselves Jews are generally accepted as such by Jews and non-Jews alike, even though such persons may not observe religious practices. While all Jews agree that a child born of a Jewish mother is Jewish, Reform Judaism goes beyond Orthodoxy and Conservative Judaism in affirming that a child is Jewish if either one of the parents is a Jew.

From a purely religious standpoint, Gentile converts to Judaism are accepted as Jewish in the fullest sense of the word; but in Israel the rabbinate has often placed obstacles in the registration of Jews who were not converted under the supervision of Orthodox rabbis. For this reason the chief rabbinate of Israel has been confronted in recent years with perplexing problems regarding the religious status of certain immigrants. The Supreme Court of Israel, however, has been making incursions into rabbinic interpretations of personal status. Citizens of the State of Israel are called Israelis, a term carrying no ethnological or religious connotations.

Jewel, John (b. May 24, 1522, Buden, Devon, Eng.—d. Sept. 23, 1571, Monkton Farleigh, Wiltshire), Anglican bishop of Salisbury and controversialist who defended Queen Elizabeth I's religious policies opposing Roman Catholicism.

Jewel, portrait by an unknown artist; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

During the reign of the Protestant king Edward VI (1547–53), Jewel was influenced by the work of the Italian scholar and Reformer Peter Martyr Vermigli to become a leader of the Reformists in England. For self-protection Jewel signed a set of anti-Protestant statements on the accession of the Roman Catholic queen Mary I (1553), who repealed laws establishing Protestantism in England. Finding it prudent also to flee the country, he traveled throughout Europe, visiting Zürich, Padua, and Strassburg, where he met Vermigli.

When Protestantism once again was protected by law under Elizabeth I, Jewel returned to England and in 1559 disputed with the Romanists at the Westminster Conference. In a sermon given that same year, he challenged Roman Catholics to produce scriptural and other traditional sources in support of their position on various issues dividing Anglicans and Romanists, including matters of clerical garb and worship ritual. At first preferring to deemphasize liturgical elaboration in accord with Puritan views, he soon came to accept Elizabeth's attitude of moderation.

As bishop of Salisbury (from 1560), Jewel pursued the controversy in a series of polemics. In 1562 he published his *Apologia pro Ecclesia Anglicana* ("Defense of the Anglican Church"), described by Mandell Creighton as "the first methodical statement of the position of the Church of England against the Church of Rome." When Thomas Harding, who had been deprived of the title of prebendary (honorary canon) of Salisbury, published his *Answer* to Jewel in 1564, Jewel wrote his *Reply* in 1565, which evoked a *Confutation* from Harding the next year. Jewel responded with his *Defense of the Apology* (1567).

The works produced by Jewel during the 1560s defined and clarified points of difference between the churches of England and of Rome, thus strengthening the ability of Anglicanism to survive as a permanent institution.

jewel beetle: *see* metallic wood-boring beetle.

Jewel Cave National Monument, national monument in southwestern South Dakota, U.S., 15 miles (24 km) west of Custer. Established in 1908, it occupies an area of 2 square miles (5 square km). The principal attractions are its limestone caverns, a series of chambers joined by narrow passages. The known length of the caverns is 77 miles (124 km).

Jewel Food Stores, Inc., former American grocery retailer acquired by Albertson's, Inc., of Boise, Idaho, in 1999. The company originated in 1899, when Frank Vernon Skiff and Frank Ross founded the Jewel Tea Company to supply condiments to the Chicago area from horse-drawn wagons. As the automobile gained in importance, the firm moved from wagons to motorized trucks to deliver its goods across the Midwest. It incorporated in Illinois in 1903 and changed its name to Jewel Companies, Inc., in 1966.

The enactment of the "Green River Ordinance," an antipeddler law in the 1930s, encouraged the company to move into the retail food business, and in 1932 it formed Jewel Food Stores, Inc., to acquire the grocery store business formerly owned by Loblaw Groceterias. The Jewel company flourished in the Midwest with a strong emphasis on customer service. In 1961 the company expanded into the retail drugstore business with the acquisition of Osco Drug, Inc. The company's retail outlets included Jewel supermarkets, Osco drugstores, and White Hen Pantry convenience stores. Renamed Jewel Companies, Inc., it was purchased by American Stores Company in 1984. In 1999 Albertson's acquired American Stores' assets, which included Jewel and Osco, Lucky Stores, Acme Markets, and Sav-on Drugs.

jewel orchid, any member of several closely related genera of orchids (family Orchidaceae) that are cultivated as ornamentals because of their striking leaf patterns.

Downy rattlesnake plantain (*Goodyera pubescens*), native to eastern North America, has dark green leaves with silver and white veins. Its small white flowers are borne on a spike, as are those of the Southeast Asian species *Anoectochilus roxburghii, A. sikkimensis, Dossinia marmorata, Ludisia discolor,* and *Zeuxine strateumatica* (also found in southeastern North America). The first four have wide green or brownish green leaves with red or gold veins borne near the base of the plant. The leaves of *Zeuxine* are arranged

Downy rattlesnake plantain (*Goodyera pubescens*)
B.M. Shaub

along the stem and may or may not be patterned.

jewelers' borax (mineral): *see* tincalconite.

jewelry, decorative objects made for the adornment of the body, usually, but not always, of materials such as gold and precious stones that have a high intrinsic value. The art of jewelry-making originated in prehistoric times when primitive people used objects from the animal world—such as horn, shell, and feathers—to adorn themselves. Cave paintings and carvings show figures decorated with bracelets, necklaces, and headdresses. Since then many forms of jewelry have evolved, so that there is hardly a part of the body for which an ornamental form has not been created. Arms and legs have been festooned variously with bracelets, rings, shoe buckles, and ankle bracelets; the head with tiaras, earrings, and combs; and the chest and neck with brooches, necklaces, belts, and breastplates.

A brief treatment of jewelry follows. For full treatment, *see* MACROPAEDIA: Dress and Adornment.

Traditionally jewelry has been a sign of social rank and a symbol, often of luck or good fortune. During pagan times, jewelry was often buried with the dead—the Egyptian tomb of King Tutankhamen yielded a rich treasure of jewelry when it was opened. During Roman times, jewelry, which had been worn exclusively by the nobility, began to be worn by people of lower social classes. With the rise of Christianity, the custom of burying the dead with jewelry was ended. Though little jewelry was made during the Middle Ages, by the 12th century the art of making things of gold was developing, and by the Renaissance, especially in Florence in the 15th century, jewelry-making reached the status of a fine art. Many of the major Florentine sculptors and architects trained first as goldsmiths.

Probably the most widely used and highly prized material for jewelry-making is gold. Its malleability, value, and colour make it ideal for a wide range of uses. Gold sheets can be embossed, engraved, pressed, or pierced into decorative forms, and gold wire can be used to join jewels together or to make chains. Other metals commonly used for jewelry-making are silver, also very malleable and less expensive than gold, and platinum, which began to be widely used in the 19th century. Nonprecious metals such as copper and steel have also been used, especially by 20th-century modern craftsmen.

Precious and semiprecious stones are the other most commonly used components of jewelry. Diamonds have traditionally been the most highly prized of such gems, varying in colour from yellow to bluish white and sometimes reaching enormous size. The brilliant-cut, which with its myriad facets best shows the characteristic sparkle of a diamond, was invented in the 17th century. By the 18th century diamonds had become so popular that imitation stones began to appear.

Rubies, emeralds, and sapphires are other precious stones used for jewelry, as are the less costly chrysoberyl, topaz, and zircon. Semiprecious stones include amethyst, garnet, opal, aquamarine, jade, turquoise, lapis lazuli, and malachite. Amber, a fossil tree resin, is a highly valued stone. Pearls and coral, though animal in origin rather than mineral, are also usually considered gemstones. Both range in colour from black to pink to white.

Common techniques used to decorate pieces of jewelry include enamelling and stone-cutting. Stones may be cut to create intaglio (engraved or incised) designs on the stones themselves (the scarab is an example), or they may be cut to make cameos. Cameos are cut from stones, such as onyx or agate, where different colours occur in layers. The background material is cut away, leaving the cameo design in relief.

From the 17th century onward the decorative qualities of jewelry gained importance over its symbolic, social, or religious significance. The nobility and the more affluent among the middle classes bought and wore jewelry. By the 19th century, industrialization put jewelry within the reach of even greater numbers. New techniques were developed to make cheaper materials—such as gold-plated metals, cultured pearls, and imitation gems—available. A number of large commercial firms—including Fabergé in Russia, Cartier in Paris, and Tiffany in New York City—rose to prominence by making and selling fine jewelry for the wealthier classes.

Jewelry has been important in other cultures as well. The gold objects of pre-Columbian civilization and the turquoise and silver jewelry of the Navajo and Pueblo Indians in the southwestern United States are two notable examples. Since early times in India, jewelry-making has been a dazzling art. The use of coloured stones was widespread, no doubt because of the great natural deposits of such stones in India, Ceylon, Thailand, and Burma.

Jewett, Frank Baldwin (b. Sept. 5, 1879, Pasadena, Calif., U.S.—d. Nov. 18, 1949, Summit, N.J.), U.S. electrical engineer and first president of the Bell Telephone Laboratories, Inc., who directed research in telephony, telegraphy, and radio and television communications.

After receiving the B.A. in 1898 from Throop Polytechnical Institute (now the California Institute of Technology) and the Ph.D. in 1902 from the University of Chicago, Jewett taught at the Massachusetts Institute of Technology, Cambridge. In 1904 he began work with the American Telephone and Telegraph Company, where he designed long-distance telephone lines, including a transcontinental line from New York to San Francisco. He also worked on telephone repeaters and directed the research that led in 1915 to the first transatlantic telephone call.

During World War I Jewett was commissioned in the U.S. Signal Corps and worked on telephone systems and the first tests for aircraft radiophones. After the war, as president of the Bell Telephone Laboratories and vice president of American Telephone and Telegraph, he directed early work on the dial telephone, sound motion pictures, the transmission of pictures over telephone wires, the electric phonograph, and submarine telephone cables. This work helped establish the Bell laboratories as a major industrial research centre.

From 1933 until 1935 Jewett served on Pres. Franklin Roosevelt's Science Advisory Board, and in 1939 he was elected president of the National Academy of Sciences. After the Second World War he advocated civilian rather than military control of scientific research.

Jewett, Sarah Orne (b. Sept. 3, 1849, South Berwick, Maine, U.S.—d. June 24, 1909, South Berwick), U.S. writer of regional fiction.

The daughter of a successful doctor, she was mainly educated at home because of her delicate health. Early in her teens Jewett determined to write about the rapidly disappearing traditions of provincial life about her, and by the age of 28 she was an established writer. Outstanding among her 20 volumes are *Deephaven* (1877) and *The Country of the Pointed Firs* (1896), the latter often regarded as her finest achievement. These books contain realistic sketches of aging Maine natives, whose manners, idioms, and pithiness she recorded with pungency and humour, sympathetically but without sentimentality.

In 1901 she became the first woman to receive an honorary degree from Bowdoin College. A disabling accident virtually ended her writing career in 1902.

jewfish, any of several large fishes of the sea bass (*q.v.*) family (Serranidae), especially *Epinephelus itajara*, found on the Atlantic coast of tropical America. This species sometimes attains a length of 2.5 metres (8 feet) and a weight of about 320 kilograms (700 pounds). The adult is dull olive-brown with faint spots and bands. Adult jewfish are usually solitary and typically remain in the same area for extended periods. The related south Pacific jewfish (*E. lanceolatus*) may reach 3.75 metres in length.

The Warsaw grouper (*E. nigritus*), living in the Atlantic between South Carolina and Brazil, and the giant sea bass (*Stereolepis gigas*) from the Pacific, off California and Baja California, are both occasionally called jewfish. They grow to about 2.2 metres and 220 kilograms.

In Australia the name jewfish is given to *Johnius antarctica* and *J. diacanthus* on the east coast and to *Glaucosoma hebraicum* on the west coast.

Jewish Agency, in full JEWISH AGENCY OF ISRAEL, Hebrew HA-SOKHNUT HA-YEHUDIT EL-ERETZ YISRA'EL, international body representing the World Zionist Organization, created in 1929 by Chaim Weizmann, with headquarters in Jerusalem. Its purpose is to assist and encourage Jews worldwide to help develop and settle Israel.

Zionists needed financial backing for their project of creating a Jewish national home in Palestine. The Jewish Agency became an external arm of the Zionists, seeking to elicit aid from non-Zionist Jews, overseeing the settlement of Jewish immigrants in Palestine, and helping set up a Jewish economy. It also negotiated with the Palestine mandatory government and Great Britain and represented Jewish interests at the League of Nations. After the anti-Semitic Nazi regime came to power in Germany (1933), the agency was instrumental in increasing the legal quota of immigrants to Palestine; it also set up the Youth Aliyah program to care for and resettle orphaned Jewish children from Nazi Germany.

In May 1942, David Ben-Gurion, representing the Jewish Agency at a Zionist conference at the Biltmore Hotel in New York City, gained support for a program, later termed the Biltmore Resolution, demanding unrestricted Jewish immigration to Palestine, the creation of a Jewish army, and the establishment of Palestine as a Jewish commonwealth. This

position drove the non-Zionist members from the agency, which emerged as spokesman for the Jewish cause in the postwar United Nations deliberations that led to the partition of Palestine (Nov. 29, 1947).

Upon the establishment of an Israeli state in 1948, the agency devoted itself primarily to problems of immigration, settlement, the Youth Aliyah, propaganda, and the cultural education of Jews outside Israel. These functions were retained even after 1951, when the Jewish Agency became legally identified with the World Zionist Organization.

Jewish calendar, religious and civil dating system based on both lunar and solar cycles.

A brief treatment of the Jewish calendar and its cycle of festivals follows. For full treatment, *see* MACROPAEDIA: Judaism.

In the Jewish calendar in use today, a day is counted from sunset to sunset, a week comprises seven days, a month contains 29 or 30 days, and a year has 12 lunar months and approximately 11 days (or 353, 354, or 355 days). In order to bring the calendar in line with the annual solar cycle, a 13th month of 30 days is intercalated in the 3rd, 6th, 8th, 11th, 14th, 17th, and 19th years of a 19-year cycle. Therefore, a leap year may total from 383 to 385 days. The Jewish Era in use today was popularly accepted about the 9th century CE and is based on biblical calculations placing the creation in 3761 BCE. (The abbreviations BCE [Before the Common Era] and CE [Common Era] correspond to BC and AD, respectively.)

The names of the months of the year are derived from Babylonian terms. (Before the Exile, the names were in Hebrew. Only four of them are known today, mentioned in the Bible: Ethanim, Bul, Abib, and Ziv.) The months are ordered according to religious usage and are: Nisan (Abib [March–April of the Western Gregorian calendar]), Iyyar (Ziv [April–May]), Sivan (May–June), Tammuz (June–July), Av (July–August), Elul (August–September), Tishri (Ethanim [September–October]), Heshvan, or Marheshvan (Bul [October–November]), Kislev (November–December), Tevet (December–January), Shevat (January–February), and Adar (February–March). The 13th month of the leap year, Adar Sheni (or ve-Adar), is intercalated before Adar and so contains the religious observances normally occurring in Adar.

The civil calendar begins with the month of Tishri, the first day of which is the holiday of Rosh Hashana ("New Year").

The Sabbath, the only Jewish holiday enjoined by the Ten Commandments, is observed on the seventh day of the week (Saturday) in commemoration of the seventh day on which God rested after completing the Creation and of God's role in history and his covenant with the Jewish people. Strictly, Jews are obligated to sanctify the Sabbath at home and in the synagogue, to avoid work on that day, and to engage in worship and study.

The annual cycle of the religious calendar begins with the celebration of Passover (Pesaḥ) on Nisan 15–22. It is one of the so-called major holidays during which work is proscribed, and it is one of the three Pilgrim Festivals that, in ancient times, required all males to attend religious observances at the Temple. Passover is celebrated in remembrance of the Israelites' servitude in Egypt and the subsequent Exodus. The holiday is so named because, on the eve of the Exodus, the homes of the Israelites were "passed over" as God delivered the final of 10 plagues on Egypt.

The next major holiday of the year is that of Shabuoth (Shavuot, or Pentecost), celebrated on Sivan 6–7. The second of the Pilgrim Festivals, it commemorates the revelation of the Torah (Law) at Sinai. It is named for the seven weeks of grain harvest that separated Passover from Shabuoth in ancient times.

The Ten Days of Penitence—beginning with Rosh Hashana ("New Year") on Tishri 1–2 and ending with Yom Kippur ("Day of Atonement") on Tishri 10—are considered the Days of Judgment for all humankind. Strict observance of the prohibition against work and other rules is expected on Rosh Hashana, but celebration is also an important element of the holiday, as indicated by the blowing of the shofar (ram's horn) during the synagogue service. Yom Kippur is the most solemn and holiest day of the Jewish year. Strictly, virtually all of the holiday is to be spent in prayer and fasting; sins are confessed and humankind and God are reconciled. The final prayer service concludes with the sounding of the shofar.

The last of the major holidays, and the third of the Pilgrim Festivals, is Sukkoth (Sukkot, or "Feast of Tabernacles," or "Feast of Booths"), which is celebrated on Tishri 15–21 in remembrance of the Israelites' wanderings after the Exodus. This period is marked by joyous celebration and ritual.

The Jewish religious calendar also includes a series of minor holidays—so called because they are not accompanied by the proscription of work—and fasts. Ḥanukka ("Dedication") commemorates the revolt against the Seleucid ruler Antiochus IV Epiphanes and the rededication of the Temple in 164 BCE. The holiday is celebrated for eight days, beginning on Kislev 25, and is marked by the lighting of candles, feasting, songs, and the giving of gifts to children. Purim ("Feast of Lots") celebrates the deliverance of Persian Jews from persecution in the 5th century BCE. During this holiday, the Book of Esther is read in the synagogue and feasts, masquerades, and Purim plays are common.

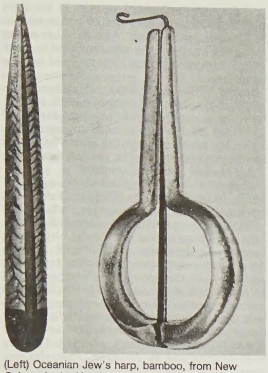
The five fast days commemorate tragic events in Jewish history. They are Shiva' 'Asar be-Tammuz (Fast of Tammuz 17); Tisha be-Av (Fast of Av 9), which commemorates the destruction of the First and Second Temples in 586 BCE and 70 CE, respectively; Tzom Gedaliahu (Tishri 3); 'Asara be-Tevet (Fast of Tevet 10); and Ta'anit Esther (Fast of Esther; Adar 13). Also celebrated are Lag ba-Omer (Iyyar 18), usually observed as a school holiday, and Tu bi-Shevat (Shevaṭ 15), in modern times associated with the planting of trees in Israel.

Since the establishment of the modern state of Israel in 1948, three other holidays have been added to the Jewish calendar. They are Holocaust Day (Nisan 27), Remembrance Day (Iyyar 4), and Independence Day (Iyyar 5).

Jewish Daily Forward, Yiddish FORVERTS, Yiddish-language newspaper published in New York City and in regional centres in the United States.

The *Forward* was founded in 1897 by the Jewish Socialist Press Federation as a civic aid and a cohesive device for Jewish immigrants from Europe. It quickly became the leading Yiddish-language newspaper in the United States. Under the guidance of Abraham Cahan, who was its editor from 1903 to 1951, the paper combined conventional news coverage with a commitment to democratic socialism and Jewish trade unionism. The *Forward* carried columns on government, politics, and education while also providing English lessons and personal advice to its readers. It also carried short stories and novels in serial form, most notably those of Isaac Bashevis Singer. At the height of its influence during World War I, the *Forward* had a daily circulation of almost 200,000 in 11 local and regional editions, but by the late 20th century its readership had greatly declined, and the paper was published only as a weekly.

Jewish Revolt, FIRST (AD 66–70), Jewish rebellion against Roman rule in Judaea. The First Jewish Revolt was the result of a long series of clashes in which small groups of Jews offered sporadic resistance to the Romans, who in turn responded with severe countermeasures. In AD 66 the Jews combined in revolt, expelled the Romans from Jerusalem, and overwhelmed in the pass of Beth-Horon a Roman punitive force under Gallus, the imperial legate in Syria (autumn, AD 66). A revolutionary government was then set up and extended its influence throughout the whole country. Vespasian was dispatched by the Roman emperor Nero to crush the rebellion. He was joined by Titus, and together the Roman armies entered Galilee, where the historian Josephus headed the Jewish forces. Josephus' army was confronted by that of Vespasian and fled. After the fall of the fortress of Jatapata, Josephus gave himself up, and the Roman forces swept the country. On the 9th of the month of Av (August 29) in AD 70, Jerusalem fell; the Temple was burned, and the Jewish state collapsed.



Jewish Revolt, SECOND (AD 132–135), Jewish rebellion against Roman rule in Judaea. The revolt was preceded by years of clashes between Jews and Romans in the area. Finally, in AD 132, the misrule of Tinnius Rufus, the Roman governor of Judaea, combined with the emperor Hadrian's intention to found a Roman colony on the site of Jerusalem and his restrictions on Jewish religious freedom and observances, roused the last remnants of Palestinian Jewry to revolt. A bitter struggle ensued. Bar Kokhba (*q.v.*) became the leader of this Second Jewish Revolt; although at first successful, his forces proved no match against the methodical and ruthless tactics of the Roman general Julius Severus. With the fall of Jerusalem and then Bethar, a fortress on the seacoast south of Caesarea, the rebellion was crushed in 135. Jews were thenceforth forbidden to enter Jerusalem.

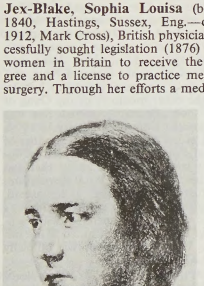
Jewish Theological Seminary of America (JTSA), the academic and spiritual centre of Conservative Judaism in the United States. Founded in New York City in 1886 as the Jewish Theological Seminary Association, the institution was first headed by Rabbi Sabato Morais, whose declared goal was to educate rabbis in modern research.

The school name was modified and its charter revised in 1902 under the seminary's second president, Solomon Schechter, whose reputation for outstanding scholarship attracted other distinguished scholars to the faculty. Since that time the seminary has grown steadily, and its present library holdings are considered to be one of the finest collections of Hebraica in the world.

The seminary grants degrees in five of its departments: the rabbinical department, the University of Judaism (a Los Angeles branch), the Teachers Institute–Seminary College of Jewish Studies, the Cantors Institute, and the Seminary College of Jewish Music. The seminary also operates the Shocken Institute for Jewish Research in Jerusalem and, among its many projects, sponsors the Jewish Museum in New York City.

Jew's harp, also called JAW'S HARP, or GUIMBARDE, musical instrument consisting of a thin wood or metal tongue fixed at one end to the base of a two-pronged frame. The player holds the frame to his mouth, which forms a resonance cavity, and plucks the instrument's tongue. The notes produced are limited to the fourth through tenth tones of the harmonic series (in relative pitch, c–e–g–bb [approximately]–c'–d'–e'). The tongue produces only one pitch; altering the shape of the mouth cav-

(Left) Oceanian Jew's harp, bamboo, from New Guinea, in the Horniman Museum, London; (right) European Jew's harp with metal frame and tongue



(Left) By courtesy of the Horniman Museum, London; (right) photograph, EB Inc.

ity isolates the individual harmonics that are components of the tongue's sound. In 18th-century Europe virtuoso players used instruments with two or more tongues of different pitch, thus allowing a complete musical scale.

Jew's harps are widely distributed in Oceania and Asia, especially in tribal cultures, and in Europe, where they were introduced from Asia by the 14th century. The characteristic European form, also found elsewhere, is a pear-shaped metal frame with a metal tongue affixed. Many non-European forms are narrow instruments cut from a single piece of bamboo or wood. In some cases the tongue is vibrated by jerks on a cord attached to its end.

The delicate, barely audible sound of the Jew's harp led in Asia to its frequent association with contemplation and to its use in 19th-century Austria as an instrument for lover's serenades. The Jew's harp is one of several idiophones (instruments whose sounding parts are resonant solids) vibrated by plucking rather than by percussion.

Jex-Blake, Sophia Louisa (b. Jan. 21, 1840, Hastings, Sussex, Eng.—d. Jan. 7, 1912, Mark Cross), British physician who successfully sought legislation (1876) permitting women in Britain to receive the M.D. degree and a license to practice medicine and surgery. Through her efforts a medical school

Sophia Jex-Blake, etching by Samuel Lawrence, 1922

By courtesy of the Bruntsfield Hospital, Edinburgh

for women was opened in London in 1874, and in 1886 she established one in Edinburgh.

Jex-Blake attended Queen's College, London, and then studied for three years in Boston and New York, returning to England in 1868. She was admitted to classes in medicine at the University of Edinburgh but was not allowed to take a degree. In 1877 she obtained the M.D. of the University of Bern and, through the King's and Queen's College of Physicians, Dublin, a license to practice in Great Britain.

Jezebel, also spelled JEZABEL (d. *c.* 843 BC), in the Old Testament (Kings I and II), the wife of King Ahab, who ruled the kingdom of Israel; by interfering with the exclusive worship of the Hebrew god Yahweh, disregarding the rights of the common man, and defying the great prophets Elijah and Elisha, she provoked the internecine strife that enfeebled Israel for decades. She has come to be known as an archetype of the wicked woman.

Jezebel was the daughter of the priest-king Ethbaal, ruler of the coastal Phoenician cities of Tyre and Sidon (modern Ṣaydā, Lebanon). When Jezebel married Ahab (ruled *c.* 874–*c.* 853), she persuaded him to introduce the worship of the Tyrian god Baal-Melkart, a nature god. A woman of fierce energy, she tried to destroy those who opposed her; most of the prophets of Yahweh were killed at her command. These cruel and despotic actions provoked the righteous wrath of Elijah; according to I Kings 17, he accurately prophesied the onset of a severe drought as divine retribution. Some time later, Elijah had the Baal priests slain after they had lost a contest with him to see which god would heed prayers to ignite a bull offering, Baal or Yahweh. When Jezebel heard of the slaughter, she angrily swore to have Elijah killed, forcing him to flee for his life (I Kings 18:19–19:3).

The last vicious act attributed to Jezebel is recorded in I Kings 21:5–16. Adjacent to Ahab's palace was a vineyard, which he coveted; it belonged to a commoner, Naboth of Jezreel (an ancient city at the foot of Mt. Gilboa, probably the site of the modern Israeli settlement of the same name). When Naboth refused to part with his vineyard ("the inheritance of my fathers"), Jezebel falsely charged him with blaspheming "God and the king," which led to Naboth's death by stoning. Elijah confronted Ahab in the vineyard, predicting that he and all his heirs would be destroyed and that dogs in Jezreel would devour Jezebel.

A few years later, Ahab perished in battle with the Syrians. Jezebel lived on for about 10 more years. Elijah's successor, Elisha the prophet, equally determined to end Baal worship, had a military commander named Jehu made king of Israel, an act that provoked civil war, for Jezebel's son Jehoram (Joram) then ruled. Jehu killed Jehoram at the site of Naboth's property and then went to Jezebel's palace. Expecting him, she adorned herself for the occasion. Looking down from her window, she taunted him, and Jehu ordered her eunuchs to throw her out the window. Later, when he commanded that she be properly buried as a king's daughter, it was discovered that dogs had eaten most of her body.

Jezreel, Hebrew YIZRE'EL (May God Give Seed), ancient city of Palestine, capital of the northern kingdom of Israel under King Ahab, located on a spur of Mt. Gilboa in Israel. King Saul was slain there in a battle with the Philistines. It was called Esdraelon in the book of Judith; to the crusaders it was Parvum Gerinum, or Le Petit Gerin, to distinguish it from Le Grand Gerin (Jenin).

The Valley of Jezreel ('Emeq Yizre'el), or Plain of Esdraelon, was an ancient trade route between the Jordan Valley and the coastal plain. Modern excavation in the area uncovered a distinctive gray-burnished pottery, which archaeologists now call Esdraelon ware.

Jezreel was also the name of a town in the territory of Judah; Khirbet Tarrama, near Hebron, has been suggested as the site. The first son of the prophet Hosea was named Jezreel, as a reminder of the bloodshed at Jezreel by which King Jehu (ruled 842–815 BC) came into power.

Jezreel, Valley of (Israel): *see* Esdraelon, Plain of.

Jhābua, town, administrative headquarters of Jhābua district, Madhya Pradesh state, central India. Located on Bahadur Sāgar (lake), it was founded in the 16th century by a Labhana freebooter and served as the capital of the former Jhābua princely state. It is a local agricultural and timber market connected by road with Dhār. There is a government college affiliated with Vikram University.

Jhābua district (about 2,600 square miles [6,800 square km]), constituted in 1948, consists of the former Jhābua and several other princely state areas. It comprises a region traversed by the forested Rāth, the northern ridges of the Vindhya Range (*q.v.*). Cultivated land lies chiefly along the Anās and Mahi (*q.v.*) rivers and their tributaries. Wheat, corn (maize), millet, and cotton are major crops; manganese deposits are worked. Pop. (2001 prelim.) town, 30,577; district, 1,396,677.

Jhālawār, town, administrative headquarters of Jhālawār district, Rājasthān state, northwestern India. The town—sometimes called Jhālrapātan, Jhālrapātan Chhaoni (cantonment), or Brijnagar—is a major road junction and agricultural market centre. The old town of Jhālrapātan (Pātan) was founded in 1796. The new town, including the palace and cantonment, lies just to the north. Jhālawār, the capital of the former princely state of the same name, has a government college affiliated with the University of Rājasthān. Nearby is the site of the ancient city of Candrāvati (*c.* 1st century AD).

Jhālawār district (2,400 square miles [6,216 square km]), part of the Mālwa Plateau, consists of a fertile undulating plain in the north and a hilly tract toward the south. Cotton, wheat, oilseeds, corn (maize), and sorghum (jowar) are the chief crops; iron-ore and sandstone deposits are worked.

Formerly a princely state named for the ruling Jhāla Rājputs (the warrior rulers of the historic region of Rājputāna), Jhālawār was created from the partition of the original Kota princely state in 1838. In 1897, when the greater part was restored to Kota, the present boundaries were created. Jhālawār became part of the state of Rājasthān in 1948. Pop. (2001 prelim.) town, 48,049; district, 1,180,342.

Jhalore (India): *see* Jālor.

Jhang Maghiāna, also called JHANG SADAR, city consisting of twin towns, headquarters of Jhang Maghiāna district, Sargodha division, Punjab province, Pakistan, just east of the Chenāb River. Maghiāna lies on the edge of the highlands overlooking the alluvial valley, while Jhang occupies the lowlands at its foot. They are connected by two roads and the Grand Trunk Road with Peshāwar and Lahore. Maghiāna, founded by Megha, ancestor of the Maghiāna Sāls, has become more important than Jhang, originally founded in 1462 and reestablished in 1688 after a flood destroyed the original settlement. Maghiāna is a wool-collecting centre, with handloom industries; its manufactures include soap, leather, locks, and brass work. Jhang manufactures blankets for the government and has other textile industries as well. The twin towns, constituted a municipality in 1867, contain a hospital, public garden, and government college affiliated with the University of the Punjab.

The area around Jhang and Maghiāna is primarily agricultural. Irrigation by means of the Chenāb Canal system is used to grow wheat and cotton. The Shorkot ruins, south of Jhang Maghiāna, may represent a city captured by Alexander the Great in 325 BC. Pop. (1998) 292,214.

Jhānsi, city, southwestern Uttar Pradesh state, northern India, at a major road and rail junction. The main city, which is enclosed by a wall, arose around a fort built in 1613 by the ruler of Orchha. The area fell to the Marāṭhās in 1732 and was acquired by the British in 1853. A massacre of British officers and civilians occurred at Jhānsi during the 1857 Indian Mutiny. In 1886 Jhānsi came under British rule in exchange for the British evacuation of Gwalior. An agricultural marketplace, the city also has a steel-rolling mill and some manufacturing. Bundelkhand University is located there, as are a railway colony and workshops. Pop. (2001 prelim.) city, 383,248; metropolitan area, 463,281.

Jharia, also spelled JHERRIA, town and coalfield in eastern Jharkhand state, eastern India. The coalfield lies in the Dāmodar Valley, covers about 110 square miles (280 square km), and produces bituminous coal suitable for coke. Most of India's coal comes from the Jharia and Rāniganj fields in the valley. The coal is worked from open pits, but wages and safety conditions are poor. The miners are usually from local groups that also work their crops at harvesttime. Pop. (2001 prelim.) 81,979.

Jharkhand (Indian state): *see* Bihār and Jharkhand.

Jhelum, city, Punjab province, northeastern Pakistan. The city lies just west of the Jhelum River (there bridged by both road and rail) and is connected by rail and the Grand Trunk Road with Peshāwar and Lahore. The old town, across the river, may have been Bucephala, founded by Alexander the Great in the 4th century BC. Although once a salt-trade centre, Jhelum is now a major timber market. The city's industries include textile mills, sawmills, newsprint plants, glassworks, and cigarette factories. It was constituted a municipality in 1867. The city has several government colleges affiliated with the University of the Punjab. The ruined temples of Katas, southwest of Jhelum, are possibly of Buddhist origin (8th–9th century AD). Pop. (1998) 145,847.

Jhelum River, river, westernmost of the five rivers in the Punjab that ultimately drain into the Indus River in Pakistan.

The Jhelum rises from a deep spring at Vernāg, in the Indian-held sector of Jammu and Kashmir state. The river meanders northwestward from the northern slope of the Pīr Panjāl Range through the Vale of Kashmir to Wular Lake, which controls its flow. Emerging from the lake, the Jhelum crosses the Pīr Panjāl in a 7,000-foot (2,100-metre) gorge with almost perpendicular sides. At Muzaffarābād, the capital of Azad Kashmir in the Pakistani-held sector of Jammu and Kashmir, the Jhelum joins the Kishanganga River and then bends southward, forming part of the border between Azad Kashmir (east) and Northwest Frontier province, Pakistan (west). The river then flows southward into Pakistan proper. Near Mangla, the Jhelum breaks through the Siwālik Range into broad alluvial plains. At Jhelum town the river turns southwestward along the Salt Range to Khushāb, where it again bends south to join the Chenāb River near Trimmu. The total length of the Jhelum is about 450 miles (725 km).

The lower course of the Jhelum has been developed for irrigation and the production of hydroelectric power. The Mangla Dam and Reservoir irrigates about 3,000,000 acres (1,200,000 hectares) and has an installed hydroelectric capacity of at least 300 megawatts. The Upper Jhelum Canal leaves the river at Mangla and runs eastward to the Chenāb River at Khānki, while the Lower Jhelum Canal starts at Rasūl. Both canals are used for irrigation. The Jhelum River is believed to be

the Hydaspes mentioned by Arrian, Alexander the Great's historian, and the Bidaspes mentioned by Ptolemy.

Jhering, Rudolf von, Jhering also spelled IHERING (b. Aug. 22, 1818, Aurich, Hanover [Germany]—d. Sept. 17, 1892, Göttingen, Ger.), German legal scholar, sometimes called the father of sociological jurisprudence. He developed a philosophy of social utilitarianism that, in emphasizing the needs of society, differed from the individualist approach of the English utilitarian Jeremy Bentham.

Jhering taught Roman law at Giessen (1852–68), at Göttingen (from 1872), and at four other universities for briefer periods. In his most ambitious book, *Geist des römischen Rechts,* 4 vol. (1852–65; "The Spirit of the Roman Law"), he elaborated the relation of law to social change. Perhaps more influential in the 20th century was his *Der Zweck im Recht,* 2 vol. (1877–83; *Law As a Means to an End*). In his view as expressed in this work, the purpose of law is the protection of individual and societal interests by coordinating them and thus minimizing occasions for conflict. If interests clash, he would give precedence to those of society.

Jhūnjhunun, also spelled JHUNJHUNU, city, northeastern Rājasthān state, northwestern India. It is a local trade centre for wool, cattle, hides, and gram (chickpeas). The city's major industries include a dye factory and woolen mills. Jhūnjhunun houses the mausoleum of Qamar-ud-Dīn Shāh, patron saint of the Kamkhani sect, as well as a 10th-century Jaina temple. The city also contains a hospital and a college affiliated with the University of Rājasthān.

The area in which Jhūnjhunun is situated consists of a semiarid sandy plain. Bajra (pearl millet), gram, mung beans, and barley are among the region's chief crops. Pop. (2001 prelim.) 100,476.

Jiang Qing, Wade-Giles CHIANG CH'ING, stage name LAN PING, original name LUAN SHUMENG (b. 1914?, Chu-ch'eng, Shantung province, China—d. May 14, 1991), third wife of Chinese communist leader Mao Zedong and the most influential woman in the People's Republic of China until her downfall in 1976, after Mao's death. As a member of the Gang of Four (*q.v.*) she was convicted in 1981 of "counter-revolutionary crimes" and imprisoned.

Reared by her grandfather, Jiang became a member of a theatrical troupe in 1929. Her activity in a communist-front organization in 1933 led to her arrest and imprisonment. Upon her release she went to Shanghai, where she played minor roles for the left-wing Tien Tung Motion Pictures Company.

When the Japanese attacked Shanghai in 1937, Jiang fled to the Chinese Nationalist wartime capital at Chungking, where she worked for the government-controlled Central Movie Studio until she crossed the Nationalist lines to join the communist forces in Yen-an. As a drama instructor at the Lu Hsün Art Academy, she met Mao for the first time when he gave a talk at the school. Their subsequent marriage was criticized by many party members, especially since the woman whom Mao divorced (one of the few women to survive the communists' Long March of 1934–35) was then hospitalized in Moscow. Party leaders agreed to the marriage on condition that Jiang stay out of politics for 30 years.

After the establishment of the People's Republic of China in 1949, Jiang remained out of public view except to serve as Mao's hostess for foreign visitors or to sit on various cultural committees. In 1963, however, she became more politically active, sponsoring a movement in the Peking opera and ballet aimed at infusing traditional Chinese art forms with proletarian themes. Jiang's cultural reform movement gradually grew into a prolonged attack on many of the leading cultural and intellectual figures in China and culminated in the Cultural Revolution that by 1966 had begun to sweep the country.

Jiang reached the height of her power and influence in 1966, winning renown for her fiery speeches to mass gatherings and her involvement with the radical young Red Guard groups of the Revolution. One of the few people whom Mao trusted, she became the first deputy head of the Cultural Revolution and acquired far-reaching powers over China's cultural life. She oversaw the total suppression of a wide variety of traditional cultural activities during the Revolution. As the Revolution waned in the late 1960s, however, so did Jiang's prominence. She reemerged in 1974 as a cultural leader and spokeswoman for Mao.

Mao died on Sept. 9, 1976, and the radicals in the party lost their protector. A month later, wall posters appeared attacking Jiang and three other radicals as the Gang of Four, and the attacks grew progressively more hostile. Jiang and the other members of the Gang of Four were soon afterward arrested. She was expelled from the Communist Party in 1977. In 1980–81 at her public trial as a member of the Gang of Four, Jiang was accused of fomenting the widespread civil unrest that had gripped China during the Cultural Revolution, but she refused to confess her guilt; instead, she denounced the court and the country's leaders. She received a suspended death sentence, but in 1983 it was commuted to life imprisonment. Her death in prison was officially reported as a suicide.

BIBLIOGRAPHY. Ross Terrill, *The White-Boned Demon* (1984), is a lengthy biography.

Jiang Zemin, Wade-Giles CHIANG TSE-MIN (b. 1926, Yang-chou, Kiangsu province, China), Chinese official who became general secretary of the Chinese Communist Party (CCP; 1989–2002) and president of China (1993–2003).

Jiang joined the CCP in 1946 and graduated from Chaio-t'ung University in Shanghai the following year with a degree in electrical engineering. He worked in several factories as an

engineer before receiving further technical training in the Soviet Union about 1955. He subsequently headed technological research institutes in various parts of China. In 1980 he became vice-minister of the state commission on imports and exports, in 1982 vice-minister of the electronics industry, and from 1983 to 1985 he served as its minister. He joined the Central Committee in 1982, became mayor of Shanghai in 1985, and entered the Politburo in 1987. Due to his support for the government's suppression of pro-democracy demonstrations in 1989, paramount leader Deng Xiaoping appointed Jiang general secretary of the CCP. He succeeded Deng as chairman of the party's Central Military Commission in 1989 and became president in 1993. Jiang combined a commitment to free-market economic reforms with a determination to preserve the CCP's monopoly of political power. His priorities were to privatize state-owned enterprises and to improve relations with the United States in various ways, including an exchange of official visits with U.S. president Bill Clinton in 1997–98. In 2002 Jiang resigned as general secretary of the CCP and the following year stepped down as president after serving the maximum two five-year terms; Hu Jintao succeeded him in both positions. Jiang remained in charge of the Central Military Commission until September 2004, when he stepped down in favour of Hu.

jib, in sailing ships, triangular sail rigged to a stay extending from the foremast, or foretopmast, to the bowsprit or to a spar, the jibboom, that is an extension of the bowsprit. The jib is first known to have been used on one-masted vessels. Its use began to spread about 1600 and extended to larger war vessels about 1700. Jibs proved handy in helping to steer and were much valued—*e.g.,* on the square-rigger, as a means of better close-hauled sailing and of setting extra sail with comparatively little labour demand. In some ships the number of jibs reached five or more, and often the jibboom itself required an extension, the flying jibboom, to carry them.

Sailing vessel with jibs indicated in white
Encyclopædia Britannica, Inc.

Most modern sailboats lack a bowsprit or a jibboom, and the lower corner of the jib is attached to a fitting on the hull near the bow.

Jibrīl, also spelled JABRĀ'IL, in Islām, the archangel who acts as intermediary between God and man and as bearer of revelation to the prophets, most notably to Muḥammad. In biblical literature Gabriel is the counterpart to Jibrīl.

Muḥammad himself could not at first identify the spirit that possessed him, and the Qur'ān mentions him by name only three times. Jibrīl, however, became Muḥammad's

Jibrīl reassuring Muḥammad that God has not forsaken him, miniature from a manuscript in the Topkapı Saray Museum, Istanbul (MS. Hazine 1222, folio 382)
By courtesy of the Topkapı Saray Museum, Istanbul

constant helper. He and the archangel Mīkāl purified Muḥammad's heart in preparation for the Prophet's ascension to heaven (*miʿrāj*), and then Jibrīl guided him through the various levels until they reached the throne of God. When Muḥammad recited a supposed revelation acknowledging the pagan goddesses al-Lāt, al-'Uzzā, and Manāt, Jibrīl chastised him for presenting as divine a message inspired by the Devil. Jibrīl also helped Muḥammad in times of political crises, coming to his aid at the Battle of Badr (624) with thousands of angels, then telling him to attack the Jewish tribes of Banū Qaynuqāʿ and Banū Qurayẓah.

Muḥammad generally only heard the voice of his inspiration, but, according to 'Ā'ishah, his wife, he saw Jibrīl twice "in the shape that he was created" and on other occasions as a man resembling Diḥyah ibn Khalīfah al-Kalbī, an extraordinarily handsome disciple of Muḥammad. Others have described the archangel as having 600 wings, each pair so enormous that they crowd the space between East and West. Jibrīl has also been depicted as sitting on a chair suspended between heaven and earth. The popular image of Jibrīl is of an ordinary, turbaned man, dressed in two green garments, astride a horse or a mule.

Muslim traditions concerning Jibrīl largely concur with biblical accounts of Gabriel, but his special relationship with Muḥammad has inspired a mass of mythical detail. Jibrīl is said to have appeared at Adam's side after his expulsion from paradise and shown him how to write and work iron and raise wheat. Jibrīl later appeared in Egypt to help Moses and to deceive the Egyptians into entering the Red Sea in pursuit of the Jews. The name of Jibrīl figures in the preparations of charms and appears with the names of the other archangels on the sides of magic squares.

jícama, also called YAM BEAN (species *Pachyrhizus erosus,* or *P. tuberosus*), leguminous vine native to Mexico and Central and South America, grown for its edible tuberous root. The plant's irregularly globular, brown-skinned tubers are white-fleshed, crisp, and juicy; some varieties (*jícama de agua*) have clear juices, and some (*jícama de leche*) have milky juice. Both types of tubers are mild-flavoured and usually are eaten raw in salads or sprinkled with lime juice and powdered chili peppers as a snack. Jícama can also be cooked. Although the very young seedpods of the plant are sometimes eaten, the mature seeds contain rotenone, a chemical used as an insecticide, and are highly toxic.

Jicaque, Indians of the northwest coast of Honduras. Their culture is similar to that of the Sumo and Miskito of northeastern Nicaragua. The Jicaque are an agricultural people, growing sweet manioc (yuca), bitter manioc, beans, and corn (maize) as staples. Fishing and hunting provide other food; domesticated animals are now common. Their houses are built of poles and thatch. Clothing is semitraditional; commercial cloth and shirts, trousers, and dresses are becoming common. Crafts include weaving, basketry, the making of metates (for grinding corn), and the manufacture of bows and arrows. The Jicaque practice polygyny. Their religion centres around two benevolent male deities and an evil female deity; offerings are made only to the evil goddess, in order to avoid ill fortune.

Jicarilla Apache, North American Indian tribe of the Eastern Apache group (*see* Apache). In the early 21st century about 2,800 Jicarilla Apache lived on or near the Jicarilla federal reservation in north-central New Mexico.

The early Jicarilla were one of several loosely organized, autonomous bands of Apache living in the Southwest. Their ancient lands included parts of present-day Colorado, Oklahoma, and New Mexico. The Jicarilla lived in wickiups (portable dwellings made of reeds or grass applied to an elliptical frame) and spoke an Eastern Apachean language. Their name, a Mexican Spanish word meaning "little basket," came from the small sealed baskets they used as drinking vessels.

In 1716 the Jicarilla were driven from their lands by the Comanche. They settled in what is now northeastern New Mexico, where they learned to supplement their traditional occupations of hunting and raiding with farming. Their relatively extensive farming practice required a more settled existence, and the Jicarilla engaged in warfare less frequently than did other Eastern Apache. They continued, however, to suffer the depredations of the Comanche: fighting in 1724 left most of the Jicarilla men dead and many women and children taken prisoner.

The surviving Jicarilla later tried to avoid warfare with white settlers. They engaged in some hostilities, however, after the early 1850s. They were subdued by the U.S. Army in 1880, and in 1887 they were settled on land reserved for them in New Mexico. Modern Jicarilla tribal organization is governed by an elected president and council, and tribal income is derived primarily from mineral leases.

Jiddah, also spelled JIDDA, JEDDAH, or JUDDAH, city and major port in central Hejaz region, western Saudi Arabia. It lies along the Red Sea west of Mecca. The principal importance of Jiddah in history is that it constituted the port of Mecca and was thus the site where the majority of Muslim pilgrims landed who were journeying to the holy cities of Mecca and Medina. The city in fact owes its commercial foundations to Caliph 'Uthmān, who in 646 made it the port for Muslim pilgrims crossing the Red Sea. In 1916 Jiddah and its Turkish garrisons surrendered to British forces. It then formed part of the Kingdom of the Hejaz until 1925, when it was captured by Ibn Sa'ūd. In the 1927 Treaty of Jiddah

the British recognized Saudi sovereignty over the Hejaz and Najd regions. Jiddah eventually was incorporated into Saudi Arabia. In 1947 the city walls were demolished, and rapid expansion followed. The city takes its name (which means "ancestress," or "grandmother") from the location there of the reputed tomb of Eve, which was destroyed by the Saudi government in 1928 in the belief that it encouraged superstition.

After World War II, Jiddah was completely modernized and expanded with the new wealth acquired by Saudi Arabia from oil royalties. Its harbour was deepened and enlarged to accommodate large vessels, and a desalinization plant was constructed in the early 1970s, thought to be the largest in the world at its completion. The city's economy, once dependent on pilgrim expenditures and fishing, was diversified to include steel-rolling mills, oil refineries, and the manufacture of cement, clothing, and pottery. Other activities include cattle raising and dairying and many small industries. One of Saudi Arabia's largest cities and busiest seaports, Jiddah is also the diplomatic capital of the country and the location of the Saudi ministry of foreign affairs and of the embassies and missions of foreign governments. Advanced education in economics and administration is offered by King Abdul Aziz University, founded in 1967. Jiddah is served by highways to Mecca and Medina and by King Abdul Aziz International Airport. Pop. (1983 est.) 1,500,000.

Jien, posthumous name JICHEN (b. May 17, 1155, Kyōto, Japan—d. Oct. 28, 1225, Ōmi province [now Shiga prefecture], near Kyōto), learned Buddhist monk and poet who became the first great Japanese historian.

Born into the highest order of the powerful, aristocratic Fujiwara family, he early in life entered a monastery of the Tendai Buddhist sect, first taking the priestly name Dōkai and later the name Jien. He soon began his historical writings designed to "enlighten people who find it hard to understand the vicissitudes of life." In his great work, the *Gukanshō* (literally, "Jottings of a Fool")—completed about 1220—he attempted to analyze the facts of Japanese history.

The *Gukanshō* reflects the pessimistic *mappō* Buddhist doctrine, which saw the feudal period in which its author lived as one of religious decline and of disintegration of Japanese civilization, a view also held by modern historians. Jien believed that changes in the feudal structure were necessary and defended the shogun's assumption of power.

Jieng (people): *see* Dinka.

Jifārah, al-, also called JEFFARA, DJEFFARA, or GEFARA, coastal plain of northern Africa, on the Mediterranean coast of extreme northwestern Libya and of southeastern Tunisia. Roughly semicircular, it extends from Qābis (Gabes), Tunisia, to about 12 miles (20 km) east of Tripoli, Libya. Its maximum inland extent is approximately 80 miles (130 km), and its area of 14,300 square miles (37,000 square km) is about equally divided between the two countries.

Al-Jifārah slopes southward from the Mediterranean coast up to the tableland of the Sahara in three distinct regions. In the north is a narrow, low, coastal strip characterized by sandy beaches and many small hollows covered with *sabkhah* (saline plains with small lakes in the rainy season). South of this is a gently rolling area of steppe vegetation, varying in elevation from about 160 to 650 feet (50 to 200 m) above sea level. The southernmost region is a piedmont at the foot of the Saharan upland, known in Libya as the Nafūsah Plateau. In Tunisia this tableland sends out a long north-south spur that forms the western border of the coastal plain and is called aẓ-Ẓahr, or Dahar (Arabic: "the back").

Most of the area has 5–10 inches (125–250 mm) annual rainfall, except for the coastal area around Tripoli, which has about 15 inches (380 mm). The coastal strip supports many palm groves; some fruit and grain crops are grown. The central region of the Jifārah, with a much lower water table, supports only nomadic herding of sheep and goats. The narrow piedmont area of al-Jifārah (up to about 1,000 feet [300 m] above sea level), a desert region with scattered oases, is everywhere separated from the Saharan upland by pronounced scarp ridges, or cuestas.

jig, folk dance, usually solo, that was popular in Scotland and northern England in the 16th and 17th centuries and in Ireland since the 18th century. It is an improvised dance performed with rapid footwork and a rigid torso.

In England jigs were sometimes danced across crossed flails and clay pipes; they were occasionally danced by performers wearing clogs and were akin to the modern clog dances of northern England. At the court of Elizabeth I, the northern jigs became fashionable in the

"The Last Jig, or Adieu to Old England," print by Thomas Rowlandson, 1818

By courtesy of the Metropolitan Museum of Art, New York. Whittelsey Fund, 1959

16th century, and the name was also loosely applied to other dances of folk origin. In the 16th and 17th centuries, jigs appeared as stage dances and as stylized keyboard compositions by such composers as William Byrd, John Bull, and Giles Farnaby. The jig soon spread to France and, in modified form as the gigue (*q.v.*), became fashionable at the court of Louis XIV.

Irish jigs are performed by one or more soloists or by couples dancing the solo dance. The music is in $\frac{6}{8}$ time. The hop, or slip, jig is a similar step dance (solo dance) in $\frac{9}{8}$ time. When set dances, or figure dances for several couples, are danced to music in jig time, they are also called jigs. The few English Morris dances for solo dancers are also called jigs. Related to the jig is the Italian *giga*, a lively couple dance still popular in the folk tradition.

Jigawa, state, northern Nigeria. It was created from the northeastern half of Kano state in 1991. Jigawa borders the Republic of Niger to the north and the Nigerian states of Yobe to the northeast, Bauchi to the southeast and south, Kano to the southwest, and Katsina to the northwest. The state consists mostly of plains covered by wooded savanna in the south and scrub vegetation in the north. It is drained by the Hadejia River, a seasonal stream that flows northeastward through the state. The state's major crops include peanuts (groundnuts), sorghum, cotton, cowpeas, millet, and the rice grown in the river valley. The herding of cattle, goats, and sheep is widespread. Most of the state's inhabitants are Hausa or Fulani. Dutse (the state capital), Gumel, Hadejia, Kazaure, and Birnin Kudu are the chief market centres. Jigawa state is crossed by the main (Lagos-Nguru) railway and by roads that link it to Kano and Bauchi states. Pop. (1991) 2,829,929.

Jigoku, in Japanese Buddhism, hell, a region popularly believed to be composed of a number of hot and cold regions located under the Earth. Jigoku is ruled over by Emma-ō, the Japanese lord of death, who judges the dead by consulting a register in which are entered all of their sins. He is assisted in his examination of the dead by two disembodied heads, which rest on pillars on either side of him. The female head, Miru-me, has the power of perceiving the sinner's most secret faults, while the male head, Kagu-hana, can detect any misdeed. Damnation is not eternal; the dead are sentenced to fixed periods of time in one region or to several regions in succession. The sentences can be shortened by the intervention of bodhisattvas (those destined to become enlightened) in response to the prayers of the living.

The *Jigoku-zōshi,* a late 12th-century scroll, depicts the 8 great hells and the 16 lesser hells in both text and paintings.

jigsaw puzzle, any set of varied, irregularly shaped pieces that, when properly assembled, form a picture or map. The puzzle is so named because the picture, originally attached to wood and later to paperboard, was cut into its pieces with a jigsaw, which cuts intricate lines and curves. Jigsaw puzzles may be very complicated vis-à-vis the number of pieces and the number of different cuts and thus take many hours to complete.

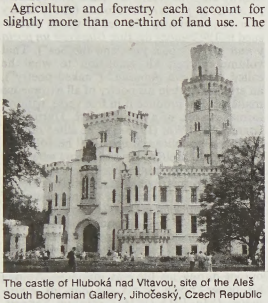
The puzzles originated as educational devices to teach geography (dissected maps) in 18th-century England. Dissected pictures followed, covering such subjects as history, alphabets, botany, and zoology. The use of popular pictures began in the 1860s and '70s, in both Great Britain and the United States. The puzzles became extremely popular in the early 1900s and had a revival in the Great Depression of the 1930s as an inexpensive, reusable amusement. Another revival began after World War II, and jigsaw puzzles have remained a popular entertainment since then.

Jih-k'a-tse (China): *see* Shigatse.

jihad, also spelled JEHAD, Arabic JIHĀD ("fight," or "battle"), a religious duty imposed on Muslims to spread Islām by waging war; jihad has come to denote any conflict waged for principle or belief and is often translated to mean "holy war."

Islām distinguishes four ways by which the duty of jihad can be fulfilled: by the heart, the tongue, the hand, and the sword. The first consists in a spiritual purification of one's own heart by doing battle with the devil and overcoming his inducements to evil. The propagation of Islām through the tongue and hand is accomplished in large measure by supporting what is right and correcting what is wrong. The fourth way to fulfill one's duty is to wage war physically against unbelievers and enemies of the Islāmic faith. Those who professed belief in a divine revelation—Christians and Jews in particular—were given special consideration. They could either embrace Islām or at least submit themselves to Islāmic rule and pay a poll and land tax. If both options were rejected, jihad was declared.

Modern Islām places special emphasis on waging war with one's inner self. It sanctions war with other nations only as a defensive measure when the faith is in danger.



Throughout Islāmic history, wars against non-Muslims, even though with political overtones, were termed jihads to reflect their religious flavour. This was especially true in the 18th and 19th centuries in Muslim Africa south of Sahara, where religiopolitical conquests were seen as jihads, most notably the jihad of Usman dan Fodio, which established the Sokoto caliphate (1804) in what is now northern Nigeria.

Jihān Shāh (Turkmen leader): *see* Jahān Shāh.

Jihlava, German IGLAU, city, Jihomoravský *kraj* (region), south-central Czech Republic. It lies in the Bohemian-Moravian Highlands, along the Jihlava River. From about 1240, its prosperity rested on its silver mines. A royal mint operated there from about 1260, and a codified town mining law (ius Regale Montanorum) served as a model for other central European mining laws. Hussite Utraquists and representatives of the Council of Basel signed a treaty at Jihlava in 1436. In 1523 the town was almost entirely destroyed by fire; its reconstruction, around the great town square, was mostly in Renaissance style. By 1600 the cloth trade had replaced silver as the town's economic basis, and a tobacco factory was introduced in the late 19th century. Today vehicles and precision instruments are manufactured as well. Pop. (1991 prelim.) 52,271.

Jihočeský, also called JIŽNÍ ČECHY, English SOUTHERN BOHEMIA, *kraj* (region), southern Czech Republic. It is bordered on the north by Středočeský and Východočesky *kraje*, on the east by Jihomoravský *kraj*, on the south by Austria, on the southwest by Germany, and on the west by Západočeský *kraj*. The Šumava Mountains dominate the southern part of the region, while the remainder consists of the Středočeská Pahorkatina, a broad, hilly plateau cut by the valleys of the northward-flowing Vltava (Moldau) River and its tributaries.

Agriculture and forestry each account for slightly more than one-third of land use. The

The castle of Hluboká nad Vltavou, site of the Aleš South Bohemian Gallery, Jihočeský, Czech Republic
M. Susta—ORBIS Fotoarchiv

main crops raised are corn (maize) for animal fodder, hay, potatoes, flax, oats, barley, wheat, clover, and rye; apples, plums, cherries, pears, and walnuts are also grown. Pigs, cattle, and poultry are the primary livestock reared. Dairying accounts for about two-fifths of the cattle and is concentrated around České Budějovice, the capital, as well as around Strakonice, Protivín, and Český Krumlov.

