In Homer's *Iliad,* Hypnos is enlisted by Hera to lull Zeus to sleep so that she can aid the Greeks in their war against Troy. As a reward for his services, Hypnos is given Pasithea, one of the Graces, to wed.

hypnosis, a special psychological state with certain physiological attributes, resembling sleep only superficially and marked by a functioning of the individual at a level of awareness other than the ordinary conscious state. This state is characterized by a degree of increased receptiveness and responsiveness in which inner experiential perceptions are given as much significance as is generally given only to external reality.

The hypnotized individual appears to heed only the communications of the hypnotist. He seems to respond in an uncritical, automatic fashion, ignoring all aspects of the environment other than those pointed out to him by the hypnotist. He sees, feels, smells, and otherwise perceives in accordance with the hypnotist's suggestions, even though these suggestions may be in apparent contradiction to the stimuli that impinge upon him. Even the subject's memory and awareness of self may be altered by suggestion, and the effects of the suggestions may be extended (posthypnotically) into the subject's subsequent waking activity.

The history of hypnosis is as ancient as that of sorcery, magic, and medicine, to whose methods it belonged. Its scientific history began in the latter part of the 18th century with Franz Mesmer (*q.v.*), a Viennese physician who used it in the treatment of patients. Because of his mistaken belief that it was an occult force, which he termed "animal magnetism," that flowed through the hypnotist into the subject, he was soon discredited; but hypnotism—or mesmerism, as it was named after him—continued to interest medical practitioners. A number of clinicians made use of it without adequate recognition of its nature until the middle of the 19th century, when the English physician James Braid (*q.v.*) studied its phenomena and coined the terms hypnotism and hypnosis.

Hypnosis attracted widespread scientific interest in the 1880s. Ambroise-Auguste Liébeault, an obscure French country physician who used mesmeric techniques, drew the support of Hippolyte Bernheim, professor of medicine at Strasbourg. Independently they wrote that hypnosis involved no physical forces and no physiological processes but was a combination of psychologically mediated responses to suggestions. At about the same time, the Austrian physician Sigmund Freud visited France and was impressed by the therapeutic potential of hypnosis for neurotic disorders. On his return to Vienna he used hypnosis to help neurotics recall disturbing events that they had apparently forgotten. As he began to develop his system of psychoanalysis, theoretical considerations, as well as the difficulty he encountered in hypnotizing some patients, led Freud to discard hypnosis in favour of free association. (Generally psychoanalysts have now come to view hypnosis as merely an adjunct to the free-associative techniques used in psychoanalytic practice.)

Despite Freud's influential adoption and then rejection of hypnosis, some use was made of the technique in the psychoanalytic treatment of soldiers with combat neuroses during World Wars I and II. Hypnosis subsequently acquired various other limited uses in medicine. Various researchers have put forth differing theories of what hypnosis is and how it could be understood, but there is currently still no generally accepted explanatory theory for the phenomenon.

The techniques used to induce hypnosis share common features. The most important consideration is that the person to be hypnotized (the subject) be willing and cooperative and that he trust in the hypnotist. The subject is invited to relax in comfort and to fix his gaze on some object. The hypnotist continues to suggest, usually in a low, quiet voice, that the subject's relaxation will increase and that his eyes will grow tired. Soon the subject's eyes do show signs of fatigue, and the hypnotist suggests that they will close. The subject allows his eyes to close and then begins to show signs of profound relaxation, such as limpness and deep breathing. He has entered the state of hypnotic trance. A person's responsiveness to being hypnotized is greatest when he believes that he can be hypnotized, that the hypnotist is competent and trustworthy, and that the undertaking is safe, appropriate, and congruent with his wishes. Therefore induction is generally preceded by the establishment of suitable rapport between subject and hypnotist.

Ordinary inductions of hypnosis begin with simple suggestions made by the hypnotist that will almost inevitably be accepted by all subjects. At this stage neither subject nor hypnotist can readily tell whether the subject's behaviour constitutes a hypnotic response or mere cooperation. Then, gradually, suggestions are given that demand increasing distortion of perception or memory (*e.g.,* that it is difficult or impossible for the subject to open his eyes). Other methods of induction may be used. The process may take considerable time or only a few seconds.

The resulting hypnotic phenomena differ from one subject to another and from one trance to another, depending upon the purposes to be served and the depth of the trance. Hypnosis is a phenomenon of degrees, ranging from light to profound trance states but with no fixed constancy. Ordinarily, however, all trance behaviour is characterized by a simplicity, a directness, and a literalness of understanding, action, and emotional response that are suggestive of childhood. The surprising abilities displayed by some hypnotized persons seems to derive partly from the restriction of their attention to the task or situation at hand and their consequent freedom from the ordinary conscious tendency to orient constantly to distracting, even irrelevant, events.

Suggestibility, a state of greatly enhanced receptiveness and responsiveness to suggestions and stimuli presented by the hypnotist, constitutes the central phenomenon of hypnosis. Appropriate suggestions by the hypnotist can induce a remarkably wide range of psychological, sensory, and motor responses from persons who are deeply hypnotized. By acceptance of and response to suggestions, the subject can become deaf, blind, paralyzed, hallucinated, delusional, amnesic, or impervious to pain or to uncomfortable body postures, or he can display various behavioral responses that he regards as reasonable or desirable in the given situation that has been suggested to him by the hypnotist.

One fascinating manifestation that can be elicited from a subject who has been in a hypnotic trance is that of posthypnotic suggestion and behaviour. By this is meant the subject's execution, at some later time, of instructions and suggestions that were given to him while he was in a trance. With adequate amnesia induced during the trance state, the individual will not be aware of the source of his impulse to perform the instructed act. Posthypnotic suggestion, however, is not a particularly powerful means for controlling behaviour when compared to a person's conscious willingness to perform actions.

Many subjects seem unable to recall what happened while they were in deep hypnosis. This posthypnotic amnesia, as it is called, can either result spontaneously from deep hypnosis or it can result from suggestion by the hypnotist during the trance state. The amnesia may include all the events of the trance state or only selected items, or it may be manifested in connection with matters unrelated to the trance. Posthypnotic amnesia may be successfully removed by appropriate hypnotic suggestions.

Conversely, hypermnesia, a memory capacity that transcends the everyday ability, is another aspect of hypnotic behaviour. For example, in the trance state, the subject, by virtue of an uncritical willingness to make the effort and a freedom from inhibitions deriving from preformed judgments, can vividly remember long-forgotten, even deeply repressed experiences, recount them in extensive detail and still maintain an amnesia for them at the ordinary level of consciousness. This remarkable ability permits the recovery of memories that are otherwise unavailable to conscious awareness, and it was thus of great usefulness to Freud as he embarked on his explorations of his patients' unconsciously held memories.

Hypnosis has been officially endorsed as a therapeutic method by medical, psychiatric, dental, and psychological associations throughout the world. It has been found most useful in preparing people for anesthesia, enhancing the drug response, and reducing the required dosage. In childbirth it is particularly helpful, because it is effective in alleviating the mother's discomfort while avoiding drug-induced impairment of the child's physiological function. Hypnosis is highly regarded in the management of otherwise intractable pain, including that of terminal cancer. It is valuable in reducing the widespread fear of dental procedures; the very people whom dentists find most difficult to treat frequently respond best to hypnotic suggestion. In the area of psychosomatic medicine, hypnosis has been used in a variety of ways. Patients have been trained to relax and to carry out, in the absence of the hypnotist, exercises that have had salutary effects on some forms of high blood pressure, headaches, and functional disorders. In psychotherapy, hypnosis has been used in a variety of ways. For example, the technique of revivifying traumatic events in order to produce an emotional catharsis continues to be a useful treatment in relieving neuroses with traumatic onset, such as those that develop in combat, among individuals with relatively stable prior adjustments.

Though the induction of hypnosis requires little training and no particular skill, when used in the context of medical treatment, it should never be employed by individuals who do not have the competence and skill to treat such problems without the use of hypnosis. Hypnosis has been repeatedly condemned by various medical associations when it is used purely for purposes of public entertainment, owing to the danger of persons suffering adverse posthypnotic reactions to the procedure. Indeed, in this regard, several nations have banned or limited commercial or other public displays of hypnosis on such grounds.

(M.T.O./A.G.H./Ed.)

hypocaust, in building construction, open space below a floor that is heated by gases from a fire or furnace below and that allows the passage of hot air to heat the room above. This type of heating was developed by the Romans, who used it not only in the warm and hot rooms of the baths but also almost universally in private houses in the northern provinces.

Many examples of such hypocausts exist in villa and house foundations in Roman centres in Germany and England. The usual custom was to lead the hot air from a hypocaust into a single vertical flue in the wall of the room to be heated, through which the hot air and smoke escaped into the open air. Where greater warmth was desired, several flues would lead up from the hypocaust in the side walls of the room; at times these wall flues consisted of hollow, oblong tiles, set close together, entirely around the room.

The usual construction of a basement hypocaust consisted of a layer of tiles laid continuously in a bed of concrete for the bottom surface. Piers approximately 8 inches (20 cm) square and about 2 feet apart were used as the supports for the hypocaust's internal space. The floor above was made of concrete or of large square tiles supporting a bed of concrete, on which the finished floor of marble or mosaic tessera was laid.

hypochondriasis, mental disorder characterized by an excessive preoccupation with one's own health and a tendency to fear or believe that one has a serious disease based on the presence of insignificant physical signs or symptoms. The hypochondriac may become convinced that he is ill even though such physical signs are completely absent, or he may exaggerate the medical significance of minor aches and pains, becoming morbidly and obsessively preoccupied with the thought of a life-threatening illness. His fears usually persist even after a thorough examination by a physician has established that no physical abnormality exists, and the doctor's reassurances have only a slight or temporary effect on such a person's apprehensions. The typical hypochondriac does not become delusional about his health, however; *i.e.,* he remains able to consider or admit the possibility that his fears are unfounded. Despite this, many hypochondriacs will go from doctor to doctor in their effort to enlist medical resources to deal with the imagined illness.

A hypochondriac's concern may focus on a supposed disease or diseases of the heart, gastrointestinal tract, or genital structures. The person may become fixated on one imagined disorder, or he may fasten on different ones as time goes by according to his own readings of medical literature, current public health concerns and fads, and so on. Hypochondriasis may exist by itself or it may be a secondary syndrome that occurs along with another mental disorder. Hypochondriasis usually firsts manifests itself in young adulthood and is equally common among males and females. In some cases it seems to represent a psychological coping mechanism that the person resorts to in order to deal with stressful life situations. Psychotherapy can be helpful in determining an underlying emotional cause, and behaviour therapy may also be helpful.

hypocoly (*Hypocolius ampelinus*), Middle Eastern songbird believed by some authorities to be related to the waxwing (family Bombycillidae) but often separated as the sole member of the family Hypocoliidae (order Passeriformes). The hypocoly is a slim grayish bird, about 18 cm (7 inches) long, with a black mask and a slight crest. The wings are black, tipped with white. The beak is short, thick, and fairly broad, the tail moderately

Hypocoly (*Hypocolius ampelinus*)
Painting by Richard Keane

long. The plumage, like that of the waxwings, is smooth, giving the bird a clean appearance. The hypocoly inhabits open semiarid or cultivated country in Iraq and neighbouring regions and during the nonbreeding season wanders widely, reaching India, southern Afghanistan, and probably Africa.

Hypodorian mode, in music, second of the eight medieval church modes. *See* church mode.

hypoglycemia, reduction of the concentration of glucose in the blood serum below normal levels, commonly occurring as a complication of treatment for diabetes mellitus. Even brief falls in serum glucose levels can produce severe brain dysfunction. In healthy individuals, an intricate glucoregulatory system acts rapidly to counter hypoglycemia by reducing insulin production (insulin is important in the mechanism that removes glucose from the bloodstream) and mobilizing energy reserves from the fat and liver. When this regulatory system does not operate, as in insulin-dependent diabetics, disproportionately large amounts of insulin in the blood result in sudden drastic falls in circulating glucose.

Fasting hypoglycemia can be a life-threatening problem; it occurs most often in diabetic patients who have accidentally overdosed on insulin by mistiming their therapy, missing meals, or exercising without compensating for increased glucose use. The condition also occurs in otherwise healthy individuals with insulin-producing tumours or as a late complication of starvation or other metabolic disorders. The symptoms of hypoglycemia result from energy starvation in the central nervous system and include mental impairment, confusion, lethargy, and seizures; in severe cases, hypoglycemia causes coma and death. Diagnosis is based on the concurrence of these neurological symptoms, low levels of circulating glucose, and the alleviation of the patient's symptoms upon the rapid oral or intravenous administration of glucose, which is the usual treatment for the condition.

Hypolydian mode, in music, sixth of the eight medieval church modes. *See* church mode.

Hypomixolydian mode, in music, last of the eight medieval church modes. *See* church mode.

hypoparathyroidism, inadequate secretion of parathyroid hormone, usually caused by accidental surgical removal of large amounts of parathyroid tissue (during thyroid surgery) or, less frequently, by defective action of the parathyroid gland. This deficiency results in low calcium and high phosphorus levels in the blood, often causing tetany (increased nervous and muscular excitability, leading to spasms).

hypophosphatemia, reduction in the concentration of phosphate in the blood serum, thus disrupting the body's energy metabolism and impairing the delivery of oxygen through the bloodstream to the tissues. Hypophosphatemia usually occurs in conjunction with other metabolic disturbances that affect the normal equilibrium between the blood circulation, the intestinal absorption of nutrients, the loss of phosphate through the kidneys, and the storage of phosphate in the bones and red blood cells. Defects in any one of these areas or, more often, in a combination of areas will reduce phosphate levels in the blood. Acute hypophosphatemia causes such neurological symptoms as weakness, tingling, depressed reflexes, tremors, and confusion. Chronic hypophosphatemia, in which a prolonged deficiency depletes the body's normal phosphate stores, causes generalized debility, weakness, and anorexia. Treatment in either case involves correction of the underlying metabolic disturbance and phosphate supplements to replenish the body's stores of that nutrient.

Familial hypophosphatemia is a sex-linked inherited disorder that is a principal cause of rickets (*q.v.*) in the developed nations. Familial hypophosphatemia is caused by a metabolic defect that leads to the loss of phosphate through the kidneys. The resulting low concentration of phosphate in the blood results in the reduced deposition in the bones of calcium phosphate, which is the substance responsible for the rigidity of bone. The result, in children, is the curved and stunted bones that are the chief symptoms of rickets.

Hypophrygian mode, in music, fourth of the eight medieval church modes. *See* church mode.

hypophysis (anatomy): *see* pituitary gland.

hypopituitarism, deficiency of pituitary secretions, caused by various forms of injury to or damage of the pituitary gland. Removal of the entire gland or deficiency of all pituitary secretions produces the condition known as panhypopituitarism, which is sometimes manifested as Simmonds' disease (*q.v.*).

hypostyle hall, in architecture, interior space whose roof rests on pillars or columns. The word means literally "under pillars," and the design allows for the construction of large spaces—as in temples, palaces, or public buildings—without the need for arches. It was used extensively in ancient Egypt—where the Temple of Amon at Karnak provides a good example—and in Persia—where the ruins at Persepolis give evidence of outstanding examples of hypostyle construction.

Although the multiple, usually large, pillars naturally consumed much of the floor space of such halls, this drawback was turned to advantage when the columns were carved in heroic or religious motifs. The design has rarely been used in more recent architecture because of more effective means of roof support.

hyposulfite of soda, most important salt of thiosulfuric acid, an unstable compound of sulfur (*q.v.*).

hypotension, also called LOW BLOOD PRESSURE, condition in which the blood pressure is abnormally low, either because of reduced blood volume or because of increased blood-vessel capacity. Though not in itself an indication of ill health, it often accompanies disease conditions.

Extensive bleeding is an obvious cause of reduced blood volume that leads to hypotension. There are other possible causes. A person who has suffered an extensive burn loses blood plasma—the blood minus the red and white blood cells and the platelets. The blood volume is reduced in a number of conditions involving loss of salt and water from the tissues—as in excessive sweating and diarrhea—and its replacement with water from the blood. Loss of water from the blood to the tissues may also result from exposure to cold. Finally, a person who remains standing for as long as one-half hour may temporarily lose as much as 15 percent of the blood water into the tissues of the legs.

Orthostatic hypotension—low blood pressure upon standing up—seems to spring from a failure in the autonomic nervous system. Normally, when a person stands up, there is a reflex constriction of the small arteries and veins to offset the effects of gravity. Hypotension from an increase in the capacity of the blood vessels is a factor in fainting and in other forms of syncope (*q.v.*). Hypotension is also a factor in poliomyelitis, in shock, and in poisoning with a depressive drug, such as a barbiturate.

hypothalamus, region of the brain lying below the thalamus and making up the floor of the third cerebral ventricle. The hypothalamus contains a control centre for many functions of the autonomic nervous system, and it has important links with the endocrine system because of its complex interaction with the pituitary gland that lies beneath it.

The hypothalamus and pituitary gland are connected by both nervous and chemical pathways. Nerve tracts from the hypothalamus stimulate the posterior pituitary's release of oxytocin and vasopressin; these are hormones that cause smooth-muscle contractions in the circulatory and reproductive systems. Hormones secreted from the hypothalamus into a portal vein leading to the anterior pituitary trigger that gland's release of growth hormone, adrenocorticotropic hormone, luteinizing hormone, and other major pituitary products.

In addition to its effects on the endocrine system, the hypothalamus also influences the body's caloric intake and weight regulation, establishing a stable "set point" for individual weight gain. The hypothalamus also regulates body heat in response to variations in external temperature, contains a centre that determines wakefulness and sleep, and regulates fluid intake and feelings of thirst.

Injuries or diseases affecting the hypothalamus usually produce symptoms of pituitary dysfunction or of diabetes insipidus; in the latter disorder, the absence of antidiuretic hormone (a hormone that promotes the reabsorption of water in the kidneys) produced by the hypothalamus induces the rapid loss of water from the body through frequent urination. Hypothalamic disease can also cause insomnia and unusual fluctuations in body temperature.

hypothec, in Roman law, a type of security for a debt in which the creditor had neither ownership nor possession. It arose in cases in which a renter needed the use of the things that he pledged as security for his continued payment of rent, usually tools or equipment necessary for working the land he was renting. Possession could be taken by the creditor only when the debt, or, in this case, the rent, was not paid.

Modern hypothecs are found in civil-law countries such as France and Germany. They are similar in concept to a mortgage, except that they do not grant title or possession to the creditor. Although applied exclusively in the past to immovables, they may now apply in certain cases to movables. Hypothecs involve real rights but do not include ownership. The creditor may, in last resort, seize the property, regardless of who is holding it; further, he may sell under the authorization of the court. These rights become operative upon nonpayment of the debt.

In France there are three types of hypothecs: contractual, judicial, and legal. Contractual hypothecs are those made between individuals, and they must be notarized before witnesses. It is necessary to state the amount to be secured in the document. Judicial hypothecs are instituted by the court against all the property, present and future, of a debtor. Legal hypothecs are rights given to married women over the property of their husbands, and to children and incapacitated individuals over the property of their guardians. This is to protect them against any mismanagement by the husband or guardian of their own or common property.

hypothermia, abnormally low body temperature in a warm-blooded creature, associated with a general slowing of physiologic activity. Hibernating animals allow their body temperatures to fall to levels only slightly above ambient temperature, in a unique kind of hypothermia from which they can recover rapidly when necessary; similar temperatures would be fatal to nonhibernators.

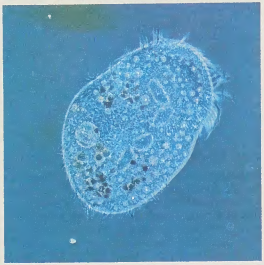
In human beings, hypothermia may be artificially induced to decrease the metabolic need for oxygen during certain surgical procedures and for the control of some kinds of cancer. The lowering of body temperature in these cases is usually accomplished through the use of ice baths. Similarly induced hypothermia is employed to inhibit metabolic process in organs removed for transplantation, thus prolonging their viability.

Accidental hypothermia may be life-threatening and constitutes a medical emergency. Low environmental temperature alone may be sufficient to cause hypothermia, as from submersion in icy water or overexposure in heavy winter snows. In cases of hypothermia due to exposure, there is often an underlying condition—such as cerebrovascular disease, hypothyroidism, severe infection, or alcohol or drug intoxication—that predisposes to the drop in body temperature. Hypothermia is serious at body temperatures below 35°C (95° F); below 32.2° C (90° F), the point at which the normal shivering reaction ceases, the condition warrants emergency treatment. Because of the physiologic slowing, pulse, respiration, and blood pressure are depressed; in some cases the victim of hypothermia appears to be dead, although revival may still be possible with appropriate treatment.

Accidental hypothermia is treated by a slow, gradual rewarming of the victim, using blankets and other passive means rather than direct application of heat. The increase in body temperature must not exceed one or two degrees F per hour, as more rapid rewarming can cause the cardiovascular system to collapse.

hypothetico-deductive method, procedure for the construction of a scientific theory that will account for results obtained through direct observation and experimentation and that will, through inference, predict further effects that can then be verified or disproved by empirical evidence derived from other experiments.

Developed by Sir Isaac Newton during the late 17th century (but named at a later date by philosophers of science), the hypothetico-deductive method assumes that properly formed theories arise as generalizations from observable data that they are intended to explain. These hypotheses, however, cannot be conclusively established until the consequences that logically follow from them are verified through additional observations and experiments. In conformity with René Descartes' rationalism, the hypothetico-deductive method treats theory as a deductive system in which particular empirical phenomena are explained by relating them back to general principles and definitions. The method, however, abandons the Cartesian claim that those principles and definitions are self-evident and valid; it assumes that their validity is determined only by the exact light their consequences throw on previously unexplained phenomena or on actual scientific problems.



hypothyroidism, a deficiency in available thyroid hormone secreted by the thyroid gland.

A brief treatment of hypothyroidism follows. For full treatment, *see* MACROPAEDIA: Endocrine Systems.

Hypothyroidism may be caused by any of a number of factors, including inadequate iodine intake (iodine being a key constituent of thyroid hormone); a defect in the synthesis of thyroid hormone; excessive intake of agents that block iodine metabolism (*e.g.*, cobalt, resorcinol, cyanate); inborn errors of metabolism; inadequate secretion of thyroid stimulating hormone from the anterior pituitary; and thyroid antibodies (autoimmunity). If the thyroid gland grows abnormally large, in an attempt to compensate for iodine lack, the condition is termed endemic, or colloid, goitre. If the gland underfunctions from birth or infancy and there is no compensatory treatment, the result is cretinism, or juvenile myxedema; if the inadequacy occurs later in life the condition is myxedema. Hypothyroidism is treated by replacement therapy using synthetic or natural thyroid hormones. *See* cretinism; myxedema.

hypotrich, any dorsoventrally flattened, oval protozoan of the ciliate order Hypotrichida, very widely distributed in both fresh and salt water. Instead of having simple cilia (hairlike processes), the hypotrichs have groups of fused cilia (cirri) arranged on the ventral surface and used for crawling. The dorsal surface is frequently equipped with rows of short, presumably tactile, bristles. Hypotrichs reproduce by sexual conjugation (nuclear exchange) and by asexual binary division. In numerous cases,

they encyst. Representative hypotrich genera include the ellipsoid *Oxytricha,* the freshwater *Gonostomum,* the sometimes violet or rose-

Hypotrich (*Onychodromus grandis*)

coloured *Uroleptus,* and, best known of all, *Euplotes.*

hypoxia, condition of the body in which the tissues are starved of oxygen. In its extreme form, where oxygen is entirely absent, the condition is called anoxia. There are four types of hypoxia: (1) the hypoxemic type, in which the oxygen pressure in the blood going to the tissues is too low to saturate the hemoglobin; (2) the anemic type, in which the amount of functional hemoglobin is too small, and hence the capacity of the blood to carry oxygen is too low; (3) the stagnant type, in which the blood is or may be normal but the flow of blood to the tissues is reduced; and (4) the histotoxic type, in which the tissue cells are poisoned and are therefore unable to make proper use of oxygen. Diseases of the blood, the heart and circulation, and the lungs may all produce some form of hypoxia.

The hypoxemic type is encountered in pilots, mountain climbers, and people living at high altitudes, where the reduced barometric pressure results in a decrease in the amount of breathable oxygen (*see* altitude sickness).

In the case of anemic hypoxia either the total amount of hemoglobin is too small to supply the body's oxygen needs, as in anemia or after severe bleeding, or hemoglobin that is present is rendered nonfunctional. Examples of the later case are carbon monoxide poisoning and metho-globinuria, in both of which the hemoglobin is so altered by toxic agents that it becomes unavailable for oxygen transport, and thus of no respiratory value.

Stagnant hypoxia, in which blood flow through the capillaries is insufficient to supply the tissues, may be general or local. If general, it may result from heart disease that impairs the circulation, impairment of veinous return of blood, or trauma that induces shock. Local stagnant hypoxia may be due to any condition that reduces or prevents the circulation of the blood in any area of the body. Examples include Raynaud's disease and Buerger's disease, which restrict circulation in the extremities; the application of a tourniquet to control bleeding; ergot poisoning; and exposure to cold.

In histotoxic hypoxia the cells of the body are unable to use the oxygen, although the amount in the blood may be normal and under normal tension. Although characteristically produced by cyanide, any agent that decreases cellular respiration may cause it. Some of these agents are narcotics, alcohol, formaldehyde, acetone, and certain anesthetic agents.

Hypsilophodon, a genus of small to medium-sized herbivorous dinosaurs that flourished from Late Jurassic to Early Cretaceous times (163 to 97.5 million years ago). *Hypsilophodon* gave its name to the family of ornithopods known as Hysilophodontidae; these primitive types ultimately gave rise to two other major groups of ornithopods—the hadrosaurs, or duck-billed dinosaurs, and the iguanodonts. *Hypsilophodon* itself was about 2 m (6.5 feet) long and weighed about 60 kg (130 pounds). It had short arms with five fingers on each hand and was equipped with much longer hind feet bearing four toes apiece. The animal had high, grooved, self-sharpening cheek teeth adapted for grinding up plant matter, as well as incisor-type teeth in its horny beak that were used to nip off vegetation. *Hypsilophodon* may also have had a ridge of bony scales running down its back, though this remains uncertain. For many decades paleontologists thought that *Hypsilophodon*'s long fingers and toes had enabled it to live in trees, but the dinosaur is now recognized to have been a swift-running, ground-dwelling plant-eater that lived in herds and depended on speed to outrun predatory carnivores.

Hypsithermal Climatic Interval, segment of the Holocene Epoch (the Holocene began about 10,000 years ago and continues to the present), dated on the basis of pollen studies. The Hypsithermal Climatic Interval began about 9,000 years ago and ended about 2,500 years ago. It has been divided into smaller units beginning with the Boreal. The Hypsithermal follows the Pre-Boreal and precedes the Sub-Atlantic intervals.

The Hypsithermal Climatic Interval was a period of comparatively warm climatic conditions. The warming trend of the Hypsithermal resulted in the elimination of many plant and animal refuges that were adjusted to cooler climate, and it has been tied to the extinction of some species. Mesolithic and Neolithic cultures are contemporaneous with Hypsithermal events in both the New and Old Worlds. In many parts of the world, pine forests gave way to forests dominated by oak during the Hypsithermal.

hypsometric curve, also called HYPSOGRAPHIC CURVE, cumulative height frequency curve for the Earth's surface or some part thereof. A hypsometric curve is essentially a graph that shows the proportion of land area that exists at various elevations by plotting relative area against relative height. In the hypsometric curve of the total Earth surface there exist two maxima of frequencies—at the 100-metre (109-yard) and the 4,700-metre (5,140-yard) elevations, which correlate with the mean level of the lowland continental areas and the deep-sea floor. This aspect of the Earth's surface, revealed by hypsometric analysis, supports the theory of a crust consisting of simatic (peridotitic, specific gravity about 3.3) materials under the oceans and of sialic (granitic to gabbroic, specific gravity about 2.7) materials of the continents.

hyrax, also called DASSIE, any of the small hoofed mammals of the order Hyracoidea. Both hyraxes and the unrelated pikas (order Lagomorpha) are also sometimes called rock rabbits; the term is misleading for hyraxes, which are neither rabbits nor exclusively rock dwellers. The term cony (coney) in the Bible actually refers not to the true cony (also a lagomorph) but to the hyrax.

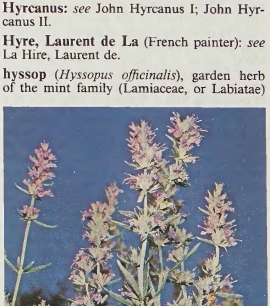
Hyraxes, native to Africa and extreme southwestern Asia, are rodentlike animals with plump heads; short necks, ears, and tails; short, slender legs; and squat bodies. Anatomically, they are characterized by small hoofs on the first and third digits of the hind foot (the middle digit is clawed); a scent gland on the back; a pair of curved, continuously growing upper incisors; four chiselike lower

Rock hyrax (*Heterohyrax*)
Leonard Lee Rue III

incisors; and rhinoceros-like molars. The rock hyraxes (*Heterohyrax*) and rock dassies, or conies (*Procavia*), are terrestrial animals that live in groups among rocks and are active by day. The tree, or bush, hyraxes (*Dendrohyrax*) are arboreal, solitary, and nocturnal.

Hyraxes are primarily vegetarian. As adults they are about 30 to 50 cm (12 to 20 inches) long and weigh about 4 to 5 kg (8 to 11 pounds). They are agile and climb well with the aid of special pads on their feet. One to three fully furred young are born after a gestation period of about seven or eight months. Natural enemies of hyraxes are pythons, eagles, and large cats.

The phylogenetic relationships of hyraxes are not clear. Their fundamental characters indicate that the group may be an ancient and unprogressive offshoot derived from the ungulate (hoofed mammal) stem. Fossils are known from the mid-Oligocene (about 30 million years ago); most of these early hyraxes were large, the largest perhaps as big as a modern horse.



Hyrcania, Old Persian VARKANA ("Wolf's Land"), ancient region located southeast of the Caspian Sea. Its capital was Zadracarta (Astrabad, modern Gorgān), and it formed part of the Median, Achaemenian, Seleucid, and Parthian empires, either as an independent province or joined with Parthia. In the list of Persian satrapies given by the Greek historian Herodotus, the Paricanians may have been the Hyrcanians.

Hyrcania was also the name of a town in Lydia, said by the Greek geographer Strabo to have derived its title from a colony of Hyrcanians settled there by the Persians.

Hyrcanus: *see* John Hyrcanus I; John Hyrcanus II.

Hyre, Laurent de La (French painter): *see* La Hire, Laurent de.

hyssop (*Hyssopus officinalis*), garden herb of the mint family (Lamiaceae, or Labiatae)

Hyssop (*Hyssopus officinalis*)
Walter Dawn

whose flowers and evergreen leaves have long been used as a flavouring for foods and beverages and as a folk medicine. The plant has a sweet scent and a warm, bitter taste. A strong tea made of the leaves and sweetened with honey is a traditional remedy for nose, throat, and lung afflictions and is sometimes applied externally to bruises. In the European Middle Ages hyssop was a stewing herb; its modern uses are for flavouring meats, fish, vegetables, salads, sweets, and such liqueurs as absinthe. Honey made from hyssop pollen is considered especially fine. The leaves contain oil of hyssop, a volatile oil used by perfumers.

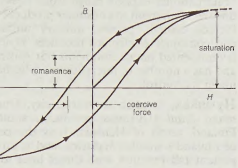
Hyssop is a small perennial plant about 0.5 m (1.5 feet) high with slim, woody quadrangular stems and narrow, elliptical, dotted leaves, about 2 to 3 cm (0.8 to 1.2 inches) long and less than 1 cm wide, that grow in pairs on the stem. Long, leafy, half-whorled spikes of little flowers (coloured violet-blue, pink, red, or white) blossom from June to September. A native of the area ranging from southern Europe eastward to Central Asia, hyssop has become naturalized in North America.

The hedge hyssop comprises herbs of the genus *Gratiola*, belonging to the Scrophulariaceae family, that are native to marshy lands throughout Eurasia and North America. *Gratiola officinalis*, of Europe, has cylindrical stems and leaves twice the size of those of true hyssop. Its flowers are solitary and located in the axils of the leaves. The herb is almost odourless but has a bitter, nauseous taste. Small quantities taken internally act as a purgative, diuretic, and emetic. In Switzerland it grows abundantly in damp pastures and is dangerous to cattle.

Ezov, the hyssop of the Bible, a wall-growing plant used in ritual cleansing of lepers, is not *Hyssopus officinalis*, which is alien to Palestine; it may have been a species of caper or savory.

Consult the INDEX *first*

Hystaspes (Greek), Old Persian VISHTASPA, name of ancient Persian rulers, grouped below chronologically and indicated by the symbol •.



• **Hystaspes,** also called GUSHTASP (fl. 7th and 6th centuries BC), protector and follower of the Iranian prophet Zoroaster. Son of Aurvataspa (Lohrasp) of the Naotara family, Hystaspes was a local ruler (*kavi*) in a country called in the Avesta (the Zoroastrian scripture) Aryana Vaejah, which may have been a Greater Chorasmian state abolished by the Achaemenid king Cyrus II the Great in the mid-6th century BC.