About four percent of Jihočeský *kraj*'s area is water, and fish-farming is an important industry. Most of the lakes, some natural, some man-made, are found in the southern highlands along the Lužnice and Vltava rivers. The fishing industry is centred at Třeboň on the Lužnice River and dates back to the Middle Ages. The Rožmberk fishpond (built 1584–90 and covering 1,790 acres [724 hectares]) is known for carp and is still impounded behind its original oaken dam, which measures 8,530 feet (2,600 m) long, 262 feet (80 m) wide, and 39 feet (12 m) high. Modern dams with their reservoirs have enlarged the industry; the Lipno Dam on the Vltava, in the Šumava Mountains, impounds a 12,350-acre (5,000-hectare) reservoir, provides hydroelectric energy, and helps regulate water levels on the Vltava for navigation and in the fishponds as well. The reservoir of the Orlík Dam in Středočeský *kraj* covers 80,640 acres (32,635 hectares), mostly in Jihočeský *kraj*. There are additional dams on the Blanice River at Husinec and on the Malše River at Římov.

Forests consist mainly of fir, spruce, pine, oak, beech, and some maple and ash; they occur mainly in the southern mountain and lake district and in the valleys of the Vltava and the Lužnice rivers. The main lumbering and paper-milling centres are: České Budějovice, Větřní, Loučovice, Pízek, Tábor, Soběslav, Pelhřimov, Lišov, and Suchdol nad Lužnicí.

The *kraj*'s relatively few mineral resources include graphite, mined at Vyšný-Lazec, Domoradice, Kolodéje, and Bližná; peat, extracted at Lenora, Třebon, Přibraz, and along the Lužnice River; limestone, quarried at Český Krumlov and Chýnov; asbestos at Borovany; feldspar at Pisek and Halamky; and brick and fire-retardant clays, extracted along the riverbanks.

České Budějovice is the *kraj*'s chief industrial centre; it has steelworks and electronics, transport-equipment, furniture, pencil, and food-processing plants, as well as several breweries. After Plzeň it is the Czech Republic's second-best-known beer centre; České Budějovice is where Budvar-style beer (German: *Budweiser*) originated. In the industrial area of Tábor-Sezimovo Ústi-Planá and Lužnicí are chemical, metalworking, transport-vehicle, electronics, paper, clothing, and food-processing plants. Other larger centres are Písek, which manufactures machinery, textiles, and musical instruments; Strakonice, producing motorcyles, machinery, and clothing; and Vimperk, with glassworks, lumber, and textile plants.

Tourism is concentrated on water sports, particularly on the reservoir lakes behind the Lipno and Orlík dams, and the Svět fishpond; on boat tours along the Vltava and Lužnice rivers; and on tours of numerous towns and memorials of the Hussite religious reform movement, which arose in this region. Husinec, 4 miles (6 km) north of Prachatice, is Jan Hus's birthplace (July 6, 1369), and parts of his house serve as a memorial museum. Tábor, the seat of the Hussite movement (1420), is the site of the Museum of the Hussite Revolutionary Movement; another museum in Kotnov Castle is devoted to Tábor's history. Trocnov, 19 miles (31 km) southeast of České Budějovice, is the birthplace of Jan Žižka, the charismatic military leader of the Hussite army. Chelčice is the birthplace of Petr Chelčický, the founder of the Bohemian Brotherhood in the 15th century; nearby Vodňany is the site of the School of Fishery.

České Budějovice is the region's cultural centre. It contains the Museum of South Bohemia, the State Scientific Library, and a teacher-training college; it is also a city under National Trust, with many buildings of the Hussite period. Hluboká nad Vltavou, 6 miles (10 km) northwest of České Budějovice, is the site of the Aleš South Bohemian Gallery, exhibiting Gothic and Baroque art. Bechyné is the location of the School of Ceramics and is noted for its spa with mud baths. Písek also is a health resort and contains a local municipal museum.

The districts south and west of České Budějovice contain between 2 and 3 percent Slovak population and a small minority of Germans. Area 4,380 square miles (11,345 square km). Pop. (1991 prelim.) 697,334.

Articles are alphabetized word by word, not letter by letter

Jihomoravský, also called JIŽNÍ MORAVA, English SOUTHERN MORAVIA, *kraj* (region), southeastern Czech Republic. Bordered by Jihočeský *kraj* to the west, Východočeský and Severomoravský *kraje* to the north, Slovakia to the east, and Austria to the south, it has an area of 5,802 square miles (15,028 square km).

The hilly Bohemian-Moravian Highlands cover the northwestern part of the region, while in the northeast the White Carpathian mountains range along the border with Slovakia. The main river system, the Morava (March), flows southward between these uplands, forming a broad, fertile valley comprising the Haná and Podluží areas.

The Haná valley produces wheat, barley, sugar beets, corn (maize), rye, and vegetables. The surrounding hill country is the Czech Republic's major producer of plums and apricots and is also important for apples, cherries, pears, and walnuts. Podluží has numerous vineyards and is noted for its wines, as well as for its plum brandy, Slivovice. The hilly areas in the northwest of Jihomoravský *kraj* are major potato producers, but flax, rye, and oats are also grown. Cattle, pigs, sheep, goats, and poultry are raised, and dairying is important in the Haná and Podluží areas.

Much of the Czech Republic's oil and natural gas is found in small deposits clustered around Břeclav and Hodonín in Podluží; there are isolated small fields near Brdo in the northeast and Mikulov in the south. An important bituminous coalfield is worked at Zbýšov, and brown coal (lignite) mining began in Mikulčice (Podluží) in 1980. Uranium is mined at Ostrov nad Oslavou. Kaolin clay is quarried at Únanov, near Znojmo, and limestone is quarried around Brno, the region's capital, near Mikulov. Jihlava, Malonín, the area of Velké Meziříčí, Polná, and Brno have quarry stone. Feldspar is quarried at Dolní Bory.

Spruce and oak forests are found north and west of Brno and around Gottwaldov; lumbering and paper milling are centred in these areas, mainly at Brno, Třebíč, Třešť, Tišnov, Rousínov, Bučovice, Holešov, and Bystřice pod Hostýnem. Hydroelectric power for industry is generated by power stations at four major dams, at Vír on the Svratka, Oslavany on the Jihlava, Kninice near Brno, and Vranov nad Dyjí on the Dyje.

Brno and Gottwaldov are the *kraj*'s major industrial centres. Brno is noted for engineering works, machinery, electro-technical products, tractors, cement, wood, paper products, textiles, and food processing. Gottwaldov, a centre of shoemaking and leather work, also produces machinery and synthetic rubber. Other important centres are Třebíč, producing leather goods and machinery; Jihlava, manufacturing electronics ware, transport equipment, machinery, and textiles; Prostějov, with steelworks and beer-production, tool, and clothing plants; Otrokovice, an aircraft-building centre; and Znojmo, producing ceramics, leather goods, and textiles and processing fruits and vegetables. An annual industrial fair is held at the Brno Fair Grounds; the region's capital also contains the track for the running of the annual Grand Prix of the Czech Republic, a motorcycle race.

Jihomoravský *kraj*'s main cultural centre, Brno, is the site of technical, agricultural and veterinary science universities, the Central Library for Veterinary Science, and the Moravian Museum, Gallery, and Library. Home of the noted composer Leoš Janáček (1854–1928), it also has the Janáček Opera House and the Janáček Academy of Music and Dramatic Art. Other cities with cultural institutions include Gottwaldov, which has the Regional Museum of Southern Moravia; Znojmo, where the South Moravian Museum is located; Kratice, a traditional printing centre, containing the Bible Museum; and Slavkov, site of the Napoleonic battle of Austerlitz (1805), where the Slavkov Historical Museum is located. Tourists are also drawn to the prehistoric excavation site of Dolní Věstonice, near Mikulov; the Slavic historic site of Mikulčice; and the Moravian Karst formations at Blansko, the best known

of which is the Punkva Cave. Other attractions are the Podluží and Haná cultural areas, noted for folk festivals, and the region's natural and man-made lakes, which have watersports facilities. Although classed as Czech, much of the population has Slovak admixture and speaks a Czech dialect (Moravian). Pop. (1999 est.) 2,051,389.

Jijel, formerly DJIDJELLI, town and roadstead port, northeastern Algeria, on the Mediterranean seacoast and the western edge of the Kabylie de Collo region. The city of Jijel, originally a Phoenician trading post, passed successively to the Romans (as Igilgili), the Arabs, and, in the 16th century, to the pirate Khayr ad-Dīn (Barbarossa). It remained a corsair stronghold until captured by the French in 1839. Strong local resistance, finally subdued in 1851, resulted in the construction of three forts along its southern fringe and minimal colonization. The original town was devastated by an earthquake in 1856. Surrounded by dense cork-oak forest and protected by a peninsula and citadel to the north, Jijel was replanned along modern lines, with wide streets shaded by plane trees. The main industries are cork processing, leather tanning, and steel making. There is an active export trade in agricultural products. Jijel is also a seaside resort with fine sand beaches and a casino.

The surrounding region supports commercial fishing and the production of citrus fruits and cereal grains. Its population includes both Arabs and Kabylies, a Berber group. Pop. (1998) 106,003.

jījim (weaving): *see* cicim.

Jīlī, al-, in full ʿABD AL-KARĪM QUṬB AD-DĪN IBN IBRĀHĪM AL-JĪLĪ (b. 1365—d. *c.* 1424), mystic whose doctrines of the "perfect man" became popular throughout the Islāmic world.

Little is known about al-Jīlī's personal life. Possibly after a visit to India in 1387, he studied in Yemen during 1393–1403. Of his more than 30 works, the most famous is *Al-Insān al-kāmil fi ma'rifat al-awākhir wa al-awā 'il* (partial Eng. trans., *Studies in Islamic Mysticism*), which contains his complex doctrine of the perfect man. The work shows clearly the influence of the pantheistic Spanish mystic Ibn al-ʿArabī (d. 1240).

Al-Jīlī maintained that the perfect man can achieve unity with the Divine Being. This unity is experienced not only by the prophets, from Adam to Muḥammad, but also by others who reach the highest level of being (*wujūd*) and become, as it were, the most select of the select. At this level, all contradictions, such as being with non-being, and vengeance with mercy, are resolved. Al-Jīlī also maintained that in every age the perfect man manifested the outward appearance and inner essences of the Prophet Muḥammad. The perfect man was thereby a channel through which the community could enjoy contact with the Divine Being. Al-Jīlī claimed that, in the town of Zabīd in Yemen in 1393, he had met the Prophet Muḥammad, who then manifested himself through al-Jīlī as sheikh, or spiritual leader.

Al-Jīlī's doctrine of the perfect man later degenerated into a belief that all holy men and mystics were able to achieve contact and unity with God.

jill (unit of measure): *see* gill.

Jim Crow Law, any of the laws that enforced racial segregation in the U.S. South between the end (1877) of the formal Reconstruction period and the beginning of a strong civil-rights movement (1950s). "Jim Crow" was the name of a minstrel routine (actually "Jump Jim Crow") performed beginning in 1828 by its author, Thomas Dartmouth ("Daddy") Rice, and by many imitators, including Joseph Jefferson. The term came to be a derogatory epithet for blacks and a designation for their segregated life.

From the late 1870s, Southern state legislatures, no longer controlled by carpetbaggers and freedmen, passed laws requiring separation of whites from "persons of colour" in public transportation. Generally, anyone of ascertainable or strongly suspected black ancestry in any degree was for this purpose a "person of colour"; the pre-Civil War distinction favouring those whose ancestry was known to be mixed—particularly the half-French "free persons of colour" in Louisiana—was abandoned. The segregation principle was extended to schools, parks, cemeteries, theatres, and restaurants in an effort to prevent any contact between blacks and whites as equals. In 1954 the Supreme Court declared segregation in public schools unconstitutional and in subsequent decisions ruled similarly on other kinds of Jim Crow legislation. *See also* black code; racial segregation.

Jim River (North Dakota–South Dakota, U.S.): *see* James River.

Jim Thorpe, borough (town), seat of Carbon county, eastern Pennsylvania, U.S. It is situated on the Lehigh River in a valley of the Pocono Mountains, 22 miles (35 km) northwest of Allentown. The borough was created in 1954 with the merger of the boroughs of Mauch Chunk ("Bear Mountain"; Inc. 1850) and East Mauch Chunk (Inc. 1854) and was named for Jim Thorpe (1888–1953), the famous Native American athlete. Thorpe's remains were brought from Oklahoma and interred in a nearby mausoleum (the Jim Thorpe Memorial).

Following the local discovery of anthracite coal in 1791, the Lehigh Coal and Navigation Company laid out the site and there built the first industrial railroad in the United States (1828), a gravity switchback line that hauled coal to the Lehigh Canal. Asa Packer, a coal baron, founded the Lehigh Valley Railroad to replace the canal in 1855. Mining has given way to tourism as the borough's economic mainstay. Flagstaff Mountain Park and Glen Onoko Falls are nearby scenic spots. Pop. (2003 est.) 4,827.

Jima, also spelled JIMMA, town, southwestern Ethiopia, 220 miles (353 km) by road southwest of Addis Ababa. It lies at an elevation of 5,740 feet (1,750 m) in a forested region known for its coffee plantations. Jima serves as the commercial centre for the region, handling coffee and other products. An agricultural school and an airport serve the town. Potassium and sodium nitrates are mined to the northeast. Pop. (1994) 88,867.

Jimaní, city, southwestern Dominican Republic. It is situated in a hilly region between the western shore of Lake Enriquillo and the Haitian border. The city is a trade centre for the coffee, fruits, and timber produced in the region. Jimaní is accessible by secondary highway from communities in both the Dominican Republic and Haiti. In 2004 flooding and mudslides devastated the city and killed hundreds of people. Pop. (1993) 3,911.

Jiménez, Juan Ramón (b. Dec. 24, 1881, Moguer, Spain—d. May 29, 1958, San Juan, P.R.), Spanish poet awarded the Nobel Prize for Literature in 1956.

After studying briefly at the University of Salamanca, Jiménez went to Madrid (1900) at the invitation of the poet Rubén Darío. His first two volumes of poetry, *Almas de violeta* ("Souls of Violet") and *Ninfeas* ("Waterlilies"), came out that same year. The two books, printed in violet and green, respectively, so embarrassed Jiménez in his later years by their excessive sentiment that he destroyed every copy he could find. A man of frail constitution, he left Madrid for reasons of health. His published volumes of that period, including *Pastorales* (1911), *Jardines lejanos* (1905;

Juan Ramón Jiménez, 1956
AP/Wide World Photos

"Distant Gardens"), and *Elegías puras* (1908; "Pure Elegies"), clearly reflect the influence of Darío, with their emphasis on individuality and subjectivity expressed in free verse.

Jiménez returned to Madrid in 1912 and, for the next four years, lived at the Residencia de Estudiantes and worked as an editor of that educational institution's periodicals. In 1916 he traveled to New York City, where he married Zenobia Camprubí Aymar, the Spanish translator of the Hindu poet Rabindranath Tagore. Shortly after his return to Spain, he published *Diario de un poeta recién casado* (1917; "Diary of a Poet Recently Married"), which was issued in 1948 under the title *Diario de un poeta y mar* ("Diary of a Poet and the Sea"). That volume marked his transition to what he called *"la poesía desnuda"* ("naked poetry"), an attempt to strip his poetry of all extraneous matter and to produce it in free verse, without formal metres, of a purer nature. During the Spanish Civil War (1936–39), he allied himself with the Republican forces, until he voluntarily exiled himself to Puerto Rico, where he spent most of the rest of his life.

Although primarily a poet, Jiménez achieved popularity in America with the translation of his prose work *Platero y yo* (1917; *Platero and I*), the story of a man and his donkey. He also collaborated with his wife in the translation of the Irish playwright John Millington Synge's *Riders to the Sea* (1920). His poetic output during his life was immense. Among his better-known works are *Sonetos espirituales 1914–1915* (1916; "Spiritual Sonnets, 1914–15"), *Piedra y cielo* (1919; "Stones and Sky"), *Poesía, en verso, 1917–1923* (1923), *Poesía en prosa y verso* (1932; "Poetry in Prose and Verse"), *Voces de mi copla* (1945; "Voices of My Song"), and *Animal de fondo* (1947; "Animal at Bottom"). A collection of 300 poems (1903–53) in English translation by Eloise Roach was published in 1962.

BIBLIOGRAPHY. Donald F. Fogelquist, *Juan Ramón Jiménez* (1976), is a biography; John C. Wilcox, *Self and Image in Juan Ramón Jiménez* (1987), critically analyzes several works.

Jiménez, Marcos Pérez: *see* Pérez Jiménez, Marcos.

Jiménez de Cisneros, Francisco, CARDENAL (Cardinal) (b. 1436, Torrelaguna, Castile [now in Spain]—d. Nov. 8, 1517, Roa, Spain), prelate, religious reformer, and twice regent of Spain (1506, 1516–17). In 1507 he became both a cardinal and the grand inquisitor of Spain, and during his public life he sought the forced conversion of the Spanish Moors and promoted crusades to conquer North Africa.

Jiménez was the son of a poor hidalgo (lower nobility) tax collector and was christened Gonzalo. He studied at the University of Salamanca and, after taking holy orders, spent a number of years in Rome (1459–66), where he disliked the humanists at the papal court but was impressed by their learning. Pope Paul II gave him an "expective letter" for the first

vacant benefice in the archdiocese of Toledo. The archbishop, Alfonso de Carillo, refused to accept the letter and, in 1473, when Jiménez insisted on his rights, threw him into prison. Refusing release at the price of giving up his claims, Jiménez remained in prison until 1479, when Carillo gave way. In 1482 Cardinal Pedro González de Mendoza, impressed by Jiménez' ability and strength of character, made him vicar general of the bishopric of Sigüenza. In 1484 Jiménez gave up this post and, apparently, a brilliant career and became a monk in the Franciscan monastery of San Juan de los Reyes at Toledo, taking the name of Fray (Brother) Francisco.

Jiménez de Cisneros, engraving after a bust by Felipe Vigarny
By courtesy of the Hispanic Society of America

In 1492, on Mendoza's recommendation, Isabella I the Catholic, of Castile, appointed him her confessor. From then on his influence grew rapidly. In 1495 he succeeded Mendoza as archbishop of Toledo. This position gave Jiménez the opportunity to initiate the reform of the Spanish clergy. At synods of Alcalá (1497) and Talavera (1498) he promulgated a series of orders: the clergy had to give up the common practice of concubinage; they were required to reside in their parishes, to go to frequent confession, and to preach and explain the gospel to their parishioners every Sunday. A simple catechism was published with the decrees. The monks, first of Jiménez' own order of the Franciscans and then of the other orders, were required to observe their traditional rules. Aristocratic ecclesiastics resented this interference with their lifestyle and appealed to Isabella and to Rome; 400 monks from Andalusia even fled to North Africa with their "wives" and became Muslims. But gradually the reforms became effective, at least in the monastic orders.

Against the advice of Hernando de Talavera, archbishop of Granada (who wanted to convert the Moors of Granada slowly by education), Jiménez introduced forced mass conversions. The Moriscos, although now nominally Christians, were neither willing to be assimilated to the Christian Spaniards nor were they accepted as equals by the latter. Jiménez' intervention was the direct cause of a Moorish revolt in 1499–1500, and he must be held largely responsible for making the Morisco problem insoluble. In 1609 the Moriscos were finally expelled from Spain.

Appointed grand inquisitor. Jiménez spent the last years of Isabella's reign mostly at her court as her principal religious and political adviser. Upon her death, in 1504, he supported the claims of Ferdinand II the Catholic, of Aragon, against his son-in-law, Philip of Burgundy, but helped to mediate the Agreement of Salamanca, which left Philip as king of Castile. On Philip's death (1506) Jiménez set up a regency government for Ferdinand, who was in Naples at the time, and stopped the intrigues of a group of high nobles who wanted to make over the regency to the Holy Roman emperor Maximilian I. Ferdinand made him grand inquisitor and obtained for him the cardinal's hat in 1507. As grand inquisitor, Jiménez insisted that the inquisitors observe the inquisitorial rules strictly, but he also extended the authority of the Supreme Council of the Inquisition (the "Holy Office") over the local inquisitorial courts. It was said that he offered from his own resources to pay Ferdinand the sum of 600,000 ducats, which the *conversos* (converted Jews) had offered the king for the abolition of the Inquisition.

Jiménez was the guiding spirit behind the Spanish campaigns in North Africa (1505–10), which he helped finance from his archiepiscopal revenues. But, because of a greater interest in Italy, Ferdinand was content with the capture of Oran and other ports and refused to support Jiménez' plan for a crusade to conquer all North Africa.

Jiménez knew that the reform of the morals and pastoral work of the clergy could not be effective without a parallel intellectual reform of the church. He thus began planning the foundation of a new university at Alcalá de Henares in 1498. It opened in 1508. Apart from the usual chairs in Thomist theology, Jiménez also established chairs in Scotist and Nominalist theology, as well as in Oriental languages. He attracted some of the finest contemporary scholars to Alcalá (although Erasmus refused his invitation). These scholars cooperated in the production of the famous Complutensian Polyglot Bible (completed in 1517 and published *c.* 1522).

At the death of Ferdinand (1516) Jiménez once more became regent of Castile. The old antagonisms between the nobility and the cities and between the Castilians and the Aragonese broke out again. Some of Ferdinand's Castilian opponents had previously gone to the court in Brussels. They were now joined by Ferdinand's Aragonese ministers, who tried to secure their position with the prospective new ruler, Ferdinand's grandson, Charles of Burgundy (later Charles I of Spain and Emperor Charles V). They were bitterly resented by those who remained in Spain. A group of Castilian nobles plotted to place Charles's young brother Ferdinand on the throne, but Jiménez forestalled them and obtained the general recognition of Charles in Castile. It was due largely to the cardinal's efforts that Charles could take over his new kingdom without open opposition (September 1517). But Jiménez died without seeing the new king. (H.G.K.)

BIBLIOGRAPHY. Reginald Merton, *Cardinal Ximenes and the Making of Spain* (1934); and Walter Starkie, *Grand Inquisitor* (1940), are both useful biographies. There is an excellent short account of Jiménez' ecclesiastical reforms in Marcel Bataillon, *Érasme et l'Espagne,* new ed. edited by Charles Amiel, vol. 1 (1991). Some of Jiménez' correspondence is collected in Diego López de Ayala, *Cartas del Cardenal Don Fray Francisco Jiménez de Cisneros* (1867); and Vicente de la Fuente, *Cartas de los secretarios del Cardenal D. Fr. Francisco Jiménez de Cisneros . . .* (1875).

Jiménez de Quesada, Gonzalo (b. *c.* 1495, Córdoba or Granada, Spain—d. Feb. 16, 1579, Mariquita, New Granada [now in Colombia]), Spanish conquistador who led the expedition that won the region of New Granada (Colombia) for Spain.

Trained as a lawyer in Granada, Quesada sailed to the New World in 1535 to serve as the chief magistrate for the colony of Santa Marta, on the northern coast of South America. The following year, although he had no military experience, Quesada led an expedition of 900 men up the Magdalena River into the interior of New Granada. After eight months of marching through tropical forests and struggling with hostile Indians, the expedition succeeded in penetrating the great central plain of Colombia—the land of the Chibcha Indians, a group of tribes that had attained a relatively high state of culture. The ruler of the Chibchas, the Zipa of Bogotá, fled as Quesada's army approached, and the conquest appeared to be accomplished. Toward the end of 1538, however, two rival conquistadores—Sebastián de Belalcázar from Quito and Nikolaus Federmann from Venezuela—challenged Quesada's claim to the New Granada triumph. The three rivals agreed to submit their case to Madrid. In July 1539 Quesada sailed from Cartagena to Spain to plead before the crown his right of conquest, but he succeeded only in winning for himself an honorary title.

On his return to New Granada, he became at once the most influential person in the colony, protecting the colonists from the severity of officials and restraining the rapacity of the *comenderos* (large landholders). Yet his own thirst for conquest (and for gold) was not yet quenched. In 1569 he set out with 500 men to search for the mythical Eldorado but returned after two years' wanderings with only 25 of his original company. The least contentious of the great conquistadores, he retired to La Suesca, his country house, where he wrote a book about his campaigns, which has been lost. He died of leprosy.

Jimeta, town, Adamawa state, eastern Nigeria. It lies on the south bank of the Benue River, and on the highway between Zing and Girei. Merged with Yola in 1935 by the Fulani administration, Jimeta regained independent town status with its own council in 1955. With the construction of a spur road to Yola (5.5 miles [9 km] south-southeast), the town became a river port for Yola, gradually taking over most of the river-borne traffic along the Benue River. From mid-July to mid-October, when the Benue has deep water, boats carry peanuts (groundnuts) and cotton from Cameroon and hides and skins from the hinterland of Yola-Jimeta downstream to the Niger River delta ports for export. Local trade handles sorghum, millet, yams, shea nuts, onions, peppers, indigo, cattle, sheep, goats, and poultry.

Jimeta is linked by road to Bombi, Mubi, Bama, and Maiduguri; a ferry service in the town crosses the Benue River. Pop. (1991 est.) 73,080.

Jimma (Ethiopia): *see* Jima.

Jimmu, in full JIMMU TENNŌ, original name KOW-YAMATO-IWARE-HIKO NO MIKOTO, legendary first emperor of Japan and founder of the imperial dynasty.

Japanese chronicles record Jimmu's expedition eastward from Hyuga in 607 BC along Japan's Inland Sea, subduing tribes as he went and ending in Yamato, where he established his centre of power. Although modern historians do not accept such details as a 7th century BC date, preferring a date in the Early Christian era, they affirm the tradition of an aggressive movement of peoples from the west.

Jimmu Tennō (the posthumous reign name by which he is generally known) is said to have been a descendant of the sun goddess Amaterasu through her celestial grandson Ninigi, whom she sent down to govern earth, and he married a descendant of the storm god Susanoo. Despite Jimmu's importance as a link between the ruling family of Japan and the divine ancestors, he has never had much of a cult following in Japan. A Shintō shrine was erected by the Japanese government in 1890 at the site of what is believed to be his burial place at Unebi.

jimsonweed, annual, herbaceous, tropical plant (*Datura stramonium*) of the potato fam-

ily (Solanaceae) that has become an introduced weed throughout much of the Northern Hemisphere. Its juices are poisonous, and it has a fairly unpleasant odour.

Jimsonweed (*Datura stramonium*)
J. Kirnas—Photo Trends

Jimsonweed grows to a height of 1 to almost 2 m (up to 6½ feet), has large, white or violet, trumpet-shaped flowers, and produces a large, spiny fruit to which the common name thornapple is sometimes applied. Commercially, it is the source of the alkaloidal drug hyoscyamine.

Jind, also spelled JHIND, city, central Haryāna state, northwestern India, on road and rail routes to Delhi, 70 miles (110 km) southeast. Another rail line connects it eastward to Pānipat. Jind is said to have been founded by the Pāṇḍavas of the *Mahābhārata* epic, who built a temple, around which the town of Jaintapuri (Jind) grew. A local grain-trade centre, it also possesses cotton-ginning factories. Several colleges are affiliated with Kurukshetra University.

The surrounding region—with the exception of low, outlying hills of the Arāvalli Range in the south—is composed of level plains broken only by shifting sand hills. Irrigated by the Sirhind Canal system, the region's chief crops include grains, gram (a leguminous plant grown for its seeds), and cotton. Jind was formerly one of the princely Phulkian states of the Punjab; it was founded in the 18th century by Sutlej Sikh chieftains. Pop. (1991) 85,300.

jingle shell, also called SADDLE OYSTER, any of several marine invertebrates of the class Bivalvia belonging to the family Anomiidae. In most species of these oysterlike bivalves, one valve (*i.e.*, half) of the shell is closely appressed to a rock surface and has a large hole or embayment in its wall through which a calcified byssus (tuft of horny threads) attaches to the rock and thus anchors the animal. The shell's upper valve, though it is more convex than the lower, is usually irregular in shape and follows the configuration of the rock surface.

The shells are often translucent and have pearly interiors. They also jingle when touched; hence the name jingle shell. They are much used in the manufacture of lampshades, chimes, and other ornaments.

jingling Johnny, also called TURKISH CRESCENT, French CHAPEAU CHINOIS, or PAVILLON CHINOIS, musical instrument consisting of a pole ornamented with a canopy (*pavillon*), a crescent, and other shapes hung with bells and metal jingling objects, and often surmounted by horsetails. It possibly originated as the staff of a Central Asian shaman, and it was part of the Turkish military Janissary band that stimulated the late 18th-century European vogue for Turkish music. The jingling Johnny was

Belgian jingling Johnny, *c.* 1800; in the Museum of Fine Arts, Boston
Leslie Lindsay Mason Collection of Musical Instruments (formerly the Galpin Collection), Museum of Fine Arts, Boston

used in European military bands in the 19th century and survives, somewhat altered, in Germany. Similar instruments occur in ancient Chinese music, probably diffused from the same Central Asian sources.

Jingō (empress of Japan): *see* Jingū.

jingoism, an attitude of belligerent nationalism, the English equivalent of the term chauvinism. The term apparently originated in England during the Russo-Turkish War of 1877–78 when the British Mediterranean squadron was sent to Gallipoli to restrain Russia and war fever was aroused. Supporters of the British government's policy toward Russia came to be called jingoes as a result of the phrase "by jingo," which appeared in the refrain of a popular song:

> We don't want to fight, yet by jingo, if we do,
> We've got the ships, we've got the men,
> And got the money, too!

Compare chauvinism.

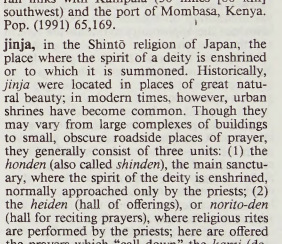
Jingū, also spelled JINGŌ, in full JINGŪ KŌGŌ, also called OKINAGATARASHI-HIME NO MIKOTO (b. AD 170?, Japan—d. 269?, Japan), semilegendary empress-regent of Japan who is said to have established Japanese hegemony over Korea.

According to the traditional records of ancient Japan, Jingū was the wife of Chūai, the 14th sovereign (reigned 192–200), and the regent for her son Ōjin. Aided by a pair of divine jewels that allowed her to control the tides, she is said to have begun her bloodless conquest of Korea in 200, the year in which her husband died. According to legend, her unborn son Ōjin, later deified as Hachiman, the god of war, remained in her womb for three years, giving her time to complete the conquest and return to Japan.

Although the traditional chronology of the period is doubtful and many of the deeds ascribed to Jingū are undoubtedly fictitious, it is certain that by the 4th century AD the Japanese had established some control over southern Korea.



There is no way of verifying the existence of a specific empress named Jingū, but it is thought that a matriarchal society existed in western Japan during this period. Chinese and Korean records, considered to be more accurate than contemporary Japanese accounts, refer to the Japanese country of Wa as the Queen Country and place it in close contact with China and Korea.

Jinhua (China): *see* Chin-hua.

Jining (China): *see* Chi-ning.

Jinja, town, southeastern Uganda, eastern Africa, where the Nile flows out of Lake Victoria, at 3,740 feet (1,140 m) above sea level. The second largest town in Uganda, it was founded in 1901 as a British administrative centre and became a municipality in 1957, when construction began on the Owen Falls Dam, 3 miles (5 km) downstream. The hydroelectric power thus provided was instrumental in Jinja's development as the country's main industrial centre. Industries include the first steel-rolling mill of eastern Africa, a copper smeltery, plywood and tobacco factories, and a grain-conditioning plant. Nearby are a brewery, a textile factory, and large sugar plantations. Products are transported by lake steamer, as well as by rail and road. Jinja has rail links with Kampala (50 miles [80 km] southwest) and the port of Mombasa, Kenya. Pop. (1991) 65,169.

jinja, in the Shintō religion of Japan, the place where the spirit of a deity is enshrined or to which it is summoned. Historically, *jinja* were located in places of great natural beauty; in modern times, however, urban shrines have become common. Though they may vary from large complexes of buildings to small, obscure roadside places of prayer, they generally consist of three units: (1) the *honden* (also called *shinden*), the main sanctuary, where the spirit of the deity is enshrined, normally approached only by the priests; (2) the *heiden* (hall of offerings), or *norito-den* (hall for reciting prayers), where religious rites are performed by the priests; here are offered the prayers which "call down" the *kami* (deity, or sacred power) and subsequently send it away; and (3) the *haiden* (hall of worship),

Main building of the Inner Shrine at Ise
By courtesy of Kokusai Bunka Shinkokai, Tokyo

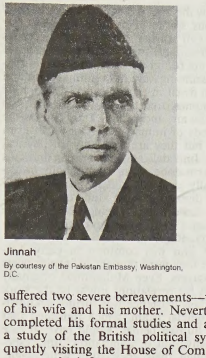
where the devotees worship and offer prayers. Large shrines may have additional structures, such as the *kagura-den* (stage for ceremonial dance), *shamusho* (shrine office), *temizu-ya* (ablution basin for washing hands and mouth before worshiping), and also *komainu* (statues of guardian animals) and *tōrō* (stone or bronze lanterns given as offerings). The sacred compound is demarcated by an entrance gateway, or torii.

Some of the most famous Shintō shrines, such as the Inner Shrine (Naikū) at the Ise Shrine, are rebuilt at regular intervals, retaining through each reconstruction original elements of great antiquity, such as frames, floors, or roof beams. A distinctive feature of Shintō architecture is the *chigi*, a scissors-shaped finial formed by the projecting ends of the bargeboards at the front and rear of the roof.

From the Meiji Restoration in 1868 to the end of World War II, Shintō shrines were governed by the home ministry and subsidized by government funds. Following the disestablishment of State Shintō, and the constitutional prohibition of subsidies, the shrines have depended for support on the offerings of their parishioners and other worshipers and on revenue from tourism and local services such as kindergartens. Many priests work at second jobs to maintain themselves and their families. Most of the more than 97,000 shrines in Japan belong to the Jinja Honchō (Association of Shintō Shrines); its membership includes the majority of Japan's 107,000,000 Shintō worshipers. Each shrine is managed by its own shrine committee, made up of priests and parishioners or their representatives.

Articles are alphabetized word by word, not letter by letter

Jinjī, also spelled GINGI, site of an almost inaccessible fortress constructed by the Hindu rulers of the Vijayanagar Empire (*c.* 1347–1642). It is located about 80 miles (130 km) southwest of Madras in the Indian state of Tamil Nādu.



In 1638 the fortress was captured from the Maratha chief Shāhjī by the Muslims of Bijāpur. In 1677 Shāhjī's son, the famous Śivājī, recaptured the fort. From 1690 it was besieged by the Mughals, only surrendering in 1698. A large Mughal army was thus immobilized for eight years, the fortress's chief claim to fame. It was passed to the nawabs of the Carnatic under the Mughals and was captured by the French in 1750 and the British in 1761. It surrendered to Hyder (Haidar) Ali of Mysore in 1780 and thereafter played no part in history.

Jinling Bajia (artists): *see* Eight Masters of Nanking.

Jinnah, Mohammed Ali, also called QĀ'ID-E A'ẒAM (Arabic: "The Great Leader") (b. Dec. 25, 1876, Karāchi, India [now in Pakistan]—d. Sept. 11, 1948, Karāchi), Indian Muslim politician, founder and first governor-general (1947–48) of Pakistan.

Early years. Jinnah was the first of seven children of Jinnahbhai, a prosperous merchant. After being taught at home, Jinnah was sent to the Sind Madrasasah High School in 1887. Later he attended the Mission High School, where, at the age of 16, he passed the matriculation examination of the University of Bombay. On the advice of an English friend, his father decided to send him to England to acquire business experience. Jinnah, however, had made up his mind to become a barrister. In keeping with the custom of the time, his parents arranged for an early marriage for him before he left for England.

In London he joined Lincoln's Inn, one of the legal societies that prepared students for the bar. In 1895, at the age of 19, he was called to the bar. While in London Jinnah

Jinnah
By courtesy of the Pakistan Embassy, Washington, D.C.

suffered two severe bereavements—the deaths of his wife and his mother. Nevertheless, he completed his formal studies and also made a study of the British political system, frequently visiting the House of Commons. He was greatly influenced by the liberalism of William E. Gladstone, who had become prime minister for the fourth time in 1892, the year of Jinnah's arrival in London. Jinnah also took a keen interest in the affairs of India and in Indian students. When the Parsi leader Dadabhai Naoroji, a leading Indian nationalist, ran for the English Parliament, Jinnah and other Indian students worked day and night for him. Their efforts were crowned with success, and Naoroji became the first Indian to sit in the House of Commons.

When Jinnah returned to Karāchi in 1896, he found that his father's business had suffered losses and that he now had to depend on himself. He decided to start his legal practice in Bombay, but it took him years of work to establish himself as a lawyer.

It was nearly 10 years later that he turned toward active politics. A man without hobbies, his interest became divided between law and politics. Nor was he a religious zealot: he was a Muslim in a broad sense and had little to do with sects. His interest in women was also limited to Ruttenbai—the daughter of Sir Dinshaw Petit, a Bombay Parsi millionaire—whom he married over tremendous opposition from her parents and others. The marriage proved an unhappy one. It was his sister Fatima who gave him solace and company.

Entry into politics. Jinnah first entered politics by participating in the 1906 Calcutta session of the Indian National Congress, the party that called for dominion status and later for independence for India. Four years later he was elected to the Imperial Legislative Council—the beginning of a long and distinguished parliamentary career. In Bombay he came to know, among other important Congress personalities, Gopal Krishna Gokhale, the eminent Maratha leader. Greatly influenced by these nationalist politicians, Jinnah aspired during the early part of his political life to become "a Muslim Gokhale." Admiration for British political institutions and an eagerness to raise the status of India in the international community and to develop a sense of Indian nationhood among the peoples of India were the chief elements of his politics. At that time, he still looked upon Muslim interests in the context of Indian nationalism.

But, by the beginning of the 20th century, the conviction had been growing among the Muslims that their interests demanded the preservation of their separate identity rather than amalgamation in the Indian nation that would for all practical purposes be Hindu. Largely to safeguard Muslim interests, the All-India Muslim League was founded in 1906. But Jinnah remained aloof from it. Only in 1913, when authoritatively assured that the league was as devoted as the Congress to the political emancipation of India, did Jinnah join the league. When the Indian Home Rule League was formed, he became its chief organizer in Bombay and was elected president of the Bombay branch.

"Ambassador of Hindu–Muslim unity." Jinnah's endeavours to bring about the political union of Hindus and Muslims earned him the title of "the best ambassador of Hindu–Muslim unity," an epithet coined by Gokhale. It was largely through his efforts that the Congress and the Muslim League began to hold their annual sessions jointly, to facilitate mutual consultation and participation. In 1915 the two organizations held their meetings in Bombay and in 1916 in Lucknow, where the Lucknow Pact was concluded. Under the terms of the pact, the two organizations put their seal to a scheme of constitutional reform that became their joint demand vis-à-vis the British government. There was a good deal of give and take, but the Muslims obtained one important concession in the shape of separate electorates, already conceded to them by the government in 1909 but hitherto resisted by the Congress.

Meanwhile, a new force in Indian politics had appeared in the person of Mohandas K. Gandhi. Both the Home Rule League and the Indian National Congress had come under his sway. Opposed to Gandhi's Non-cooperation Movement and his essentially Hindu approach to politics, Jinnah left both the League and the Congress in 1920. For a few years he kept himself aloof from the main political movements. He continued to be a firm believer in Hindu–Muslim unity and constitutional methods for the achievement of political ends. After his withdrawal from the Congress, he used the Muslim League platform for the propagation of his views. But during the 1920s the Muslim League, and with it Jinnah, had been overshadowed by the Congress and the religiously oriented Muslim Khilāfat committee.

When the failure of the Non-cooperation Movement and the emergence of Hindu revivalist movements led to antagonism and riots between the Hindus and Muslims, the league gradually began to come into its own. Jinnah's problem during the following years was to convert the league into an enlightened political body prepared to cooperate with other organizations working for the good of India. In addition, he had to convince the Congress, as a prerequisite for political progress, of the necessity of settling the Hindu–Muslim conflict.

To bring about such a rapprochement was Jinnah's chief purpose during the late 1920s and early 1930s. He worked toward this end within the legislative assembly, at the Round Table Conferences in London (1930–32), and through his 14 points, which included proposals for a federal form of government, greater rights for minorities, one-third representation for Muslims in the central legislature, separation of the predominantly Muslim Sind region from the rest of the Bombay province, and the introduction of reforms in the North-West Frontier Province. But he failed. His failure to bring about even minor amendments in the Nehru Committee proposals (1928) over the question of separate electorates and reservation of seats for Muslims in the legislatures frustrated him. He found himself in a peculiar position at this time; many Muslims thought that he was too nationalistic in his policy and that Muslim interests were not safe in his hands, while the Indian National Congress would not even meet the moderate Muslim demands halfway. Indeed, the Muslim League was a house divided against itself. The Punjab Muslim League repudiated Jinnah's leadership and organized itself separately. In disgust, Jin-

nah decided to settle in England. From 1930 to 1935 he remained in London, devoting himself to practice before the Privy Council. But when constitutional changes were in the offing, he was persuaded to return home to head a reconstituted Muslim League.

Soon preparations started for the elections under the Government of India Act of 1935. Jinnah was still thinking in terms of cooperation between the Muslim League and the Hindu Congress and with coalition governments in the provinces. But the elections of 1937 proved to be a turning point in the relations between the two organizations. The Congress obtained an absolute majority in six provinces, and the league did not do particularly well. The Congress decided not to include the league in the formation of provincial governments, and exclusive all-Congress governments were the result. Relations between Hindus and Muslims started to deteriorate, and soon Muslim discontent became boundless.

Creator of Pakistan. Jinnah had originally been dubious about the practicability of Pakistan, an idea that Sir Muḥammad Iqbāl had propounded to the Muslim League conference of 1930; but before long he became convinced that a Muslim homeland on the Indian subcontinent was the only way of safeguarding Muslim interests and the Muslim way of life. It was not religious persecution that he feared so much as the future exclusion of Muslims from all prospects of advancement within India as soon as power became vested in the close-knit structure of Hindu social organization. To guard against this danger he carried on a nationwide campaign to warn his coreligionists of the perils of their position, and he converted the Muslim League into a powerful instrument for unifying the Muslims into a nation.

At this point, Jinnah emerged as the leader of a renascent Muslim nation. Events began to move fast. On March 22–23, 1940, in Lahore, the league adopted a resolution to form a separate Muslim state, Pakistan. The Pakistan idea was first ridiculed and then tenaciously opposed by the Congress. But it captured the imagination of the Muslims. Pitted against Jinnah were men of the stature of Gandhi and Jawaharlal Nehru. And the British government seemed to be intent on maintaining the political unity of the Indian subcontinent. But Jinnah led his movement with such skill and tenacity that ultimately both the Congress and the British government had no option but to agree to the partitioning of India. Pakistan thus emerged as an independent state in 1947.

Jinnah became the first head of the new state. Faced with the serious problems of a young nation, he tackled Pakistan's problems with authority. He was not regarded as merely the governor-general; he was revered as the father of the nation. He worked hard until overpowered by age and disease in Karāchi, the place of his birth, in 1948. (M.Hu.)

BIBLIOGRAPHY. Stanley Wolpert, *Jinnah of Pakistan* (1984), is a well-documented major biography. Hector Bolitho, *Jinnah, Creator of Pakistan* (1954, reprinted 1981), includes a survey of the political background. Other works include Sheila McDonough (ed.), *Mohammed Ali Jinnah, Maker of Modern Pakistan* (1970); C.M. Naim (ed.), *Iqbal, Jinnah, and Pakistan: The Vision and the Reality* (1979), studying the political and social views of these leaders; Allen Hayes Merriam, *Gandhi vs Jinnah: The Debate Over the Partition of India* (1980), a well-documented comparative examination of the two men's ideologies; and Ayesha Jalal, *The Sole Spokesman: Jinnah, the Muslim League, and the Demand for Pakistan* (1985), an analysis of the political and historical role of Jinnah.

jinni, plural JINN, also called GENIE, Arabic JINNĪ, in Arabic mythology, a supernatural spirit below the level of angels and devils. *Ghūl* (treacherous spirits of changing shape), *'ifrīt* (diabolic, evil spirits), and *si'lā* (treacherous spirits of invariable form) constitute classes of jinn. Jinn are beings of flame or air who are capable of assuming human or animal form and are said to dwell in all conceivable inanimate objects—stones, trees, ruins—underneath the earth, in the air, and in fire. They possess the bodily needs of human beings and can even be killed, but they are free from all physical restraints. Jinn delight in punishing humans for any harm done them, intentionally or unintentionally, and are said to be responsible for many diseases and all kinds of accidents; however, those human beings knowing the proper magical procedure can exploit the jinn to their advantage.

Belief in jinn was common in early Arabia, where they were thought to inspire poets and soothsayers. Even Muḥammad originally feared that his revelations might be the work of jinn. Their existence was further acknowledged in official Islām, which indicated that they, like human beings, would have to face eventual salvation or damnation. Jinn, especially through their association with magic, have always been favourite figures in North African, Egyptian, Syrian, Persian, and Turkish folklore and are the centre of an immense popular literature, appearing notably in *The Thousand and One Nights.* In India and Indonesia they have entered local Muslim imaginations by way of the Qur'ānic descriptions and Arabic literature. *See also* ghoul; 'ifrit.

Jinotega, city, north-central Nicaragua. It lies in the central highlands just south of Lake Apanás. The surrounding area is rugged, but its fertile soils produce coffee, tobacco, corn (maize), beans, potatoes, other vegetables, fruits, and wheat. Jinotega's industrial activities include flour milling, tanning, coffee processing, and the manufacturing of hats and mats. The city is linked with the Matagalpa highway, giving it access to the Pan-American Highway. Pop. (1985 est.) 18,488.

Jinotepe, city, southwestern Nicaragua. It is situated in the Diriamba Highlands at an elevation of 1,867 feet (569 m) above sea level. Given city status in 1883, it was a scene of heavy fighting in 1979 between Sandinista guerrillas and government troops. Jinotepe is a major commercial and manufacturing centre. The hinterland is known primarily for its coffee, but rice, sugarcane, and sesame also are grown. Livestock raising is widespread, and there is some lumbering. Limestone quarries and saltworks are located in the vicinity. Jinotepe lies along the Pan-American Highway south of Managua, the national capital, and on a branch of the Pacific Railway. The city's colonial church has a reliquary of precious metals and gems, and an annual festival honours the patron saint, St. James the Great. Pop. (1985 est.) 23,538.

Jinshi (China): *see* Chin-shih.

Jinshin-no-ran (Japanese: "War of the Year of the Monkey"), English CIVIL WAR OF AD 672, in Japanese history, war of imperial succession that brought an emperor with a secure military base to the Japanese throne for the first time in history. The war strengthened the power of the imperial family at the expense of powerful associated clans, such as the Nakatomi and Soga.

The conflict erupted following the death of the emperor Tenji in AD 672, when Prince Ōtomo was elevated to the throne as the emperor Kōbun through the efforts of the aristocratic clans that had resisted Tenji's centralization measures. Prince Ōama, son of the deceased emperor, gathered together his own military forces and defeated Ōtomo at his capital in Ōmi province (modern Shiga prefecture). Ōama then succeeded to the throne as the emperor Temmu, making his new capital at Asuka in Yamato province (modern Nara prefecture), which was removed from the influence of the Nakatomi and Soga clans.

Jirajara, also called JIRARA, Indians of northwestern Venezuela who were extinct by the mid-17th century. The little known about them suggests that they were very similar culturally to the Caquetío (*q.v.*).

Jirásek, Alois (b. Aug. 23, 1851, Hronov, Bohemia, Austrian Empire [now in Czech Republic]—d. March 12, 1930, Prague, Czechoslovakia), the most important Czech novelist in the period before World War I, as well as a great national figure.

Jirásek was a secondary-school teacher until his retirement in 1909. He wrote a series of historical novels imbued with faith in his nation and in progress toward freedom and justice. He was particularly attracted by the Hussite period of Bohemian history (15th century), to which he devoted his most famous work, the trilogy *Mezi proudy* (1891; "Between the Currents"), *Proti všem* (1894; "Against All the World"), and *Bratrstvo* (1899–1908; "Brotherhood"). Perhaps of greater artistic significance is his five-volume portrayal of the 19th-

Jirásek
Telepress, Prague

century Czech national revival in *F.L. Věk* (1888–1906), and his best work is probably his last major novel, *Temno* (1915; "Darkness"), in which he painted a vivid picture of Bohemia in the grip of the Counter-Reformation. Jirásek's novels are founded upon careful historical reading, and his rich and detailed descriptive passages contribute to his work a colour and individuality that offset the conventionality of the characterizations.

During World War I Jirásek publicly expressed the Czech desire for national independence, notably when he read out the "national oath" at a demonstration in Prague on April 13, 1918. His literary output also included plays and short stories.

Jiří (Czech personal name): *see under* George.

Jirjā, also spelled GIRGA, town, Sawhāj *muḥāfaẓah* (governorate), Upper Egypt. It is situated on the west bank of the Nile River, which encroached considerably on the town in the 18th and 19th centuries. In pharaonic times it was probably the town of This (Tny), ancestral home of the 1st dynasty (*c.* 2925–*c.* 2775 BC), which unified Egypt. Its present name derives from the ancient Coptic monastery of Mar Girgis, dedicated to St. George. In the 14th century AD it became a centre of the Hawwārah, an Arabized Berber tribe; in about 1576 they were conquered by the Ottoman governor of Egypt, who then made Jirjā the seat of the governor of Upper Egypt. During the reign of Muḥammad 'Alī (1805–48), it was absorbed into a larger territorial unit. In 1859 Sawhāj replaced Jirjā as the provincial capital.

Possessing several fine mosques and known for its quality pottery, Jirjā also has cotton-weaving, sugar-refining, and dairying industries. The sugar refinery was enlarged in the early 1980s to a capacity of 75,000 tons per year. The valley on the west bank produces cotton, cereals, dates, and sugarcane. With a considerable Coptic minority, it is the seat of a Coptic bishop. A Roman Catholic monastery outside the town is reputedly the second oldest in Egypt. About 10 miles (16 km) south are the ruins of ancient Abydos. Across the river on the narrow east bank, the tombs of the nobles of ancient This line the limestone cliff face. Pop. (1985 prelim.) 70,899.

jitō, in feudal Japan, land steward appointed by the central military government, or shogunate, whose duties involved levying taxes and maintaining peace within the manor. First appointed at the beginning of the 12th century, the *jitō* enforced the edicts of the shogunate and ensured that taxes were correctly apportioned and collected. In return for his services, the *jitō*'s position was made hereditary, and he received a share of the produce of the estate. He also served as the local judge and was entitled to levy a special "commissariat-rice" (*hyōrō-mai*) tax for his own use.

In any emergency the *jitō* were expected to provide military service to the shogun, or hereditary military dictator of Japan. It was from the *jitō* that the military governors of a province were appointed. By the 14th century the power of these military governors, or *shugo*, had increased tremendously, while the lower levels of the *jitō* merged with the regular landowning class.

jitterbug, exuberant ballroom dance popular in the 1930s and '40s, originating in the United States and spread internationally by U.S. armed forces during World War II. Its original freewheeling acrobatic swings and lifts were modified for more conservative ballroom

versions. Couples did most versions while holding one or both hands. Step patterns varied widely and included such dances as the lindy hop (*c.* 1927, named for Charles Lindbergh's transatlantic flight), in which dancers usually did two slow "dig" steps (ball of the foot, then the heel) and two quicksteps (one foot back, one in place), and the jive, in which dancers took a step to each side and then executed two "shuffles" (side step, almost close other foot, side step). Jitterbug music—also called jive, or jump—is in $\frac{4}{4}$ time with syncopated rhythm.

Jiu Defile, also called JIU PASS (Romania): *see* Surduc Pass.

Jiu River, river formed south of Petroşani, southwestern Romania, with the joining of two headstreams rising in the Vîlcan and Parîng mountains. It then flows south, cutting a wild, deep gorge, the Surduc Pass in the Transylvanian Alps (Southern Carpathians), before flowing onto the Danube Plain and into the Danube River. The length of the Jiu River is about 205 miles (330 km). The upper Jiu Basin forms the Petroşani Depression and coalfield.

jiva, Sanskrit JĪVA, according to the Jaina philosophy of India, "living substance," or "souls," as opposed to ajiva (*ajīva*), or "non-living substance."

Souls are eternal and infinite in number and are not the same as the bodies that they inhabit. In a pure state (*mukta-jīva*), souls rise to the top of the universe, where they reside with other perfected beings and are never again reborn. Most souls are, however, *saṃsārin*, that is, covered with a thin veil of good or bad karma (the effects of past deeds), which is conceived as a kind of matter, accumulated by the emotions in the same way that oil accumulates dust particles.

Jivas are divided according to the number of sense organs that they possess. Men, gods, and demons possess the five sense organs plus reason. Even the four elements (earth, air, water, fire) are inhabited by minute clusters of invisible souls, called *nigodas*. They belong to the lowest class of jiva, possess only the sense of touch, share common functions such as respiration and nutrition, and experience intense pain. The whole space of the world is said to be packed with *nigodas*. They are the source of souls to take the place of the infinitesimally small number that have until now been able to attain moksha (*mokṣa*), or release from the cycle of rebirths.

Jívaro, South American Indian people living in the Montaña (the eastern slopes of the Andes), in Ecuador and Peru north of the Marañón River. They speak a language of the Jebero-Jivaroan group. An aboriginal population was once about 30,000 but now numbers less than 20,000.

The Jívaro have a tropical-forest agriculture, growing cassava, corn (maize), sweet potatoes, and other crops supplemented by the gathering of wild fruits, fishing, and hunting. The blowgun and poisoned darts are their chief weapons. Related families live in a single large community house rather than in a village.

Like other peoples of the Montaña, the Jívaro are warlike. Although influenced by Jesuit missionary efforts, they remain proud that they were never really conquered. The Jívaro are known for their technique of shrinking human heads to the size of an orange. These shrunken heads (*tsantsas*) are prepared by removing the skin and boiling it; hot stones and sand are then put inside the skin to shrink it further. Headhunting was motivated by a desire for revenge and by the belief that a head gave the taker supernatural power.

Jīzah, Al-, *muḥāfaẓah* (governorate) of Upper Egypt, on the west bank of the Nile, extending toward the southwest into the Western (Libyan) Desert as far as Al-Wādī al-Jadīd governorate. It is bordered on the north by Al-Minūfiyah governorate and on the south by Banī Suwayf and Al-Fayyūm governorates. It includes Al-Baḥrīyah and part of Al-Farāfirah oases and has an area of 32,878 square miles (85,153 square km).

The settled portion of the governorate in the Nile valley is about 409 square miles (1,059 square km). Aside from the capital, Al-Jīzah, most of this portion is agricultural. Crops include corn (maize), cotton, wheat, millet, berseem (clover), and market vegetables grown for use in Cairo. The area produces dates, and there is a date-packing factory at Al-Badrashayn, near the west bank of the Nile. Al-Jīzah is the largest industrial centre. Mineral resources include iron ore and coal found at Al-Baḥrīyah oasis. A railway transports the ore to the steel plant at Ḥulwān, in Cairo governorate.

Historical sites in the governorate include the Giza (Al-Jīzah) pyramids and Sphinx of the 4th dynasty (*c.* 2613–2494 BC) and the ruins of Memphis, the ancient capital of Egypt, and its cemetery, Ṣaqqārah, just to the west. The governorate has an airport at Imbābah, north of Al-Jīzah, near Cairo. It is served by the Cairo-Aswān railway, which has a station in Al-Jīzah, and also by highway. The population includes a small number of oasis and desert dwellers. Pop. (1986 prelim.) 3,700,054.

Jīzah, Al-, also spelled GIZA, GIZAH, or EL-GIZA, city, capital of al-Jīzah (*muḥāfaẓah*) (governorate) of Upper Egypt, located on the west bank of the Nile just south-southwest of Cairo. It is a suburb of the national capital, with a distinctive character enriched by several archaeological and cultural sites.

The district was settled in prehistoric times; Neolithic objects have been found there. Southwest of the city are the three great pyramids of the pharaohs: Khufu (Cheops), Khafre (Chephren), and Menkaure (Mykerinos), all 4th dynasty (*c.* 2613–*c.* 2494 BC). Because of their tremendous size and precise construction, they have been visited by travelers for millennia (*see* Giza, Pyramids of). Other monuments include the Sphinx, smaller pyramids, tombs, and temples. In earliest Muslim times Al-Jīzah formed a defense line with the island of Roda (Ar-Rawḍah) and, later, Cairo, against incursions up the river from the sea. In AD 643 its defenses were completed by 'Amr ibn-al-'Āṣ, general of the caliph 'Umar ibn al-Khaṭṭāb; they were restorations of earlier Byzantine fortifications. In the time of Caliph al-Ma'mūn (reigned 813–833), Al-Jīzah was linked to Cairo by a bridge of boats and then by successive permanent bridges. Later, a chief mosque was added (961) and Al-Jīzah became the chief town of a *kūrah* (district) and later of its province. The six present bridges link both banks with Ar-Rawḍah and Az-Zamālik islands.

The city has modern housing, government offices, embassies, research institutes, hotels, parks, a zoo, and a well-known entertainment district. The University of Cairo, founded in 1908, was reestablished in Al-Jīzah in 1924. The city also has an ophthalmic research institute, the Academy of the Arabic Language, the Higher School of Applied Arts, and offices of the Ministry of Agriculture. Most of Egypt's motion-picture industry is also concentrated there. Other industries produce cement, iron products, wood products, automobile parts, cotton and polyester textiles, footwear, and beer. The Cairo-Aswān railway has a station in the city. Pop. (1986 prelim.) 1,870,508.

Jīzān, also called QĪZĀN, formerly AT-TIHAMEH, town and port, southwestern Saudi Arabia, on the Red Sea opposite the Farasān Islands. Defined by the 1934 Treaty of Aṭ-Ṭā'if as belonging to Saudi Arabia, the town has been claimed by Yemen since the 1960s. Jīzān is the principal town of the Tihāmah coastal plain and the exporting and shipping centre of Asir region.

The surrounding area is well cultivated because of irrigation projects undertaken by the government and has become one of the main agricultural regions of Saudi Arabia. Crops include wheat, rice, barley, millet, and sorghum. Exports include grain sorghum, sesame, dried fish, dates, and salt; other economic activities are fishing, shipbuilding, and salt mining. The local architecture displays Ottoman and Yemeni influences. Roads link the port to its fertile hinterland, and an airport provides connections to other parts of Saudi Arabia. Pop. (1992) 56,565.

Jizang (Buddhist philosopher): *see* Chi-tsang.