• **Hystaspes** (fl. late 6th century BC), son of Arsames, king of Parsa, and father of the Achaemenid king Darius I of Persia.

According to the 5th-century-BC Greek historian Herodotus, Hystaspes was governor of Persis under Cyrus II the Great and Cambyses II and accompanied Cyrus on his last campaign against the Massagetai in 530 BC. When Darius seized the throne in 522, Hystaspes was governor of Parthia and Hyrcania, where he suppressed a revolt in 521. Despite the differences in genealogies, some authorities identify him with Hystaspes, the protector of the prophet Zoroaster.

hysterectomy, surgical removal of the complete uterus (total hysterectomy) or of the complete uterus except for the cervix (subtotal hysterectomy). The cervix is the outermost portion of the uterus, which projects into the vagina. Removal of the uterus is indicated in a number of abnormal situations, including the presence of a cancer or of a benign tumour of the type called myoma, or fibroid tumour, if the myoma is large or rapidly growing, causes excessive bleeding or discomfort, or seems to be breaking down. Hysterectomy may also be performed after cesarean section—delivery of an infant through the abdominal wall—if there are such complications as uncontrolled bleeding, gross infection, or cancer of the cervix.

hysteresis, lagging of the magnetization of a ferromagnetic material, such as iron, behind variations of the magnetizing field. When ferromagnetic materials are placed within a coil of wire carrying an electric current, the magnetizing field, or magnetic field strength *H*,

Magnetic hysteresis loop

From R.T. Weidner and R.L. Sells, *Elementary Classical Physics* (1965); Allyn and Bacon Publishing Company

caused by the current forces some or all of the atomic magnets in the material to align with the field. The net effect of this alignment is to increase the total magnetic field, or magnetic flux density *B*. The aligning process does not occur simultaneously or in step with the magnetizing field but lags behind it.

If the intensity of the magnetizing field is gradually increased, the magnetic flux density *B* rises to a maximum, or saturation, value at which all of the atomic magnets are aligned in the same direction. When the magnetizing field is diminished, the magnetic flux density decreases, again lagging behind the change in field strength *H*. In fact, when *H* has decreased to zero, *B* still has a positive value called the remanence, residual induction, or retentivity, which has a high value for permanent magnets. *B* itself does not become zero until *H* has reached a negative value. The value of *H* for which *B* is zero is called the coercive force. A further increase in *H* (in the negative direction) causes the flux density to reverse and finally to reach saturation again, when all the atomic magnets are completely aligned in the opposite direction. The cycle may be continued so that the graph of the flux density lagging behind the field strength appears as a complete loop, known as a hysteresis loop. The energy lost as heat, which is known as the hysteresis loss, in reversing the magnetization of the material is proportional to the area of the hysteresis loop. Therefore, cores of transformers are made of materials with narrow hysteresis loops so that little energy will be wasted in the form of heat.

hysteria, a type of psychiatric disorder in which a wide variety of sensory, motor, or psychic disturbances may occur. It is traditionally classified as one of the psychoneuroses and is not dependent upon any known organic or structural pathology. The term is derived from the Greek *hystera,* meaning "uterus," and reflects the ancient notion that hysteria was a specifically female disorder resulting from disturbances in uterine functions. Actually, hysterical symptoms may develop in either sex and may occur in children and elderly people, although they are observed most commonly in early adult life.

Hysteria, in its clinically pure form, seems to occur more often among the psychologically naive than among sophisticated persons. Hysterias tend to be more common among persons in the lower ranges of intelligence than among those in the higher ranges. The incidence of hysteria appears to have been diminishing over the years in many areas of the world, probably because of cultural factors such as increasing psychological sophistication, diminishing sexual prudery and inhibition, and a less authoritarian family structure. Cases of classical hysteria, such as those frequently described by 19th-century clinicians, have become rare. Most psychoneuroses encountered in actual clinical practice are apt to be "mixed" forms in which hysterical symptoms may be found interspersed with other varieties of neurotic disturbances. Isolated hysterical symptoms may also occur in conjunction with psychotic disorders.

The sensory and motor manifestations of hysteria take many forms and are designated conversion reactions because the underlying anxiety is assumed to have been "converted" into a physical symptom. Sensory disturbances may range from paresthesias ("peculiar" sensations) through hyperesthesias (hypersensitivity) to complete anesthesias (loss of sensation). They may involve the total skin area or any fraction of it, but the disturbances generally do not follow any anatomic distribution of the nervous system. In medieval times in Europe and as late as the end of the 17th century, the finding of such discrete areas of anesthesia on the body of a person was considered proof that the person was a witch. Other hysterical sensory disturbances may encompass the special senses of vision, hearing, taste, or smell; or they may involve the experiencing of severe pain for which no organic cause can be determined.

Motor symptoms vary from complete paralysis to tremors, tics, contractures, or convulsions (hystero-epilepsy). In each instance neurological examination of the affected part of the body reveals an intact neuromuscular apparatus with normal reflexes and normal electrical activity and responses to electrical stimulation. Other motor disturbances that are at times hysterical in origin are loss of speech (aphonia), coughing, nausea, vomiting, or hiccuping.

Psychic symptoms may be equally varied and are usually classified under the broad heading of dissociative reactions. Attacks of amnesia, in which the person is unable to remember who he is or anything about himself, are among the more striking of these. Sleepwalking (somnambulism) is also considered to be a hysterical dissociative reaction, as are also the occasional dramatic cases of multiple personality.

hystero-epilepsy, hysterical seizures that resemble epilepsy and, in diagnosis, must be distinguished from it. In hystero-epilepsy the reflexes and responses to stimulation in the part of the body affected are normal, and the electroencephalogram shows no significant abnormality in the brain waves. Usually the person affected can be roused by painful stimuli and is never completely unconscious. The convulsion usually takes place when others are present, and, in contrast to epileptic episodes, the person affected rarely injures himself or is incontinent. *See also* epilepsy.

Hythe, town ("parish"), Shepway district, county of Kent, England, on the English Channel coast at the eastern end of Romney Marsh and on the Royal Military Canal. (The canal was built as a defensive moat when Napoleon threatened invasion of Britain.) The old town lies on the hillside inland from the canal, and the modern town, a seaside resort, lies between the canal and the coast. When the mouth of the River Rother was blocked and diverted eastward by shingle, the medieval port of Hythe replaced the Roman Portus Lemanis, where Lympne and West Hythe now stand, 2 miles (3 km) west of Hythe. Lympne Church has a Norman tower built with Roman material. Hythe ("Landing Place") was

a port already in Saxon times, and its royal charter of 1205 confirmed earlier privileges. The port flourished for a time as one of the original Cinque Ports (*q.v.*), but it declined as the shingle drift encroached further. The town also suffered from French raids. Pop. (1981 prelim.) 12,723.

Hyundai Group, major diversified corporation in South Korea. The international company supplies a product line that ranges from ships to stereo equipment. Headquarters are in Seoul.

Hyundai began as a construction firm founded by Chung Ju Yung in 1947. The company operated within South Korea until 1965, when it initiated a road building project in Thailand that marked the beginning of its growth into a multinational conglomerate.

In the firm's first move outside the construction field, Hyundai in 1967 formed Hyundai Motor Company, which grew to become the country's largest producer of automobiles. It exports cars and trucks throughout the Far East. The company moved into the shipbuilding market in 1973 with the formation of Hyundai Heavy Industries, which produces a variety of vessels, ranging from custom yachts to supertankers. The Hyundai Group also includes divisions that build and export diesel and electric locomotives, freight cars, and passenger coaches for the railroad industry, and offshore drilling and extraction equipment to the oil industry.

International exports range from heavy industrial equipment to consumer products, and include cement, pianos, military uniforms, and consumer electronics products. Hyundai is represented on all continents but Australia, and has a number of international subsidiaries under its control.

Hyvinkää, Swedish HYVINGE, city, Uudenmaan *lääni* (Uusimaa province), southern Finland, north of Helsinki. It is the centre of Finland's woollen industry, and is an important rail junction with direct lines to the ports of Hangö (Hanko, the southernmost in Finland), Helsinki, and Porvoo (Borgå). The city also has railway workshops, a granite quarry, and a rubber-products plant. Because of its fine climate and timbered surroundings, Hyvinkää has become a winter resort and health spa popular among the inhabitants of Helsinki, 35 mi (55 km) south. Pop. (1983 est.) mun., 37,965.

Hywel AB OWAIN GWYNEDD (d. 1170), Welsh warrior-prince and lyric poet whose eight extant compositions include the only love poems found in the works of the early Welsh court poets. Also included among the eight are poems expressing love of country, perhaps the first such works in Welsh literature. The son of Owain Gwynedd, Hywel played a major part in the occupation of Ceredigion (Cardiganshire) by the house of Gwynedd (*c.* 1153). He probably died in battle against his half brothers near Pentraeth, Anglesey; he was buried at Bangor, Wales.

Hywell THE GOOD (Welsh king): *see* Howel Dda.

I Am movement, religious movement in the United States that taught that the Mighty I Am is the source of power and of all things necessary for everyone. It was begun in the 1930s by Guy Ballard (1878–1939), a mining engineer, and his wife, Edna (1886–1971). The name of the movement came from the Bible verse (Exodus 3:14) in which God replies to Moses, "I am who I am."

Although not consistent in their teachings, the Ballards essentially taught that the power of the Mighty I Am was available to individuals through many Ascended Masters, the principal ones being Jesus and St. Germain. The Ascended Masters spoke through their special representatives on earth, the Accredited Messengers, who were Edna and Guy Ballard and their son, Donald.

Guy Ballard's professed first meeting with St. Germain, said to have taken place in 1930 at Mount Shasta in northern California, was recounted in Ballard's book, *Unveiled Mysteries* (1934). St. Germain was said to have lived on earth and been reincarnated several times before reaching the desired state of an Ascended Master. He had been Samuel in the Old Testament, Francis Bacon of England, and, apparently, the Count de St. Germain, an 18th-century Frenchman who was involved in politics and interested in the occult. According to Ballard, St. Germain took him backward in time and revealed many of Ballard's previous lives (he had been George Washington) and those of his wife and son. Ballard was introduced to many mysteries, and it was revealed to him how the Ascended Masters would work through the Accredited Messengers on earth.

Unveiled Mysteries was sold extensively throughout the United States. In 1934 the Ballards began holding classes in Chicago in which messages were given through the Ballards from the Ascended Masters. The Ballards began traveling to other cities to conduct classes and meetings. In the early part of the movement their religious presentations and life-style were quite simple, but as the movement gained followers and financial success, more elaborate meetings were developed. During the most successful period, in 1938, the movement was estimated to have from 1,000,000 to 3,000,000 members, but no official statistics were available. It was true, however, that thousands of people filled the largest auditoriums in the large cities of the United States to see and hear the Ballards. Local organizations were formed to carry on the movement, and a monthly periodical, *The Voice of the I Am,* was published. Headquarters were in Chicago.

The Ballards were increasingly criticized by the press and were accused of fraud. In 1939 Guy Ballard announced that he had been instructed by St. Germain to suspend all public meetings. In the future, meetings and classes were to be open only to those accepted into the movement.

A major reversal occurred when Guy Ballard died on Dec. 29, 1939. Mrs. Ballard had his body cremated and on Jan. 1, 1940, announced in a class that Ballard had ascended and was now an Ascended Master. News of his death, however, led many followers to leave the movement, since the Ballards had taught that the ascension, the liberation forever from the physical body and from reincarnation, would come without the experience of physical death. Edna Ballard carried on as leader of the movement and often reported messages from her late husband.

Another crisis occurred in 1940 when Edna, Donald, and several other leaders in the movement were indicted for fraudulently obtaining money from believers by deceptive means. The trial, long and sensational, led to the conviction of Edna and Donald on several counts. After various appeals, the U.S. Supreme Court in 1946 set aside the indictment because of a technicality. The use of the mails, however, was denied to the Ballards. The vitality of the movement declined, but at the time of Mrs. Ballard's death in 1971 there were still some faithful followers.

I-ch'ang, Pinyin YICHANG, city in western Hupeh *sheng* (province), China. I-ch'ang stands on the left bank of the middle Yangtze River, immediately below the entrance to the magnificent gorges of the Ta-pa Mountains to the west, and has a harbour formed by the small island of Hsia-pa. The level of the river, which has a violent current, varies enormously—sometimes by as much as 50 feet (15 m) between high and low water. Despite these drawbacks I-ch'ang has always been an important river port, much of the traffic from Szechwan province being transshipped onto larger vessels there.

I-ch'ang is an ancient city, which underwent many changes of name, and was constantly disputed during periods when China was politically divided, being the key gateway to the rich province of Szechwan. Until the 17th century it was usually known either as I-ling Chün or as Shan Chou. It received the name I-ch'ang only under the Ch'ing dynasty (1644–1911). It was opened to foreign trade as a treaty port in 1877. A Western quarter then grew up alongside the ancient walled city, and its trade grew rapidly; many Western commercial firms established branches there.

In 1914 the first section of a railway from I-ch'ang to Chungking (Ch'ung-ch'ing) was laid as part of a projected line from Han-k'ou to Chungking, but the project was abandoned in the political chaos of the day, and the track was torn up in 1915. I-ch'ang is connected by a spur to a line that runs from Hsiang-fan to I-tu, about 15 miles (25 km) to the southeast on the Yangtze. In the 1930s, I-ch'ang also became an air service stop on the route from the coast to Szechwan, and roads were built to provide good local communications. After 1938, during the Sino-Japanese War (1937–45), when the Japanese began to drive up the Yangtze from Han-k'ou, I-ch'ang was badly damaged by repeated bombing and eventually fell to the Japanese army in 1940. I-ch'ang was as far as the Japanese got, and until 1945 its commerce virtually was at a standstill. Not until the 1950s did shipping begin to recover.

Although it is the collecting and distribution centre for the commerce of the surrounding counties, and although it is on a highway running from Han-k'ou into Szechwan, most of its trade still consists of the transshipment of rice, oils, timber, and natural products from Szechwan and the transshipment of manufactured goods from the north and from the coastal provinces destined for Szechwan. Before World War II it had only a few small rice mills and some engineering facilities connected with shipping. After 1949, however, it was fairly extensively industrialized. The city now has flour, textile, and paper mills, oil-extraction plants, and a chemical industry producing industrial chemicals, fertilizers, and pharmaceuticals. The shipyards have also been rebuilt. Pop. (1988 est.) 353,000.

I Ching, also spelled YI CHING, Pinyin YI JING (Chinese: "Classic of Changes," or "Book of Changes"), an ancient Chinese text, one of the Five Classics (*Wu Ching*) of Confucianism. The main body of the work has traditionally been attributed to Wen Wang (fl. 12th century BC), sage and father of the founder of the Chou dynasty, and contains a discussion of the divinatory system used by the Chou dynasty wizards. A supplementary section of "commentaries" is believed to be the work of authors of the Warring States period (475–221 BC) and, as a philosophical exposition, represents an attempt to explain the world and its ethical principles, applying a largely dialectic method. For this the work came to have great importance in the history of Chinese philosophy. Modern scholars, nevertheless, have been troubled by the inclusion of the *I Ching* among the Confucian classics, for Confucius (551–479 BC) seems to have deliberately avoided speaking of anything that suggested esoteric doctrines. The answer seems to be that Han dynasty Confucianists (*c.* 2nd century BC), influenced by the Taoist quest for immortality, justified their use of *I Ching* by attributing certain of its commentaries to Confucius. It was then a natural step to include the book among the Five Classics of antiquity.

Though the book was originally used for divination, its influence on Chinese minds and its universal popularity are due to a system of cosmology that involves humans and nature in a single system. The uniqueness of the *I Ching* consists in its presentation of 64 symbolic hexagrams that, if properly understood and interpreted, are said to contain profound meanings applicable to daily life. Throughout the ages, *I Ching* enthusiasts have claimed that the book is a means of understanding, and even controlling, future events.

The *I Ching* hexagrams are formed by joining in pairs, one above the other, eight basic trigrams (*pa kua*). Each trigram has a name, a root meaning, and a symbolic meaning. The legendary emperor Fu Hsi (24th century BC) is said to have discovered these trigrams on the back of a tortoise. Wen Wang is generally credited with having formed the hexagrams.

In practice, one "creates" a hexagram by casting lots in one of several ways. The hexagram is built up from the bottom, line by line, by successive lots. Solid lines have the number nine, broken lines have the number six. Solid lines represent *yang* (the male cosmic principle), while broken lines represent *yin* (the female cosmic principle). These two principles explain all being and all change by their ceaseless interaction.

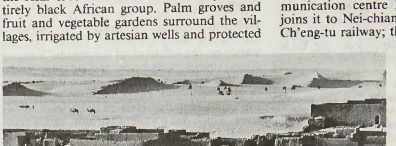
Individual lines of a hexagram have been compared to single notes of music. Though each note has a quality and significance in itself, its truest significance depends on its place in a musical score. Because the same principle applies to individual lines of a hexagram, the *I Ching* text first explains each line separately, then gives an overall interpretation of the unit. The text is often expressed in cryptic, thought-provoking language, thus allowing the user great leeway in interpreting its significance.

I-ch'un, Pinyin YICHUN, city, central Heilungkiang *sheng* (province), China. I-ch'un is situated in the densely forested area of the Hsiao hsing-an (Lesser Khingan) Range, at the intersection of the I-ch'un River, from which it takes its name, and the T'ang-wang, a tributary of the Sungari River. Until 1949 it was a minor market town under T'ang-yuan *hsien* (county). Since 1949 it has grown at an astonishing rate as a major centre of the lumber industry. It is situated in the mountains among virgin forests, and at first its population had to be supported by importing foodstuffs; only in the late 1950s did local agriculture begin to develop. Almost the entire industrial output of the city consists of timber and timber products. Pop. (1988 est.) 770,000.

I-go (board game): *see* Go.

I-hsin (Chinese prince): *see* Kung Ch'in-wang.

I-lan, *hsien* (county), northeastern Taiwan, occupying an area of 825 square miles (2,137 square km) and bordered by the *hsien* of T'ai-pei (north), T'ao-yüan and Hsin-chu (west), and T'ai-chung and Hua-lien (south) and by the Philippine Sea (east). The Chung-yang Mountains extend over the southern part, and the Hsüeh-shan Mountains border the northwestern part of I-lan *hsien.* In the northeast, the I-lan River has formed a fertile triangular basin, where paddy rice, sugarcane, peanuts



(groundnuts), and sweet potatoes are grown. Sulfur, manganese, mica, copper, talc, marble, and iron ore are worked or mined. The major industries include rice, sugar, and sawmilling; fish processing; and fertilizer, cement, chemical, and paper manufacturing. T'ai-p'ing Mountain, in the south-central part of the county, is one of the biggest logging stations in Taiwan; it is also a major tourist resort. The *hsien* produces much of the *pan-ya* (smoked and salted ducks) in Taiwan. Su-ao, an important harbour on Taiwan's eastern coast, is connected by railway with the cities of Hualien to the south and Chi-lung (Keelung) to the north; the harbour is also connected by the Lang-yang Tunnel to the Lung-te Industrial District, site of export-import industries. I-lan city is the administrative seat. Pop. (1992 est.) 454,010.

I-lan, *shih* (municipality) and seat of I-lan *hsien* (county), northeastern Taiwan, the centre of the only sizable alluvial basin on the island's mountainous eastern coast. The basin itself was largely formed as the delta of the Cho-Shui River and is about 30 miles (50 km) from north to south. I-lan city lies in the centre of this plain on the Lan River. The plain is a fertile rice-producing region, and I-lan is a major rice market. A railway connects the city with Chi-lung (Keelung) and Taipei to the north and also runs southward to Su-ao, Hualien, and T'ai-tung. The I-lan area was largely settled by Chinese. There is some minor industry, mainly papermaking (using wood from the forests in the surrounding mountains) and the manufacture of fertilizers. Pop. (1989 est.) 86,580.

I li (Chinese: "Ceremonies and Rituals"), Pinyin YI LI, collection of Chinese rituals probably compiled during Western Han times (206 BC–AD 8) and listed, along with two other ritual texts (*Li chi,* "Collection of Rituals"; *Chou li,* "Rites of Chou"), among the Nine, Twelve, and Thirteen Classics of Confucianism. Its subject matter is somewhat different from the other ritual classics in that it gives special emphasis to such events as weddings, funerals, religious sacrifices, festivals, and official audiences.

I-li River, I-li also spelled ILI, Chinese (Wade-Giles) I-LI HO, or (Pinyin) YILI HE, river in western Sinkiang Uighur autonomous *ch'ü* (region), China. It is 870 miles (1,400 km) long and drains the basin between the Tien Shan ("Celestial Mountains") to the south and the P'o-lo-k'o-nu Mountains to the north. Both ranges are extremely high. The drainage basin of the I-li and its principal tributaries—the K'a-shih, K'ung-chi-ssu, and T'e-k'o-ssu rivers—is rugged and mountainous, the axes of the mountain systems running approximately west-east. Just within the Chinese frontier the valley broadens out to form a fertile plain around I-ning (Kuldja). The I-li River flows westward into Kazakhstan, to the north of Alma-Ata, and eventually discharges into Lake Balkhash. The I-li valley is much wetter than most of Chinese Central Asia and has a large settled farming population, predominantly engaged in cultivating wheat. The uplands support flocks of sheep, goats, and horses.

I-n-Salah, also spelled AÏN SALAH, oasis town, central Algeria, on the southern edge of the arid Tademaït Plateau. At the crossing of ancient trans-Saharan caravan routes, it was once an important trade link between northern and central Africa but has declined in modern times owing to high transportation costs and the exodus of workers to the developing gas fields 60 miles (100 km) southwest. Mainly visited by the nomadic Tuareg, it remains dependent upon the exportation of dates. The oasis has four red or violet clay brick *ksars* (walled villages), each with a citadel. Of these, the Ksar el-Arab oasis is inhabited by an entirely black African group. Palm groves and fruit and vegetable gardens surround the villages, irrigated by artesian wells and protected

Ksar (walled village) at I-n-Salah, Algeria
Victor Englebert—De Wys, Inc.

by hedges from the encroaching sand. Southwest of I-n-Salah (meaning "good well") are two *sebkhas* (large, enclosed basins), fed in the winter by underground drainage. Pop. (1987 prelim.) 20,733.

I-ning (China): *see* Kuldja.

I novel, Japanese WATAKUSHI SHŌSETSU, or SHISHŌSETSU, form or genre of 20th-century Japanese literature that is characterized by self-revealing narration, with the author usually as the central character.

The I novel grew out of the naturalist movement that dominated Japanese literature during the early decades of the 20th century. The term is used to describe two different types of novel, the confessional novel (characterized by prolonged, often self-abasing, revelation) and the "mental attitude" novel (in which the writer probes innermost thoughts or attitudes toward everyday events in life). Notable I novelists include Kasai Zenzō, Uno Kōji, Kamura Isota, Amino Kiku, Takii Kōsaku, and Ozaki Kazuo.

I-pin, Pinyin YIBIN, city in southern Szechwan *sheng* (province), China. It is situated at the junction of the Min and the Yangtze rivers at the southwestern corner of the Szechwan Basin. Above I-pin the Yangtze is called the Chin-sha River. Junk traffic can reach Le-shan, to the north on the Min, and P'ing-shan, to the south on the Chin-sha, and there is heavy river traffic with Ch'ung-ch'ing (Chungking) downstream. It has traditionally also been a staging post of the main route from Ch'eng-tu to K'un-ming in Yunnan province and a commercial and collecting centre for goods from northern Yunnan and southwestern Szechwan. The city stands in a good defensive position on a high bluff above the river.

A county administration was set up there in the 2nd century BC, and it first received the name I-pin in 742. Until the Sung dynasty (960–1279) the minor frontier prefecture there was called Jung, but, with the rapid expansion of Szechwan in Sung times, it grew rapidly, receiving its modern county name and becoming the seat of the prefecture of Hsü. In Ming (1368–1644) and Ch'ing (1644–1911) times, it became Hsü-chou's superior prefecture, known to Europeans as Suifu. In 1912 it reverted to the status of a county as I-pin. In 1913 steamship communication with Ch'ung-ch'ing was opened, and it subsequently grew into a major collection and distribution centre dependent upon Ch'ung-ch'ing. Its commercial development progressed during World War II, when there was an influx of eastern merchants; some industry was also founded.

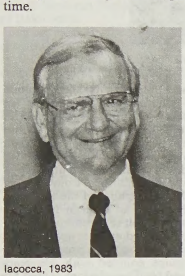
From 1949 I-pin's importance as a communication centre has increased. A railway joins it to Nei-chiang, on the Ch'ung-ch'ing–Ch'eng-tu railway; the highways of the region have also been improved. Industry has been greatly expanded. The area has been known at least since the 7th century AD as a source of subterranean salt, which now supplies a large chemical plant. There is also a large paper mill. Pop. (1990) 241,019.

I-Thou, theological doctrine of the full, direct, mutual relation between beings, as conceived by Martin Buber and some other 20th-century philosophers. The basic and purest form of this relation is that between man and God (the Eternal Thou), which is the model for and makes possible I-Thou relations between human beings. The relation between man and God, however, is always an I-Thou one, whereas that between man and man is very frequently an I-It one, in which the other being is treated as an object of thought or action. According to Buber, man's relation to other creatures may sometimes approach or even enter the I-Thou realm. Buber's book *Ich und Du* (1923; *I and Thou*) is the classic work on the subject.

I-ti (Chinese emperor): *see* T'ung-chih.

I-ti (Chinese emperor): *see* Cheng-te.

I-tsung (Chinese emperor): *see* Ch'ung-chen.



I-yang, Pinyin YIYANG, city, northern Hunan *sheng* (province), China. The city is situated approximately 47 miles (75 km) northwest of Ch'ang-sha on the Tzu River, to the south of Lake Tung-t'ing, on the main highway from Ch'ang-sha to Ch'ang-te. An ancient county, it was established in the 2nd century BC. Its seat was originally sited northeast of the present city, but it moved in T'ang (618–907) times. From 589 it was a county subordinate to Ch'ang-sha. Briefly an independent prefecture under the name T'ing in Sung times (960–1279), it again had that status under Mongol rule (1279–1368). In 1368, however, it again became a subordinate county under Ch'ang-sha. It has traditionally been a collecting centre for agricultural and other products from the Tzu Shui Basin, and until recent times most of its population engaged in the transport of timber, coal, mineral ores, and grain. A long-established handicraft tradition was mostly based on local wood and bamboo. In recent years I-yang has also developed industrially, producing iron and steel, as well as electrical equipment. Pop. (1990) 185,818.

IAAF: *see* International Amateur Athletic Federation.

Iacchus, also spelled IAKCHOS, minor deity associated with the Eleusinian Mysteries, the

best known of the ancient Greek mystery religions. On the day preceding the commencement of the mysteries, Iacchus' name was invoked with the names of the earth goddess Demeter and her daughter Kore (Persephone) during the procession from Athens to Eleusis, a city in Attica. Probably originally a personification of the ritual invocation (*Iakch' ō Iakche*), Iacchus was variously identified. According to some sources he was synonymous with Bacchus (a title of the wine god Dionysus), whose name was similar to his. Iacchus was also regarded as the son of Zeus and Demeter (or sometimes as her consort) and differentiated from the Theban Bacchus (Dionysus), who was the son of Zeus and Semele. Still other traditions identified Iacchus as the son of Kore or of Dionysus. In art Iacchus was portrayed holding a torch and leading the celebrants.

Iacocca, Lee, byname of LIDO ANTHONY IACOCCA (b. Oct. 15, 1924, Allentown, Pa., U.S.), American automobile executive who, as president and chairman of the board of the foundering Chrysler Corporation, secured the largest amount of federal financial assistance ever given to a private corporation at that time.

Iacocca, 1983
UPI/Bettmann

The son of an Italian immigrant, Iacocca graduated from Lehigh University, Bethlehem, Pa., in 1945 and received a master's degree in engineering from Princeton University in 1946. Hired as an engineer by the Ford Motor Company, he quickly proved that he was better suited for sales. By 1960 he had become general manager of the Ford division and a vice-president of the company. Iacocca's increasing influence at Ford was hastened by his successful promotion of the sporty yet inexpensive Mustang. He was named president of Ford in 1970, but his brash, unorthodox manner led to his dismissal in 1978.

The following year Iacocca was hired by the Chrysler Corporation, which, having accumulated a huge inventory of low-mileage cars at a time of rising fuel prices, faced bankruptcy. Iacocca appealed to the federal government for aid, gambling that it would not allow Chrysler to fail when the national economy was already depressed. Although his request sparked intense debate over the role of government in a market economy, Congress in 1980 agreed to guarantee $1,500,000,000 in loans if the company could raise another $2,000,000,000 on its own. Iacocca responded by finding new sources of credit and by trimming operations, closing plants, and persuading labour unions to accept layoffs and wage cuts. He then shifted the company's emphasis to fuel-efficient models and undertook an aggressive advertising campaign that included personal appearances on television commercials. By 1981 Chrysler showed a small profit, and three years later it announced record profits of more than $2,400,000,000. Iacocca became a national celebrity. His autobiography, *Iacocca* (1984), and a second book, *Talking Straight* (1988), were best-sellers. Iacocca retired as Chrysler's chief executive in 1992.

iamb, metrical foot consisting of one unstressed syllable (as in classical verse) or one unstressed syllable (as in English verse) followed by one long or stressed syllable, as in the word ◡ ′ be|cause. Considered by the ancient Greeks to approximate the natural rhythm of speech, iambic metres were used extensively for dramatic dialogue, invective, satire, and fables. Also suited to the cadence of the English language, iambic rhythms, especially iambic tetrameter and pentameter, are the preeminent metres of English verse. Substitution of other types of feet to add variety is common in basically iambic verse. An example of iambic metre is the English ballad, composed of quatrains written in alternating lines of iambic tetrameter and iambic trimeter. For example:

◡ ′ ◡ ′ ◡ ′ ◡ ′
There lived|a wife|at Ush|er's Well,
◡ ′ ◡ ′ ◡ ′
And a weal|thy wife|was she:
◡ ′ ◡ ′ ◡ ′ ◡ ′
She had|three stout|and stal|wart sons,
◡ ′ ◡ ′ ◡ ′
And sent|them o'er|the sea.

Iamblichus (b. *c.* AD 250, Chalcis, Coele Syria [now in Lebanon]—d. *c.* 330), Syrian philosopher, a major figure in the philosophical school of Neoplatonism and the founder of its Syrian branch.

Though only his minor philosophical works have survived, the basic elements of Iamblichus' system can be understood from the references to his teachings in the writings of the 5th-century philosopher Proclus. He wrote, in Greek, the treatise known under the Latin name *De Mysteriis* (*On the Egyptian Mysteries,* 1821). His other works include: *On the Pythagorean Life; The Exhortation to Philosophy,* or *Protrepticus; On the General Science of Mathematics; On the Arithmetic of Nicomachus;* and *Theological Principles of Arithmetic.*

Iamblichus, more than any other single philosopher, has generally been credited with the transformation of the Neoplatonism advocated by Plotinus earlier in the 3rd century into the stiff and complicated, yet often profound, pagan religious philosophy, best known from the works of Proclus. Attempting to develop a theology encompassing all of the rites, myths, and divinities of syncretistic paganism, he was the first Neoplatonist to displace Plotinus' purely spiritual and intellectual mysticism in favour of theurgy, the magical conjuration of the gods. Beyond the One of Plotinus, identical with the Good, Iamblichus asserted that a higher One exists outside the range of human knowledge and qualifications. To the three existing ethical virtues of Neoplatonism—political, purifying, and exemplary—he added the contemplative virtue and placed above all four the priestly, or unifying, virtues by which men obtain ecstatic union with the One. For his stress on theurgy and his elevation of the nonintellectual virtues, Iamblichus was known for the next two centuries as "the divine," or "inspired."

Iangiiul (Uzbekistan): *see* Yangiyul.

Iao, valley, Maui county, northwestern Maui Island, Hawaii, U.S., on the eastern slope of Puu Kukui Mountain. Formed by erosion of the caldera whose volcano created the island's western peninsula. the valley comprises a deep, narrow gorge 5 miles (8 km) long and flanked by heavily forested walls almost a mile in height. Iao Needle, a volcanic monolith 2,250 feet (686 m) high, soars nearly straight up from the valley floor. A bronze tablet at its base commemorates the bloody 1790 battle of Kepaniwai (meaning "dammed stream," referring to the blockage of the torrent by the bodies of Maui warriors), which added Maui to the kingdom of Kamehameha the Great.

Kepaniwai Park and Heritage Gardens, near the valley entrance and Wailuku, has landscaped gardens representing Hawaii's various cultures. Iao Stream is dammed there to provide wading and swimming pools.