Jizera Mountains, Czech JIZERSKÉ HORY, German ISERGEBIRGE, part of the Sudeten mountain ranges in northern Bohemia, Czech Republic, extending into Poland. It comprises a small group of peaks, though it has the highest point in the Czech Republic, at Jizera (3,681 feet [1,122 m]); Wysoka Kopa in Poland is slightly higher (3,698 feet [1,127 m]). The Jizera Mountains group is separated from the Lužice Mountains (Lužické Hory) by the Neisse (Nisa) River. Liberec lies in this valley, and its northern suburbs extend up the Jizera slopes. The mountains are a major source of granite for building.

Jizera River, German ISER, tributary of the Elbe (Labe) River in northern Czech Republic. It rises at the southern base of Smrk Mountain on the Polish border, in the Giant (Krkonoše) Mountains, and flows generally south past Turnov and Mladá Boleslav. It reaches the Elbe northeast of Prague after a course of 106 miles (171 km).

Jižní Čechy (Czech Republic): *see* Jihočeský.

Jižní Morava (Czech Republic): *see* Jihomoravský.

jizya, also spelled JIZYAH, Arabic JIZYAH, head or poll tax that early Islāmic rulers demanded from their non-Muslim subjects.

Islāmic law made a distinction between two categories of non-Muslim subjects—pagans and dhimmis ("protected peoples," or "peoples of the book"; *i.e.,* those peoples who based their religious beliefs on sacred texts, such as Christians, Jews, and Zoroastrians). The Muslim rulers tolerated the dhimmis and allowed them to practice their religion. In return for protection and as a mark of their submission, the dhimmis were required to pay a special poll tax known as the jizya. The rate of taxation and methods of collection varied greatly from province to province and were greatly influenced by local pre-Islāmic customs. In theory the tax money was to be used for charitable purposes and the payment of salaries and pensions. In practice, however, the revenues derived from the jizya were deposited in the private treasuries of the rulers. The Ottomans usually used the proceeds of the jizya to pay their military expenses.

A convert to Islām, in theory, was no longer required to pay the jizya. The Umayyad caliphs (661–750), however, faced with increasing financial difficulties, demanded the jizya from recent converts to Islām as well as from the dhimmis. This discrimination against converts was a cause of the Abū Muslim rebellion (747) in Khorāsān and helped to precipitate the downfall of the Umayyads.

jnana, Sanskrit JÑANA ("knowledge"), in Hindu philosophy, knowledge that is a total experience of its object, particularly the supreme being or reality, as contrasted with *vijñāna,* "knowing one thing from another," or "practical knowledge." The nature of jnana depends importantly on that of its object, but all schools of Hindu philosophy agree that the total cognitive experience of the supreme object sets the soul free from the transmigratory life and the polarities this imposes upon thought. Its opposite, *ajñāna* (also called avidya), therefore becomes important, because it is the false apprehension of reality that keeps the soul from attaining release. While literally meaning "ignorance," *ajñāna* conveys more the sense of mistaken knowledge, which has a large measure of validity as far as the realities of the present world are concerned but conceals the truth of a reality outside it.

Consult the INDEX *first*

Jñānadeva, also called JÑĀNEŚVARA (b. 1275, Alandi, Yādavas, India—d. 1296, Alandi), foremost of the Indian Mahārāshtrian mystical poets, author of the highly acclaimed *Jñāneśvarī,* a commentary in Marāṭhī verse on the *Bhagavadgītā* ("The Lord's Song").

Jñānadeva was a founder of the devotional school of mysticism known as Vārakarī ("Pilgrim"), so called because of the emphasis it places on pilgrimages to the shrine of Viṭṭhala (or Viṭhobā, a local manifestation of the Hindu god Vishnu [Viṣṇu]) at Pandharpur. His celebrated commentary, the *Jñāneśvarī,* was written about 1290. He also wrote the *Amṛtānubhava,* a work on Upanishadic philosophy, and a number of devotional hymns.

There is a tradition—not fully accepted by scholars—that Jñānadeva and his two brothers, Nivṛttinātha and Sopānadeva, and his sister, Muktābāī, were excommunicated by their Brahman caste fellows and persecuted because they were the children of a *sannyāsin,* or ascetic (their father, who had renounced the world without the consent of his wife, was asked by his guru to return to the life of a householder). All four children were highly respected as saints and poets, and all four voluntarily ended their lives when they were in their early 20s, believing that their work was completed.

JNR: *see* Japanese National Railways.

Jo-erh-kai Marsh, Pinyin ZOIGĚ ZHAOZE, large marsh lying mostly in north-central Szechwan *sheng* (province), China. It lies on the Tsinghai-Tibet plateau and extends across the border of Szechwan into southeastern Tsinghai province. It occupies 1,000 square miles (2,600 square km) of the southwestern part of the Tibetan Highlands at an elevation of 11,800 feet (3,600 m) above sea level. The marsh, formed by abundant rain and snow, lies in a region of restricted drainage with a long frost period (fewer than 20 frost-free days annually). It is bordered on the northeast by the Min Mountains and on the west by the A-mi-ma-ch'ing Mountains; the Huang Ho (river) runs through the western part of the marsh from south to north. Beneath its uneven surface lies a layer of peat generally 7–10 feet (2–3 m) thick but increasing to as much as 20–23 feet (6–7 m) deep in some places. Crossed by the Chinese Communists during the Long March (1934–35), the marsh was then a wilderness area. In the 1970s ditches were dug, parts of the marsh drained, and cattle, sheep, and horses pastured on the reclaimed grasslands.

Joab (fl. 1000 BC), in the Old Testament (2 Samuel), a Jewish military commander under King David, who was his mother's brother. He led the commando party that captured Jerusalem for David and as a reward was appointed commander in chief of the army. He played a leading part in many of David's victories (*e.g.,* against the Ammonites and the Edomites) and led the loyal force that crushed the rebellion of David's son Absalom. Utterly devoted to David, Joab believed that he knew David's interests better than David himself did; hence he killed Absalom, although David had commanded that his life be saved. Joab showed his characteristic ruthlessness in the treacherous murder of two of his potential rivals, Abner and Amasa. Joab obeyed under protest when ordered by David to carry out a national census. During David's last days, Joab supported the abortive bid for the throne by David's son Adonijah and was executed by the successful Solomon.

Joachim, SAINT: *see* Anne and Joachim, Saints.

Joachim OF FIORE, Fiore also spelled FLORIS, Italian GIOACCHINO DA FIORE (b. *c.* 1130/35, Celico, Kingdom of Naples [Italy]—d. 1201/02, Fiore), Italian mystic, theologian, biblical commentator, philosopher of history, and founder of the monastic order of San Giovanni in Fiore. He developed a philosophy of history according to which history develops in three ages of increasing spirituality: the ages of the Father, the Son, and the Holy Spirit.

The known facts regarding the life of Joachim of Fiore are few. Legends about his parentage and youth are of little historical significance, but from an autobiographical reference it seems certain that he went on a pilgrimage to the Holy Land that reputedly had an effect on his conversion to the religious life. He became a Cistercian monk at Sambucina and in 1177 abbot of Corazzo (Sicily). About 1191 he broke away from the distracting duties of administration and retired into the mountains to follow the contemplative life. Although claimed as a fugitive by the Cistercians, Joachim was allowed by Pope Celestine III to form the disciples who gathered around him at San Giovanni in Fiore (a town located in present-day Cosenza province in Calabria) into the Order of San Giovanni in Fiore in 1196.

Far more significant is the evidence for the inner development of a man who came to believe that spiritual understanding would be given to one who wrestled with the "letter" of the Scriptures to get at the "spirit." Three moments of special illumination are indicated, but the first is only known in legendary form, connected with either his pilgrimage or his novitiate at Sambucina. The second, recorded by himself, took place one Easter eve, after a period of frustrated study of the biblical book of Revelation when he felt himself "imprisoned" by difficulties. In the midnight silence, suddenly his mind was flooded with clarity and his understanding released from prison. The third was an experience at Pentecost, when, after a time of agonizing doubt on the doctrine of the Trinity, Joachim had a vision of a psaltery with 10 strings, in a triangular form, that clarified the mystery through a visual symbol and called forth paeans of praise from him. He expresses this experience of illumination given after mental striving in terms of the city seen intermittently by the approaching pilgrim or of the spirit breaking through the hard rind of the letter.

He was summoned by Pope Lucius III in 1184 and urged to press on with the biblical exegesis he had begun. This probably refers to the *Liber concordie Novi ac Veteris Testamenti* ("Book of Harmony of the New and Old Testaments"), in which Joachim worked out his philosophy of history, primarily in a pattern of "twos"—the concords between the two great dispensations (or Testaments) of history, the Old and the New. But already Joachim's spiritual experience was creating in his mind his truly original "pattern of threes." If the *spiritualis intellectus* springs from the letter of the Old and New Testaments, then history itself must culminate in a final age of the spirit that proceeds from both the previous ages. Thus was born his trinitarian philosophy of history in which the three Persons are, as it were, built into the time structure in the three

ages or *status* of the Father, Son, and Holy Spirit.

The third *status* was to be won by the church only after arduous pilgrimage and great tribulation, like the Israelites marching through the wilderness and crossing the Jordan River into the Promised Land. As guides through this crucial stage, Joachim prophesied the advent of two new orders of spiritual men, one of hermits to agonize for the world on the mountaintop and one a mediating order to lead men on to the new spiritual plane. Although the third age belongs par excellence to contemplatives, secular clergy and laymen are not shut out of it. In a strange diagram, a "ground plan" of the New Jerusalem, various categories of monks are grouped around the seat of God, but below, secular clergy and tertiaries (lay members) live according to their rule.

In the *Expositio in Apocalypsim* ("Exposition of the Apocalypse"), Joachim seeks to probe the imminent crisis of evil, as pictured in the apocalyptic symbols of Antichrist, and the life of the spirit to follow. His third main work, the *Psalterium decem chordarum* ("Psaltery of Ten Strings"), expounds his doctrine of the Trinity through the symbol of his vision of the 10-stringed psaltery. Here and in a lost tract he attacked the doctrine of "quaternity" (an overemphasis on the "one essence" of the Godhead that seems to separate it from the three Persons of the Trinity and so create a fourth), which he attributed to Peter Lombard, a 12th-century theologian. Besides this trilogy, written concurrently, Joachim left minor tracts and one uncompleted major work, the *Tractatus super quattuor Evangelia* ("Treatise on the Four Gospels").

Joachim was a poet and artist. His lyricism breaks through the biblical exegesis that he chose as his medium and the turgid Latin of his style. Above all, his visual imagination is expressed in the unique *Liber figurarum* ("Book of Figures"; discovered in 1937), a book of drawings and figures thought to be a genuine work by most Joachim scholars today. Here his vision of the culminating age of history is embodied in trees that flower and bear fruit luxuriantly at the top; his doctrine of the Trinity is expressed in remarkable geometric figures; his kaleidoscopic vision fuses images in some strange shapes, such as the tree that becomes an eagle, which may have influenced Dante. Joachim's figures probably carried his ideas in exciting and popular form far more widely than his indigestible writings.

In his lifetime Joachim was acclaimed as a prophet, gifted with divine illumination, and this is how he was seen by the first chroniclers after his death. The condemnation of his tract against Peter Lombard by the fourth Lateran Council in 1215 dimmed his reputation for a time, but the appearance of the Franciscan and Dominican mendicant orders, hailed as Joachim's new spiritual men, reestablished him as a prophet. The Spiritual Franciscans at mid-13th century and various other friars, monks, and sects down to the 16th century appropriated his prophecy of a third age. But Joachim has always had a double reputation, as saint and as heretic, for cautious Christian thinkers and leaders have seen his writings as highly dangerous. The debate as to whether he was orthodox or heretic continues today.

BIBLIOGRAPHY. *Chief works of Joachim. Liber concordie Novi ac Veteris Testamenti; Expositio in Apocalypsim* (1527); *Psalterium decem chordarum* (1527); *Tractatus super quattuor Evangelia*, ed. by E. Buonaiuti (1930); *Liber figurarum*, ed. by L. Tondelli, M. Reeves, and B. Hirsch-Reich (1954).

Secondary works. E. Buonaiuti, *Gioacchino da Fiore, i tempi, la vita, il messaggio* (1931), good for background, some disputed views; A. Crocco, *Gioacchino da Fiore* (1960), excellent on some aspects of Joachim's theology; H. Grundmann, *Studien über Joachim von Floris* (1927), a fundamental work from which all modern research starts; *Neue Forschungen über Joachim von Fiore* (1950), surveys recent work to date; M. Reeves, *The Influence of Prophecy in the Later Middle Ages: A Study in Joachimism* (1969), attempts to trace Joachim's influence after his death; M. Reeves and B. Hirsch-Reich, *The* Figurae *of Joachim of Fiore* (1972); L. Tondelli, *Il Libro delle Figure dell'Abate Gioacchino da Fiore*, vol. 1 (1953), states the case for the authenticity of the *Liber figurarum* and examines its influence, especially on Dante; F. Russo, *Bibliografia gioachimita* (1954), useful but full of errors; K. Lowith, *Meaning in History*, ch. 8 (1949), a consideration of the effects of Joachim's prophecy on modern political developments and ideology.

Articles. M.W. Bloomfield, "Joachim of Flora: A Critical Survey of His Canon, Teachings, Sources, Biography and Influence," *Traditio*, 13:249–311 (1957); M. Reeves, "The *Liber figurarum* of Joachim of Fiore," *Mediaeval and Renaissance Studies*, 2:57–81 (1950), a short study with some illustrations.

Joachim, Joseph (b. June 28, 1831, Kittsee, near Pressburg, Austria-Hungary—d. Aug. 15, 1907, Berlin), Hungarian violinist known for his masterful technique and his interpretations of works of Bach, Mozart, and Beethoven.

Joachim first studied at Budapest, and at age seven he appeared with his teacher S. Serwaczyński. In 1844 he visited London, where he was sponsored by Mendelssohn and achieved an outstanding success. In 1849 he led the

Joseph Joachim
F. Bruckmann Verlag Bildarchiv

orchestra at Weimar, and in 1853, the orchestra at Hannover. In 1868 he became director of the Hochschule für Ausübende Tonkunst (Berlin), where he acquired a reputation as a fine teacher, attracting pupils from all of Europe. In 1869 he founded the Joachim Quartet, which became renowned for its performances of the late string quartets of Beethoven.

In his playing, Joachim subordinated technical virtuosity to aesthetic values, and he thus brought about a reform in program making that turned away from the spectacular. His close friend Johannes Brahms consulted with him on his violin concerto and dedicated it to him, and Schumann's *Phantasy for Violin and Orchestra* was written for him. Joachim's own compositions, influenced by Brahms and Schumann, comprise chiefly works for the violin, notably the *Hungarian Concerto in D Minor*.

Joachim I Nestor (b. Feb. 24, 1484—d. July 11, 1535, Kölln an der Spree, Brandenburg), elector of Brandenburg, an opponent of the Habsburg emperors, yet a devout Roman Catholic who prevented the spread of Protestantism in his lands during his lifetime.

Joachim at first supported Francis I of France at the imperial election of 1519 and at one point even hoped to attain the title himself, but he finally backed Charles I of Spain, who became Charles V. Relations between the Emperor and the Elector were never cordial, however, for Joachim remained a French sympathizer. In domestic affairs, he reformed the legal code and settled his warlike nobles by granting them lands and positions. Interested in humanistic studies, he founded a university at Frankfurt an der Oder in 1506. Joachim remained an implacable enemy of the Reformation and even forced his sons, who sympathized with the reformers, to pledge that

Joachim I, detail from an oil painting by Lucas Cranach the Elder, 1529; in Monbijou Palace, Berlin
Foto Marburg—Art Resource/EB Inc.

Brandenburg would remain Catholic after his death. In his will, he divided Brandenburg between his two sons.

Joachim II Hektor (b. Jan. 13, 1505, Kölln an der Spree, Brandenburg—d. Jan. 3, 1571, Jagdschloss Köpenick, Brandenburg), elector of Brandenburg who, while supporting the Holy Roman emperor, tolerated the Reformation in his lands and resisted imperial efforts at re-Catholicization.

The elder son of Joachim I, Joachim II was given the Old (Altmark) and Middle Marks of Brandenburg on his father's death in 1535. Although he remained a Catholic, he sympathized with the Reformation and tolerated Protestantism in his lands from 1539 on. His religious liberalism was rewarded when the Brandenburg estates twice paid his considerable debts. In the disputes between the Emperor and Germany's Protestant princes, Joachim tried to reconcile the two parties. He sided with Charles V during the wars against the Schmalkaldic League of Protestant princes. After the Protestant defeat at the Battle of Mühlberg (1547), he persuaded Philip the Magnanimous, landgrave of Hesse, to surrender and was instrumental in securing a pardon for John Frederick I the Magnanimous of Saxony, who had been condemned to death. Joachim supported the Augsburg Interim (1548) and played a major role at the negotiations leading to the Peace of Augsburg

Joachim II, detail from an oil painting by Lucas Cranach the Younger, *c.* 1570; in Monbijou Palace, Berlin

(1555), which reestablished peace in Germany between the warring religious factions. Finally, in 1569, two years before his death, he received the duchy of Prussia as a fief from King Sigismund II Augustus of Poland.

Joachim Frederick, German JOACHIM FRIEDRICH (b. Jan. 1, 1546, Kölln an der Spree, Brandenburg [Germany]—d. July 28, 1608, en route from Storkow to Rüdersdorf), elector of Brandenburg (1598–1608), eldest son of Elector John George.

Joachim established the rule of primogeniture for the Hohenzollern electorate by a family agreement known as the Gera Bond (1598), which confirmed the practice begun by Albert III Achilles whereby Brandenburg formed the inheritance of the elector's eldest son. By the death of George Frederick of Prussia, Joachim became regent of the duchy of Prussia, ruled nominally by the mentally retarded Albert Frederick, but he had some difficulty in asserting his position (the position being established more firmly by his son and heir John Sigismund, who eventually became duke of Prussia). In Brandenburg he made concessions to the nobles at the expense of the peasantry and admitted the right of the estates to control taxation.

Joachin (king of Judah): *see* Jehoiachin.

Joad, C(yril) E(dwin) M(itchinson) (b. Aug. 12, 1891, Durham, Durham county, Eng.—d. April 9, 1953, London), British philosopher, author, teacher, and radio personality. He was one of Britain's most colourful and controversial intellectual figures of the 1940s. A pacifist and an agnostic until the last years of his life, a champion of unpopular causes and a writer of popular philosophical works, he became widely known to the British public as an agile participant in the BBC "Brains Trust" program from 1941 to 1947.

As a student at Balliol College, Oxford, Joad formed the pacifist and socialist views that led to his conscientious objection during World War I and to his vigorous promotion of pacifism early in World War II. After 16 years in the civil service, he retired in 1930 to become head of the department of philosophy and psychology at Birkbeck College, University of London.

A staunch rationalist, cast in the mold of H.G. Wells and George Bernard Shaw, he had no particular philosophical originality; but in some 40 books he set forth the ideas of others with great clarity, in addition to his own prickly opinions. Among his works are: *Guide to Philosophy* (1936) and *Guide to the Philosophy of Morals and Politics* (1938). In his last work, *The Recovery of Belief* (1952), he outlined his new-found faith in a theistic system.

Joakim (king of Judah): *see* Jehoiakim.

Naples

• **Joan I,** Joan also spelled JOANNA (b. 1326—d. May 22, 1382, Lucania, Kingdom of Naples [Italy]), countess of Provence and queen of Naples (1343–82) who defended her claim as well as that of the house of Anjou to the throne of Naples, only to lose it to Charles of Durazzo (Charles III of Naples). Beautiful and intelligent, she was also a patron of the poets and scholars of her time.

Joan I succeeded her grandfather, King Robert, in 1343, after her marriage to her cousin Andrew, brother of Louis I of Hungary (1342–82); her accession was intended to reconcile the Hungarian and Angevin claims on Naples. The swarm of Hungarians who

followed Andrew to Naples, however, antagonized many of the Angevins at court, including Joan herself. Consequently, when Andrew was assassinated (Sept. 18, 1345), Joan was accused of having been privy to the crime.

Joan married Louis of Taranto in 1347 but fled to Avignon, Fr., when Louis I invaded Naples in 1348, seeking to avenge Andrew's assassination. During her exile, she sold Avignon to the papacy on condition that she be declared innocent of the assassination. She was able to return to Naples permanently in 1352, thanks to the intervention of Pope Innocent VI.

After Louis of Taranto's death (1362), Joan married James III, king of Majorca, who, whether fearing for his life or attempting to recover his own kingdom, was almost continuously absent from Naples until his death in 1375. Meanwhile, Joan had consolidated her rule somewhat and had recognized Frederick III as king of Sicily, thereby ending an ancient Sicilian dispute between the Angevins and the Aragonese.

In 1376 Joan married the military adventurer Otto of Brunswick and later recognized as her heir to the throne Louis, Duke d'Anjou, brother of the French king Charles V. In 1378 she also recognized the antipope Clement VII. Charles of Durazzo, whom Joan had previously recognized as her heir, secured the aid of Pope Urban VI, who crowned him king of Naples in Rome (1381). Charles captured Naples in June, declaring himself king. He imprisoned Joan in the castle of Muro, where he had her suffocated.

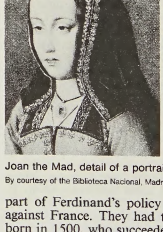
• **Joan II,** also spelled JOANNA (b. 1371, Naples, Kingdom of Naples [Italy]—d. Feb. 2, 1435, Naples), queen of Naples whose long reign (1414–35) was marked by a succession of love affairs, by continual intrigues, and by power struggles over her domain between the French house of Anjou and that of Aragon, in Spain.

After her first husband, William of Austria, died in 1406, Joan is reported to have led a promiscuous life. When her brother Ladislas died in 1414, she became queen and appointed her lover Pandolfello Alopo grand chamberlain. Alopo temporarily removed from power the condottiere Muzio Attendolo Sforza, an important figure in the previous regime. On July 14, 1415, Joan married Jacques de Bourbon, Count de la Marche, who, confident of his power, soon had Alopo executed (1415), usurped the queen's power, and demanded the death of a Neapolitan baron who led the opposition to the increasing French influence in Naples. The barons, who had arranged the marriage in the first place, rebelled, forcing Jacques to leave Naples.

Joan appointed her next lover, Giovanni Caracciolo (called Sergianni), as grand seneschal; he made peace with Sforza and appointed him grand constable. Nevertheless, Sforza supported Louis III of Anjou's claim to the Neapolitan throne. Joan thereupon called on Alfonso V the Magnanimous of Aragon for aid, adopting him as her heir. Alfonso arrived in Naples in July 1421 and began to intervene in Neapolitan affairs. When Joan and Caracciolo invited Sforza back to Naples, Alfonso arrested Caracciolo and besieged Joan in Castle Capuano (1423). After Sforza rescued her, she renounced her adoption of Alfonso and recognized Louis as heir. Alfonso was soon forced out of Naples.

The increasingly powerful Caracciolo tried to isolate the queen and made new overtures to Alfonso. He was assassinated, however, by plotting nobles (August 1432). Joan later disinherited Louis and readopted Alfonso (April 1433) and then readopted Louis in June. When Louis died (Nov. 14, 1434), she recognized as her heir his son René of Anjou, whom Alfonso drove from Naples a few years after Joan's death.

Navarre



• **Joan I,** byname JOAN OF NAVARRE, French JEANNE DE NAVARRE (b. Jan. 14, 1273, Barsur-Seine, Fr.—d. April 2, 1305, Vincennes), queen consort of France (from 1285) and queen of Navarre (as Joan I, from 1274), mother of three French kings—Louis X, Philip V, and Charles IV.

Joan was the sole daughter and heir of Henry I, king of Navarre, her brother Theobald (Thibaut) having died at an early age. She married (Aug. 16, 1284) the future Philip IV the Fair of France, thus bringing to the French crown her rights to Navarre and the countships of Champagne and Brie. On her death in childbirth in 1305 these rights were transmitted to her son, the future Louis X. Joan was a woman of great intelligence and vivacity, a lover of arts and letters who founded the famous college of Navarre.

Spain: Aragon/Castile

• **Joan,** byname JOAN THE MAD, Spanish JUANA LA LOCA (b. Nov. 6, 1479, Toledo, Castile [Spain]—d. April 11, 1555, Tordesillas, Spain), queen of Castile (from 1504) and of Aragon (from 1516), though power was exercised for her by her husband, Philip I, her father, Ferdinand II, and her son, the emperor Charles V (Charles I of Spain).

Joan was the third child of Ferdinand II of Aragon and Isabella I of Castile and became heiress in 1500 on the death of her brother and elder sister. She had married Philip of Burgundy, son of the emperor Maximilian, as

Joan the Mad, detail of a portrait

By courtesy of the Biblioteca Nacional, Madrid

part of Ferdinand's policy of securing allies against France. They had two sons, Charles, born in 1500, who succeeded as emperor and king of Spain, and Ferdinand, his lieutenant and successor as emperor, and four daughters, all of whom became queens—Eleanor, who married Manuel I of Portugal and then Francis

l of France; Isabella, who married Christian II of Denmark; Maria, who married Louis II of Hungary; and Catherine, who married John III of Portugal.

Her mental imbalance showed itself in 1502 in the form of extravagant, though justified, jealousy of the unfaithful Philip. On the death of her mother she returned with Philip to Castile and there claimed the regency against her father, who retired to Aragon. The shock of Philip's sudden death (Sept. 25, 1506) intensified her melancholia, and she refused to be parted from his embalmed body. Her father, Ferdinand, returned to take over the regency, and from 1509 she lived under guard at Tordesillas. On Ferdinand's death, her son Charles arrived from the Low Countries and ascertained her unfitness to rule, before taking power. She was legally queen of Spain throughout almost all of his long reign.

Joan, POPE, legendary female pontiff who supposedly reigned, under the title of John VIII, for slightly more than 25 months, from 855 to 858, between the pontificates of Leo IV (847–855) and Benedict III (855–858). It has subsequently been proved that a gap of only a few weeks fell between Leo and Benedict and that the story is entirely apocryphal.

One of the earliest extant sources for the Joan legend is the *De septem donis Spiritu Sancti* ("The Seven Gifts of the Holy Spirit") by the 13th-century French Dominican Stephen of Bourbon, who dated Joan's election *c.* 1100. In this account the nameless pontiff was a clever scribe who became a papal notary and later was elected pope; pregnant at the time of her election, she gave birth during the procession to the Lateran, whereupon she was dragged out of Rome and stoned to death.

The story was widely spread during the later 13th century, mostly by friars and primarily by means of interpolations made in many manuscripts of the *Chronicon pontificum et imperatorum* ("The Chronicle of the Popes and Emperors") by the 13th-century Polish Dominican Martin of Troppau. Support for the version that she died in childbirth and was buried on the spot was derived from the fact that in later years papal processions used to avoid a particular street, allegedly where the disgraceful event had occurred. The name Joan was not finally adopted until the 14th century; other names commonly given were Agnes or Gilberta.

According to later legend, particularly by Martin (who dated her election in 855 and who specifically named her Johannes Angelicus), Joan was an Englishwoman; but her birthplace was given as the German city of Mainz—an apparent inconsistency that some writers reconciled by explaining that her parents migrated to that city. She supposedly fell in love with an English Benedictine monk and, dressing as a man, accompanied him to Athens. Having acquired great learning, she moved to Rome, where she became cardinal and pope. From the 13th century the story appears in literature, including the works of the Benedictine chronicler Ranulf Higden and the Italian humanists Giovanni Boccaccio and Petrarch.

In the 15th century, Joan's existence was regarded as fact, even by the Council of Constance in 1415. During the 16th and 17th centuries the story was used for Protestant polemics. Such scholars as Aeneas Silvius Piccolomini (afterward Pope Pius II) and Cardinal Caesar Baronius regarded the story as unfounded; but it was the Calvinist David Blondel who made the first determined attempt to destroy the myth in his *Éclaircissement familier de la question: Si une femme a été assise au siège papal de Rome* (1647; "Familiar Enlightenment of the Question: Whether a Woman Had Been Seated on the Papal Throne in Rome"). According to one theory, the fable grew from widespread gossip concerning the influence wielded by the 10th-century Roman woman senator Marozia and her mother Theodora of the powerful house of Theophylact.

Joan OF ARC, SAINT, byname THE MAID OF ORLÉANS, French SAINTE JEANNE D'ARC, OR LA PUCELLE D'ORLÉANS (b. *c.* 1412, Domrémy, Bar, Fr.—d. May 30, 1431, Rouen; canonized May 16, 1920; feast day May 30; French national holiday, second Sunday in May), national heroine of France, a peasant girl who, acting as she believed under divine inspiration, led the French to a momentous victory that was a turning point in the Hundred Years' War.

A brief account of the life and works of Saint Joan of Arc follows; for a full biography, *see* MACROPAEDIA: Joan of Arc.

Joan, the daughter of a tenant farmer, led French armies—at the insistence of the "voices" of St. Michael, St. Catherine, and St. Margaret—to victory over the English at Orléans (1429) and opened the way for the coronation of King Charles VII of France at Reims. She was captured and imprisoned in 1430, condemned as a heretic by an English-dominated church court in 1431, and burned at the stake. Officially rehabilitated later in the same century, she was declared a saint by Pope Benedict XV in 1920.

Joan's achievement was to revive the courage of the French army, to encourage popular faith in the Valois dynasty, and to bring about a reconciliation between Charles VII and Philip III, duke of Burgundy (1435), thus providing the practical basis for a French recovery. Beyond this, the story of Joan will probably always be a source of controversy. Facts about her campaigns and about the motives and actions of her supporters and enemies are subject to dispute. Assessments of Joan's character and mission range from inspired saint to deluded hysteric. In any event, Joan held fast to her beliefs throughout her career and, except for a few days near the end, never swerved from her goals. She became a symbol of French national consciousness.

Joan OF NAVARRE, French JEANNE DE NAVARRE (b. *c.* 1370—d. July 9, 1437, Haverigate Bowe, Essex, Eng.), the wife of Henry IV of England and the daughter of Charles the Bad, king of Navarre.

In 1386 Joan was married to John IV (or V), duke of Brittany; they had eight children. John died in 1399, and Joan was regent for her son John V (or VI) until 1401. Early in 1402 a marriage was arranged between Joan and Henry IV of England, and the ceremony took place by proxy on April 3, 1402. Because Brittany was not on good terms with England, the Bretons did not favour the match, so that when Joan embarked for England she left her older children with the duke of Burgundy. Her coronation took place on Feb. 26, 1403, at Westminster. She had no children by this marriage. After Henry IV died in March 1413, Joan maintained good relations with her stepson, Henry V. After a few years, however, her situation became awkward because Brittany, ruled by Joan's son, John V (or VI), was still hostile to England. In 1419 she was accused of witchcraft and, though the whole matter was vague, was imprisoned. Joan's life was uneventful after her release in 1422.

João Pessoa, port city and capital, Paraíba *estado* ("state"), northeastern Brazil. It is situated at 148 feet (45 m) above sea level, on the right bank of the Paraíba do Norte River, 11 miles (18 km) above its mouth and north of Recife.

Founded in 1585, the city for many years was known successively as Filipea de Nossa Senhora das Neves, Frederikstad, and Paraíba. In 1930 the name was officially changed to

Cloister of the Franciscan church, João Pessoa, Braz.
Epaminondas Carneiro Lima—EB Inc.

honour João Pessoa, the state president who was killed in the revolution led by Getulio Vargas. Colonial buildings include the Church of Nossa Senhora das Neves ("Our Lady of the Snows") and the 18th-century São Francisco Church. The Cape Branco lighthouse at Point Seixas is the most easterly point in Brazil. João Pessoa is the seat of Paraíba University (1955). The city manufactures electrical products, chemicals, metals, plastics, and seaweed products. Pop. (1985 est.) mun., 396,197.

Job, SAINT, Russian SVYATOY IOV (d. June 19 [June 29, New Style], 1607, Staritsa, Russia; canonized Oct. 9, 1989), first Russian Orthodox patriarch of Moscow (1589–1605).

Until Job's election, the head of the Russian church had held the title metropolitan of Moscow and was, at least nominally, subordinate to the patriarch of Constantinople. Moscow, however, was eager to have its own patriarch, and it took advantage of the pecuniary needs of the patriarchs of Antioch and Constantinople to suggest that, in exchange for giving them financial support, Moscow be given a patriarch. At that time, the Orthodox church had only four patriarchs—those of Constantinople, Antioch, Alexandria, and Jerusalem—instead of the traditional five. Moscow hoped to fill the role of primary patriarch, which, in the Orthodox view, had belonged to Rome before the East-West Schism of 1054.

Patriarch Jeremiah of Constantinople ultimately agreed to Moscow's suggestion and in 1589 elevated Job, who was then metropolitan of Moscow, to the position of patriarch of all Russia. In 1593 the patriarchs of Antioch, Alexandria, and Jerusalem confirmed Job's appointment but placed Moscow fifth in the hierarchy of patriarchates.

Job's elevation had both religious and political ramifications. Because Job no longer had

to guard Moscow's primacy within Russia, he was able to raise the bishops of Novgorod and Rostov to the position of metropolitan. On the other hand, when Tsar Fyodor died in 1598, the Russian people turned to Patriarch Job to secure a new tsar, and he chose Boris Godunov, whose reign marked the beginning of the Time of Troubles in Russia. In 1605 Job was removed from his office by boyars who opposed the Godunovs. He was sent to Uspensky Monastery in Staritsa, where he died two years later.

Consult the INDEX *first*

Job, The Book of, an Old Testament book that is often counted among the masterpieces of world literature. It is found in the third section of the biblical canon known as the Ketuvim, or Writings. The book's theme is the eternal problem of unmerited suffering, and it is named after its central character, Job, who attempts to understand the sufferings that engulf him.

The Book of Job may be divided into two sections of prose narrative, consisting of a prologue (Chapters 1–2) and epilogue (Chapter 42:7–17); and intervening poetic disputation (Chapters 3–42:6). The prose narratives date to before the 6th century BC, and the poetry has been dated between the 4th and the 6th century BC. Chapters 28 and 32–37 were probably later additions.

The Book of Job's artful construction accounts for much of its impact. The poetic disputations are set within the prose framework of an ancient legend that originated outside Israel. This legend concerns Job, a prosperous man of outstanding piety. Satan acts as an agent provocateur to test whether or not Job's piety is rooted merely in his prosperity. But faced with the appalling loss of his possessions, his children, and finally his own health, Job still refuses to curse God. Three of his friends then arrive to comfort him, and at this point the poetic dialogue begins. The poetic discourses consist of three cycles of speeches, in each of which Job disputes with his three friends and converses with God. All these discourses probe the meaning of Job's sufferings—the reason for them and the manner in which Job should respond. In the three cycles, Job proclaims his innocence and the injustice of his suffering, while his friends argue that Job is so afflicted because of personal sin. Job, convinced of his faithfulness and uprightness, is not satisfied with this explanation. The conversation between Job and God resolves the dramatic tension without, however, solving the problem of undeserved suffering. The speeches evoke Job's trust in the purposeful activity of God in the affairs of the world, even though God's ways with man remain mysterious and inscrutable.

job training: *see* employee training.

Jobs, Steve, in full STEVEN PAUL JOBS (b. Feb. 24, 1955, California, U.S.), cofounder of Apple Computer, Inc., and a charismatic pioneer of the personal computer era.

Jobs was raised by adoptive parents in Cupertino, Calif., located in what is now known as Silicon Valley. In 1974 Jobs reconnected with Stephen Wozniak, a former high school friend, who told him of his design for an inexpensive computer logic board. Together the two incorporated Apple Computer in 1977. Their first complete computer, the Apple II, was an immediate success, becoming synonymous with the boom in personal computers. In 1981 the company had a record-setting public stock offering and, in 1983, made the quickest entrance (to that time) into the *Fortune* 500 list of America's top companies. In 1983 John Sculley was recruited as chief executive officer.

Soon after a 1979 technology demonstration at the Xerox Corporation's Palo Alto (Calif.) Research Center, Jobs personally led a small group within Apple to build a low-cost computer with a graphical user interface. The Macintosh, or Mac, as the machine became known, was introduced in January 1984 in an extraordinary publicity campaign. However, the first Macs were underpowered and expensive, and they had few software applications—all of which resulted in disappointing sales. In 1985 Sculley convinced Apple's board of directors to remove the company's famous cofounder.

Jobs quickly started another firm, the NeXT Corporation, designing workstation computers for the education market. In 1986 Jobs bought Pixar Animation Studios, eventually building it into a major producer of full-length animated films, including *Toy Story* (1995), the first feature film to be completely computer animated. In late 1996, Apple, saddled by huge financial losses, bought NeXT and brought Jobs back as a consultant. By 1997 Apple's prodigal cofounder was once again at the helm. He quickly forged an alliance with Apple's erstwhile foe, the Microsoft Corporation, scrapped Apple's clone agreements, and simplified the company's product line. He also engineered an award-winning advertising campaign that urged potential customers to "think different" and buy Macs. By the end of the year, Jobs was able to announce consistent profits for the once-moribund company. Though Apple did not regain the industry dominance it once had, Steve Jobs had reestablished himself as a master high-technology marketer and visionary.

Job's tears (species *Coix lacryma-jobi*), leafy, jointed-stemmed annual grass of the family Poaceae, native to tropical Asia and naturalized in North America. It is 1 to 3 m (3 to nearly 10 feet) tall. Job's tears receives its name from the hard, shiny, tear-shaped beads that enclose the seed kernels. They are off-white or dark in colour and are 6 to 12 mm (0.25 to 0.5 inch) long. They are sometimes used for jewelry and rosaries. Job's tears is native to the Indian subcontinent but is now widespread throughout the tropical zone. It grows in marshy places and is cultivated in China, the seed kernel having a supposed medicinal value. The seed kernel is also edible,

Job's tears (*Coix lacryma-jobi*)
W.H. Hodge

and forms of it are used as cereal foods in parts of East Asia and in the Philippines.

Jöchi, also spelled JUCHI (d. February 1227), Mongol prince, the eldest of Genghis Khan's four sons and, until the final years of his life, a participant in his father's military campaigns.

Jöchi, like his brothers, received his own *ulus* (vassal kingdom to command), a *yurt* (a domain for his *ulus*), and an *inju* (personal domains to support his court). His lands were in the western part of the Mongol empire. For reasons that are not entirely clear, an antagonism apparently developed after 1221 between Jöchi and his father. From 1222 until his death, five years later, Jöchi did not participate in Genghis Khan's battles, though he did participate in the attack on the Volga Bulgars in 1223. Genghis Khan may have thought that his son was plotting his death, but Jöchi died before he could take any action. Genghis Khan died six months later, and Jöchi's lands were divided among his sons. His eldest son, Orda, founded the White Horde, his second son, Batu, the Golden Horde.

Jōchō (d. 1057, Japan), great Japanese Buddhist sculptor who developed and perfected so-called *kiyosebō*, or joined-wood techniques.

The son (or pupil) of a famous sculptor, Kōshō, Jōchō chiefly worked for Fujiwara Michinaga, de facto ruler of Japan at that time, and his clan. In 1022 he was awarded the Buddhist title of *hokkyō*, an unprecedented honour for a Buddhist sculptor, for various sculptures he had contributed to the Hōjō Temple in Kyōto. Later he was rewarded by an even more exalted title for sculptures made for the Fujiwaras' family temple, Kōfuku Temple, in Nara. He was also instrumental in improving the social position of Buddhist sculptors by organizing a guild, which came to be called "Bussho," or the Buddhist sculpture studio. The Amida (Amitabha) of the Hōō-dō (Phoenix Hall), of the Byōdō Temple at Uji, near Kyōto, is his only extant work. Carved in 1053, it embodies tranquillity and gracefulness, effects achieved by Jōchō's brilliant use of the joined-wood technique.

Jochumsson, Matthías (b. Nov. 11, 1835, Skógar, Thorskafjördur, Ice.—d. Dec. 18, 1920, Akureyri), Icelandic poet, translator, journalist, and dramatist.

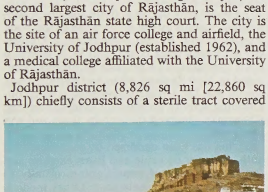
Through his religious poetry, his hymns and funeral elegies, and in his heroic narrative poems, Jochumsson preached Christian faith and humanity alongside the pagan virtues of the Saga Age. His unaffected assumption of greatness alienated some Icelandic contemporaries, but he was loved and admired by Scandinavian writers. His intellectual integrity and rich humanity finally established him as a national figure.

Jockey Club, supreme authority in control of horse racing and breeding in Great Britain, formed about 1750 to regulate racing at Newmarket, Suffolk, and support the sport generally. Its Turf Board, consisting of nine Jockey Club stewards, coordinates long-term policy as opposed to day-to-day operation. Overall control of the sport is in the hands of the Joint Racing Board, composed of members of the Jockey Club and members of the Horserace Betting Levy Board appointed by the government. The club also publishes the *Racing Calendar* and *General Stud Book.* Headquarters are at Newmarket.

Other countries have established similar organizations—*e.g.,* the American Jockey Club (founded 1893).

Jodelle, Étienne (b. 1532, Paris, France—d. July 1573, Paris), French dramatist and poet, one of the seven members of the literary circle known as La Pléiade, who applied the aesthetic principles of the group to drama.

Jodelle aimed at creating a classical drama



that in every respect would be different from the moralities and mysteries then occupying the French stage; he succeeded in producing the first modern French tragedy and comedy. These plays have the reputation of being unactable and unreadable, but they set a new example that prepared the ground for the great Neoclassical tragedians Corneille and Racine. His first play, *Cléopâtre captive*, a tragedy in verse, was presented before the court at Paris in 1553. The cast included his friends Rémy Belleau and Jean de La Péruse. Jodelle wrote two other plays, *Eugène* (1552), a comedy, and *Didon se sacrifiant*, another verse tragedy, based on Virgil's account of Dido.

In the prologue to *Eugène* Jodelle explained his theory of comedy. It must deal with people of low or middle class because, he argued, among them can be found the erudity and ignorance that are the stuff of comedy. Tragedy, on the other hand, must have as its characters kings or other nobility, like the audiences for which it is written, because the populace would not understand the classical allusions of tragedy.

Jodhpur, city, administrative headquarters of Jodhpur district, Rājasthān state, northwestern India. It was founded in 1459 by Rāo Jodha, a Rājput (one of the warrior rulers of the historic region of Rājputāna), and served as the capital of the former princely state of Jodhpur. Parts of the city are surrounded by an 18th-century wall. The fort, which contains the palace and a historical museum, is built on an isolated rock eminence that dominates the city. The 4th-century ruins of Mandor, the ancient capital of Mārwār, lie immediately to the north.

A major road and rail junction, the city is a trade centre for agricultural crops, wool, cattle, salt, and hides. It has engineering and railway workshops and manufactures cotton textiles, brass and iron utensils, bicycles, ink, and polo equipment. Jodhpur is famous for its handicraft products, which include ivory goods, glass bangles, cutlery, dyed cloth, lacquerwork, felt and leather products, marble stonework, and carpet weaving. Jodhpur, the second largest city of Rājasthān, is the seat of the Rājasthān state high court. The city is the site of an air force college and airfield, the University of Jodhpur (established 1962), and a medical college affiliated with the University of Rājasthān.

Jodhpur district (8,826 sq mi [22,860 sq km]) chiefly consists of a sterile tract covered

The fort overlooking Jodhpur, Rājasthān, India
Kaypox—Shostal

with high sand hills, sometimes referred to as Mārwār ("region of death"). Its north and northwest areas form part of the Great Indian (Thar) Desert. The Lūni, the only river in the district, irrigates the southern region. Bajra (pearl millet), pulses, jowar (sorghum), oilseeds, mung (the edible seeds of an Asian bean), and corn (maize) are the chief crops; some cotton and wheat are produced. Lignite, iron-ore, tungsten, garnet, glass-sand, and gypsum deposits are worked. The district has several poultry farms, and sheep, cattle, and camels are bred there.

Jodhpur, the largest princely state in the former Rājputāna Agency, consisted of the present district of Jodhpur as well as Nāgaur, Pāli, Jālor, and Barmer districts. It was founded *c.* 1212, reached the zenith of its power under the ruler Rāo Maldeo (1532–69), and gave allegiance to the Mughals after the invasion of the Mughal emperor Akbar in 1561. The Mughal emperor Aurangzeb invaded and plundered Mārwār in 1679, ordering the conversion of its inhabitants to Islām. The princely states of Jodhpur, Jaipur, and Udaipur formed an alliance, however, and prevented control by the Muslims. The Jodhpur and Jaipur princes then regained the privilege of marriage with the Udaipur family (which they had forfeited on allying with the Mughals) on condition that children of Udaipur princesses be first in succession. Quarrels resulting from this stipulation, however, finally led to the establishment of the supremacy of the Marāṭhās, a Hindu warrior caste. In 1818 Jodhpur came under British paramountcy. It joined the state of Rājasthān in 1949. Pop. (1991 prelim.) city, 648,621; district, 2,127,552.

Jodl, Alfred (b. May 10, 1890, Würzburg, Ger.—d. Oct. 16, 1946, Nürnberg), German general who, as head of the armed forces operations staff, helped plan and conduct most of

Jodl
Ullstein, Berlin

Germany's military campaigns during World War II.

Primarily a staff officer during and after World War I, Jodl served as head of the department of national defense in the War Ministry from 1935. A competent staff officer and Adolf Hitler's faithful servant to the end, he was named chief of the armed forces operations staff on Aug. 23, 1939, and, with Wilhelm Keitel, became a key figure in Hitler's central military command, directing all of Germany's campaigns except the beginning of the Russian invasion in the second half of 1941. On May 7, 1945, he signed the capitulation of the German armed forces to the Western Allies at Reims, Fr. As chief of operations staff he had signed many orders for the shooting of hostages and for other acts contrary to international law. He was executed after trial and conviction for war crimes by the International Military Tribunal at Nürnberg.

Jōdo (Japanese: Way to the Pure Land), devotional sect of Japanese Buddhism stressing faith in the Buddha Amida and heavenly reward. *See* Pure Land Buddhism.

Jodocks (German king): *see* Jobst.

Jodrell Bank Experimental Station, also called NUFFIELD RADIO ASTRONOMY LABORATORIES, location of one of the world's largest fully steerable radio telescopes, which has a reflector that measures 76 metres (250 feet) in diameter. The telescope is located with other smaller radio telescopes at Jodrellbank (formerly Jodrell Bank), about 32 kilometres (20 miles) south of Manchester in the county of Cheshire, Eng. Immediately after World War II the British astronomer Alfred Charles Bernard Lovell, working at the University of Manchester's botanical site at Jodrell Bank with war-surplus radar equipment, began research in radio and radar astronomy. Construction of the telescope began in 1952. Operation began shortly before the launching, on Oct. 4, 1957, by the Soviet Union of the first artificial Earth satellite (Sputnik I); and the satellite's carrier rocket was tracked at Jodrell Bank by radar. Most of the operational time at Jodrell Bank is devoted to astronomy rather than to tracking and communication, but the telescope has been part of the tracking network for the United States program of space exploration and monitored most of the Soviet accomplishments. The Jodrell Bank telescope transmitted the first photographs from the surface of the Moon, received Feb. 6, 1966, by the Soviet Luna 9 probe.

Jōei Shikimoku (1232), in Japanese history, administrative code of the Kamakura shogunate (central military government) by which it pledged just and impartial administration of law to its vassal subjects. The *shikimoku,* or formulary (called Jōei because of its promulgation during the year so named), was a collection of rules for the guidance of the shogun's courts; it dealt with religious matters, land disputes, and criminal offenses. Moderate and conciliatory, especially in its leniency to former enemies of the shogunate and in its acknowledgement of the separate administrative system headed by the emperor, it generally applied to the upper classes only.

Joel, Book of, second of 12 Old Testament books that bear the names of the Minor Prophets. The Jewish canon lumps all together as The Twelve and divides Joel into four chapters; Christian versions combine chapters 2 and 3.

The book relates nothing about Joel except his name and that of his father. An analysis of the text further indicates that Joel lived during the period of the Second Temple of Jerusalem (516 BC–AD 70), for his book reflects the liturgy then in use.

The book's central theme is a concept borrowed from preexilic prophets that salvation will come to Judah and Jerusalem only when the people turn to Yahweh. Then they will not only receive divine favour, but the land itself will become fertile.

Joenckema, Rembert van (Flemish scientist): *see* Dodoens, Rembert.

Joensuu, city, capital of Pohjois-Karjalan *lääni* (province), southeastern Finland, at the mouth of the Pielisjoki (river), southeast of Kuopio. Chartered in 1848, the city is a rail junction and centre for lumber shipment and has connections by steamship, highway, and air. Local industry includes plywood and lumber mills. Notable landmarks include the town hall (1914), designed by the 20th-century architect Eliel Saarinen, the Pielisjoki Castle, the Museum of North Karelia, a Greek Orthodox church (1887), and a monument in honour of Olli Tiainen, a peasant leader who led guerrilla fighters to victory over the Russians in 1808. Pop. (1991 est.) 47,405.

Joffre, Joseph-Jacques-Césaire (b. Jan. 12, 1852, Rivesaltes, Fr.—d. Jan. 3, 1931, Paris), commander in chief (1914–16) of the French armies on the Western Front in World War I, who won fame as "the Victor of the Marne."

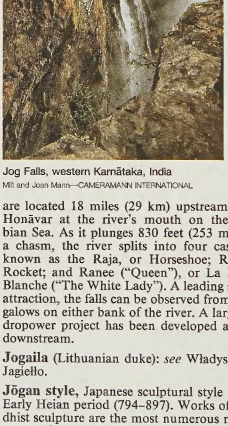
After graduating from the École Polytechnique, he took part as a subaltern in the siege of Paris (1870–71) and later served in Indochina, West Africa, and Madagascar. Promoted to general of division in 1905, he was appointed chief of the French general staff in 1911 and thereby commander in chief in the event of war. Joffre was responsible for the French Army's calamitous plan of campaign with which it began operations in 1914 against

Germany, calling for mass attacks across the Franco-German frontier. The plan's futility became apparent when a massive German

Joffre, detail of a portrait by H. Jacquier, 1915
H. Roger-Viollet

encircling movement through Belgium caught Joffre and the rest of the French high command unawares and threatened to outflank the Allied forces and capture Paris. Once convinced of the developing German threat on the French left flank, Joffre shifted his forces and created a new French army, the 6th, under his direct authority, to counter the threat of German envelopment. In this moment of supreme trial his best qualities came to the fore; his imperturbability, force of character, and courage saved the situation. Constantly threatened by greatly superior German forces wheeling in a great northern arc on Paris, the French retreated steadily until their left flank was fighting just outside the city by September 5. Joffre then issued the order that on September 6 launched the Allied counterstroke, the first of the battles of the Marne. The encounter resulted in the partial repulse of the German advance and the ruin of German hopes for a swift victory on the Western Front.

By the end of 1914 the Western Front had settled into the heavily entrenched lines that existed until 1918. Throughout 1915 the French armies under Joffre attempted to burst through the German positions at ruinous cost, and failed. Joffre's prestige began to wane, and the evident lack of French preparation for the German attack on Verdun in 1916, for which he was held responsible, prepared his downfall. After being stripped of the power of direct command, Joffre resigned on Dec. 26, 1916, and the same day was created a marshal of France. His *Mémoires,* in two volumes, were published in 1932.



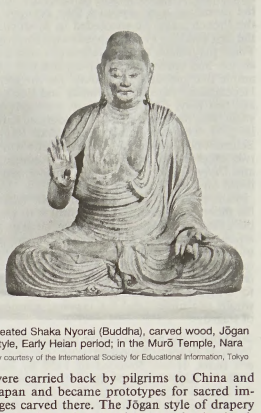
Joffrey, Robert, original name ABDULLAH JAFFA BEY KHAN (b. Dec. 24, 1930, Seattle, Wash., U.S.—d. March 25, 1988, New York, N.Y.), American dancer, choreographer, and director, founder of the Joffrey Ballet (1956).

Joffrey's father was an immigrant from Afghanistan, and his mother was Italian-born. He began studying tap dancing but soon turned to ballet with Mary Ann Wells, at whose school in Seattle he met Gerald Arpino, who would one day became his company's codirector. After moving to New York City in 1948 and studying with Alexandra Fedorova and at the School of American Ballet, Joffrey joined Roland Petit's Ballets de Paris during the company's 1949 season in New York City. In 1953 Joffrey opened a school, the American Ballet Center, and by then had already created his first major ballet, *Persephone* (1952).

Joffrey formed his first small company, the Robert Joffrey Ballet Concert, in 1954, and in 1956 he formed the Robert Joffrey Ballet with Arpino as chief choreographer. In 1966 the company became the City Center Joffrey Ballet and thereafter grew to international fame. Its name was later changed to simply the Joffrey Ballet. By the time of Joffrey's death his company was performing annually in Los Angeles as well as in New York City. In 1995 Arpino moved the company to Chicago and renamed it the Joffrey Ballet of Chicago.

Joffrey's works of note include *Pas des Déesses* (1954), *Gamelan* (1962), *Astarte* (1967), *Remembrances* (1973), and *Postcards* (1980). Joffrey commissioned many new ballets from new or untried choreographers. His company was noted for its eclectic repertoire that drew upon the classics, new works, and fusions of modern dance and ballet. Joffrey was also noted for his choreographic work on operatic productions.

Jog Falls, also called GERSOPPA FALLS, cataract of the Sharavati River, western Karnātaka state, southwestern India. The Jog Falls



Jog Falls, western Karnātaka, India
Mill and Joan Mann—CAMERAMANN INTERNATIONAL

are located 18 miles (29 km) upstream from Honāvar at the river's mouth on the Arabian Sea. As it plunges 830 feet (253 m) into a chasm, the river splits into four cascades known as the Raja, or Horseshoe; Roarer; Rocket; and Ranee ("Queen"), or La Dame Blanche ("The White Lady"). A leading scenic attraction, the falls can be observed from bungalows on either bank of the river. A large hydropower project has been developed at Jog, downstream.

Jogaila (Lithuanian duke): *see* Władysław II Jagiełło.

Jōgan style, Japanese sculptural style of the Early Heian period (794–897). Works of Buddhist sculpture are the most numerous monuments of the period. The figures are columnar icons, erect, symmetrical, and perfectly balanced, carved from single blocks of wood and displaying a keen sense of material, with no attempt to smooth over cuts of the knife. The massive bodies are corpulent and heavy, with almost flabby chests, large round faces, large lips, wide noses, and wide eyes. These parts are simplified to an almost geometric formula. Size and simple contours give the sculpture a forbidding monumentality.

The drapery, known as *hompa* ("wave"), is one of the most distinguishing features of the Jōgan style. The folds are cut deeply in a simple measured rhythm, a technique that is suggestive of the string drapery of the colossal image of the Buddha at Bāmiān, Afghanistan, a focal figure for all pilgrims traveling the Central Asian pilgrimage routes to Bāmiān and India. Holy images done in this style

Seated Shaka Nyorai (Buddha), carved wood, Jōgan style, Early Heian period; in the Murō Temple, Nara
By courtesy of the International Society for Educational Information, Tokyo

were carried back by pilgrims to China and Japan and became prototypes for sacred images carved there. The Jōgan style of drapery is actually an intermediate stage in the development of this mannerism. Alternating series of small and large waves compose the folds of the drapery.

The sculpture of this period is not confined to Buddhism. Shintō deities also were produced but in a simpler, blocklike, and more massive manner.

jogging, form of running at an easy pace, particularly popular from the 1960s in the United States. There, an estimated 7,000,000 to 10,000,000 joggers sought fitness, weight loss, grace, physical fulfillment, and relief from stress by jogging. Joggers expend from 10 to 13 calories per minute in this exercise (compared with approximately 7 to 9 calories per minute for tennis).

The popularity of this activity was given substantial impetus by the publication of the book *Jogging* (1967) by Bill Bowerman, a University of Oregon track coach, and W.E. Harris, a heart specialist. The practice of jogging originated in New Zealand when an Olympic track coach, one Dr. Lydiard, suggested it as a conditioning activity for retired Olympic runners; Bowerman observed the activity there and was impressed.

Jogging has been endorsed by many medical authorities for its value as a heart exercise and for general physical conditioning, usually to be practiced on alternate days. Other medical authorities, however, warn that fallen arches, shin splints, sweat miliaria, strained Achilles tendons, bruised heels, and knee and back ailments can result from jogging—usually done on hard surfaces with the feet striking the ground from 600 to 750 times per mile. Warm-up exercises before jogging, properly designed shoes, loose clothing, proper jogging technique, and general good health—as well as sensible objectives—are necessary for safe pursuit of the activity. The U.S. National Jogging Association was formed in 1968 to promote the pastime.

Jogjakarta (Indonesia): *see* Yogyakarta.

Jogues, Saint Isaac (b. Jan. 10, 1607, Orléans, France—d. Oct. 18, 1646, Ossernenon, near Fort Orange, New Netherland [now Auriesville, N.Y., U.S.]; canonized 1930; feast day October 19), French-born Jesuit missionary who sacrificed his life for the Christianization of North American Indians.

Jogues entered (1624) the Society of Jesus at Rouen, France, was ordained in 1636, and was assigned to Canada. For six years in the

Huron lands near Georgian Bay he instructed and aided the Indians. In 1641 he began the Jesuit missions to the Ojibwa tribe at Sault-Ste-Marie. The following year warring Iroquois captured him, his companion René Goupil, and a Huron band near Montreal and brought them to Ossernenon, where Goupil was slain. Jogues was enslaved for 13 months. Aided by the Dutch of nearby Fort Orange (Albany), he escaped down the Hudson River, becoming the first priest to visit New Amsterdam (now New York City). On Christmas of 1643 he reached France, where he had been presumed dead. In 1645–46 he was sent by the government to Ossernenon to establish peace between the French and the Mohawk Indians. But when he arrived at Ossernenon the Mohawks accused him of witchcraft, murdered him, and placed his head on a pole for public display.

Johan (Dutch, Norwegian, Swedish, etc., personal name): *see under* John.

Johanan ben Zakkai (fl. 1st century AD), Palestinian Jewish sage, founder of an academy and an authoritative rabbinic body at Jamnia, who had a decisive influence on the continuance and development of traditional Judaism after the destruction of the Temple (AD 70).

As is the case with all the Talmudic teachers (the rabbis who interpreted and applied the Oral Law), little strictly biographical information about Johanan ben Zakkai has been preserved: Talmudic and Midrashic sources (commentative and interpretative writings) are principally devoted to the teachings of the sages and of what they came to represent. Thus, what can be reported essentially about Johanan is this: even before AD 70 he acted as a leading representative of the Pharisees in debate with priestly and Sadducean authorities. (The Pharisees stressed rigorous observance of the Law, inclusion of the oral tradition as normative, and an interpretative adaptation of traditional precepts to new situations; the Sadducees, an elitist conservative group, accepted only the Written Law as authoritative and were more literalist and static in their interpretation.) Johanan's school was apparently famous, and one in search of learning would go to extremes, if need be, to be admitted there. Furthermore, Johanan was opposed to the policy of those who were determined on war with Rome at all costs. By quitting beleaguered Jerusalem according to most accounts in 70 (though it is possible that he left as early as 68) and being brought to the Roman camp, he somehow succeeded in getting permission to set up an academy in Jamnia (Jabneh), near the Judaean coast, and there he was joined by a number of his favourite disciples. Two of them, Eliezer ben Hyrcanus and Joshua ben Hananiah, who are credited with having smuggled their master out of Jerusalem in a coffin, were to become, by the end of the century and the beginning of the following one, the leading teachers of their generation and had a profound influence on the greatest scholars of the next generation.

It is therefore hardly excessive to say that Johanan's teachings are to be traced not merely to the relatively few statements specifically attributed to him but to many views that become articulate during the 2nd century: for example, that acts of loving kindness atone no less effectively than the former Temple sacrificial ritual and are indeed at the core of the universe since its creation; that the study of Torah (the divine instruction or Law) is a central purpose of man and a paramount form of serving God; that a number of ceremonies and regulations once confined to the Temple were to be adopted even outside the Temple complex "to serve as memorials of the Sanctuary"; at the same time, despite the unique sanctity of Jerusalem, basic decisions regarding practice and instruction were now to be permitted to the authorized scholars wherever circumstances compelled them to sit in session. Such views, truly radical in origin, became normative rabbinical teaching and permanent components of Judaism.

Thus, it may be said that, by establishing in Jamnia a major academy and authoritative rabbinic body, Johanan fixed the conditions for continuing Judaism's basic traditions after the destruction of the Temple; and that, by his lively sense of the need for reinterpreting inherited concepts in new circumstances, he laid the foundations on which Talmudic and rabbinic Judaism built their structure.

The chief preoccupation of Johanan and his students was the study and continuing development of the Law (Halakha). He and they also engaged in the study of nonlegal subjects (Aggada), especially in connection with biblical exegesis (Midrash), explanation and interpretation of the biblical contents. In addition, he was interested in esoteric themes related to the subject of creation and the visions of the Merkava (the divine chariot of Ezekiel 1), discourses on which were even delivered by some of his disciples. And, at least before the destruction of the Temple, if not thereafter as well, he seems to have held occasional sessions when certain ethical-philosophical questions, typical of Hellenistic-Roman popular philosophical discussion, were raised and explored. His homiletic interpretations of scripture often unite the symbolic with the rationalistic in a remarkable way. Why were not hewn stones permitted in the building of the altar? Because iron is for weapons of destruction, and the altar of God is intended to bring peace, he answers. Why is the ear of one who prefers servitude to have a hole bored in it? Because we are God's servants, and man heard at Sinai with his own ears. Let the unlistening ear be bored. Such are typical comments by Johanan. Although he had discouraged what must have seemed to him unwarranted messianic proclamations, a saying attributed to him in his last illness suggests that messianic speculation was not alien to him.

Of all the Palestinian Jewish sages of the 1st century AD, none apparently proved so fundamentally influential in his own time and for subsequent generations of scholars and spiritual leaders as Johanan ben Zakkai. In the history of Talmudic literature and thought, Johanan is rightly seen as continuing the Hillelite tradition, although this should not be interpreted to mean that he inherited only Hillel's teachings. (J.Gol.)

Johannes VON TEPL, also called JOHANNES VON SAAZ (b. *c.* 1350, Tepl or Schüttwa, Bohemia [now in Czech Republic]—d. *c.* 1415, Prague), Bohemian author of the remarkable dialogue *Der Ackermann aus Böhmen* (*c.* 1400; *Death and the Ploughman*), the first important prose work in the German language.

After taking a degree at Prague University, he was appointed, probably before 1378, a notary in Saaz (Žatec), and he became headmaster of the grammar school there in 1383. In 1411 he became a notary of Prague New Town, where he remained until his death.

In the *Ackermann*—which, though described in a Latin dedication as an exercise in rhetoric, probably arose from the death of the author's first wife in 1400—a plowman, representing Man, bitterly accuses Death of unjust dealings toward humanity. Death's counterarguments reconcile the plowman to the necessity of Death's activities, though the plowman still champions human nobility against Death's more negative view. God, the judge, awards Death the victory but Man the honour. Its complex structure, vigorous rhythmical prose, and expression of human grief make this work—despite the uncertain state of the text—unique in medieval German literature. Widely regarded as essentially medieval in thought and even in technique, it contains elements of Renaissance literature and humanist thought.

Jóhannes Jónasson (Icelandic poet): *see* Jónasson, Jóhannes Bjarni.

Johannesburg, city, Gauteng province, South Africa. Founded in 1886 after the discovery of gold, Johannesburg was for nearly a century the centre of South Africa's gold-mining industry. It is now the country's chief industrial and financial metropolis. The Greater Johannesburg area forms the largest urban complex in the country and one of the largest on the African continent. Pop. (1991) city, 712,507; (1996) metropolitan area, 1,480,530.

A brief treatment of Johannesburg follows. For full treatment, *see* MACROPAEDIA: Johannesburg.

Johannesburg lies on the southern slopes of the Witwatersrand—commonly called the Rand—a rocky watershed of east-west ridges surrounded by the broad interior plateau known as the Highveld. The city's general elevation ranges from 5,700 to 5,900 feet (1,740 to 1,800 m). The area's climate is semiarid and subtropical, with a mean temperature of 55° F (13° C) in July and 75° F (24° C) in December. The city receives about 28 inches (700 mm) of rainfall annually.

Johannesburg is the chief centre of South African mining, manufacturing, and finance. Gold mines lie to the south and southwest of the city. Many industries are located in the city, including plants that produce specialty steels and textiles. The city is also a centre for domestic and international banking and is the home of the Johannesburg Stock Exchange.

Johannesburg lies in the most thickly populated part of South Africa. Until 1991 the city's population was legally segregated by colour according to South Africa's apartheid policies, so that the nonwhite groups were each restricted to residence in certain areas called "townships." The largest of these was Soweto (South-Western Townships), a sprawling urban complex for Africans (blacks). Johannesburg's Indian population was restricted to the Asiatic township of Lenasia. Despite the South African government's abandonment of apartheid in the early 1990s, most Africans still live in townships, and the city remains racially segregated.

Johannesburg was governed by the Greater Johannesburg Metropolitan Board, an elective body created under the country's post-

apartheid constitution. The board had representatives from all across the metropolitan area of Greater Johannesburg, which extends over more than 200 square miles (500 square km) and includes more than 500 suburbs and townships. The Municipal Structures Act of 1998 integrated Johannesburg's metropolitan government, granting power to an elected city council and executive mayor.

The major administrative and commercial area of the city is in the vicinity of Eloff and Commissioner streets. Architectural styles are derived chiefly from Cape, European (English, Dutch, Renaissance Italian), and American models. The city's cultural institutions include the Johannesburg Art Gallery and museums with collections on South African history, military history, medicine, and archaeology. The Civic Theatre is the home of Johannesburg's opera, ballet, music, and drama.

Higher education is offered by the University of Witwatersrand (1922; mainly for English-speaking students) and Rand Afrikaans University (1966). A branch of Vista University opened in Soweto in 1982. Advanced technical education is offered at Technikon Witwatersrand. Teacher-training courses are available at several different colleges of education.

Local public transport is provided by an expanding system of motorways and, in the suburbs and other areas, by bus services and commuter railways. Johannesburg is the meeting place of roads from major towns in South Africa. The city's large railway station constitutes the heart of the nation's rail system. Johannesburg International Airport is located 14 miles (22 km) northeast of the city.

Johannitius (Arab scholar): *see* Ḥunayn ibn Isḥāq (al-Ibādī).

Johannsen, Wilhelm Ludvig (b. Feb. 3, 1857, Copenhagen, Den.—d. Nov. 11, 1927, Copenhagen), Danish botanist and geneticist whose experiments in plant heredity offered strong support to the mutation theory of the Dutch botanist Hugo de Vries (that changes in heredity come about through sudden, discrete changes of the heredity units in germ cells). Many geneticists thought Johannsen's ideas dealt a severe blow to Charles Darwin's theory that new species were produced by the slow process of natural selection.

Johannsen studied in Copenhagen, Germany, and Finland and was a professor first at the Institute of Agriculture in Denmark and then at the University of Copenhagen. After working initially in plant physiology, he devoted himself entirely to experimental research in heredity, becoming a leading authority in that subject. He found in studies with princess beans that in the succession of individuals arising from a single seed there existed what he termed a "pure line," in which the hereditary units of all individuals are the same. About 1905 he demonstrated that he could produce large or small plants from beans of corresponding size. He concluded that although the plants differed in external characteristics, or in their "phenotype," they nevertheless carried identical hereditary units or, in other words, preserved a common "genotype"; his terms phenotype and genotype are now a part of the language of genetics. Johannsen supported de Vries' discovery that variation in genotype can occur by mutation; that is, as a sudden, spontaneous appearance of a new species character. The new character, while independent of natural selection in its initial occurrence, is then subject to natural selection, as described by Darwin, as it either survives or disappears in future generations.

johannsenite, silicate mineral in the pyroxene family. It has a molecular formula of $Ca(Mn,Fe)Si_2O_6$. A calcium-manganese-iron silicate mineral, johannsenite is produced either by metamorphic processes in altered limestones or is associated with pyrite or other minerals in copper, lead, and zinc ores. It is moderately hard, has a glassy lustre, and forms brown, gray, or green crystals or fibres. Common deposits are found in Arizona, New Mexico, and Oregon, U.S.; Italy; Japan; and New South Wales, Australia. For detailed physical properties, *see* pyroxene (table).

Johansson, Christian, in full PER CHRISTIAN JOHANSSON (b. May 20, 1817, Stockholm, Sweden—d. 1903, St. Petersburg, Russia), Swedish-born ballet dancer and a chief teacher at the Imperial Ballet School in St. Petersburg who helped develop the Russian style of ballet.

Johansson studied at the Royal Swedish Ballet School and in Copenhagen with August Bournonville, who was most responsible for establishing the traditions of the Royal Danish Ballet. In 1841 Johansson became premier danseur at the Imperial Ballet in St. Petersburg, Russia. In 1860 he began teaching at the Imperial School and on his retirement from the stage in 1869 was officially appointed to the school teaching staff.

As opposed to the strict, repetitive Italian method, Johansson's teaching method incorporated a variety of ballet styles: the Russian, the Danish, and the classic French. He emphasized purity of line but, like Bournonville, made sharp distinction between the male and female style. During an era when male ballet dancers were generally unpopular and were often given only supporting roles, Johansson was particularly knowledgeable about male ballet technique and often advised Marius Petipa, choreographer of the Imperial Ballet. Johansson's pupils, many of whom danced in Petipa's ballets and later became teachers, included Eugenia Sokolova, Olga Preobrajenska, Mathilde Kschessinskaya, and Anna Pavlova.

Johansson, Ingemar, in full JENS INGEMAR JOHANSSON (b. Sept. 22, 1932, Göteborg, Sweden), Swedish-born world heavyweight boxing champion from June 26, 1959, when he knocked out champion Floyd Patterson in three rounds, until June 20, 1960, when he was knocked out by Patterson in five rounds (both bouts in New York City).

As an amateur boxer Johansson was a member of the European Golden Gloves team in 1951 and the Swedish Olympic Games team in 1952. He won the European professional heavyweight title in 1956, and in 1958 he scored a one-round knockout over Eddie Machen, a leading American heavyweight. On March 13, 1961, at Miami Beach, Johansson attempted to regain the championship but failed when Patterson scored a sudden knockout in the sixth round.

Johansson won the European heavyweight championship again in 1962, forfeited the title in 1963 for failing to defend it, and then retired. From 1952 to 1963 he had 28 bouts, winning 26, 17 by knockouts. His two losses to Patterson were the only defeats in his professional career. Johansson later made his permanent residence in west Florida, U.S.

Johansson, Lars, pseudonym LUCIDOR (b. Oct. 18, 1638, Stockholm, Sweden—d. Aug. 13, 1674, Stockholm), Swedish lyric poet, author of some of the most powerful poems of the Baroque period in Swedish literature.

Early orphaned, Johansson was reared by an uncle and educated both in Sweden and abroad. He returned to Sweden and became known as a writer of funeral elegies and epithalamiums. His most personal poems are drinking songs and funeral hymns—a typically Baroque combination. His models were the German Baroque poets, but his best poems surpass theirs in intensity of feeling and power of expression. His most famous song is "Skulle jag sörja så vore jag tokot" ("Were I to grieve, then I were a fool"). Johansson's poetry was posthumously published in *Helicons blomster* (1689; "Helicon's Flower"). His collected poems were edited by F. Sandwall in an edition with commentary (1914–30).

BOHEMIA

• **John,** byname JOHN OF LUXEMBOURG, or JOHN OF BOHEMIA, Czech JAN LUCEMBURSKÝ, or JAN S ČECH (b. Aug. 10, 1296, Luxembourg—d. Aug. 26, 1346, Crécy, France), king of Bohemia from 1310 until his death, and one of the more popular heroic figures of his day, who campaigned across Europe from Toulouse to Prussia.

He was born the son of the future Holy Roman emperor Henry VII of the house of Luxembourg and was made count of Luxembourg in 1310. At about the same time, he also was named king of Bohemia, and on Feb. 7, 1311, he was solemnly crowned at Prague. When his father died in 1313, John was too young to succeed him as emperor and supported instead the

John of Luxembourg, 14th-century silver denier of John as Count of Luxembourg; in the British Museum

Courtesy of the trustees of the British Museum

election of Louis the Bavarian as Emperor Louis IV (1314). John subsequently sided with Louis in his struggle against Frederick of Austria (1322); but in later years he was estranged from the Emperor, especially after Louis's alliance with England against France in the Hundred Years' War. John's own sympathies strongly favoured the French. He had sent his own son, the future emperor Charles IV, to be reared in Paris, and he several times fought in the service of France.

Throughout his reign, John campaigned variously against the Lithuanians and the Russians, against Hungary, England, and Austria, and in northern Italy and in the Tirol. He extended his Bohemian crownland northward, acquiring parts of Upper Lusatia (1320–29) and Silesia (1327–30), and also made himself master of much of Lombardy. His lavish expenditures, heavy taxation, and incessant peregrinations, however, cost him popularity at home and enhanced the power of the Bohemian nobility.

John's continuing quarrels with the Emperor brought him into alliance with the papacy; and in 1346, in concert with Pope Clement VI, he secured the formal deposition of Louis IV and the election of his son Charles as king of the Romans (July 1346). He then went to help King Philip VI of France against the English but was killed at the Battle of Crécy.

Brandenburg

• John (b. Aug. 3, 1513, Tangermünde, Brandenburg—d. Jan. 13, 1571, Küstrin, Neumark, Brandenburg), margrave of Brandenburg-Küstrin and a German Protestant ruler who remained loyal to the Catholic Habsburg emperors; he fought against his fellow Protestant princes and was conspicuously successful in the government of his territories.

John was the younger son of Joachim I, elector of Brandenburg, who divided his territory between his two sons. John inherited the eastern lands, the so-called Neumark, while his brother, Joachim II, received the larger, older territories (1535). Although brought up as a strict Roman Catholic, John became a strict Protestant and joined the Protestant Schmalkaldic League, formed to defend the Reformist princes from the Emperor. In 1545, however, having received assurances from Charles that he would not be forced to relinquish his beliefs, he joined the emperor Charles V's side, and his troops contributed to the defeat of the Schmalkaldic League in 1547. After the Augsburg Interim religious agreement of 1548, resulting in the exile of numerous Protestants, John once more opposed the Emperor, but again, impelled by distrust of his fellow princes, returned to the imperial fold. In return, Charles appointed him imperial councilor. John's salary, coupled with wise government of his lands and successful speculations, enabled him to leave a capital of more than 500,000 guilders on his death. Since he did not leave sons, his territories reverted to his brother's son John George.

Brittany

• John I, also called JOHN THE REDHEAD, French JEAN LE ROUX (b. 1217—d. 1286), duke of Brittany (from 1237), son of Peter I. Like his father, he sought to limit the temporal power of the clergy; consequently he was excommunicated, upon which he journeyed to Rome to win absolution. Subsequently, he and his wife, Blanche of Champagne, traveled with St. Louis on the crusade to Tunisia (1270).

• John II (b. 1239—d. 1305, Lyon), duke of Brittany (from 1286) and count of Richemont, son of John I. He accompanied his father on St. Louis's crusade to Tunisia (1270) and fought also in Palestine. He returned to Europe in 1272 and, in subsequent years, shifted repeatedly from one side to another in the wars between Edward I of England and Philip IV of France, who made him a peer of France (1297). His son, Arthur II, succeeded him.

• John III, byname JOHN THE GOOD, French JEAN LE BON (b. 1286—d. 1341), duke of Brittany (from 1312), son of Arthur II. His death without heirs resulted in the War of the Breton Succession, pitting two indirect heirs, John of Montfort and Charles of Blois. Despite three marriages—to Isabella of Valois (d. 1309), Isabella of Castile (d. 1328), and Joan of Savoy (1334)—he was left childless and designated Charles of Blois his successor, to whom he espoused his niece (1338).

• John (IV), byname JOHN OF MONTFORT, French JEAN DE MONTFORT (d. 1345), claimant to the duchy of Brittany upon the death of his childless half brother, John III. He was the only surviving son of Arthur II.

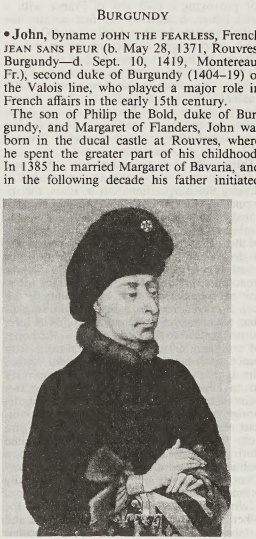
At first, John of Montfort had recognized John III's designation of Charles of Blois (nephew of King Philip VI of France) as the successor; but then John of Montfort reneged, had himself crowned at a convocation of bishops and lords at Nantes, and thus started the War of the Breton Succession. John was supported by Edward III of England (who claimed suzerainty over Brittany), but Philip VI favoured his own nephew and captured John at Nantes (1341). John, however, escaped from prison and defeated Charles's partisans at Cadoret (1345). When John himself died the same year, his widow, Joan of Flanders, defended the claims of his son, John IV.

Certain authorities count John of Montfort among the dukes of Brittany; he then becomes John IV, and his successors John V and John VI.

• John IV (or V), also called EARL OF RICHMOND, byname JOHN OF MONTFORT, OF JOHN THE VALIANT, OF THE CONQUEROR, French JEAN DE MONTFORT, OF JEAN LE VAILLANT, OF LE CONQUÉRANT (b. *c.* 1340—d. Nov. 1, 1399, Nantes, Fr.), duke of Brittany from 1365, whose support for English interests during the Hundred Years' War (1337–1453) nearly cost him the forfeit of his duchy to the French crown. The instability of his reign is attributable not only to his alliances with England but also to his imposition of harsh taxes on his subjects.

John was educated at the court of King Edward III of England. He ended the War of the Breton Succession in September 1364 by defeating Charles of Blois at Auray; he was recognized as duke of Brittany by King Charles V of France in the Treaty of Guérande (April 12, 1365). John secretly aided Edward's cause in 1370, giving the English soldier Robert Knowles a haven in Brittany when Knowles faced defeat at the hands of French forces. In 1372, after making an alliance with Edward, John was granted the earldom of Richmond for allowing the English to garrison his fortresses in Brittany.

After the French drove the English from most of the duchy, however, John fled to England (April 1373). Charles's confiscation of John's property in 1378 met with condemnation from the people of Brittany, but John lost this support when he made an alliance with King Richard II of England in 1380. He managed to reverse his loss by making peace with the regents for King Charles VI through the second Treaty of Guérande (Jan. 15, 1381). In 1392 he was again in ill repute with the crown for instigating an assassination attempt on Charles VI's constable of France, Oliver of Clisson, with whom he had had a long personal feud.



• John V (or VI), byname JOHN THE WISE, French JEAN LE SAGE (b. Dec. 24, 1389—d. Aug. 28, 1442), duke of Brittany from 1399, whose clever reversals in the Hundred Years' War and in French domestic conflicts served to strengthen his duchy.

John was on good terms with Philip the Bold, duke of Burgundy, who was his guardian. He began to favour the Armagnac faction in the French civil war, however, after the murder of its leader, Louis, duc d'Orléans, in 1407, though he did not fight the Burgundians. He allowed his subjects to fight the English, but he himself maintained a truce with Henry V of England, and his Breton troops were too late to aid the French at the Battle of Agincourt. John long acknowledged the Treaty of Troyes (1420), which made Henry V of England regent of France and heir to the French throne; but yet he had an alliance with the disinherited dauphin Charles and later allowed his own brother Arthur to become constable of France when the dauphin was claiming the French crown as Charles VII. Though he made efforts toward a real entente with Charles in the 1430s, John was party to the revolts of the Praguerie in 1440 and the League of Nevers in 1442. Within Brittany John brought about significant governmental, military, and economic reforms.

Burgundy

• John, byname JOHN THE FEARLESS, French JEAN SANS PEUR (b. May 28, 1371, Rouvres, Burgundy—d. Sept. 10, 1419, Montereau, Fr.), second duke of Burgundy (1404–19) of the Valois line, who played a major role in French affairs in the early 15th century.

The son of Philip the Bold, duke of Burgundy, and Margaret of Flanders, John was born in the ducal castle at Rouvres, where he spent the greater part of his childhood. In 1385 he married Margaret of Bavaria, and in the following decade his father initiated

John the Fearless, portrait by an unknown master of the southern Netherlands, *c.* 1415; in the Musée Royal des Beaux-Arts, Antwerp

By courtesy of the Musee Royal des Beaux-Arts, Antwerp; photograph, A.C.L. Brussels

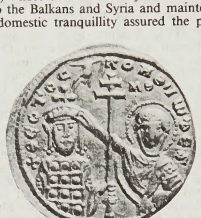
him into the arts of government and warfare, though he was not given any post of responsibility. Even in 1396, at the age of 24, when he became leader of the Burgundian crusade against the Ottoman Turks in defense of Hungary, his leadership was only nominal. The actual conduct of the expedition, which ended in the disastrous defeat of the crusaders on the battlefield of Nicopolis and the capture of John by the Turks (an adventure that earned him the epithet the Fearless), was entrusted to a group of councilors and military advisers appointed by Philip the Bold. John evidently benefited from the blunders of these com-

manders, for his subsequent career showed that he was the only one of the Valois rulers of Burgundy who knew how to handle an army.

When John at last succeeded his father in 1404 as duke of Burgundy and count of Burgundy, Flanders, and Artois, he was 33 years old.

John the Fearless spent most of his time and his considerable political and military energies in France, Paris being his normal place of residence and seat of government. His only significant personal participation as duke of Burgundy in major events outside France took place in 1408, when he led a Burgundian army to aid his beleaguered brother-in-law, the bishop of Liège, John of Bavaria, against the citizens of Liège, who were in open revolt. On the field of Othée, on Sept. 23, 1408, the men of Liège were decisively defeated, and Burgundian influence was extended over the city and over the bishopric of Liège. From the start, then, John found himself involved in French affairs and was in part responsible for provoking a civil war in France with a rival house, headed by his first cousin, the King's younger brother, Louis, duc d'Orléans. Each man sought control of the mad king Charles VI and his queen and of the capital Paris. While the notorious murder by Duke John of his cousin by hired assassins in 1407 enabled John to subdue Paris and the crown, the opposition to the Burgundians by Louis's followers and heirs continued. Their faction was named after its main supporter, Bernard VII, comte d'Armagnac.

During the five years between 1413 and 1418, in which the Armagnacs succeeded in driving the Burgundians out of Paris, the internal situation in France was further complicated by a new English invasion led by the ambitious king, Henry V. Duke John was one of those French princes who, while pretending to do his best to reach the battlefield of Agincourt to give battle to the English (1415), was unaccountably delayed on the way. His intermittent negotiations with King Henry V did not, however, lead to a firm Anglo-Burgundian alliance, and in the autumn of 1419 John turned instead to the Armagnacs, in the hopes of arranging a truce or even making a firm peace settlement with their youthful leader, the dauphin Charles (the future Charles VII), in an alliance against the English. The two princes, each with 10 companions, met on the bridge of Montereau, some 50 miles southeast of Paris. As the diplomatic parley began, John the Fearless was struck down and killed during a dispute started by the Armagnacs, a political assassination that contemporary evidence shows was almost certainly carefully premeditated.



John pursued aims similar to those of the other rulers of his day: the consolidation and extension of his own and his family's power. In spite of his lapses into violence, his love of intrigue, his hypocrisy, and his rashness, he was a successful diplomat and military leader; he was more dynamic and more of a reformer than his son Philip the Good and more cunning, though less scrupulous, than his father. Yet he has received less attention from historians than either of them. In the eye of history, especially French history, he has long been regarded as a traitor and assassin. There was, perhaps, a dark and sinister element in his character, but he lived in an age when vice, tyranny, and murder were the common properties of every ruler. If he wrought destruction in France, he also brought peace and prosperity to his own Burgundian lands.

(R.Va.)

Byzantine Empire

•John I Tzimisces (b. 925—d. Jan. 10, 976, Constantinople), Byzantine emperor (969–976) whose extension of Byzantine influence into the Balkans and Syria and maintenance of domestic tranquillity assured the prestige

John I Tzimisces (left), effigy on a Byzantine gold coin, 969–976; in a private collection
Peter Clayton

and stability of the empire for his immediate successors.

Descended from an aristocratic Armenian family, John was related through his mother to the general, and later emperor, Nicephorus II Phocas. He entered the imperial army and fought with Nicephorus against the Arabs in Cilicia and Syria. Having helped Nicephorus gain the throne, he was rewarded with the supreme command of Byzantine forces in the East. His ambition for the throne later led him into the conspiracy with his mistress, Theophano (the Emperor's wife), that led to the assassination of Nicephorus in December 969. Forced to do penance by Polyeuctus, patriarch of Constantinople, in order to receive the imperial crown, John banished Theophano to a convent and punished the murderers.

John I strengthened the empire by coupling diplomatic skill with military strength. In 970 he married Theodora, sister of Constantine VII Porphyrogenitus, the legitimate claimant to the throne, to offset challenges to his rule at home. When the Bulgars attacked the empire in 971, he led his forces against their capital, captured their tsar, and forced them to recognize Byzantine suzerainty. In July 971 he defeated the Russian prince Svyatoslav, ending threats to Byzantine rule in the north. To preserve the Byzantine position in the West, he arranged a marriage between one of his relatives and the future Holy Roman emperor Otto II. Turning to the East, he reduced the Fāṭimid strength around Antioch in 974–975, taking Antioch, Damascus, and other cities in Syria. Before he could retake Jerusalem he died, probably of typhoid.

Where the same name may denote a person, place, or thing, the articles will be found in that order

•John II Comnenus (b. 1088—d. April 8, 1143), Byzantine emperor (1118–43) whose reign was characterized by unremitting attempts to reconquer all important Byzantine territory lost to the Arabs, Turks, and Christian crusaders.

A son of Emperor Alexius I Comnenus and Irene Ducas, John kept an austere court and spent most of his reign with his troops. He sought to strengthen Byzantine finances by

John II Comnenus, detail of a mosaic, *c.* 1118; in Hagia Sophia, Istanbul
Hirmer Fotoarchiv, München

ending Venetian trading privileges in the empire, but was forced to restore them after an unsuccessful war (1122). He thwarted Pecheneg, Hungarian, and Serbian threats during the 1120s, and in 1130 allied himself with the German emperor Lothair II (III) against the Norman king Roger II of Sicily.

In the later part of his reign John focussed his activities on the East. In 1135 he defeated the Danismend emirate of Melitene. Two years later he reconquered all of Cilicia from the kingdom of Lower Armenia and later forced Raymond of Poitiers, prince of Antioch, to recognize Byzantine suzerainty. Though John and Raymond formed an alliance against the Turkish Atabegs of Syria, their campaigns were not particularly successful. In 1143 John returned to press his claims to Antioch. He died following a hunting accident after naming his fourth son, Manuel I, to succeed him.

•John III Ducas Vatatzes (b. 1193, Didymoteichos, Byzantine Empire—d. Nov. 3, 1254), emperor of Nicaea (1222–54) who, by acquiring territory, encouraging economic growth, and supporting a cultural revival from his capital at Nicaea (modern İznik, Tur.), paved the way for the recovery of Constantinople from the Latin emperors and the reestablishment of the Byzantine Empire.

Born to an aristocratic Byzantine family, he married Irene, daughter of Theodore I Lascaris, emperor of Nicaea, becoming emperor on Theodore's death. Civil war broke out when Theodore's brothers, Alexius and Isaac, protested the succession, but John defeated them in battle and imprisoned and blinded them (1223). Two years later he also defeated the Latin forces supporting his rivals and made himself master of Asia Minor. He later clashed with Theodore Ducas, despot of Epirus, after the latter took Thessalonica and proclaimed himself Byzantine emperor (1225). John's forces were routed by Theodore when they attempted to take Adrianople later that year. Allied with the Bulgarian tsar John Asen II, John III defeated Theodore in battle (1230) and besieged Constantinople in 1235. Realizing the potential threat from Nicaea, however, Asen declared war on his ally. A peace was arranged in 1237, and, when Asen died in 1241, John III annexed territory in Bulgaria and attacked the despotate of Epirus. By 1242 he had reduced Epirus' territory and forced it to recognize Nicaean suzerainty.

John III also promoted the isolation of Latin Constantinople by making pacts with Western leaders. About 1250 he promised to become the vassal of Frederick II, Holy Roman emperor, in return for aid in reconquering Constantinople. Though the pact was sealed by John's marriage to the Emperor's daughter, Constance, little came of their agreement. He also negotiated, unsuccessfully, with the papacy, promising to end the schism between

the Eastern and Western churches if the Latins returned Constantinople.

In domestic policy John III made the Nicaean empire economically self-supporting, improved agriculture and stockbreeding, built hospitals and poorhouses, and encouraged the development of Nicaea's cultural life. His popularity among his subjects and his reputation for goodness caused him to be canonized a saint of the Eastern Church a half century after his death.

•John IV LASCARIS (b. 1250—d. 1261?), emperor of Nicaea whose brief reign as a minor was filled with intrigue and conspiracies that culminated in the seizure of power by Michael Palaeologus, the future Byzantine emperor Michael VIII.

John IV's parents were the Nicaean emperor Theodore II Lascaris (reigned 1254–58) and Helen, a daughter of the Bulgarian tsar John Asen II. Eight years old when his father died, John was advised by his regent George Muzalon, a trusted friend of the former emperor. But Muzalon was assassinated nine days after Theodore's death by associates of Michael Palaeologus, who then became regent. Michael proclaimed himself emperor and was crowned co-emperor with John in December 1258. He was crowned sole ruler in August 1261 in the church of Hagia Sophia in Constantinople, after his troops retook the city from its Latin rulers. Relegated to the background since 1258, John IV was then blinded and imprisoned in a fortress in Bithynia.

•John V PALAEOLOGUS (b. 1332—d. Feb. 16, 1391), Byzantine emperor (1341–91) whose rule was marked by civil war and increased domination by the Ottoman Turks, despite his efforts to salvage the empire.

Nine years old when his father, Andronicus III, died, John was too young to rule, and a dispute over the regency broke out between his mother, Anna of Savoy, and John Cantacuzenus, chief minister under Andronicus III. Cantacuzenus won the ensuing civil war and was crowned co-emperor with John V at Constantinople in 1347. Despite John V's subsequent marriage to Helen, Cantacuzenus' daughter, he formed an alliance with the Venetians against Cantacuzenus, forcing him to abdicate in 1354.

When the Ottoman Turks, who had gained a foothold in Europe by occupying Gallipoli, threatened Constantinople (1354), John appealed to the West for help, proposing to end the schism between the Byzantine and Latin churches. Though the popes promised him a crusade in return for his recognition of Rome, it never materialized, and the schism continued. Wars with the Serbs and Turks drained the Byzantine treasury, and John was arrested as an insolvent debtor when he visited Venice in 1369.

In 1371 John was forced to recognize the suzerainty of the Turks when they gained control of large parts of Macedonia. When he was deposed and imprisoned in 1376 by his son, the Turks helped him regain the throne (1379); but when John tried to rebuild the fortifications around Constantinople, the Turkish sultan ordered them destroyed, threatening to blind John's heir, Manuel, then residing at the Turkish court. John left Manuel an empire greatly reduced in size and strength, a Turkish overlord, and a frightened populace.

•John VI CANTACUZENUS (b. 1292—d. June 15, 1383, Mistra, Byzantine Empire), statesman, Byzantine emperor, and historian whose dispute with John V Palaeologus over the imperial throne induced him to appeal for help to the Turks, aiding them in their conquest of the Byzantine Empire.

John was chief adviser to Andronicus III Palaeologus, having helped him gain the throne from his grandfather Andronicus II. From 1328 to 1341 Cantacuzenus directed

John VI Cantacuzenus, detail from an illuminated manuscript, 14th century; in the Bibliothèque Nationale, Paris (Ms. Gr. 1242)
Hirmer Fotoarchiv, München

both domestic and foreign policy for the Emperor. He encouraged a reform of the law courts and promoted commercial independence from the Genoese and Venetians by initiating a large shipbuilding project. He distinguished himself in battle against the Serbs and in 1337 helped incorporate the despotate of Epirus, in western Greece, into the empire.

When Andronicus III died in 1341, Cantacuzenus asserted his claim as regent for the young John V, but when he (Cantacuzenus) left Constantinople to battle the Serbs in Thrace, his opponents—led by John V's mother, Anna of Savoy—declared him a traitor and imprisoned his supporters.

Cantacuzenus proclaimed himself emperor, however, at Didymoteichos on Oct. 26, 1341. From 1343 to 1345 he arranged alliances with the Turks and married his daughter to the Ottoman sultan Orhan. He regained Constantinople in February 1347 with Turkish help, and was crowned co-emperor with John V in May.

As John VI, Cantacuzenus agreed to reign for only 10 years and to allow John V to rule alone after that time. He married his daughter Helen to the young emperor to seal the agreement. By 1354 Cantacuzenus was anxious to continue his rule and crowned his son, Matthew, co-emperor. John V appealed to the Venetians for aid and succeeded in retaking Constantinople in 1354. Cantacuzenus was forced to abdicate and retired to a monastery, where he wrote his memoirs, a valuable source for the history of the period from 1320 to *c.* 1357.

•John VII PALAEOLOGUS (b. 1360—d. *c.* 1410), Byzantine emperor who reigned for several months in 1390 by seizing control of Constantinople from his grandfather, the emperor John V Palaeologus.

From 1399 to 1402 he acted as regent for John V's successor, Manuel II, at Constantinople while Manuel journeyed to the West to appeal for help against Turkish attacks. During Manuel's absence John arranged a treaty with the Ottoman Turks, granting them financial and religious privileges. Manuel disavowed the treaty on his return and sent John to be governor of Thessalonica (modern Thessaloníki, Greece).

•John VIII PALAEOLOGUS (b. 1390—d. Oct. 31, 1448, Constantinople), Byzantine emperor who spent his reign appealing to the West for help against the final assaults by the Ottoman Turks on the Byzantine Empire.

Son of Manuel II Palaeologus, John was crowned co-emperor with his father in 1421 and succeeded him in July 1425. He ruled the area immediately surrounding Constantinople, while his brothers governed remnants of the fragmented empire in the Greek Peloponnese and in the districts on the Black Sea.

Constantinople was besieged in June 1422 by the Turkish sultan Murad II, and when the Turks took Thessalonica (modern Thessaloníki, Greece) in March 1430, John turned to the West for help. In 1437 he went to Italy, where he brought about a union between the Byzantine and Latin churches at the Council of Ferrara–Florence (1439). Western efforts against the Turks failed, and the union stirred dissension among the Byzantines, who refused to submit their church to the papacy. John's spirit was broken, and intrigues over the succession, coupled with news of the Turkish victory over the Hungarians in the Second Battle of Kosovo in October 1448, hastened his death.

CONSTANTINOPLE

•John, byname JOHN OF BRIENNE, French JEAN DE BRIENNE (b. *c.* 1148—d. March 1237, Constantinople), count of Brienne who became titular king of Jerusalem (1210–29) and Latin emperor of Constantinople (1231–37).

A penniless younger son of the French count Erard II of Brienne and Agnes of Montbéliard, John passed most of his life as a minor noble until befriended by King Philip II Augustus of France, who arranged for him to marry Mary (Marie) of Montferrat, queen of the crusader state of Jerusalem, in 1210. John reached the Palestinian town of Acre on Sept. 13, 1210, married Mary the following day, and was crowned at Tyre on October 3. Mary died in 1212, and John was named regent for their infant daughter, Yolande de Brienne, who inherited the crown as Isabella II. In 1214 John married Princess Stephanie of Armenia, daughter of the Armenian king Leo II, and later had a son by her.

As regent, John arranged a five-year truce with al-Malik al-ʿĀdil, sultan of Egypt and Syria, in July 1212, and during the truce he persuaded Pope Innocent III to launch the Fifth Crusade in support of his daughter's kingdom. In 1218 he joined the crusading force from the West in an expedition against the Egyptian port of Damietta. After quarrelling with the crusade leader, the cardinal legate Pelagius, John left Egypt in February 1220, returning in July 1221 to witness the humiliating defeat of the crusaders and the abandonment of the siege of Damietta.

Stephanie died in 1219; John then married Berengaria, daughter of Ferdinand III of Castile, and in 1225 gave his daughter Isabella in marriage to the Holy Roman emperor Frederick II, trying to retain his rights as regent of the kingdom of Jerusalem. Immediately following the marriage, however, Frederick began to contest these rights.

In 1228 John was invited to Constantinople to be regent and co-emperor with the young Baldwin II and arranged a match between Baldwin and his four-year-old daughter by Berengaria. Crowned in 1231, John helped fend off attacks by the Bulgarian tsar Ivan Asen II and the Nicaean emperor John III Vatatzes, but shortly before his death he was forced to appeal to the West for help.

DENMARK

•John (b. June 5, 1455, Denmark—d. Feb. 20, 1513, Alborg, Den.), king of Denmark (1481–1513) and Norway (1483–1513) and king (as John II) of Sweden (1497–1501) who failed in his efforts to incorporate Sweden into a Danish-dominated Scandinavian union. He

was more successful in fostering the commercial development of Danish burghers to challenge the power of the nobility.

John succeeded his father, Christian I, king of Denmark and Norway, in 1481, but only by agreeing to a stringent charter imposed by the Danish nobles to limit royal power. Although he was also recognized as sovereign by the Swedish state council (1483), the Swedish regent, Sten Sture the Elder, was able to postpone John's coronation as king of Sweden. In 1490 John divided the territories of Schleswig and Holstein with his brother Frederick (later king of Denmark as Frederick I).

Ignoring the royal charter of 1483, John expanded the authority of his office and further offset the nobles' power by supporting the Danish merchant class against its chief rivals, the traders of the Hanseatic League (a north German trading confederation). His anti-Hanseatic policy was furthered by trade agreements with England, the Netherlands (1490), and the merchants of the south German house of Fugger.

John of Denmark, Norway, and Sweden; detail from a plaster cast of his tombstone, original sculpture by Claus Berg, *c.* 1513; in the Cathedral of St. Canute, Odense, Den.

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Den.

John was able to force Sten Sture to resign the regency of Sweden (1497) and was crowned king after allying himself with Ivan III, grand prince of Moscow, in 1493. He then ordered the building of a navy to control the Baltic Sea but suffered a serious military defeat in 1500 in a peasant uprising in Dithmarschen (now in Germany). The defeat helped persuade dissident Swedish nobles to rebel and reinstall Sten Sture as regent of Sweden, but Norwegian and Danish uprisings against John's rule were suppressed.

John's commercial treaty with England led to a war against Sweden and the Hanseatic city of Lübeck (1510–12), in which the new Danish navy scored repeated victories.

England

• John, byname JOHN LACKLAND, French JEAN SANS TERRE (b. Dec. 24, 1167, Oxford—d. Oct. 18/19, 1216, Newark, Nottinghamshire, Eng.), king of England from 1199 to 1216. In a war with the French king Philip II, he lost Normandy and almost all his other possessions in France. In England, after a revolt of the barons, he was forced to seal the Magna Carta (1215).

Youth and rivalry for the crown. John was the youngest son of Henry II and Eleanor of Aquitaine. Henry's plan (1173) to assign to John, his favourite son (whom he had nicknamed Lackland), extensive lands upon his marriage with the daughter of Humbert III, count of Maurienne (Savoy), was defeated by the rebellion the proposal provoked among John's elder brothers. Various provisions were made for him in England (1174–76), including

John, detail of a tomb effigy in Worcester cathedral

By courtesy of the National Monuments Record, London

the succession to the earldom of Gloucester. He was also granted the lordship of Ireland (1177), which he visited from April to late 1185, committing youthful political indiscretions from which he acquired a reputation for reckless irresponsibility. Henry's continued favour to him contributed to the rebellion of his eldest surviving son, Richard I (later called Coeur de Lion), in June 1189. For obscure reasons John deserted Henry for Richard.

On Richard's accession in July 1189, John was made count of Mortain (a title that became his usual style), was confirmed as lord of Ireland, was granted lands and revenues in England worth £6,000 a year, and was married to Isabella, heiress to the earldom of Gloucester. He also had to promise (March 1190) not to enter England during Richard's absence on his crusade. But John's actions were now dominated by the problem of the succession, in which his nephew, the three-year-old Arthur I, duke of Brittany, the son of his deceased elder brother Geoffrey, was his only serious rival. When Richard recognized Arthur as his heir (October 1190), John immediately broke his oath and returned to England, where he led the opposition to Richard's dictatorial chancellor, William Longchamp. On receiving the news in January 1193 that Richard, on his way back from the crusade, had been imprisoned in Germany, John allied himself with King Philip II Augustus of France and attempted unsuccessfully to seize control of England. In April 1193 he was forced to accept a truce but made further arrangements with Philip for the division of Richard's possessions and for rebellion in England. On Richard's return, early in 1194, John was banished and deprived of all his lands. He was reconciled to Richard in May and recovered some of his estates, including Mortain and Ireland, in 1195, but his full rehabilitation came only after the Bretons had surrendered Arthur to Philip II in 1196. This led Richard to recognize John as his heir.

Accession to the throne. In 1199 the doctrine of representative succession, which would have given the throne to Arthur, was not yet generally accepted, and following Richard's death in April 1199 John was invested as duke of Normandy and in May crowned king of England. Arthur, backed by Philip II, was recognized as Richard's successor in Anjou and Maine, and it was only a year later, in the Treaty of Le Goulet, that John was recognized as successor in all Richard's French possessions, in return for financial and territorial concessions to Philip.

War with France. The renewal of war in France was triggered by John's second marriage. His first wife, Isabella of Gloucester, was never crowned, and in 1199 the marriage was dissolved on grounds of consanguinity, both parties being great-grandchildren of Henry I. John then intervened in the stormy politics of his county of Poitou and, while trying to settle the differences between the rival families of Lusignan and Angoulême, himself married Isabella (August 1200), the heiress to Angoulême, who had been betrothed to Hugh IX de Lusignan. This politically conceived marriage provoked the Lusignans into rebellion the next year; they appealed to Philip II, who summoned John to appear before his court. In the general war that followed his failure to answer this summons, John had a temporary success at Mirebeau in August 1202, when Arthur of Brittany was captured, but Normandy was quickly lost (1204). By 1206, Anjou, Maine, and parts of Poitou had also gone over to King Philip.

These failures, foreshadowed under Henry II and Richard, were brought about by the superiority of French resources and the increasing strain on those of England and Normandy. Nevertheless, they were a damaging blow to John's prestige, and, equally important, they meant that John resided now almost permanently in England. This factor, coinciding with the death (1205) of the chancellor and archbishop of Canterbury, Hubert Walter, gave his government a much more personal stamp, which was accentuated by the promotion of members of his household to important office. His determination to reverse the continental failure bore fruit in ruthlessly efficient financial administration, marked by taxation on revenues, investigations into the royal forests, taxation of the Jews, a great inquiry into feudal tenures, and the increasingly severe exploitation of his feudal prerogatives. These measures provided the material basis for the charges of tyranny later brought against him.

Quarrel with the church. John's attention was diverted and his prestige disastrously affected by relations with the papacy. In the disputed election to the see of Canterbury following the death of Hubert Walter, Pope Innocent III quashed the election of John's nominee in procuring the election of Stephen Langton (December 1206). John, taking his ground on the traditional rights of the English crown in episcopal elections, refused to accept Langton. In March 1208, Innocent laid an interdict on England and excommunicated John (November 1209). The quarrel continued until 1213, by which time John had amassed more than £100,000 from the revenues of vacant or appropriated sees and abbeys. But such a dispute was a dangerous hindrance to John's intention to recover his continental lands. In November 1212 he agreed to accept Langton and the Pope's terms. Apparently at his own behest, he surrendered his kingdom to the papal nuncio at Ewell, near Dover, on May 15, 1213, receiving it back as a vassal rendering a tribute of 1,000 marks (£666 13*s.* 4*d.*) a year. He was absolved from excommunication by Langton in July 1213, and the interdict was finally relaxed a year later. John thus succeeded in his aim to secure the papacy as a firm ally in the fight with Philip and in the struggle already pending with his own baronage. But his treatment of the church during the interdict, although arousing little if any opposition among the laity at the time, angered monastic chroniclers, who henceforth loaded him with charges of tyranny, cruelty, and, with less reason, of sacrilege and irreligion.

Baronial rebellion and the Magna Carta. In August 1212 recurrent baronial discontent had come to a head in an unsuccessful plot to murder or desert John during a campaign planned against the Welsh. Pope Innocent's terms had included the restoration of two of those involved, Eustace de Vesci and Robert Fitzwalter, and, although the barons soon lost papal support, they retained the protection of Stephen Langton. John, skillfully isolating the malcontents, was able to launch his long-planned campaign against the French, landing at La Rochelle in February 1214. He

achieved nothing decisive and was forced to accept a truce lasting until 1220. Returning to England in October 1214, he now had to face much more widespread discontent, centred mainly on the northern, East Anglian, and home counties. After lengthy negotiations in which both sides appealed to the Pope, civil war broke out in May 1215. John was compelled to negotiate once more when London went over to the rebels in May, and on June 15 at Runnymede he accepted the baronial terms embodied in a document known as the Articles of the Barons. On June 19, after further revisions of the document, the king and the barons accepted Magna Carta, which ensured feudal rights and restated English law. This settlement was rendered unworkable by the more intransigent barons and by John's almost immediate appeal to Pope Innocent against it. Innocent took the King's side, and in the ensuing civil war John captured Rochester castle and laid waste the northern counties and the Scottish border. His cause was weakened by the arrival of the future Louis VIII of France, who invaded England at the barons' request. John continued to wage war but died, leaving the issues undecided. His death made possible a compromise peace, including the restoration of the rebels, the succession of his son Henry III, and the withdrawal of Louis.

Assessment. John's reputation, bad at his death, was further depressed by writers of the next generation. Of all centuries prior to the present, only the 16th, mindful of his quarrel with Rome, recognized some of his quality. He was suspicious, vengeful, and treacherous; Arthur I of Brittany was probably murdered in captivity, and Matilda de Braose, the wife of a recalcitrant Marcher baron, was starved to death with her son in a royal prison. But John was cultured and literate. Conventional in his religion rather than devout, he was remembered for his benefactions to the church of Coventry, to Reading Abbey, and to Worcester, where he was buried and where his effigy still survives. He was extraordinarily active, with a readiness to travel that gave him a knowledge of England matched by few other monarchs. He took a personal interest in judicial and financial administration, and his reign saw important advances at the Exchequer, in the administration of justice, in the importance of the privy seal and the royal household, in methods of taxation and military organization, and in the grant of chartered privileges to towns. If his character was unreliable, his political judgment was acute. In 1215 many barons, including some of the most distinguished, fought on his side. (J.C.H.)

BIBLIOGRAPHY. Kate Norgate, *John Lackland* (1902, reprinted 1970), the most exhaustive scholarly biography, is still valuable. W.L. Warren, *King John,* 2nd ed. (1978), is a lively, modern account. J.C. Holt, *King John* (1963), discusses both the medieval and modern assessment of the King. For accounts of the reign, see Sidney Painter, *The Reign of King John* (1949), which is thorough and extensive; J.C. Holt, *The Northerners* (1961), a study of the baronial opposition, and *Magna Carta* (1965), for the origins and course of John's quarrel with the barons. D.M. Stenton, *English Justice Between the Norman Conquest and the Great Charter, 1066–1215* (1964), has an important essay on King John and the courts of justice. R.E. Turner, *The King and His Courts: The Role of John and Henry III in the Administration of Justice, 1199–1240* (1968), a general survey of the King's legal powers and functions, is also valuable. F.M. Powicke, *The Loss of Normandy, 1189–1204,* 2nd ed. (1961), a definitive study of John's defeat on the Continent, is also useful on financial and military administration.

Ethiopia

France

• **John I,** also called JOHN THE POSTHUMOUS, French JEAN LE POSTHUME (b. Nov. 15, 1316—d. Nov. 19/20, 1316, Paris), king of France, the posthumous son of Louis X of France by his second consort, Clémence of Hungary. He died a few days after his birth but is reckoned among the kings of France.

His uncle, who succeeded him as Philip V, has been accused of having caused his death, or of having substituted a dead child in his place; but nothing has ever been proved. In 1358 a man called Giannino, in Florence, persuaded Clémence's nephew, Louis I of Hungary, that he was John I; but otherwise he met with little success and died in jail in Naples (1363).

• **John II,** byname JOHN THE GOOD, French JEAN LE BON (b. April 16, 1319, near Le Mans, Fr.—d. April 8, 1364, London), king of France from 1350 to 1364. Captured by the English at the Battle of Poitiers on Sept. 19, 1356, he was forced to sign the disastrous treaties of 1360 during the first phase of the Hundred Years' War (1337–1453) between France and England.

John II, portrait by an unknown French artist, 14th century, in the Louvre, Paris

Archives Photographiques

After becoming king on Aug. 22, 1350, John continued a truce with the English until later that year, when he had an English hostage, Raoul de Brienne, comte d'Eu, former constable of France, executed. By March 1351 King Edward III of England realized the impossibility of remaining at peace; but John committed the first act of hostility by attacking and recapturing Saint-Jean-d'Angély in western France that September 7. John signed a new truce with England on Sept. 12, 1351, but broke it by supporting the partisans of Charles of Blois (a pretender to Brittany, then held prisoner by Edward) in August 1352; the peace, however, was extended until September 23.

John's other bitter enemy was Charles II the Bad, king of Navarre, to whom John gave his daughter Joan in marriage as an offer of alliance; the enmity still remained strong, however, because John never paid a dowry or recognized a rent of 15,000 livres due to Charles. John further irritated Charles by giving the new constable of France, Charles de La Cerda, lands that were claimed by Charles of Navarre. In revenge, the latter had the new constable assassinated; but in spite of John's rage, the two kings made a superficial peace in February 1354. Charles desired an alliance with Edward, which so frightened John that he made another peace with Charles on Sept. 10, 1355. On April 16, 1356, at Rouen, John took his revenge on Charles by having him imprisoned.

Meanwhile Edward, displeased by the 1355 alliance between John and Charles, invaded France later that year but then returned to England before any confrontations. At the same time, Edward's son Edward, prince of Wales (later called the Black Prince), attacked southern France. Unable to halt the English invasions because he lacked funds, John gathered the States General to seek money and to impose an unpopular salt tax. John first went to defend Paris and Chartres. He and the Prince of Wales finally met near Poitiers in September 1356. The French army was decimated, and John was taken prisoner, leaving the French people grief-stricken and confused.

John was taken to London in April 1357, where he was lodged in the Savoy palace; there he concluded treaties (January 1358 and March 1359) so harsh that they were repudiated in France. Finally the treaties of Brétigny and of Calais (May and October 1360) fixed John's ransom at 3,000,000 gold écus and surrendered most of southwestern France to Edward. On Oct. 9, 1360, John was released to raise a ransom that France could not afford to pay, and hostages were accepted in his place. When one of the hostages (John's own son) escaped, John, feeling dishonoured, returned to England on his own volition as a prisoner.

Hainaut

• **John I:** *see* John II (Holland).

Holland

• **John II,** also called JOHN OF AVESNES, Dutch JAN VAN AVESNES (b. *c.* 1247—d. Sept. 11?, 1304, Hainaut), count of Hainaut (1280–1304) and of the Dutch provinces of Holland and Zeeland (1299–1304), who united the counties and prevented the northward expansion of the house of Dampierre, the counts of Flanders.

Eldest son of John of Avesnes, count of Hainaut, and Alida, sister of Count William II of Holland, John secured the title count of Hainaut in 1280 as John I. Long a friend of King Philip IV the Fair of France, the Count influenced his cousin, Count Floris V of Holland, to end his long, friendly relations with King Edward I of England and make an alliance with France, an action that was violently opposed by several Dutch nobles, who seized and murdered Floris (June 27, 1296).

John was then named governor of Holland and guardian of Floris' 15-year-old son, after whose death (1299), he became count of Holland as John II. Though the people of Holland accepted his leadership, he had to ward off a challenge by King Albert I of Germany (1300), repel an invasion by English forces (1300), subdue a rebellion in Zeeland (1301), and fight the army of the Dampierres for two years before driving the Flemish from Holland and Zeeland in 1304.

Hungary

• **John,** original name JÁNOS ZÁPOLYA, or SZÁPOLYAI (b. 1487, Szepesváralja, Hung.—d. July 22, 1540, Szászebes), king and counter-king of Hungary (1526–40) who rebelled against the House of Habsburg.

John began his public career in 1505 as a member of the Diet of Rákos; it was upon his motion that the Diet voted that no foreign prince would ever again be elected king of Hungary after the death of King Ulászló II, who also was king of Bohemia as Vladislas II. Appointed *voivode* (governor) of Transylvania in 1511, John brutally suppressed the peasant uprising of 1514 and, thereby, increased his popularity with the gentry. Consequently the second Diet of Rákos appointed him governor of the infant king Louis II. He failed to acquire the appointment as palatine (imperial governor) of Hungary, which was given to István (Stephen) Báthory in 1519, and dissension between the two contributed to the Turkish conquest of Belgrade two years later.

When the Ottoman sultan Süleyman I the Magnificent invaded Hungary in 1526, and the young king Louis was slain at the Battle of Mohács in August that year, John was accused, probably without justification, of de-

liberate treachery for failing to reach the king in time with a relief army.

Nevertheless, the last Turkish regulars had left Hungary by the end of October; and, with the Turks gone, one party of nobles elected John king (Nov. 10, 1526); but Louis II's brother-in-law, Ferdinand, archduke of Austria (and later Holy Roman emperor as Ferdinand I), also claimed the throne in virtue of the Habsburg-Jagiello family compact, and his adherents crowned him, too, in 1527. An internecine struggle, in which Süleyman supported John, went on until 1538, when by the secret Treaty of Nagyvárad, Hungary was divided: Ferdinand took western Hungary with Croatia; John had the remaining two-thirds, with the royal title and his capital at Buda, and Ferdinand was to succeed on John's death. John, however, remarried and had a son, John Sigismund (1540–71), whom on John's death his adherents elected king. Ferdinand asserted his claim, but Süleyman then, posing as John Sigismund's protector, himself occupied most of central and southern Hungary, leaving Ferdinand with only the western portion.

Papacy

• **John I,** Saint (b. Tuscany [Italy]—d. May 18, 526, Ravenna; feast day May 18), pope from 523 to 526 who ended the Acacian Schism (484–519), thus reuniting the Eastern and Western churches by restoring peace between the papacy and the Byzantine emperor Justin I.

Unfortunately the reunion ended friendly relations between the papacy and Theodoric the Great, the Ostrogothic ruler at Rome. Theodoric mistrusted the rapprochement, and his hostility flared when Justin took harsh measures against the heretical Arian sect in the Byzantine Empire. Theodoric was himself an Arian Christian, and in 525 he ordered Pope John to negotiate a withdrawal of Justin's edict. John was the first pope to go to Constantinople, but his attempt there to obtain a reversal of Justin's policies was only partly successful. After he returned to Ravenna (526), Theodoric had him cast into prison, where he soon died, probably of starvation. He is honoured as a martyr.

• **John II,** original name mercurius (b. Rome [Italy]—d. May 8, 535, Rome), pope from 533 to 535 and the first pontiff to change his original name, which he considered pagan.

John's pontificate opposed Nestorianism, the heresy that separated the divine and human natures of Christ and denied the Virgin Mary the title Mother of God. Nestorianism had been condemned by the Council of Chalcedon in 451. In 534 the Byzantine emperor Justinian I persuaded John to condemn the Acoemeti, a group of monks in Constantinople who had adopted Nestorianism. They were excommunicated on March 24/25, 534, thus ending the Theopaschite controversy.

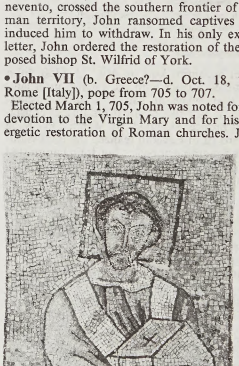
• **John III,** original name catelinus? (b. Rome? [Italy]—d. July 13, 574, Rome), pope from 561 to 574.

Records of John's pontificate were destroyed during an invasion of Italy by the Lombards, whose kingdom was in northern Italy. In 571 John persuaded the Byzantine general Narses to defend Rome, but the Romans opposed Narses because he allegedly caused the Lombard invasion. To avoid involvement in the ensuing quarrel, John withdrew to the catacombs until Narses' death (*c.* 573).

• **John IV** (b. Dalmatia [now in Croatia]—d. Oct. 12, 642, Rome), pope from 640 to 642.

A Roman archdeacon, John was elected (Dec. 24, 640) as successor to Pope Severinus. He perpetuated Severinus' condemnation of monothelitism, a 7th-century heresy concerning the will of Christ. He sent an emissary to redeem Balkan Christians captured during Slavic invasions. John was against the date for Easter favoured by Celts in Ireland, and he defended the highly controversial orthodoxy of Pope Honorius I, who had held that Christ's human and divine natures were indivisible and that the Son's will was not different from that of the Father.