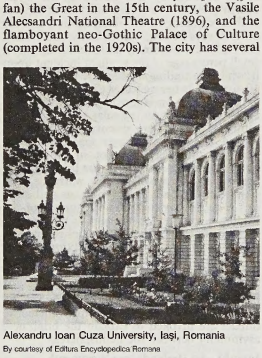
A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Iapetus, exterior moon in the Saturn system, extraordinary because of its surface markings. Discovered by Gian Domenico Cassini in 1671, Iapetus orbits Saturn once every 79.33 Earth days at a distance of 3,561,000 km (2,212,800 miles). The satellite's radius and mass are, respectively, 730 ± 10 km (454 ± 6 miles) and $1.88 \pm 0.12 \times 10^{24}$ grams, implying a bulk density of 1.16 ± 0.09 grams per cubic centimetre. A solid object with so low a density must be composed mainly of ices. The period of rotation of Iapetus is observed to equal its period of revolution, as is the case with the Earth's Moon, and for the same reason—namely, tides exerted on the solid body of the satellite by the gravity of the larger nearby planet. As a result, one face of Iapetus is always leading in its orbital motion and the other always trailing. Remarkably, the leading hemisphere is extremely dark, reflecting only a small percentage of the sunlight incident upon it, while the trailing hemisphere is as much as 10 times a better reflector. This corresponds to the greatest variation in brightness across any object known in the solar system.

Impact craters were discovered during the early 1980s by the Voyager spacecraft in the trailing hemisphere but not in the leading one. The surface material in the bright trailing hemisphere is almost certainly water ice, possibly with an admixture of methane and other ices. The dark material at the surface of the leading hemisphere is thought to be complex organic molecules, perhaps supplied by Saturn's outermost satellite, Phoebe, or produced *in situ* by solar ultraviolet irradiation of the methane component of the ice. In the latter case, the rapid evaporation of methane ice and ballistic transport of material from the leading to the trailing hemisphere by micrometeorite impact are invoked to explain the brightness asymmetry between the hemispheres.

Iarmhí, An (Ireland): *see* Westmeath.

Iaşi, *judeţ* (county), northeastern Romania, occupying an area of 2,112 square miles (5,469 square km), and bounded on the east by Moldova. The southward-flowing Prut River marks the county's eastern border with Moldova, and the Siret River drains the hilly terrain of the county to the south. Iaşi county was a part of feudal Moldavia. Iaşi city is the county seat and has chemical, textile, and food industries. Building materials are produced in Ciurea and Hîrlău, and machinery factories operate in Paşcani. The county's agricultural activities consist of cereal cultivation and livestock raising. Ciric, located north of Iaşi, is a boating resort. A fortified monastery, situated south of Iaşi city, was founded by Prince Duca in 1672. Răducăneni, Mădîrjac, and Şipote are other towns. Birnova Forest and the natural monument of Repédea Hill, containing fossiliferous rocks, are notable features of the area. A university and several technical and professional institutes are found in Iaşi. Highways and railway connections extend through Iaşi, Tîrgu Fru-



mos, and Paşcani. An airport is located near Iaşi city. Pop. (2002) 819,044.

Iaşi, German JASSY, city, capital of Iaşi *judeţ* (district), northeastern Romania. It is situated on the Bahlui River near its confluence with the Prut, in the Moldavian plain, 8 mi (13 km) west of the border with Moldova and 200 mi northeast of Bucharest.

There were recognizable settlements at the site in the 7th century. The town received its German name (perhaps from the Cuman *jagers,* or bowmen) in the late 14th and early 15th centuries, when it became a fortified customs post on the trade routes along the Prut Valley. In the mid-15th century it became a residence of the prince of Moldavia. From 1564 to 1859, before the union of the Romanian principalities, it was the capital of Moldavia.

Iaşi was sacked several times by Turks, Tatars, and Poles, was burned to the ground on one occasion, and suffered a plague in 1734; but it endured as a cultural and economic centre. In 1640, Prince Vasile Lupu established a school and set up a printing press in the Byzantine church of the Trei Ierarhi (Three Hierarchs), built 1635–39, from which the first book printed in Moldavia was issued.

Other historical buildings include the Alexandru Ioan Cuza University (founded 1860), the church of St. Nicholas built by Stephen (Ştefan) the Great in the 15th century, the Vasile Alecsandri National Theatre (1896), and the flamboyant neo-Gothic Palace of Culture (completed in the 1920s). The city has several

Alexandru Ioan Cuza University, Iaşi, Romania

educational and research institutes and a branch of the Academy of Romania. It has good road and rail connections and an expanding industry, including chemicals, pharmaceuticals, plastics, and textiles. Pop. (2002) 321,580.

Iasion, also called IASIOS, in Greek mythology, Cretan youth loved by Demeter, the corn goddess, who lay with him in a fallow field that had been thrice plowed. Their son was Plutus (*q.v.*), the wealth within the soil. According to another version, Iasion attempted to ravish the goddess and was struck by lightning hurled by Zeus. Iasion perhaps originated as an ancient agricultural deity associated with a fertility rite. *See also* Demeter.

Ibadan, capital city of Oyo state, Nigeria, located on seven hills (average elevation 700 ft [200 m]), 100 mi (160 km) from the Atlantic coast. It is the nation's second largest city (after Lagos).

Ibadan's beginnings are shrouded in mystery; they were recorded only in oral tradition. It is said that the earliest group of settlers at Ibadan were fugitives from justice who were expelled from nearby villages. This small group later swelled with the arrival of immigrants from all over Yorubaland (now western Nigeria).

Recorded history begins in 1829, after the region had been convulsed by extended intertribal wars. In that year, the victorious armies of the Ife, Ijebu, and Oyo kingdoms camped at Ibadan and formed the nucleus of the modern city. The British colonial government assumed control of the city in 1893. After the railway arrived from Lagos (1901), the line was extended northward to Kano (1912), thus ensuring the city's continuing economic importance.

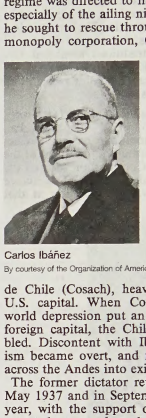
The economic activities of Ibadan include agriculture, commerce, handcrafts, manufacturing, and service industries. Although the city's farming population is still large for an urban area, it has declined. Many cultivators are part-time farmers who augment their earnings with other work.

Ibadan is also an important commercial centre. Virtually every street and corner in the traditional core and the inner suburbs of the city is a market square or stall. Within the city there are two eight-day periodic markets—Ibuko (Bode) and Oje—and many daily markets. The largest daily market stretches in a belt from the railway station in the west to the centre of the city and is Ibadan's commercial core.

Some local crafts still flourish. These include weaving, spinning and dyeing, pottery making, and blacksmithing. The *adire* ("tie-dye") cloth dyed locally in large pots of indigo is popular. The small businesses in the city engage in corn milling, leather working, wood and steel furniture making, printing, photography, hotel management, and motor and other repairing. There are, however, few modern manufacturing industries. Ibadan is well served by roads. The city has a fleet of privately owned taxi cabs and minibuses, and regular bus services are operated within the city and its suburbs.

The University of Ibadan and a technical institute are located in the city, and there are many specialized institutions. The university library maintains the largest collection of books in the country. There is also a branch of the National Archives on the university campus.

Of the city's six parks, the most important is Agodi Garden. There are also zoological and botanical gardens, two main stadiums, and a large number of athletic facilities. Pop. (2000) 1,731,000.



Ibagué, capital of Tolima department, central Colombia, on the eastern slopes of the Andean Cordillera Central (Central Mountains). Founded as San Bonifacio de Ibagué in 1550 on the site of an Indian village, it was moved to its present location, on a plain 4,216 ft (1,285 m) above sea level, because of Indian attacks. It was the capital of the republic for a short time in 1854. The rapid expansion of coffee planting on the slopes above the city contributed to its growth, especially after 1890.

The plain and the neighbouring valleys produce cacao, tobacco, rice, and sugarcane. Tolima University in Ibagué (founded in 1945) was given university status in 1954. The city is situated on the road that crosses the Boquerón del Quindío (Quindío Pass) into the Cauca Valley. This road connects Armenia and Bogotá, and Ibagué's location along this route has made the city an important commercial centre. Pop. (1999 est.) 393,664.

Ibáñez, Vicente Blasco: *see* Blasco Ibáñez, Vicente.

Ibáñez del Campo, Carlos (b. Nov. 3, 1877, Chillán, Chile—d. April 28, 1960, Santiago), Chilean president from 1927 to 1931 and from 1952 to 1958. Although by preference Ibáñez was aligned with foreign reactionaries, he made many constructive domestic reforms.

After a military career of 30 years, Ibáñez participated in a revolt in September 1924 against the government of Arturo Alessandri Palma. From 1925 to 1927 Ibáñez in effect controlled Chile while serving as minister of war and then as minister of the interior. In 1927 he forced the resignation of President Emiliano Figueroa Larraín and until 1931 held office as chief executive. Backed by the army, he exiled or jailed all opposition. His regime was directed to material development, especially of the ailing nitrate industry, which he sought to rescue through the creation of a monopoly corporation, Compañía de Salitre

Carlos Ibáñez

de Chile (Cosach), heavily dependent upon U.S. capital. When Cosach failed and the world depression put an end to the influx of foreign capital, the Chilean economy crumbled. Discontent with Ibáñez' authoritarianism became overt, and in July 1931 he fled across the Andes into exile in Argentina.

The former dictator returned from exile in May 1937 and in September of the following year, with the support of Chilean Nazis, attempted an armed revolt that promptly failed. In August of 1939 he led another uprising that was again quickly crushed. His propensity for unsuccessful coups coupled with his reactionary views and Nazi associations caused his defeat when he ran for the presidency in 1942. In 1952, however, the 75-year-old Ibáñez again ran for the presidency with arch-reactionary support (he was closely aligned with Argentina's President Juan Perón) but won the election through an appeal directed to the depressed urban elements and the rural workers. His presidency was in marked contrast to his dictatorship in the 1920s, for he now demonstrated an ability to conciliate opposition, reorganized government departments to promote efficiency, and encouraged industrial growth. Despite his efforts, however, the Chilean economy was in desperate straits when he left office at the age of 81.

Ibani (Nigeria): *see* Bonny.

Ibar River, river in south-central Serbia and Montenegro, rising in the Mokra Planina (mountains) and flowing eastward to Kosovska Mitrovica, then northward to join the Zapadna Morava River. Its length is 171 mi (276 km), and it has a drainage area of 3,100 sq mi (8,000 sq km). Major tributaries are the Raška, Studenica, and Sitnica. The adjacent upland is forested, but there are croplands in the stream valleys, where the settlement pattern is frequently one of tightly grouped hamlets.

Ibara (people): *see* Bara.

Ibara Saikaku: *see* Ihara Saikaku.

Ibaraki, prefecture (*ken*), central Honshu, Japan, facing the Pacific Ocean. It occupies 2,351 sq mi (6,090 sq km) of the northeastern Kantō Plain. Ibaraki is bordered (south) by the Tone-gawa (Tone River) and contains part of Suigo-Tsukuba Quasi-national Park. Main features of this section of the park include Ka-

Harvesting rice at Itako in Ibaraki prefecture, Japan
Takayuki Toyama—Bon

sumiga-ura (Lake Kasumi), the second largest Japanese lake after Lake Biwa; the canals and creeks of the Tone River delta; the ancient Shintō Kashima Shrine; and the tourist centre of Itako town.

Ibaraki is basically agricultural, producing cereals, potatoes, and tobacco. Coal is mined at Ibaraki town and copper at Hitachi. Industry increased in the prefecture during the 1960s, while production in the Tokyo–Yokohama Metropolitan Area declined. There are petrochemical works at Kashima and Kasumi, and electric machinery is built. The first Nuclear Energy Research Institute was founded in Tōkaimura in 1956. Many of the cities were castle towns. Mito, the prefectural capital, was developed under the Mito branch of the Tokugawa Shogunate; its Kairaku Garden is one of the most celebrated in Japan. Pop. (1999 est.) 3,002,449.

Ibarbourou, Juana de, original name JUANITA FERNÁNDEZ MORALES (b. March 8, 1895, Melo, Uruguay—d. July 1979), Uruguayan poet, one of the most famous South American women poets.

Ibarbourou's poetry, rich in sensual images and expressed in simple language, deals with the themes of love and nature. A note of narcissism and eroticism present in her early works, such as *Los lenguas de diamante* (1919; "Tongues of Diamond") and *Raiz salvaje* (1922; "Savage Root"), gave way later, in *La rosa de los vientos* (1930; "The Rose of the Winds"), to a sense of declining beauty and vitality and, finally, in *Perdida* (1950; "Lost"), to an expression of despair in old age. Although her later poetry lacked the passion and feeling of her earlier work, she remained one of the most popular poets of South America. She was elected president of the Sociedad Uruguaya de Escritores (Society of Uruguayan Writers) in 1950.

Ibarra, in full SAN ANTONIO DE IBARRA, city, north-central Ecuador, situated in an Andean valley at an elevation of 7,300 feet (2,200 m), within the Ecuadorian Lake District. It was founded in 1606 by the soldier Cristóbal Torre, a representative of Miguel de Ibarra, the president of the royal *audiencia* of Quito (a judicial–legislative body), and was named for him. Though largely destroyed by an earthquake in 1868, it has retained much of its colonial architecture and atmosphere.

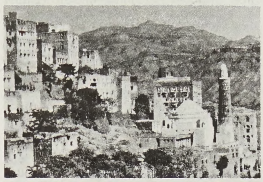
Ibarra is the trade centre for the region's agricultural products, including cotton, sugarcane, coffee, cereals, and livestock. It has a large sugar refinery and is famous for its wood carvings and native textiles and silverwork.

Landmarks include Our Lady of Mercy colonial shrine; the nearby ruins of Caranqui, where the last Inca emperor, Atahuallpa, was supposedly born; and Laguna de Yaguarcocha ("Lake of Blood"), named after a battle between the Caras and the Incas in which the slain were thrown into the lake. Ibarra is a Roman Catholic episcopal see. The Pan-American Highway and the railway to Quito pass through the city. Pop. (1997 est.) 119,243.

Ibarra, José María Velasco: *see* Velasco Ibarra, José María.

Ibárruri (Gómez), (Isidora) Dolores, pseudonym LA PASIONARIA (Spanish: "The Passionflower") (b. Dec. 9, 1895, Gallarta, near Bilbao, Spain—d. Nov. 12, 1989, Madrid), Spanish Communist leader, who earned a legendary reputation as an impassioned orator during the Spanish Civil War, coining the Republican battle cry, "*No pasarán!*" ("They shall not pass!").

Born the eighth of 11 children of a Viscayan miner, Ibárruri was compelled by poverty to quit school at age 15 to work as a seamstress and later as a cook. Becoming radicalized, she published in 1918 an article in a newspaper called *El Minero Vizcaino,* using for the first time the pseudonym La Pasionaria. Two years later she joined the newly formed Spanish Communist Party. After a turbulent



Ibárruri
© Lapi-Viollet

career, in which she was jailed several times for political activities, she emerged as one of the Communist deputies in the Republican parliament and, by the outbreak of the Civil War in 1936, had become a national figure. A sometimes violent radio and street orator, she made such famous exhortations as "It is better to die on your feet than to live on your knees" (July 1936).

With Francisco Franco's victory in 1939 she escaped by plane to the Soviet Union, where over the years she represented her party at Kremlin congresses, until Santiago Carrillo succeeded her as secretary-general in 1960. Though reputed to be an old-line Stalinist, she protested the Soviet invasion of Czechoslovakia in 1968. She returned to Spain on May 13, 1977, some 18 months after Franco's death and 34 days after the Spanish government again legalized the Communist Party. She was reelected to her deputy seat in the Spanish parliament that year but later resigned because of ill heath. She remained honorary president of the Spanish Communist Party until her death. Throughout her career Ibárruri almost always appeared dressed in black.

She married Julián Ruiz in 1915 and separated from him in the 1930s. Only two of her six children survived childhood; a son, Rubén, was killed at Stalingrad as an officer in the Red Army. In 1962 she published her memoirs, *El único camino* ("The Only Way"; Eng. trans., *They Shall Not Pass*).

Ibb, city, southwestern Yemen, lying in the Yemen Highlands on a spur of the rugged Mount Shamaḥī, at 6,725 feet (2,050 m) above sea level. The city's origins, according to Arab myth, date to biblical times. The area became important in the Middle Ages, when the Ṣulayḥid princess Sayyidah Arwā ruled over much of Yemen from her capital at nearby Jiblah (11th century AD). Long an administrative capital, Ibb in the 20th century was the seat of a semiautonomous emirate, abolished by an administrative reform of the monarchy in the 1940s.

The highland city of Ibb, Yemen, on a spur of Mount Shamaḥī; at right, the Jāmiʿ Mosque
Claude Delfarge

Ibb is the centre of a fertile agricultural region. Elevations vary from 4,000 to 6,000 feet (1,200 to 1,800 m), and most of the cultivated area is terraced. Crops grown on the rich volcanic soil include grains (wheat, barley, millet), fruits and vegetables, coffee, and kat (a mild narcotic). Livestock, mainly sheep, are extensively grazed.

The city is one of the most picturesque in Yemen; it is surrounded by a thick wall, inset with tall houses. There are about 60 mosques in Ibb; the twin-minareted Muẓaffariyah Mosque is particularly fine. Well-built multistory houses, typical of Yemeni urban architecture, are numerous. An aqueduct from the nearby mountains, supplemented by a small-scale modern distribution system, supplies running water to many of the houses—an unusual feature for the country.

The *sūq* ("marketplace") in Ibb is the trade centre for the agricultural and pastoral products of the region; the city also has some small handicraft industries. Ibb is an important way station on the north–south highway from the old port of Mocha (al-Mukhā), via Taʿizz and Dhamār, to the national capital of Ṣanʿā'. Ibb suffered an earthquake in 1982. Pop. (1994) 103,300.

Iberia, in full COMPAÑÍA MERCANTIL ANÓNIMA IBERIA (Spanish: "Iberia Commercial Limited-liability Company"), Spanish state-owned airline created by law on June 7, 1940, and given rights to the air transport of persons and cargo within Spain. It took control of a privately owned company established in 1937, which in turn had revived the name of a company called Iberia, Compañía Aérea de Transportes, founded June 28, 1927. The current name was adopted Sept. 5, 1941.

In the beginning, Iberia's service was entirely within Spain (including service to the resort of Majorca). After World War II, beginning in 1946, Iberia developed services to London and Latin America. Direct service to New York City was opened in 1954. Iberia now flies to various points in Europe, Africa, and North and South America.

Iberian, Spanish IBERO, one of a prehistoric people of southern and eastern Spain who later gave their name to the whole peninsula. The waves of migrating Celtic peoples from the 8th to 6th century BC onward settled heavily in northern and central Spain, penetrated

Portugal and Galicia, but left the indigenous Bronze Age Iberian people of the south and east intact. Greek geographers give the name Iberian, probably connected with that of the Ebro (Iberus) River, to tribes settled on the southeastern coast, but, by the time of the Greek historian Herodotus (mid-5th century BC), it applied to all the peoples between the Ebro and Huelva rivers, who were probably linguistically connected and whose material culture was distinct from that of the north and west. There were, however, areas of overlap between the Iberian and Celtic peoples, as in the Celtiberian tribes of the northeastern Meseta Central and in Catalonia and Aragon.

Of the Iberian tribes mentioned by classical authors, the Bastetani were territorially the most important and occupied the Almeria region and mountainous Granada region. The tribes to the west of the Bastetani are usually grouped together as "Tartessian," after the name Tartessos given to the region by the Greeks. The Turdetani of the Guadalquivir River valley were the most powerful of this group. Culturally the tribes of the northeast and of the Valencian coast were greatly influenced by the Greek settlements at Emporion (modern Ampurias) and in the Alicante region, those of the southeast by influences from the Phoenician trading colonies at Malaca (Málaga), Sexi (Almuñéca), and Abdera (Adra), which later passed to the Carthaginians.

On the east coast the Iberian tribes appear to have been grouped around independent city-states. In the south there were monarchies, and the treasure of El Carambolo, near Seville, has been thought to be that of a ruler of Tartessos. Religious sanctuaries have yielded bronzes and terra-cotta figures, especially in mountainous areas. There is a wide range of ceramics in the distinctive Iberian styles. Exported pottery has been found in southern France, Sardinia, Sicily, and Africa; and Greek imports were frequent. The splendid "Lady of Elche," a bust with characteristic headdress and ornaments, also shows classical influence. The Iberian economy had a rich agriculture and mining and metallurgy.

The Iberian language, a non-Indo-European tongue, continued to be spoken into early Roman times. Along the east coast it was written in Iberian script, a system of 28 syllabic and alphabetic characters, some derived from Greek and Phoenician systems but most of unknown origin. Many inscriptions in the script survive. Few words, however, except place-names on the coinage struck by many cities in the 3rd century BC, can be understood. The Iberians retained their writing system until the Roman conquest, when the Latin alphabet came into use. Although the modern Basque language was formerly thought to be the descendant of Iberian, many scholars now believe the two languages to be separate.

Iberian Peninsula, peninsula in southwestern Europe, occupied by Spain and Portugal. Its name derives from its ancient inhabitants whom the Greeks called Iberians, probably after the Ebro (Iberus), the peninsula's second longest river (after the Tagus). The Pyrenees form an effective land barrier in the northeast from the rest of Europe, and in the south at Gibraltar the peninsula is separated from North Africa by a narrow strait. The Atlantic Ocean washes the western and northern coasts, and the Mediterranean Sea the eastern. Cape da Roca, in Portugal, is the most westerly point of continental Europe.

Ibero-Maurusian industry, also called ORANIAN INDUSTRY, North African stone-tool industry dating from the late Würm (last) Glacial Period, about 16,000 years ago. The former presumption that the industry extended into Spain explains the prefix "Ibero-" in the name. The industry does bear a close resemblance to the late Magdalenian culture in Spain, which is broadly contemporary (*c.* 15,000 BC). Subsequent study, however, suggests that the Ibero-Maurusian industry is derived from a Nile River valley culture known as Halfan, which dates from about 17,000 BC. Human remains are rather frequently associated with Ibero-Maurusian artifacts, and it appears that the industry belonged to a group of people known as the Mechta-el-Arbi race, considered to have been a North African branch of Cro-Magnon man.

The Ibero-Maurusian industry, much more widespread than the Mesolithic Capsian industry (8000–2700 BC), is found along the entire coastline of North Africa and inland as well as in Morocco, Tunisia, and the Cyrenaica (Barqah) region of Libya. It is characterized by a great many small-backed blades and, unlike the Capsian, an absence of burins (a sort of chisel, probably used for working wood).

Ibert, Jacques, in full JACQUES-FRANÇOIS-ANTOINE IBERT (b. Aug. 15, 1890, Paris, France—d. Feb. 5, 1962, Paris), composer whose music is admired for its colourful, technically polished, and often witty neoclassical style.

Ibert studied at the Paris Conservatory and in 1919 won the Prix de Rome for his cantata *Le Poète et la fée* ("The Poet and the Fairy"). In Rome he composed his most popular work, the symphonic suite *Escales* (1922; "Ports of Call"). From 1937 until 1960 Ibert was director of the French Academy in Rome. He wrote for almost every genre. Of his seven operas the most successful was *Angélique* (1926). The brilliantly witty *Divertissement* (1930) was a popular orchestral piece.

Iberus River (Spain): *see* Ebro River.

Iberville, town, Montérégie region, southern Quebec province, Canada, on the east bank of the Richelieu River, opposite Saint-Jean-sur-Richelieu. Originally called Christieville, it was renamed in 1854 for the French explorer Pierre Le Moyne d'Iberville. The town is a rail and highway hub and a residential district of Saint-Jean. Economic activities include woodworking, dairying, sawmilling, quarrying, iron founding, and the manufacture of chemicals and pottery. Pop. (1991) 9,352.

Iberville, Pierre Le Moyne d', in full PIERRE LE MOYNE D'IBERVILLE ET D'ARDILLIÈRES (baptized July 20, 1661, Ville-Marie de Montréal [now Montreal]—d. July 9, 1706, Havana, Cuba, Spanish empire), French-Canadian naval hero and explorer, noted for his exploration and battles on behalf of the French in Hudson Bay and in the territory of Louisiana.

Son of prominent Montreal fur trader Charles Le Moyne, Iberville spent his young manhood in raids against English trading posts on Hudson Bay. In 1686 he joined the expedition of Pierre de Troyes to the James Bay region, capturing three forts over which he was made commander. Over the next decade, Iberville distinguished himself in numerous actions against the English, notably at Schenectady, N.Y. (1690), Pemaquid, Maine (1696), and St. John, Newfoundland (1696). His most brilliant foray was the Hudson Bay campaign of 1697, which success made him, at age 36, New France's most celebrated hero.

After the Treaty of Rijswijk (1697) temporarily settled the dispute between the English and the French over Hudson Bay, Iberville was commissioned to fortify the mouth of the Mississippi in order to secure the claim made on Louisiana by Cavelier de La Salle. In January 1699 Iberville explored the northern coast of the Gulf of Mexico, rediscovering the mouth of the Mississippi. Later he established a temporary fort, Fort Maurepas, on Biloxi Bay (now Ocean Springs, Miss.) and then sailed for France. The following year he returned and established a second fort, Fort La Boulaye, just below present-day New Orleans and in 1702 constructed a new post, Fort Louis, on the Mobile River. The success of these defense projects by Iberville persuaded Louis XIV to begin colonizing Louisiana.

In subsequent years the War of the Spanish Succession (1701–14) turned Iberville's attention toward the English, hampering his plans to develop Louisiana. In early 1706, commanding a French fleet in the West Indies, he sacked the islands of Nevis and St. Christopher, forcing the English to surrender 24 ships and capturing 6,000 slaves and 1,700 settlers. On the eve of a major expedition against the English in Carolina, Iberville died suddenly.

(Ja.H.)

ibex, any of several surefooted, sturdy wild goats of the genus *Capra,* family Bovidae (order Artiodactyla), found in the mountains of Europe, Asia, and northeastern Africa. The European, or Alpine, ibex (*C. ibex ibex*) is typical. It stands about 90 cm (3 feet) at the shoulder and has brownish gray fur, darker on the underparts. The male has a beard and large, semicircular horns with broad, transversely ridged front surfaces. The European ibex inhabits the line of perpetual snow and lives in herds, except for the old males, which are usually solitary. Formerly common throughout the higher ranges of the Alps, this ibex is now greatly reduced in numbers. It is protected locally in the Italian Alps and has been reintroduced elsewhere.

Pyrenean ibex (*Capra pyrenaica*)
Tierbilder Okapia, Frankfurt am Main

Among the subspecies closely related to the European ibex are the Siberian, or Asiatic, ibex (*C. i. sibirica*), which is larger and has longer horns, and the nubian ibex (*C. i. nubiana*), which is smaller and has long, slender horns. Other ibexes include the Abyssinian, or walia, ibex (*C. i. walie,* or *C. walie,* depending on the authority) and the Pyrenean, or Spanish, ibex (*C. pyrenaica*). For the Nilgiri ibex (*Hemitragus hylocrius*), *see* tahr.

Ibi, town and river port, Taraba state, east-central Nigeria, on the south bank of the Benue River, opposite the mouth of the Shemankar River. Founded in the 1850s by a slave of Hamman, the Fulani emir of Muri (to the northeast), it became a post for slave traders from Muri, known as the *bayin Fulani.* In the late 19th century British merchants of the Royal Niger Company observed Ibi's Hausa traders marketing tin products and thereupon prospected for and found in 1904 the vast tin deposits on the Jos Plateau.

Ibi is a collecting point for sesame seeds and soybeans. Salt extraction, a traditional occupation of the women in the vicinity, has been eclipsed by imported European salt. Local trade among the mostly Jukun population is in sorghum, millet, yams, rice, and beans. It serves as the port for Wukari 23 miles (37

km) south, to which it is linked by road. Pop. (1983 est.) 27,759.

Ibibio, people of the southeastern area of Nigeria, mainly in the Cross River state; they

Carved figure from a male dancer's headdress, Ibibio people, Nigeria, in the Metropolitan Museum of Art, New York City

speak dialects of Efik-Ibibio, a language of the Kwa branch of the Niger-Congo family. They comprise the following major divisions: Efik (*q.v.*), Northern (Enyong), Southern (Eket), Delta (Andoni-Ibeno), Western (Anang), and Eastern (Ibibio proper).

The Ibibio are mainly rain forest cultivators of yams, taro, and cassava; their major export products are palm oil and kernels. The Ibibio are noted for their skillful wood carving.

Their villages consist of compounds of rectangular buildings, each with several rooms, arranged around a courtyard. Villages, numbering about 500 persons, are divided into wards and sometimes into physically distinct hamlets, occupied by separate patrilineages. Wards are governed internally by a council consisting of heads of households and the secular head of the ward. The lineage head is a moral authority who has ritual duties and serves as guardian for ancestral shrines; he may also be the secular leader. Groups of villages form larger territorial units united by traditions of descent from a single parent village or village group and by the possession of a common tutelary spirit and a common totem. Secret societies, both male and female, are prominent in Ibibio village organization. Membership in the *ekpo* society, for example, available to wealthy men who can meet the expense involved, confers high social status and political authority; these men participate in ceremonies concerned with ancestral spirits and are believed to protect the community through magic and religious ritual.

ibis, any of about 20 species of medium-sized wading birds constituting the subfamily Threskiornithinae of the family Threskiornithidae (order Ciconiiformes), which also includes the spoonbills. Ibises occur in all warm regions except on South Pacific islands. They wade in shallow lagoons, lakes, bays, and marshes, using their slender, down-curved bills to feed on small fishes and soft mollusks. They range in length from about 55 to 75 centimetres (22 to 30 inches). They fly with neck and legs extended, alternately flapping and sailing.

Ibises usually breed in vast colonies, building compact stick nests low in bushes or trees and laying three to five eggs, usually dull white or mottled with brown.

The glossy ibis (*Plegadis falcinellus*) and its close relative the white-faced ibis (*P. chihi*) are small forms with dark reddish brown and glossy purplish plumage. As a group they are found throughout the warmer regions of the world.

The hadada ibis, or hadada (*Hagedashia hagedash*), of Africa, is a greenish ibis known for its loud call.

The straw-necked ibis (*Threskiornis spinicollis*) is unknown outside Australia. It is less aquatic than the other species; its principal food is grasshoppers.

The hermit ibis (*Geronticus eremita*), an endangered species, inhabits northern Africa and the Middle East. Its bill and the bare skin on its head are reddish. Breeding colonies once existed in central and southern Europe, Syria, and Algeria but are now known only in Turkey and Morocco.

The Japanese ibis (*Nipponia nippon*) is white with a red face. Also an endangered species, it was considered to be on the verge of extinction in the late 20th century.

The sacred ibis (*Threskiornis aethiopica*), of southern Arabia and Africa south of the Sahara (and formerly of Egypt), was sacred to the ancient Egyptians. It is about 75 cm (30

Sacred ibis (*Threskiornis aethiopica*)
M.P. Kahl

in.) long, white with black in its wings, dark plumes on the lower back, and a bare black head and neck.

The scarlet ibis (*Eudocimus ruber*) inhabits northern South America; the white ibis (*E. albus*) ranges Central and North America.

For wood storks, sometimes called wood ibises, *see* stork.

ibisbill (*Ibidorhyncha struthersii*), Asian bird named for its long, red, down-curved bill (similar to that of an ibis), which it uses to probe for food under stones along streams and ponds. Rather heavyset birds about 40 centimetres (16 inches) long, ibisbills have

Ibisbill (*Ibidorhyncha struthersii*)
Painting by H. Douglas Pratt

shorter legs than their familial relatives the avocets and stilts (family Recurvirostridae, order Charadriiformes). The body is gray, with a black breast band and facial mask.

Ibisbills nest at 3,000 metres (9,840 feet) or higher in the Himalayas; they winter in the foothills.

Ibiza, also spelled IVIZA, or IVICA, island, Baleares province, Spain, one of the Balearic Islands in the western Mediterranean. It lies 50 mi (80 km) southwest of Majorca and has an area of 221 sq mi (572 sq km). A strategic point of great importance in ancient times, the island was inhabited by the Phoenicians and Carthaginians and has some notable archaeological sites, relics from which are housed in the Archaeological Museum at Ibiza city. The island's hilly relief, culminating in La Atalaya (1,558 ft [475 m]), is truncated in the central northern coast to form a *costa brava* ("rugged coast") with cliffs exceeding 800 ft in height and penetrated by *calas* (small coves). There are several irrigated lowlands (*huertas*), and the hillsides are intensively terraced. Agriculture is mainly of a subsistence nature, but

Ibiza city and port, Spain
Josef Muench

almonds, dried figs, and apricots are exported. Salt produced by the evaporation of seawater has been the main export for centuries (about 70,000 tons annually). Fish and charcoal, surplus to local needs, are also sent to the mainland. Because of its mild winter climate and its beaches, the island enjoys a substantial tourist trade. Most of the inhabitants live on farms and small villages scattered throughout the island, Ibiza city being the main centre and the only urban settlement. Pop. (1999 est.) city, 32,700; (1991) island, 80,538.

Iblīs, in Islām, the personal name of the devil, probably derived from the Greek *diabolos.* Iblīs, the counterpart of the Jewish and Christian Satan, is also referred to as *'adūw Allāh* (enemy of God), *'adūw* (enemy), or, when he is portrayed as a tempter, *ash-Shaytān* (demon).

At the creation of man, God ordered all his angels to bow down in obedience before Adam. Iblīs refused, claiming he was a nobler being since he was created of fire, while man came only of clay. For this exhibition of pride and disobedience, God threw Iblīs out of heaven. His punishment, however, was postponed until the Judgment Day, when he and his host will have to face the eternal fires of hell; until that time he is allowed to tempt all but true believers to evil. As his first demonic act, Iblīs, referred to in this context as *shaytān,* entered the Garden of Eden and tempted Eve to eat of the tree of immortality, causing both Adam and Eve to forfeit paradise. Disguised as the *hātif,* the mysterious voice of Arab mythology, Iblīs also tempted 'Alī, Muḥammad's son-in-law, unsuccessfully trying to keep him from performing the ritual washing of the Prophet's dead body.

Iblīs has long been a figure of speculation among Muslim scholars, who have been trying to explain the ambiguous identification of Iblīs in the Qur'ān as either angel or *jinnī,* a contradiction in terms, as angels are created of light (*nūr*) and are incapable of sin, while *jinn* are created of fire (*nār*) and can sin. Traditions on this point are numerous and conflicting: Iblīs was simply a *jinnī* who inappropriately found himself among the angels in heaven; he was an angel sent to Earth to do battle with the rebellious *jinn* who inhabited the Earth before man was created; Iblīs was himself one of the terrestrial *jinn* captured by the angels during their attack and brought to heaven. *See also* shayṭān.

Ibn 'Abbād, in full ABŪ 'ABD ALLĀH MUḤAMMAD IBN ABĪ ISḤĀQ IBRĀHĪM AN-NAFZĪ AL-ḤIMYARĪ AR-RUNDĪ (b. 1333, Ronda, Spain—d. 1390, buried Bāb al-Futūḥ, Mor.), Islāmic theologian who became the leading mystical thinker of North Africa in the 14th century.

Attracted to Morocco by the famous *madrasahs* (religious colleges), Ibn 'Abbād emigrated there at an early age. He abandoned legal studies in a quest for mystical knowledge. In 1359 he settled in the town of Salé and became an adherent of the Shādhilīyah order of mystics, which emphasized a personal commitment to Ṣūfism (Islāmic mysticism) and institutionalized spiritual asceticism. The order's spread and popularity in North Africa owed much to Ibn 'Abbād's teachings and writings. Because the order and Ibn 'Abbād represented moderate mystical tendencies, there was no conflict between them and the traditional theologians of Morocco, and in 1375 he was appointed an *imām* (leader of public prayers) by the ruler of Morocco.

As a scholar, Ibn 'Abbād was especially noted for two collections of his correspondence, *Rasā'il kubrā* ("Major Correspondence") and *Rasā'il ṣughrā* ("Minor Correspondence"), which contained spiritual directions and instructions to his followers.

Ibn Abbās: *see* 'Abd Allāh ibn al-'Abbās.

Ibn Abī ar-Rijāl, Aḥmad (ibn Ṣāliḥ) (b. July 1620, ash-Shabaṭ, Arabia—d. March 1681, Ṣan'ā'), Yemeni scholar and theologian, who is the best source of historical information on the little-known sect of Shī'ī Muslims in Yemen called the Zaydīs.

After completing his education, Ibn Abī ar-Rijāl joined the religious-bureaucratic establishment and reached the important rank of secretary and court orator under the rule of Ismā'īl al-Mutawakkil, the Zaydī spiritual and temporal ruler of Yemen.

Ibn Abī ar-Rijāl was a scholar of some renown; most of his works are lost, however, and only their titles remain. Of special note among his surviving works is a biographical dictionary of 1,300 Zaydī leaders of Yemen and Iraq, his *Maṭla' al-budūr wa-majma' al-buḥūr* ("Rising of the Moons and Meeting of the Seas"). The *Maṭla',* now a standard source, is particularly important because the Zaydīs were extremely secretive about their beliefs.

Ibn Abī 'Aṣrūn, in full SHARAF AD-DĪN ABŪ SA'D 'ABD ALLĀH IBN MUḤAMMAD IBN HIBAT ALLĀH IBN MUṬAHHAR AT-TAMĪMĪ AL-MAWṢILĪ IBN ABĪ 'AṢRŪN, also called AL-ḤALABĪ, or AD-DIMASHQĪ (b. February 1099/1100, Ḥadīthah, Baghdad Caliphate—d. October/November 1189, Damascus), scholar who became a leading Shāfi'ī (one of the four schools of Islāmic law) theologian and the chief judicial officer of the Ayyūbid caliphate.

After completing his theological training, Ibn Abī 'Aṣrūn held various religious and judicial posts in Iraq. In 1154 he was invited to Damascus by its ruler; he taught religious subjects there and became the administrator of the *waqf*s (religious endowments). He held numerous other judicial appointments in Syria, Iraq, and Turkey, until in 1177/78 the famous Saladin, the Ayyūbid sultan, appointed him as the Shāfi'ī *qāḍī* ("judge") of Syria, the highest judicial appointment in the realm.

Ibn Abī 'Aṣrūn had to retire because of blindness in 1179/80. During his lifetime six *madrasahs* (religious colleges) were built in his honour. He wrote a number of works on religious subjects, none of which is extant.

Ibn al-Abbār, in full ABŪ 'ABD ALLĀH MUḤAMMAD AL-QUDĀ'Ī (b. February 1199, Valencia, Emirate of Balansiya [Valencia]—d. Jan. 6, 1260, Tunis), historian, theologian, and humorist who became one of the most famous students of Islāmic Spain.

Ibn al-Abbār began his official career as a secretary to the Muslim governor of the Emirate of Balansiya. After the fall of Valencia (September 1238), he settled in Tunisia and was employed as the head of the chancellery by the Ḥafṣid ruler Abū Zakarīyā' Yaḥyā and his successor, al-Mustanṣir.

While in Tunisia Ibn al-Abbār engaged in scholarly pursuits. His *Tuḥfat al-qadīm,* a major study of the Islāmic poets of Muslim Spain, is particularly important. He was also a humorist and a satirist of considerable ability. Ibn al-Abbār's alleged disrespectful attitude toward al-Mustanṣir angered the ruler. The scholar's fall from power and subsequent execution may have resulted from a satirical poem that he directed against al-Mustanṣir.

Ibn al-'Arabī, in full MUḤYĪ AD-DĪN ABŪ 'ABD ALLĀH MUḤAMMAD IBN 'ALĪ IBN MUḤAMMAD IBN AL-'ARABĪ AL-ḤĀTIMĪ AṬ-ṬĀ'Ī IBN AL-'ARABĪ, also called ASH-SHAYKH AL-AKBAR (b. July 28, 1165, Murcia, Valencia—d. Nov. 16, 1240, Damascus), celebrated Muslim mystic-philosopher who gave the esoteric, mystical dimension of Islāmic thought its first full-fledged philosophic expression. His major works are the monumental *al-Futūḥāt al-Makkīyah* ("The Meccan Revelations") and *Fuṣūṣ al-ḥikam* (1229; "The Bezels of Wisdom").

Ibn al-'Arabī was born in the southeast of Spain, a man of pure Arab blood whose ancestry went back to the prominent Arabian tribe of Ṭā'ī. It was in Seville, then an outstanding centre of Islāmic culture and learning, that he received his early education. He stayed there for 30 years, studying traditional Islāmic sciences; he studied with a number of mystic masters who found in him a young man of marked spiritual inclination and unusually keen intelligence. During those years he travelled a great deal and visited various cities of Spain and North Africa in search of masters of the Ṣūfī (mystical) Path who had achieved great spiritual progress and thus renown.

It was during one of these trips that Ibn al-'Arabī had a dramatic encounter with the great Aristotelian philosopher Ibn Rushd (Averroës; 1126–98) in the city of Córdoba. Averroës, a close friend of the boy's father, had asked that the interview be arranged because he had heard of the extraordinary nature of the young, still beardless lad. After the early exchange of only a few words, it is said, the mystical depth of the boy so overwhelmed the old philosopher that he became pale and, dumfounded, began trembling. In the light of the subsequent course of Islāmic philosophy the event is seen as symbolic; even more symbolic is the sequel of the episode, which has it that, when Averroës died, his remains were returned to Córdoba; the coffin that contained his remains was loaded on one side of a beast of burden, while the books written by him were placed on the other side in order to counterbalance it. It was a good theme of meditation and recollection for the young Ibn al-'Arabī, who said: "On one side the Master, on the other his books! Ah, how I wish I knew whether his hopes had been fulfilled!"

In 1198, while in Murcia, he had a vision in which he felt he had been ordered to leave Spain and set out for the East. Thus began his pilgrimage to the Orient, from which he never was to return to his homeland. The first notable place he visited on this journey was Mecca (1201), where he "received a divine commandment" to begin his major work *al-Futūḥāt al-Makkīyah,* which was to be completed much later in Damascus. In 560 chapters, it is a work of tremendous size, a personal encyclopaedia extending over all the esoteric sciences in Islām as Ibn al-'Arabī understood and had experienced them, together with valuable information about his own inner life.

It was also in Mecca that he became acquainted with a young girl of great beauty who, as a living embodiment of the eternal *sophia* (wisdom), was to play in his life a role much like that which Beatrice played for Dante. Her memories were eternalized by Ibn al-'Arabī in a collection of love poems (*Tarjumān al-ashwāq;* "The Interpreter of Desires"), upon which he himself composed a mystical commentary. His daring "pantheistic" expressions drew down on him the wrath of Muslim orthodoxy, some of whom prohibited the reading of his works at the same time that others were elevating him to the rank of the prophets and saints.

After Mecca, he visited Egypt (also in 1201) and then Anatolia, where, in Qunya, he met Ṣadr ad-Dīn al-Qūnawī, who was to become his most important follower and successor in the East. From Qunya he went on to Baghdad and Aleppo. By the time his long pilgrimage had come to an end at Damascus (1223), his fame had spread all over the Islāmic world. Venerated as the greatest spiritual master, he spent the rest of his life in Damascus in peaceful contemplation, teaching, and writing. It was during his Damascus days that one of the most important works in mystical philosophy in Islām, *Fuṣūṣ al-ḥikam,* was composed in 1229, about 10 years before his death. Con-

sisting only of 27 chapters, the book is incomparably smaller than *al-Futūḥāt al-Makkīyah*, but its importance as an expression of Ibn al-'Arabī's mystical thought in its most mature form cannot be overemphasized. (T.I.)

Ibn al-Ash'ath, in full 'ABD AR-RAḤMĀN IBN MUḤAMMAD IBN AL-ASH'ATH (d. 704), Umayyad general who became celebrated as leader of a revolt (AD 699–701) against the governor of Iraq, al-Ḥajjāj.

A member of the noble tribe of Kindah of the old aristocracy, Ibn al-Ash'ath was at first friendly toward the Umayyad authorities but then began to smart under the governance of the plebeian administrators. Styling himself Nāṣir al-mu'minīm (Helper of the Believers) in opposition to the Umayyad and other "bad" Muslims, he slowly became so estranged from al-Ḥajjāj that a clash of wills led to open revolt.

In 699 al-Ḥajjāj dispatched a crack force of Kūfans and Basrans, known as the Peacock Army, to put down a rebellion in Kābulistān (in present Afghanistan). After an initial invasion of Kābulistān, Ibn al-Ash'ath, the commanding general, decided to wait until spring before continuing his campaign. Al-Ḥajjāj pressed for immediate action, and the dispute led to a revolt by Ibn al-Ash'ath and his troops.

Ibn al-Ash'ath moved slowly westward into Iraq, gathering support from both Arabs and non-Arabs along the way and engaging in two battles, one a victory and one a mild setback, forcing him to withdraw from Basra to Kūfah.

Al-Ḥajjāj, having received in the meantime a steady stream of Syrian reinforcements from the caliph 'Abd al-Malik ibn Marwān, confronted Ibn al-Ash'ath's superior army of 200,000 at Dayr al-Jamājim, outside Kūfah. Negotiations were initiated by the caliph's agents, who offered the rebels the dismissal of al-Ḥajjāj, equal pay with their Syrian counterparts, and a governorship for Ibn al-Ash'ath. The Iraqis, however, rejected the proposals and were defeated in battle in September 701. The last of the rebellion was finally put down in October, when al-Ḥajjāj destroyed the Iraqi army in a violent battle at Maskin, on the Shaṭṭ ad-Dujaylah. The defeated Iraqis fled to Sijistān, eventually surrendering to the Syrians, while Ibn al-Ash'ath took refuge in Kābul; he either was murdered or committed suicide in 704.

Ibn al-Athīr, in full ABŪ AL-ḤASAN 'ALĪ 'IZZ AD-DĪN IBN AL-ATHĪR (b. May 12, 1160, Jazīrat Ibn 'Umar, Jazira, Emp. of the Caliphate—d. 1233, Mosul), influential Arab historian.

Ibn al-Athīr spent a scholarly life in Mosul, but often visited Baghdad. He was for a time with Saladin's army in Syria and later lived in Aleppo and Damascus. His chief work was a history of the world, *al-Kāmil fī at-tārīkh* ("The Complete History"), starting with the creation of Adam. Long a standard work, this history has been criticized in the 20th century for being somewhat derivative. He also wrote a history of the atabegs (former Seljuq army officers who founded dynasties) of Mosul called *al-Bāhir*, which was drawn from his own experience and from that of his father, who held office under the Zangids of Mosul. Among his other works were compilations of biographical and genealogical material of earlier authors.

Ibn al-Athīr's older brother, Majd ad-Dīn ibn al-Athīr (1149–1210), who worked in Mosul for its ruler and was a scholar of note, made a collection of the sayings and acts of the Prophet Muḥammad and a dictionary of obscure terms in Ḥadīth (accounts of Muḥammad and his followers) collections. The youngest brother, Ḍiyā' ad-Dīn ibn al-Athīr (1163–1239), was a noted author and literary critic who worked for Saladin and became vizier to Saladin's son, al-Malik al-Afḍal.

Ibn al-'Awwām (fl. second half of 12th century, at Seville), agriculturist who wrote the Arabic treatise on agriculture, *Kitāb al-filāḥah*, the outstanding medieval work on the subject. The Spanish translation, published in the early 1800s, consists of 35 chapters dealing with agronomy, cattle and poultry raising, and beekeeping. It deals with 585 plants; explains the cultivation of more than 50 fruit trees; and includes many valuable observations on soils, manures, plant grafting, and plant diseases. Much of the material was derived from Greek and Arabic literature, especially from the treatise on Nabatean agriculture of Ibn Waḥshiyah, but Ibn al-'Awwām made many additions to the accumulated knowledge and experience of his Moorish contemporaries.

Ibn al-Bawwāb, in full ABŪ AL-ḤASAN 'ALĪ IBN HILĀL IBN AL-BAWWĀB, also called IBN AS-SITRĪ (b. late 10th century, Iraq—d. 1022 or 1031, Baghdad), Arabic calligrapher of the 'Abbāsid Age (750–1258) who reputedly invented the cursive *rayḥānī* and *muḥaqqaq* scripts. He refined several of the calligraphic styles invented a century earlier by Ibn Muqlah, including the *naskhī* and *tawqī* scripts, and collected and preserved for his students numerous original manuscripts of that master.

Ibn al-Bawwāb was from a poor family: the name he is known by means literally "son of the doorkeeper." Nevertheless, he received a thorough education in law and is said to have known the Qur'ān by heart. Ibn al-Bawwāb's interest in calligraphy was inspired by Muḥammad ibn Asad and was developed under Muḥammad ibn Samsamānī, both of whom were students of Ibn Muqlah. Altogether, Ibn al-Bawwāb reputedly produced 64 copies of the Qur'ān by hand. One of the most beautiful in the *rayḥānī* script is in the Laleli Mosque in Istanbul, a gift of the Ottoman Sultan Selim I (1470–1512). Ibn al-Bawwāb was recognized as a master in his own time; his school of calligraphy lasted until Baghdad fell to the Mongol invaders more than two centuries after his death.

Ibn al-Fāriḍ, in full SHARAF AD-DĪN ABŪ ḤAFṢ 'UMAR IBN AL-FĀRIḌ (b. March 22, 1181 or March 11, 1182, Cairo—d. Jan. 23, 1235, Cairo), Arab poet whose expression of Ṣūfī mysticism is regarded as the finest in the Arabic language.

Son of a Syrian-born inheritance-law functionary, Ibn al-Fāriḍ studied for a legal career but abandoned law for a solitary religious life in the Muqaṭṭam hills near Cairo. He spent some years in or near Mecca, where he met the renowned Ṣūfī as-Suhrawardī of Baghdad. Venerated as a saint during his lifetime, Ibn al-Fāriḍ was buried in the Muqaṭṭam hills, where his tomb is still visited.

Many of Ibn al-Fāriḍ's poems are *qaṣīdahs* ("odes") on the lover's longing for reunion with his beloved. He expresses through this convention his yearning for a return to Mecca and, at a deeper level, a desire to be assimilated into the spirit of Muḥammad, first projection of the Godhead. He developed this theme at length in *Naẓm as-sulūk* (Eng. trans. by A.J. Arberry, *The Poem of the Way*, 1952). Almost equally famous is his "Khamrīyah" ("Wine Ode"; Eng. trans., with other poems, in Reynold Alleyne Nicholson's *Studies in Islamic Mysticism* [1921] and in *The Mystical Poems of Ibn al-Fāriḍ*, translated by A.J. Arberry [1956]). This long *qaṣīdah* describes the effects of the wine of divine love. Although Ibn al-Fāriḍ's poetry is mannered in style, with rhetorical embellishments and conventional imagery, his poems contain passages of striking beauty and deep religious feeling.

Ibn al-'Ibrī (medieval Syrian scholar): *see* Bar Hebraeus.

Ibn al-Jawzī, in full 'ABD AR-RAḤMĀN IBN 'ALĪ IBN MUḤAMMAD ABŪ AL-FARAJ IBN AL-JAWZĪ (b. 1126, Baghdad—d. 1200, Baghdad), jurist, theologian, historian, preacher, and teacher who became an important figure in the Baghdad establishment and a leading spokesman of traditionalist Islām.

Ibn al-Jawzī received a traditional religious education, and, upon the completion of his studies, he chose a teaching career, becoming by 1161 the master of two religious colleges. A fervent adherent of Ḥanbalī doctrine (one of the four schools of Islāmic law), he was a noted preacher whose sermons were conservative in viewpoint and supported the religious policies of the Baghdad ruling establishment. In return he was favoured by the caliphs, and by 1178/79 he had become the master of five colleges and the leading Ḥanbalī spokesman of Baghdad.

In the decade 1170–80, he attained the height of his power. Becoming a semi-official inquisitor, he constantly searched for doctrinal heresies. He attacked and instigated persecutions against those who he felt had deviated from strict traditionalist Islām. He was particularly critical of Ṣūfīs (Muslim mystics) and of theologians who practiced Shī'ī Islām (one of the two major branches of Islām). His zeal antagonized many liberal theologians. His power within the Baghdad establishment owed a great deal to his excellent relations with successive caliphs and their advisers. The arrest in 1194 of Ibn Yūnus, his old friend and patron, marked the end of Ibn al-Jawzī's career and his close links with governmental circles. In that year he was arrested and exiled to the city of Wāsiṭ. He was partially rehabilitated on the eve of his death and allowed to return to Baghdad.

Ibn al-Jawzī's scholarly works reflected his adherence to Ḥanbalī doctrine. Much of his work was of a hagiographical and polemical nature. Of particular interest was his *Ṣifat aṣ-Ṣafwah* ("Attributes of Mysticism"), an extensive history of mysticism, which argued that the true mystics were those who modelled their lives on the Companions of the Prophet.

Ibn an-Nafīs, in full 'ALĀ'AD-DĪN ABŪ AL-'ALĀ' 'ALĪ IBN ABĪ AL-ḤARAM AL-QURAYSHĪ AD-DIMASHQĪ IBN AN-NAFĪS (d. 1288), Arab physician who first described the pulmonary circulation of the blood. In finding that the wall between the right and left ventricles of the heart is solid and without pores, he disputed Galen's view that the blood passes directly from the right to the left side of the heart. Ibn an-Nafīs correctly stated that the blood must pass from the right ventricle to the left ventricle by way of the lungs. But the significance of his statement remained unheeded, and, in fact, was probably unknown by physicians in western countries. It was only in the 20th century that his work was brought to light. Ibn an-Nafīs studied in Damascus under the physician ad-Dakhwār and went to Egypt to take charge of the Nāṣirī Hospital in Cairo. He wrote treatises on eye diseases and diet and commentaries on medical writings of Hippocrates, Avicenna, and Ḥunayn ibn Isḥāq.

Ibn ʿAqīl, in full ABŪ AL-WAFĀʾ ʿALĪ IBN ʿAQĪL IBN MUḤAMMAD IBN ʿAQĪL IBN AḤMAD AL-BAGHDĀDĪ AZ-ẒAFARĪ (b. 1040, Baghdad—d. 1119), Islāmic theologian and scholar of the Ḥanbalī school, the most traditionalist of the schools of Islāmic law. His thoughts and teachings represent an attempt to give a somewhat more liberal direction to Ḥanbalism.

In 1055–66 Ibn ʿAqīl received instruction in Islāmic law according to the tenets of the Ḥanbalī school. During these years, however, he also became interested in liberal theological ideas that were regarded as reprehensible by his orthodox Ḥanbalī teachers. These ideas represented two diverse trends within Islāmic thought—that of the Muʿtazilites, those who sought to understand and interpret religion according to the canons of logical inquiry and reason, and that of the teachings of the mystic al-Ḥallāj, especially his concept of *waḥdat ash-shuhūd* (unity of phenomena), a doctrine that attempted to accommodate the idea of unity (*tawḥīd*) of Ṣūfism (Islāmic mysticism) and the orthodox theologians' concern with the revealed law (*sharʿ*).

Ibn ʿAqīl's attraction to these ideas weakened his standing in the conservative Ḥanbalī community of Baghdad. He aroused further animosity when in 1066, at the relatively young age of 26, he attained a professorship at the important mosque of al-Manṣūr, at least partly as a result of patronage. The professional jealousy of those theologians who had been passed over, coupled with his espousal of innovative and controversial doctrines, led to Ibn ʿAqīl's persecution. After the death of his influential patron, Abū Manṣūr ibn Yūsuf, in 1067 or 1068, he was forced to retire from his teaching position. Until 1072 he lived in partial retirement under the protection of Abū Manṣūr's son-in-law, a wealthy Ḥanbalī merchant. The controversy over his ideas came to an end in September 1072, when he was forced to retract his beliefs publicly before a group of orthodox theologians. This retraction may have been based on expediency and was in keeping with the recognized practice of *taqiyah* (precautionary dissimulation).

Ibn ʿAqīl spent the rest of his life in the pursuit of scholarship. His most famous work was the *Kitāb al-funūn* ("Book of Sciences"), an encyclopaedia of knowledge dealing with a large variety of subjects. This work was said to have included between 200 and 800 volumes, all but one of which have been lost.

Ibn as-Sitrī: *see* Ibn al-Bawwāb.

Ibn Bābawayh, also spelled IBN BABŪYA, in full ABŪ JAʿFAR MUḤAMMAD IBN ABŪ AL-ḤASAN ʿALĪ IBN ḤUSAYN IBN MŪSĀ AL-QUMMĪ, also called AṢ-ṢADŪQ (b. *c.* 923, Khorāsān province, Iran—d. 991, Rayy), Islāmic theologian, author of one of the "Four Books" that are the basic authorities for the doctrine of Twelver (Ithnā ʿAshārī) Shīʿah.

Little is known about Ibn Bābawayh's life. According to legend he was born as the result of special prayers to the *mahdī* (the expected one). In 966 he left Khorāsān for Baghdad, possibly attracted by the Shīʿī inclination of the Būyid dynasty that ruled there. Within a short time he was recognized as the spokesman and leading intellectual figure of Twelver Shīʿah.

More than 200 separate works have been attributed to Ibn Bābawayh, although only a few are now extant. His *Risālat al-ʿItiqādāt* (*Shīʿite Creed,* 1942) is important for the study of the doctrinal development of Shīʿah. His works are still widely used wherever Twelver Shīʿī are found.

Ibn Bābūyā (Muslim theologian): *see* Ibn Bābawayh.

Ibn Bājjah (Arab philosopher): *see* Avempace.

Ibn Baṭṭūṭah, in full ABŪ ʿABD ALLĀH MUḤAMMAD IBN ʿABD ALLĀH AL-LAWĀTĪ AṬ-ṬANJĪ IBN BAṬṬŪṬAH (b. Feb. 24, 1304, Tangier, Morocco—d. 1368/69, Mor.), the greatest medieval Arab traveller and the author of one of the most famous travel books, the *Riḥlah* (*Travels*), which describes his extensive travels covering some 75,000 miles (more than 120,000 km) in trips to almost all the Muslim countries and to regions as far as China and Sumatra.

Life and travels. Ibn Baṭṭūṭah was from a family that produced a number of Muslim judges (*qāḍīs*). He received the traditional juristic and literary education in his native town of Tangier. In 1325, at the age of 21, he started his travels by undertaking the pilgrimage to Mecca. At first his purpose was to fulfill this religious duty and to broaden his education by studying under famous scholars in the Near East (Egypt, Syria, and Hejaz). That he achieved his objectives is corroborated by long enumerations of scholars and Ṣūfī (Islāmic mystic) saints whom he met and also by a list of diplomas conferred upon him (mainly in Damascus). These studies qualified him for judicial office, whereas the claim of being a former pupil of the then-outstanding authorities in traditional Islāmic sciences greatly enhanced his chances and made him thereafter a respected guest at many courts.

But this was to follow later. In Egypt, where he arrived by the land route via Tunis and Tripoli, an irresistible passion for travel was born in his soul, and he decided to visit as many parts of the world as possible, setting as a rule "never to travel any road a second time." His contemporaries travelled for practical reasons (such as trade, pilgrimage, and education), but Ibn Baṭṭūṭah did it for its own sake, for the joy of learning about new countries and new peoples. He made a living of it, benefitting at the beginning from his scholarly status and later from his increasing fame as a traveller. He enjoyed the generosity and benevolence of numerous sultans, rulers, governors, and high dignitaries in the countries he visited, thus securing an income that enabled him to continue his wanderings.

From Cairo, Ibn Baṭṭūṭah set out via Upper Egypt to the Red Sea but then returned and visited Syria, there joining a caravan for Mecca. Having finished the pilgrimage in 1326, he crossed the Arabian Desert to Iraq, southern Iran, Azerbaijan, and Baghdad. There he met the last of the Mongol khans of Iran, Abū Saʿīd (1316–36), and some lesser rulers. Ibn Baṭṭūṭah spent the years between 1327 and 1330 in Mecca and Medina leading the quiet life of a devotee, but such a long stay did not suit his temperament.

Embarking on a boat in Jidda, he sailed with a retinue of followers down both shores of the Red Sea to Yemen, crossed it by land, and set sail again from Aden. This time he navigated along the eastern African coast, visiting the trading city-states as far as Kilwa (modern Tanzania). His return journey took him to southern Arabia, Oman, Hormuz, southern Persia, and across the Persian Gulf back to Mecca in 1332.

There a new, ambitious plan matured in his mind. Hearing of the sultan of Delhi, Muḥammad ibn Tughluq (1325–51), and his fabulous generosity to Muslim scholars, he decided to try his luck at his court. Forced by lack of communications to choose a more indirect route, Ibn Baṭṭūṭah turned northward, again passed Egypt and Syria, and boarded ship for Asia Minor in Latakia. He crisscrossed this "land of the Turks" in many directions at a time when Anatolia was divided into numerous petty sultanates. Thus, his narrative provides a valuable source for the history of this country between the end of the Seljuq power and the rise of the House of Ottoman. Ibn Baṭṭūṭah was received cordially and generously by all the local rulers and heads of religious brotherhoods (*akhīs*).

His journey continued across the Black Sea to the Crimea, then to the northern Caucasus and to Saray on the lower Volga, capital of the khan of the Golden Horde, Muḥammad Özbeg (1312–41). According to his narrative, he undertook an excursion from Saray to Bulgary on the upper Volga and Kama, but there are reasons to doubt his veracity on this point. On the other hand, the narrative of his visit to Constantinople in the retinue of the Khan's wife, a Byzantine princess, seems to be an eyewitness record, although there are some minor chronological discrepancies. Ibn Baṭṭūṭah's description of the Byzantine capital is vivid and, in general, accurate. Although he shared the strong opinions of his fellow Muslims toward unbelievers, his account of the "second Rome" shows him as a rather tolerant man with a lively curiosity. Nevertheless, he always felt happier in the realm of Islām than in non-Muslim lands, whether Christian, Hindu, or pagan.

After his return from Constantinople through the Russian steppes, he continued his journey in the general direction of India. From Saray he travelled with a caravan to Central Asia, visiting the ancient towns of Bukhara, Samarkand, and Balkh, all of these still showing the scars left by the Mongol invasion. He took rather complicated routes through Khorāsān and Afghanistan, and, after crossing the Hindu Kush (mountains), he arrived at the frontiers of India on the Indus River on Sept. 12, 1333, by his own dating. The accuracy of this date is doubtful, as it would have been impossible to cover such enormous distances (from Mecca) in the course of only one year. Because of this discrepancy, his subsequent dating until 1348 is highly uncertain.

At this time he was already a man of some importance and fame, with a large train of attendants and followers and also with his own harem of legal wives and concubines. India and its ruler, Muḥammad ibn Tughluq, lived up to Ibn Baṭṭūṭah's expectations of wealth and generosity, and the traveller was received with honours and gifts and later appointed grand *qāḍī* of Delhi, a sinecure that he held for several years.

Though he had apparently attained an easy life, it soon became clear that his new position was not without danger. Sultan Muḥammad, an extraordinary mixture of generosity and cruelty, held sway over the greater part of India with an iron hand that fell indiscriminately upon high and low, Muslim and Hindu alike. Ibn Baṭṭūṭah witnessed all the glories and setbacks of the Sultan and his rule, fearing daily for his life as he saw many friends fall victim to the suspicious despot. His portrait of Muḥammad is an unusually fine piece of psychological insight and mirrors faithfully the author's mixed feelings of terror and sympathy. Notwithstanding all his precautions, Ibn Baṭṭūṭah at last fell into disgrace, and only good fortune saved his life; gaining favour again, he was appointed the Sultan's envoy to the Chinese emperor in 1342.

He left Delhi without regrets, but his journey was full of other dangers: not far away from Delhi his party was waylaid by Hindu insurgents, and the traveller barely escaped with his life. On the Malabar Coast he became involved in local wars and was finally shipwrecked near Calicut, losing all his property and the presents for the Chinese emperor. Fearing the wrath of the Sultan, Ibn Baṭṭūṭah chose to go to the Maldive Islands, where he spent nearly two years; as a *qāḍī*, he was soon active in politics, married into the ruling family, and apparently even aspired to become sultan.

Finding the situation too dangerous, he set out for Ceylon, where he visited the ruler as well as the famous Adam's Peak. After a new shipwreck on the Coromandel Coast, of eastern India, he took part in a war led by his brother-in-law and went again to the Maldives and then to Bengal and Assam. At this time he decided to resume his mission to China and sailed for Sumatra. There he was given a new ship by the Muslim sultan and started for China; his description of his itinerary contains some discrepancies.

He landed at the great Chinese port Zaytūn (identified as Ch'üan-chou near Amoy) and then travelled on inland waterways as far as Peking and back. This part of his narrative is rather brief, and the itinerary, as well as the chronology, presents many problems and difficulties, not yet surmounted, that cast shadows of doubt on his veracity.

Equally brief is his account of the return voyage via Sumatra, Malabar, and the Persian Gulf to Baghdad and Syria. In Syria he witnessed the ravages of the Black Death of 1348, visited again many towns there and in Egypt, and in the same year performed his final pilgrimage to Mecca. At last he decided to return home, sailing from Alexandria to Tunisia, then to Sardinia and Algiers, finally reaching Fès, the capital of the Mārinid sultan, Abū 'Inān, in November 1349.

But there still remained two Muslim countries not yet known to him. Shortly after his return he went to the kingdom of Granada, the last remnant of Moorish Spain, and two years later (in 1352) he set out on a journey to the western Sudan. His last journey (across the Sahara to West Africa) was taken unwillingly at the command of the Sultan. Crossing the Sahara, he spent a year in the Empire of Mali, then at the height of its power under Mansa Sulaymān; his account represents one of the most important sources of that period for the history of that part of Africa.

Toward the end of 1353 Ibn Baṭṭūṭah returned to Morocco and, at the Sultan's request, dictated his reminiscences to a writer, Ibn Juzayy (died 1355), who embellished the simple prose of Ibn Baṭṭūṭah with an ornate style and fragments of poetry. After that he passes from sight, and it is known only that he died in 1368 or 1369, holding the office of *qāḍī* in a town in Morocco, and that he was buried at his native town of Tangier.

Assessment. The claim of Ibn Baṭṭūṭah to be "the traveller of Islām" is well-founded: it is estimated that the extent of his wanderings was 75,000 miles, a figure hardly surpassed by anyone before the age of steam. He visited, with few exceptions (central Persia, Armenia, and Georgia), all Muslim countries, as well as many adjacent non-Muslim lands. While he did not discover new or unknown lands, and his contribution to scientific geography was minimal, the documentary value of his work has given it lasting historical and geographical significance. He met at least 60 rulers and a much greater number of viziers, governors, and other dignitaries; in his book he mentioned more than 2,000 persons who were known to him personally or whose tombs he visited. The majority of these persons are identifiable by independent sources, and there are surprisingly few errors in names or dates in Ibn Baṭṭūṭah's material.