• **John V** (b. Syria?—d. Aug. 2, 686, Rome [Italy]), pope from July 23, 685, to Aug. 2, 686.



As deacon, John was one of Pope St. Agatho's legates to the sixth ecumenical council at Constantinople (680–681), which condemned the monothelite heresy (the view that Christ had only one will—*i.e.,* divine). He succeeded Pope St. Benedict II and was consecrated July 23, 685. A man of learning and generosity, he made liberal donations for the poor.

• **John VI** (b. Greece?—d. Jan. 11, 705, Rome), pope from 701 to 705.

John was consecrated on Oct. 3, 701. When the Byzantine commander Theophylactus invaded the Italian mainland from Sicily, John protected him from the local reaction; and when Gisulfo, the Lombard duke of Benevento, crossed the southern frontier of Roman territory, John ransomed captives and induced him to withdraw. In his only extant letter, John ordered the restoration of the deposed bishop St. Wilfrid of York.

• **John VII** (b. Greece?—d. Oct. 18, 707, Rome [Italy]), pope from 705 to 707.

Elected March 1, 705, John was noted for his devotion to the Virgin Mary and for his energetic restoration of Roman churches. John

John VII, mosaic; in St. Peter's, Rome
Alinari—Art Resource

did not recognize the decrees of the Council of Trullo (Constantinople, 692), submitted by the Byzantine emperor Justinian II, which included disapproval of such customs as celibacy of the clergy and rules for fasting.

• **John** (fl. 9th century, Italy), antipope during January 844.

A Roman archdeacon well liked by the populace, John was elected by them on January 25 against the nobility's candidate, Sergius II. John withdrew to the Lateran Palace, his stronghold for a brief period. Concurrently, Sergius was consecrated pope at St. Peter's without imperial sanction. John was saved from being murdered by the noble faction through the intervention of Sergius, who then imprisoned him in a monastery. In the following June, Sergius was finally approved by the Frankish emperor Lothair I, and John's subsequent history is unknown.

• **John (VIII):** *see* Joan, Pope.

• **John VIII** (b. Rome [Italy]—d. Dec. 16, 882, Rome), pope from 872 to 882.

John was a deacon of the Roman church when elected on Dec. 14, 872, to succeed Pope Adrian II. He supported archbishop St. Methodius in the Christianization of the Slavs and sanctioned the use of the Slavic language for the liturgy. To unite southern Italy against invasions of the Saracens—Muslim enemies—John allied with the Frankish emperor Louis II. On Louis's death (875) John named and then crowned King Charles II the Bald of France as Western emperor. He supported Charles against the Saracens, but the resistance dissipated when Charles died.

Meanwhile, John was harassed by the cardinal bishop of Porto, Formosus (later pope), and his supporting faction. John deposed and excommunicated Formosus in 876.

John solved a controversy over orthodoxy between the Holy See and the East by recognizing in 879 the heretofore condemned Photius as patriarch of Constantinople. Between 875 and 881 he fortified Rome against the Saracens and founded a papal navy. In 881 he crowned the Frankish king Charles III the Fat as emperor. Throughout his pontificate, John was threatened by intrigues among his political enemies. He is said to have been murdered in a local conspiracy.

• **John IX** (b. Rome [Italy]—d. January 900), pope from 898 to 900.

Consecrated in January 898, John was opposed by the rival candidate Sergius (later Pope Sergius III), whom he excommunicated. John immediately held councils at Rome and Ravenna to rehabilitate Pope Formosus, whose corpse had been exhumed (897) by Pope Stephen VI (VII) for a posthumous trial that declared his election as pope invalid. John's councils condemned Stephen's synod and destroyed its acts, restored the clergy deposed by Stephen and his faction, and confirmed the Constitutio Romana of the Frankish emperor Lothair I, thereby making compulsory the presence of an imperial emissary at papal elections.

• **John X** (b. Tossignano, near Imola, Romagna [Italy]—d. May/June 928, Rome), pope from 914 to 928. He was archbishop of Ravenna (*c.* 905–914) when chosen to succeed Pope Lando about March 914.

John approved the severe rule of the newly founded Benedictine order of Cluny. To drive the Saracens (Muslim enemies) from southern Italy, John allied with the Byzantine emperor Constantine IV and King Berengar I of Italy. In August 915, with the Roman senator Theophylactus and Duke Alberic I of Spoleto, John's forces defeated the Saracens on the Garigliano River. In December 915 he crowned Berengar as Holy Roman emperor. When Berengar was assassinated in 924, John allied with King Hugh of Italy. This enraged Theophylactus' daughter, Marozia, herself a powerful Roman senator; she ordered John imprisoned in Castel Sant'Angelo, Rome, where he was probably smothered to death.

• **John XI** (b. 910?, Rome [Italy]—d. December 935/January 936, Rome), pope from 931 to about 935.

He was the son of Marozia (dominant lady of the Roman Crescentii family) perhaps by her reputed lover, Pope Sergius III. John was con-

secrated in February/March 931. He served his mother's political ends until 932/933, when his half-brother Alberic II (Marozia's son by Duke Alberic I of Spoleto) deposed, arrested, and imprisoned her in Castel Sant'Angelo, Rome, and confined John to the Lateran. He remained a prisoner until his death.

•John XII, original name OTTAVIANO, English OCTAVIAN (b. 937?, Rome—d. May 14, 964), pope from 955 to 964.

He was the only son of Duke Alberic II of Spoleto, then ruler of Rome, who ordered Octavian's election (Dec. 16, 955) as pope when he was only about 18 years of age.

The young pope changed his name to John, and he crowned the German king Otto I the Great and his wife Adelaide as Holy Roman emperor and empress on Feb. 2, 962. But he rebelled when Otto issued his controversial *Privilegium Ottonianum* ("Ottonian Privilege"), which ordered John to take an oath of obedience to the Emperor. On Nov. 6, 963, Otto called a council at St. Peter's, Rome, which on Dec. 4, 963, deposed John for instigating an armed conspiracy against Otto and for dishonourable conduct. The council replaced John with Pope Leo VIII. In February 964, after Otto left, Leo was deposed by a synod conducted by John. Soon after, John died suddenly in the arms of his mistress.

•John XIII (b. Rome—d. Sept. 6, 972, Rome), pope from 965 to 972.

He was bishop of Narni, Papal States, when chosen pope on Oct. 1, 965, by Emperor Otto I. Although John was a pious and learned man, the Roman nobles opposed Otto's choice and kidnapped John (December 965). In 966 Otto saved him and took savage vengeance on his enemies. John crowned Otto's 12-year-old son Otto II as emperor (Christmas 967). Immediately before the Byzantine princess Theophano married Otto II (972), John crowned her as empress. John's alliance with the imperial family made his pontificate peaceful.

•John XIV, original name PIETRO CANEPANOVA (b. Pavia, Lombardy—d. Aug. 20, 984, Rome), pope from 983 to 984.

He was bishop of Pavia when chosen pope in November/December 983 by the Holy Roman emperor Otto II. His election was opposed by the powerful Roman Crescentii family, which supported Antipope Boniface VII. Boniface had been expelled by Otto but returned to Rome when Otto died (Dec. 7, 983). Aided by the Crescentii, he imprisoned John in the Castel Sant'Angelo, Rome, and presumably had him murdered, either by starvation or by poison. John's sole extant document is a letter to Archbishop Alo of Benevento, Italy, concerning church reform.

•John (XV): *see* John (XX) (Papacy).

•John XV (or XVI) (d. March 996, Rome), pope from 985 to 996, who carried out the first solemn canonization in history by papal decree.

His election, August 985, came during one of the darkest periods in papal history, shadowed by the murders of the popes Benedict VI and John XIV by the antipope Boniface VII. Boniface had been the candidate of the powerful Roman Crescentii family, and his sudden death in 985 consequently caused the family a political setback. Crescentius II's success in swaying John's election revived that family's good fortune. John's pontificate was thus dominated by Crescentius, except during the interpositions of Empress Theophano, the Holy Roman emperor Otto II's widow. Eventually John appealed to the German king Otto III, later Holy Roman emperor, against Crescentius but died before Otto could intervene. John's solemn canonization of Bishop St. Ulrich of Augsburg in 993 was the first recorded.

•John XVI (or XVII), original name GIOVANNI FILAGATO, Latin JOHANNES PHILAGATHUS (b. Rossano, Calabria—d. *c.* 1013), antipope from 997 to 998.

A monk whom the Holy Roman emperor Otto II named abbot of the monastery of Nonantola, Italy, he attained an influential position at the court of Otto's widow, the empress Theophano. In 988 Theophano made John bishop of Piacenza, Italy, later raising his see to an archbishopric. He was godfather of Theophano's son, the imperial prince Otto (III) and later king of Germany, who in 995 sent John to Constantinople as legate for his prospective marriage to a Byzantine princess. When Pope John XV died (March 996), Otto named his cousin Bruno (Gregory V) as the successor. The Crescentii, a powerful Roman family, opposed Otto's choice, and while he was in Germany, Crescentius II led a revolt that usurped Gregory's office. John returned from Constantinople, and Crescentius, planning to ally Rome with Byzantium against Otto, offered John the papacy. Over the protests of his friend Abbot St. Nilus of Rossano, John accepted. In 997 the exiled Gregory excommunicated Crescentius. Otto brought an army to Italy the following year, and a reign of terror ensued. Otto captured both Crescentius and John. Crescentius was beheaded on April 29, and John, after having been blinded and mutilated, was either imprisoned or confined to a monastery. His life was spared through the intercession of Nilus.

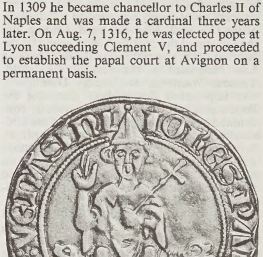
•John XVII (or XVIII), original name SICCO, or SECCO (b. Rome—d. Dec. 6, 1003), pope from June to December 1003. Chosen by the patrician John Crescentius III, he succeeded Pope Sylvester II. John was merely a puppet of the Crescentii, then the most influential family in Rome.

•John XVIII (or XIX), original name FASANO (b. Rome—d. June/July 1009, Rome), pope from 1004 to 1009.

Like his predecessor, Pope John XVII, his election was influenced by the Roman patrician John Crescentius III. He was consecrated in January 1004. More independent of the powerful Italian Crescentii family than John XVII, he eventually abdicated and died shortly thereafter at the Abbey of St. Paul Outside the Walls, Rome.

•John XIX (or XX), original name ROMANO, Latin ROMANUS (d. November/December 1032), pope from 1024 to 1032.

A member of the Tusculani family that followed the powerful Crescentii as rulers of Rome, he was a layman when he succeeded his brother Pope Benedict VIII in April/May 1024. On Easter 1027 he crowned as Holy Roman emperor the German king Conrad II, who controlled his ecclesiastical affairs except in Rome. Generally considered inept as pope because of his greed, John consented to be paid for recognizing the patriarch of Constantinople. A public outcry forced him to withdraw the agreement.



•John (XX), nonexistent pope. A confusion in the numbering of popes named John after John XIV resulted because Marianus Scotus and other 11th-century historians mistakenly believed that there had been a pope named John between antipope Boniface VII and the true John XV. Therefore they mistakenly numbered the real popes John XV to XIX as John XVI to XX. These popes have since customarily been renumbered XV to XIX, but John XXI and John XXII continue to bear numbers that they themselves formally adopted on the assumption that there had indeed been 20 Johns before them. In current numbering there thus exists no pope by the name of John XX.

•John XXI, original name PEDRO JULIÃO, byname PEDRO HISPANO (the Spaniard), Latin PETRUS JULIANI, or PETRUS HISPANUS (b. *c.* 1210–20, Lisbon—d. May 20, 1277, Viterbo, Papal States), pope from 1276 to 1277, one of the most scholarly pontiffs in papal history.

Educated at the University of Paris (*c.* 1228–35), where he received his master's degree *c.* 1240, John taught medicine at the new University of Siena, Italy. In 1272 Pope Gregory X, who made John his personal physician, appointed him archbishop of Braga and cardinal bishop of Tusculum in 1273 (consecrated 1274). After the five-week pontificate of Adrian V, John was elected on Sept. 8, 1276. He chose as his principal adviser Cardinal John Gaetan Orsini, who soon was to succeed him as Nicholas III. John's short pontificate strove for unity between Rome and the Eastern Church. In addition to his psychological treatise *De anima* ("On the Soul") and his commentary to Pseudo-Dionysius the Areopagite's *Celestial Hierarchy,* John wrote one of the most widely used medieval textbooks on logic, *Summulae logicales* ("Small Logical Sums"). One of his most important medical works was *Liber de oculo* ("Concerning the Eye"). He was crushed to death when the ceiling of the papal palace at Viterbo collapsed.

•John XXII, original name JACQUES DUÈSE, or D'EUZE (b. Cahors, Fr.—d. Dec. 4, 1334, Avignon), second Avignon pope (reigned 1316–34), who centralized church administration, condemned the Spiritual Franciscans, and, against Emperor Louis IV, upheld papal authority over imperial elections.

Born of a wealthy bourgeois family at Cahors in southwestern France, Jacques Duèse studied canon and civil law at Paris and Orléans. In 1309 he became chancellor to Charles II of Naples and was made a cardinal three years later. On Aug. 7, 1316, he was elected pope at Lyon succeeding Clement V, and proceeded to establish the papal court at Avignon on a permanent basis.

Leonard von Matt—EB Inc.

Early in his pontificate, John intervened in a long-standing conflict between two factions in the Franciscan order—the Spirituals, who favoured strict adherence to St. Francis' rule of poverty, and the Conventuals, who held to a broader interpretation. He supported the Conventuals and persecuted Spirituals who resisted his decision. He later condemned the whole Franciscan theory of evangelical poverty in two decretals (letters): *Ad Conditorem Canonum* (1322) and *Cum Inter Nonnullos* (1323), asserting scriptural evidence to show that Christ and the Apostles had owned property.

John also intervened in a quarrel over the crown of the Holy Roman Empire between Louis the Bavarian (Emperor Louis IV) and Frederick of Austria. Louis defeated Frederick in 1322, but John forbade him to exercise

imperial authority until he, as pope, settled the dispute. Louis's answer was the Sachsenhausen Appellation (May 22, 1324), in which he denied papal authority over imperial elections and attacked John's condemnation of the Spiritual Franciscans. At the same time Louis received at his court the political philosophers Marsilius of Padua and John of Jandun, who, in their work *Defensor pacis* ("Defender of the Peace"), had declared the authority of an ecumenical council superior to that of the pope. John retaliated by excommunicating Louis, but, on April 18, 1328, the Emperor had John deposed at Rome. (His condemnation of the Spirituals was held to conflict with the pronouncement of Nicholas III.) The Franciscan Peter of Corbara (Pietro Rainalducci) was elected antipope as Nicholas V, and Michael of Cesena, general of the Franciscan order, appealed to the authority of a church council against John. John thereupon excommunicated Peter and deposed Michael. When Louis returned to Germany in 1329, Peter submitted to John and was subsequently imprisoned at Avignon. The Emperor attempted, without success, to effect a reconciliation with the Pope, and thereafter the Franciscans and their philosopher ally Marsilius continued to carry on a vigorous antipapal propaganda from the imperial court at Munich.

New accusations of heresy were provoked by John's ideas about the experience of God by the souls of the blessed in the afterlife (the Beatific Vision), which he expressed in four sermons delivered in the winter of 1331–32. Most theologians held that the saints in heaven were immediately admitted to a full vision of the Godhead. John disagreed, holding that the fullness of the Beatific Vision would be delayed until the resurrection of the dead and the Last Judgment at the end of the world. Thomas Wallensis, an English Dominican, was imprisoned for publicly disputing the Pope's position, which was subsequently condemned by a committee of doctors of the University of Paris. A pro-imperial cardinal, Napoleone Orsini, began secret negotiations with the Emperor for the convocation of an ecumenical council to judge John. John tried to reconcile his views with those of his opponents before his death in 1334.

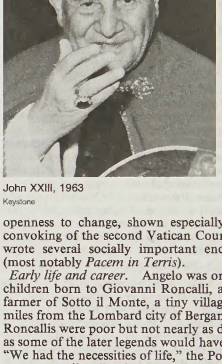
During his pontificate, John had promoted missionary activity in Asia, establishing Catholic bishoprics in Anatolia, Armenia, Iran, and India. At Avignon he founded a papal library and at Cahors, a university. Like most of the Avignon popes, he showed favouritism to his relatives and fellow countrymen. Of 28 cardinals created by him, 20 were from southern France and 3 were his nephews. In appearance he was small, thin, and pale; in character, impetuous, astute, obstinate, and autocratic, though simple and approachable.

His most lasting achievements were in the sphere of law and finance. He added to the body of church law the canons (decrees) of his predecessor, Clement V, and many of his own canons were later added. These were the last additions to canon law until the 16th century. The papal treasury, greatly depleted at the time of his accession, was greatly increased when he died. By the bulls (solemn documents) *Execrabilis* (1317) and *Ex Debito* (1319), he increased papal control over the distribution of church offices and over the fees paid by their recipients. He also compiled a new tax book, fixing fees for 145 documents issued by the papal chancery, which was not revised for the next two centuries.

(D.L.D.)

BIBLIOGRAPHY. Guillaume Mollat, *Les Papes d'Avignon (1305–1378),* 10th ed. (1964; *The Popes at Avignon, 1305–1378,* 1963), is the standard and best general account of the Avignon papacy. Yves Renouard, *La Papauté à Avignon,* 3rd ed. (1954; *The Avignon Papacy, 1305–1403,* 1970), is also very good, especially on the administrative side, and draws attention to the geographical importance of Avignon in the development of papal government. Noel Valois, "Jacques Duèse, pape sous le nom de Jean XXII," *Histoire littéraire de la France,* 34:391–630 (1914), gives the best account of John's relations with the Franciscans and of his views on the Beatific Vision and his contributions to missionary activity and to the liturgy. See also S. Baluze, *Vitae Paparum Avenionensium,* 2 vol. (1693), rev. by Guillaume Mollat (1917), contemporary lives with extensive notes by the chief modern authority; Guillaume Mollat, Auguste Coulon, and Suzanne Clémencet, *Les Registres de Jean XXII* (issued in fascicles), papal letters with an invaluable introduction on papal administration; and Decima Douie, *The Nature and the Effect of the Heresy of the Fraticelli* (1932), somewhat out of date but still the fullest account in English of John XXII's relations with the Franciscans.

•John (XXIII), original name BALDASSARE COSSA (b. Naples—d. Nov. 22, 1419, Florence), schismatic antipope from 1410 to 1415.



After receiving his doctorate of law at Bologna, Cossa entered the Curia during the Western Schism, when the papacy suffered from rival claimants (1378–1417) to the throne of St. Peter. Pope Boniface IX made him cardinal in 1402. From 1403 to 1408 he served as papal representative in Bologna. The Schism worsened with the hopeless deadlock between Pope Gregory XII and Antipope Benedict XIII; in 1408 Cossa deserted Gregory. In an attempt to save the church, the cardinals convened the invalid Council of Pisa (1409), at which Cossa was a leading figure. The council failed in its objectives, declared both Gregory and Benedict deposed, and elected a third rival, Antipope Alexander V. At the death of Alexander, in May 1410, he was succeeded on May 25 by Cossa as John XXIII.

Meanwhile, King Ladislas of Naples—whom Pope Innocent VII had named "defender" of the church—was occupying Rome and protecting Gregory. Ladislas' rival was Louis II of Anjou, pretender to Naples, who joined forces with John and entered Rome in April 1411. Although Ladislas was defeated on May 19, he soon reorganized his army and forced Louis to withdraw. John then abandoned Louis and in 1412 negotiated with Ladislas; in exchange for Ladislas' repudiation of Gregory, John granted Ladislas large sums of money and territorial concessions. In May/June 1413, however, Ladislas proved disloyal by sacking Rome and expelling John, who fled to Florence, where the German king Sigismund (later Holy Roman emperor) was working for a general council to end the Schism. Sigismund induced John to call the Council of Constance. Interpreting the negotiation between Sigismund and John as a threat to his position in Italy, Ladislas pursued the Pope—who was then en route to Constance while Sigismund was returning to his German kingdom—but died on Aug. 6, 1414.

The Council of Constance opened on Nov. 5, 1414. Although the majority of the council's members acknowledged the Council of Pisa and its candidate, John, political rivalries soon arose; the Italians endorsed John, but eventually the Germans, English, and French asked for the abdication of John, Gregory, and Benedict, thus ridding the Holy See of all three rival pontiffs. At first, John refused to abdicate, but on March 2, 1415, he agreed to resign if his rivals would do the same. Yet on March 20/21 he fled from Constance disguised as a layman, hoping to deprive the council of its authority and to cause its disintegration. Enraged by his desertion, the council pronounced itself supreme, ordered John's arrest and deposed him on May 29, 1415, received Gregory's resignation, condemned Benedict, elected Pope Martin V, and thus restored church unity. John was returned to Constance, where, despite his acceptance of Martin's election, he remained Sigismund's prisoner. In 1418 he was released for a heavy ransom. Martin made John cardinal-bishop of Tusculum in 1419, but John died a few months later.

•John XXIII, original name ANGELO GIUSEPPE RONCALLI (b. Nov. 25, 1881, Sotto il Monte, Italy—d. June 3, 1963, Rome; beatified Sept. 3, 2000; feast day Oct. 11), one of the most popular popes of all times (reigned 1958–63), who inaugurated a new era in the history of the Roman Catholic Church by his

John XXIII, 1963
Keystone

openness to change, shown especially in his convoking of the second Vatican Council. He wrote several socially important encyclicals (most notably *Pacem in Terris*).

Early life and career. Angelo was one of 13 children born to Giovanni Roncalli, a tenant farmer of Sotto il Monte, a tiny village seven miles from the Lombard city of Bergamo. The Roncallis were poor but not nearly as destitute as some of the later legends would have had it. "We had the necessities of life," the Pope used to say testily, "and we were strong and healthy." Though Angelo, the third child and oldest son of the family, went off to prepare for the priesthood as a child of 11, he continued to spend vacations with the family and remained close to them throughout his life.

No matter how powerful he became, however, he never helped any of the other Roncallis to advance in the world. "The world is only interested in making money . . . ," he wrote to his brother Saverio after he became pope. "A great honour has come to our family," he acknowledged, but he urged Saverio and the others to remain humble, seek no honours or preferments, and take no material advantage of their relationship to the Pope. "At my own death," he concluded, "I shall not be denied the praise which did so much honour to the holiness of Pius X: born poor, he died poor." In his last will he bequeathed each of the living members of the family a legacy of less than $20—his total personal fortune.

Angelo, the churchman, however, was destined to spend most of his life among the powerful and cultivated. Inevitably, that set him apart from the other Roncallis almost from the beginning. While still a seminarian, he was already beginning to feel out of place in Sotto il Monte, where he was charged with priggishness and "putting on airs." "Only three days of the holidays have passed and already I am weary of them," he recorded in the diary that he allowed to be published after his death. He was eager, he wrote, to return to Bergamo, with its orderly life of study, prayer, and genteel fellowship, and to escape from the

petty gossip, suspicion, and jealousies of the village.

Roncalli was not an especially brilliant student. He did well enough, however, to be sent to Rome for theological studies in 1900. After only one year at the Seminario Romano, his education was interrupted when he was drafted into military service and assigned to an infantry company conveniently stationed at Bergamo. Later, as a priest, he returned to the army during World War I. Again he served in Bergamo, first as a hospital orderly and later as a military chaplain with the rank of lieutenant.

Even with the time out for military service, he was not yet 23 when he was ordained a priest, in Rome on Aug. 10, 1904. The next day he said his first mass at St. Peter's Basilica. After a visit to the family in Sotto il Monte, he returned to the Seminario Romano for further study. Eventually he received a doctorate in canon law.

As a graduate student in Rome, Roncalli took the first step that was to lead to the papacy a half century later. Simply because he was a priest of Bergamo, he was asked by the reigning pope, Pius X, to assist in the ceremony of consecration for a new bishop, Giacomo Radini-Tedeschi, who had been appointed to take over the diocese of Bergamo. The new bishop, a member of the Italian nobility, was much taken by the young priest and asked him to serve as his secretary.

Back in Bergamo, Don Angelo, in addition to his secretarial duties, was assigned to the faculty of the diocesan seminary. For the next nine years he served as a professor of theology and spiritual director of the young men preparing for ordination. As the Bishop's right-hand man, he gained a wide range of pastoral experience.

Roncalli had great esteem for his superior, who was known as the most progressive prelate in Italy. After the Bishop's death, in 1914, he wrote an appreciative biography of the prelate and sent a copy to the pope, Benedict XV, who had been one of Radini-Tedeschi's personal friends.

With the war behind him, Roncalli was summoned to wider service in the church. In 1920, Pope Benedict, recalling Radini-Tedeschi's biographer, named him a director of the Italian organization for the support of foreign missions. The position was not notably significant in a church top-heavy with dignitaries, but it brought him into personal contact with a number of important clerical figures throughout Europe, and his name became recognizable in ecclesiastical Rome. He also gained some attention because of his work as a part-time historian who specialized in some of the minor activities of St. Charles Borromeo, a cardinal of Milan who played an important role in the 16th-century Counter-Reformation. It was Roncalli's researches for this project that first brought him into contact with Msgr. Achille Ratti, the Milanese librarian who would become Pius XI.

Service as a Vatican diplomat. Pius XI later remembered the Bergamo priest's gift for personal dealings and brought him into the Vatican's diplomatic service. Roncalli was appointed apostolic visitor to Bulgaria in March 1925. In keeping with custom, he was made an archbishop before he left Rome. He spent the next 10 years in that obscure but delicate post, where he was expected to protect the interests of a small Roman Catholic community in a country overwhelmingly Eastern Orthodox. His diary reveals that he was often lonely and discouraged in Bulgaria, but he carried out the assignment with tact, patience, and notable good humour. Still, he was not deemed to be among the best qualified clerics in the papal diplomatic corps.

His next assignment was equally unpromising. He was appointed apostolic delegate to Greece, which was combined with naming him head of the Vatican diplomatic mission to Turkey. Again he was called upon to represent powerless Catholic minorities in an Eastern Orthodox nation, Greece, and a Muslim nation, Turkey. He made his home in Istanbul, where he was generally ignored by both the Turkish government and the Vatican but was warmly appreciated in the diplomatic colony as an amiable host and affable dinner companion.

None of these posts loomed large in the Western-oriented Vatican, and the Archbishop had good reason to believe that his career had reached a dead end. Later, he confessed that he was stunned by the announcement, at the end of 1944, that he had been named papal nuncio to Charles de Gaulle's newly liberated France; his first thought was that a clerical error must have been made in Rome.

The French post was particularly delicate at the time. Roncalli's predecessor, Msgr. Valerio Valeri, had been close to the collaborationist Gen. Philippe Pétain during the German occupation, and de Gaulle made it clear to the Vatican that since Valeri had become persona non grata to the French people, he would have to be replaced immediately. France was still seething with a spirit of vengeance against former collaborators. It would be the new nuncio's obligation to deal with the ill will created by his predecessor and by the bishops who had cooperated with the hated Vichy government. Someone in the Vatican remembered the genial archbishop languishing in the Near East, and it was decided that, though he was not noted for his political astuteness, perhaps he had precisely the qualifications needed under the circumstances. Roncalli was told that he would be expected to cool the atmosphere, reestablish the independence of the church, and gain the release of a number of German seminarians who were being held as prisoners of war. In addition, he had to deal with an outburst of radicalism among the younger French clergy, which the conservative forces in the Vatican Curia found highly disturbing.

His success in carrying out the assignment was acknowledged by the papacy when Archbishop Roncalli was named a cardinal by Pius XII. In January 1953 the red hat, the symbol of a cardinal, was conferred on him by the Socialist president of France, Vincent Auriol.

Reign as pope. As a cardinal, Roncalli immediately became eligible for one of the major Italian archbishoprics. Appointed patriarch of Venice at the age of 71, he had cause once more to believe that he had reached the end of the line. Thus, perhaps no one was more surprised than he when, after the death of Pius XII on Oct. 9, 1958, he was elected pope on the 12th ballot—clearly a compromise candidate acceptable to all parties only because of his advanced years.

Perhaps a younger pontiff would have been less daring and innovative than John XXIII turned out to be. Soon after his coronation, he announced almost casually that he was summoning an ecumenical council—a general meeting of the bishops of the church—the first in almost a century. He said the idea came to him in a sudden inspiration. His purpose was to "bring the church up to date" (aggiornamento) and to work for its spiritual regeneration. He was the first pope since the Reformation who acknowledged frankly that Catholicism stood in need of reinvigoration and reform.

It was long a truism among church historians that councils are followed by upheaval and disorder in the church. The Pope's decision, consequently, was received coolly by his conservative Curia, who were convinced that the church had prospered under Pius XII's leadership and who saw no good reason for the changes John envisioned. Some of the Vatican cardinals in fact did everything in their power to delay the council until the old man had passed from the scene and the project could be quietly dropped. But the Pope pushed on with his plan and lived long enough to preside over the first session of the second Vatican Council in the fall of 1962.

In keeping with his wishes, the council fathers pledged that they would be consistently positive. No condemnations or anathemas were to be made; political hostilities were to be ignored; and the church above all was to recognize that it was not the master but the servant of humanity. The Pope made it clear that the second Vatican Council was convened as a pastoral council. No new dogmas were to be pronounced, though old doctrines and disciplines were to be reexamined. What John sought, he said, was a "New Pentecost," a new outpouring of the Holy Spirit.

The council, according to John's design, would make a new start toward achieving Christian unity by putting aside the hostilities of the past and acknowledging the Catholics' share of responsibility for the scandal of a divided Christianity. With his long experiences among the Eastern Orthodox, John's interest in Christian ecumenism seemed natural enough, but no one in Rome was quite prepared for the extent of his openness. He received Eastern Orthodox, Anglican, and Protestant religious leaders with extreme cordiality and made sure they were invited to send observers to the Vatican Council. He removed certain words offensive to Jews from the official liturgy of the church. On one notable occasion, he introduced himself to a group of Jewish visitors with the biblical words, "I am Joseph your brother," referring to the Old Testament story of the meeting of the sons of the patriarch Jacob at the court of Egypt.

He travelled around Rome freely, breaking with the tradition that the pope, deprived of his former temporal power, was a "prisoner of the Vatican." In an attempt to depoliticize the church, he played down his position as ruler of the Vatican and emphasized his role as "servant of the servants of God," a traditional title of the pope. In that spirit he called on the President of Italy and cordially received the son-in-law of the Soviet premier, Nikita Khrushchev, in private audience. Among his other visitors were the Archbishop of Canterbury—the first such meeting since the 14th century—the Moderator of the Scottish Kirk, and a Shintō (the religious cult of Japan) high priest—the first such official in history to be received at the Vatican.

During the Cuban missile crisis of 1962, the Pope publicly urged both the United States and the Soviet Union to exercise caution and restraint and won the appreciation of both Pres. John F. Kennedy and Premier Khrushchev. His major encyclical, *Pacem in Terris* ("Peace on Earth"), addressed to all mankind, was received warmly throughout the world and praised by politicians as well as churchmen. Straightforward and frankly optimistic, it avoided the language of diplomacy and set forth the requirements for world peace in profoundly human terms. Distinguishing between the philosophy of Marxism and actual governments to which it gave birth, John suggested that peaceful coexistence between the West and the Communist East was not only desirable but was actually necessary if mankind was to survive. He thereby diluted the religious energy that had been poured into the Cold War as a result of the militant policies shaped by his predecessor.

John saw himself as a reconciler. In statement after statement he emphasized the church's significance as a supranational spiritual force in the world. His greatest claim on the world's affection, however, rested on the warmth of his personality rather than on any of his formal statements. He remained simple and

unaffected, in spite of the baroque setting in which he found himself, and instinctively appealed directly to human values that everyone could understand.

"Since you could not come to me, I came to you," he told the inmates of a Roman prison. When Mrs. John F. Kennedy, then wife of the President of the United States, came to call, he rehearsed "Mrs. Kennedy, Madame Kennedy" in his poor English. Then, when she appeared he spontaneously spread open his arms and cried out, "Jacqueline!" He once told a Communist diplomat, "I know you are an atheist, but won't you accept an old man's blessing?" When a shabby peasant woman reached up to touch him as he was being carried through St. Peter's, he stopped to clasp her hand. "There is no reason why you shouldn't get as close as the King of Jordan did," he said.

The roly-poly pontiff—he was short of stature and never overcame a tendency toward corpulence—gradually became a kind of father figure for the world. When he died in 1963, it was generally recognized that he had become one of the best loved men on Earth.

Assessment. There was nothing in the earlier life of Angelo Giuseppe Roncalli to suggest that his reign as pope would be anything other than the decorous, tradition-bound, static pontificate the Sacred College of Cardinals was counting on when it chose him as an "interim" pope—a *papa di passaggio*—in October 1958. His brilliant, strong-willed predecessor had shaped a defensive policy for dealing with the modern world that the cardinals thought would serve the needs of the church for another century, and they had every reason to believe, from his past behaviour, that the elderly Cardinal Roncalli would maintain the status quo for the few years he had to live. Then, according to the plan, the church would be turned over to a younger prelate who was cast in Pius XII's mold. As pope, however, Roncalli put into effect so many of the ideas he had entertained privately during a half century of obediently serving others that the church was never the same again.

Roncalli might have lived and died as an obscure parish priest had he been less of a conformist throughout all but the last few years of his life. The child of a peasant family, he began his career in the church with no connections of any significance and no powerful patron to guide him through the maze of ecclesiastical politics. His steady climb was due above all to his readiness to subdue his own preferences, follow orders, and adjust without complaint to the will of his superiors. Such was the clerical ideal proposed at his seminary in Bergamo, and it guided him throughout his life.

His successor, Paul VI, instituted formal proceedings that could lead to his canonization as a saint. Had the ancient custom of popular canonization still been in effect in 1963, however, that honour would probably have been given to him immediately by the tearful crowd who were gathered in St. Peter's Square when his death was announced. In 2000 he was beatified by Pope John Paul II. (Jo.C.)

BIBLIOGRAPHY. Biographical works include E.Y. Hales, *Pope John and His Revolution* (1965); A. Lazzarini, *Giovanni XXIII* (1958; *Pope John XXIII*, 1959); Meriol Trevor, *Pope John* (1967); and Paul Johnson, *Pope John XXIII* (1974), a good popular biography. The Pontiff's diary, which he began writing as a seminarian and finished when he was pope, was published as *Il giornale dell'anima*, 4th ed. (1965; *The Journal of a Soul*, 1965). His encyclicals and major public addresses may be found in *The Encyclicals and Other Messages of John XXIII* (1964). Pope John's papacy and its impact on the church are discussed in most of the books about the second Vatican Council and developments in contemporary Roman Catholicism. Among these in English are Xavier Rynne, *Letters from Vatican City* (1963); Gary MacEóin, *What Happened at Rome? The Council and Its Implications for the Modern World* (1966); and in translation, Hans Küng, *Konzil und Wiedervereinigung* (1960; *The Council and Reunion*, 1961).

PATRIARCHATE

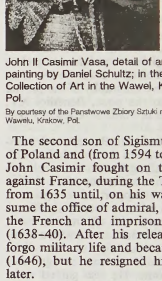
•John XI BECCHUS (b. *c.* 1235, Nicaea, Empire of Nicaea—d. March 1297, Nicomedia, Byzantine Empire), Greek Orthodox patriarch of Constantinople (1275–82) and leading Byzantine proponent of reunion between the Greek and Roman churches.

As archivist and assistant chancellor to Constantinople's anti-unionist patriarch Arsenius (1255–65), Becchus at first opposed union with Rome, taking the stand of his patriarch against that of the pro-unionist emperor Michael VIII Palaeologus. Eventually, however, he was won over by the Emperor and sent on several diplomatic missions, laying the groundwork for reunion. When Pope Gregory X convened preliminary councils to explore the advantages of an East–West union, however, Becchus once again opposed the project and as a result was imprisoned by Michael. During his captivity, he studied Greek and Latin theology as well as the sources of the East–West schism and thereafter strongly advocated the union, which was tentatively negotiated at the Council of Lyon in 1274.

With the abdication of the anti-unionist patriarch Joseph I, Becchus was named to the office in May 1275. As both Greek and Roman desire for reunion wavered, John's unwavering support met with vehement opposition from Orthodox monasteries and ultimately from the Emperor; he abdicated his patriarchal throne in 1279 and was later recalled when the Emperor again sought a reunion, this time for political reasons. With the death of Michael VIII and the accession of the anti-unionist Andronicus II Palaeologus to Byzantium's throne in 1282, relations with Rome broke down and Becchus resigned permanently.

While in exile, he wrote strong polemics against many anti-Latinist Orthodox theologians, particularly George of Cyprus, who had succeeded to the patriarchal throne as Gregory II. Although he was deported to the more remote area of Nicomedia because of these virulent attacks, Becchus refused to compromise, and his persistence helped bring about Gregory's deposition in 1289.

Among Becchus' principal works are his *Epigraphai* ("Collected Texts"), an anthology of patristic writings on the theology of the Holy Spirit; a tract on the peace and union of the ancient and new Roman Churches; and various polemical treatises proposing recognition of papal primacy.



POLAND

•John I Albert, Polish JAN OLBRACHT (b. Dec. 27, 1459, Kraków, Pol.—d. June 17, 1501, Toruń), king of Poland and military leader whose reign marked the growth of Polish parliamentary government.

Second son of King Casimir IV of Poland and Elizabeth of Habsburg, John Albert proved his military ability by defeating the Tatars at Kopystrzyn in 1487 and at Zasław in 1491. After his father's death he was elected king of Poland by nobles in the privy council. Beset by financial problems, in 1493 he convened the privy council, which henceforth called the senate, along with a new legislative body, the chamber of deputies, representing the *szlachta* (gentry) in the first national Sejm (Diet or Parliament). In return for subsidies he agreed to preserve traditional privileges of nobles and gentry and granted extensive legislative powers to the Sejm (Diet).

John Albert also tried to extend his power. Having purchased some lands and acquired others through diplomacy, he embarked on a campaign in Moldavia in 1497. Initiating the campaign in response to the hospodar Stephen the Great's request for aid against the Tatars, John Albert also hoped to capture the towns of Kilia and Belgorod (Akkerman) at the mouths of the Danube and Dnestr rivers. But Stephen, fearing the King's ambitions, suspected that he intended to depose him and put his own brother, the Polish prince Sigismund (later king as Sigismund I the Old), on the Moldavian throne. When the Polish forces entered Moldavia, they met fierce resistence from Stephen's army and suffered a heavy defeat at Suceava in 1497. From 1498 to 1501 the King was occupied with repelling Tatar attacks on Poland's eastern border. When he died, he was preparing to invade the Prussian lands of his recalcitrant vassal, Frederick of Saxony, grand master of the Teutonic Order.

•John II Casimir Vasa, Polish JAN KAZIMIERZ WAZA (b. March 22, 1609, Kraków, Pol.—d. Dec. 16, 1672, Nevers, Fr.), king of Poland (1648–68) and pretender to the Swedish throne whose reign was marked by heavy losses of Polish territory incurred in wars against the Ukrainians, Tatars, Swedes, and Russians.

John II Casimir Vasa, detail of an oil painting by Daniel Schultz; in the State Collection of Art in the Wawel, Kraków, Pol.

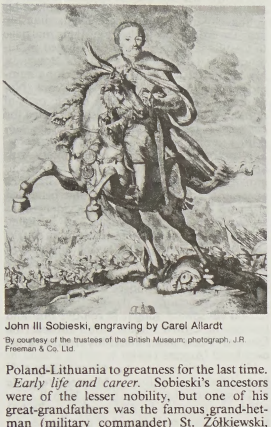
The second son of Sigismund III Vasa, king of Poland and (from 1594 to 1599) of Sweden, John Casimir fought on the Habsburg side against France, during the Thirty Years' War, from 1635 until, on his way to Spain to assume the office of admiral, he was arrested by the French and imprisoned for two years (1638–40). After his release he decided to forgo military life and became a Jesuit novice (1646), but he resigned his position a year later.



A few months after his brother King Władysław IV's death in May 1648, he was elected to the Polish throne and soon married Marie Louise de Gonzague-Nevers, his brother's widow.

John Casimir tried to end an insurrection of Poland's semi-autonomous Ukrainian Cossack subjects by negotiation but was forced to continue the war by Polish nobles who wished to increase their control over the Ukraine. He defeated the Cossacks and their Tatar allies at Beresteczko June 28–30, 1651, but the fighting began anew when the Cossacks submitted themselves to the Russian tsar in return for military aid. While the Polish army was fighting on the eastern border of Poland, the Swedish army invaded from the west and occupied most of the country by October 1655.

John Casimir fled abroad but returned in 1656, when Polish peasants and gentry rebelled against Swedish control. At the conclusion of the war with Sweden in 1660, he had to renounce his rights to the Swedish throne and to northern Livonia. In January 1667 Poland signed a truce with Russia whereby half of Belorussia (with Smolensk), Chernigov, and all of the Ukraine east of the Dneper River and Kiev, west of the river, were ceded to Russia.

Disgusted with external warfare and facing a rebellion by the Diet, the King abdicated (Sept. 16, 1668) and retired to France, where he served as titular abbot of Saint-Germain-des-Prés until his death in 1672.

• **John III Sobieski,** Polish JAN SOBIESKI (b. Aug. 17, 1629, Olesko, Pol.—d. June 17, 1696, Wilanów), elective king of Poland (1674–96), a soldier who drove back the Ottoman Turks and briefly restored the kingdom of Poland-Lithuania to greatness for the last time.

John III Sobieski, engraving by Carel Allardt

Early life and career. Sobieski's ancestors were of the lesser nobility, but one of his great-grandfathers was the famous grand-hetman (military commander) St. Żółkiewski, and, when John was born, his father, James (Jakób) (1588–1646), had already taken a step to the higher ranks, sharing an office on the royal court. At the end of his life, the father even became castellan of Kraków, an office that secured him the highest rank among the members of the Polish Senate, or first chamber of the parliament.

John was well educated and toured western Europe in his youth, as was usual for a Polish noble of his class. When the Swedes invaded Poland in 1655, he joined them in opposition to the Polish king John Casimir. The following year he changed sides again and became one of the leaders in the fight to expel the Swedes. In 1665, through the influence of his patroness, Queen Maria Louisa (Ludwika), he was appointed to the prestigious office of grand marshal. In 1666 he became field commander of the Polish army. In October 1667 he defeated the Tatars and the Cossacks near Podhajce (now Podgaytsy, in Ukraine), and in the spring of 1668, when he triumphantly returned to Warsaw, he was named commander in chief. In 1665 he had married an ambitious young French widow, Marie-Casimire de la Grange d'Arquien (Marysieńka). Marysieńka planned to have John elected king after King John Casimir's resignation in 1668. When this plan failed—the nobility elected Michael Wiśniowiecki in 1669—she began working to obtain support from Louis XIV of France for her husband's advancement. Since they were often separated—the husband on the front, his wife on journeys to France—Sobieski wrote long letters to Marysieńka, which are now a highly interesting and important historical source. Her letters have not been preserved.

During the short reign of King Michael (1669–73), Sobieski distinguished himself by further victories over the Cossacks, and simultaneously he tried to undermine Michael, whose policies favoured the Habsburgs against France. Michael died in November 1673, and almost on the same day Sobieski won a splendid victory over the Turks under Hussein Paşa near Chocim (Hotin). Although this victory did not alter the disastrous conditions of the Peace of Buczacz concluded in 1672 (Poland had to cede territory to the Turks and to pay a considerable indemnity), Sobieski's reputation was so great that in May 1674 he was elected king in preference to the candidate backed by the Habsburgs.

At first Sobieski followed a pro-French policy. He tried to end the Turkish war by French mediation and concluded the secret Treaty of Jaworów with France (June 1675), in which he promised to fight the Holy Roman (Habsburg) emperor after the conclusion of peace with the Turks. In fact, only an armistice with them was concluded at Żórawno (October 1676), and the conditions were only slightly more favourable than those of Buczacz.

Sobieski's hopes of compensating for losses to the Turks in the southeast by using French and Swedish support to make territorial gains from Prussia in the northwest were also disappointed. Furthermore, Louis XIV was neither ready to recognize Marysieńka's French relatives as members of a royal family nor willing to support the succession of Sobieski's son James (Jakób) to the Polish throne. The great nobles, especially those from Lithuania, were opposed to the French alliance because they feared that Sobieski was striving to attain absolute power with the help of France. It was becoming clear, moreover, that it was impossible to reconcile the interests of Poland and those of Louis, whose aim was to use Sobieski as an obedient vassal against the Habsburgs. Poland, for its part, had no differences with the Habsburgs and, after a series of Turkish attacks, came to regard the Ottomans, the allies of France, as its deadliest enemies.

The siege of Vienna. Sobieski, therefore, though always an admirer of France, shifted away from the French alliance and concluded a treaty with the Holy Roman emperor Leopold I against the Turks (April 1, 1683). By the terms of the treaty, each ally had to support the other with all his might if the other's capital were to be besieged. Thus, when a great Turkish army approached Vienna late in the summer of 1683, Sobieski himself rushed there with about 25,000 men. Because he had the highest rank of all military leaders gathered to relieve Vienna, he took command of the entire relief force (about 75,000 men) and achieved a brilliant victory over the Turks at the Kahlenberg (Sept. 12, 1683), in one of the decisive battles of European history.

In the campaign that followed in Hungary (in the autumn of 1683), however, Sobieski was less successful, and his relations with the emperor Leopold deteriorated because of differences in temperament and conflicting political plans. Sobieski's idea was to liberate Moldavia and Walachia (present-day Romania) from Ottoman rule and to expand Poland's influence to the shores of the Black Sea. But his advances into Moldavia, undertaken between 1684 and 1691, were mostly failures, and during the last one he was even in danger of being captured. Despite his previous victories, he was thus not able to achieve his objective. Only in 1699, three years after his death, were the territories that had been lost in 1672 recovered.

In the last years of his life, from 1691 until his death in 1696, Sobieski was often seriously ill and had to face quarrels with the nobles and within his own family. His eldest son, James, was bitterly opposed to the Queen and the younger princes. All of Sobieski's sons were interested in succeeding to the throne and tried to obtain help, either from the Emperor or from France. The marriage of Sobieski's daughter Kunegunda to Maximilian II Emanuel, elector of Bavaria (1694), was the only bright spot in these rather gloomy years.

Although the second half of the reign was much less brilliant than the first, the personal wealth of the royal couple continued to grow because they knew how to obtain money in exchange for offices and favour. Thus, the King left a considerable fortune when he died.

Sobieski also spent large sums on his residences in Żółkiew and Jaworów and especially on the palace of Wilanów near Warsaw, a fine example of Baroque architecture. He was also a patron of poets and painters. Of all the Polish rulers of the 17th century, he was the best educated and took the greatest interest in literature and cultural life.

The struggle against Ottoman power in Europe was the keystone of Sobieski's foreign policy, with which all other foreign relations were closely connected. When the Russians, traditionally Poland's enemies, showed willingness to join the league against the Turks, Sobieski concluded with them the "Eternal" Peace of 1686 (the Grzymułtowski Peace). In this treaty, Kiev, which had been under temporary Russian rule since 1667, was permanently ceded by Poland. But despite all the failures and disappointments he experienced after 1683, Sobieski was able to deliver southeastern Poland from the threat of Ottoman and Tatar attack.

In domestic policy Sobieski was least successful. All his endeavours to strengthen the position of the crown and stabilize the army failed completely, and his own sons opposed him. The nobles showed little interest in defending the country after the great victory of 1683 had been won, and the Lithuanian magnates fought each other rather than the Turks. Thus, John Sobieski, although a brilliant general and organizer, was unable to prevent rebellion in his family and the dissension among his subjects that finally led to Poland's downfall in the 18th century. This tends to make him, in the final reckoning, a somewhat tragic figure.

PORTUGAL

• **John I,** byname THE PRINCE OF FOND MEMORY, OF JOHN OF AVIZ, JOHN THE GREAT, OF JOHN THE BASTARD, Portuguese O PRINCIPE DE BOA MEMÓRIA, OF JOÃO DE AVIZ, JOÃO O GRANDE, OF JOÃO O BASTARDO (b. April 11, 1357, Lisbon—d. Aug. 14, 1433, Lisbon), king of Portugal from 1385 to 1433, who preserved his country's independence from Castile and initiated Portugal's overseas expansion. He was the founder of the Aviz, or Joanina (Johannine), dynasty.

Early life. John was the illegitimate son of King Pedro I and Teresa Lourenço. At age six he was made master of the military Order of Aviz; he received an ecclesiastical and military education, probably at Aviz in Alentejo. On his father's death, in 1367, his half-brother Ferdinand became king and embarked on a calamitous rivalry with the new ruler of Castile, Henry II, who finally forced Ferdinand to accept a Castilian marriage for his infant heiress, Beatriz, thus compromising the future independence of Portugal.

When Ferdinand died, in 1383, his widow, Queen Leonor, submitted to the demand of her Castilian son-in-law, John I, that he be recognized as king of Portugal. John of Aviz, who had hitherto remained carefully in the background, though he had been arrested for a time in 1382, was now persuaded by a group of young nationalists, led by Nuno Álvares Pereira, to murder Queen Leonor's favourite and adviser, the Galician João Fernandes Andeiro, conde de Ourém. Popular support was

at once stirred up for John, and Queen Leonor fled from Lisbon, appealing to Castile for help. In May 1384 Castilian armies besieged John in Lisbon until the outbreak of plague forced them to withdraw (September).

Election as king. John had been named defender of the realm; but in April 1385 representatives of the three estates met in the Cortes (assembly) of Coimbra, and, after it had been demonstrated that King Pedro's elder surviving sons had not been legitimized, John was elected king. The cities of Lisbon and Porto and the merchants and trade guilds enthusiastically backed him, but much of the older nobility still favoured the Castilian succession. John and Nuno Álvares, now his constable, marched northward and obtained the submission of the chief places but returned on hearing that the Castilians were preparing a major invasion. As Spanish forces entered central Portugal, John and Nuno Álvares advanced to bar the road to Lisbon and won the famous Battle of Aljubarrota (Aug. 14, 1385). This victory assured Portugal's independence and made John a desirable ally. He had already received some English aid, and a small party of English archers had fought for him at Aljubarrota; and he now concluded the Treaty of Windsor (May 9, 1386), which became the cornerstone of the Anglo-Portuguese alliance. In consequence, John of Gaunt, duke of Lancaster, arrived in Galicia hoping, through his second marriage (1371), with the daughter of King Pedro I of Castile, to realize his claim to the Castilian crown. John of Aviz sealed the alliance by marrying, in February 1387, Lancaster's daughter, Philippa. A joint invasion of León was unsuccessful, and Lancaster withdrew. John of Aviz made a 10-year truce with Castile in 1389, but frontier warfare with Castile was intermittent thereafter until peace was finally made in 1411.

Consolidation and expansion. John's elder sons had now reached the age at which they could become knights, and it was ostensibly on their behalf that he organized an expedition against Ceuta, which fell in a day (Aug. 24, 1415). He had probably hoped to advance into Morocco and tap the African caravan routes, but, instead, Ceuta became a beleaguered outpost supplied from the Portuguese Algarve. This stimulated the maritime explorations, beginning with the rediscovery and settlement of the Madeira Islands and the Azores.

John's court now became a centre of culture, influenced through Queen Philippa by English traditions. Of their sons, the *inclita geração* ("illustrious generation"), the eldest, Edward, administered the kingdom under his father and was later king; the second, Pedro, travelled through Europe and was regent after Edward's death; and the third, Henry, known as the Navigator, was the patron and organizer of the overseas discoveries. For them, John introduced the title of duke into Portugal. Their sister, Isabel, married Philip the Good, duke of Burgundy and count of Flanders, thus consolidating Portuguese interests in the Low Countries. John's bastard son, Afonso, married the daughter of the constable Nuno Álvares, and their descendants, the House of Bragança, became kings of Portugal from 1640.

John's long struggle with Castile and the need to recompense a new aristocracy caused serious financial difficulties, but he rallied his people around his throne and acquired a reputation as a cautious leader and shrewd statesman. He rewarded the faithful trade guilds by granting them permanent representation in the House of Twenty-four, in which two members of each of the 12 major guilds were to sit. He also granted them a special magistrate, the judge of the people. At Porto he ended the unpopular civil jurisdiction exercised over the city by the bishop. He displayed his devotion by building near Leiria the great Abbey of Batalha to commemorate his victory and serve as a pantheon. He was the author of a work on hunting (*Livro da montaria*), his favourite pastime.

There is a portrait of John in the Museum of Ancient Art, Lisbon, and recumbent statues of John and Philippa over their tomb at Batalha. (H.V.L.)

BIBLIOGRAPHY. John's reign, like those of his predecessors, D. Pedro and Fernando, was chronicled by Fernão Lopes. There are several modern editions in Portuguese, but only a short excerpt has been translated by E. Prestage in *The Chronicles of Fernão Lopes and Gomes Eannes de Zurara* (1928). A modern biography in Portuguese is Damião Peres, *D. João I* (1917). The events of the beginning of the reign are dealt with fully by S. Dias Arnaut, *A crise nacional dos fins do século XIV* (1960). An excellent account of the international politics and military enterprises of the period is in P.E. Russell, *English Intervention in Spain and Portugal in the Time of Edward III and Richard II* (1955).

•John II, byname THE PERFECT PRINCE, Portuguese O PRINCIPE PERFEITO (b. 1455, Lisbon—d. October 1495, Alvor, Port.), king of Portugal from 1481 to 1495, regarded as one of the greatest Portuguese rulers, chiefly because of his ruthless assertion of royal authority over the great nobles and his resumption of the exploration of Africa and the quest for India.

Early life. John was the great-grandson of the founder of the House of Aviz, John I, and only surviving son of Afonso V by his queen and cousin, Isabella. He was educated by the humanists of the court and was married to his cousin Leonor in 1471. He participated in his father's conquest of Arzila in Morocco, where he was knighted, and was given a separate household at Beja in southern Portugal. In 1474 his father entrusted him with the "trade of Guinea" and the African explorations. When Afonso V claimed the Castilian throne in opposition to Isabella I, plunging Portugal into war, he appointed John his regent (April 1475). The Prince mobilized an army and marched to support his father, but the Battle of Toro (March 1476) checked the Portuguese intrusion into Castile. Afonso V departed for France in a fruitless search for an alliance, while John defended the frontier and parried a Spanish counterattack. Afonso's lack of success caused him to announce his abdication. John was proclaimed king, but his father returned and resumed his reign, concluding the disadvantageous Treaty of Alcáçovas before his death in August 1481.

Assertion of power. At John II's accession, this peace treaty had obliged him to place his young children under Spanish guardianship near the frontier as a pledge of their marriage to Castilians. Afonso had been limited in authority by the ambitious House of Bragança, the wealthiest family in Portugal. John summoned the Cortes (assembly) at Évora (November 1481) and imposed a drastic oath of obedience on his vassals. He also reasserted the *beneplacet*, requiring papal letters to be submitted to him before publication. He successfully negotiated a revision of the treaty with Spain, by which his children were restored to him. He then accused the Duke of Bragança of treason and had him tried and beheaded at Évora (June 1483). Although evidence was produced that the Braganças had intrigued with Castile, it seems clear that John sought vengeance for their having caused the death of his maternal grandfather, the regent Dom Pedro. He confiscated the Braganças' vast estates and appointed royal judges in what had been private jurisdictions of the nobility. When a second conspiracy sought to remove him and bestow the crown on his wife's brother the Duke of Viseu, John killed his rival with his own hand (August 1484).

African exploration. In Africa Afonso V had preferred crusading in Morocco to trade and discovery of the west coast. John II himself never returned to Africa after Arzila but supported the development of commerce and exploration.

In December 1481 he sent Diogo de Azambuja to build the fortress of St. George at Mina (the "gold mine"), near Benin, a powerful native kingdom in the territory of modern Nigeria. Gold currency had been restored by his father, and the new trade now doubled the royal revenues, and in 1485 John assumed the title of lord of Guinea. He had already sent Diogo Cão to search for the seaway to India, and Cão had discovered the Congo. Christopher Columbus tried to interest him in his plan to reach India by a western route. John rejected this but licensed Fernão Dulmo to search for new islands, apparently without result. In 1485 he sent Cão on a second voyage that reached southwestern Africa but failed to find the Cape. When in 1486 merchants in Benin heard news of a native potentate far to the east who was thought to be the legendary Christian ruler Prester John, the King sent Pero da Covilhã and Afonso Paiva to visit India and Ethiopia by an overland route. He also sent Bartolomeu Dias to take over Cão's task of finding the southern extremity of Africa; Dias' return in December 1488 demonstrated that Africa could be rounded and India reached by sea, but it was only after John's death that Vasco da Gama's successful expedition to India was launched. In 1490 a mission was sent to consolidate relations with the kingdom of Congo. In 1493 Columbus arrived in Lisbon with tidings of, as he supposed, islands off Asia, and the Pope awarded these discoveries to the Spanish crown. But John II protested and began negotiations leading to the celebrated Treaty of Tordesillas (June 1494), which gave to Spain all lands west of a line 370 leagues to the west of the Cape Verde Islands. This line, however, reserved Brazil (still apparently unknown) for Portugal.

John had previously negotiated with the papacy, ceding the *beneplacet* but retaining the right to have ecclesiastical cases settled in Portugal and obtaining permission for a crusade

against the Moors. He sent a minor expedition against Anafé and obtained tribute from Safi and Azemmour in Morocco, but in 1489 his attempt to build a fortress at the mouth of the Loukkos was prevented by the ruler of Fez.

When in May 1492 Ferdinand and Isabella of Spain decided to expel the Jewish population, John received a delegation of Spanish Jews who offered 60,000 cruzados for the permanent admission of 600 wealthy families to Portugal, together with a fee of eight cruzados a head for the temporary admission of others, who would be allowed to remain eight months, after which John would supply ships for them to leave. In fact, ships were provided only for Tangier and Arzila; some Jewish children were sent to settle the island of São Tomé.

John's son Afonso was married to the eldest daughter of the Spanish rulers, but soon thereafter the Prince was thrown from a horse and killed (July 1491). John was deeply affected. He thought of legitimizing his other son Jorge but had already promised the succession to his wife's surviving brother, Manuel. He suffered a long illness and died in 1495 at the small castle of Alvor in the province of Algarve. John's exercise of personal power, particularly against the nobles, explains the epithet the Perfect Prince, which owes its origin to Lope de Vega's play about him. (H.V.L.)

Sources are the contemporary chronicler Rui de Pina, *Croniqua Delrey Dom Joham II* (1792; modern edition by Alberto Martins de Carvalho, 1950), whose version is borrowed and amplified by Garcia de Resende. A biography in English is that of Elaine Sanceau, *The Perfect Prince* (1959).

• John III, byname JOHN THE PIOUS, Portuguese JOÃO O PIEDOSO (b. June 6, 1502, Lisbon—d. June 11, 1557, Lisbon), king of Portugal from 1521 to 1557. His long reign saw the development of Portuguese seapower in the Indian Ocean, the occupation of the Brazilian coast, and the establishment of the Portuguese Inquisition and of the Society of Jesus.

Shortly after succeeding his father, Manuel I, John married Catherine, sister of Charles V, Holy Roman Emperor and king of Spain, while Charles married John's sister Isabella. These marriages paved the way for the succession of Philip II of Spain to the Portuguese throne in 1580. By the Treaty of Madrid (1529), Portugal secured the Moluccas, or Spice Islands, recognizing Spain's claim to the Philippines; this complemented the Treaty of Tordesillas dividing the New World between the peninsular powers. In 1533 John promoted Portuguese settlement in Brazil and in 1549 set up a central government at Bahia. In India the Portuguese conquered the city of Diu (1535), and they established trade with Siam and a settlement at Macau (Macao) in China. In North Africa John III relinquished some of the costly coastal fortresses, recognizing that Portuguese interests demanded reduction of its commitments.

John III retained control of the spice trade, but profits declined and costs increased, as did the number of court pensioners and the indebtedness of the state.

Though at first favourable to Erasmus, John imposed religious orthodoxy, instituting the Inquisition in 1536. He entrusted the Jesuits with control of the College of Arts of the University of Coimbra, and they remained dominant in Portuguese education and in missionary work in Brazil and the Orient.

John III's heir, also John, died in 1554. His grandson Sebastian, born in 1554, succeeded him in 1557 under the regency of his widow, the Spanish queen Catherine.

• John IV, also called (1630–40) JOÃO, 8° DUQUE (8th duke) DE BRAGANÇA, byname JOHN THE FORTUNATE, Portuguese JOÃO O AFORTUNADO (b. March 18/19, 1604, Vila Viçosa, Port.—d. Nov. 6, 1656, Lisbon), king of Portugal from 1640 as a result of the national revolution, or restoration, which ended 60 years of Spanish rule. He founded the dynasty of Bragança (Braganza), beat off Spanish attacks, and established a system of alliances.

John, duke of Bragança, the wealthiest nobleman in Portugal, married Luisa de Guzmán, daughter of the Spanish duke of Medina Sidonia. The Bragança duchy, founded in 1461, was a collateral of the extinct royal House of Aviz; and, when the restorers of independence overthrew the Spanish governor on Dec. 1, 1640, they offered John the crown. On December 15 he was enthroned as John IV. Supported by the Cortes, the national assembly, he entrusted each province with its own defense and sent missions to seek recognition from France, England, and the Netherlands. His alliance with the English Stuarts (1642) was frustrated by the English Civil Wars, but in 1654 John made a new treaty with the English Commonwealth, which gained him military aid in return for trading privileges. The Dutch, already in possession of Pernambuco in northeastern Brazil, seized Angola but were expelled from both, while retaining their conquests in the East Indies. The Spanish were defeated at Montijo (May 26, 1644) and were blocked from further invasion.

John IV and his Queen Leonor governed through a royal council and a committee of the Cortes, the Board of Three Estates, and instituted the Overseas Council. He survived attempts at assassination and Spanish attempts to influence the Vatican to isolate the Portuguese church. John was a notable composer.

At John's death his wife became regent for their son Afonso VI (ruled 1656–83). His daughter Catherine of Braganza married Charles II of England in 1662.

• John V (b. Oct. 22, 1689, Lisbon—d. July 31, 1750, Lisbon), king of Portugal from 1706 to 1750, whose relatively peaceful reign saw an increase in the wealth and power of the crown and a generous patronage of learning, culture, and the church.

John inherited Portugal's involvement in the War of the Spanish Succession (1701–14) from his father, Peter II (1683–1706), but peace was finally made with France (1713) and Spain (1715). For the remainder of John's long reign, except for a brief campaign against the Turks, the country remained at peace. The great wealth derived from the gold and diamonds of Brazil, Portugal's colony, freed him from financial dependence on the Cortes, the national assembly, and increased the already substantial power of the crown.

Although John attempted to restore the navy and stimulated industry and building, his administration was not noted for its vigour. His great wealth enabled him to emulate the magnificence of other European courts. In addition, he endowed libraries, encouraged scholarship, patronized the arts, and founded a Royal Academy of History (1720), as well as museums of natural history and architecture. He spent lavish sums on the church and sought to enhance the ecclesiastical status of his court, though his efforts involved him in a lengthy dispute with the papacy.

In his later years John suffered from ill health and the government became dominated by churchmen whose incompetence resulted in neglect of the country's affairs. John was succeeded by his son Joseph.

• John VI (b. May 13, 1767, Lisbon—d. March 10, 1826, Lisbon), prince regent of Portugal from 1799 to 1816, and king from 1816 to 1826, whose reign saw the revolutionary struggle in France, the Napoleonic invasion of Portugal (during which he established his court in Brazil), and the implantation of representative government in both Portugal and Brazil.

John was the younger son of Queen Maria I, becoming heir on the death of his elder brother and taking power in 1792 as a result of the mental illness of his mother. In 1799 her illness was declared incurable, and he assumed the title of prince regent, which he used until her death in March 1816. John married Carlota Joaquina, eldest daughter of Charles IV of Spain, and supported Spain against the French Republic. But Spain made peace at Basel in 1795 and served as a vehicle for French pressure on Portugal. In 1801 Spain finally invaded Portugal, though peace was made at Badajoz. In 1807, after his victories in central Europe, Napoleon proclaimed his European blockade, threatening to close the port of Lisbon. As French troops crossed Spain and approached Lisbon, the royal family retired to Brazil with the government (November 1807). Britain guaranteed the throne of the Braganças and in 1808 sent an army to Portugal under Arthur Wellesley (later duke of Wellington), which forced the surrender of the French. John gave full military support to Wellesley, and two French invasions were repelled. After Napoleon's surrender in 1814, John was expected to return; but, on Napoleon's escape from Elba, John returned to Brazil, which he made a united kingdom with Portugal. On March 20, 1816, his mother died, and he became king.

His annexation of Montevideo led to a conflict with Spain, and his stay in Brazil made the Portuguese impatient for reform. In 1820 the radical revolution in Spain spread to Portugal, and he finally agreed to leave Brazil and to sanction a liberal constitution, leaving his heir Peter (Pedro) in Rio de Janeiro. He accepted radical reform limiting his powers, but the liberals precipitated the separation of Brazil, of which his son was declared emperor. When the French intervened to suppress radicalism in Spain (1823), the Portuguese radicals were discredited and overthrown. John VI was restored to his authority but promised a constitution. The absolutists supported his queen, Carlota Joaquina, and made their son Michael (Miguel) commander-in-chief. John attempted to steer a middle course, separating from his wife and sending Michael into exile.

John then negotiated with Peter in Brazil, using the services of a British diplomat, Sir Charles Stuart. He reluctantly accepted the political separation of Brazil in 1825, dying soon after. He supported his favourite daughter, Maria Isabel, as regent, pending the decision of Peter, who attempted to resolve the dynastic and political problem by abdicating the crown of Portugal in favour of his daughter, Maria II, and bestowing his own constitution on Portugal.

RUSSIA

• John I–VI: *see* Ivan I–VI *under* Ivan (Russia).

SAXONY

• John, byname JOHN THE STEADFAST, German JOHANN DER BESTÄNDIGE (b. June 30, 1468, Meissen, near Dresden, Saxony—d. Aug. 16, 1532, Schweinitz, near Wittenberg, Wittenberg), elector of Saxony and a fervent supporter of Martin Luther; he took a leading part in forming alliances among Germany's Protestant princes against the Habsburg emperors' attempts at forced reconversion.

After his father's death in 1486, John ruled the lands of the Ernestine branch of the Wettin dynasty of Saxony jointly with his older brother Frederick III the Wise, succeeding his brother as elector in 1525. A firm Lutheran, John immediately created the League of Gotha with Philip the Magnanimous, landgrave of Hesse, and shortly thereafter, the Torgau

League with Germany's northern princes. For the first time, German Lutheran rulers were united in a firm alliance. He was leader of the church reformers at the Diet of Speyer (1526) and obtained concessions on the religious question from the emperor Charles V. When these concessions were rescinded at the next diet in 1529, John became one of the original Protestants by signing the minority protest. He accepted the Lutheran Augsburg Confession (1530) and in the winter of 1530–31 was one of the key figures in the formation of the Schmalkaldic League to protect Protestant interests. Charles V, who needed the reformers' aid against the Turks, consequently agreed to the religious Peace of Nürnberg (1532). At the time of John's death, electoral Saxony, staunchly Lutheran, had become the leading Protestant state in Germany.

•**John** (b. Dec. 12, 1801, Dresden, Saxony—d. Oct. 29, 1873, Pillnitz, near Dresden), king of Saxony (1854–73) who was passionately interested in law and in the arts. Under the name Philalethes he published a translation of Dante's *Divine Comedy* (1839–49).

John took part in the commission that drew up the constitution of 1831 and succeeded to the throne upon the death of his brother, King Frederick Augustus II. He was persuaded by his minister, Friedrich von Beust, to support Austria against Prussia in the Seven Weeks' War (1866). After Austria's defeat, however, he dismissed Beust and supported Bismarck's North German Confederation. During the Franco-German War (1870–71) Saxony supported Prussia.

Scotland

•**John,** also called JOHN DE BALLIOL, or BALIOL (b. *c.* 1250—d. April 1313, Château Galliard, Normandy, Fr.), king of Scotland from 1292 to 1296, the youngest son of John de Balliol and his wife Dervorguilla, daughter and heiress of the lord of Galloway.

His brothers dying childless, he inherited the Balliol lands in England and France in 1278 and succeeded to Galloway in 1290. In that year, when the heiress to the kingdom of Scotland, Margaret, the Maid of Norway, died, Balliol became one of 13 competitors for the crown. He at once designated himself "heir of the kingdom of Scotland," clearly anticipating the vindication of his claim, which was derived from his mother, daughter of Margaret, eldest daughter of David, earl of Huntingdon, brother to kings Malcolm IV and William I the Lion. His chief rival was Robert de Bruce (grandfather of King Robert I).

The English king Edward I met the Scottish baronage at Norham in Northumberland and insisted that as adjudicator between the claimants he should be recognized as overlord of Scotland. His court of 104 persons discussed the rival titles for more than a year, but Balliol's simple claim by primogeniture ultimately prevailed. Edward I confirmed the decision on Nov. 17, 1292, and Balliol was enthroned at Scone on November 30, doing homage to Edward at Newcastle on December 26. John, however, soon proved rebellious; and when in June 1294 Edward demanded military aid from Scotland for his projected war in Gascony, the Scottish reaction was to conclude a treaty of mutual aid with the French. When Edward I sent an army to Gascony in January 1296, the Scots raided northern England. Edward reacted quickly; he took Berwick on March 30. Castle after castle fell to the English king, and at Montrose, John resigned his kingdom to Edward. He was stripped of his arms and knightly dignity in a ceremony which later earned him the nickname "Toom (empty) Tabard." John was a prisoner in the Tower of London until July 1299, when papal intervention secured his release. Thereafter, he lived in Normandy.

Spain: Aragon

•**John I** (b. Dec. 27, 1350—d. May 16, 1395), king of Aragon (1387–1395), son of Peter IV. Influenced by his wife, Yolande, he pursued a pro-French policy but refused to become involved in the Hundred Years' War. He died by a fall from his horse, like his namesake, cousin, and contemporary of Castile, John I. He was a man of insignificant character, with a taste for artificial verse.

•**John II** (b. 1398 Medina del Campo, Leon—d. 1479, Barcelona), king of Aragon (1458–79) and also king of Navarre (1425–79); he was the instigator of the union of Castile and Aragon through the historic marriage of his son Ferdinand with Isabella of Castile.

John was a younger son of Ferdinand of Antequera, elected king of Aragon (as Ferdinand I) in 1412. John and his brothers retained their positions and revenues in Castile, and he married Blanche, the heiress to Navarre, of which he claimed the kingship (1425–79). On his wife's death, he married Juana Enriques, daughter of the admiral of castile (1447), whose ambitions led to a conflict between John and his eldest son by his first marriage, Charles, prince of Viana.

In 1458 John succeeded his elder brother Alfonso V as king of Aragon, with Sicily and Sardinia. He was blamed for the mysterious death of his son Charles, who had a strong following in Catalonia, where John's policies were deeply resented. The Catalans offered the crown to Peter of Portugal, who died, after which they appealed to the French for aid. In October 1469 John arranged for his son by his second marriage, Ferdinand, to marry Isabella, the recognized heiress to Castile, despite the opposition of her brother, Henry IV of Castile. This marriage led to the union of Castile and Aragon and the creation of the modern state of Spain. In Aragon, John's rule deepened the rift between Aragon proper and Catalonia.

Spain: Castile

•**John I** (b. Aug. 20, 1358, Épila, Castile—d. Oct. 9, 1390, Alcalá de Henares), king of Castile from 1379 to 1390, son of Henry II, founder of the dynasty of Trastámara.

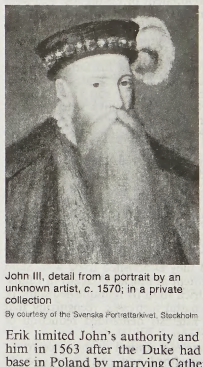
In the beginning of his reign John had to contend with the hostility of John of Gaunt, who claimed the crown by right of his wife Constance, daughter of Peter I the Cruel. The king of Castile finally bought off the claim of his English competitor by arranging a marriage between his son Henry and Catherine, daughter of John of Gaunt, in 1387. Before this date he had been engaged in hostilities with Portugal, which was in alliance with John of Gaunt. His first quarrel with Portugal was settled by his marriage, in 1382, with Beatriz, daughter of the Portuguese king Ferdinand. On the death of his father-in-law in 1383, John endeavoured to enforce the claims of his wife, Ferdinand's only child, to the crown of Portugal. He was resisted by the national sentiment of the people and was utterly defeated at the Battle of Aljubarrota (Aug. 14, 1385).

King John was killed at Alcalá five years later by the fall of his horse, while he was riding in a fantasia with some of the light horsemen known as the *farfanes,* who were mounted and equipped in the Arab style.

•**John II** (b. March 6, 1405, Toro, Castile—d. July 21, 1454, Valladolid), king of Castile from 1406 to 1454; his political weakness led him to rely on his favourite, Alvaro de Luna, whom he made constable. He was nevertheless considered a man of cultivated taste and a patron of poets.

John succeeded his father, Henry III, as an infant of less than two years of age, under the joint regency of his mother, Catherine of Lancaster, and his uncle, the infante Ferdinand, who became king of Aragon (as Ferdinand I) in 1412. John took the reins in 1419 but soon placed himself in the hands of his companion Luna, who contested the influence of Ferdinand's sons in Castile. This led to factional struggles among the nobles, during which Luna enriched himself and his supporters. In 1430 a settlement was reached, and John II led a campaign against Granada, defeating the Muslims in the Battle of Higueruela (1431). John II sequestered his son, the future Henry IV, at Segovia, giving rise to fresh rivalries. He and Luna vanquished the dissidents at the Battle of Olmedo in 1445.

In 1447 Luna persuaded John, now a widower, to marry Isabella of Portugal, who soon opposed him. After Luna had connived at a murder, the tide turned; and in 1453 John II was persuaded to arrest and execute his favourite. He proved unable to govern alone.



During John's reign the revival of learning had its effect on the culture of the court and nobility. The King protected the poet Juan de Mena and encouraged other writers.

Sweden

•**John II:** *see* John (Denmark).

•**John III** (b. Dec. 21, 1537, Stegeborg Castle, Sweden—d. Nov. 17, 1592, Stockholm), king of Sweden (1568–92), a deeply religious ruler who attempted to reconcile the Swedish Lutheran Church with the Catholic leadership in Rome and to revive discarded elements of the Catholic liturgy.

After being named duke of Finland by his father in 1556, John, the elder son of the second marriage of the Swedish king Gustav I Vasa, pursued a foreign policy independent of the crown, leading to a conflict with his half brother Erik XIV, king of Sweden from 1560.

John III, detail from a portrait by an unknown artist, *c.* 1570; in a private collection

By courtesy of the Svenska Portrettarkivet, Stockholm

Erik limited John's authority and imprisoned him in 1563 after the Duke had acquired a base in Poland by marrying Catherine (1562), sister of Sigismund II Augustus of Poland. After his release in 1567, John joined with his younger brother, the future Charles IX of Sweden, in 1568 to overthrow Erik and secure the throne for himself. He soon ended Sweden's long war against Denmark by signing the Treaty of Stettin (1570), in which he formally renounced Sweden's Estonian acquisitions, though he actually intended to keep them; the territories were largely regained by the end of his reign.

An expert theologian, John believed in the possibility of a synthesis of Lutheranism and Roman Catholicism and negotiated to that end with Catholic leaders in Rome and Spain. He introduced a liturgy of his own in 1577, the "Red Book," which restored some of the

Catholic liturgical usages that had been swept away in the triumph of Lutheranism in Sweden. By 1580 he realized that a settlement with Rome was impossible but renewed his efforts to impose the "Red Book" over an opposition led chiefly by his brother, Charles.

In 1586 John nominated his son Sigismund, who had been brought up as a Catholic, for the vacant Polish throne but withdrew his sponsorship when the Poles demanded the return of Estonia as a condition of Sigismund's accession. The Swedish nobility, however, who controlled the state council, supported Sigismund's candidacy, seeing the link with Poland as an aid against Russia and the prospect of an absentee ruler as a way of enhancing their own power. John and Charles, who had contested his brother's religious policy, became reconciled in common opposition to the nobles' aspirations, but Sigismund nevertheless assumed the Polish throne in 1587.

Although scholarly and cultured, a lavish and discriminating patron of the arts, John had been a poor administrator and a worse financier. He died embittered by his failure to impose his own religious views on the Swedish Church.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

John, SAINT: *see* John I *under* John (Papacy).

John IV OF ODZUN, Armenian HOVHANNES IV OTZNETZI (b. 650, Odzun, Armenia—d. 729, Dvin), Armenian Orthodox catholicos (supreme head of the Armenian Church), a learned theologian and jurist who strove for greater ecclesiastical autonomy for the Armenian Church and supported the movement in the Eastern Church in favour of orthodox Christological theology (*see* Christology).

With a reputation for learning, John was chosen catholicos in 718. Soon afterward he convened a national synod at Dvin to reform the Armenian Church's liturgy and its pastoral discipline. At first apparently in sympathy with the heterodox Monophysites (*q.v.*) in the Eastern Church, he held a second national synod in 726 at Manzikert, near present Erzurum, Tur., to consider union with the Syrian Jacobite Church, a Monophysite community. John is noted for his attempt to reconcile the subtleties of Syrian and Armenian mystical Christology with the exactness of orthodox definitions. He thus sought to express his own theological tradition in terms consonant with the doctrinal decrees of the general council of Chalcedon (451), the standard for Eastern and Western Christological belief.

John's principal writings include a theological treatise on Christ, in which he emphasized the reality of Christ's human nature and material body, in opposition to the view of the extreme Monophysites; a brief tract in which he argued for the preservation of the independent dogma of the Armenian Church within the Eastern Orthodox world; a discourse denouncing the Paulicians (*q.v.*); and a reform of the structure and literary style of the Armenian psalter and prayer book.

Also credited to John is the *Kanonagirk'* ("Corpus of Canon Law"), the first collection of church legislation in the Armenian Church.

The writings of John of Odzun were edited in Armenian and translated into Latin by J.B. Aucher in 1838.

John BAR QURSOS, also called JOHN OF TELLA (b. 483—d. 538, Antioch, Syria), monk and bishop of Tella (near modern Aleppo, Syria), a leading theological propagator of moderate Monophysitism (*see* Monophysites).

A soldier before becoming a monk, John was made bishop in 519 and undertook the spread of a doctrine of Christ's person and work common to Syrian and Egyptian monasticism, a belief derived from a beatifying inner experience of Christ's divine transcendence. Attempting a mediatory theological formula, he rejected those positions he considered extreme. On one hand, he dismissed the teaching of the general Council of Chalcedon (451) as open to an interpretation of a dual personhood in Christ. On the other hand, he viewed the extreme Monophysitism of archimandrite (abbot) Eutyches of Constantinople as derogating from Christ's true humanity.

Summoned to Constantinople in 533 to participate in the dispute over the Christological issue, he later fell victim to the violence of the strict orthodox party in Syria reacting to the earlier bloody persecution by the Monophysites during their ascendancy. Because of the emperor Justinian's (527–565) new policy of conformity with Pope Leo I's (440–461) doctrinal directives declared at Chalcedon, John was arrested, then slain at Antioch. His writings include a liturgical treatise on the celebration of the Lord's Supper, a document that sheds light on the history of early Christian worship.

John CHRYSOSTOM, SAINT: *see* Chrysostom, Saint John.

John CLIMACUS, SAINT (b. *c.* 579—d. *c.* 649, Mt. Sinai, Sinai Peninsula; feast day March 30), Byzantine monk and author of *Climax tou paradeisou* (Greek: "The Ladder of Divine Ascent," the source of his name "John of the Ladder"), a handbook on the ascetical and mystical life that has become a Christian spiritual classic.

After entering the monastery of St. Catherine on Mt. Sinai *c.* 600, John withdrew to live as a hermit in a nearby cell. He was chosen abbot *c.* 639 and ruled until shortly before he died; the book was written during this period.

John's "Ladder" symbolizes the Old Testament patriarch Jacob's dream of a climb to heaven. The work is divided into 30 chapters, representing the 30 years of the life of Jesus before he began his public ministry, which describe the steps in the spiritual struggle to moral perfection. It culminates on the highest rung in passive contemplation and the mystical ecstasy of divine union.

Although influenced by earlier Egyptian and other Eastern monastic writers, John exhibits psychological insights with a distinctive, terse style. Translation of the "Ladder" into almost all classical and modern languages attests to its perennial popularity, having affected especially the Hesychast (mystical and quietistic prayer method) movement among Greek Orthodox and Russian contemplatives.

John DAMASCENE, SAINT: *see* John of Damascus, Saint.

John DE BALLIOL, Balliol also spelled BALIOL: *see* John *under* John (Scotland); Balliol, John de.

John EUDES, SAINT: *see* Eudes, Saint John.

John LACKLAND: *see* John *under* John (England).

John LEONARDI, SAINT, Italian SAN GIOVANNI LEONARDI (b. 1541?, near Lucca, Republic of Lucca—d. Oct. 9, 1609, Rome; canonized 1938; feast day October 9), founder of the Roman Catholic Ordo Clericorum Regularium Matris Dei (Clerks Regular of the Mother of God), whose members were commonly called Leonardini; the order was distinguished for learning and was originally devoted to combatting Protestantism and to promoting the Counter-Reformation.

Joining the now-extinct Apostolic Clerics of St. Jerome, John was ordained priest *c.* 1572 and became particularly active in charity. He soon attracted and trained some laymen and in 1574 founded his religious congregation in Lucca. In 1579 he formed the Confraternity of Christian Doctrine; his congregation of Clerks Regular received episcopal approval in 1583.

John's campaign against Protestantism, however, was so fervent that only with papal protection was he admitted into the Republic of Lucca, which opposed his policies for political reasons. He was aided by St. Philip Neri, the religious reformer, and St. Joseph Calasanz, whose order of the Pious Schools (Piarists) temporarily merged with the Leonardini. John's work attracted the support of Pope Clement VIII, who in 1595 officially approved John's congregation. Having begun four more religious orders amidst his reforming activities, John also cofounded (1603) a seminary to train priests for foreign missions. He died after contracting influenza while nursing epidemic victims. Sta. Maria in Campitelli, Rome, mother church of the Clerks Regular, contains his relics. The Leonardinis' general edition of *S. Giovanni Leonardi, fondatore dei Chierici Regolari della Madre di Dio* appeared in 1938. Other lives include those by L. Marracci, A. Bianchini, and F. Ferraironi.

John OF AVESNES: *see* John II *under* John (Holland).

John OF AVILA, SAINT, Spanish SAN JUAN DE AVILA (b. 1499/1500, Almodóvar del Campo, near Toledo, Spain—d. May 10, 1569, Montilla; canonized 1970; feast day May 10), reformer, one of the greatest preachers of his time, author and spiritual director whose religious leadership in 16th-century Spain earned him the title Apostle of Andalusia.

Jewish-born, he attended the universities of Salamanca and Alcalá, where he studied philosophy and theology under the celebrated Spanish theologian Domingo de Soto. After being ordained priest in 1525 at Alcalá, he gave the fortune inherited from his parents to charity. Although he had prepared for missionary work to North America, he was persuaded in 1527 by Archbishop Hernando de Contreras of Seville to remain in Spain.

Beginning in 1529, John undertook missions throughout Andalusia for nine years. While attracting throngs of penitents, converts, and the faithful, his apostolate also created some influential enemies. The Inquisition investigated his fervent denunciation of wealth and of vice and his encouragement of rigorism; even a spurious connection between his Jewish heritage and charges of heresy was considered. He was acquitted in 1533, after which his fame rose tremendously, securing his reputation as one of Spain's greatest evangelists.

His reform of clerical life (he was a champion of celibacy), considered to be his finest achievement, influenced such eminent disciples as SS. Francis Borgia, John of God, Teresa of Avila, and Luís of Granada (who, in 1588, wrote a life of John, noting him as a leading spiritual director). In 1537 John co-organized the University of Granada with Archbishop Gaspare Avalos; outstanding among the other colleges he founded was that of Baeza. He helped foster in Spain the Society of Jesus, to which he was devoted; he died before he could carry out his plan to become a Jesuit.

John's *Audi filia* ("Listen, Daughter"), a treatise on Christian perfection addressed to the nun Doña Sancha Carillo, is considered to be a masterwork; his classical spiritual letters were edited by J.M. de Buck (*Lettres de direction*) in 1927. His complete works (*Obras completas del B. Mtro. Juan de Avila*) were edited by L. Sala Balust (2 vol.) in 1952–53.

John was beatified in 1894 by Pope Leo XIII

and canonized (1970) by Pope Paul VI, who called him a model for modern priests suffering from an identity crisis. L. degli Oddi's *Life of the Blessed Master John of Avila* appeared in 1898; later lives include that by J.M. de Buck (1927).

John OF AVIZ: *see* John I *under* John (Portugal).

John OF BEVERLEY, SAINT (b. Harpham, Yorkshire, Northumbria—d. May 7, 721, Beverley, Yorkshire), bishop of York, one of the most popular medieval English saints.

After studies at St. Augustine's Monastery, Canterbury, Kent, under the celebrated abbot St. Adrian, John entered Whitby Abbey, Yorkshire. In 687 he succeeded St. Eata as bishop of Hexham, Northumberland, and in 705 was consecrated bishop of York. He founded a monastery at Inderawood, later called Beverley, where he retired after resigning his bishopric between 717 and 720 to St. Wilfrid the Younger.

King Henry V of England ascribed to John the victory of his troops over the French at Agincourt, Fr., on Oct. 25, 1415—the anniversary of the translation of John's remains to York (1037) from Beverley, where his shrine was a popular pilgrimage during the Middle Ages. In 1416 Henry ordered John's feast day, May 7, to be kept throughout England. Accounts of John's miracles are in the *Ecclesiastical History of the English People* by the Venerable Bede.

John OF BOHEMIA: *see* John *under* John (Bohemia).

John OF BRIENNE: *see* John *under* John (Constantinople).

John OF CAPISTRANO, SAINT, Italian SAN GIOVANNI DA CAPISTRANO (b. 1386, Capistrano, Kingdom of Naples—d. Oct. 23, 1456, Villach, Duchy of Carinthia; canonized 1690; feast day October 23), one of the greatest Franciscan preachers of the 15th century and leader of an army that liberated Belgrade from a Turkish invasion.

In 1412 he became magistrate of Perugia, Papal States, where a civil quarrel caused his imprisonment. He experienced an emotional conversion while in prison and after his release in 1416 became a Franciscan. He was ordained in 1426, after which his fame as a preacher spread because of his efforts to restore doctrinal harmony and to promote education. He became the principal force in the founding of the Franciscan Observants, a severely ascetic group of friars who separated from the more liberal Conventuals. In 1451 he was sent to Austria by Pope Nicholas V to convert the Hussites (followers of the Bohemian religious reformer Jan Hus). Aware of the Turkish threat to eastern Europe, he helped raise and lead the army that lifted the Turkish siege of Belgrade in 1456. He died of plague on return from his crusade. John Hofer's *St. John Capistran* appeared in 1943.

John OF DAMASCUS, SAINT, also called SAINT JOHN DAMASCENE, Latin JOHANNES DAMASCENUS (b. *c.* 675, Damascus—d. Dec. 4, 749, near Jerusalem; Western feast day December 4), Eastern monk and theological doctor of the Greek and Latin churches whose treatises on the veneration of sacred images placed him in the forefront of the 8th-century Iconoclastic Controversy, and whose theological synthesis made him a preeminent intermediary between Greek and medieval Latin culture.

John of Damascus succeeded his father as one of the Muslim caliph's tax officials, and while still a government minister he wrote three *Discourses on Sacred Images, c.* 730, defending their veneration against the Byzantine emperor Leo III and the Iconoclasts. The Iconoclasts obtained a condemnation of John at the Council of Hieria in 754 that was reversed at the second Council of Nicaea in 787.

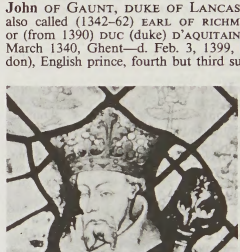
Soon after 730, John became a monk at Mar Saba, near Jerusalem, and there passed the rest of his life studying, writing, and preaching, acquiring the name "the Golden Orator" (Greek: *Chrysorrhoas,* literally "the Golden Stream"). Among his approximately 150 written works the most significant is *Pēgē gnōseōs,* ("The Source of Knowledge"), a synthesis of Christian philosophy and doctrine that was influential in directing the course of medieval Latin thought and that became the principal textbook of Greek Orthodox theology. Revised *c.* 743, it is composed of three parts: the philosophical ("Dialectica"), drawing largely from the late 3rd-century Neoplatonist Porphyry's *Isagoge,* an introduction to the logic of Aristotle; the historical, transcribing sections from the 4th-century Greek churchman Epiphanius' work *Panarion,* on heresies; and the theological and most widely known segment, the "Exposition [*Ekthesis*] of the Orthodox Faith." Essentially a résumé of the 4th-century Cappadocian Fathers Basil, Gregory of Nazianzus, and Gregory of Nyssa, and expressed in Aristotelian vocabulary, it manifests some distinctive originality in John's choice of texts and annotations reflecting Antiochene analytical theology. Through its translation into Oriental languages and Latin, the "Exposition" served both Eastern and Western thinkers not only as a source of logical and theological concepts but also, by its systematic style, as a model for subsequent theological syntheses composed by medieval Scholastics. The "Exposition" speculates on the nature and existence of God, providing points of contention for later theologians.

Elsewhere the "Exposition" analyzes the nature of free choice and the will. The author was sensitive to this question in light of Christian doctrine on personal responsibility for salvation. He describes the human will as a rational appetite or inclination to the good, functioning with regard to ends or goals rather than with means, which relate more to the intellect. In God there is will but no deliberation.

A counterpart to *The Source of Knowledge* is John's anthology of moral exhortations, the *Sacred Parallels,* culled from biblical texts and from writings of the Church Fathers. Among his literary works are several intricately structured *kanōns* (*q.v.*), or hymns for the Greek liturgy, although his reputation in liturgical poetry rests largely on his revision of the Eastern Church's hymnal, the *Octoēchos.*

John OF EPHESUS, also called JOHN OF ASIA (b. *c.* 507, Amida, Mesopotamia—d. *c.* 586, Chalcedon, Bithynia, Asia Minor), Monophysite bishop of Ephesus, who was a foremost early historian and leader of Monophysites (*q.v.*) in Syria.

A Syrian monk, he became a deacon at Amida in 529, but because of the Byzantine persecution of the Monophysites he was forced to lead a nomadic life. Later, at the Eastern imperial court of Constantinople, John was able to gain the support of the empress Theodora and, through her, the favour of the emperor Justinian, culminating in his appointment *c.* 542 as titular bishop of Ephesus. Enjoined to evangelize pagan areas about Constantinople and the mountainous region of central Asia Minor, he succeeded, according to his own estimate, in baptizing more than 70,000 persons and in building numerous churches and monasteries in place of pagan temples that he caused to be destroyed. Justinian's successor, the emperor Justin II, a supporter of the orthodox cause, in 572 imprisoned John and later banished him to Chalcedon.



John wrote an ecclesiastical history, recording events from the time of Julius Caesar (died 44 BC) to AD 585, in three volumes, of which only the third is extant. He also wrote *c.* 568 some lives of the Eastern saints, of signal value as a primary source for sketches of Oriental monks and ascetics.

John OF FORDUN (b. probably at Fordoun, Aberdeen, Scot.—d. after 1384), first chronicler to attempt a continuous history of Scotland. His work is nationalistic in attitude and reliable where he is not dealing with legendary subjects. Evidence about his life is derived from the prologues to Walter Bower's *Scotichronicon.* He may have been a chantry priest in Aberdeen cathedral.

Of John's seven-part chronicle, book 5 (Scotland, 1057–1153) and the fragmentary book 6 (England before 1066) seem to have been composed first. The true continuation of book 5 is his *Gesta annalia* (Scotland, 1153–1363). These were all completed by 1363; thereafter John travelled until 1383, wrote books 1–3 (legendary) and book 4 (814–1057), and brought the *Gesta annalia* down to 1384. Walter Bower's *Scotichronicon,* completed 1447, is in part an expansion and continuation of John's work. John's chronicle was edited, with translation, by W.F. Skene in *Historians of Scotland,* vol. 1 and 4 (1871–72).

John OF GAETA (pope): *see* Gelasius II.

John OF GAUNT, DUKE OF LANCASTER, also called (1342–62) EARL OF RICHMOND, or (from 1390) DUC (duke) D'AQUITAINE (b. March 1340, Ghent—d. Feb. 3, 1399, London), English prince, fourth but third surviv-

John of Gaunt, duke of Lancaster, detail of a window by an unknown artist, *c.* 1440–50; in the antechapel of All Soul's College, Oxford

By courtesy of the Royal Commission on Historical Monuments, Crown copyright reserved

ing son of the English king Edward III and Philippa of Hainaut; he exercised a moderating influence in the political and constitutional struggles of the reign of his nephew Richard II. He was the immediate ancestor of the three 15th-century Lancastrian monarchs, Henry IV, V, and VI. The term Gaunt, a corruption of the name of his birthplace, Ghent, was never employed after he was three years old; it became the popularly accepted form of his name through its use in Shakespeare's play *Richard II.*

Through his first wife, Blanche (d. 1369), John, in 1362, acquired the duchy of Lancaster and the vast Lancastrian estates in England and Wales. From 1367 to 1374 he served as a commander in the Hundred Years' War (1337–1453) against France. On his return he obtained the chief influence with his father, but he had serious opponents among a group of powerful prelates who aspired to hold state offices. He countered their hostility by forming a curious alliance with the religious reformer John Wycliffe. Despite John's extreme unpopularity, he maintained his position after the accession of his ten-year-old nephew, Richard II, in 1377, and from 1381 to 1386 he mediated between the King's party and the opposition group led by John's younger brother, Thomas Woodstock, earl of Gloucester.

In 1386 John departed for Spain to pursue his claim to the kingship of Castile and Leon

based upon his marriage to Constance of Castile in 1371. The expedition was a military failure. John renounced his claim in 1388, but he married his daughter, Catherine, to the young nobleman who eventually became King Henry III of Castile and Leon.

Meanwhile, in England, war had nearly broken out between the followers of King Richard II and the followers of Gloucester. John returned in 1389 and resumed his role as peacemaker.

His wife Constance died in 1394, and two years later he married his mistress, Catherine Swynford. In 1397 he obtained legitimization of the four children born to her before their marriage. This family, the Beauforts, played an important part in 15th-century politics. When John died in 1399, Richard II confiscated the Lancastrian estates, thereby preventing them from passing to John's son, Henry Bolingbroke. Henry then deposed Richard and in September 1399 ascended the throne as King Henry IV. The standard biography is still S. Armitage-Smith, *John of Gaunt* (1904), but it must be read in conjunction with recent political histories of the period.

John OF GOD, SAINT, Spanish SAN JUAN DE DIOS, original name JUAN CIUDAD, Portuguese SÃO JOÃO DE DEUS, or JOÃO CIDADE (b. March 8, 1495, Montemor-o-Novo, Port.—d. March 8, 1550, Granada, Spain; canonized 1690; feast day March 8), founder of the Hospitaller Order of St. John of God (Brothers Hospitallers), a Roman Catholic religious order of nursing brothers. In 1886 Pope Leo XIII declared him patron of hospitals and the sick.

Formerly a shepherd and soldier, he was so moved by the sermons of the mystic John of Avila, who became his spiritual adviser, that he decided to devote his life to the care of the poor and the sick. For that purpose he rented a house in Granada (1537), where his work won ecclesiastical approval and attracted others. Bishop Sebastián Ramírez of Tüy, Spain, named him John of God and gave John and his followers their habit. When John died, his companion, Antonio Martino, succeeded him, and the rule for his order was posthumously drafted. Subsequent houses, richly endowed by King Philip II of Spain, were soon opened. The order was first approved in 1586 by Pope Sixtus V, and by the late 1970s it claimed 1,800 brothers and had hospitals worldwide.

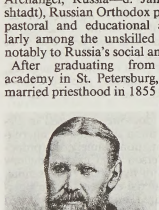
John OF JANDUN, French JEAN DE JANDUN (b. *c.* 1286, Jandun, Champagne, Fr.—d. 1328, Todi, Papal States), foremost 14th-century interpreter of Averroës' rendering of Aristotle.

After study at the University of Paris, John became master of arts at the Collège de Navarre in Paris, where he lectured on Aristotle. He associated with Marsilius of Padua, writer of the *Defensor Pacis,* which asserted the superiority of civil authority over that of the pope. Because of controversy over this work, John and Marsilius sought the protection of Louis IV of Bavaria. After a series of condemnatory papal bulls, they were excommunicated as heretics by Pope John XXII in 1327.

John of Jandun's most influential writings are commentaries on Aristotle; his major concern was the division between faith and reason. Some critics think that he held a "double-truth" theory, believing that contradictory statements of faith and reason may be simultaneously true; others call him anti-Christian, and still others judge him to be a thinker of the Augustinian tradition.

John OF JERUSALEM (b. *c.* 356—d. 417), theologian and bishop, a strong advocate of the Platonistic Alexandrian tradition during the 5th-century doctrinal controversies of the Eastern Church, and co-author of a celebrated collection of catechetical conferences on the Jerusalem Christian creed.

A monk from his early years, John succeeded the noted theologian Cyril of Jerusalem as bishop *c.* 387. In 393 he was attacked by the Western biblical scholar Jerome and by the influential Bishop Epiphanius of Salamis, Cyprus, for adhering to the views of Origen (*q.v.*) of Alexandria.



When Epiphanius incited the Palestinian monks to anti-Origenism, John retaliated by denying them access to the holy places in Jerusalem and refusing to baptize their converts or bury their dead. In the fall of 396, Jerome published a virulent manifesto denouncing John. The consequent scandal reverberated throughout the Greek and Western churches. Reconciled with Jerome at Easter in 397, through the mediation of Theophilus, patriarch of Alexandria, John remained neutral in the continuing Origenist polemic between Jerome and his former theological colleague Tyrannius Rufinus.

Contention arose again, however, over Pelagius' teaching that man is capable of leading a moral life without divine help. Though John received him sympathetically in Palestine, Jerome and an emissary from Augustine of Hippo denounced him as heretical at the Jerusalem synod in July 415. When Augustine's disciples invoked the authority of their master against Pelagius, John retorted that in Jerusalem he alone was the Christian authority. He then devised a compromise formula, distasteful to Jerome, declaring that God can enable the earnest man to avoid sin. Pelagius was judged free of doctrinal error, which was confirmed in December 415 at the metropolitan Council of Diospolis. Soon afterward, John tacitly permitted the Pelagians to sack the monastery at Bethlehem, a centre of vehement anti-Pelagianism, and was sharply reproved by Pope Innocent I.

John is credited with the possible partial authorship, long attributed to Cyril of Jerusalem, of the theologically esteemed *Catecheses,* a series of Easter instructions for the newly baptized. An English translation of the *Catecheses* was edited by F. L. Cross (1951).

John OF KRONSHTADT, original name IVAN ILICH SERGEYEV (b. Oct. 31, 1829, near Archangel, Russia—d. Jan. 2, 1909, Kronshtadt), Russian Orthodox priest-ascetic whose pastoral and educational activities, particularly among the unskilled poor, contributed notably to Russia's social and spiritual reform.

After graduating from the theological academy in St. Petersburg, John entered the married priesthood in 1855 and went to Kronshtadt to minister at the parish church of St. Andrew. There he established among the underprivileged a fraternal association and "work centre" that offered instruction in industrial arts, technical and general education, religious training, and social services. "Father John," as he was called, exercised a widespread moral authority among the various social classes and was reputed to have performed wonders and miracles. He influenced many in the corrupt and despairing Russian society toward moral conversion and a return to religious practices.

John of Kronshtadt, detail of an engraving, 1890
BBC Hulton Picture Library

John facilitated the worship and sacramental life of the masses by practical innovations in the liturgy and wrote several spiritual works, including *My Life in Christ* and "A Response to the False Doctrines of Count [Leo] Tolstoy." Politically conservative, he rejected any advocacy of radical reform. Despite his condemnation of their activities, a cult of admirers began a quasi-divine worship of him.

John OF LUXEMBOURG: *see* John *under* John (Bohemia).

John OF MATHA, SAINT, French SAINT JEAN DE MATHA (b. June 23, 1160, Faucon-de-Barcelonette, Fr.—d. Dec. 17, 1213, Rome; feast day February 8), cofounder of the Order of the Most Holy Trinity for the Redemption of Captives, commonly called Trinitarians, or Mathurins, a Roman Catholic mendicant order originally dedicated to freeing Christian slaves from captivity under the Muslims.

John received his early education at Aix-en-Provence, Fr., and then retired to a hermitage near Faucon; he later studied theology at Paris, where he was ordained priest. In 1197 he planned to form a group of monks to rescue Christians captured by the Muslims and enslaved in Africa. He may have been joined in this venture by the hermit Felix of Valois; recent historians, however, have come to doubt whether Felix actually existed. At Rome in 1198, John obtained approval for his order from Pope Innocent III, who made John the first superior general. On his return to France, John, possibly accompanied by Felix, was received by King Philip II Augustus, who sanctioned the establishment of the Trinitarians in France. John founded the motherhouse at Cerfroid in the region of Picardy and adopted a severe form of the Rule of St. Augustine of Hippo. In 1655 John's relics were transferred to Madrid; his cult was officially approved in 1655 and again in 1694.

The biographical details given above are those generally accepted as authentic. According to the spurious hagiographies of 15th- and 16th-century Trinitarians, John and Felix founded other French convents and dispatched some of their members to the Crusades. In 1202 John supposedly went to Tunis, Tunisia, and liberated 110 prisoners there, after which he ransomed several more Christian slaves in Spain. His second voyage to Tunis was recorded to have been a near calamity: severely persecuted by the Muslims, he embarked and managed to reach Ostia Antica, Italy, even though his ship was badly damaged. These accounts, however, and the miracles attributed to John were discovered in the 20th century to be fabrications; the hagiographical problem is explained in P. Deslandres' *L'Ordre des Trinitaires pour le rachat des captifs,* 2 vol. (1903).

John OF MIRECOURT, French JEAN DE MÉRICOUR, Latin JOHANNES DE MERCURIA (fl. 14th century), French Cistercian monk, philosopher, and theologian whose skepticism about certitude in human knowledge and whose limitation of the use of reason in theological statements established him as a leading exponent of medieval Christian nominalism (the doctrine that universals are only names with no basis in reality) and voluntarism (the doctrine that will and not reason is the dominant factor in experience and in the constitution of the world).

Originally from the Vosges Mountains in Lorraine, John, also called "the White Monk" because of his religious clothing, obtained his bachelor's degree in theology at Paris in 1345 and wrote a commentary on the *Sentences,* or theological theses, of Peter Lombard. In 1347

the university faculty censured 63 propositions from this commentary for their divergence from Roman Catholic orthodoxy. Later that year, however, following the counsel of Pope Clement VI that church authority should not involve itself in philosophical matters not immediately related to matters of faith, the faculty granted John's request to submit an accompanying "apology," or clarification, with his theological commentary and then reduced the censure to 41 propositions. John's basic proposals were that rational certitude is largely unattainable because of the fallibility of the senses, and, even granting the possibility of the human mind's forming correct ideas, truth escapes it because God, in his absolute power, can alter reality. Accordingly, John denied the possibility of rationally proving the existence of God as the most perfect of all beings or as the first cause of all that exists, indeed, even that any created thing requires a cause. He submitted that it is more meritorious for man to believe in God's existence by faith informed with love than to reach certainty by deductive reasoning.

John, however, admitted the certainty of self-existence, the doubting of which served only to prove the existence of a doubting self. His difficulties with church authorities arose principally from his attributing to God a role in the existence of evil and suffering, citing that, even if God is said only to permit evil, he in effect causes it. John's extreme views derived from his concern to safeguard at least a limited area of cognitional certitude, while acknowledging God's absolute freedom to effect anything, even the possibility that man might hate him.

John OF MONTFORT: *see* John (IV) *under* John (Brittany); John IV (or V) *under* John (Brittany).

John OF NEPOMUK, SAINT, also called JOHN OF POMUK, OF JOHN NEPOMUCEN, Czech SVATÝ JAN NEPOMUCKÝ (b. *c.* 1345, Nepomuk, Bohemia [now in Czech Republic]—d. March 20, 1393, Prague; canonized 1729; feast day May 16), patron saint of the Czechs, who was murdered during the bitter conflict of church and state that plagued Bohemia in the latter 14th century.

Saint John of Nepomuk, statue by an unknown artist in the workshop of Jan Brokof, 1709; in front of the Chapel of St. Mary's Visitation, Radič, Czech Republic
Milan Posselt

In 1383 John began studies at Padua, Italy, where he became a doctor of canon law and subsequently received several church offices. In 1390 he was made vicar general for the archbishop of Prague. In 1393 the archbishop, with John's support, excommunicated one of the favourites of King Wenceslas IV of Bohemia and thwarted the king's ambition to make a new bishopric out of the province of Prague. John was arrested as the archbishop's chief agent. Wenceslas personally tortured him with fire, after which he reconsidered and released him on an oath of secrecy regarding his treatment. John, however, was dying, and to conceal the evidence Wenceslas had him gagged, shoved into a goatskin, and cast into the Vltava River. Bohemian Catholics later regarded him as a martyr.

The Austrian chronicler Thomas Ebendorferus' account that John was killed for refusing to reveal to the king the confessions of his wife, Queen Sophia, was officially declared false in 1961.

John OF PARIS, also called JOHN THE DEAF, OF JOHN QUIDORT, French JEAN DE PARIS, JEAN LE SOURD, OF JEAN QUIDORT, medieval Latin JOHANNES DE SOARDIS (b. *c.* 1255, Paris, France—d. Sept. 22, 1306, Bordeaux, Gascony [France]), Dominican monk, philosopher, and theologian who advanced important ideas concerning papal authority and the separation of church and state and who held controversial views on the nature of the Eucharist.

A lecturer at the University of Paris and the author of several works defending the doctrines of St. Thomas Aquinas, he was condemned in 1286 for some of his theological propositions but cleared himself by further explanation.

In *De potestate regia et papali* (*c.* 1302; "On Royal and Papal Powers"), he held that church and state both derived power from God but were independent of each other, the church serving spiritual ends and the state serving secular ends. The pope could intervene in secular matters only if the moral or theological order was involved. John also held that since the pope was elected by men, he could be removed by men for good reason. *De potestate,* directed against the extreme papal claims of Pope Boniface VIII, was a valuable contribution to theology.

In his eucharistic doctrines expressed in *Determinatio* (1304), John suggested an alternative to transubstantiation, namely, the proposition that the Person of Christ somehow enters into a kind of hypostatic, or essential, union with the material elements. John's heterodoxy was censured, and he was sentenced to perpetual silence; he died before his appeal to Pope Clement V could be decided.

John OF SAINT THOMAS, Spanish JUAN DE SANTO TOMÁS, original name JUAN POINSAT (b. July 9, 1589, Lisbon, Port.—d. June 1644, Fraga, near Barcelona, Spain), philosopher and theologian whose comprehensive commentaries on Roman Catholic doctrine made him a leading spokesman for post-Reformation Thomism, a school of thought named after its foremost theorist, St. Thomas Aquinas (*c.* 1225–74), who systematically integrated Catholic teaching with Aristotelian concepts.

Born of a noble family involved in church and government, John entered the Dominican order in Madrid, assuming the religious name John of St. Thomas on July 18, 1610. From 1620 he taught theology at Madrid; at Piacenza, near Parma; and at the University of Alcalá, Spain, where he obtained the chair of theology in 1641. Two years later King Philip IV of Spain called him to Madrid to be his adviser and confessor. While accompanying Philip on military campaigns, John wrote a major treatise, *De Donis Spiritus Sancti* (*Gifts of the Holy Spirit*).

After he was appointed one of the theological interrogators for the Spanish Inquisition, the ecclesiastical heresy trials, John won a reputation for equity in defending the accused, particularly faculty members from Louvain, which was at that time under Spanish jurisdiction. Among his principal works are the *Cursus Philosophicus,* 9 vol. (1632–36; "Course in Philosophy") and the *Cursus Theologicus,* 7 vol. (1637–44; "Course in Theology"), explicating questions on major speculative themes such as the nature of theology and divine revelation, the demonstrability of God's existence, human freedom, and the rationale for morality, Christian worship, and the church. The *Cursus Philosophicus* includes an exposition of formal logic that has served as the basis for traditional Roman Catholic teaching on the psychology of knowledge. Set forth in the academic manner of the 16th-century Dominican scholar Cajetan, John's treatises refrained from the polemical style of later Counter-Reformation theological literature. His death was possibly the result of poison administered by envious Spanish courtiers. *The Material Logic of John of St. Thomas: Basic Treatises* and *Outlines of Formal Logic,* English translations, were published in 1955.

John OF SALISBURY (b. 1115/20, Salisbury, Wiltshire, Eng.—d. Oct. 25, 1180, probably at Chartres, France), one of the best Latinists of his age, who was secretary to Theobald and Thomas Becket, archbishops of Canterbury, and who became bishop of Chartres.

After 1135 he attended cathedral schools in France for 12 years and studied under Peter Abelard (1136). He was a clerk in Theobald's household in 1148 and during the next five years was mainly employed by the archbishop on missions to the Roman Curia. His *Historia pontificalis* (*c.* 1163) gives a vivid description of the papal court during this period, partly through its character sketches. From 1153 John's main duty was to draft the archbishopric's official correspondence with the Curia, especially in connection with appeals. In the late summer of 1156 this activity angered King Henry II, who regarded him as a champion of ecclesiastical independence.

The crisis passed, but to some extent it influenced John's two books, the *Policraticus* and the *Metalogicon* (both 1159), in which his general intention was to show his contemporaries that in their thought and actions they were defecting from the true task of humanity. His work represented a protest against the professional specialization slowly developing in royal and papal administration and in the universities. He unfavourably contrasted the way of life followed by courtiers and administrators with an ideal practice derived from Latin poets and from classical and patristic writers.

Out of favour with Henry, John was exiled to France (1163) shortly before Becket was exiled. From his refuge in the monastery of Saint-Rémi at Reims, John wrote many letters assessing the prospects of the Canterbury case. After the reconciliation of Henry and Becket, he returned to England (1170) and was in Canterbury Cathedral when Becket was assassinated (Dec. 29, 1170). Thereafter, John was occupied with collecting Becket's correspondence and preparing a biographical introduction. He became bishop of Chartres

in 1176 and took an active part in the third Lateran Council (March 1179). He was buried at Chartres.

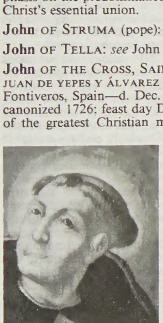
John OF SCYTHOPOLIS (fl. 6th century), Byzantine theologian and bishop of Scythopolis, in Palestine (*c.* 536–550), whose various treatises on the person and work of Christ and commentaries on Neoplatonic philosophy sought to integrate all possible elements among contrary doctrinal positions. He is sometimes confused with a contemporary, John Philoponus, also called John the Grammarian.



A learned lawyer, John composed several tracts against Monophysite teaching, a heretical doctrine maintaining a single, divine nature in Christ subsuming his humanity. His major work was a treatise, written *c.* 530, defending the theory (termed dioenergism) of Christ's dual source of vital activity, human and divine, against his contemporary Severus of Antioch, a Monophysite leader. Another work attacked the early-5th-century heretic Eutyches, one of the founders of Monophysitism.

John was the first Christian author to annotate and defend the orthodoxy of the writings of the influential 5th-century Greek Neoplatonist Pseudo-Dionysius the Areopagite, in a commentary composed *c.* 532 and preserved in both Greek and Syriac versions. Doctrinally John is termed neo-Chalcedonian in that on one hand he sustained the Christological teaching of the general council of Chalcedon (451) and its affirmation of the dual, human–divine nature in Christ; on the other he integrated with this formula the orthodox tenets of Cyril of Alexandria, Egypt, and his emphasis on the predominance of the divinity in Christ's essential union.

John OF THE CROSS, SAINT, original name JUAN DE YEPES Y ÁLVAREZ (b. June 24, 1542, Fontiveros, Spain—d. Dec. 14, 1591, Ubeda; canonized 1726; feast day December 14), one of the greatest Christian mystics and Spanish poets, doctor of the church, reformer of Spanish monasticism, and cofounder of the contemplative order of Discalced Carmelites.

Saint John of the Cross, detail of an oil painting by Joaquín Canedo, 1795; in the Museo Provincial, Valladolid, Spain

By courtesy of the Museo Provincial, Valladolid, Spain; photograph Mas, Barcelona

John became a Carmelite monk at Medina del Campo, Spain, in 1563 and was ordained priest in 1567. St. Teresa of Avila, the celebrated mystic, enlisted his help (1568) in her restoration of Carmelite life to its original observance of austerity. A year later, at Duruelo, he opened the first Discalced Carmelite monastery. Reform, however, caused friction within the order and led to his imprisonment, first in 1576 and again in 1577 at Toledo, where he wrote some of his finest poetry. Escaping in August 1578, he later won high office in the order, becoming vicar provincial of Andalusia from 1585 to 1587. Near the end of his life the Discalced Carmelites were again troubled by dissension, and he withdrew to absolute solitude.

John schematized the steps of mystical ascent—a self-communion that in quietude leads the individual from the inharmonious distractions of the world to the sublime peace of reunion between the soul and God. John's schematization combines a poetic sensitivity for the nuances of mystical experience with a theological and philosophical precision guided by his study of St. Thomas Aquinas. By virtue of his intense poems, "Cántico espiritual" ("The Spiritual Canticle"), "Noche obscura del alma" ("The Dark Night of the Soul"), and "Llama de amor viva" ("The Living Flame of Love"), he achieves preeminence in Spanish mystical literature, expressing the experience of the mystical union between the soul and Christ.

In "Noche," perhaps his best known work, he describes the process by which the soul sheds its attachment to everything and eventually passes through a personal experience of Christ's Crucifixion to his glory. The lyric consists of eight stanzas "in which the soul sings of the fortunate adventure that it had in passing through the dark night of faith . . . to union with the Beloved."

Though John reaches peaks of lyricism, he also presents the reader with considerable difficulties because his approach is rigorously intellectual. The same word may recur twice within four lines of a poem with a different symbolism on each occasion.

E.A. Peers's *St. John of the Cross* appeared in 1932, followed by his *Handbook to the Life and Times of St. Teresa and St. John of the Cross* in 1954. *The Collected Works of St. John of the Cross* were translated into English by K. Kavanaugh and O. Rodriguez in 1964. The revised edition of J.F. Nims's English translation of *The Poems of St. John of the Cross* appeared in 1968.

John OF THE HEART OF JESUS: *see* Dehon, Léon-Gustave.

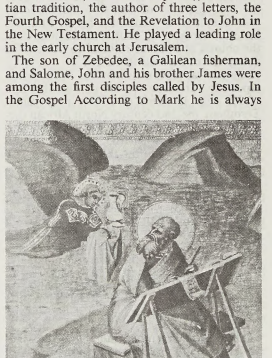
John SCHOLASTICUS, also called JOHN OF ANTIOCH (b. *c.* 503, near Antioch, Syria—d. Aug. 31, 577, Constantinople), patriarch of Constantinople (as John III), theologian, and ecclesiastical jurist whose systematic classification of the numerous Byzantine legal codes served as the basis for Greek Orthodox Church (canon) law.

A lawyer and priest, John served as Antioch's patriarchal legate at Constantinople until early 565, when the emperor Justinian named him patriarch, having just exiled the orthodox patriarch Eutychius. With the ascendancy of the Chalcedonian (orthodox) party during the reign of Justin II (reigned 565–578), John found himself in the curious position of mediator between Monophysite heretical factions (who held the belief that Christ had a single, divine nature); he later served as agent of the Emperor's policy for repressing the entire unorthodox movement.

While still a cleric in Antioch, *c.* 545, John compiled the "Collection of Canons," the earliest catalog of Byzantine Church legislation that has been preserved. It collated imperial ecclesiastical statutes with those of the 4th-century theologian-legislator Basil of Cappadocia. At Constantinople he composed the "Collection of 87 Chapters," a synthesis of the emperor Justinian's supplementary legislation on church matters. Among other works attributed to John are theological writings relative to Trinitarian doctrinal controversy, the "Catechetical Discourse," and instructions for religious initiation, the "Mystagogia."

John SOBIESKI: *see* John III Sobieski *under* John (Poland).