His *Riḥlah*, as his book is commonly known, is an important document shedding light on many aspects of the social, cultural, and political history of a great part of the Muslim world. A curious observer interested in the ways of life in various countries, he describes his experiences with a human approach rarely encountered in official historiography. His accounts of his travels in Asia Minor, East and West Africa, the Maldives, and India form a major source for the histories of these areas, whereas the parts dealing with the Arab and Persian Near East are valuable for their wealth of detail on various aspects of social and cultural life.

On the whole, Ibn Baṭṭūṭah is reliable; only his alleged journey to Bulgary was proved to be invented, and there are some doubts concerning the Far Eastern part of his travels. A few grave and several minor discrepancies in the chronology of his travels are due more to lapses in his memory than to intentional fabrication. A number of formerly uncertain points (*e.g.*, travels in Asia Minor and the visit to Constantinople) have been cleared away by recent research and the discovery of new corroborative sources.

Another interesting aspect of the *Riḥlah* is the gradual revealing of the character of Ibn Baṭṭūṭah himself; in the course of the narrative the reader may learn the opinions and reactions of an average middle-class Muslim of the 14th century. He was deeply rooted in orthodox Islām but, like many of his contemporaries, oscillated between the pursuit of its legislative formalism and an adherence to the mystic path and succeeded in combining both. He did not offer any profound philosophy but accepted life as it came to him, leaving to posterity a true picture of himself and his times. (I.Hr.)

BIBLIOGRAPHY. C. Defremery and B.R. Sanguinetti (eds.), *Voyages d'Ibn Batoutah*, 4 vol. (1853–58), remains still the standard Arabic edition and French translation; the reprint of 1969 is useful for a new introduction and commentary by Vincent Monteil. Sir Hamilton Gibb, *The Travels of Ibn Battuta*, vol. 1 (1958), vol. 2 (1962), vol. 3 (1971), no. 110, 117, and 144, 2nd ser. of the Hakluyt Society, is an unabridged translation of high literary merit with excellent footnotes. An abridged version by the same author, *Ibn Battuta, Travels in Asia and Africa* (1929, reprinted 1969), is more popular. Herman F. Janssens, *Ibn Batoutah: Le Voyageur de l'Islam* (1948), is the best account of the traveller and his travels, short and precise but without scholarly claims. Ivan Hrbek, "The Chronology of Ibn Battuta's Travels," *Archiv Orientalní*, 30:409–486 (1962), attempts to solve the chronological problems and to reconstruct the true itinerary.

ibn Daud, Abraham ben David Halevi, also called RABAD I (b. *c.* 1110, Toledo, Castile—d. *c.* 1180, Toledo), physician and historian who was the first Jewish philosopher to draw on Aristotle's writings in a systematic fashion. He is probably more esteemed today for his history *Sefer ha-kabbala* ("Book of Tradition") than for his major philosophic work, *Sefer ha-emuna ha-rama* ("Book of Sublime Faith"), extant only in Hebrew and German translations.

Ibn Daud wrote the former work in answer to an attack on rabbinic authority by the Karaites, a heretical Jewish sect that considered only Scripture as authoritative, not the Jewish Oral Law as embodied in the Talmud, the rabbinic compendium of law, lore, and commentary. Thus, he attempted to demonstrate the unbroken chain of rabbinic tradition from Moses, providing much valuable information about contemporary Spanish Jewry, their synagogues, and their religious practices.

Deriving his Aristotelianism from the 11th-century physician and philosopher Avicenna and other Islāmic writers, Ibn Daud intended the *Emuna ha-rama* as a solution to the problem of free will. Divided into three sections dealing with physics and metaphysics, religion, and ethics, the *Emuna ha-rama* was eclipsed by the more precise Aristotelian writings of the 12th-century rabbi Maimonides.

Ibn Durayd, in full ABŪ BAKR MUḤAMMAD IBN AL-ḤASAN AL-AZDĪ IBN DURAYD (b. 837/838, Basra, Iraq—d. Aug. 13, 933, Baghdad), Arab philologist who wrote a large Arabic dictionary, *Jamharat al-lughah* ("Collection of Language").

Ibn Durayd traced his descent to an Arab tribe of Oman, and in 871, to avoid the Zanj (black African) slave rebellion, during which Basra was sacked, he moved to Oman. He stayed there more than a decade. After returning to Basra and later living in Fārs (southwestern Iran), Ibn Durayd settled in Baghdad in 920. He was given a pension there by the 'Abbāsid caliph al-Muqtadir. The anthologist Abū al-Faraj al-Iṣbahānī was his student at this time.

Ibn Durayd's dictionary was written in Fārs and was inspired in part by the earlier dictionary *Kitāb al-'ayn* of the grammarian al-Khalīl. Words are listed alphabetically in *Jamharat al-lughah*, but all permutations of the root letters are given together. Among Ibn Durayd's other works are *Kitāb al-ishtiqāq* ("Book of Derivation"), on the etymology of Arab names, and *al-Malāḥin* ("Ambiguities of Speech"), a book of ambivalent words for the use of persons forced to swear. Ibn Durayd was also a gifted poet.

ibn Ezra, Abraham ben Meir (b. 1092/93, Tudela, Emirate of Saragossa—d. 1167, Calahorra, Spain), poet, grammarian, traveller, Neoplatonic philosopher, and astronomer, best known as a biblical exegete whose commentaries contributed to the Golden Age of Spanish Judaism.

As a young man, he lived in Muslim Spain. Not much is known about his early life. He was on friendly terms with the eminent poet and philosopher Judah ha-Levi, and he travelled to North Africa and possibly to Egypt. Primarily known as a scholar and poet up to that point, in about 1140 Ibn Ezra began a lifelong series of wanderings throughout Europe, in the course of which he produced distinguished works of biblical exegesis and disseminated biblical lore.

His biblical commentaries include expositions of the Book of Job, the Book of Daniel, Psalms, and, most importantly, a work produced in his old age, a commentary on the Pentateuch, the five books of Moses. Although his exegeses are basically philological, he inserted enough philosophical remarks to reveal himself to be a Neoplatonic pantheist. At the same time, he believed that God gave form to uncreated, eternal matter, a concept somewhat at odds with his Neoplatonic emanations doctrine. Ibn Ezra, in his departure from orthodox biblical interpretation (although he extolled such orthodoxy), is sometimes held to be a precursor of the great 17th-century philosopher Spinoza. His commentary on the Pentateuch is sometimes ranked with the classic 11th-century commentaries by Rashi on the Talmud, the rabbinic compendium of law, lore, and commentary.

Ibn Ezra also translated the Hispano-Hebrew grammarians who had written in Arabic and wrote grammatical treatises. He also had a good knowledge of astronomy and cast horoscopes, and he believed in numerological mysticism as well.

ibn Ezra, Moses (ben Jacob ha-Sallaḥ) (b. *c.* 1060, Granada, Spain—d. *c.* 1139), Hebrew poet and critic, one of the finest poets of the golden age of Spanish Jewry (900–1200). He was one of the first Jewish poets to write secular verse; his surname, "ha-Sallaḥ" (Hebrew: Writer of Penitential Poems), however, was bestowed because of his penitential prayers (*seliḥot*).

Known in Arabic as Abū Hārūn Mūsā, he belonged to a prominent Hispano-Hebrew family (his three brothers were eminent scholars) and was related to the poet and biblical interpreter Abraham ibn Ezra. He fell deeply in love with a niece, the daughter of one of his older brothers, and she requited his love. His brother, however, refused his suit, giving her hand to a younger brother. This episode affected Ibn Ezra deeply, not only estranging him from his brothers and driving him from

Granada but also influencing his subsequent poetry.

Both his sacred and his secular poetry are generally considered to be unsurpassed in mastery of the Hebrew language and poetic structure and style. Much of his secular poetry is found in the cycle *Tarshish.* In it, he celebrates love, the pleasures of wine, and the beauty of birdsong and bemoans faithlessness and the onset of old age.

His later works were mostly penitential prayers of an introspective, melancholy cast; many of them are included in the liturgy of the Sefardim (Jews of Spanish or Portuguese descent) for the New Year and the Day of Atonement. He also wrote a moving elegy when his former love died in childbirth.

Ibn Ezra wrote, in Arabic, an important treatise on the poetic art, *Kitāb al-muḥāḍarah wa al-mudhākarah* ("Conversations and Recollections"; translated into Hebrew as *Shirat Yisra'el,* or "Song of Israel," in 1924 by B. Halper). Dealing with Arabic, Castilian, and Jewish poetry, the work is an important Spanish literary history.

Also in Arabic, Ibn Ezra wrote a philosophical treatise, sections of which were translated into Hebrew as *'Arugat ha-bosem* ("The Bed of Spices"). It deals with such problems as the attributes of God and the microcosmic nature of man and is largely a compilation of the thoughts of other philosophers.

Ibn Falaquera, in full SHEMTOB BEN JOSEPH IBN FALAQUERA, Falaquera also spelled PALQUERA (b. *c.* 1225—d. *c.* 1295), Spanish-born Jewish philosopher and translator who propagated a reconciliation between Jewish Orthodoxy and philosophy and defended Maimonides' *Guide of the Perplexed* against the attacks of the traditionalists.

His numerous works include *Dialogue Between a Philosopher and a Man of Piety;* an ethical treatise known as *The Balm of Sorrow;* an introduction to the study of the sciences entitled *Reshit ḥokhma* ("The Beginning of Wisdom"), which reproduces al-Farabi's *Aims of the Philosophy of Plato and Aristotle* and which was translated into Latin at the end of the 15th century; *Sefer ha-ma'alot* ("Book of Degrees"), which advocates the Neoplatonic ideal of the contemplative life; a commentary on Maimonides' *Guide* under the title *More ha-more* ("Guide of the Guide"); and an abstract of Ibn Gabirol's influential *Fons vitae* in Hebrew.

Consult the INDEX *first*

Ibn Gabirol, in full SOLOMON BEN YEHUDA IBN GABIROL, Arabic ABŪ AYYŪB SULAYMĀN IBN YAḤYĀ IBN GABIRŪT, Latin AVICEBRON, or AVENCEBROL (b. *c.* 1022, Málaga, Caliphate of Córdoba—d. *c.* 1070, Valencia, Kingdom of Valencia), one of the outstanding figures of the Hebrew school of religious and secular poetry during the Jewish Golden Age in Moorish Spain. He was also an important Neoplatonic philosopher.

Early life and career. Born in Málaga about 1022, Ibn Gabirol received his higher education in Saragossa, where he joined the learned circle of other Cordoban refugees established there around famed scholars and the influential courtier Yekutiel ibn Ḥasan. Protected by this patron, whom Ibn Gabirol immortalized in poems of loving praise, the 16-year-old poet became famous for his religious hymns in masterly Hebrew. The customary language of Andalusian literature had been Arabic, and Hebrew had only recently been revived as a means of expression for Jewish poets. At 16 he could rightly boast of being world famous:

> . . . My song is a crown for kings
> and mitres on the heads of governors.
> My body walks upon the earth,
> while my spirit ascends to the clouds.
> Behold me: at sixteen my heart
> like that of a man of eighty is wise.

He made, however, the mistake of lampooning Samuel ha-Nagid, a rising Jewish statesman and vizier in the Berber kingdom of Granada, who was also a talented poet, Talmudist, strategist, and model writer of letters. After making poetical amends, Ibn Gabirol seems to have been admitted to the favour of this vizier, whose main court encomiast he subsequently became.

This happened while the poet was involved (on the Saragossan side) in the disproportionate strife between the grammarians of Saragossa and those of Granada concerning Hebrew linguistics. Being an emancipated Cordoban, he offended the orthodox with heresies such as recommending childlessness, denunciation of the "world," Neoplatonism, and an almost insane self-aggrandizement (coupled with the use of animal epithets for his opponents). He apparently had to flee from Saragossa; the circumstances leading to his departure are described in his "Song of Strife":

> Sitting among everybody crooked and foolish
> his [the poet's] heart only was wise.
> The one slakes you with adder's poison,
> the other, flattering, tries to confuse your head.
> One, setting you a trap in his design
> will address you: "Please, my lord."
> A people whose fathers I would despise
> to be dogs for my sheep . . . .

His "Song of Strife" and other poems show that his being a synagogal poet did not protect him against the hatred of his co-religionists in Saragossa, who called him a Greek because of his secular leanings.

Against all warnings by his patron Yekutiel, Ibn Gabirol concentrated on Neoplatonic philosophy, after having composed a non-offensive collection of proverbs in Arabic, *Mukhtār al-jawāhir* ("Choice of Pearls"), and a more original, though dated, ethical treatise (based on contemporary theories of the human temperaments), also in Arabic, *Kitāb iṣlāḥ al-akhlāq* ("The Improvement of the Moral Qualities"). The latter contains chapters on pride, meekness, modesty, and impudence, which are linked with the sense of sight; and on love, hate, compassion, and cruelty, linked with hearing and other senses.

In need of a new patron after the execution of Yekutiel in 1039 by those who had murdered his king and taken over power, Ibn Gabirol secured a position as a court poet with Samuel ha-Nagid, who, becoming the leading statesman of Granada, was in need of the poet's prestige. Ibn Gabirol composed widely resounding poems with a messianic tinge for Samuel and for Jehoseph (Yūsuf), his son and later successor in the vizierate of Granada. All other biographical data about Ibn Gabirol except his place of death, Valencia, must be extrapolated from his poetry.

Poetry. The Jewish subculture of Moorish Andalusia (southern Spain) was engendered by the cultural "pressure" of the Arab peers. Ibn Gabirol's dual education, typical for the Jewish intelligentsia in the larger cities, must have encompassed both the entire Hebrew literary heritage—the Bible, Talmud, and other rabbinic writings and, in particular, Hebrew linguistics—and the Arabic, including the Qur'ān, Arabic secular and religious poetry and poetics, and the philosophical, philological, and possibly medical literature.

His poetry, like that of the entire contemporary Hebrew school, is modelled after the Arabic. Metrics, rhyme systems, and most of the highly developed imagery follow the Arabic school, but the biblical language adds a particular tinge. Many of Ibn Gabirol's poems show the influence of the knightly Arab bard al-Mutanabbī and the pessimistic Abū al-'Alā' al-Ma'arrī.

His secular topics included exaggerated, Arab-inspired self-praise, justified by the fame of the child prodigy; love poems (renouncing yet keenly articulate); praise of his noble and learned protectors, together with scathingly satirical reproach of others; dirges (the most moving of which are linked with the execution of the innocent Yekutiel); wine songs (sometimes libertine); spring and rain poems; flower portraits; the agonizingly realistic description of a skin ailment; and a long didactic poem on Hebrew grammar. Ibn Gabirol's long poetic description of a castle led to the discovery of the origins of the first Alhambra palace, built by the above-mentioned Jehoseph. Of a very rich production, about 200 secular poems and even more religious ones were preserved, though no collection of his poems survived. Many manuscript fragments of the former came to light only recently, preserved in synagogue attics by his co-religionists' respect for the Hebrew letter. Many of his religious poems were included in Jewish prayer books throughout the world.

His religious poems, in particular the poignant short prayers composed for the individual, presuppose the high degree of literacy typical of Moorish Spain, and they, too, show Arabic incentive. His famed rhymed prose poem "Keter malkhut" ("The Crown of the Kingdom"), a meditation stating the measurements of the spheres of the universe, jolts the reader into the abject feeling of his smallness but, subsequently, builds him up by a proclamation of the divine grace.

The following morning meditation exemplifies his religious poetry:

> See me at dawn, my Rock;
> my Shelter, when my plight
> I state before Thy face
> likewise again at night,
> Outpouring anguished thought—
> that Thou behold'st my heart
> and what it contemplates
> I realise in fright.
> Low though the value be
> of mind's and lip's tribute
> to Thee (accomplishes aught
> my spirit with its might?).
> Most cherish'st Thou the hymn
> we sing before Thee. Thus,
> while Thou support'st my breath,
> I praise Thee in Thine height.
> Amen.

Philosophy. His *Fountain of Life,* in five treatises, is preserved in toto only in the Latin translation, *Fons vitae,* with the author's name appearing as Avicebron or Avencebrol; it was re-identified as Ibn Gabirol's work by Salomon Munk in 1846. It had little influence upon Jewish philosophy other than on Leōn Hebreo (Judah Abrabanel) and Benedict de Spinoza, but it inspired the Kabbalists, the adherents of Jewish esoteric mysticism. Its influence upon Christian Scholasticism was marked, although it was attacked by St. Thomas Aquinas for equating concepts with realities. Grounded in Plotinus and other Neoplatonic writers yet also in Aristotelian logic and metaphysics, Ibn Gabirol developed a system in which he introduced the conception of a divine will, like the Logos (or divine "word") of Philo. It is an essential unity of creativity of and with God, mutually related like sun and sunlight, which mediates actively between the transcendent deity and the cosmos that God created out of nothingness (to be understood as the potentiality for creation). Matter emanates directly from the deity as a prime matter that supports all substances and even the "intelligent" substances, the sphere-moving powers and angels. This concept was accepted by the Franciscan school of Scholastics but rejected by the Dominicans, including St. Thomas,

for whom form (and only one, not many) and not matter is the creative principle. Since matter, according to Aristotle and Plotinus, "yearns for formation" and, thus, moving toward the nearness of God, causes the rotation of the spheres, the finest matter of the highest spheres is propelled by the strongest "yearning," which issues from God and returns to him and is active in man (akin to the last line of Dante's *Divine Comedy:* "The love which moves the sun and the other stars").

Yet, the dry treatise does not betray the passionate quest of the Neoplatonist author. A philosophical poem, beginning "That man's love," reveals the human intent. Therein, a disciple asks the poet-philosopher what importance the world could have for the deity (to be understood in Aristotelian terms as a deity that only contemplates its own perfection). The poet answers that all of existence is permeated, though to different degrees, by the yearning of matter toward formation, and he declares that this yearning may give God the "glory" that the heavens proclaim, as the Bible teaches. (F.P.B.)

BIBLIOGRAPHY. A brief biography may be found in Israel Davidson and Israel Zangwill, *Selected Religious Poems of Solomon ibn Gabirol* (1923). Other biographical treatments are in H. Graetz, *History of the Jews,* vol. 3 (1956); S.W. Baron, *A Social and Religious History of the Jews,* vol. 7–8 (1958), which also gives a characterization of the poet's works; and F.P. Bargebuhr, *El Palacio de la Alhambra en el siglo XI* (1966; *The Alhambra: A Cycle of Studies on the Eleventh Century in Moorish Spain,* 1968), with translations of secular poems—biographical information is contained in the preface to the English edition; and *Salomo ibn Gabirol: Ostwestliches Dichtertum* (1976). Ibn Ḥazm, in full ABŪ MUḤAMMAD ʿALĪ IBN AḤMAD IBN SAʿĪD IBN ḤAZM (b. Nov. 7, 994, Córdoba, Caliphate of Córdoba—d. Aug. 15, 1064, Manta Līsham, near Seville), Muslim litterateur, historian, jurist, and theologian of Islāmic Spain, famed for his literary productivity, breadth of learning, and mastery of the Arabic language. One of the leading exponents of the Ẓāhirī (literalist) school of jurisprudence, he produced some 400 works, covering jurisprudence, logic, history, ethics, comparative religion, and theology, and *The Ring of the Dove,* on the art of love.

Life. Ibn Ḥazm was born into a notable family that claimed descent from a Persian client of Yazīd, the brother of Muʿāwiyah, the first of the Umayyad dynasty rulers in Syria. Muslim families of Iberian (Spanish) background commonly adopted genealogies that identified them with the Arabs; scholars therefore tend to favour evidence suggesting that Ibn Ḥazm was a member of a family of Iberian Christian background from Manta Līsham (west of Seville). Ḥazm, his great-grandfather, probably converted to the Islāmic faith, and his grandfather Saʿīd moved to Córdoba, the capital of the caliphate. Aḥmad, his father, a devout and learned man, held a high position under al-Manṣūr and his successor, al-Muẓaffar, a father and son who ruled efficiently in the name of the caliph Hishām II. Living in the circles of the ruling hierarchy provided Ibn Ḥazm, an eager and observant student, with excellent educational opportunities. Experiences in the surroundings of the harem made an indelible impression upon him.

Circumstances for Ibn Ḥazm changed drastically upon the death of al-Muẓaffar in AD 1008, when the stability that the Umayyads had provided for more than two and one-half centuries collapsed. A bloody civil war ensued and continued until 1031, when the caliphate was abolished and a large number of petty states replaced any semblance of a centralized political structure. The family was uprooted, and Aḥmad died in 1012; Ibn Ḥazm continued to boldly and persistently support Umayyad claimants to the office of caliph, for which he was frequently imprisoned.

By 1031 he began to express his convictions and activistic inclinations through literary activity, becoming a very controversial figure. With the exception of a short stay on the island of Majorca, he apparently spent most of his time on the family estate in Manta Lisham. According to one of his sons, he produced some 80,000 pages of writing, comprising about 400 works. Less than 40 of these works are still extant.

Literary activities. The varied character of his literary activity covers an impressive range of jurisprudence, logic, history, ethics, comparative religion, and theology. His appreciation of the resources of the Arabic language and his skillful use of poetry and prose are evident in all his works. One delightful example is *The Ring of the Dove* (*Ṭawq al-ḥamāmah*), on the art of love. Probably best known for his work in jurisprudence and theology, for which the basic qualification was a thorough knowledge of the Qurʾān (the Islāmic scripture) and Ḥadīth (Tradition), he became one of the leading exponents of the Ẓāhirī school of jurisprudence. The Ẓāhirī principle of legal theory relies exclusively on the literal (*ẓāhir*) meaning of the Qurʾān and Tradition. Though his legal theories never won him many followers, he creatively extended the Ẓāhirī principle to the field of theology. He made a comparative study on the religious pluralism of his day, which is among the earliest of such studies and is highly regarded for its careful historical detail.

An activist by nature with a deep sense of the reality of God, Ibn Ḥazm lived very much in the political and intellectual world of his times; in spite of his activism, however, he was very much a nonconformist and a loner. He conversed and debated with the leading contemporaries of his area, to whom he exhibited an insatiable thirst for knowledge as well as uncompromising convictions. A most observant, compulsive analysis, meticulous in detail, and devoted to the clarity of his positions, he demanded the same of others. According to a saying of the period, the tongue of Ibn Ḥazm was a twin brother to the sword of al-Ḥajjaj, a famous 7th-century general and governor of Iraq. He attacked, in his writings, deceit, distortion, and inconsistency; but at the same time Ibn Ḥazm exhibited a sensitive spirit and expressed profound insights about the dimensions of human relationships.

He was shunned and defamed for his political and theological views. When some of his writings were burned in public, he said that no such act could deprive him of their content. Although attacks against him continued after his death, various influential defenders appeared. Though he apparently was easy to despise, Ibn Ḥazm could hardly be ignored. He was frequently and effectively quoted, so much so that the phrase "Ibn Ḥazm said" became proverbial. (J.W.F.)

BIBLIOGRAPHY. Ibn Ḥazm, *Ṭawq al-ḥamāmah,* trans. by A.J. Arberry, *The Ring of the Dove* (1953), contains many references to Ibn Ḥazm's experiences. E. García Gómez's translation in Spanish, *El collar de la paloma* (1952), contains a good introduction to Ibn Ḥazm's life and also an extensive biobibliography. The article by R. Arnaldez in the *Encyclopaedia of Islam,* new ed. (1968), is one of the few up-to-date comprehensive surveys of Ibn Ḥazm's life, works, and thought. Ignaz Goldziher, *Die Zâhiriten, ihr Lehrsystem und ihre Geschichte* (1884; *The Zâhirîs: Their Doctrine and Their History,* trans. and ed. by Wolfgang Behn, 1971), is a basic work on the Ẓāhirī school of law and Ibn Ḥazm's application of the system to theology. See the biography of Ibn Ḥazm in Ibn Khallikan, *Wafayat al-Ayan wa-Anbā' al-Zamān,* Eng. trans. by Baron MacGuckin de Slane, 4 vol. (1842–71, reprinted 1961), a translation of a famous biographical dictionary of the 13th century.

Ibn Isḥāq, in full MUḤAMMAD IBN ISḤĀQ IBN YASĀR IBN KHIYĀR (b. *c.* 704, Medina, Arabia—d. 767, Baghdad), Arab biographer of the Prophet Muḥammad whose book, in a recension by Ibn Hishām, is one of the most important sources on the Prophet's life.

Ibn Isḥāq was the grandson of an Arab prisoner captured by Muslim troops in Iraq and brought to Medina, where he was freed after accepting Islām. Ibn Isḥāq's father and two uncles collected and transmitted information about the Prophet in Medina, and Ibn Isḥāq soon became an authority on the Prophet's campaigns.

He studied in Alexandria and subsequently moved to Iraq, where he lived in the Jazīrah and Ḥīrah regions, and finally in Baghdad. Informants met on these travels furnished him with much of the information for his *Sīrah,* or life, of Muḥammad. Ibn Hishām, who died some 60 years after Ibn Isḥāq, made the revision through which it is known today (complete Eng. trans. by A. Guillaume, *The Life of Muḥammad,* 1955, and partial trans. by Edward Rehatsek as edited by Michael Edwardes, *The Life of Muhammad Apostle of Allah,* 1964). This extensive biography covers Muḥammad's genealogy and birth, the beginning of his mission and of the revelation of the Qurʾān, his migration to Medina and campaigns of conquest, and concludes with his death. Citations from the *Sīrah* also appear in the works of Arabic historians such as aṭ-Ṭabarī.

Ibn Isḥāq was criticized by some Muslim scholars, including the theologian and jurist Mālik ibn Anas. Ibn Ḥanbal accepted Ibn Isḥāq as an authority for the campaigns but not for traditions about the Prophet having legal force, on the grounds that he was not always exact enough in naming his authorities.

Ibn Janāḥ, also called IBN JONAH, ABU AL-WALĪD MARWĀN, bynames RABBI JONAH and RABBI MARINUS (b. *c.* 990, Córdoba—d. *c.* 1050, Zaragoza, Spain), perhaps the most important medieval Hebrew grammarian and lexicographer. Known as the founder of the study of Hebrew syntax, he established the rules of biblical exegesis and clarified many difficult passages.

Trained as a physician, Ibn Janāḥ practiced medicine, but, out of profound religious conviction, he also devoted much time to the scientific investigation of Hebrew so as to place biblical exegesis on a firm linguistic basis. His first work, *al-Mustalḥa* ("The Complement"), like his other works, was written in Arabic. It was a criticism of and a supplement to the verb studies of Judah ben David Ḥayyuj, the founder of scientific Hebrew grammar.

The critical aspect of Ibn Janāḥ's study embroiled him in a long and bitter dispute with the partisans of Ḥayyuj. Though his polemics against them have been lost, their substance has been preserved in his principal work, *Kitāb at-tanqīḥ* ("Book of Exact Investigation"). In the first of its two parts, *Kitāb al-luma* ("Book of the Many-Coloured Flower Beds"), Ibn Janāḥ dealt in large measure with grammar proper and included discussions of parts

of speech and prefixes and provided a detailed outline of noun declensions. Particularly important was the section on syntax, which has scarcely been surpassed.

The second part of the *Tanqīḥ, Kitāb al-uṣūl* ("Book of the Roots"), is a Hebrew lexicon in which Ibn Janāḥ showed the nuances of word roots and illustrated them with examples. He made extensive comparisons of Hebrew and Arabic and thereby managed to clarify the meaning of many words. His comments facilitated the exegesis of many abstruse biblical passages, and the origin of various corrections by modern textual critics can be found in his work.

Ibn Jubayr, in full ABŪ AL-ḤUSAYN MUḤAMMAD IBN AḤMAD IBN JUBAYR (b. 1145, Valencia, Emirate of Balansiya [Valencia]—d. Nov. 29, 1217, Alexandria), Spanish Muslim known for a book recounting his pilgrimage to Mecca.

The son of a civil servant, Ibn Jubayr became secretary to the Almohad governor of Granada, but he left that post for his pilgrimage, which was begun in 1183 and ended with his return to Granada in 1185. He wrote a lively account of this journey, *Riḥlah* (Eng. trans. by R.J.C. Broadhurst, *The Travels of Ibn Jubayr,* 1952; French trans. by Maurice Gaudefroy-Demombynes, *Voyages,* 1949–56).

It is a valuable source for the history of the time, containing memorable descriptions of his voyages across the Mediterranean in Genoese ships, his unhappy encounters with both Christian and Muslim customs collectors, the Cairo of Saladin, his trip up the Nile to Upper Egypt, and across the Red Sea to Jidda, Mecca, and Medina, and of his return by way of Iraq, Syria, and Sicily. Ibn Jubayr journeyed east twice more without recording his travels. The second trip lasted from 1189 to 1191; the third, begun in 1217, was ended by his death in Egypt.

Ibn Kathīr, in full ʿIMĀD AD-DĪN ISMĀʿĪL IBN ʿUMAR IBN KATHĪR (b. *c.* 1300, Bursa, Byzantine Empire—d. February 1373, Damascus), Muslim theologian and historian who became one of the leading intellectual figures of 14th-century Syria.

Ibn Kathīr was educated in Damascus and upon completion of his studies obtained his first official appointment in 1341, when he joined an inquisitorial commission formed to determine certain questions of heresy. Thereafter he received various semi-official appointments, culminating in June/July 1366 with a professorial position at the Great Mosque of Damascus.

As a scholar, Ibn Kathīr is best remembered for his 14-volume history of Islām, *al-Bidāyah wa an-nihāyah* ("The Beginning and the End"), a work that utilized nearly all the available sources and formed the basis of a number of writings by later historians. Ibn Kathīr was also a noted student of Ḥadīth (the transmitted chain of sayings traced back to the Prophet Muḥammad); his *Kitāb al-jāmiʿ* is an alphabetical listing of the Companions of the Prophet and the sayings that each transmitted, thus reconstructing the chain of authority for each *ḥadīth.*

Ibn Khaldūn, in full WALĪ AL-DĪN ʿABD AR-RAḤMĀN IBN MUḤAMMAD IBN MUḤAMMAD IBN ABĪ BAKR MUḤAMMAD IBN AL-ḤASAN IBN KHALDŪN (b. May 27, 1332, Tunis—d. March 17, 1406, Cairo), the greatest Arab historian, who developed one of the earliest nonreligious philosophies of history, contained in his masterpiece, the *Muqaddimah* ("Introduction to History"). He also wrote a definitive history of Muslim North Africa.

Background and early life. Ibn Khaldūn was born in Tunis in 1332; the Khaldūnīyah quarter in Tunis still stands almost unchanged and, in it, the house where he is believed to have been born.

As Ibn Khaldūn relates in his autobiography (*at-Taʿrīf bi-Ibn Khaldūn*), the family claimed descent from Khaldūn, who was of South Arabian stock, came to Spain in the early years of the Arab conquest, and settled in Carmona. The family subsequently moved to Seville, played an important part in the civil wars of the 9th century, and was long reckoned among the three leading houses of that city. In the course of the next four centuries, the Ibn Khaldūns successively held high administrative and political posts under the Umayyad, Almoravid, and Almohad dynasties; other members of the family served in the army, and several were killed at the Battle of az-Zallāqah (1086), which temporarily halted the Christian reconquest of Spain. But the respite thus won proved short, and in 1248, just before the fall of Seville and Córdoba, the Ibn Khaldūns and many of their countrymen judged it prudent to cross the Straits of Gibraltar and landed at Sabtah (now Ceuta, a Spanish exclave), on the northern coast of Morocco.

There the refugees from Spain were of a much higher level of socio-economic status than the local North Africans, and the family was soon called to occupy the leading administrative posts in Tunis. The historian's father also became an administrator and soldier but soon abandoned his career to devote himself to the study of theology, law, and letters. In Ibn Khaldūn's words:

> He was outstanding in his knowledge of Arabic and had an understanding of poetry in its different forms and I can well remember how the men of letters sought his opinion in matters of dispute and submitted their works to him.

In 1349, however, the Black Death struck Tunis and took away both his father and his mother.

Education and diplomatic career. Ibn Khaldūn gives a detailed account of his education, listing the main books he read and describing the life and works of his teachers. He memorized the Qurʾān, studied its principal commentaries, gained a good grounding in Muslim law, familiarized himself with the masterpieces of Arabic literature, and acquired a clear and forceful style and a capacity for writing fluent verse that was to serve him well in later life when addressing eulogistic or supplicatory poems to various rulers. Striking by their absence are books on philosophy, history, geography, or other social sciences; this does not mean that he did not study these subjects—scholars know that he wrote summaries of several books by the 12th-century Arab philosopher Averroës—but it is to be presumed that Ibn Khaldūn acquired most of his very impressive knowledge in these fields after he had completed his formal education.

This came at the age of 20, when he was given a post at the court of Tunis, followed three years later by a secretaryship to the Sultan of Morocco in Fez. By then he was married. After two years of service, however, he was suspected of participation in a rebellion and was imprisoned. Released after nearly two years and promoted by a new ruler, he again fell into disfavour, decided to leave Morocco, and crossed over to Granada, for whose Muslim ruler he had done some service in Fez and whose prime minister, the brilliant writer Ibn al-Khaṭīb, was a good friend. Ibn Khaldūn was then 32 years old.