John TALAIA (fl. 5th century), theologian and bishop of Alexandria, Egypt, whose struggle to maintain his episcopal office and preserve the ascendancy of the orthodox party in conjunction with Popes Simplicius (468–483) and Felix III (483–492), against the incursion of Acacius, the heterodox patriarch of Constantinople, occasioned a temporary schism between Eastern and Western churches.



A priest and majordomo of the church in Alexandria, John was recommended to the emperor Zeno (474–491) at Constantinople by Bishop Timothy of Alexandria to succeed him and thus continue orthodox rule. At the death of Timothy, John was duly elected (April 482) but was soon denounced by Patriarch Acacius as a Eutychian heretic (*see* Eutyches). John's denial resulted in a charge of perjury. Because of pressure from Zeno, he was forced to vacate the church of Alexandria and was replaced by one of Acacius' supporters, Petrus III Mongus.

Later in 482 when Acacius wrote, under the authority of Zeno, the *Henoticon* (Greek: "Edict of Union"), a theological formula of Christian Trinitarian and Christological faith incorporating the decisions of the general councils of Nicaea (325) and of Constantinople (381), and after John sought redress from Pope Felix III, he excommunicated Acacius and his sect in 485 for failing to consult the Roman Church in the promulgation of the *Henoticon.* Schism was thus precipitated, although it ended in 519 when the emperor Justin I sought reconciliation. Nevertheless, it established an independent Byzantine church and activated a developing alienation that finally erupted in the definitive schism of 1054. John was never restored to Alexandria, but in 484 he was appointed bishop of Nola, Italy, where he soon died.

Consult the INDEX *first*

John THE APOSTLE, SAINT, also called SAINT JOHN THE EVANGELIST, OF SAINT JOHN THE DIVINE (fl. 1st century AD), in Christian tradition, the author of three letters, the Fourth Gospel, and the Revelation to John in the New Testament. He played a leading role in the early church at Jerusalem.

The son of Zebedee, a Galilean fisherman, and Salome, John and his brother James were among the first disciples called by Jesus. In the Gospel According to Mark he is always

Saint John the Apostle, on Patmos, writing the book of Revelation, detail of a 14th-century painting; in the Städelsches Kunstinstitut, Frankfurt, Ger.

By courtesy of the Städelsches Kunstinstitut, Frankfurt

mentioned after James and was no doubt the younger brother. His mother, Salome, was among those women who ministered to the

circle of disciples. James and John were called by Jesus "Boanerges," or "sons of thunder," perhaps because of some character trait such as the zeal exemplified in Mark 9:38 and Luke 9:54 when John and James wanted to call down fire from heaven to punish the Samaritan towns that did not accept Jesus. John and his brother, together with Simon Peter, formed an inner nucleus of intimate disciples. In the Fourth Gospel, ascribed by early tradition to John, the sons of Zebedee are mentioned only once, as being at the shores of the lake of Tiberias when the risen Lord appeared; whether the "disciple whom Jesus loved" (who is never named) mentioned in this Gospel is to be identified with John (also not named) is not clear from the text.

John's authoritative position in the church after the Resurrection is shown by his visit with Peter to Samaria to lay hands on the new converts there. It is to Peter, James (not the brother of John but "the brother of Jesus"), and John that Paul successfully submitted his Gospel for recognition. What position John held in the controversy concerning the admission of the Gentiles to the church is not known; the evidence is insufficient for a theory that the Johannine school was anti-Pauline—*i.e.*, opposed to granting Gentiles membership in the church.

John's subsequent history is obscure and passes into the uncertain mists of legend. At the end of the 2nd century, Polycrates, bishop of Ephesus, claims that John's tomb is at Ephesus, identifies him with the beloved disciple, and adds that he "was a priest, wearing the sacerdotal plate, both martyr and teacher." That John died in Ephesus is also stated by Irenaeus, bishop of Lyon *c.* AD 180, who says John wrote his Gospel and letters at Ephesus and Revelation at Patmos. During the 3rd century, two rival sites at Ephesus claimed the honour of being the Apostle's grave. One eventually achieved official recognition, becoming a shrine in the 4th century. In the 6th century the healing power of dust from John's tomb was famous (it is mentioned by the Frankish historian Gregory of Tours); at this time also, the church of Ephesus claimed to possess the autograph of the Fourth Gospel.

Legend was also active in the West, being especially stimulated by the passage in Mark 10:39, with its hints of John's martyrdom. Tertullian, the 2nd-century North African theologian, reports that John was plunged into boiling oil from which he miraculously escaped unscathed. During the 7th century, this scene was portrayed in the Lateran basilica and located in Rome by the Latin Gate; it is still annually commemorated on May 6. John's feast day otherwise is December 27. This belief that John did not die is based on an early tradition. In the original form of the apocryphal *Acts of John* (second half of the 2nd century) the Apostle dies; but in later traditions he is assumed to have ascended to heaven like Enoch and Elijah. A popular tradition known to Augustine declared that the earth over his grave heaved as if the Apostle were still breathing.

The legends that contributed most to medieval iconography are mainly derived from the apocryphal *Acts of John.* These *Acts* are also the source of the notion that John became a disciple as a very young man. Iconographically, the young, beardless type is early (as in a 4th century sarcophagus from Rome), and this type came to be preferred (though not exclusively) in the medieval West. In the Byzantine world the evangelist is portrayed as old, with long, white beard and hair, usually carrying his Gospel. His symbol as an evangelist is an eagle. On account of the inspired visions of the book of Revelation the Byzantine churches entitled him "the Theologian"; and the title appears in Byzantine manuscripts of Revelation but not in manuscripts of the Gospel. (H.Cha.)

BIBLIOGRAPHY. A scholarly study of St. John's life may be found in commentaries on the Gospel, Epistles, and Apocalypse; especially commentaries on the Gospel by R.E. Brown (1966–70), J.N. Sanders (1968), and R. Schnackenburg (1968). See also the entry under December 27 in *Butler's Lives of the Saints,* vol. 4 (1956). For an appreciation of Johannine theology, see F.M. Braun, *Jean le théologien,* 3 vol. (1959–67).

John THE BAPTIST, SAINT (b. Judaea—fl. early 1st century AD), Jewish prophet of priestly origin who preached the imminence of God's Final Judgment and baptized those who repented in self-preparation for it; he is revered in the Christian Church as the forerunner of Jesus Christ.

After a period of desert solitude, he attained notice as a prophet in the region of the lower Jordan Valley. He had a circle of disciples, and Jesus was among the recipients of his rite of baptism.

Sources of information about John. The primary sources for information about John's life and activity are the four Gospels (Matthew, Mark, Luke, and John), the Acts of the Apostles, and the Jewish historian Josephus' *Antiquities of the Jews.* In using these works for historical reconstruction, allowances must be made for the known tendencies of each writer. All four Gospels recognize in John the start of the Christian Era, and each in its own way tries to reconcile John's precedence in time and Jesus' acceptance of his message and of a baptism of repentance from his hands (elements suggesting subordination to John), with the author's belief in Jesus as Messiah and Son of God. The Gospel According to Mark presents Jesus as the hidden Messiah, known only to a narrow circle, and John as the prophet Elijah returned and as the one who had to "come first to restore all things"

Saint John the Baptist, fresco by Pinturicchio, 1504–05; in the chapel of St. John Baptist, the cathedral of Siena, Italy
Alinari—Art Resource/EB Inc.

but who also remained hidden and suffered death with little acknowledgment of his true status (Mark 9). An early collection of sayings of Jesus, known to biblical scholars simply as Q, similarly represents the Baptist as the herald of the Coming One and of the imminent Kingdom, yet tries to stress his preparatory character, and so his subordination to Jesus. Matthew and Luke develop these two sources. The Gospel According to Matthew emphatically identifies John as the returning Elijah, herald of the Kingdom of God (Matt. 3). For Matthew, John's death, like that of Jesus, illustrates the old Israel's hostility to God's offer of salvation. Luke, in his Gospel and in the Acts of the Apostles, neglects the identification with Elijah but describes John as Jesus' forerunner and as inaugurator of the time of fulfillment of prophecy. Luke's account of the infancy of John and of Jesus does not necessarily derive from an underlying document composed in a "Baptist" sect, although it uses material perhaps transmitted by former disciples of the Baptist. It depicts the birth of Jesus and John in two parallel series of scenes, each with an angelic annunciation, conception, marvellous birth, circumcision, hymns greeting the children and predicting their destiny, and infancy. Even in his mother's womb John recognizes Jesus—also still in his mother's womb—as his Lord. The Gospel According to John reduces the Baptist from an Elijah to a model Christian preacher, a mere voice; it omits any description of Jesus' baptism. Its tendency has often been labelled polemic against a continuing group of disciples of John, but it is more plausibly explained by the evangelist's desire that this ideal witness recognize the full character of the Christ as he is presented in the Gospel According to John and as a necessary consequence of the tension between the highly developed understanding of Christ in this Gospel and those details in early Christian tradition that suggested Jesus' subordination to John. The Gospels are thus primarily interested in the relations between John and Jesus.

Josephus sought to present Jewish religious phenomena in Hellenistic categories and to deemphasize any political elements unfavourable to Roman imperial control.

Life and work. After allowances are made for the tendencies of each of these sources, the following items about John appear relatively trustworthy. He was born somewhere in Judaea (localized at 'En Kerem from at least AD 530) to Zechariah, a priest of the order of Abijah, and his wife, Elizabeth, perhaps a relative of Mary, the mother of Jesus. His formative years were spent in the Judaean desert, where monastic communities, such as the Essenes (a strict Jewish sect that existed from about the 2nd century BC to the end of the 1st century AD), and individual hermits often educated the young in their own ideals.

In 27/28 or 28/29 John attained public notice, not as a priest but as a prophet. He was active in the region of the lower Jordan Valley, from "Aenon near Salim" (near modern Nablus) to a point east of Jericho. His dress of an austere camel's hair garment was the traditional garb of the prophets, and his diet of locusts and wild honey represented either strict adherence to Jewish purity laws or the ascetic conduct of a Nazirite (a Jew especially vowed to God's service). His mission was addressed to all ranks and stations of Jewish society. His message was that God's wrathful judgment on the world was imminent and that, to prepare for this judgment, the people should repent their sins, be baptized, and produce appropriate fruits of repentance. Certain problems about the meaning of John's message continue to be debated: In Matt. 3, John says, "he who is coming after me is mightier than I"; this might refer to God himself, a human messiah, or a transcendent divine being. He also says, "I baptize you with water . . . ; he will baptize you with the Holy Spirit and with fire"; this second baptism might symbolize the judgment the one coming would carry out. John's followers were characterized by penitent fasting, beyond the demands of Jewish Law, and special prayers. John's ethical call for justice and

charity in Luke 3 requires righteousness from everyone in his own situation.

Although, like earlier prophets, John had an inner circle of disciples, baptism was not an admission rite into this group. It was a rite (immersion in running water) that symbolized repentance in preparation for the coming world judgment and was to be accompanied, before and afterward, by a righteous life. It was hardly conceived as a sacrament, in the Christian sense conveying forgiveness, or as superseding Judaism and marking off a new people, including both Jews and Gentiles, prepared for God's final Kingdom; nor is a hypothesis that it symbolized a new Israel's crossing of the Red Sea toward a new national deliverance demonstrable. Equally unprovable is that it was a rite symbolizing man's reunion with divinity and return to his heavenly home—a sacrament of salvation and rebirth. The Jewish rite of baptism of converts differs fundamentally and is not its source. There were several other baptizing groups found about the same time and place, but none of these various and little-known baptisms can be shown to have inspired John's. It may have resembled in parts the initiatory baptism of the Essenes, though their other baptisms were more concerned with maintaining their community's ritual purity. John's baptism probably symbolized not so much anticipated entrance into the Kingdom of God as an anticipatory submission to the coming world judgment, which was represented as a coming second "baptism" by the Holy Spirit in a river of fire.

Possible relationship with the Essenes. The discovery of the Dead Sea Scrolls has drawn attention to the numerous parallels between John's mission and that of the Essenes, with whom John may have received some of his religious training. Both were priestly in origin, ascetic, and with intense and, in many respects, similar expectations about the end of the world. But John neither belonged to nor intended to found any organized community; he did not stress study of the Mosaic Law; and his message was more widely directed (to the poor, to sinners) than was that of the Essenes.

Jesus, who was baptized by John, saw in John the last and greatest of the prophets, the one who prepared for the coming of God's Kingdom (Mark 9, Matt. 11, Luke 7), and in many ways his ministry continued and developed John's. Whether John, who probably expected a divine Son of Man, recognized him in Jesus is not clear, but many of his disciples later followed Jesus.

Some time after baptizing Jesus, John was imprisoned by Herod Antipas, ruler of Galilee and central Transjordan. His crime was hardly the innocuous moral message Josephus presents, nor would his message, as found in the Gospels, have had much more immediate political bite. Herod had married (illegally, by Jewish Law) Herodias, the divorced wife of his half brother, after divorcing his first wife, the daughter of King Aretas IV of the Nabataeans, an adjacent Arab people. John's denunciation of this marriage doubtless presented Herod with the danger that his Jewish subjects would combine with his semi-Arab subjects in opposition to him. John's execution certainly preceded Aretas' victory over Herod in 35–36, a defeat popularly considered to have been divine vengeance on Herod for killing John. According to the Gospels, John's death preceded Jesus'; any greater chronological precision depends on the dates of Jesus' ministry and death. It is probable that John's followers recovered and buried his body and revered his tomb. The traditional burial site, at Sebaste (originally Samaria), near "Aenon by Salim," is attested from 360 onward.

(Jo.St.)

BIBLIOGRAPHY. On the ancient sources, see the standard commentaries on the Gospels, the Acts of the Apostles, and Josephus ("Loeb Classical Library"). Among recent monographs, Carl H. Kraeling, *John the Baptist* (1951), is primarily a historical investigation, while Walter Wink, *John the Baptist in the Gospel Tradition* (1968), studies the Gospels' tendencies and their differing representations of John. For analogous contemporary baptizing groups, see J. Thomas, *Le Mouvement baptiste en Palestine et Syrie* . . . (1935), and more recent literature on the community that produced the Dead Sea Scrolls. Most encyclopaedias of religion or biblical studies contain articles on John. Representative are: P. Vielhauer in *Die Religion in Geschichte und Gegenwart,* 3rd ed., vol. 3, pp. 804–808 (1959), who offers the mainline view of critical New Testament scholarship; and W.R. Farmer in *The Interpreter's Dictionary of the Bible,* vol. 2, pp. 955–962 (1962), who stresses the political aspects of John's activity.

John THE FASTER, SAINT (fl. late 6th century—d. Sept. 2, 595, Constantinople; feast days January 7 and August 29), patriarch of Constantinople (John IV) and mediator of theological disputes between the Orthodox and Monophysites (*q.v.*). He reinforced Constantinople's preeminence among patriarchal cities in the Eastern Church by assuming the contested title of ecumenical patriarch. His sobriquet "the Faster" derived from his meagre use of food.

John's devout and conciliatory nature attracted him to Patriarch John III Scholasticus, who ordained him deacon at the cathedral of Hagia Sophia and appointed him to minister to the needs of the poor. Favoured by the Eastern Roman emperor Tiberius II, John became patriarch of Constantinople in 582. A dispute over the title ecumenical patriarch, appropriated by John at a synod in 588 and continued by his successors to the present, evoked charges from the 6th-century popes Pelagius II and Gregory I of usurping spiritual authority. Historical and linguistic evidence exists, however, to show that the title had precedent in both East and West; it signified a spiritual primacy relative to the political boundaries of the Byzantine Empire, whose capital, Constantinople, was in ecclesiastical rank second only to Rome. The Greek Byzantine Church, impressed by his ascetical and charitable character, proclaimed him a saint.

John, Acts of, an apocryphal (noncanonical and unauthentic) Christian writing, composed about AD 180, purporting to be an account of the travels and miracles of St. John the Evangelist. Photius, the 9th-century patriarch of Constantinople, identified the author of the Acts of John as Leucius Charinus, otherwise unknown. The book reflects the heretical views of early Christian Docetists, who denied the reality of Christ's physical body and attributed to it only the appearance of materiality. The Acts of John likewise has a hymn containing formulas to evade demons who, according to Gnostic teachings, could impede one's journey to heaven. The book was condemned by the second Council of Nicaea, in AD 787, because of its subversion of orthodox Christian teachings.

John, Augustus (Edwin) (b. Jan. 4, 1878, Tenby, Pembrokeshire, Wales—d. Oct. 31, 1961, Fordingbridge, Hampshire, Eng.), Welsh

Augustus John, self-portrait, chalk, *c.* 1901; in the National Portrait Gallery, London

painter, an accomplished portraitist, muralist, and draughtsman.

John studied at the Slade School of Fine Art from 1894 to 1898. By the age of 20 he had won a reputation as one of the most brilliant draughtsmen in England. His portraits and other paintings done around 1900 gained attention for the vigour and originality of their approach and technique. He enjoyed a wide reputation as an artist by 1910. A colourful personality, John adopted a highly individualistic and bohemian lifestyle; he roamed over Wales, Ireland, and Dorset, living with gypsies and learning their customs and language. The painting "Encampment on Dartmoor" (1906; private collection) is based on these experiences. After World War I John's creative vitality declined even as his reputation continued to grow. He painted portraits of many of the leading personalities of Europe in a slick and somewhat superficial style, occasionally recapturing in such works his former boldness and integrity of form. His most significant portraits include the strong and sensuous "Smiling Woman" (*c.* 1908; Tate Gallery, London), a portrait of his second wife, Dorelia, and those of James Joyce, G.B. Shaw, cellist Mme Suggia, and poet Dylan Thomas. *Augustus John: A Biography,* by Michael Holroyd, was published in 1974–75.

John, Gospel According to, fourth of the four New Testament narratives recounting the life and death of Jesus Christ; John's is the only one of the four not considered among the Synoptic Gospels (*i.e.,* those presenting a common view). Although the Gospel is ostensibly written by John, "the beloved disciple" of Jesus, there has been considerable discussion of the actual identity of the author. The language of the Gospel and its well-developed theology suggest that the author may have lived later than John and based his writing on John's teachings and testimonies. Moreover, the facts that several episodes in the life of

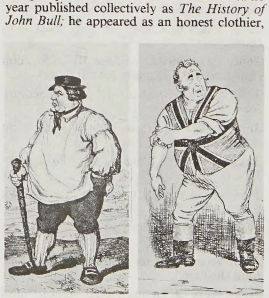
Jesus are recounted out of sequence with the Synoptics and the final chapter appears to be a later addition suggest that the text may be a composite. The Gospel's place and date of composition are also uncertain; many scholars suggest that it was written at Ephesus, in Asia Minor, in about AD 100 for the purpose of communicating the truths about Christ to Christians of Hellenistic background.

John's Gospel differs from the Synoptic Gospels in several ways: it covers a different time span than the others; it locates much of Jesus' ministry in Judea; and it portrays Jesus discoursing at length on theological matters. The major difference, however, lies in John's overall purpose. The author of John's Gospel tells us that he has chosen not to record many of the symbolic acts of Jesus and has instead included certain episodes in order that his readers may understand and share in the mystical union of Christ's church, that they "may believe that Jesus is the Christ, the Son of God, and that believing you may have life in his name" (20:30). This motive pervades the narrative, as do a kind of mystic symbolism and repeated emphasis on the incarnation. The author begins his account with a pronouncement on the incarnation that clearly intimates Genesis ("In the beginning was the Word, and the Word was with God, and the Word was God."). The author continually adds interpretative comments of his own to clarify Jesus' motives. In the narration of certain miraculous deeds, for example, the feeding of the 5,000 (6:1–15), which appears in all four Gospels, John's version is explained as symbolic of a deeper spiritual truth ("I am the bread of life; . . ."). Throughout John's Gospel, Jesus openly presents himself as the divine Son of God, not hiding his identity as he does in Mark. Thus, the author of John's Gospel does not merely narrate a series of events but singles out details that support an ordered theological interpretation of those events.

Because of its special theological character, the Gospel According to John was considered in ancient times to be the "spiritual Gospel," and it wielded a profound and lasting influence on the development of early Christian doctrine.

John, letters of, three New Testament writings, all composed sometime around AD 100 and traditionally attributed to John the Evangelist, son of Zebedee and disciple of Jesus. The author of the first letter is not identified, but the writer of the second and third calls himself "presbyter" (elder). Though the question of authorship has been much discussed, the language and contents of the three letters suggest a common source.

The first letter was apparently addressed to a group of churches where "false prophets," denounced as Antichrist, denied the incarnation of Jesus and caused a secession so substantial that the orthodox remnant was sadly depleted. The faithful were deeply disturbed that the heresy found favour among pagans, and they apparently felt inferior because those who had left their midst claimed to have profound mystical experiences. The heretics asserted that they possessed perfection, were "born of God," and were without sin. By placing themselves above the Commandments, they in fact sanctioned moral laxity. John's letter thus urges the Christian community to hold fast to what they had been taught and to repudiate heretical teachings. Christians are exhorted to persevere in leading a moral life, which meant imitating Christ by keeping the Commandments, especially that of loving one another. The spirit of the letter closely parallels that of the Fourth Gospel.



The second and third letters are closely akin to the first in language and ideas. The second exhorts a church, fancifully called "the elect lady and her children," to boycott heretics who deny the reality of the incarnation. The third letter is addressed to a certain Gaius and complains that "Diotrephes, who lies to put himself first, does not acknowledge my authority"—a hint that Gnostic teachings were severely disrupting the community.

John, Revelation to, also called APOCALYPSE OF JOHN: *see* Revelation to John.

John Bartholomew and Son, mapmaking and publishing company of the United Kingdom, located in Edinburgh and specializing in the use of hypsometric (layer) colouring in relief maps. The company was established in 1826 by John Bartholomew. It originally published such diverse items as checkbooks, election literature, and maps. In 1856 his son John George Bartholomew (1831–93), the well-known Scottish cartographer, assumed control of the management, and the company developed into a larger, more prosperous business and acquired its own printing press (1860). Since 1890 production has been devoted mainly to cartographical publications. The company's much acclaimed Environmental Map Programme for Education, using satellite photography to study the Earth's environment and physical features, was launched in 1978. Some of the company's well-known publications are the *World Travel Map Series, World Atlas, Times World Wall Map, National Map Series,* and *City Plans Series.*

John Birch Society, private organization founded in the United States on Dec. 9, 1958, by Robert H.W. Welch, Jr. (1899–1985), a retired Boston candy manufacturer, for the purpose of combating Communism and promoting various ultraconservative causes. The name derives from John Birch, an American Baptist missionary and U.S. Army intelligence officer who was killed by Chinese Communists on Aug. 25, 1945, making him, in the society's view, the first hero of the Cold War. The society publishes the journal *American Opinion,* issued 11 times a year, and a monthly *Bulletin* for members. The *Blue Book,* written by Welch, outlines the nature and purposes of the society. Its headquarters is in Belmont, Mass.

John Bull, in literature and political caricature, a conventional personification of England or of English character. Bull was invented by the Scottish mathematician and physician John Arbuthnot as a character in an extended allegory that appeared in a series of five pamphlets in 1712 and later in the same year published collectively as *The History of John Bull;* he appeared as an honest clothier, bringing action with his linen-draper friend Nicholas Frog (Holland) against Lewis Baboon (Louis XIV) for interfering with trade. The wide circulation of the satire fixed Bull as a popular personification in 18th-century political writings.

John Bull as (left) a countryman in an 1829 cartoon and (right) wearing a Union Jack waistcoat in a 1911 cartoon by "Poy" (Percy Hutton Fearon) in the London *Daily Dispatch*

By courtesy of (right) J. Henry Fearon; photograph, R.B. Fleming & Co. Ltd

Subsequently, the French Revolutionary and Napoleonic wars brought John Bull's first great period in caricature, when such satirists as James Gillray and Thomas Rowlandson conventionalized a gross, rather stupid figure, weighed down with debt or taxation or oppression, according to the artists' political allegiance; but, less than 50 years later, "HB" (John Doyle) raised John Bull in the social scale, and he became the portly, prosperous citizen. This was the typical native representation, however; hostile foreign caricature identified him with "perfidious Albion."

John Bull's widest recognition came in the middle and late 19th century, especially through the influential cartoons portraying him in the periodical *Punch.* The most familiar and frequent representation was that developed by *Punch* cartoonists John Leech and Sir John Tenniel: the jovial and honest farmer figure, solid and foursquare, sometimes in Union Jack waistcoat and with bulldog at heel. John Bull had by now become so universally familiar that the name frequently appeared in book, play, and periodical titles and pictorially as a brand name or trademark for manufactured goods.

John Day, city, Grant county, northeast central Oregon, U.S., situated at the confluence of John Day River and Canyon Creek, near the Strawberry Mountain Wilderness Area. A stopover on the Pony Express trail from The Dalles (220 mi [354 km] northwest), it originated in the early 1860s, along with adjacent Canyon City, as a mining and cattle town. It was named for the river, which had in turn been named after a heroic Virginian scout of the Astor overland expedition (1811). The present city is a trading point for a cattle and mining region and is headquarters of the Malheur National Forest, which spreads over the foothills of the Blue Mountains. Timber, beef, and tourism are the economic mainstays. The nearby Herman and Eliza Oliver Historical Museum houses relics of the gold-mining days. Westward along the river is the John Day Fossil Beds National Monument, with fossils more than 30,000,000 years old, and Picture Gorge, with ancient Indian pictographs. Pop. (1990) 1,836.

John Dory (fish): *see* dory.

John Frederick, byname JOHN FREDERICK THE MAGNANIMOUS, German JOHANN FRIEDRICH DER GROSSMÜTIGE (b. June 30, 1503, Torgau, Saxony—d. March 3, 1554, Weimar, Saxe-Weimar), last elector of the Ernestine branch of the Saxon House of Wettin and leader of the Protestant Schmalkaldic League. His wars against the Holy Roman emperor Charles V and his fellow princes caused him to lose both the electoral rank and much of his territory.

The elder son of the elector John the Steadfast, John Frederick succeeded to the Ernestine lands in 1532. As head of the Schmalkaldic League (*q.v.*) for the defense of the reformers, he hesitated to oppose the Holy Roman emperor Charles V, in whose pacific intentions he believed. His Naumburg coup, when he forced the replacement of an elected Catholic bishop by a Protestant one, however, helped convince Charles V to take up arms against the Reformation. Furthermore, by seizing the town of Wurzen, John Frederick ignored the rights of his second cousin Maurice, Saxon duke of the rival Albertine branch of the House of Wettin.

The ensuing enmity helped split Germany's Protestant princes. When the Emperor defeated the Schmalkaldic League at the Battle

John Frederick the Magnanimous, portrait by Lucas Cranach the Elder; in the Gemäldegalerie, Berlin
By courtesy of the Staatliche Museen zu Berlin

of Mühlberg (1547) with the aid of Maurice, the electoral dignity was granted to the Albertines. John Frederick, wounded and taken prisoner, was condemned to death but saved himself by acquiescing to electoral and territorial losses. He refused to compromise on religious issues, however, and enjoined his sons to refuse peace with Maurice. In 1552, during a war between the Emperor and Maurice, John Frederick was freed. After the death of Maurice (1553), he hoped to regain the electorship but was disappointed when Maurice's successor Augustus was granted the title. Considered a martyr of Protestantism, John Frederick continued to enjoy the respect of his people and fellow princes until his death.

John Frederick (II), byname JOHN FREDERICK THE MIDDLE ONE, German JOHANN FRIEDRICH DER MITTLERE (b. Jan. 8, 1529, Torgau, Saxony—d. May 9, 1595, Steyr, Austria), Ernestine duke of Saxony, or Saxe-Coburg-Eisenach, whose attempts to regain the electoral dignity, lost by his father to the rival Albertine branch of the House of Wettin, led to his capture and incarceration until his death.

On the imprisonment of his father, the former elector John Frederick the Magnanimous, John Frederick II and his brothers John William and John Frederick III the Younger ruled the remaining Ernestine lands jointly. In 1565, on John Frederick III's death, John Frederick II became sole ruler, after ceding Coburg as a separate duchy to John William. A strict Lutheran, he repeatedly purged the clergy of his realm for teachings of which he disapproved. John Frederick never forgave the Emperor for his father's loss of the electorship. Attempting to regain the dignity, he allied himself with the powerful Palatinate and the adventurer Wilhelm von Grumbach (*q.v.*) and tried to foment an uprising. Placed under the imperial ban in 1566, John Frederick was captured at Gotha in 1567. For the next 28 years until his death he was held prisoner in various places. His wife, Elizabeth of the Palatinate, shared his captivity.

John George, German JOHANN GEORG, name of rulers grouped below by country and indicated by the symbol •.

Brandenburg

•**John George** (b. Sept. 11, 1525, Kölln an der Spree, Brandenburg—d. Jan. 18, 1598, new style, Kölln an der Spree), elector of Brandenburg who in 1571 succeeded his father, Joachim II. Under his rule the divided electorate was reunited. His economies earned him the surname Oekonom (Steward) and made him popular with the nobility, to whom he granted concessions at the expense of the peasant class. A Lutheran, John George welcomed Protestant refugees from France and the Netherlands, but refused to become involved in the religious wars of either country.

Saxony

•**John George I** (b. March 5, 1585, Dresden, Saxony—d. Oct. 8, 1656, Dresden), elector of Saxony from 1611, whose irresolution lost for Saxony, then the richest and most powerful of the German states, opportunities for ascendancy and territorial expansion.

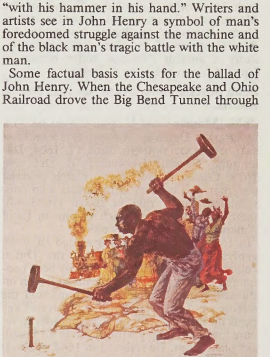
An easygoing, indolent drunkard whose chief wish was "to drink his beer in peace," he was a faithful adherent of the house of Habsburg. As a result of his inability to grasp political opportunities, he lost the leadership of the German Protestants, first to Frederick V of the Palatinate, then to Gustavus II Adolphus of Sweden, and last to Frederick William of Brandenburg. During the Thirty Years' War, his vacillation and half-hearted efforts lost him the Bohemian crown and the chance to acquire permanently the archbishopric of Magdeburg. The Peace of Westphalia (1648), which ended the Thirty Years' War, determined the ascendance of Brandenburg over Saxony.

•**John George II** (b. May 31, 1613, Dresden, Saxony—d. Aug. 22, 1680, Freiberg, Saxony), elector of Saxony (1657–80), under whom Dresden became the musical centre of Germany.

In 1657, just after his accession, he made an arrangement with his three brothers with the object of preventing disputes over their separate territories, and in 1664 he entered into friendly relations with Louis XIV of France. He received money from the French king, but the existence of a strong anti-French party in Saxony induced him occasionally to respond to the overtures of the emperor Leopold I. The elector's primary interests were not in politics but in music and art. He adorned Dresden; welcoming foreign musicians and others, he gathered around him a large and splendid court, and his capital was the constant scene of musical and other festivals. His enormous expenditure compelled him in 1661 to grant greater control over monetary matters to the estates, a step that laid the foundation of the later system of finance in Saxony.

•**John George III** (b. June 20, 1647, Dresden, Saxony—d. Sept. 12, 1691, Tübingen, Württemberg), elector of Saxony (1680–91).

He forsook the vacillating foreign policy of his father, John George II, and in June 1683 joined an alliance against France. Having raised the first standing army in the electorate, he helped to drive the Turks from Vienna in September 1680, leading his men with great gallantry; but, disgusted with the attitude of the emperor Leopold I after the victory, he returned at once to Saxony. However, he sent aid to Leopold in 1685. When Louis XIV's armies invaded Germany in September 1688, John George was one of the first to take up arms against the French; and, after sharing in the capture of Mainz, he was appointed commander in chief of the imperial forces. He had not, however, met with any notable success when he died at Tübingen.



Like his father, he was very fond of music, but he appears to have been less extravagant. His wife was Anna Sophia, daughter of Frederick III, king of Denmark, and both his sons, John George and Frederick Augustus, became electors of Saxony, the latter also becoming king of Poland as Augustus II.

•**John George IV** (b. Oct. 18, 1668, Dresden, Saxony—d. April 27, 1694, Dresden), elector of Saxony (1691–94).

At the beginning of his reign his chief adviser was Hans Adam von Schöning (1641–96), who counselled a union between Saxony and Brandenburg and a more independent attitude toward the emperor Leopold I. In accordance with this advice certain proposals were put before Leopold to which he refused to agree; consequently the Saxon troops withdrew from the imperial army, a proceeding that led the chagrined emperor to seize and imprison Schöning in July 1692. Although John George was unable to procure his minister's release, Leopold managed to allay the elector's anger, and early in 1693 the Saxon soldiers rejoined the imperialists. John George IV is chiefly celebrated for his passion for Magdalene Sibylle von Neidschütz (d. 1694), created in 1693 countess of Rochlitz, whom on his accession he publicly established as his mistress. John George left no legitimate issue, and the electorship passed to his brother Frederick Augustus (Augustus II of Poland).

John Henry, hero of a widely sung U.S. black folk ballad. It describes his contest with a steam drill, in which John Henry crushed more rock than did the machine but died "with his hammer in his hand." Writers and artists see in John Henry a symbol of man's foredoomed struggle against the machine and of the black man's tragic battle with the white man.

Some factual basis exists for the ballad of John Henry. When the Chesapeake and Ohio Railroad drove the Big Bend Tunnel through

John Henry, tempera painting by James Lewicki, 1961; in the artist's collection
James Lewicki

the Allegheny Mountains in West Virginia, from 1870 to 1873, steel drivers hammered steel drills into the rock to make holes into which to pack explosives. The modern steam drill was introduced into the South in 1870; hence, it is possible that the comparative efficiency of the two methods could have been tested at Big Bend.

Although Southern blacks sang about John Henry, they told few stories of him, and, like Paul Bunyan, he is not truly a folk hero. The imaginative treatment by Roark Bradford in *John Henry* (1931) made the name known to many Americans.

John Hyrcanus I (b. *c.* 175 BC—d. 104 BC), high priest and ruler of the Jewish nation from 135/134 to 104 BC. Under his reign the Hasmonean kingdom of Judaea in ancient Palestine attained power and great prosperity, and the Pharisees, a scholarly sect with popular backing, and the Sadducees, an aristocratic sect that comprised the priesthood, became well-defined religious parties.

Hyrcanus was the youngest son of Simon

Maccabeus and thus a member of the Hasmonean dynasty. In 137 BC he and his brother Judas commanded the force that heroically repelled the invasion of Judaea led by Cendebeus, the general of the Syrian king Antiochus VII Sidetes. In 135 Hyrcanus' brother-in-law, Ptolemy, the governor of Jericho, assassinated Hyrcanus' father and two elder brothers; Hyrcanus then succeeded to the high priesthood and the supreme authority in Judaea. The remainder of Hyrcanus' reign was marked by his efforts to punish his enemies, ward off the Syrians, and enlarge Judaea's boundaries. Although he struggled in vain to destroy Ptolemy, he successfully thwarted Syrian incursions by alliance with Rome and conquered the unfriendly neighbouring territories of Samaria and Idumaea (Edom). He forced Idumaea to convert to Judaism, the first example of conversion imposed by the Jews in their history. Upon his death Hyrcanus was succeeded by his eldest son, Aristobulus I. Hyrcanus' reign was the last under which Judaea was a powerful, united state.

John Hyrcanus II (d. 30 BC, Jerusalem), high priest of Judaea from 76 to 40 BC, and, with his brother Aristobulus II, last of the Maccabean (Hasmonean) dynastic rulers. Under Hyrcanus' vacillating leadership, Judaea (southern of the three traditional divisions of ancient Palestine, today mostly in Israel) fell into vassalage to Rome.

John Joseph OF AUSTRIA: *see* Juan José de Austria.

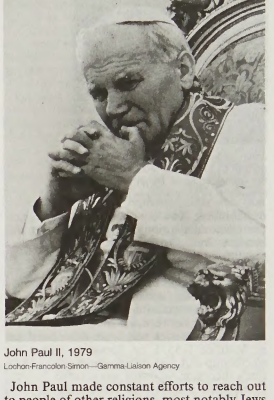
John Maurice OF NASSAU, byname THE BRAZILIAN, Dutch JOHAN MAURITS VAN NASSAU, DE BRAZILIAAN (b. June 17, 1604, Dillenburg, Nassau [Germany]—d. Dec. 20, 1679, Cleves, Brandenburg), Dutch colonial governor and military commander who consolidated Dutch rule in Brazil (1636–44), thereby bringing the Dutch empire in Latin America to the peak of its power.

In 1636 John Maurice was named *kapitein-generaal* (governor-general) of the Dutch colony in Brazil, which had recently been conquered from Portugal. He expanded Dutch influence in the Caribbean and sponsored the seizure of Angola (1641) and of several key ports on the west African coast in order to secure trade and supply African slaves for Brazilian plantations. He resigned in 1644. A revolt against Dutch rule broke out the next year.

John o'Groats, locale near Dunnet Head, in the district of Caithness, Highland region, Scotland. The expression "from Land's End to John o'Groats" (a distance of about 870 miles [1,400 km]) means "from end to end of Great Britain." The northernmost part of the British mainland is in fact nearby Dunnet Head, and the point on the mainland farthest from Land's End is nearby Duncansby Head. The most northerly point in the British Isles is the Muckle Flugga lighthouse on a rock off the island of Unst in Shetland.

John Paul I, Latin JOHANNES PAULUS, original name ALBINO LUCIANI (b. Oct. 17, 1912, Forno di Canale, Italy—d. Sept. 28, 1978, Rome), pope whose 34-day pontificate in 1978 was the shortest in modern times. He was the first pope to choose a double name and did so in commemoration of his two immediate predecessors, John XXIII and Paul VI.

Born of a poor family, Albino was graduated from the Gregorian University in Rome and was ordained a priest in 1935. Appointed deputy director of the seminary in the Belluno diocese, he taught moral theology, canon law, and sacred art. In 1948 he was made vicar-general of his diocese, and in 1958 he was appointed bishop of Vittorio Veneto. Made archbishop of Venice in 1969, he became a cardinal in 1973. He was elected pope on Aug. 26, 1978, the first pope with a pastoral rather than a diplomatic or scholarly background since Pius X (reigned 1903–14). He died of a heart attack.



John Paul II, Latin IOANNES PAULUS, original name KAROL JÓZEF WOJTYŁA (b. May 18, 1920, Wadowice, Pol.), the bishop of Rome and head of the Roman Catholic church since 1978, the first non-Italian pope in 455 years and the first ever from a Slavic country. His trips abroad often attracted enormous crowds, including some of the largest ever assembled, and his crusades against political oppression were widely praised. His nonviolent activism spurred movements that contributed to the peaceful dissolution of the communist Soviet Union in 1989. His critics charged, however, that he mishandled church administration and failed to resolve controversy on some issues of sexual morality.

The first two decades of Wojtyła's life coincided with the only period of independence that Poland would know between 1772 and 1989. He thus grew up experiencing national freedom but also understanding its vulnerability. After one year at the Jagiellonian University in Kraków, Wojtyła's formal studies were interrupted when German forces invaded Poland in September 1939. He continued his studies in the university's clandestine classes, and, to avoid Nazi arrest, worked for chemical manufacturer Solvay—making him the only pope in modern times to have been a labourer.

Wojtyła was ordained into the Catholic priesthood in November 1946. He immediately left Poland for two years of study in Rome, earning his first doctorate in philosophy (Angelicum University, 1948). Returning to Poland, Wojtyła became an assistant pastor in the village of Niegowić in 1948. Within a year he was moved to Kraków's St. Florian's parish. Over the next decade, Wojtyła taught at the Jagiellonian University, where he also completed a master's degree in theology and a doctorate in sacred theology (both in 1948). He was appointed chair of ethics at the Catholic University of Lublin (1954).

In 1958 Pope Pius XII appointed him auxiliary bishop of Kraków. Wojtyła was a prominent participant in the Second Vatican Council (1962–65). Pope Paul VI designated him archbishop of Kraków in 1963 and added the rank of cardinal in 1967. As archbishop, Wojtyła was instrumental in winning permission from the communist government to build a new church (consecrated in 1977) in Kraków's industrial suburb Nowa Huta.

He was elected pope on Oct. 16, 1978, and installed on October 22 as John Paul II. From the moment of his inauguration, John Paul presented an activist image that was amplified by his travels. Parading his message through many cultures and speaking in many languages, the energetic and handsome 58-year-old pope became a media icon. His potent mix of religion and politics—and its deep roots in Poland—was dramatized in his trips abroad, which, in effect, surrounded the Soviet Union with messages of religious freedom, national independence, and human rights. In the first 10 years of his papacy, John Paul supported Poland's dissident Solidarity trade union, advising Poles to advance slowly so that the communist regime would have little excuse to impose martial law. This strategy was thrown into crisis when John Paul was shot and nearly killed by a Turkish gunman, Mehmet Ali Agca, on May 13, 1981. The assassination attempt was almost certainly a conspiracy, but investigators have never proved who sponsored it. Throughout the 1980s, however, it was widely believed that the Soviets had been behind the attempt in the hope of demoralizing Solidarity. In 1989 the communists asked for negotiations with the trade union. This was followed within months by the dissolution of the Soviet bloc and, eventually, the collapse of the U.S.S.R. Visits from John Paul also weakened several dictatorships and juntas in such countries as Brazil, the Philippines, Haiti, Paraguay, and Chile. He was awarded the U.S. Congressional Gold Medal in January 2001.

John Paul II, 1979
Lochon-Francolon Simon—Gamma-Liaison Agency

John Paul made constant efforts to reach out to people of other religions, most notably Jews and Muslims; he declared anti-Semitism a sin, and held numerous meetings with Islām's top religious authorities. In 1986 he invited leaders of all major religions to Assisi, Italy, for a universal prayer service for world peace. Traveling to Egypt in February 2000, he met with Sunnite Islām's highest religious authority, the Sheikh al-Azhar. In March 2000 in Jerusalem, Israeli Prime Minister Ehud Barak welcomed John Paul to the Yad Vashem Holocaust Memorial with the words "Blessed are you in Israel." John Paul later met with Muslim leaders at the Al-Aqsā Mosque and then prayed alone at the Western Wall.

Hoping to strengthen the Catholic faith in many cultures, John Paul canonized many more Catholic saints—drawn from a broader geographic and occupational spectrum—than had any of his predecessors. With the February 2001 installation of 44 cardinals representing five continents, John Paul had named more than 150 new cardinals during his long pontificate. He directed the rewriting of several major church texts and spoke out on an array of highly contentious issues, denouncing abortion, premarital sex, and homosexual practices (though not homosexual inclination). He continually rebuffed new pleas for priests to be allowed to marry and, although he blocked women from entering the priesthood, he nonetheless advocated full equality for women in other realms of life.

Some believe John Paul overemphasized individual human rights and religious and national freedom while failing to reverse the decline in vocations and church attendance. His defenders counter that he enriched the faith with a humanistic Catholicism based upon the person and inspiration of Christ—a model the pope cited in his inaugural homily by asserting that human beings, if redeemed in Christ, could be greater than they ever imagined. While some critics charge that his teachings were unfocused, his supporters say John Paul's encyclicals and other assertions are so numerous, varied, and farsighted that it will take years for the depth and scale of his effect on Catholicism to be understood. (W.B.B.)

John William Friso, Dutch JOHAN WILLEM FRISO (b. Aug. 14 [Aug. 4, Old Style], 1687, Dessau, Anhalt—d. July 14, 1711, near Dordrecht, Neth.), Dutch prince of Nassau-Dietz and of Orange and stadholder of the provinces of Friesland and Groningen, whose rejection as stadholder by five of the seven Dutch provinces in 1702 marked the return to political supremacy of the States General (national assembly).

The son of Henry Casimir II, stadholder and captain general of Friesland and Groningen, and Henriëtte Amalia of Anhalt-Dessau, John William succeeded to his father's titles in 1696. Although his cousin, the stadholder William III, prince of Orange (William III as king of England after 1689), named John William as successor to his titles in 1695, he was rejected as stadholder general on William III's death in 1702, marking the beginning of the second stadholderless period (1702–47) in Dutch history. His claim to William's possessions was also disputed by William's cousin Frederick I of Prussia.

John William served with distinction as a general against France in the War of the Spanish Succession (1701–14) and in 1709 married Maria Louise of Hesse-Kassel. He was on the verge of a settlement with Frederick I when he drowned while crossing the Hollands Diep en route to The Hague. His posthumous son, William IV, prince of Orange-Nassau, became stadholder of the Netherlands in 1747.

Johne's disease, also called PARATUBERCULOSIS, serious infectious disease caused by *Mycobacterium* (or *Bacillus*) *paratuberculosis.* Although principally a disease of cattle, it can affect horses, sheep, deer, and goats. Cows may not show signs of the disease for as long as a year after exposure to it.

Chronic diarrhea and loss of weight are prominent effects; a substantial drop in milk production also occurs. A diseased animal's coat becomes rough and does not shed as usual. The disease is spread chiefly in the droppings of diseased animals. Slaughter of afflicted animals is advocated as a control.

Johnny Appleseed: *see* Chapman, John.

Johns, Jasper (b. May 15, 1930, Augusta, Ga., U.S.), American painter and graphic artist who is generally associated with the Pop art movement.

Johns studied briefly (1947–48) at the University of South Carolina at Columbia and then moved to New York City to pursue a career as an artist. In 1954 he became friends with Robert Rauschenberg, and that year he began his series of paintings of American flags. His first one-man show, held at the Leo Castelli Gallery in New York City in 1958, was a resounding success.

The paintings Johns went on to produce depict commonplace, two-dimensional subjects such as flags, targets, maps, numbers, and letters of the alphabet, all readily recognizable and painted in simple colours. He was able to raise these objects to the level of icons through his paint handling and an extremely sensitive manipulation of surface texture, which he obtained by the encaustic technique, in which pigments are mixed with hot liquid wax. In their willful and ironic banality and their rejection of emotional expression, these early works were a radical departure from the Abstract Expressionist styles that dominated the American art scene at the time. Johns's unabashed depiction of commonplace emblems and objects was emulated by many Pop art artists; one of Johns's best-known works is a cast sculpture of two Ballantine Ale cans, "Painted Bronze" (1960).

From 1961 Johns began to affix real objects to the surface of his canvases. While continuing to paint numbers, flags, and labels through the early 1960s, he also began to incorporate more fluid brushstrokes and rawer paint textures in such works as "Diver" (1962). Changing his style in the 1970s, he produced near-monochrome paintings composed of clusters of parallel lines that he called "crosshatchings." The paintings he did in the 1980s contain both figural elements and autobiographical references.

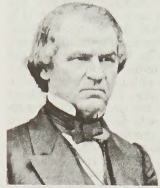
"Target with Plaster Casts," encaustic on canvas with plaster casts by Jasper Johns, 1955; in the collection of David Geffen, Los Angeles

© Jasper Johns/VAGA, New York City; photograph courtesy of the Leo Castelli Gallery, New York City

In 1996 the Museum of Modern Art in New York City organized an extensive retrospective of Johns's career.

Johns Hopkins University, privately controlled institution of higher learning at Baltimore, Md., U.S. Opened primarily as a graduate school for men in 1876 with an endowment from Johns Hopkins, a Baltimore banker, it also provided undergraduate instruction for men. The university became coeducational in 1907.

Johns Hopkins Hospital, a separate institution, was opened in 1889, but because of lack of funds the university was unable to initiate a medical school at that time. In 1893 a group of women interested in obtaining opportunities in medical education raised an endowment of $500,000 given with the understanding that women would be admitted to Johns Hopkins Medical School on the same terms as men. It is operated in close relationship with Johns Hopkins Hospital. In 1918 the School of Hygiene and Public Health was opened.



Besides its world-renowned medical facilities, the university is also noted for its School of Advanced International Studies. The university maintains the Johns Hopkins Press, the oldest continuously operated university press in the United States. The university also has a faculty of arts and sciences and an applied physics laboratory.

Johnson, Amy (b. July 1, 1903, Kingston upon Hull, Humberside, Eng.—disappeared Jan. 5, 1941, over the Thames estuary), pioneering female aviator who first achieved fame as a result of her attempt to set a record for solo flight from London to Darwin, Australia.

Johnson graduated from the University of Sheffield and began work as a secretary in London. While in London she became absorbed in aviation and airplanes. She gained her pilot's license in 1928, and she was also the first British woman granted a ground engineer's license. On May 5, 1930, she set off on her solo flight to Darwin; eventually missing the record by three days, she nevertheless gained great popularity in the English-speaking world for her spirit and daring.

Thereafter Johnson made a number of long-distance flights—in 1931 she set a record for her flight across Siberia to Tokyo, and in 1932 she broke the record for solo flight to Cape Town, S.Af. She joined the Air Transport Auxiliary in 1939. It was while on a flying mission for the Air Ministry that she disappeared.

Johnson, Andrew (b. Dec. 29, 1808, Raleigh, N.C., U.S.—d. July 31, 1875, near Carter Station, Tenn.), 17th president of the United States (1865–69), who took office upon the assassination of President Abraham Lincoln during the closing months of the American Civil War (1861–65). His lenient Reconstruction policies toward the South embittered the Radical Republicans in Congress and led to his political downfall.

Andrew Johnson

By courtesy of the Library of Congress, Washington, D.C.

Johnson's lack of formal schooling and his homespun quality were distinct assets in building a political base in eastern Tennessee, where his family moved in 1826. Before he was 21 he organized a workingman's party that elected him first alderman and then mayor of Greeneville. During his eight years in the legislature (1835–43), he found a natural home in the states' rights Democratic Party of Andrew Jackson and emerged as the raucous spokesman for mountaineers and small farmers. He went to Congress for 10 years as their representative (1843–53), after which he served as governor of Tennessee (1853–57). Elected a U.S. senator in 1856, he generally adhered to the dominant Democratic views favouring lower tariffs and opposing antislavery agitation. In 1860, however, he broke dramatically with the party when, after Lincoln's election, he vehemently opposed Southern secession. When Tennessee seceded in June 1861, he alone among the Southern senators remained at his post and refused to join the Confederacy. Although denounced by his constituents, he remained loyal to the Union. In recognition of this support, Lincoln appointed him (May 1862) military governor of Tennessee, by then under Federal control.

To broaden the base of the Republican Party to include loyal "war" Democrats, Johnson was selected to run for vice president on Lincoln's successful reelection ticket of 1864. Thrust unexpectedly into the presidency (April 1865), he was faced with reconstruction of the Confederate states as his most vexing problem. Congressional Republicans who favoured severe measures toward the defeated South were disappointed with the new president's program, which readmitted seceded states to the Union with few provisions for reform or civil rights for freedmen. Congress was outraged at the return of power to traditional white aristocratic hands, coupled with the emergence of restrictive Black Codes. In the Congressional elections of 1866, Johnson's efforts to explain and defend his policies and defeat Congressional opponents proved vain as the Radicals won a strong majority, sufficient to override any presidential veto.

In March 1867 the new Congress passed, over Johnson's veto, the first of the Reconstruction Acts, providing for Negro suffrage and military administration of the Southern states. By vetoes and narrow interpretation of the law, the President managed to delay the

program so seriously that he contributed materially to its failure. He further played into his enemies' hands by an imbroglio over the Tenure of Office Act, passed the same day, forbidding the chief executive to remove certain federal officers without the Senate's concurrence. Johnson plunged ahead and dismissed from office Secretary of War Edwin M. Stanton—the Radicals' ally within his Cabinet—to provide a court test of the act's constitutionality. In response, the House of Representatives voted articles of impeachment against the President—the first such occurrence in U.S. history. In a theatrical trial before the Senate, the charges proved weak, however, and the key votes (May 16 and 26, 1868) fell one short of the necessary two-thirds for conviction, seven Republicans voting with Johnson's supporters. Despite his exoneration, Johnson's usefulness as a political leader was over, though after returning to Tennessee he finally won reelection as a senator (1875) shortly before he died.

Johnson, Ban, byname of BYRON BANCROFT JOHNSON (b. Jan. 5, 1864, Norwalk, Ohio, U.S.—d. March 28, 1931, St. Louis, Mo.), U.S. professional baseball administrator and first president of the American League of Professional Baseball Clubs (1900–27).

Johnson attended Oberlin and Marietta colleges in Ohio; he also attended law school in Cincinnati but did not finish the course. He became a reporter for the *Cincinnati Commercial Gazette* in the mid-1890s and later became sports editor. He met many baseball players, owners, and managers, including Charles Comiskey, who in 1894 persuaded him to become president of the Western League. After a year he abandoned his newspaper work and devoted the rest of his life to baseball.

In that period professional baseball was engaged in a "war" between the National League and Johnson's Western League (renamed the American League in 1900). The American League began to move teams into what had been exclusively National League territory, culminating in 1903 with a New York City franchise. In that year the Cincinnati Agreement between the two leagues resolved competition between them. Johnson initiated the annual World Series championship games between the two leagues in 1903 and cleaned up rowdyism at the ballparks to the point that baseball acquired an image conducive to family attendance. Though Johnson helped expose the Black Sox scandal (*q.v.*) of 1920, he opposed the appointment of a single commissioner for baseball to replace the earlier three-man commission. His differences with the first commissioner, Kenesaw Mountain Landis, gradually eroded his authority, and he resigned in 1927. He was elected to the Baseball Hall of Fame in 1937.

Johnson, Charles Anthony, original name of Sir Charles Anthony Johnson Brooke, second raja of the Brooke Raj (*q.v.*).

Johnson, Charles Spurgeon (b. July 24, 1893, Bristol, Va., U.S.—d. Oct. 27, 1956, Louisville, Ky.), U.S. sociologist, authority on race relations, and the first black president (1946–56) of Fisk University, Nashville, Tenn. (established in 1867 and long restricted to black students). Earlier he had founded and edited (1923–28) the intellectual magazine *Opportunity,* a major voice of the "Negro Renaissance" of the 1920s.

After graduation from Virginia Union University, Richmond, Johnson studied under the sociologist Robert Ezra Park at the University

Charles Spurgeon Johnson
Fisk University News Bureau

of Chicago and then worked for the Chicago Commission on Race Relations (1919–21). His first important writing, *The Negro in Chicago* (1922), was a sociological study of the race riot in that city in July 1919. His research technique, called "community self-survey of race relations," facilitated the gathering of sociological data and interpretations from both blacks and whites. After directing research for the National Urban League, New York City, he served as chairman of the social sciences department at Fisk (1928–47). After World War II he helped to plan the reorganization of the Japanese educational system.

In *Growing Up in the Black Belt* (1941), Johnson denied the common assertion that U.S. race relations constitute a true caste system; he pointed out that the status of the Negro in American society did not have universal acquiescence or a religious basis. Among his other books are *The Negro in American Civilization* (1930), *The Negro College Graduate* (1936), and *Patterns of Negro Segregation* (1943).

Johnson, Cornelius, also called CORNELIS JOHNSON VAN CEULEN, or VAN KEULEN, Johnson also spelled JONSON, JANSSEN, or JANSON (baptized Oct. 14, 1593, London—d. Aug. 5, 1661, Utrecht, Neth.), Baroque painter, considered the most important native English portraitist of the early 17th century.

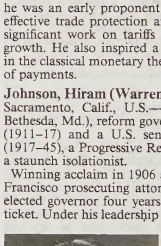
The son of Dutch parents living in London, he was patronized by James I and Charles I but seems to have lost his popularity with the court when Van Dyck came to England in 1632. His English career dates to 1643, after which he went to Holland, painting in Middelburg, Amsterdam, The Hague, and finally Utrecht.

Johnson seldom painted anything except bust portraits, usually oval in format. These pictures are distinguished for their sensitive rendering of the sitter's likeness and their delicate and deft technique; *e.g.,* "Sir Robert Dormer" (1642; T. Cottrell-Dormer Collection, Rousham House, Oxfordshire). He generally painted upon wood panels on a small scale, sometimes producing replicas of his larger works.

Johnson, Eyvind (b. July 29, 1900, Svartbjörnsbyn, near Boden, Swed.—d. Aug. 25, 1976, Stockholm), one of the few working-class novelists to bring not only new themes and points of view to Swedish literature but also to experiment with new forms and techniques of the most advanced kind. With Harry Edmund Martinson he was awarded the Nobel Prize for Literature in 1974.

After a grim boyhood of hard labour in his home region near the Arctic Circle, Johnson, as a youth of 20 with practically no schooling, made his way south into war-devastated western Europe. He was never quite happy on his visits home because of Sweden's readiness to ignore the misery at its borders. His early novels, in which the influence of Proust, Gide, and Joyce can be discerned, are mainly concerned with man's frustration. In *Bobinack* (1932), an exposé of the machinations of modern capitalism, *Regn i gryningen* (1933; "Rain at Daybreak"), an attack on modern office drudgery and its effects, and *Romanen om Olof,* 4 vol. (1934–37), which tells of his experiences as a logger in the sub-Arctic, he begins to seek out the causes for that frustration. During World War II and immediately preceding it, Johnson's novels took the form of intense protest against totalitarian terror and sharp attacks against neutralism. *Strändernas svall* (1946; *Return to Ithaca,* 1952) and *Hans nådes tid* (1960; *The Days of His Grace,* 1968) have been translated into many languages.

Johnson, Gerrard: *see* Jensen, Gerrit.



Johnson, Harry Gordon (b. May 26, 1923, Toronto—d. May 8, 1977, Geneva), Canadian-born economist who managed to synthesize diverse viewpoints in economics. Johnson was one of the dominant economists of the post-World War II generation, a ubiquitous figure at conferences, with a published output that dwarfed those of his contemporaries and that contained real contributions in macroeconomics and international trade.

Johnson graduated from the University of Toronto in 1943 and from Cambridge University in 1946. He taught at Cambridge (1948–56) and then, after three years at the University of Manchester, at the University of Chicago. At the time of his death he was in the highly unusual position of holding full professorships at two major institutions, the University of Chicago, where he was the Charles F. Grey Professor of Economics, and the London School of Economics.

Although Johnson was an astringent critic of the later followers of Keynes, neither did he espouse the conservative Chicago school of monetarism. Perhaps his most lasting contributions are to be found in trade theory, where he was an early proponent of the concept of effective trade protection and later published significant work on tariffs and on trade and growth. He also inspired a revival of interest in the classical monetary theory of the balance of payments.

Johnson, Hiram (Warren) (b. Sept. 2, 1866, Sacramento, Calif., U.S.—d. Aug. 6, 1945, Bethesda, Md.), reform governor of California (1911–17) and a U.S. senator for 28 years (1917–45), a Progressive Republican and later a staunch isolationist.

Winning acclaim in 1906 as a crusading San Francisco prosecuting attorney, Johnson was elected governor four years later on a reform ticket. Under his leadership the legislature cur-

Hiram Johnson, *c.* 1912
By courtesy of the Library of Congress, Washington, D.C.

tailed the political hold on California of the Southern Pacific Railroad and placed the state in the forefront of the Progressive movement.

In 1912 Johnson helped form the Progressive Party and was its unsuccessful vice-presidential candidate on a ticket with Theodore Roosevelt. In the Senate he opposed the dominant conservative tendencies of the Republican Party, supporting ameliorative farm legislation and, in the 1930s, New Deal measures to

relieve unemployment. Gradually he became best known for his implacable isolationism, opposing U.S. adherence to the Treaty of Versailles, the League of Nations, and the Permanent Court of International Justice, known as the World Court. He sponsored the Neutrality acts of the 1930s and resisted all preparedness measures before World War II as well as the formation of the United Nations.

Johnson, Jack, byname of JOHN ARTHUR JOHNSON (b. March 31, 1878, Galveston, Texas, U.S.—d. June 10, 1946, Raleigh, N.C.), first black to hold the heavyweight boxing championship of the world.

Johnson fought professionally from 1897 to 1928 and engaged in exhibition matches as late as 1945. He won the title by knocking out champion Tommy Burns in Sydney, Dec. 26, 1908, and lost it on a knockout by Jess Willard in 26 rounds in Havana, April 5, 1915.

Jack Johnson
UPI Compix/EB Inc.

Until his fight with Burns, discrimination limited Johnson's opportunities and purses. When he became champion, a hue and cry for a "Great White Hope" produced numerous opponents.

At the height of his career Johnson was excoriated by the press for having twice married white women, and he further offended white supremacists by knocking out former champion James J. Jeffries, who was induced to come out of retirement as a "Great White Hope." In connection with one of his marriages, Johnson was convicted in 1912 of violating the Mann Act in transporting his wife across state lines before their marriage. He was sentenced to a year in prison and was released on bond, pending appeal. Disguised as a member of a black baseball team, he fled to Canada, made his way to Europe, and was a fugitive for seven years.

He defended the championship three times in Paris before agreeing to fight Willard in Cuba. Some observers thought that Johnson, mistakenly believing that the charge against him would be dropped if he yielded the championship to a white man, deliberately lost to Willard. From 1897 to 1928, Johnson had 114 bouts, winning 80, 45 by knockouts.

In 1920 Johnson surrendered to U.S. marshals and served his sentence, fighting in several bouts within the federal prison at Leavenworth, Kan. After his release he fought occasionally and appeared in vaudeville and carnival acts, appearing finally with a trained flea act. He wrote two books of memoirs, *Mes Combats* (in French, 1914) and *Jack Johnson in the Ring and Out* (1927; reprinted 1975). He died in an automobile accident.

Johnson, James Weldon (b. June 17, 1871, Jacksonville, Fla., U.S.—d. June 26, 1938, Wiscasset, Maine), poet, diplomat, and anthologist of black culture.

Trained in music and other subjects by his mother, a schoolteacher, Johnson graduated from Atlanta University with A.B. (1894) and M.A. (1904) degrees and later studied at Columbia. For several years he was principal of the black high school in Jacksonville, Fla. He read law at the same time, was admitted to the Florida bar in 1897, and began practicing there. During this period, he and his brother, John Rosamond Johnson (1873–1954), a composer, began writing songs, and in 1901 the two went to New York, where they wrote some 200 songs for the Broadway musical stage.

In 1906 President Theodore Roosevelt appointed him U.S. consul to Puerto Cabello, Venezuela, and in 1909 he became consul in Corinto, Nicaragua, where he served until 1914. He later taught at Fisk University. Meanwhile, he began writing a novel, *Autobiography of an Ex-Coloured Man* (published anonymously, 1912), which attracted little attention until it was reissued under his own name in 1927. From 1916 Johnson was a leader in the National Association for the Advancement of Colored People (NAACP).

Fifty Years and Other Poems (1917) was followed by his pioneering anthology *Book of American Negro Poetry* (1922) and books of *American Negro Spirituals* (1925, 1926), collaborations with his brother. His best-known work, *God's Trombones* (1927), a group of black dialect sermons in verse, includes "The Creation" and "Go Down Death." Johnson's introductions to his anthologies contain some of the most perceptive assessments ever made of black contributions to American culture. *Along This Way* (1933) is autobiography.

Johnson, J.J., original name JAMES LOUIS JOHNSON (b. Jan. 22, 1924, Indianapolis, Ind., U.S.—d. Feb. 4, 2001, Indianapolis), American jazz composer and trombonist.

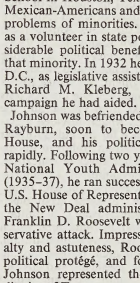
Johnson's early training as a pianist was followed by study of the trombone, beginning when he was 15. He became a professional musician in 1941 and during the decade worked in the orchestras of Benny Carter and Count Basie. He became widely recognized as a dexterous soloist who had assimilated the techniques of the bebop movement of the 1940s. After a temporary retirement in 1952, he returned in 1954 to tour with fellow trombonist Kai Winding; their duets have been recognized as watersheds in the evolution of jazz trombone technique. In 1959 he made his debut as an orchestral composer at the Monterey Festival.

Johnson virtually abandoned playing in the 1970s in order to concentrate on composing, arranging, and conducting scores for film and television. He returned to performing and recording in the 1980s and released a series of albums throughout the next two decades that are considered among his best work, including *Things Are Getting Better All the Time* (1983), *Quintergy* (1988), and *Let's Hang Out* (1992).

Johnson, John Arthur (boxer): *see* Johnson, Jack.

Johnson, John H(arold) (b. Jan. 19, 1918, Arkansas City, Ark., U.S.), American magazine and book publisher, the first black American to attain major success in those fields.

Johnson's mother decided to settle in Chicago while visiting that city in 1933 to see the World's Fair. The young Johnson was an honour student at Du Sable High School in Chicago. He was managing editor of the school paper and business manager of the yearbook and decided on journalism as a career. He later studied at the University of Chicago and Northwestern University, while working for a life insurance company catering to blacks. There he conceived the idea of a magazine for blacks, which became *Negro Digest,* its first issue (1942) sold some 3,000 copies. From that beginning Johnson launched *Ebony,* a picture magazine for blacks, in 1945. *Ebony*'s initial press run of 25,000 copies was completely sold out. By 1967 the magazine, modified in format and content, had a circulation of more than 1,000,000. Johnson went on to create other black magazines, and then moved into publishing black-oriented books, all published by Johnson Publishing Co. Later he diversified into such areas as radio broadcasting, insurance, and cosmetics manufacturing.



Johnson, Lyndon B(aines) (b. Aug. 27, 1908, Gillespie county, Texas, U.S.—d. Jan. 22, 1973, San Antonio, Texas), 36th president of the United States (1963–69). A moderate Democrat and vigorous U.S. Senate leader, he was elected vice president in 1960 and acceded to the presidency upon the assassination of President John F. Kennedy (Nov. 22, 1963). During his administration he signed into law the most comprehensive civil-rights legislation since Reconstruction, initiated major social service programs, and bore the brunt of national opposition to his administration's actions in Vietnam.

The eldest of five children, Johnson was born in a three-room house in the hills of southwest Texas. Though both his father and grandfather had served in the Texas legislature, the Johnson ranch along the Pedernales River was barren and the family very poor. As a young man he resisted college, preferring to hitchhike around the country taking odd jobs for a living. Eventually he enrolled at Southwest Texas State Teachers College at San Marcos, where he trained as a teacher in three whirlwind years.

An early teaching job, at Sam Houston High School in Houston, Texas, introduced him to Mexican-Americans and, through them, to the problems of minorities. Working strenuously as a volunteer in state politics, he reaped considerable political benefit as a champion of that minority. In 1932 he went to Washington, D.C., as legislative assistant to Representative Richard M. Kleberg, whose congressional campaign he had aided.

Johnson was befriended by the powerful Sam Rayburn, soon to become speaker of the House, and his political career blossomed rapidly. Following two years as director of the National Youth Administration in Texas (1935–37), he ran successfully for a seat in the U.S. House of Representatives at a time when the New Deal administration of President Franklin D. Roosevelt was under heavy conservative attack. Impressed by Johnson's loyalty and astuteness, Roosevelt made him his political protégé, and for the next 12 years Johnson represented the 10th congressional district of Texas.

In 1941 Johnson failed in a bid for elevation to the U.S. Senate in a special election. But in 1948 he tried again, and, in a vicious campaign that included vote fraud on both sides in the deciding Democratic primary, he narrowly won his seat in the Senate, where he remained for 12 years, becoming Democratic whip in 1951. During those years he developed his talent for negotiating and reaching accommodation among dissident political forces. By methods sometimes tactful but often ruthless,

Lyndon B. Johnson
By courtesy of the National Archives, Washington, D.C.

he created a remarkably disciplined group of Senate Democrats. As majority leader (1955–61), he stressed consensus, and his skilled leadership was largely responsible for passage of the civil-rights bills of 1957 and 1960—the first in the 20th century.

By 1960 Johnson's prodigious political talents had made him something of a legend in national politics, and many were surprised when he accepted Kennedy's invitation to join the national Democratic ticket as a vice presidential candidate. However, he campaigned energetically, and many observers felt that his presence on the ticket was essential to the Democratic victory.

It was during a political tour of Johnson's home state of Texas in November 1963 that President Kennedy was assassinated, thrusting Johnson into the most difficult role of his long political career. In the tempestuous days after the death of Kennedy, Johnson helped to calm national hysteria and ensure continuity in the presidency. In his first few months in office the new president succeeded in getting Congress to pass highly important legislation—previously stalled—concerning civil rights, tax reduction, an antipoverty program, and conservation.

In November 1964 Johnson won reelection with an unprecedented popular majority of more than 15,000,000 votes, which he interpreted as an extraordinary mandate to pursue his domestic reform program aimed at creating what he called the "Great Society." Altogether, he succeeded in pushing through the most impressive mass of social legislation since the New Deal of the 1930s. Among these measures were the Civil Rights Act of 1964, which attacked racial segregation in public accommodations and schools and racial discrimination in employment; the Voting Rights Act of 1965, which outlawed the literacy tests used to prevent blacks from voting; and the Medicare bill of 1965, which provided a system of health insurance for the elderly under the Social Security program. Johnson undertook other important initiatives in education, housing and urban development, transportation, environmental conservation, and immigration. But the effect of these accomplishments was vitiated by increasing U.S. military involvement in the war in Indochina, which had begun under the previous administration.

Despite specific campaign pledges not to extend hostilities, the president and his advisers—fearful that South Vietnam would fall before communist aggression—steadily increased U.S. intervention until 500,000 American troops were in Indochina by 1967. As each new escalation met with fresh enemy response, and, as no end to the combat appeared in sight, the president's public support diminished markedly. His gravest criticism came from the "doves," those who favoured an early negotiated settlement of the war. Strident student opposition to both the war and the draft system spread to include liberals, intellectuals, and civil-rights leaders, while the administration's budget—once geared to the abolition of poverty and racial injustice—buckled under the strain of wartime spending.

On March 31, 1968, after three of the most turbulent years in U.S. political history, Johnson startled television viewers with a national address that included three announcements: that he had just ordered major reductions in the bombing of North Vietnam, that he was requesting peace talks, and that he would neither seek nor accept his party's renomination to the presidency.

In January 1969 he returned home to operate his ranch near Johnson City, Texas, and to write his version of the presidential years, *The Vantage Point* (1971). Less than one week before the signing of an agreement to end the war in Vietnam, Johnson suffered a heart attack at his home and died.

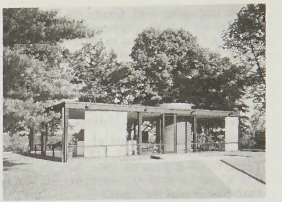
Conkin, *Big Daddy From Pedernales* (1986); and Robert Dallek, *Lone Star Rising: Lyndon Johnson and His Times, 1908–1960* (1991), are biographies. Robert A. Divine (ed.), *The Johnson Years*, 2 vol. (1987), collects scholarly essays on his presidency.

Johnson, Magic, byname of EARVIN JOHNSON, JR. (b. Aug. 14, 1959, Lansing, Mich., U.S.), American basketball player who led the National Basketball Association (NBA) Los Angeles Lakers to five championships.

The son of an auto worker, Johnson earned his nickname "Magic" for his creative and entertaining ball handling. He was an intense competitor who won everywhere he played. He led his high school team to a state championship in 1977, Michigan State University to the National Collegiate Athletic Association championship in 1979, and the U.S. team to a basketball gold medal at the 1992 Olympics in Barcelona, Spain.

Johnson achieved his greatest success in the professional ranks, guiding the Lakers to NBA championships in 1980, 1982, 1985, 1987, and 1988. He was named the NBA's Most Valuable Player in 1987, 1989, and 1990. He played point guard and brought new versatility to that position. At 6 feet 9 inches (2.06 m), he was a dangerous inside scorer and a capable rebounder. However, he was best known for innovative no-look and bounce passes and expert floor leadership. At the time of his initial retirement due to HIV infection in 1991, Johnson was the NBA's all-time leader in assists (9,921).

Johnson, Pauline, in full EMILY PAULINE JOHNSON (b. March 10, 1862, Six Nation Indian Reserve, Brant county, Upper Canada [now in Ontario]—d. March 7, 1913, Vancouver, B.C.), Canadian Indian poet who celebrated the heritage of her people in poems that had immense appeal in her lifetime.



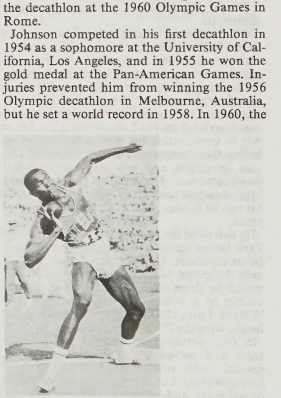
The daughter of a Mohawk chief and an English mother, Johnson began publishing poetry in her teens. Using her Indian name, "Tekahionwake," she toured Canada, England, and the United States, giving poetry recitals in a buckskin dress. Later she settled in Vancouver, where she wrote prose tales based on romanticized Indian life and legend: *Legends of Vancouver* (1911), *The Shagganappi* (1913), and *The Moccasin Maker* (1913). Her verse was collected as *Flint and Feather* (1912). Her poem "The Song My Paddle Sings" is familiar to all Canadian schoolchildren.

Johnson, Philip C., in full PHILIP CORTELYOU JOHNSON (b. July 8, 1906, Cleveland, Ohio, U.S.), American architect and critic known for both his promotion of the International Style and, later, for his role in defining postmodernist architecture.

Johnson majored in philosophy at Harvard University, graduating in 1927. In 1932 he was named director of the Department of Architecture of the Museum of Modern Art (MOMA) in New York. With Henry-Russell Hitchcock he wrote *The International Style: Architecture Since 1922* (1932), which provided a description of (and also a label for) post-World War I modern architecture.

In 1940 Johnson returned to Harvard, where he studied architecture with Marcel Breuer. His real mentor, however, was Mies van der Rohe, with whom he worked on the widely praised Seagram Building, New York City (1958). After World War II Johnson returned to MOMA as director of the architecture department from 1946 to 1954. His influential monograph *Mies van der Rohe* was published in 1947 (rev. ed., 1953).

Johnson's reputation was enlarged by the design of his own "Glass House," at New Canaan, Conn. (1949). The house, which



"Glass House," New Canaan, Conn., by Philip C. Johnson, 1949
© Bill Maris/Esto

is notable for its severely simple, rectilinear structure and its use of large glass panels as walls, owed much to the precise, minimalist aesthetic of Mies but also alluded to the work of 18th- and 19th-century architects. This balance between Miesian influence and historical allusion shifted in the 1950s. Beginning with the Temple Kneses Tifereth Israel, Port Chester, N.Y. (1954–55), Johnson made fuller use of curvilinear (particularly arch) forms and historical quotation, a pattern continued in the art gallery at Dumbarton Oaks, Washington, D.C. (1962–64), and the IDS Center, a multibuilding group in Minneapolis, Minn. (1974). Johnson's style took a final turn with the New York City American Telephone and Telegraph headquarters (1982). Designed with a top resembling a Chippendale cabinet, the building was considered by critics to be a landmark in the history of postmodern architecture. Johnson's partner in these endeavours was the architect John Henry Burgee (b. 1933).

Johnson, Rafer, in full RAFER LEWIS JOHNSON (b. Aug. 18, 1935, Hillsboro, Texas, U.S.), American athlete who won a gold medal in the decathlon at the 1960 Olympic Games in Rome.

Johnson competed in his first decathlon in 1954 as a sophomore at the University of California, Los Angeles, and in 1955 he won the gold medal at the Pan-American Games. Injuries prevented him from winning the 1956 Olympic decathlon in Melbourne, Australia, but he set a world record in 1958. In 1960, the

Rafer Johnson, putting the shot in the Olympic decathlon, 1960
AP/Wide World Photos

closest decathlon in Olympic history, Johnson scored 8,392 points, winning by only 58 points over his nearest competitor. At that Olympiad Johnson became the first black to carry the U.S. flag in the Olympic procession. He received the James E. Sullivan Memorial Award as the outstanding amateur athlete of 1960 and retired from sports soon afterward. He became a sports commentator and then an executive with the Continental Telephone

Corporation in Atlanta, Ga., in 1979. He made a dramatic appearance to light the torch signaling the opening of the 1984 Olympic Games in Los Angeles.

Johnson, Reverdy (b. May 21, 1796, Annapolis, Md., U.S.—d. Feb. 10, 1876, Annapolis), constitutional lawyer, U.S. senator from Maryland (1845–49, 1863–68), attorney general under President Zachary Taylor (1849–50), and minister to Great Britain (1868–69). Able to grasp either side of an issue, he was called "the Trimmer" for his ability to bring about compromises.

Although he lived in a slave state, Johnson opposed slavery and the annexation of possible slave territory after the Mexican War (1846–48). He helped to keep Maryland in the Union during the American Civil War (1861–65). Nonetheless, he represented the slave-owning defendant in the famous Dred Scott case (1857), in which the U.S. Supreme Court decided that blacks could not be citizens of the United States.

During the Civil War Johnson generally opposed extreme measures, and afterward he sought a moderate reconstruction program for the defeated South. As a senator he voted for a wartime loyalty oath, but after the war he was instrumental in having test oaths declared unconstitutional. He aided in securing acquittal in impeachment proceedings against President Andrew Johnson (1868). As minister to Great Britain he prepared the way for the peaceful settlement of disputes between that nation and the United States over British policy toward the Confederacy.

Johnson, Richard M(entor) (b. 1780, near Louisville, Va. [now in Kentucky], U.S.—d. Nov. 19, 1850, Frankfort, Ky.), ninth vice president of the United States (1837–41), in

Richard M. Johnson, lithograph
portrait by Charles Fenderich, 1840
By courtesy of the Library of Congress, Washington, D.C.

the Democratic administration of President Martin Van Buren.

Admitted to the bar in 1802, Johnson was elected to the state legislature in 1804 and two years later to the U.S. House of Representatives, where he served for 20 years (1807–19, 1829–37); he was also in the U.S. Senate from 1819 to 1829. Despite his early affiliation with the Whigs, he became a loyal supporter of President Andrew Jackson (1829–37), accommodating himself to the Democratic position on low tariffs and the dissolution of the national bank. In turn, Jackson insisted on Johnson's nomination for vice president in 1836. For the first time in U.S. history, the Electoral College could not agree among four candidates, and thus Johnson was selected by the Senate.

Though Johnson's term in office was uneventful, opposition to him within the party increased, and the Democratic national convention of 1840 took the unprecedented course of refusing to nominate anyone for the vice presidency. In the ensuing election, Johnson was defeated by the Whig candidate John Tyler. Johnson retired to private life and died shortly after being reelected to the Kentucky legislature.

Johnson, Robert (b. *c.* 1911, Hazlehurst, Miss., U.S.—d. Aug. 16, 1938, near Greenwood, Miss.), American blues composer, guitarist, and singer whose eerie falsetto singing voice and masterful, rhythmic slide guitar influenced both his contemporaries and many later blues and rock musicians.

Born into the large family of a sharecropper, Johnson was reared in Memphis, Tenn., and near Robinsonville, Miss. He learned to play the harmonica and then the guitar, probably influenced both by recordings and by personal contact with Eddie "Son" House, Charley Patton, Willie Brown, and other well-known Mississippi Delta bluesmen. He traveled widely throughout Mississippi, Arkansas, Texas, and Tennessee and as far north as Chicago and New York, playing at house parties, juke joints, and lumber camps and on the street. In 1936–37 he made a series of recordings in San Antonio and Dallas, Tex. His repertoire included several blues songs by House and others, but Johnson's original numbers, such as "Me and the Devil Blues," "Hellhound on My Trail," and "Love in Vain" are his most compelling pieces. Despite the limited number of his recordings, Johnson had a major impact on other musicians, including Muddy Waters and Elmore James.

Johnson died of poisoning after drinking strychnine-laced whisky in a juke joint.

Johnson, Robert Wood (b. Feb. 15, 1845, Carbondale, Pa., U.S.—d. Feb. 7, 1910, New Brunswick, N.J.), American manufacturer who helped further the cause of modern surgery by developing antiseptic bandages and dressings.

Johnson began his career as an apprentice in a pharmacy and went on to become a retail pharmacist and then a drug broker in New York City. In 1874, he formed the partnership of Seabury & Johnson to manufacture bandages using a new formula employing India rubber. Eleven years later Johnson left that partnership to form the now well-known company of Johnson & Johnson with his brothers James and Edward. The company became known for its high-quality, inexpensive medical supplies and dressings. Johnson held the title of president from the time of the company's founding until his death in 1910.

Johnson was an early proponent of the teachings of Joseph Lister, who advocated antiseptic surgery and care of the wound to prevent infection. These theories were still novel during the late 1800s. Johnson worked to develop a dressing that would be as germ-free as possible, from its manufacture in his plants to its eventual use in surgeries across the country.

Johnson, Samuel, byname DR. JOHNSON (b. Sept. 18, 1709, Lichfield, Staffordshire, Eng.—d. Dec. 13, 1784, London), English poet, essayist, critic, journalist, lexicographer, and conversationalist, regarded as one of the outstanding figures of 18th-century life and letters. His *Dictionary of the English Language* (1755) was the first major English dictionary to use illustrative historical quotations.

A brief treatment of Samuel Johnson follows. For full treatment, *see* MACROPAEDIA: Johnson, Samuel.

Johnson, the son of a bookseller, was educated at the University of Oxford and set up a school near Lichfield, which was not a success. In 1737 he went to London with a former pupil, David Garrick, and made friends with Richard Savage. His early writings were journalism for the *Gentleman's Magazine.* He came to public notice with attacks on Robert Walpole's ministry. In 1745 he turned his attention to William Shakespeare, writing *Miscellaneous Observations on the Tragedy of Macbeth,* and he published his didactic poem *The Vanity of Human Wishes* in 1749. In 1746 he signed a contract to prepare his *Dictionary of the English Language.* The *Dictionary* gave Johnson a great reputation, but he still had to rely on journalism and hack writing for a living. In 1750 his paper *The Rambler* began to appear, to be followed by his weekly column entitled "The Idler." His philosophical tale *Rasselas* was written in 1759 in order to meet a pressing demand for money. *The Lives of the Most Eminent English Poets* (1777) shows Johnson's power to lift hackwork to the level of sustained literary criticism.

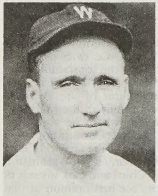
In 1763 Johnson met James Boswell, with whom he formed one of the most famous friendships in literary history. In 1773 they journeyed together through the Highlands of Scotland and to the western islands, and both left entertaining accounts of the trip. In 1765 Johnson's edition of Shakespeare was completed, and in the year of its publication Trinity College, Dublin, conferred the LL.D. degree on him. Brilliant as Johnson was as a writer, he was reportedly even more brilliant as a conversationalist.

Johnson, Thomas (b. Nov. 4, 1732, Calvert county, Md. [U.S.]—d. Oct. 26, 1819, Rose Hill, near Frederick, Md.), American Revolutionary War leader, first governor of Maryland (1777–79), and associate justice of the United States Supreme Court (1792–93).

Johnson studied law in Annapolis, Md., and entered the provincial assembly in 1762. Opposed to British colonial policy, he was a member of several committees formed to draft memorials to the crown for redress of grievances and of the convention charged with organizing a colonial congress. He represented Maryland at the first Continental Congress in Philadelphia in September 1774. At the second Congress it fell to him to nominate George Washington as commander in chief. Johnson supported conciliation with Great Britain but, once persuaded that the effort was fruitless, voted for the Declaration of Independence, helped frame the constitution of the state of Maryland, and, as the first brigadier general of the state militia, recruited 1,800 men to join Washington.

He was elected the first governor of the state of Maryland in 1777 and was twice reelected, after which he served in the legislature. After the war, he and Washington formed a company to extend navigation of the Potomac River. He also served briefly in the Maryland ratification convention, where he supported ratification of the federal Constitution, and then became chief judge of the General Court of Maryland. He was named by Washington to the U.S. Supreme Court and took his seat in 1792. Johnson wrote the first opinion of that court but, because of ill health, served only briefly. Appointed to the board of commissioners of Federal City, he was largely responsible for renaming it Washington in honour of his friend.

Johnson, Uwe (b. July 20, 1934, Cammin, Ger.—d. March 12, 1984, Sheerness, Kent, Eng.), German author, many of whose novels explore the contradictions of life in a Germany divided after World War II.



Johnson was born into a Mecklenburg family of ancient Swedish descent. He studied German at the universities of Rostock and Leipzig, where he received a diploma in 1956. He translated the work of several American and British authors before beginning to write himself. His first novel, *Ingrid Babendererde,* was refused by East German publishers when he declined to make various alterations to it. The novel remained unpublished. Aware that the same problem might well arise repeatedly, he moved to West Berlin in 1959. His subsequent work focused on the estrangement between people in the two Germanys.

Once in the West, Johnson published *Mutmassungen über Jakob* (1959; *Speculations About Jakob*, 1963), *Das dritte Buch über Achim* (1961; *The Third Book About Achim*, 1967), shorter fiction in *Karsch, und andere Prosa* (1964; the novella *Eine Reise wegwohin* translated as *An Absence*, 1969), and *Zwei Ansichten* (1965; *Two Views*, 1966). All of Johnson's work was experimental: the narrative abruptly shifts from one consciousness or place to another; words assume different meanings when used by different characters; objects and events are described with intricate exactness, as if to emphasize their constancy against the mutability of emotions and reminiscences. In the tetralogy *Jahrestage. Aus dem Leben von Gesine Cresspahl* (1970–83; "Anniversaries: From the life of Gesine Cresspahl"), Johnson used a montage technique, combining newspaper clippings, notes, and narrative to describe problems in New York in the 1960s and events in German history between the 1920s and 1960s as recalled by the heroine's family.

Johnson lived in New York (1966–68), returned to West Berlin, and moved to England in 1974. Although younger than many of them, he was a member of the Gruppe 47 authors of postwar Germany. Later works included an essay on the poet Ingeborg Bachmann, *Eine Reise nach Klagenfurt* (1974; "A Journey to Klagenfurt"): a volume of essays, including two in English, *Berliner Sachen* (1975; "Berlin Affairs"); and *Begleitumstände: Frankfurter Vorlesungen* (1980; "Circumstances: Frankfurt Lectures"). Studies of Johnson include Mark Boulby's *Uwe Johnson* (1974).

Johnson, Virginia E(shelman): *see* Masters, William H(owell); and Johnson-Masters, Virginia E(shelman).

Johnson, Walter (Perry), byname BIG BARNEY, or THE BIG TRAIN (b. Nov. 6, 1887, Humboldt, Kan., U.S.—d. Dec. 10, 1946, Washington, D.C.), U.S. professional baseball

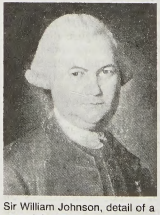
Walter Johnson
UPI/EB Inc.

player who had perhaps the greatest fastball in the history of the game. A right-handed thrower and batter, Johnson pitched for the Washington Senators of the American League from 1907 through 1927.

During those 21 seasons he struck out more batters (3,508) and scored more shutout victories (110 or 113; authorities differ) than did any other pitcher in major league history. He also won the most games (413, 414, or 416) and pitched the most innings (5,923⅔) among players whose careers were entirely in the 20th century. In 1983 his career strikeout record was broken by three pitchers: Nolan Ryan, Steve Carlton, and Gaylord Perry.

Johnson was nonplaying manager of the Washington club (1929–32) and of the Cleveland Indians (1933–35). A popular player, Johnson was elected in 1936 to the Baseball Hall of Fame.

Johnson, William (b. Dec. 27, 1771, Charleston, S.C.—d. Aug. 4, 1834, Brooklyn, N.Y., U.S.), associate justice of the United States Supreme Court from 1804 who established the practice of rendering individual opinions—concurring or dissenting—in addition to the majority opinion of the court. A deeply sensitive man and a learned, courageous jurist, he set himself against the dominance exercised over the court by Chief Justice John Marshall.



After serving in the South Carolina House of Representatives (1794–99; speaker, 1798–99), Johnson was elected by the legislature to the Court of Common Pleas, at that time the highest tribunal in the state. During his tenure as a state judge he was active in organizing at Columbia a college that later became the University of South Carolina.

Appointed by Pres. Thomas Jefferson in March 1804, Johnson was the first Democratic-Republican justice of the U.S. Supreme Court. In attempting to secure the court's position as the interpreter of the law and the Constitution (largely according to Federalist Party principles), Chief Justice Marshall discouraged the writing of seriatim (separate) opinions, delivered the opinion of the court in most major cases, and strove for unanimity among his colleagues. Johnson, however, often expressed independent views; he had been accustomed to preparing seriatim opinions in the state court, and in this predisposition he was supported by Jefferson, a political opponent of Marshall.

Although Jefferson and Johnson remained friends until the former's death in 1826, Johnson did not always sustain Jeffersonian policy. In *Gilchrist* v. *Collector of Charleston* (1808), Johnson, while holding federal circuit court, allowed clearance from the port of Charleston to a ship detained under Jefferson's Embargo Act of 1807, a measure intended to preserve U.S. neutrality in the Napoleonic Wars. In Supreme Court cases Johnson usually agreed with Marshall's insistence on broad federal power unhampered by state action. More than his fellow justices, however, Johnson favoured cooperation rather than antagonism between federal and state governments and economic regulation in the public interest. Concurring with Marshall's opinion in *Gibbons* v. *Ogden* (1824), he defended the regulatory power of Congress over interstate and foreign commerce; over one of Marshall's few dissents, he upheld, in *Ogden* v. *Saunders,* (1827), state power to alleviate economic distress. Late in his life Johnson angered many in his state by his circuit court decision in *Holmes* v. *United States* (1832), rejecting state nullification of federal statutes.

Justice William Johnson, the First Dissenter (1954) was written by Donald Grant Morgan.

Johnson, Sir William, 1ST BARONET (b. 1715, Smithtown, County Meath, Ire.—d. July 11, 1774, near Johnstown, N.Y.), pioneer in

Sir William Johnson, detail of a portrait by Matthew Pratt, *c.* 1772; in the collection of the New York State Education Department

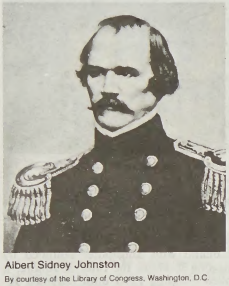
the Mohawk Valley, New York, whose service as colonial superintendent of Indian affairs was largely responsible for keeping the Iroquois neutral and even friendly to the British in the latter stages of the struggle with the French for control of North America.

Immigrating to the New World in 1737, Johnson purchased his first tract of land two years later, thus beginning the acquisitions that eventually made him one of the largest landholders and wealthiest settlers in British America. His rapport with neighbouring Indians began early on his estate, Mount Johnson, on the north bank of the Mohawk River, which became a centre of Indian trade and a shelter for the Mohawks. He tried to indoctrinate the natives in European ways by encouraging educational and missionary activities. His ties with the Indians were further cemented when, following the death of his first wife, he married successively two Mohawk women. The second of these was Molly Brant, sister of the Indian leader Joseph Brant.

Because of Johnson's skill as a diplomat, Gov. George Clinton in 1746 made him colonel of the Six Iroquois Nations (also known as the Iroquois League). Spending much of his time keeping peace among the tribes, he gleaned valuable information at frequent council meetings and organized and supplied war parties against the French. After a dispute with the provincial assembly several years later, he resigned his superintendency, but when the last French and Indian War broke out (1756) he was hastily pressed into service and promised new authority directly from the crown. At the Albany Congress of 1754 he conducted the British negotiations with the Indians and partially succeeded in assuring their support in the approaching war against the French.

In 1755 Johnson was appointed superintendent of the Six Iroquois Nations and their allies. Commissioned a major general, he defeated French forces at Lake George, N.Y. (September 8). He was made a baronet and the following year reappointed northern Indian superintendent—a post he held for the next 18 years. In 1759 he commanded a force that captured Ft. Niagara, and in 1760 he joined Sir Jeffrey Amherst's victorious assault on Montreal. After the war he was active in subduing the Indian uprising known as Pontiac's Conspiracy (1763–64) and was chief British negotiator in the settlement of 1768, the first Treaty of Ft. Stanwix. A reliable biography is J.T. Flexner's *Mohawk Baronet: Sir William Johnson of New York* (1959).



Johnson City, city, Washington county, northeastern Tennessee, U.S., lying in the Great Appalachian Valley, 98 mi (158 km) east-northeast of Knoxville. In the 1760s farmers and iron-makers settled in the vicinity. Following the arrival of the East Tennessee and Virginia Railroad in 1857, a settlement grew up around the water tank; it was called Johnson's Depot after Henry Johnson, the town's first postmaster. In 1859 it was renamed Haynesville for Landon C. Haynes, later a Confederate senator, but was renamed for Johnson again in 1861. The economy depends on diversified agriculture (cattle, alfalfa, and poultry), a burley tobacco market, and manufactures, which include telephone and electrical equipment, textiles, hardwood flooring, hospital supplies, chemicals, clothing, furniture, tools, and building materials. There is mining and quarrying (limestone) in the area. A Veterans Administration Center (Mountain Home) serves a five-state area. Educational facilities include East Tennessee State University (1909), Milligan College (founded in 1866 as Buffalo Male and Female Institute), and Steed College (1940). Inc. 1869. Pop. (1990) city, 49,381; Johnson City–Kingsport–Bristol MSA, 436,047.

Johnson City, city, seat (1858) of Blanco county, south central Texas, U.S., on the

Pedernales River, 40 miles (64 km) west of Austin. The hometown of President Lyndon B. Johnson, it was founded in 1879 by James Polk Johnson, a forebear of the president, and was incorporated in 1944. It is a ranching supply centre and tourist base for the Lyndon B. Johnson National Historic Site, designated in 1969. The Johnson City Unit of the site includes the frame house (1901) where Johnson spent his boyhood and the Johnson Settlement, a restored ranch home owned in the mid-19th century by Sam Ealy Johnson, the president's grandfather. The LBJ Ranch Unit in Gillespie County, near Stonewall, 13 miles (21 km) west, includes the president's birthplace (a reconstructed late 19th-century farmhouse) and the family cemetery where Johnson is buried. The Lyndon B. Johnson State Park (269 acres [109 hectares]) is nearby, with a visitor centre containing Johnson family memorabilia. Hereford cattle, sheep, and goats are raised in the surrounding rolling hill country, and the city is a grading point for wool, mohair, and turkeys. Pop. (1990) 932.

Johnston, Albert Sidney (b. Feb. 2, 1803, Washington, Ky., U.S.—d. April 6, 1862, Shiloh, Tenn.), Confederate general during the American Civil War (1861–65); his death in the second year of the war was considered an irreparable loss by the South.

An 1826 graduate of the U.S. Military Academy, West Point, N.Y., Johnston fought in the Black Hawk War (1832) and the Mexican War (1846–48) and was in the bloodless expedition against the Mormons in Utah (1857). When his adopted state of Texas seceded from the Union in 1861, he resigned his commission as commander of the U.S. Pacific Department and was appointed second-ranking general in the Confederate Army by President Jefferson Davis, whom he had known at West Point. Assuming command of the Western Department in September, Johnston succeeded in raising and organizing an army to guard a long and vulnerable line from the Mississippi River to the Allegheny Mountains. His forces were no match, however, for the superior numbers of the North, which forced the Confederates to retreat from Forts Henry and Donelson, in Tennessee, and from Bowling Green, Ky., and led to the fall of Nashville, Tenn., in February 1862. Nevertheless, bitter criticism of Johnston did not affect Davis' confidence in him.

Albert Sidney Johnston
By courtesy of the Library of Congress, Washington, D.C.

Concentrating his army at Corinth, Miss., Johnston determined to attack General Ulysses S. Grant at Pittsburg Landing. His surprise assault upon the Union forces at the Battle of Shiloh (April 6 and 7) was almost successful, but he was mortally wounded in the first afternoon's fighting.

Johnston, Archibald: *see* Warriston, Archibald Johnston, Lord.

Johnston, David Claypoole (b. March 1799, Philadelphia—d. Nov. 8, 1865, Dorchester, Mass., U.S.), American cartoonist who, strongly influenced by the English caricaturist George Cruikshank, produced imaginative and original drawings.

As a schoolboy, Johnston showed an interest in drawing, and in 1815 he was apprenticed to a successful Philadelphia engraver. Shortly afterward he began making caricatures, which he published himself. They were popular, but the subjects he ridiculed were influential, and so he switched to an acting career. He first appeared on the stage in 1821, and for several years he played with a Philadelphia company. In 1825 he joined a Boston company, and along with his acting he made caricatures, particularly of actors and actresses. After a year he decided to devote himself to drawing and to book illustration. He quickly became popular, particularly as a lithographer.

Beginning in 1830 and until 1849, Johnston annually issued a series of humorous etchings under the title *Scraps,* and it was because of these that he came to be called the American Cruikshank.

Johnston, Edward (b. Feb. 11, 1872, Uruguay—d. Nov. 26, 1944, Ditchling, Sussex, Eng.), British teacher of calligraphy who had a widespread influence on 20th-century typography and calligraphy, particularly in England and Germany. He has been called the father of the modern revival of lettering.

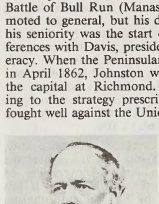
The son of a Scottish military officer, Johnston was brought to England as a child and received his early education at home. After graduating in medicine from the University of Edinburgh (1898) he went to London, where, instead of practicing his profession, he began to accept writing commissions. His teaching career began in 1899, when W.R. Lethaby, an English architect and educator, asked him to take charge of writing and lettering classes at the London Central School of Arts and Crafts. He taught there until 1913, and beginning in 1901 he also taught at the Royal College of Art, South Kensington. Through Lethaby, Johnston met Sydney Cockerell, who had been associated with William Morris' Kelmscott Press. Cockerell directed his attention to the manuscripts in the British Museum, and, encouraged by Cockerell, he rediscovered techniques for making and using reeds and quills.

Johnston's outstanding and highly influential *Writing and Illuminating, and Lettering* (1906), containing clear and practical information on writing procedures, was followed by *Manuscript and Inscription Letters* (1909). Commissioned by the London Underground Railway to execute a new alphabet for its signs and publicity, he finished in 1916 a sans serif design that was a notable success and is considered the first modern sans serif face, the precursor of many such types.

Johnston's teaching was notable in conveying the fundamental principle that writing and printing are interdependent. Among his students who later became well-known calligraphers and designers of letters were Anna Simons, T.J. Cobden-Sanderson, Eric Gill, Graily Hewitt, and Percy Smith.

Johnston, Sir Harry Hamilton (b. June 12, 1858, London—d. Aug. 31, 1927, Woodsetts House, near Worksop, Nottinghamshire, Eng.), British explorer, botanist, and pioneer colonial administrator. Widely traveled in Africa and speaking many African languages, he was closely involved in what has been called the scramble for Africa by 19th-century colonial powers. He published 40 books on African subjects and from 1891 to 1895 served as the first British commissioner in Nyasaland, now the Republic of Malawi.

He gained his early African experience as a painter, natural-history collector, and freelance journalist. He was in Tunis (1879–80), then traveled through Angola and up the Congo River (1882–83). On a botanical expedition to Kilimanjaro in eastern Africa, he



Harry Hamilton Johnston, pencil sketch by T.B. Wirgman, 1894; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

obtained a land concession that helped draw the frontiers between British and German territories in that region. Joining the consular service in 1885, he spent three years administering a British protectorate in eastern Nigeria. Between 1888 and 1891 he exercised much influence on British African policy and obtained the treaties on which the United Kingdom based its claims to Nyasaland and Northern Rhodesia. Knighted in 1896, Johnston served two years as consul general in Tunis and then was special commissioner in Uganda (1899–1901).

Johnston, Joseph E(ggleston) (b. Feb. 3, 1807, near Farmville, Va., U.S.—d. March 21, 1891, Washington, D.C.), Confederate general who never suffered a direct defeat during the American Civil War (1861–65). His military effectiveness, though, was hindered by a long-standing feud with Jefferson Davis.

A graduate of the U.S. Military Academy, West Point, N.Y. (1829), Johnston resigned his commission at the outbreak of the Civil War to offer his services to his native state of Virginia. Given the rank of brigadier general in the Confederate Army of the Shenandoah (May 1861), he was credited in July with the first important Southern victory at the First Battle of Bull Run (Manassas). He was promoted to general, but his dissatisfaction with his seniority was the start of his lengthy differences with Davis, president of the Confederacy. When the Peninsular Campaign began in April 1862, Johnston withdrew to defend the capital at Richmond. Although objecting to the strategy prescribed by Davis, he fought well against the Union forces. Severely

Joseph E. Johnston
By courtesy of the Library of Congress, Washington, D.C.

wounded at the Battle of Fair Oaks (Seven Pines) in May, he was replaced by General Robert E. Lee.

A year later Johnston assumed control of Confederate forces in Mississippi threatened

by the Federal advance on Vicksburg. He warned General John C. Pemberton to evacuate the city, but President Davis countermanded Pemberton to hold it at all costs. Lacking sufficient troops, Johnston could not relieve Pemberton, and Vicksburg fell on July 4, 1863. Bitterly criticized, he nonetheless took command of the Army of the Tennessee in December as the combined armies of the North advanced toward Atlanta, Ga. Subsequent events demonstrated the soundness of Johnston's strategy of planned withdrawal to avoid a defeat by superior forces and the disintegration of the Confederate Army; nevertheless, Davis, dissatisfied with his failure to defeat the invaders, replaced him in July.

Restored to duty in February 1865, Johnston took command of his old army, now in North Carolina, and succeeded in delaying the advance of General William T. Sherman at Bentonville, in March. But lack of men and supplies forced Johnston to order continued withdrawal, and he surrendered to Sherman at Durham Station, N.C., on April 26.

After the war, Johnston engaged in business ventures, wrote his memoirs, served in the U.S. House of Representatives (1879–81), and was named U.S. commissioner of railroads in 1885.

Johnston and Sand Islands, unincorporated territory of the U.S. in the central Pacific Ocean, 715 miles (1,150 km) southwest of Honolulu. A raised coral atoll formation measuring 3,000 by 600 feet (900 by 180 m), the two islands have a total land area of 320 acres (130 hectares). Johnston, the larger, rises to 44 feet (13 m) at Summit Peak. Both are within a 7.5-mile (12-kilometre) semicircular reef. Rainfall is sparse, and there are no sources of fresh water. Vegetation is limited to bunch grass and herbs. Sand Island is uninhabited.

Sighted in 1807 by an English mariner, Captain C.J. Johnston, the islands were uninhabited and remained unclaimed until 1858, when both the United States (under the Guano Act of 1856) and the Kingdom of Hawaii laid claim. The islands' guano deposits were exhausted by 1908. Declared a bird sanctuary in 1926 under the administration of the U.S. Department of Agriculture, the atoll was placed under the U.S. Navy in 1934. By 1941 a naval air station had been built, the landing field taking up almost the full length of the island. Johnston was transferred to U.S. Air Force jurisdiction in 1948 and was associated with U.S. nuclear-weapons tests until 1962. The island has been managed by the Defense Nuclear Agency since 1974. A facility for incinerating U.S. chemical weapons stockpiles went into operation on the island in the early 1990s. Pop. (2000 est.) 1,100.

Johnstown, city, seat (1838) of Fulton county, east-central New York, U.S. It lies near the Mohawk River, adjoining Gloversville, 43 miles (69 km) northwest of Albany. It was founded in 1762 by Sir William Johnson, whose baronial home, Johnson Hall, is preserved. Drumm House and Tryon County Court House also date from the colonial period. A minor battle of the American Revolution was fought there on Oct. 25, 1781, six days after the Battle of Yorktown. Elizabeth Cady Stanton, pioneer suffragette, was born at Johnstown in 1815. Glove making is the basic industry. The city is the seat of Fulton-Montgomery Community College (1963). Inc. village, 1808; city, 1895. Pop. (2000) 8,511.

Johnstown, city, Cambria county, southwestern Pennsylvania, U.S. It lies at the confluence of the Conemaugh River and Stony Creek, 76 miles (122 km) east of Pittsburgh. Johnstown is the centre of a metropolitan area comprising more than 60 townships and boroughs.

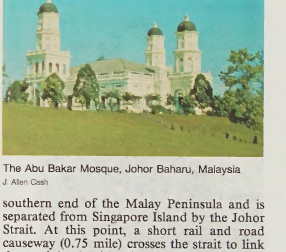
Founded in 1800 by Joseph Johns, a Swiss Mennonite, it was known as Conemaugh until renamed in 1834 to honour the founder. Johnstown first became important as the western terminus of the Allegheny Portage Railroad (1831–34), a series of inclined planes whereby Pennsylvania Canal barges were transported piggyback on railway cars for 36 miles (58 km) over the Allegheny Mountains. In 1861 use of the Kelly converter (for converting iron to steel) spurred the growth of Johnstown's steel industry, which developed the nation's first blooming mill (for the breaking down of steel ingots) and produced the first American-made steel rails. By 1873 Johnstown had become a leading American steelmaking centre.

The city was the victim of a disastrous flood in 1889. At 3:10 PM on May 31, the South Fork Dam, a poorly maintained earthfill dam holding a major upstream reservoir, collapsed after heavy rains, sending a great wall of water rushing down the Conemaugh Valley at speeds of 20 to 40 miles per hour (32 to 64 km/h). At 4:07 PM, the 30-foot high wall of water smashed into Johnstown, which lay on the floodplain of the Conemaugh River. The flood swept away most of the northern half of the city, killing 2,209 people and destroying 1,600 homes. Grandview Cemetery contains the graves of more than 700 unidentified victims. The Johnstown Flood National Memorial stands at the site of the old dam. After another disastrous flood in 1936, a flood-control program was completed (1943), but this did not prevent heavy flooding in July 1977 in which 68 people were killed.

Johnstown's modern industries include the production of clothing, chemicals, furniture, fabricated steel plate, and the manufacture of wheels, axles, freight cars, and wire. The Johnstown branch of the University of Pittsburgh was founded in 1927. Inc. city, 1898. Pop. (2000) city, 23,906; Johnstown MSA, 232,621.

Johor, formerly JOHORE, southernmost traditional region of West Malaysia (Malaya). Its 250-mile (400-kilometre) coastline along the Strait of Malacca and South China Sea also winds around the Republic of Singapore's northern border and is dotted with small islands. Johor is generally flat and jungle covered, with large swamps, but rises in the east-central region to peaks of over 3,000 feet (900 m).

Founded by Mahmud, the fugitive sultan of Malacca, and his son Ala'ud'din after the Malaccan kingdom fell to the Portuguese (1511), the area declined in the 18th century when the seat of power shifted to the Riau (Riouw) islands, south of Singapore. The governors of the Johore sultanate were recognized as independent by the British in the cession of Singapore (1819). After 1830, Chinese pepper



Coconut palm grove in Johor region, Malaysia
Art Resource

and gambier (catechu) planters settled in the plains, and a few small trading centres were established along the rivers.

The region's economy developed after 1919, when the railway was extended southward from Malaya's tin and rubber belt to Singapore, bringing to an end Johore's historical isolation (by swamps) from the rest of the peninsula. Following World War I, large-scale rubber planting was introduced, and tin and iron deposits were discovered. Bauxite is worked at Teluk Ramunia. Johor is a major producer of oil palms, and coconut (copra) and pineapple estates flourish in the swampy plains, particularly in the peat areas to the west. Canning factories adjoin the estates. Johor Tenggara is the site of a large agricultural and resettlement project, which is part of a long-term (1970–90) development plan.

Because of Johor's shallow harbours, its trade depends on Singapore's port facilities. Commodity movements are now mainly by roads, all converging on the region's main city, Johor Baharu (*q.v.*), which is linked by causeway to Singapore. The latter nation depends on Johor's Teberau River for its water supply. Johor has become essentially a part of Singapore's hinterland; its economic relations with the Pahang region to the north are negligible. Aside from Johor Baharu, other important towns are Muar, Mersing, Segamat (*qq.v.*), and Batu Pahat. Pop. (1997 est.) 2,554,100.

Johor Baharu, formerly JOHORE BAHRU, city, southern West Malaysia. It lies at the

The Abu Bakar Mosque, Johor Baharu, Malaysia
J. Allen Cash

southern end of the Malay Peninsula and is separated from Singapore Island by the Johor Strait. At this point, a short rail and road causeway (0.75 mile) crosses the strait to link the mainland with Singapore. Founded by Temenggong Ibrahim, the ruler of Johore, it was called Tanjung Putri until renamed Johore Bahru ("New Johore") in 1866, replacing Johore Lama ("Old Johore"), 18 miles (29 km) east.

The town, long a trade outlet for the products of the peninsula and a major port of entry, is on low hills surrounded by rubber, oil-palm, and pineapple estates. It has a textile industry, and bauxite is mined at Teluk Ramunia to the southeast. Many of its residents use the amenities of the city of Singapore, of which it is almost a satellite. The Malay dialect spoken in the Johor Baharu district is considered the standard for Malaysia. The town, largely Chinese in character, has the Istana Besar ("big palace"), the picturesque Abu Bakar Mosque, the Bukit Serene Palace (the sultan's residence), and a public zoo. The Technological University of Malaysia (founded 1904; university status 1972) is located here. Pop. (1991) city, 328,646; urban agglom., 442,250.

Johore Strait, Bahasa Malaysia SELAT TABRAU, northern arm of the Singapore Strait, 30 mi (50 km) long and ¾–3 mi wide, between the Republic of Singapore and the region of Johor at the southern tip of the Malay Peninsula. It is crossed by a rail and road causeway linking Johor Baharu, Malaysia, with Woodlands, Singapore. The strait was the scene of fighting in February 1942 during the Japanese drive to conquer Singapore, then a British colony. Its eastern portion contains the

Singapore islands of Ubin and Tekong Besar and has a deepwater access channel to Changi naval base on Singapore's northeastern coast.

Joiachin (king of Judah): *see* Jehoiachin.

joinder and impleader, in law, processes whereby third parties are brought into suits because their participation is necessary for the successful adjudication of the issues. Impleading occurs when a third party against whom the defendant may himself have a claim is brought into the original suit in the interests of time and efficiency. Joinder of suit occurs when two or more issues are dispensed within the same hearing.

Impleading is a procedural device. Any defendant who claims that a third party may have a portion (or more) of the liability claimed by the plaintiff has the right to bring that third party into the suit. By the same token, the same right is available to a plaintiff against whom a defendant (or defendants in third-party suits) may have filed a counterclaim.

The courts have tended to favour such causes of action in the interest of time and costs saved.

Joinder may be mandatory in some instances. Compulsory joinder requires the uniting of a person who must be made a party with others in a suit because his participation is necessary for a just adjudication of the matter. A plaintiff bringing several claims on a related subject must follow the procedure of joinder or risk having those several suits barred from a hearing on the ground that they constitute a multiplicity of suits. A similar procedure is available for defendants, as compulsory counterclaims must also be raised in such a case situation.

Permissive joinder is the uniting of several persons, under certain instances, as either defendant or plaintiff, until they can bring suit or be sued separately.

Joinder and impleading, as procedural devices, are both required, in certain situations, in the interest of saving time and money in the pursuit of a just verdict, and are also considered a desirable right on the part of those who would certainly benefit from these procedures.

joint, in anatomy, a structure connecting two or more adjacent elements of the skeleton.

A brief treatment of joints follows. For full treatment, *see* MACROPAEDIA: Supportive and Connective Tissues.

Structurally, there are two types of joints: diarthrosis, containing fluid, and synarthrosis, which function without fluid. Synarthroses are classified as fibrous, cartilaginous, or fibrocartilaginous. The elements of a fibrous joint are connected with collagen fibres. Cartilaginous joints, or synchondroses, are transient, linking bones which become fused after birth; they usually disappear before the age of 25. Fibrocartilaginous joints, or symphyses, are the connections between the body of one bone and the body of another. With two exceptions, all symphyses are located in the spinal column and are termed intervertebral disks. These disks have a hard, elastic outer ring, and a soft, mucoid core. Disks permit the vertebrae of the spine to move and insulate against the jolts of severe movements, such as jumping.

A diarthrosis, or synovial joint, consists of a sac (bursa) containing fluid which both nourishes and lubricates the joint, making motion possible. All synovial joints are either ovoid (which is either convex or concave in all directions) or sellar, with concave and convex sides at right angles to each other. The ovoid bone surface is termed male if it is convex, and female if it is concave.

The collagen fibres which connect the bones of a joint are ligaments. It was accepted until recently that ligaments held the bones of a joint in place, but it is now believed that it is in fact muscles which keep bones in their joint. Joints are nourished by blood supplied through capillaries, with the exceptions of the moving cartilage parts of a joint, disks, and menisci, which are nourished by synovial fluid.

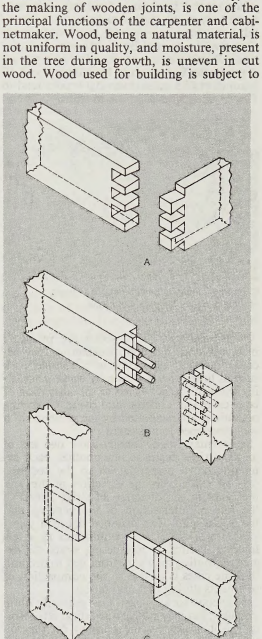
Joint disease is one of the leading causes of invalidism. The disease can be of a short duration or can be chronic and can affect one joint or many. The aged are most susceptible to joint disease, but all ages can be affected. These disorders can be classified in two general categories: inflammatory, causing swelling, pain, redness, and heat; and noninflammatory, in which inflammation is not the principal effect.

Arthritis refers to all inflammatory joint diseases, whereas synovitis describes inflammation of the lining of a joint. Spondylitis is the term for inflammation of the spine. Rheumatism refers to a state of discomfort related to any part of the skeletal system, including tendons and ligaments. When joints become infected the illness is known as infectious arthritis. Having symptoms similar to infectious arthritis, but with no known cause, is rheumatoid arthritis. It usually affects matching joints of the body, such as knees and wrists, and leads to a serious incapacity in an estimated one-third of all cases.

Diseases referred to as collagen diseases describe a general condition of abnormality of the connective tissues. These include lupus erythematosus, which can affect any organ or structure of the body, causing eruptions on the face, inflammation of the joints and eyes, and kidney disease or afflictions of the central nervous system. Rheumatic fever is frequently defined as a collagen disease. It resembles rheumatoid arthritis but is usually linked to a streptococcal infection.

Noninflammatory joint diseases include traumatic joint diseases, which are the result of joint injuries and can take the form of a sprain, fracture, or dislocation. A sprain is an injury to the ligaments, tendons, or muscles resulting from an abrupt, jerking movement. It will normally heal in a matter of days. A more severe stress can cause ligaments, tendons, or muscles to tear, healing by fibrous union. Joint dislocations demand extended immobilization and, in some instances, surgery to heal.

Osteoarthritis is a degenerative joint disease of the cartilage. All adults past middle age are to some degree affected. This disease is the most destructive when located in the hip. It is extremely unusual for a single injury to be the cause of osteoarthritis, but repeated stresses can make people vulnerable to this affliction.



Congenital and hereditary abnormalities are not always evident at birth. Defects that appear at birth or at an early age are most often structural, whereas those that manifest later in life are usually the result of systemic metabolic deficiencies which lead to structural problems.

Joint diseases can have other causes. Nutritional inadequacies can cause rickets and scurvy. Hemophilia causes bleeding into the joints, a damaging condition called hemarthrosis. Bone tissue death not caused by infection, termed aseptic necrosis, can lead to insufficient blood supply to the joint. Acromegaly, extreme activity of the pituitary gland, causes an overabundance of joint cartilage in peripheral joints, leading to osteoarthritic damage. A Charcot joint is characterized by an inability to receive sensory stimulation. This has a severely destructive impact on joints. A heart attack is frequently the cause of shoulder-hand syndrome, or it can be related to neck vertebrae diseases. Its symptoms are pain in the shoulders and swelling in the hands.

Evidence of joint disease can be traced as far back as fossils from the Mesozoic Era. Rheumatoid arthritis has been detected in Egyptian mummies. All chronic arthritis was interpreted as gout until recent times. The first man to determine the existence of rheumatism was the Parisian physician Guillaume de Baillou in 1591.

For diagnostic purposes, X-rays are used to detect bone problems but not abnormalities of tissue or joints. Synovial fluid is analyzed to aid in the diagnosis of inflammatory diseases. A synovial biopsy assists in determining whether arthritis is infectious or rheumatoid in nature.

joint, in carpentry, junction of two or more members of a framed structure. Joinery, or the making of wooden joints, is one of the principal functions of the carpenter and cabinetmaker. Wood, being a natural material, is not uniform in quality, and moisture, present in the tree during growth, is uneven in cut wood. Wood used for building is subject to

movement caused by changes in its moisture content. Though such movement is frequently quite small and accurately predictable, it remains a critical consideration in joint design. Because wood has been used as a building material for centuries throughout the world, the designs of most joints were perfected hundreds of years ago and have changed little since that time.

The object of the joint is to fix two members together so that the joint has the greatest possible mechanical strength and is as unobtrusive as possible. Though there are many joints in use, they fall into a few basic groups, many being variations and elaborations on fundamentally simple ideas. Practically all are based on handwork, and with few exceptions