The following year he was sent to Seville to conclude a peace treaty with Pedro I the Cruel of Castile. There he saw "the monuments of my ancestors." Pedro "treated me with the utmost generosity, expressed his satisfaction at my presence and showed awareness of the preeminence of our ancestors in Seville." Pedro even offered him a post in his service, promising to restore his ancestral estates, but Ibn Khaldūn politely declined. He gladly accepted the village that the Sultan of Granada bestowed on him, however, and, feeling once more secure, brought over his family, which he had left in safety in Constantine. But, to quote him once more, "enemies and intriguers" turned the all-powerful prime minister, Ibn al-Khaṭīb, against him and raised suspicions regarding his loyalty; it can be conjectured that the task of these enemies must have been greatly facilitated by the apparent jealousy between the two most brilliant Arab intellectuals of the age. Once more, Ibn Khaldūn found it necessary to take his leave, and he returned to Africa. The following 10 years saw him change employers and employment with disconcerting rapidity and move from Bejaia (Bougie) to Tilimsān (Tlemcen), Biskra, Fez, and once more to Granada, where he made an unsuccessful effort to save his old rival and friend, Ibn al-Khaṭīb, from being killed by order of its ruler.

During this period Ibn Khaldūn served as prime minister and in several other administrative capacities, led a punitive expedition, was robbed and stripped by nomads, and spent some time "studying and teaching." This extreme mobility is partly explained by the instability of the times. The Almohad Empire, which had embraced the whole of North Africa and Muslim Spain, had broken down in the middle of the 13th century, and the convulsive process from which Morocco, Algeria, and Tunisia were subsequently to emerge was under way; wars, rebellions, and intrigues were endemic, and no man's life or employment was secure. But in Ibn Khaldūn's case two additional factors might be suspected—a certain restlessness and a capacity to make enemies, which may account for his constant complaints about the "intriguers" who turned his employers against him.

The Muqaddimah: Ibn Khaldūn's philosophy of history. In 1375, craving solitude from the exhausting business of politics, Ibn Khaldūn took the most momentous step of his life: he sought refuge with the tribe of Awlād ʿArīf, who lodged him and his family in the safety of a castle, Qalʿat ibn Salāmah, near what is now the town of Frenda, Alg. There he spent four years, "free from all preoccupations," and wrote his massive masterpiece, the *Muqaddimah* (an introduction to history). His original intention, which he subsequently achieved, was to write a universal history of the Arabs and Berbers, but before doing so he judged it necessary to discuss historical method, with the aim of providing the criteria necessary for distinguishing historical truth from error. This led him to formulate what the 20th-century English historian Arnold Toynbee has described as "a philosophy of history which is undoubtedly the greatest work of its kind that has ever yet been created by any mind in any time or place," a statement that goes even beyond the earlier eulogy by Robert Flint:

> As a theorist on history he had no equal in any age or country until Vico appeared, more than three hundred years later. Plato, Aristotle and Augustine were not his peers . . . .

But Ibn Khaldūn went even further. His study of the nature of society and social change led him to evolve what he clearly saw was a new science, which he called *ʿilm al-ʿumrān* ("the science of culture") and which he defined thus:

> This science . . . has its own subject, viz., human society, and its own problems, viz., the social transformations that succeed each other in the nature of society.

Indeed it is not too much to claim, as did a contemporary Arab scholar, Sāṭiʿ al-Ḥuṣrī, that in Book I of the *Muqaddimah,* Ibn Khal-

dūn sketches a general sociology; in Books II and III, a sociology of politics; in Book IV, a sociology of urban life; in Book V, a sociology of economics; and in Book VI, a sociology of knowledge. The work is studded with brilliant observations on historiography, economics, politics, and education. It is held together by his central concept of *'aṣabīyah,* or "social cohesion." In this cohesion, which arises spontaneously in tribes and other small kinship groups, but which can be intensified and enlarged by a religious ideology, that provides the motive force that carries ruling groups to power. Its inevitable weakening, due to a complex combination of psychological, sociological, economic, and political factors, which Ibn Khaldūn analyzes with consummate skill, heralds the decline of a dynasty or empire and prepares the way for a new one, based on a group bound by a stronger cohesive force.

It is difficult to overstress Ibn Khaldūn's amazing originality. Muhsin Mahdi, a contemporary Iraqi-American scholar, has shown how much his approach and fundamental concepts owe to classical Islāmic theology and philosophy, especially Averroism. And, of course, he drew liberally on the historical information accumulated by his predecessors and was doubtless influenced by their judgments. But nothing in these sources or, indeed, in any known Greek or Latin author can explain his deep insight into social phenomena, his firm grasp of the links binding the innumerable and apparently unrelated events that constitute the process of historical and social change.

One last point should be made regarding his basic philosophy of history. Clearly, for Ibn Khaldūn, history was an endless cycle of flowering and decay, with no evolution or progress except for that from primitive to civilized society. But, in brief descriptions of his own age, which have not received as much attention as they deserve, he showed that he could both visualize the existence of sharp turning points in history and recognize that he was witnessing one of them: "When there is a general change of conditions . . . as if it were a new and repeated creation, a world brought into existence anew." The main cause he gives for this great change is the Black Death, with its profound effect on Muslim society, but he was fully aware of the impact of the Mongol invasions, and he may also have been impressed by the development of Europe, the merchants and ships of which thronged the seaports of North Africa and some of the soldiers of which served as mercenaries in the Muslim armies.

Journey to Egypt. During his stay in Qal'at ibn Salāmah, Ibn Khaldūn not only completed the first draft of the *Muqaddimah* but he also wrote part of his massive history, *Kitab al-'ibar,* a work that is not of such universal significance but which does constitute the best single source on the history of Muslim North Africa. Such a task, however, required frequent reference to other books and archives; this, together perhaps with nostalgia for the more active world of politics, drew him back to city life. A severe illness finally convinced him to leave his refuge; he secured permission to return to Tunis, where he "engaged exclusively in scholarly work," completing much of his history. But once more he aroused both the jealousy of a prominent scholar and the suspicion of the ruler, and in 1382, at the age of 50, he received permission to sail to Egypt, ostensibly for the purpose of performing the pilgrimage to Mecca.

After 40 days he landed in Alexandria and shortly afterward was in Cairo, then, as now, by far the largest and most opulent city in the Arab world. Its impact on him was profound: "I saw the metropolis of the ear, the garden of the world, the gathering place of the nations . . . the palace of Islām, the seat of dominion . . . ." His curiosity about Cairo was evidently of long duration, for he quotes the replies several eminent North Africans had made to his enquiries on their return from that city, including: "He who has not seen it does not know the power of Islām."

Within a few days "scholars thronged on me, seeking profit in spite of the scarcity of merchandise [!] and would not accept my excuses, so I started teaching at al-Azhar," the famous Islāmic university. Shortly afterward, the new Mamlūk ruler of Egypt, Barqūq, with whom he was to remain on good terms except for one or two brief periods of misunderstanding, appointed him to a professorship of jurisprudence at the Qamḥīyah college and, within five months, made him chief judge of the Mālikī rite, one of the four recognized rites of Sunnī Islām. Barqūq also successfully interceded with the ruler of Tunis to allow Ibn Khaldūn's family to rejoin him, but the ship carrying them foundered in the port of Alexandria, drowning all on board.

Later years. Ibn Khaldūn took his judicial duties quite seriously; he claimed to have been guided in his judgments solely by the merits of each case and attempted to reform the numerous abuses that had developed in the administration of justice. He must have struck the tolerant and easy-going Egyptians as somewhat dour and puritanical, and his own opinion is recorded by one of his students: "These Egyptians behave as though the Day of Judgement would never come!" At any rate, "trouble gathered against me from every quarter and darkened the atmosphere between me and the rulers"; he was dismissed, then served again as chief judge only for one year, toward the end of his life. But he was given another professorship—he pointed out that endowed chairs were plentiful in Cairo—and spent his time teaching, writing, and revising his *Muqaddimah.* He was also able to perform the pilgrimage to Mecca, sailing from aṭ-Ṭawr, near Suez, and returning by way of Upper Egypt. Some years later he went to Damascus and the Holy Cities of Palestine, thus further widening his knowledge of the eastern Arab world. It is interesting to note that he visited the tomb of Abraham in Hebron and the Church of the Nativity in Bethlehem, both Abraham and Jesus being honoured prophets, but he refused to enter the Holy Sepulchre, "the site of what they claim to be the Crucifixion," an event that Muslims deny occurred.

Ibn Khaldūn was forced to play a minor part in the palace revolt of 1389, but he apparently did so under duress, and Barqūq seems to have borne him no grudge. Otherwise, one gets the impression of a ripe, wise, and respected scholar, surrounded by admirers, sought out by visitors, peacefully enjoying the calm pleasures of old age. He had every reason to expect this state of affairs to continue, but fate had reserved for him one more encounter, the most dramatic of all.

Rescue by Timur. In 1400 Timur and his victorious Tatar horde invaded Syria, and the new sultan of Egypt, Faraj, went out to meet them, taking Ibn Khaldūn and other notables with him. Shortly thereafter, the Mamlūk army returned to Egypt, leaving Ibn Khaldūn in besieged Damascus. The situation soon becoming hopeless, the civilian notables of the city started negotiations with Timur, during the course of which he asked to meet Ibn Khaldūn. The latter was thereupon lowered over the city wall by ropes and spent some seven weeks in the Tatar camp, of which he has given a detailed description in his autobiography.

Timur treated him with respect, and the historian used all his accumulated worldly wisdom and courtly flattery to charm the ferocious world conqueror. Probably dreaming of further conquests, Timur asked for a detailed description of North Africa and got not only a short lecture on that subject, on the caliphate, and on *'asabīyah* but also an extensive written report. Ibn Khaldūn took advantage of Timur's good mood to secure a safe-conduct for the civilian employees left in Damascus and permission for himself to return to Egypt but not before he witnessed the sack of the city and the burning of its great mosque.

After an exchange of gifts with Timur, he headed southward but was robbed and stripped by a band of Bedouins and only with difficulty made his way to the coast. There a "ship belonging to Ibn Osman, the sultan of Rum, stopped, carrying an ambassador to the sultan of Egypt" and took him to Gaza, establishing his only contact with what was soon to become the dominant power in the Middle East—the Ottoman dynasty. The rest of his journey to Cairo was uneventful, as indeed were the remaining years of his life. He died in 1406 and was buried in the cemetery outside Bāb an-Naṣr, one of Cairo's main gates.

Significance. Just as Ibn Khaldūn had no known predecessors in the history of Muslim thought, so he had no worthy successors. But he did make an impact on his students in Cairo, one of whom, al-Maqrīzī, showed an insight worthy of his master in analyzing the inflation that was rampant in his time and was the author of several voluminous works that cast much light on contemporary social conditions. Indeed, it is perhaps not too fanciful to attribute to Ibn Khaldūn's influence the remarkable revival of historical writing in 15th-century Egypt. Later, several distinguished 16th- and 17th-century Ottoman scholars and statesmen took a keen interest in Ibn Khaldūn's work, and a partial translation of the *Muqaddimah* into Turkish was made in the 18th century. But it was only after the 1860s, when a complete French translation of the *Muqaddimah* appeared, that Ibn Khaldūn found the worldwide audience his incomparable genius deserved. (C.I.)

BIBLIOGRAPHY. An autobiography was published by Muhammad al-Tanji, *At-ta'rīf bi-Ibn Khaldūn* (1951); an excellent translation of the introduction is Franz Rosenthal, *Ibn Khaldun: The Muqaddimah,* 3 vol. (1958); a translation of passages dealing with the social sciences is provided by Charles Issawi in *An Arab Philosophy of History* (1950). The best comprehensive study is Muhsin Madhi, *Ibn Khaldun's Philosophy of History* (1957; reprinted 1964); the encounter with Timur is described in Walter Fischel, *Ibn Khaldun and Tamerlane* (1952).

Ibn Khallikān, in full SHAMS AD-DĪN ABŪ AL-'ABBĀS AḤMAD IBN MUḤAMMAD IBN KHALLIKĀN (b. Sept. 22, 1211, Irbil, Iraq—d. Oct. 30, 1282, Damascus), Muslim judge and author of a classic Arabic biographical dictionary. Ibn Khallikān studied in Irbil, Aleppo, and Damascus.

Ibn Khallikān was an assistant to the chief judge of Egypt until 1261, when he became *qāḍī al-quḍāt* (chief judge) of Damascus. He adhered to the Shāfi'ī branch of Muslim law, and for the first years had deputy judges of the other three main branches. In 1271 he was dismissed. He taught in Cairo until he regained his judgeship and returned to Damascus in 1278.

Ibn Khallikān's fame rests on his biographical dictionary *Wafayāt al-a'yān wa-anbā' abnā' az-zamān* ("Deaths of Eminent Men and History of the Sons of the Epoch"; trans. by Baron de Slane, *Ibn Khallikan's Biographical Dictionary,* 1842–74). He began arranging material for it in 1256 and worked on it until 1274, continuing to improve it with marginal notes. He excluded the Prophet Muḥammad, the caliphs, and other subjects about whom adequate information already existed. Ibn Khallikān selected factual material for his biographies with intelligence and scholarship and rounded them out with poetry and anecdotes. His book is a valuable source for his contemporaries and contains excerpts from earlier biographies no longer extant.

Ibn Miskawayh, in full ABŪ ʿALĪ AḤMAD IBN MUḤAMMAD IBN YAʿQŪB IBN MISKAWAYH (b. *c.* 930—d. 1030, Rayy, Iran), Persian scientist, philosopher, and historian whose scholarly works became models for later generations of Islāmic thinkers.

Little is known of Ibn Miskawayh's personal life. It is believed he converted to Islām from Zoroastrianism, the religion of pre-Islāmic Iran. His interests included alchemy and poetry, and some 20 works are attributed to him. His most notable contributions, however, were in ethics and history. His moral treatise *Tahdhīb al-akhlāq,* influenced by the Aristotelian concept of the mean, is considered one of the best statements of Islāmic philosophy. The Islāmic philosopher Naṣīr ad-Dīn Ṭūsī (died 1274) modelled his *Akhlāq Naṣīrī* ("The Naṣīrī Ethics") on the *Tahdhīb al-akhlāq.*

As a historian Ibn Miskawayh is noted for his Persian "nationalist" bias and his conviction that the history of peoples offers moral instruction, as well as his abandonment of legends as a source. His universal history *Kitāb tajārib al-umam wa taʿāqub al-himam* (7 vol.; Eng. trans. by D.S. Margoliouth, *The Eclipse of the ʿAbbasid Caliphate,* 1921), was noted for its use of all available sources and greatly stimulated the development of Islāmic historiography.

Ibn Muqlah, in full ABŪ ʿALĪ MUḤAMMAD IBN ʿALĪ IBN MUQLAH (b. 886, Baghdad—d. 940, Baghdad), one of the foremost calligraphers of the ʿAbbāsid Age (750–1258), reputed inventor of the first cursive style of Arabic lettering, the *naskhī* script, which replaced the angular Kūfic as the standard of Islāmic calligraphy. In the *naskhī* script Ibn Muqlah introduced the rounded forms and curved lines that in later styles were refined to give Arabic writing the flowing beauty for which it is renowned. Although *naskhī* was originally intended for use in copying the Qurʾān, by the 11th century it was used widely for royal and common correspondence and as architectural decoration.

Among the other scripts invented by Ibn Muqlah were the *tawqī* and the more elegant *thuluth.* In addition to his calligraphic work, Ibn Muqlah led a colourful political life. He was appointed vizier three times, and three times he lost that office for being involved in political intrigue. The third time, he was sentenced to life in prison, where he died in 940.

ibn Paquda, Bahya ben Joseph: *see* Bahya ben Joseph ibn Pakuda.

Ibn Qutaybah, in full ABŪ MUḤAMMAD ʿABD ALLĀH IBN MUSLIM AD-DĪNAWARĪ IBN QUTAYBAH (b. 828, al-Kūfah, Iraq—d. 889, Baghdad), writer of *adab* literature—that is, of literature exhibiting wide secular erudition and also of theology, philology, and literary criticism. He introduced an Arabic prose style outstanding for its simplicity and ease, or "modern" flavour.

Little is known of Ibn Qutaybah's life. Of Khorāsānian stock, he was *qāḍī* (religious judge) of Dinawar (*c.* 851–870). From *c.* 871 until his death he taught at Baghdad.

The 14 surviving volumes definitively ascribed to Ibn Qutaybah include the *Kitāb adab al-kātib* ("Secretary's Guide"), a compendium of Arabic usage and vocabulary; *Kitāb al-ʿArab* ("Arab Book"), a defense of Arab rather than Iranian cultural preeminence in the caliphate; *Kitāb al-maʿārif* (Book of Knowledge"), a handbook of history; *Kitāb ash-shiʿr wa ash-shuʿarāʾ* ("Book of Poetry and Poets"), a chronological anthology of early Arabic poetry, with an introduction that presented Ibn Qutaybah's canons of literary criticism; and *Kitāb ʿuyūn al-akhbar* ("Book of Choice Narratives"), a collection of *adab* studies dealing with the authority of the overlord, the conduct of war, nobility, character, eloquence, and friendship, valued for its wealth of examples from history, poetry, and proverbs.

Ibn Rushd (Islāmic philosopher): *see* Averroës.

Ibn Saʿūd, in full ʿABD AL-ʿAZĪZ IBN ʿABD AR-RAḤMĀN IBN FAYṢAL IBN TURKĪ ʿABD ALLĀH IBN MUḤAMMAD ĀL SAʿŪD (b. *c.* 1880, Riyadh, Arabia—d. Nov. 9, 1953, aṭ-Ṭāʾif, Saudi Arabia), tribal and Muslim religious leader who formed the modern state of Saudi Arabia and initiated the exploitation of its oil.

The young leader. The Saʿūds ruled much of Arabia from 1780 to 1880; but, while Ibn Saʿūd was still an infant, his family, driven out

Ibn Saʿūd
Camera Press

by their rivals, the Rashīds, became penniless exiles in Kuwait. In 1901 Ibn Saʿūd, then 21, set out from Kuwait with 40 camelmen in a bold attempt to regain his family's lands.

Reaching their old family capital, Riyadh, the little group slipped into the town by night (January 1902). The Rashīdī governor slept in the castle but came out every morning after dawn. Ibn Saʿūd lay hidden until the governor emerged. Then, rushing forward with his men, he killed him and seized the castle. This exploit roused the former supporters of his dynasty. They rallied to so magnetic a leader, and in two years of raids and skirmishes Ibn Saʿūd reconquered half of central Arabia.

Ibn Rashīd, however, appealed for help to the Turks, who sent troops; Ibn Saʿūd suffered a defeat at their hands on June 15, 1904. But he was not driven from central Arabia and soon reconstituted his forces, the years 1907 to 1912 being passed in desultory fighting. The Turks eventually left, unable to supply their troops.

Role of religion in Ibn Saʿūd's policy. Ibn Saʿūd decided, in the years before World War I, to revive his dynasty's support for Wahhābism, an extremist Muslim puritan revival. Ibn Saʿūd was in fact a devoted puritan Muslim—to him the Qurʾān was literally the word of God, and his life was regulated by it. Yet he was also aware that religious fanaticism could serve his ambition, and he deliberately fostered it, founding a militantly religious tribal organization known as the Ikhwān (Brethren). This fanatical brotherhood encouraged his followers to fight and to massacre their Arab rivals, and it helped him to bring many nomadic tribesmen under more immediate control.

He was able to persuade the religious leaders to declare it a religious duty of all Wahhābīs to abandon nomadism and to build houses at the desert wells. Thus settled, they could more easily be levied into his army. But the scheme was unrealistic: nomads who sold their flocks were often unable to cultivate and were reduced to penury. The destitution of the more fanatical tribes, however, made them more eager to raid, and Ibn Saʿūd was not slow to suggest that they plunder the subjects of Ibn Rashīd.

During World War I Ibn Saʿūd entered into a treaty with the British (December 1915), accepting protectorate status and agreeing to make war against Ibn Rashīd, who was being supported by the Turks. But despite British arms and a subsidy of £5,000 a month from the British government (which continued until 1924) he was inactive until 1920, arguing that his subsidy was insufficient. During 1920–22, however, he marched against Ibn Rashīd and extinguished Rashīdī rule, doubling his own territory but without significantly increasing his meagre revenue.

Ibn Saʿūd now ruled central Arabia except for the Hejaz region along the Red Sea. This was the territory of Sharīf Ḥusayn of Mecca, who had become king of the Hejaz during the war and who declared himself caliph (head of the Muslim community) in 1924. Sharīf Ḥusayn's son ʿAbd Allāh had become ruler of Transjordan in 1921, and another son, Fayṣal, king of Iraq. Ibn Saʿūd, fearing encirclement by this rival dynasty, decided to invade the Hejaz. He was then at the height of his powers; his strong personality and extraordinary charm had won the devotion of all his subjects. A skillful politician, he worked closely with the religious leaders, who always supported him. Relying on the Ikhwān to eliminate his Arab rivals, he sent them to raid his neighbours, then cabled the British, whose imperial interests were involved, that the raid was against his orders. In 1924 the Ikhwān took Mecca, and the Hejaz was added to his dominions.

At this point, there were no more rivals whom Ibn Saʿūd could conquer, for those remaining had treaties with Britain. But the Ikhwān had been taught that all non-Wahhābī Muslims were infidels. When Ibn Saʿūd forbade further raiding, they charged him with treachery, quoting his own words against him. In 1927 they invaded Iraq against his wishes. They were repulsed by British aircraft, but Ibn Saʿūd's authority over them had vanished, and on March 29, 1929, the Ikhwān, the fanatics whom he himself had trained, were crushed by Ibn Saʿūd himself at the Battle of Sibilla.

Foundation of Saudi Arabia. This battle opened a new era; thereafter Ibn Saʿūd's task was government, not conquest. In 1932 he formally unified his domains into the Kingdom of Saudi Arabia. An absolute monarch, he had no regular civil service or professional administrators. All decisions were made by him or by those he personally delegated for a particular task. There was little money, and he himself was not interested in finance. In May 1933 Ibn Saʿūd signed his first agreement with an American oil company. Not until March 1938 did the company strike oil, and work virtually ceased during World War II, so that Ibn Saʿūd was again nearly penniless.

Saudi Arabia took no part in the war, but toward its end the exploitation of oil was resumed. By 1950 Ibn Saʿūd had received a total of about $200,000. Three years later, he was getting some $2,500,000 a week. The effect was disastrous on the country and on Ibn Saʿūd. He had no idea of what to do with all the money, and he watched helplessly the triumph of everything he hated. His austere religious views were offended. The secluded, penurious, hard, but idealistic, life of Arabia was vanishing. Such vast sums of money drew half the swindlers in the Middle East to this puritan religious sanctum. Ibn Saʿūd was unable to cope with financial adventurers. His last years were marked by severe physical and emotional deterioration. He died at aṭ-Ṭāʾif in 1953. (J.B.Gl.)

BIBLIOGRAPHY. David A. Howarth, *The Desert King* (1964), is the best biography; J.B. Glubb, *War in the Desert* (1960), describes Ikhwān raids and meetings with Ibn Sa'ūd. See also H.St.J. Philby, *Arabia of the Wahhabis* (1930). Philby knew Ibn Sa'ūd intimately but was strongly prejudiced in his favour. Ameen F. Rihani, *Ibn Sa'oud of Arabia* (1928), is an account of a visit to Ibn Sa'ūd in 1923.

Ibn Shaddād, in full ABŪ AL-MAḤĀSIN YŪSUF IBN RĀFI' IBN SHADDĀD BAHĀ' AD-DĪN (b. 1145, Mosul, Iraq—d. 1234, Aleppo, Syria), Arab writer and statesman, author of the *Sīrat Salāḥ ad-Dīn* ("Life of Saladin"). He was first a teacher at Baghdad and then professor at Mosul.

In 1187, after making the pilgrimage to Mecca, Ibn Shaddād entered the service of Saladin, who was waging war against the Christians in Palestine. Ibn Shaddād sought Saladin's favour by urging him to the vigorous prosecution of this war and presented him with his treatise on the laws and discipline of sacred war. He remained constantly devoted to Saladin and was employed on various embassies and in departments of the civil government, being appointed judge of the army and judge of Jerusalem. After Saladin's death Ibn Shaddād remained the friend of his son Malik aẓ-Ẓāhir, who appointed him judge of Aleppo. There he employed some of his wealth in the foundation of colleges. When Malik aẓ-Ẓāhir died, his son Malik al-'Azīz was a minor, and Ibn Shaddād had the chief power in the regency, using it for the patronage of learning. He lived in retirement after the abdication of Malik al-'Azīz.

ibn Shem Ṭov, Joseph ben Shem Ṭov (b. *c.* 1400—d. *c.* 1460), Jewish philosopher and Castilian court physician who attempted to mediate the disdain shown for philosophy by contemporary Jewish scholars by undertaking a reconciliation of Aristotelian ethical philosophy with Jewish religious thought, best exemplified by his influential *Kevod Elohim* (written 1442; "The Glory of God"). Here he expounded his belief that answers sought through philosophical inquiry can be valuable in one's quest for religious knowledge and that even religious principles should be subjected to such inquiry. Although as a philosopher he advocated intellectual pursuits, Joseph maintained that the immortality of the soul was assured not by intellectual development but by conscientious religious observance. He also upheld the value of mysticism and intuition in the understanding of religious precepts.

Ibn Sīnā (Persian physician): *see* Avicenna.

Ibn Taymīyah, in full TAQĪ AD-DĪN ABŪ AL-'ABBĀS AḤMAD IBN 'ABD AS-SALĀM IBN 'ABD ALLĀH IBN MUḤAMMAD IBN TAYMĪYAH (b. 1263, Harran, Mesopotamia—d. Sept. 26, 1328, Cairo), a reformer of Islām's most forceful theologians who, as a member of the Pietist school founded by Ibn Ḥanbal, sought the return of the Islāmic religion to its sources: the Qur'ān and the *sunnah*, revealed writing and the prophetic tradition. He is also the source of the Wahhābīyah, a mid-18th-century traditionalist movement of Islām.

Ibn Taymīyah was born in Mesopotamia. Educated in Damascus, where he had been taken in 1268 as a refugee from the Mongol invasion, he later steeped himself in the teachings of the Pietist school. Though he remained faithful throughout his life to that school, of whose doctrines he had an unrivalled mastery, he also acquired an extensive knowledge of contemporary Islāmic sources and disciplines: the Qur'ān (Islāmic scripture), the Ḥadīth (sayings attributed to the Prophet Muḥammad), jurisprudence (*fiqh*), dogmatic theology (*kalām*), philosophy, and Ṣūfī (Islāmic mystical) theology.

His life was marked by persecutions. As early as 1293 Ibn Taymīyah came into conflict with local authorities for protesting a sentence, pronounced under religious law, against a Christian accused of having insulted the Prophet. In 1298 he was accused of anthropomorphism (ascribing human characteristics to God) and for having criticized, contemptuously, the legitimacy of dogmatic theology.

During the great Mongol crisis of the years 1299 to 1303, and especially during the occupation of Damascus, he led the resistance party and denounced the suspect faith of the invaders and their accomplices. During the ensuing years Ibn Taymīyah was engaged in intensive polemic activity: either against the Kasrawān Shī'ah in the Lebanon; the Rifā'īyah, a Ṣūfī religious brotherhood; or the *ittiḥādīyah* school, which taught that the Creator and the created become one, a school that grew out of the teaching of Ibn al-'Arabī (died 1240), whose monism he denounced.

In 1306 he was summoned to explain his beliefs to the governor's council, which, although it did not condemn him, sent him to Cairo; there he appeared before a new council on the charge of anthropomorphism and was imprisoned in the citadel for 18 months. Soon after gaining his freedom, he was confined again in 1308 for several months in the prison of the *qāḍīs* (Muslim judges who exercise both civil and religious functions) for having denounced the worship of saints as being against religious law (Sharī'ah).

He was sent to Alexandria under house arrest in 1309, the day after the abdication of the sultan Muḥammad ibn Qalāwūn and the advent of Baybars II al-Jāshnikīr, whom he regarded as a usurper and whose imminent end he predicted. Seven months later, on Ibn Qalāwūn's return, he was able to return to Cairo. But in 1313 he left Cairo once more with the Sultan, on a campaign to recover Damascus, which was again being threatened by the Mongols.

Ibn Taymīyah spent his last 15 years in Damascus. Promoted to the rank of schoolmaster, he gathered around him a circle of disciples from every social class. The most famous of these, Ibn Qayyim al-Jawzīyah (died 1350), was to share in Ibn Taymīyah's renewed persecutions. Accused of supporting a doctrine that would curtail the ease with which a Muslim could traditionally repudiate a wife and thus ease the ill effects of the practice, Ibn Taymīyah was incarcerated on orders from Cairo in the citadel of Damascus from August 1320 to February 1321.

In July 1326 Cairo again ordered him confined to the citadel for having continued his condemnation of saint worship, in spite of the prohibition forbidding him to do so. He died in prison, deprived of his books and writing materials, and was buried in the Ṣūfī cemetery amid a great public gathering. His tomb still exists and is widely venerated.

Ibn Taymīyah left a considerable body of work—often republished in Syria, Egypt, Arabia, and India—that extended and justified his religious and political involvements and was characterized by its rich documentation, sober style, and brilliant polemic. In addition to innumerable *fatwās* (legal opinions based on religious law) and several professions of faith, the most beautiful of which is the *Wāsiṭīyah*, two works merit particular attention. One is his *As-Siyāsat ash-sharʿīyah* ("Treatise on Juridical Politics"), available in French and English translations. The other, *Minhāj as-sunnah* ("The Way of Tradition"), is the richest work of comparative theology surviving from medieval Islām.

Ibn Taymīyah desired a return to the sources of the Muslim religion, which he felt had been altered too often, to one extent or another, by the different religious sects or schools. The sources were the Qur'ān and the *sunnah:* revealed writing and the prophetic tradition. The *ijmāʿ*, or community consensus, had no value in itself, he insisted, unless it rested on those two sources. His traditionalism, however, did not prevent Ibn Taymīyah from allowing analogical reasoning (*qiyās*) and the argument of utility (*maṣlaḥah*) a large place in his thought, on the condition that both rested on the objective givens of revelation and tradition. Only such a return to sources, he felt, would permit the divided and disunited Muslim community to refind its unity.

In theodicy (the justification of God as good when evil is observable in the world), Ibn Taymīyah wished to describe God as he is described in the Qur'ān and as the Prophet did in the *sunnah,* which led him to side with theological schools in disagreement with contemporary opinion. This position was the point of departure for a critique, often conducted with very subtle argument, of the ideas of such dogmatic theologians as al-Ash'arī or Fakhr ad-Dīn ar-Rāzī, such philosophers as Avicenna and Averroès, or such mystics as Ibn al-'Arabī.

Concerning praxes (practices), Ibn Taymīyah believed that one could only require, in worship, those practices inaugurated by God and his Prophet and that one could only forbid, in social relations, those things forbidden by the Qur'ān and the *sunnah.* Thus, on the one hand, he favoured a revision of the system of religious obligations and a brushing aside of condemnable innovations (*bidʿah*), and, on the other, he constructed an economic ethic that was more flexible on many points than that espoused by the contemporary schools.

In politics Ibn Taymīyah recognized the legitimacy of the first four caliphs, but he rejected the necessity of having a single caliphate and allowed for the existence of many emirates. Within each emirate he demanded that the prince apply the religious law strictly and rely on it for his legal opinion, and Ibn Taymīyah demanded from those under the prince's jurisdiction that they obey the established authority except where it required disobedience to God, every Muslim being required to "will the good and forbid the bad" for the benefit of the common welfare.

Though Ibn Taymīyah had numerous religious and political adversaries in his own time, he has strongly influenced modern Islām for the last two centuries. He is the source of the Wahhābīyah, a strictly traditionist movement founded by Muḥammad ibn 'Abd al-Wahhāb (died 1792), who took his ideas from Ibn Taymīyah's writings. Ibn Taymīyah also influenced various reform movements that have posed the problem of reformulating traditional ideologies by a return to sources. (H.L.)

Farrukh. *Ibn Taimiyya on Public and Private Law in Islam* (1966).

ibn Tibbon, Jacob ben Machir, also called DON PROFIAT (b. *c.* 1236, Marseille—d. *c.* 1312, Montpellier, Fr.), French Jewish physi-

cian, translator, and astronomer whose work was utilized by Copernicus and Dante. He was highly regarded as a physician and served as regent of the faculty of medicine at the University of Montpellier. He was the grandson of the renowned translator Samuel ben Judah ibn Tibbon.

Jacob translated into Hebrew a large number of works, including Arabic versions of Euclid's *Elements* and Ptolemy's encyclopaedic work on astronomy, the *Almagest*. He also translated Arabic works by al-Ghazālī (1058–1111) and Averroës.

As a student of astronomy, Jacob described a quadrant of his own invention. Adapted by mariners, it came to be known as "Quadrans Judaicus." His book on astronomical tables, *Luḥot* ("Tables"), was utilized by Dante in his *Divine Comedy*.

He joined his cousin Judah ben Moses ibn Tibbon, who was a rabbi in Montpellier and also a translator, in actively supporting the followers of Maimonides; the Maimonists interpreted the Bible allegorically and studied science and philosophy.

ibn Tibbon, Judah ben Saul (b. 1120, Granada, Spain—d. *c.* 1190, Marseille), Jewish physician and translator of Jewish Arabic-language works into Hebrew; he was also the progenitor of several generations of important translators.

Persecution of the Jews forced Judah to flee Granada in 1150, and he settled in Lunel, in southern France, where he practiced medicine, according to an account in 1160 by a contemporary traveller, Benjamin of Tudela.

In his Hebrew versions, which became standard, Judah made accessible various classic philosophic works by Arabic-speaking Jews who had frequently utilized the concepts of both Muslim and Greek philosophers. Thus, Judah's translations served to disseminate Arabic and Greek culture in Europe. In addition he often coined Hebrew terms to accommodate the ideas of the authors he was translating. Among his outstanding renditions from Arabic into Hebrew are the following:

1. *Amanat wa-i'tiqadat* of Sa'adia ben Joseph (882–942), a major rabbinic authority, translated as *Sefer ha-emunot we-ha-de'ot* (1186; *Beliefs and Opinions*, 1948). It is a Jewish philosophical classic discussing the relationship between reason and divine revelation.

2. *Al-Hidayah ila farā'id al-qulūb* of Bahya ben Joseph ibn Pakuda, a rabbinic judge, translated as *Ḥovot ha-levavot* (*Duties of the Heart*, 1925–47). This work, which became a widely read classic of Jewish devotional literature, examines the ethics of a man's acts and the intentions that give the acts meaning.

3. *Sefer ha-Kuzari* ("Book of the Khazar") by the Spanish Hebrew poet Judah ha-Levi (*c.* 1085–*c.* 1141), which recounts in dialogue form the arguments presented before the king of the Khazars by a rabbi, a Christian, a Muslim scholar, and an Aristotelian philosopher, with the subsequent conversion of the king to Judaism.

Judah ben Saul ibn Tibbon also translated the grammar of Abū al-Walīd Marwān ibn Janāḥ (*c.* 990–*c.* 1050), which became a basis for the work of future Hebrew grammarians. In addition, he wrote a well-known ethical will, *Musar Ab* (about 1190; "A Father's Admonition"), to his son Samuel ben Judah ibn Tibbon, who subsequently also became a noteworthy translator.

ibn Tibbon, Moses ben Samuel (b. Marseille, fl. 1240–83), Jewish physician like his father, Samuel ben Judah ibn Tibbon, and his paternal grandfather, Judah ben Saul ibn Tibbon, and an important translator of Arabic-language works into Hebrew. His translations served to disseminate Greek and Arab culture throughout Europe. Besides original works, which included commentaries with an allegorical bias on the Pentateuch, the Song of Songs, and Haggadic passages (those not dealing with Jewish law) in the Talmud, he also translated Arabic-language works by Jews and Arabs dealing with philosophy, mathematics, astronomy, and medicine.

Following the family tradition, he translated from the Arabic a number of works by the medieval Jewish philosopher Maimonides (1135–1204), notably portions of Maimonides' commentary on the Mishna (one of two parts of the Talmud), his treatises on hygiene, poisons, and logic, and his *Sefer ha-mitzwot*, an analysis of the 613 commandments of the Pentateuch.

Among the Arabic writings, Moses translated the commentaries on Aristotle by Averroës (1126–98), a philosopher who later had a marked influence on Christian theologians; a medical digest by the Persian philosopher and physician Avicenna (980–1037); and a philosophical work (known in English as the "Book of Principles") by the Muslim philosopher and Aristotelian disciple al-Fārābī (878–950). Moses also translated Euclid's *Elements*.

ibn Tibbon, Samuel ben Judah (b. *c.* 1150, Lunel, Fr.—d. *c.* 1230, Marseille), Jewish translator and physician whose most significant achievement was an accurate and faithful rendition from the Arabic into Hebrew of Maimonides' classic *Dalālat al-ḥā'irīn* (Hebrew *More nevukhim*; English *The Guide of the Perplexed*).

From his father, Judah ben Saul ibn Tibbon, Samuel received a thorough grounding in medicine, Jewish law and lore, and Arabic. Like his father, Samuel earned his living as a physician; he also travelled extensively in France, Spain, and Egypt.

After corresponding with Maimonides to elucidate difficult passages in the *Guide*, in about 1190 Samuel published his translation. This work, which interprets scripture and rabbinic theology in the light of Aristotelian philosophy, has influenced both Jewish and Christian theologians. In the translating process, he enriched the Hebrew language through the borrowing of Arabic words and the adoption of the Arabic practice of forming verbs from substantives.

He also translated Maimonides' treatise on resurrection and his commentary on *Pirqe avot* ("Sayings of the Fathers"), which appears in the Talmud; in addition, he translated the works of several Arabic commentators on the writings of Aristotle and Galen. Samuel ibn Tibbon was the father of the eminent translator Moses ben Samuel ibn Tibbon.

Ibn Ṭufayl, in full MUḤAMMAD IBN ʿABD AL-MALIK IBN MUḤAMMAD IBN MUḤAMMAD IBN ṬUFAYL AL-QAYSĪ, also called ABŪ BAKR MUḤAMMAD IBN ʿABD AL-MALIK IBN MUḤAMMAD IBN MUḤAMMAD IBN ṬUFAYL AL-QAYSĪ (b. 1109/10, Guādix, Spain—d. 1185/86, Marrakech, Mor.), Moorish philosopher and physician who is known for his *Ḥayy ibn yaqẓan* (*c.* 1175; Eng. trans. by L.E. Goodman, *Ḥayy ibn Yaqẓan by Ibn Ṭufayl*, 1972), a philosophical romance in which he describes the self-education and gradual philosophical development of a man who passes the first 50 years of his life in complete isolation on an uninhabited island. Ibn Ṭufayl also wrote a number of medical treatises in Arabic and served as the court physician and general adviser to the Almohad ruler Abū Yaʿqūb Yūsuf from 1163 to 1184.

Ibn Tūmart, in full ABŪ ʿABD ALLĀH MUḤAMMAD IBN TŪMART (b. *c.* 1080, Anti-Atlas Mountains, Mor.—d. August 1130), Berber spiritual and military leader who founded the al-Muwaḥḥidūn confederation in North Africa (*see* Almohads). The doctrine he taught combined a strict conception of the unity of God with a program of juridical and puritanical moral reform, based on a study of the Qur'ān and of tradition.

Ibn Waḥshiyah (fl. *c.* 900), Middle Eastern agriculturist and toxicologist alleged to have written *al-Filāḥah an-Nabaṭīyah* ("Nabatean Agriculture"), a major treatise dealing with plants, water sources and quality, weather conditions, the causes of deforestation, soils and their improvement, crop cultivation, and other similar subjects. The Arabic text, although not original, having been derived mainly from Greek sources, especially from the *Geoponics*, became a basic resource for later treatments such as that by the Muslim agriculturalist, Ibn al-ʿAwwām, who flourished in the second half of the 12th century.

Ibn Zuhr, in full ABŪ MARWĀN ʿABD AL-MALIK IBN ABĪ AL-ʿALAʾ ZUHR, also called AVENZOAR OF ABUMERON (b. *c.* 1090, Seville—d. 1162, Seville), one of medieval Islām's foremost thinkers and the greatest medical clinician of the western caliphate.

An intensely practical man, he disliked medical speculation; for that reason, he opposed the teachings of the Persian master physician Avicenna. In his *at-Taysīrfī al-mudāwāt wa at-tadbīr* ("Practical Manual of Treatments and Diet"), later translated into Hebrew and Latin, he described serious pericarditis (inflammation of the membranous sac surrounding the heart) and mediastinal abscesses (affecting the organs and tissues in the thoracic cavity above the diaphragm, excluding the lungs) and outlined surgical procedures for tracheotomy, excision of cataracts, and removal of kidney stones. He also discussed excessive contraction and dilation of the pupil (miosis and mydriasis) and advocated use of the narcotic plant *Mandragora* for treatment of ocular disease.

A teacher of the prominent Muslim physician Averroës, Ibn Zuhr had great influence on medical practice in Christian Europe.

Ibo (people): *see* Igbo.

ibogaine, hallucinogenic drug and the principal iboga alkaloid, found in the stems, leaves, and especially in the roots of the African shrub *Tabernanthe iboga*. Ibogaine was isolated from the plant in 1901 and was synthesized in 1966. In small doses it acts as a stimulant; in large doses it has been used as a narcotic. In West Africa and the Congo, tribesmen have used iboga extracts or chewed the root of the plant in order to remain calm, but alert, while stalking game.

Chemically, ibogaine is an indole hallucinogen that can block the action of serotonin (the indole amine transmitter of nerve impulses) in brain tissue. Ibogaine occurs as a crystalline solid and is soluble in alcohol and other organic solvents. Ibogaine hydrochloride is a crystalline salt, soluble in alcohol and in water. It was proposed for medical use as an antidepressant, but it was rejected in favour of more practical and less toxic drugs.

Ibrahim (b. Nov. 4, 1615, Constantinople—d. Aug. 18, 1648, Constantinople), Ottoman sultan whose unstable character made him prey to the ambitions of his ministers and relatives and to his own self-indulgence; as a consequence, the Ottoman state was weakened by war, misrule, and rebellion during his reign (1640–48).

Early in his reign under the guidance of the able but ambitious grand vizier Kemankeş Kara Mustafa Paşa, İbrahim established peaceful relations with Persia and Austria (1642) and recovered the Sea of Azov hinterland from the Cossacks. After the execution of Kara Mustafa (1644), İbrahim, acting on the advice of his new ministers, sent an expedition to Crete; thus began the long war with Venice (1645–69). Having spent his early life in confinement, İbrahim was mentally unsta-

ble and came increasingly under the influence of the women of the harem and his court ministers. His eccentricities and extravagance necessitated the imposition of new taxes, arousing discontent in Constantinople and the outlying provinces. He was deposed on Aug. 8, 1648, by a Janissary uprising supported by the ulama (religious notables) and was executed 10 days later.

Ibrāhīm, Tall (Iraq): *see* Cuthah.

Ibrāhīm al-Ḥāqilānī, Latinized form ABRAHAM ECCHELLENSIS (b. Feb. 18, 1605, Ḥāqil, Syria—d. July 15, 1664, Rome, Papal States [Italy]), Maronite Catholic scholar noted for his Arabic translation of books of the Bible.

Ordained a deacon, Ibrāhīm taught Arabic and Syriac first at Pisa, then in Rome, and in 1628 he published a Syriac grammar. In 1640 he began collaborating on the Le Jay Polyglot Bible, publishing the Book of Ruth in Arabic, Syriac, and Latin and 3 Maccabees in Latin and Arabic. In 1646 he became professor at the Collège de France, Paris, but in 1652 he returned to Rome to work on preparation of the Arabic version of the Bible, published in 1671. Among his Latin translations were a history of the patriarchs of Alexandria (1653) and three books of the *Conics* by the geometrician Apollonius of Perga (1661).

Ibrāhīm Lodī (d. April 21, 1526, Pānipat, India), last Afghan sultan of Delhi of the Lodi dynasty, a suspicious tyrant who increasingly alienated his nobles during his reign.

The son of Sikandar, Ibrāhīm succeeded to the throne on his father's death (Nov. 21, 1517) and was quickly faced with continuing disputes between the royal family and Afghani nobles. One noble, Dawlat Khān Lodī, governor of the Punjab, fearing for his own safety, called in the Mughal king of Kābul, Bābur, who advanced toward Delhi and defeated and killed Ibrāhīm in the first battle of Pānipat. This victory led to the founding of the Mughal Empire in India.

İbrahim Müteferrika (b. *c.* 1670, Kolozsvár, Transylvania [now Cluj-Napoca, Rom.]—d. 1745, Constantinople, Ottoman Empire [now Istanbul, Tur.]), Ottoman diplomat known for his contributions to the 18th-century reform movement in the Ottoman Empire; he sponsored the introduction of printing into the Turkish domains.

A Hungarian by origin, İbrahim converted to Islām and entered the Ottoman diplomatic service. He took part in negotiations with Austria and Russia and was active in promoting the Ottoman-French alliance (1737–39) against Austria and Russia and Ottoman-Swedish action against Russia.

In 1727 İbrahim established a printing press on which he printed works on language, history, geography, and the natural and physical sciences. In 1731 he wrote a treatise that showed the causes of Ottoman decline, described European forms of government and military organization, and proposed reforms in the Ottoman system.

İbrahim Paşa (b. *c.* 1493, Párga [Greece]—d. March 15, 1536, Constantinople, Ottoman Empire [now Istanbul, Tur.]), Ottoman grand vizier (1523–36) who played a decisive role in diplomatic and military events during the reign of Sultan Süleyman I (1520–66).

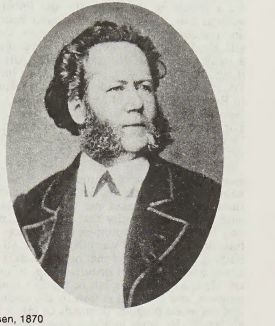
Ibrahim's first military expedition was to Egypt (1524), where he reestablished order and introduced administrative and fiscal measures that solidified Ottoman authority there. After his Egyptian success, he was appointed commander in chief of the Danubian campaigns of 1526, 1529 (a siege of Vienna), and 1532. In 1533, vested with full powers, he represented the sultan in negotiations with the Holy Roman emperor Charles V over the Hungarian question; these negotiations established most of Hungary as tributary to the Ottomans and confirmed the extraordinary powers of the grand vizier.

In the eastern provinces, İbrahim, as early as 1526, had put down a revolt of the Turkmen tribes in Anatolia (Asia Minor). At the outbreak of war with the Ṣafavids of Iran, as commander of the Ottoman army, he occupied Tabriz, Iran, in August 1534. Five months later Baghdad was taken. In Constantinople (January 1536) he conducted preliminary negotiations with the representative of the French king for a commercial treaty. Alarmed by his usurpation of the titles of sovereignty and fearing for his own throne, Süleyman had him executed.

Ibrahim Pasha (b. 1789, Kavalla, Rumelia [now Kavála, Greece]—d. Nov. 10, 1848, Cairo, Egypt), viceroy (*vali*) of Egypt under Ottoman rule and a general of outstanding ability.

A son, or adopted son, of the famous *vali* Muḥammad ʿAlī, in 1805 Ibrahim joined his father in Egypt, where he was made governor of Cairo. During 1816–18 he successfully commanded an army against the Wahhabite rebels in Arabia. Muḥammad ʿAlī sent him on a mission to the Sudan in 1821–22, and on his return he helped train the new Egyptian army on European lines. When the Ottoman sultan Mahmud II asked for Egyptian assistance to crush the Greek revolt, an expedition commanded by Ibrahim landed in Greece in 1824 and subdued the Morea (Peloponnese), but a combined British, French, and Russian squadron eventually compelled the Egyptian force to withdraw.

It was in Syria that Ibrahim and his French chief of staff, O.J.A. Sève (Suleiman Pasha al-Faransawi), won military fame. In 1831–32, after a disagreement between Muḥammad ʿAlī and the Ottoman sultan, Ibrahim led an Egyptian army through Palestine and defeated an Ottoman army at Homs. He then forced the Bailan Pass and crossed the Taurus, gaining a final victory at Konya on Dec. 21, 1832. By the Convention of Kütahya, signed on May 4, 1833, Syria and Adana were ceded to Egypt, and Ibrahim became governor-general of the two provinces.



Ibrahim's administration was relatively enlightened. At Damascus he created a consultative council of notables and suppressed the feudal regime. But his measures were harshly applied and roused sectarian opposition. Sultan Mahmud resented the Egyptian occupation, and in 1839 an Ottoman army invaded Syria. At Nizip on June 24 Ibrahim won his last and greatest victory; the Ottoman fleet deserted to Egypt. Fearing the disintegration of the Ottoman Empire, the European powers negotiated the Treaty of London in July 1840, by which Muḥammad ʿAlī forfeited Syria and Adana in return for the hereditary rule of Egypt. British naval forces threatened the Egyptians, who evacuated the occupied territories in the winter of 1840–41. By 1848 Muḥammad ʿAlī had become senile, and Ibrahim was appointed viceroy but ruled for only 40 days before his death.

İbrahim Şinasi Efendi: *see* Şinasi, İbrahim.

Ibsen, Henrik (Johan) (b. March 20, 1828, Skien, Nor.—d. May 23, 1906, Kristiania [formerly Christiania; now Oslo]), major Norwegian playwright of the late 19th century who introduced to the European stage a new order of moral analysis that was placed against a severely realistic middle-class background and developed with economy of action, penetrating dialogue, and rigorous thought.

Ibsen was born at Skien, a small lumbering town of southern Norway. His father was a respected general merchant in the community until 1836, when he suffered the permanent disgrace of going bankrupt. As a result, he sank into a querulous penury, which his wife's withdrawn and sombre religiosity did nothing to mitigate. There was no redeeming the family misfortunes; as soon as he could, aged just 15, Henrik moved to Grimstad, a hamlet of some 800 persons 70 miles (110 km) down the coast. There he supported himself meagerly as an apothecary's apprentice while studying nights for admission to the university. And during this period he used his few leisure moments to write a play.

This work, *Catilina* (1850; *Catiline*), grew out of the Latin texts Ibsen had to study for his university examinations. Though not a very

Ibsen, 1870
Universitetsbiblioteket, Oslo

good play, it showed a natural bent for the theatre and embodied themes—the rebellious hero, his destructive mistress—that would preoccupy Ibsen as long as he lived. In 1850 he went to Christiania (known since 1925 by its older name of Oslo), studied for entrance examinations there, and settled into the student quarter—though not, however, into classes. For the theatre was in his blood, and at the age of only 23 he got himself appointed director and playwright to a new theatre at Bergen, in which capacity he had to write a new play every year.

This was a wonderful opportunity for a young man eager to work in drama, but it brought Ibsen up against a range of fearsome problems he was ill-equipped to handle. In the medieval Icelandic sagas Norway possessed a heroic, austere literature of unique magnificence; but the stage on which these materials had to be set was then dominated by the drawing-room drama of the French playwright Eugène Scribe and by the actors, acting traditions, and language of Denmark. Out of these materials young Ibsen was asked to create a "national drama."

First at Bergen and then at the Norwegian Theatre in Christiania from 1857 to 1862, Ibsen tried to make palatable dramatic fare out of incongruous ingredients. In addition to writing plays which were uncongenial to him and unacceptable to audiences, he did a lot of directing. He was too inhibited to make a forceful director, but too intelligent not to pick up a great deal of practical stage wisdom from his experience. After he moved to Christiania and after his marriage to Suzannah Thoresen in 1858, he began to develop qualities of independence and authority that had been hidden before.

Two of the last plays that Ibsen wrote for the Norwegian stage showed signs of new spiritual energy. *Kjærlighedens komedie* (1862; *Love's Comedy*), a satire on romantic illusions, was violently unpopular, but it expressed an authentic theme of anti-idealism that Ibsen

would soon make his own; and in *Kongsemnerne* (1863; *The Pretenders*) he dramatized the mysterious inner authority that makes a man a man, a king, or a great playwright. This one play was in fact the national drama after which Ibsen had been groping so long, and before long it would be recognized as such. But it came too late; though the play was good, the theatre in Christiania was bankrupt, and Ibsen's career as a stage writer was apparently at an end.

But the death of his theatre was the liberation of Ibsen as a playwright. Without regard for a public he thought petty and illiberal, without care for traditions he found hollow and pretentious, he could now write for himself. He decided to go abroad, and applied for a small state grant. He was awarded part of it, and in April 1864 he left Norway for Italy. For the next 27 years he lived abroad, mainly in Rome, Dresden, and Munich, returning to Norway only for short visits in 1874 and 1885. For reasons that he sometimes summarized as "small-mindedness," his homeland had left a very bitter taste in his mouth.

With him into exile Ibsen brought the fragments of a long semi-dramatic poem to be named *Brand*. Its central figure is a dynamic rural pastor who takes his religious calling with a blazing sincerity that transcends not only all forms of compromise but all traces of human sympathy and warmth as well. "All or nothing" is the demand that his god makes of Brand and that Brand in turn makes of others. He is a moral hero, but he is also a moral monster, and his heart is torn by the anguish that his moral program demands he inflict on his family. He never hesitates, never ceases to tower over the petty compromisers and spiritual sluggards surrounding him. Yet in the last scene where Brand stands alone before his god, a voice thunders from an avalanche that, even as it crushes the pastor physically, repudiates his whole moral life as well: "He is the god of love," says the voice from on high. So the play is not only a denunciation of small-mindedness but a tragedy of the spirit that would transcend it. The poem faced its readers not just with a choice but with an impasse; the heroic alternative was also a destructive (and self-destructive) alternative. In Norway *Brand* was a tremendous popular success, even though (and in part because) its central meaning was so troubling.

Hard on the heels of *Brand* (1866) came *Peer Gynt* (1867), another drama in rhymed couplets presenting an utterly antiheroical view of human nature. If Brand is a moral monolith, Peer Gynt is a capering will-o'-the-wisp, a buoyant and self-centred opportunist who is aimless, yielding, and wholly unprincipled, yet who remains a lovable and beloved rascal. The wild and mocking poetry of *Peer Gynt* has ended by overshadowing *Brand* in the popular judgment. But these two figures are interdependent and antithetical types who under different guises run through most of Ibsen's classic work. Like Don Quixote and Sancho Panza, they are universal archetypes as well as unforgettable individuals.

With these two poetic dramas, Ibsen won his battle with the world; he paused now to work out his future. A philosophical-historical drama on the Roman emperor Julian the Apostate had long been on his mind; he finished it in 1873 under the title *Kejser og Galilaeer* (*Emperor and Galilean*), but in a ten-act form too diffuse and discursive for the stage. He wrote a modern satire, *De unges forbund* (1869; *The League of Youth*) and then after many preliminary drafts a prose satire on small-town politics, *Samfundets støtter* (1877; *Pillars of Society*). But Ibsen had not yet found his proper voice; when he did, its effect was not to criticize or reform social life but to blow it up. The explosion came with *Et dukkehjem* (1879; *A Doll's House*).

This play presents a very ordinary family—a bank manager named Torvald Helmer, his wife Nora, and their three little children. Torvald supposes himself the ethical member of the family, while his wife assumes the role of a pretty irresponsible in order to flatter him. Into this snug, not to say stifling, arrangement intrude several hard-minded outsiders, one of whom threatens to expose a fraud that Nora had once committed (without her husband's knowledge) in order to obtain a loan needed to save his life. When Nora's husband finally learns about this dangerous secret, he reacts with outrage and repudiates her out of concern for his own social reputation. Utterly disillusioned about her husband, whom she now sees as a hollow fraud, Nora declares her independence of him and their children and leaves them, slamming the door of the house behind her in the final scene.

Audiences were scandalized at Ibsen's refusal in *A Doll's House* to scrape together (as any other contemporary playwright would have done) a "happy ending," however shoddy or contrived. But that was not Ibsen's way; his play was about knowing oneself and being true to that self. Torvald, who had thought all along that he was a sturdy ethical agent, proves to be a hypocrite and a weak compromiser; his wife is not only an ethical idealist, but a destructive one, as severe as Brand.

The setting of *A Doll's House* is ordinary to the point of transparency. Ibsen's plot exploits with cold precision the process known as "analytic exposition." A secret plan (Nora's forgery) is about to be concluded (she can now finish repaying the loan), but before the last step can be taken, a bit of the truth must be told, and the whole deception unravels. It is a pattern of stage action at once simple and powerful. Ibsen used this technique (which he gained for him an international audience.

Ibsen's next play, *Gengangere* (1881; *Ghosts*), created even more dismay and distaste than its predecessor by showing worse consequences of covering up even more ugly truths. Ostensibly the play's theme is congenital venereal disease, but on another level, it deals with the power of ingrained moral contamination to undermine the most determined idealism. Even after lecherous Captain Alving is in his grave, his ghost will not be laid to rest. In the play, the lying memorial that his conventionally-minded widow has erected to his memory burns down even as his son goes insane from inherited syphilis and his illegitimate daughter advances inexorably toward her destiny in a brothel. The play is a grim study of contamination spreading through a family under cover of the widowed Mrs. Alving's timidly respectable views.

A play dealing with syphilis on top of one dealing with a wife's abandonment of her family sealed Ibsen's reputation as a Bad Old Man, but progressive theatres in England and all across the Continent began putting on his plays. His audiences were often small, but there were many of them, and they took his plays very seriously. So did conventionally-minded critics; they denounced Ibsen as if he had desecrated all that was sacred and holy. Ibsen's response took the form of a direct dramatic counterattack. Doctor Stockmann, the hero of *En folkefiende* (1882; *An Enemy of the People*), functions as Ibsen's personal spokesman. In the play he is a medical officer, charged with inspecting the public baths on which the prosperity of his native town depends. When he finds their water to be contaminated, he says so publicly, though the town officials and townspeople try to silence him. When he still insists on speaking the truth, he is officially declared an "enemy of the people." Though portrayed as a victim, Doctor Stockmann, like all Ibsen's idealistic truth-tellers after Brand, also carries within him a deep strain of destructiveness. (His attacks on the baths will, after all, ruin the town; it's just that by comparison with the truth, he doesn't care about this.) Ibsen's next play would make this minor chord dominant.

In *Vildanden* (1884; *The Wild Duck*) Ibsen completely reversed his viewpoint by presenting on stage a gratuitous, destructive truth-teller whose compulsion visits catastrophic misery on a family of helpless innocents. With the help of a number of comforting delusions, Hjalmar Ekdal and his little family are living a somewhat squalid but essentially cheerful existence. Upon these helpless weaklings descends an infatuated truth-teller, Gregers Werle. He cuts away the moral foundations (delusive as they are) on which the family has lived, leaving them despondent and shattered by the weight of a guilt too heavy to bear. The havoc wrought on the Ekdal family is rather pathetic than tragic; but the working out of the action achieves a kind of mournful poetry that is quite new in Ibsen's repertoire.

Each of this series of Ibsen's classic modern dramas grows by extension or reversal out of its predecessor; they form an unbroken string. The last of the sequence is *Rosmersholm* (1886), in which variants of the destructive saint (Brand) and the all-too-human rogue (Peer) once more strive to define their identities, but this time on a level of moral sensitivity that gives the play a special air of silver serenity. Ex-parson Johannes Rosmer is the ethical personality, while the adventuress Rebecca West is his antagonist. Haunting them both out of the past is the spirit of the parson's late wife, who had committed suicide under the subtle influence, we learn, of Rebecca West, and because of her husband's high-minded indifference to sex. At issue for the future is a choice between bold, unrestricted freedom and the ancient, conservative traditions of Rosmer's house. But even as he is persuaded by Rebecca's emancipated spirit, she is touched by his staid, decorous view of life. Each is contaminated by the other, and for differing but complementary reasons, they tempt one another toward the fatal millpond in which Rosmer's wife drowned. The play ends with a double suicide in which both Rosmer and Rebecca, each for the other's reasons, do justice on themselves.

Ibsen's playwriting career by no means ended with *Rosmersholm*, but thereafter he turned toward a more self-analytic and symbolic mode of writing that is quite different from the plays that made his world reputation. Among his later plays are *Fruen fra havet* (1888; *The Lady from the Sea*), *Hedda Gabler* (1890), *Bygmester Solness* (1892; *The Master Builder*), *Lille Eyolf* (1894; *Little Eyolf*), *John Gabriel Borkman* (1896), and *Naar vi døde vaagner* (1899; *When We Dead Awaken*). Two of these plays, *Hedda Gabler* and *The Master Builder*, are vitalized by the presence of a demonically idealistic and totally destructive female such as first appeared in *Catiline*. Another obsessive personage in these late plays is an aging artist who is bitterly aware of his failing powers. Personal and confessional feelings infuse many of these last dramas; perhaps these resulted from Ibsen's decision in 1891 to return to Norway, or perhaps from the series of fascinated, fearful dalliances he had with young women in his later years. After his return to Norway, Ibsen continued to write plays until a stroke in 1900 and another a year later reduced him to a bedridden invalid. He died in Kristiania in 1906.

Ibsen was in the forefront of those early modern authors whom one could refer to as the great disturbers; he belongs with Fyodor Dostoyevsky, Friedrich Nietzsche, and William Blake. Ibsen wrote plays about mostly prosaic and commonplace persons; but from them he elicited insights of devastating directness, great subtlety, and occasional flashes of rare beauty His plots are not cleverly contrived games but

deliberate acts of cognition, in which persons are stripped of their accumulated disguises and forced to acknowledge their true selves, for better or worse. Thus, he made his audiences reexamine with painful earnestness the moral foundation of their being. During the last half of the 19th century he turned the European stage back from what it had become—a plaything and a distraction for the bored—to make it what it had been long ago among the ancient Greeks, an instrument for passing doom-judgment on the soul. (R.M.A.)

Lyons (comp.), *Critical Essays on Henrik Ibsen* (1987); and Rolf Fjelde (ed.), *Ibsen: A Collection of Critical Essays* (1965). Among the many full-length critical studies are P.F.D. Tennant, *Ibsen's Dramatic Technique* (1948, reprinted 1965); M.C. Bradbrook, *Ibsen, the Norwegian: A Revaluation*, new ed. (1966); J.L. Wisenthal (ed.), *Shaw and Ibsen* (1979); and John S. Chamberlain, *Ibsen: The Open Vision* (1982).

ibuprofen, nonsteroidal anti-inflammatory drug that is often used to treat dysmenorrhea and the symptoms of rheumatoid arthritis. Like aspirin, ibuprofen is effective against minor pain, fever, and tissue-swelling and works by inhibiting prostaglandin synthesis. (Prostaglandins are diverse and potent body chemicals that, among other effects, aid blood clotting and work to sensitize nerve endings.)

Ibuprofen may irritate the gastrointestinal tract, and other ill effects may result if the drug is combined with certain other drugs. Allergy to aspirin may indicate a similar reaction to ibuprofen. The drug is not recommended for use by children under age 12, and, like aspirin and acetaminophen, it should not be used during pregnancy except under medical supervision. Ibuprofen is marketed under such trade names as Advil and Nuprin.

Ibuse Masuji (b. Feb. 15, 1898, Kamo, Hiroshima prefecture, Japan—d. July 10, 1993, Tokyo), Japanese novelist noted for sharp but sympathetic short portraits of the foibles of ordinary people.

Ibuse was first interested in poetry and painting but was encouraged to write fiction when he entered Waseda University in 1918. His greatest popularity came after World War II, but he was already known in the 1930s for such stories as the satiric *Sanshōuo* (1929; *The Giant Salamander*) and the historical novel *Jon Manjiro hyōryūki* (1937; *John Manjiro, the Castaway: His Life and Adventures*).

Ibuse's wide interests led him to deal with many kinds of themes, particularly intellectual fantasies employing animal allegories, historical fiction, and tales of country life. His sharp eye for satire and subtle sense of humour prevent his evident compassion from lapsing into sentimentality. After the war, *Honjitsu kyūshin* (1949; *No Consultations Today*), characterizing a town by the patients who come to the doctor's office, and *Yōhai taichō* (1950; *A Far-Worshiping Commander*), an antimilitary satire, were especially well received. Ibuse received the Order of Culture for the novel *Kuroi ame* (1966; *Black Rain*), which deals with the long-lasting social effects of the bombing of Hiroshima.

Ibycus (fl. 6th century BC, Samos, Ionia [Greece]), lyric poet from the Greek colony of Rhegium in Italy, one of the nine lyric poets recognized by later Greek criticism.

Ibycus left Sicily for the Aegean island of Samos, where the tyrant Polycrates became his patron. Ancient authorities found it hard to distinguish his early work from that of Stesichorus, but even in the few surviving fragments of Ibycus' lyrics there are signs of marked individuality. The most prominent fragments describe the charms of handsome youths and reveal the aging poet's fear of falling in love. Cicero regarded him as more devoted to love poetry than Alcaeus and Anacreon. A late legend relates how Ibycus called a flock of cranes passing overhead to witness as he was being murdered by robbers near Corinth. One of the robbers later saw the cranes over Corinth and involuntarily referred to them as the avengers of Ibycus, a remark that led to the unmasking of the murderers.

IC analysis (linguistics): *see* immediate constituent analysis.

Ica, *departamento* (formed 1866) of southern Peru, composed of the western slope of the Andes, the arid Pacific coast, the northern end of the coastal range, and the Chincha Islands. Ica is sparsely inhabited, except in irrigated areas such as the Chincha and Ica valleys. Cotton cultivation is widespread; the white, long-stapled cotton grown in the irrigated lands of the Peruvian coast originated in the Pisco valley. Grapes and other fruits are also important products; at Ica city, the departmental capital, the well-known brandy named for the port of Pisco (through which it is exported) is made. Fishing is important at Pisco and San Andrés. Area 8,235 square miles (21,328 square km). Pop. (1991 est.) 527,400.

Ica, city, capital of Ica *departamento*, southern Peru. It is located about 30 miles (48 km) from the Pacific Ocean and 170 miles (275 km) southeast of Lima in the extremely arid and intensively irrigated coastal valley of the Ica River. Ica lies within a wide expanse of high plains that border the Andean foothills to the east. A town (originally called Valverde) established nearby in 1563 was moved to the present site of Ica after being destroyed by an earthquake in 1569. It was officially renamed San Jerónimo de Ica in 1640. The region has long been known for the cultivation and processing of cotton and grapes.

A university was established in the city in 1961, and the Cabrera Museum has a collection of stones and pottery of the Nazca culture (*c.* 200 BC–AD 600). Ica is connected by rail and road to the port of Pisco 40 miles (64 km) northwest. Pop. (1990 est.) 152,300.

Icacinaceae, family of tropical trees, shrubs, and woody climbers, belonging to the order Celastrales, comprising more than 55 genera. The alternate leaves usually are leathery and simple in outline; the flowers are small, whitish or greenish, clustered, and either unisexual or bisexual. Several species of *Pennantia* and *Villaresia* are cultivated as ornamental plants. The tropical American *Calatola costaricensis* provides a nut that is roasted and eaten whole or ground into tortilla meal.

icaco (tree): *see* coco plum.

Icarus, in Greek mythology, son of the inventor Daedalus who perished by flying too near the Sun with waxen wings. *See* Daedalus.

Icarus, asteroid that has a more eccentric orbit and also approaches nearer the Sun (within 30 million km [19 million miles]) than does any other known body in the solar system except comets. It was discovered in 1949 by Walter Baade of the Hale Observatories (now Palomar Observatory), California. Its orbit extends from beyond Mars to within that of Mercury; it can approach within 6.4 million km of the Earth. In June 1968 Icarus, the first asteroid to be examined by radar, proved to have a diameter of about 0.8 km, considerably smaller than previous estimates, and a rotation period of about 2.5 hours.

Icauna (France): *see* Yonne River.

Icaza, Jorge, in full JORGE ICAZA CORONEL (b. July 10, 1906, Quito, Ecuador—d. May 26, 1978, Quito), Ecuadorean novelist and playwright whose brutally realistic portrayals of the exploitation of his country's Indians brought him international recognition as a spokesman for the oppressed.

Icaza started writing for the theatre, but when he was censured for a 1933 dramatic script, *El dictador,* he turned his attention, and his indignation, to the novel. He gained immediate fame and generated much controversy with his first novel, *Huasipungo* (1934; rev. ed., 1951; *Huasipungo: The Villagers*, or *The Villagers*). The title is an Indian term for the small plot of land given the Indian worker by a landowner in return for the worker's labour on the estate. The book depicts the manner in which the Indians are deprived of their *huasipungo* and then slaughtered when they rebel against their oppressors. It was greeted with outrage by the upper classes in Ecuador and quickly became a left-wing propaganda implement. Some critics have called the work mere propaganda, and others fault its construction. But its powerful language has led many critics to acclaim it as a masterpiece of realism.

Icaza continued to dramatize the struggles of the poor in novels, and he never stopped writing for the theatre. His further writings include *En las calles* (1934; "In the Streets"), *Media vida deslumbrados* (1942; "Half a Life Amazed"), *Huairapamushcas* (1948), *Seis veces la muerte* (1954; "Death Six Times"), and *El chulla Romero y Flores* (1958; "The Loner Romero y Flores"). Over the same period Icaza also wrote numerous plays. His *Obras escogidas* ("Selected Works") was published in Mexico in 1961.

After 1973 Icaza served as his country's ambassador to Peru and the Soviet Union. His themes as well as his realistic style influenced a generation of writers in Ecuador and throughout Latin America.

ice, solid substance produced by the freezing of water vapour or liquid water. At temperatures below 0° C (32° F), water vapour develops into frost at ground level and snowflakes (each of which consists of a single ice crystal) in clouds. Below the same temperature, liquid water forms a solid, as, for example, river ice, sea ice, hail, and ice produced commercially or in household refrigerators. *See also* glacier; pack ice; permafrost.

A brief treatment of ice follows. For full treatment, *see* MACROPAEDIA: Ice and Ice Formations.

Ice consists of compact aggregates of many crystals. This fact, however, is not readily apparent, because ice crystals grown from liquid water, unlike those from water vapour, do not develop crystal faces. Typical specimens of ice derived from liquid water have crystals that measure roughly 1 to 20 mm (0.04 to 0.78 inch) in size. In old glacier ice, the constituent crystals have grown larger by long-continued recrystallization and reach about 50 cm (20 inches) in diameter.

To melt one gram (0.04 ounce) of ice, 79.8 calories of heat—*i.e.,* the latent heat of fusion—must be supplied. This is high compared with the latent heat of most substances and makes ice useful as a refrigerating agent or heat sink. Melting ice remains at a constant temperature of 0° C.

Ice has a density of 0.919 g/cm^{-3}, as opposed to 0.9998 g/cm^{-3} for water. Consequently, a mass of ice occupies 9 percent more volume than an equal mass of water at 0° C. This condition accounts for the bursting of water pipes on freezing and for the fact that ice floats in water, with about $^1/_{10}$ of its volume

above the surface. Because of the increase in volume on freezing, the melting point of ice decreases under pressure. It falls by 0.0075° C per atmosphere of applied pressure. The low sliding friction of ice surfaces, as witnessed in ice skating and in the skidding of automobiles on icy roads, results from melting and the consequent lubrication that occurs where the sliding object increases the pressure on the ice.

Structure. An ice crystal is composed of water molecules linked together by hydrogen bonds, which form as a result of the attraction between the hydrogen atoms of each molecule and the oxygen atoms of other molecules. Each of the molecules forms bonds to four neighbouring molecules at the corners of a tetrahedron around it. The tetrahedral arrangement gives rise to puckered hexagonal rings of water molecules, and these hexagons on the molecular scale are responsible for the hexagonal symmetry of the ice crystal. The hexagonal rings of molecules join together side by side to form an open lattice of puckered hexagonal layers, which lie perpendicular to the hexagonal axis.

The bent shape of the water molecule, which is similar in water vapour and ice, allows the two hydrogen atoms of each molecule to be directed toward any two of the four neighbours to which it is bonded. As a result, each water molecule can assume six different orientations. These occur statistically, with equal probability, subject only to the condition that the neighbouring molecules must adjust their orientations so that only one hydrogen atom occurs along each bond line and thus none of the hydrogen bonds is broken. This type of statistical disorder in the molecular orientations has important effects on the physical properties of ice, and it contributes to the ice crystal a definite amount of entropy that does not vanish at absolute zero (−273.15° C).

One consequence is that the ice structure does not provide sites suitable in size or bonding environment for most of the common inorganic ions or organic molecules. For this reason, ice formed by the freezing of water solutions of most substances is very much purer than the solutions themselves, a phenomenon that is the basis for the freezing method for desalination of seawater.

Electrical properties. The water molecule acts as a small electric dipole because the hydrogen atoms carry a positive charge (+0.33 electron units) and the oxygen atoms a negative charge (−0.66 electron units). An applied electric field tends to align the molecular dipoles, and the molecules respond by changing from one of their six possible orientations to another, this being allowed by the orientation-disordered structure. Ice thus has a very high dielectric constant (approximately 100). The mechanism by which water molecules change from one orientation to another involves the presence of defects in the crystal structure. These defects, called bond defects, are places in the crystal where a hydrogen bond is broken, either by omission of a hydrogen atom along the bond line, or by inclusion of two hydrogen atoms along the line. The bond defects are present in low concentration, only about one bond in 10 million being broken at 0° C. The defects wander rapidly through the crystal, jumping from one bond to the next, and each jump of a defect is accompanied by rotation of the water molecule past which the defect jumps. The motion of the bond defects thus determines the rate of molecular reorientation. Under an alternating electric field of frequency higher than about 50,000 cycles per second, the bond defects do not have time to reorient the molecules in response to the field, and the dielectric constant drops to a low value (about 3).

Under a steady voltage, ice conducts a steady electric current, the charge being transported by the migration of protons (hydrogen ions) through the crystal. The conductivity is much higher than that of most nonmetallic crystals except semiconductors, and ice therefore is called a protonic semiconductor. The protons do not exist in the crystal as free ions but instead are attached to water molecules, as H_3O^+ ions. These ions, together with OH^- ions in equal numbers, occupy water molecule sites in the crystal and constitute a second type of defect in the ideal structure of ice. These ionic defects are present in a concentration of approximately one defect for every 10^{11} water molecule sites. An H_3O^+ defect moves through the crystal simply by the jumping of one of its three protons along the hydrogen bond to a neighbouring water molecule, thereby converting the neighbour into the H_3O^+ ion. Movement of the ionic defects through the crystal transports charge and is responsible for the protonic conductivity of ice.

Flow. To casual observation, ice is a brittle material and shatters like glass when struck with a hammer or ice pick. However, under low stresses of long duration or under higher stresses when fracture is inhibited by pressure (*e.g.*, at depth in glaciers), ice flows plastically. The hexagonal layers of the ice crystal can glide past one another—much like sheets of paper sliding over one another—by the movement of crystal dislocations. The flow of glacier ice, for example, takes place by the deformation of the individual crystals in this manner, but the different crystals, gliding in different directions, tend to interfere with one another. This considerably impedes the flow and also forces the crystals to bend. The bending does not become severe, however, because a process of recrystallization causes new, fresh crystals to grow continuously at the expense of the old, deformed ones.

The flow of ice in bulk appears somewhat like the flow of a very viscous liquid, except that the viscosity coefficient is not a constant, as in liquids. Instead, it decreases rapidly with increasing stress, so that the flow rate increases much more rapidly than in simple proportionality to the stress.

ice age, also called GLACIAL AGE, any geologic period during which thick ice sheets cover vast areas of land. Such periods of large-scale glaciation may last several million years and drastically reshape surface features of entire continents. A number of major ice ages have occurred throughout Earth history. The earliest known took place during Precambrian Time dating back more than 570 million years. The most recent periods of widespread glaciation occurred during the Pleistocene Epoch (1,600,000 to 10,000 years ago). A lesser, recent glacial stage called the Little Ice Age began in the 16th century and advanced and receded intermittently over three centuries. Its maximum development was reached about 1750, at which time glaciers were more widespread on Earth than at any time since the principal Quaternary Ice Ages.

ice bug, any insect of the small order Grylloblattodea (about 15 species). This rare and primitive insect is found in the mountains of Japan, western North America, and eastern Siberia. A pale, wingless creature between 15 and 30 mm (0.6 and 1.2 inches) long, it has biting mouthparts, long antennae, and small compound eyes. Grylloblattids usually live beneath rocks near mountain snow lines or beneath rotten logs at lower altitudes. They feed on other insects.

ice cave, cavity in ice or an underground cave that has permanent ice deposits. The two types of ice cave are wholly unrelated.

The first type of ice cave is formed by meltwater streams carving labyrinths in the bases of glaciers or by streams and wind hollowing out tunnels in snowfields. These usually have scalloped, translucent walls that transmit a blue light.

The second type of ice cave occurs either when frigid winter air settles into downward-leading caverns where it cannot be forced out or when moisture freezes in currents of cold air. Frozen lakes, icicles, and ice draperies are common formations. Helictite-like icicles also form where air currents deflect the freezing water. The splendid ice deposits formed in the lava caves of the northwestern United States are dwarfed by the limestone ice-cave systems of the Alps. The Eisriesenwelt ("Ice Giant World") in Austria exhibits a frozen landscape that extends 42 km (26.1 miles).

ice cream, frozen dairy food made from cream or butterfat, milk, sugar, and flavourings. Frozen custard and French-type ice creams also contain eggs. Hundreds of flavours have been devised, the most popular being vanilla, chocolate, and strawberry.

Iced desserts were introduced into Europe from the East. Marco Polo brought back descriptions of fruit ices from his travels in China. Italian cooks developed recipes and techniques for making both water and milk ices; Buontalenti, one of the cooks taken to France by Catherine de Medici, first prepared such treats for the French court. In 1670 a Sicilian, Francisco Procopio, opened a café in Paris and began to sell ices and sherbets, which became so popular that by 1676 there were 250 ice makers in the capital. Tortoni, owner of a café in late-18th-century Paris, is credited with developing cream ices. In the United States, ice cream was served by George Washington, Thomas Jefferson, and Dolley Madison. Philadelphia became the hub of ice-cream manufacture in the United States; the ice-cream soda was invented there in 1874. The ice-cream cone, portable and self-contained, originated at the 1904 World's Fair in St. Louis, Mo., U.S.

Commercial ice cream is made by combining, under constant agitation, the liquid ingredients (milk, cream, syrups, etc.). These liquids are heated and combined with dry ingredients (sugar, stabilizers, dried eggs or milk) to form a mix, which is then pasteurized and homogenized. The mix is ripened for several hours in a refrigerated vat, then combined with finely chopped fruit, nuts, or other solids. The mix is agitated while being frozen in order to incorporate air and control the size of the ice crystals that are formed. The partially frozen ice cream is drawn off into packages and frozen solid, or "hardened." So-called soft-service ice cream was invented in 1939; it is served directly from the freezing machine without being allowed to harden.

Homemade ice cream is often made with a base of boiled custard. The mix, with flavourings, is poured into a canister surrounded with ice and salt or a refrigerator unit. The contents of the canister are agitated by means of a hand crank or electric motor until the ice cream is softly frozen. The ice cream is usually allowed to harden further in a freezer.

ice dancing, the art or sport of dancing on ice, using skates. Although the English diarist Samuel Pepys claimed to have danced on the ice during London's great frost of 1683, modern ice dancing probably developed out of the Vienna Skating Club's adaptation of the waltz in the 1880s. The sport grew rapidly in popularity during and after the 1930s, and dance steps now recognized internationally include the 10- or 14-step, killian, and varieties of the waltz, tango, and fox-trot. Dance steps are made up of figure-skating movements and are usually performed in set, unvarying patterns. Competitions include two compulsory dances; the original set pattern, an original dance created to a previously announced rhythm, with music and choreography chosen by the skaters; and the free dance, a long program performed to music and choreography of the

French ice dancers Isabelle and Paul Duchesnay competing at the World Ice-Dance Championships
© Duomo Photography

skaters' choice, though the music must feature a dance rhythm. Ice dancers are judged on the difficulty and originality of the dance steps, their interpretation of the music, and their timing and unison. Unlike pair skating, ice dancing does not allow the introduction of movements of strength or skill (particularly overhead lifts, jumps, and spins of more than one and one-half rotations), which are inconsistent with the character of the dance. Also, dancers must keep one skate on the ice at all times. World ice-dance championships, under supervision of the International Skating Union, were initiated in 1950. Ice dancing has been an Olympic event since 1976. For world champions, *see* Sporting Record: *Ice skating. See also* Olympic Games.

ice formation, any mass of ice that occurs on the Earth's continents or surface waters. Such masses form wherever substantial amounts of liquid water freeze and remain in the solid state for some period of time. Familiar examples include glaciers, icebergs, pack ice, and ground ice associated with permafrost—*i.e.,* perennially frozen soil found in frigid regions.

A brief treatment of ice formations follows. For full treatment, see MACROPAEDIA: Ice and Ice Formations.

Approximately three-quarters of the Earth's fresh water is stored in the enormous ice sheets that cover Antarctica and Greenland and in the smaller ice caps, mountain glaciers, and pediments scattered throughout the rest of the world. These expanses of perennial ice originate on land by the compaction and recrystallization of snow and other forms of precipitation under the weight of successive layers that have accumulated year after year. They occur in every region, including the Equator at high altitudes.

River and lake ice also occur over a good portion of the world. These sheets of ice remain on their respective surface-water bodies for varying lengths of time. Lakes in Antarctica, for example, are completely covered with ice throughout the entire year, whereas those in the colder areas of the continental United States experience freezing surface-water temperatures for only about 100 days in an average year.

In the oceanic waters of the polar regions, ice occurs in the form of pack ice and icebergs. Pack ice consists of frozen saltwater that has been broken up and jammed together by wind. In most cases, it is only one to two years old, and it expands during winter to cover large areas of the oceans. During spring and summer, warmer temperatures cause the pack ice to melt, resulting in a retreat of its borders. The same warmer weather conditions promote the calving (breaking off) of icebergs at the seaward edges of glacial masses. These large chunks of ice (some extend several kilometres in length) then drift with the current toward the Equator.

Permafrost usually consists of rocks and soil particles consolidated by ice. Such frozen ground occurs in regions where temperatures below 0° C (32° F) persist for two years or more (*e.g.,* the Arctic and sub-Arctic). It is estimated that permafrost underlies nearly 25 percent of the terrestrial land surface. Various forms of ground ice are found in permafrost. The most conspicuous of these is foliated ice, which frequently develops in thermal contraction cracks in permafrost as wedge-shaped, vertical, or inclined sheets 2.5 cm to 3 m (about 1 inch to 10 feet) wide and 0.3 to 9.2 m deep. Another prominent form is pingo ice, which occurs horizontally or in lens-shaped masses.

ice hockey, game played on ice by two teams, each composed of six players on skates. The players use sticks to hit a hard-rubber disk, called a puck, into their opponent's goal.

A brief treatment of ice hockey follows. For full treatment, *see* MACROPAEDIA: Sports, Major Team and Individual.

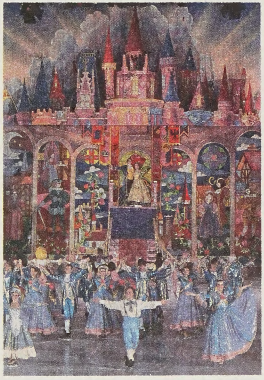
Ice hockey is believed to have developed from a hockey-type game played by Micmac Indians and adopted by settlers who added elements of field hockey; this is alleged to have evolved into the game of shinty, which was played by British soldiers stationed in Canada during the 1860s. The first record of a puck, rather than a ball, being used was in 1860 at Kingston Harbour, Ont., and the first game with rules was played in 1875 between two student teams at McGill University in Montreal. The game thereafter spread quickly throughout Canada and the United States.

The National Hockey League (NHL), organized in 1917, consists of professional teams in the United States and Canada. The annual Stanley Cup, which is the highest award in professional ice hockey, was first given in 1893–94 to the best Canadian team and since 1917 to the winner of the NHL play-offs. Ice hockey was made an event in the Winter Olympic Games in 1920, and in 1924 the Boston Bruins became the first U.S. team in the NHL. The World Hockey Association was founded in 1972 as a rival to the NHL, but in 1979 the two leagues were merged.

A game consists of three 20-minute periods (overtime is used in the NHL and U.S. college games to resolve games that are tied at the end of regulation time; regular-season games may end in a tie if not resolved in overtime). Ice hockey is the only major sport in which substitution is allowed while the game is in play. Players are frequently substituted, rarely staying on the ice for more than two minutes. The goalies are the only exception, as it is their duty to protect the goal, from which they will only occasionally stray.

Ice hockey is a very aggressive game, and players must wear protective equipment. The puck is often stripped from a player by means of a hit, or check, to the body. Many types of hits are illegal and draw penalties. For minor fouls the offending player is usually required to sit out two minutes of play, leaving his team shorthanded. If the opposing team scores a goal during a penalty, the penalized player comes back on the ice. This man-advantage situation is referred to as a power play. For more serious fouls a player usually must sit out for 5 or 10 minutes, but a substitute may be used except in cases of excessive violence. For Stanley Cup winners and world amateur champions, *see* Sporting Record: *Ice hockey. See also* Olympic Games.

ice plant, also called SEA FIG, or SEA MARIGOLD (*Mesembryanthemum crystallinum*), low-growing annual plant, of the carpetweed family (Aizoaceae) and one of about 75 species commonly called fig-marigolds, constituting the genus *Mesembryanthemum.* Most are fleshy-leaved desert herbs native to the Old World. Ice plant is the most commonly grown species and is named for the transparent, glistening swellings on its edible



Ice plant (*Mesembryanthemum crystallinum*)
Ray Oakdale from Root Resources

leaves. It is cultivated in gardens and as an indoor pot plant. It is naturalized in California where it clothes road embankments and provides an erosion control.

ice shelf, thick mass of floating ice that is attached to land, formed from and fed by tongues of glaciers extending outward from the land into sheltered waters. Where there are no strong currents, the ice becomes partly grounded on the sea bottom and attaches itself to rocks and islands. The shelf is pushed forward by glacial pressure until its forward growth is terminated by sea currents. Built up by accretions of snowfall, it remains relatively stable for millions of years. It is a phenomenon presently found only in Antarctica, where the largest ice barrier, the Ross Ice Shelf, extending into the Ross Sea, is about the size of France. Ice shelves are thought to have been responsible for the formation of many fjords in Scandinavia and elsewhere during the Pleistocene Epoch.

ice show, professional skating spectacle that combines the colourful movement of huge casts of skaters with all the arts of the theatre—brilliant lighting, gorgeous costumes, special musical scores, and careful direction. Among the features of an ice show are big production numbers, clowns, skating chimpanzees,

The cast of *Walt Disney's World on Ice* performing the finale of "Beauty and the Beast"
Walt Disney's World on Ice courtesy of Irvin Feld and Kenneth Feld Productions, Inc.

and a pas de deux—a showpiece dance for two performers, male and female, who are usually champion figure or freestyle skaters. One of the earliest ice shows was staged in 1915 at the Hippodrome in New York City. Featuring a German ice ballerina, Charlotte (Oelschlagel), and an ice ballet imported from Berlin, the show, called *Flirting in St. Moritz,* created a sensation in New York City, ran for 300 days, and inspired *The Frozen Warning* (1916), the first motion picture centred on skating. Another pioneer ice show, *The Ice Follies,* was first produced in 1936 by Oscar Johnson, Edward Shipstad, and Roy Shipstad. In 30 years it played to more than 60,000,000 people. Later prominent shows in the United States were *Ice Capades,* the *Hollywood Ice Review; Sonja Henie Ice Revue,* produced by the Norwegian skating star Sonja Henie; and *Holiday on Ice Shows,* presented on ingenious mobile rinks, complete with portable refrigeration equipment that could be set up indoors or out. In northern European countries, especially in Great Britain, Russia, and the Scandinavian countries, elaborate pantomimes with stories portrayed on ice have been popular.

Consult the INDEX *first*

ice skating, the recreation and sport of gliding across an ice surface on blades fixed to the bottoms of shoes (skates). The sport of ice skating has three main divisions: figure skating (*q.v.*), which involves the performance of various jumps, spins, and dance movements; speed skating (*q.v.*), which is racing on ice skates; and ice dancing (*q.v.*), which involves dancing on them.

Ice skating probably developed in Scandinavia as early as 1000 BC, the first skates being made from shank or rib bones of elk, oxen, reindeer, and other animals. Metal was eventually introduced for skate blades, and improvements in skate design during the 19th century resulted in the modern skate. The figure skate, which is the type best suited for general pleasure skating as well as for figure skating and ice dancing, is easily distinguished from other skates by the serrations, or "teeth," at the front of its blade. The blade itself is about an eighth of an inch wide and has a curvature corresponding to that of a circle having a six-foot radius. The blade has a hollow ridge, thereby emphasizing its two sharpened outer edges; these are the surfaces on which skating movements are made. The blade is slightly longer than the boot or shoe to which it is attached. The boot, which is usually black for men and white for women, has a strong reinforced arch support and a stiffening material around the heel and under the arch.

As a recreation skating has been continuously practiced on the canals of the Netherlands since the Middle Ages by both males and females. It was popular in England in the 17th century, and the first skating club was formed in Edinburgh in 1742. In the 1740s British servicemen introduced ice skating to North America. It was also popular at the French court about 1776, Marie-Antoinette being among the skaters. Napoleon Bonaparte skated at Auxerre in 1781.

The first speed racing in England was in the Fens during 1814, and the first race for amateurs took place in 1823. The Skating Club (for figure skating) was founded in London in 1830. The first all-iron ice skate that clipped onto the boot was invented by E.W. Bushnell of Philadelphia in 1848. The New York Skating Club was formed in 1860, and in the mid-1860s Jackson Haines, a dancing master from Chicago, demonstrated in Europe a technique incorporating dance movements. The Vienna Ice Club, founded in 1867, used Haines's ideas and developed a Viennese school of skating that resulted in the modern international school of figure skating. The first rink in Canada was opened at Toronto in 1868, and a rink opened at Davos, Switz., in 1877. The first rink with artificially frozen ice, a private one, the Glaciarium, was opened in London in 1876, and throughout the century larger and public rinks with artificially produced ice appeared.

Crude team games played on ice are mentioned as early as the 2nd century AD, but only in the 19th century did such goal-scoring sports on skates as bandy, shinty, and ice hurling appear in northern Europe. Sports involving ice skating alone were organized by the National Skating Association of Great Britain (1879), the United States Figure Skating Association (1886), and the Canadian Amateur Skating Association (1888). These groups, with other national groups formed in the interim, founded in 1892 the International Skating Union (ISU), which thereafter became the world governing body for speed skating, ice dancing, and figure skating. World championships had begun in the 1890s for speed skating (men only) and figure skating. Skating events were included in the Olympic Winter Games from their inception in 1924: figure skating for men and women from 1924; speed skating for men from 1924 and for women from 1960; and ice dancing from 1976. The rise in popularity of ice hockey (*q.v.*) from mid-19th-century beginnings coincided with that of pure skating from the 1920s. The increasing number of rinks with artificially produced ice throughout the 20th century spread the popularity of recreational ice skating. For world champions, *see* Sporting Record: *Ice skating. See also* Olympic Games.

iceberg, floating mass of freshwater ice that has broken from the seaward end of a glacier or a polar ice sheet. Icebergs are typically found in open seas, especially around Greenland and Antarctica. They form mostly during the spring and summer when warmer weather increases the rate of calving (separation) of icebergs at the boundaries of the Greenland and Antarctic ice sheets and smaller outlying glaciers. In the Northern Hemisphere, for example, about 10,000 icebergs are produced each year from the west Greenland glaciers, and an average of 375 flow south of Newfoundland into the North Atlantic shipping lanes, where they are a hazard to navigation.

A brief treatment of icebergs follows. For full treatment, *see* MACROPAEDIA: Ice and Ice Formations.

At the point where glaciers or ice shelves meet the sea, water pressure beneath the ice shelf or glacier tongue interacts with the outward-moving glacier. Tides, which may have ranges up to 6 m (20 feet) in the Arctic, together with small sea level changes associated with wind and swells, produce an intermittent increase and decrease in force on the protruding end of the glacier or ice shelf, and this results in the birth of a large monolith of drifting ice. Another way in which an iceberg is formed, characteristic of southern Greenland glaciers, consists of a melting or evaporation of the surface portions of the glacier near its terminus at a greater rate than the water erosion on its underside. This results in an underwater shelf, and eventually, through continued erosion by water, natural buoyancy of submerged ice, and periodic tidal and other hydraulic forces, the shelf is broken off and an iceberg floats to the surface. Most Antarctic icebergs are formed through gradual break off from the Antarctic continental ice sheet as it thins toward the coast and exudes into the ocean as a great ice shelf with fronts hundreds of kilometres long.

Icebergs are produced at a rate of approximately 280 cubic km per year (67 cubic miles per year) in the Arctic and 1,800 cubic km (430 cubic miles) per year in the Antarctic. Western Greenland is the major iceberg source area in the Northern Hemisphere. Eastern Greenland icebergs tend to move northward; they are small and few in number. There are also few icebergs in the Arctic Basin proper. The source area for most icebergs in the Barents Sea is Franz Josef Land. Icebergs are not found in the North Pacific except in sounds along the Alaskan-Canadian coast between latitudes 55° N and 60° N. In the Southern Hemisphere most icebergs are concentrated south of the Antarctic current convergence at about 60° S.

Arctic icebergs vary in size from the size of a large piano, called growlers, to the dimensions of a ten-story building. Most icebergs have a specific gravity of 0.9, and thus six-sevenths of the mass is below the sea surface. Many icebergs in the Arctic are about 45 m tall and 180 m long. Icebergs of the Antarctic are tabular in shape and not only are far more abundant but are of enormous dimensions compared with those in the Arctic. Lengths up to 8 km (5 miles) are not unusual, with ice 45 m above water.

From the known amount of precipitation over Greenland, and the assumption that the ice volume and precipitation rate now are approximately the same as they were many centuries ago, it can be estimated that the mean age of the ice in icebergs is 5,000 years. Arctic ice islands and giant Antarctic bergs last as long as 10 years at high latitude. Most icebergs from western Greenland melt within two years of calving from the parent glacier.

Once an Arctic Ocean iceberg has been calved and moves out to the open sea, it usually transits Baffin Bay in from three months to two years, during which time it undergoes some disintegration through melting and calving of smaller chunks of ice from its perimeter. This results in a decrease in mass of about 90 percent by the time it reaches the coast of Newfoundland and the Grand Banks in the North Atlantic. When the iceberg enters the region of the Grand Banks, where the warm waters of the Gulf Stream meet the colder waters of the Labrador Current, it has only a few days of life remaining. In mild sea conditions an iceberg deteriorates at a rate of height decrease of about 2 m per day in 0°–4° C (32°–40° F) water, and about 3 m per day in 4°–10° C (40°–50° F) water.

The day-to-day movement of an iceberg is controlled by the size and shape of the iceberg, previous and present wind, surface wind current, and general ocean current. The most important factor in assessing wind drift of icebergs is size and shape. Winged icebergs, those with saillike pinnacles around the central mass, are very much influenced by the winds and move at speeds of one knot (44 kilometres, or 24 nautical miles) per day under the influence of steady winds of 30 knots. The momentum of icebergs is so great that once in motion they continue for hours after the wind has abated.

In general, however, the drift of icebergs is the combined result of both the ocean current and the wind. When the winds are variable or less than 32 knots, and the current greater than 0.5 knot, the current predominates, but when steady 30-knot winds blow for more than 12 hours, the wind effect becomes important even in areas where the ocean current is one to two knots.

In the open ocean most ice is seen by radar at ranges depending upon the size of its subaerial silhouette, but smaller icebergs or growlers can only be detected when the sea surface is calm, and then only at ranges of about 1.6 km. Sonar is effective in detecting icebergs; the range of detection, however, is frequently limited by the water conditions and speed of commercial vessels. The problem of iceberg protection in the Northern Hemisphere is one of tracking icebergs as they come down the

Labrador Current, and reporting the whereabouts of these floating menaces to all North Atlantic shipping as often as twice daily.

iceboating, also called ICE YACHTING, a winter sport of sailing and racing on ice in modified boats. An iceboat is basically a sailboat that travels on thin blades, or runners, on the surface of the ice. An iceboat consists first of a single fore-and-aft spar, called the backbone,

DN-60 iceboats
UPI

which may be wide enough to have a cockpit in its hull to carry the crew. This spar, or hull, is securely mounted on a broad, flexible crosspiece, or runner plank, which is at a right angle to it and which has a steel runner at each of its two ends. A third runner, the steering runner, is mounted at either the fore or aft end of the hull and is controlled by the helmsman using a tiller. A vertical mast carries either one or two sails, usually a mainsail and a jib. Smaller iceboats dispense with a cockpit in the hull and instead have a shallow, elliptical tray mounted on the backbone and upon which the one- or two-man crew sits. The modern iceboat's structural elements are made of high-strength steel.

Although there are hints of iceboating in the archaeological past as far back as 2000 BC in what is now the Scandinavian region, iceboating as a means of winter transport dates firmly only to the 17th and 18th centuries on the frozen Gulf of Riga and on the canals of the Netherlands. In 1790 the first iceboat appeared on the Hudson River in New York.

The sport began in the mid-19th century, the Poughkeepsie Ice Yacht Club being formed in 1865 and the Hudson River Ice Yacht Club in 1870. A Swedish club was founded in 1901, and in 1928 the European Ice Yachting Union was formed with Latvia, Lithuania, Estonia, Sweden, Austria, and Germany as members.

The wooden ice yachts of the 19th century were large and had six or seven crew members. The *Icicle* was 22.9 yards (21 m) long and had 1,070 square feet (99 square m) of sail. Ice yachting was a rich man's sport. In 1900 the fleet of the Hudson River club numbered more than 50, including 6 of the first class with more than 600 square feet (54.75 square m) of sail. These large iceboats reached speeds which at that time were the fastest ever attained by any vehicle. The American iceboat *Scud,* for example, sailed at 107 miles per hour (172 km/h) in 1885.

In about 1931, Starke Meyer of Milwaukee, Wis., designed a hull with the steering runner at the bow and the runner plank at the stern, instead of the other way around, as in most previous designs. The downward and forward thrust of the mast, located between the two points of support, served to increase rudder traction and reduce the tendency of the craft to spin on the ice. Meyer's bow-steering design defeated all competition, and smaller versions, called skeeters, with a sail of only about 75 square feet (7 square m), showed that they could sail safely and fast. By 1940 the design had crystallized, and the skeeter, or class E boat, as it is now designated, enjoyed a rapid growth. Skeeters were able to rival the larger iceboats in sailing speed, and they have dominated all open competitions over the past decades. The standard skeeter has a hull that is 22 feet (6.7 m) long. The DN-60, a boat with 60 square feet (5.6 square m) of sail, designed in the hobby shop of *The Detroit News* in 1937, suddenly caught on in the late 1950s and has been popular ever since. The standard DN is 12 feet (3.6 m) long with 60 to 80 square feet (5.6 to 7.4 square m) of sail.

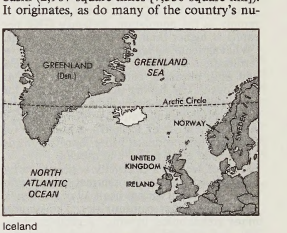
The iceboat can reach at least four times the speed of the wind propelling it, and speeds of over 140 miles per hour (220 km/h) have been recorded. An iceboat that is sailing downwind can reach no greater a speed than that of the wind itself. But an iceboat can reach much faster speeds when it sails across the wind rather than being pushed along by it, since the boat creates a wind from the velocity of its own movement that greatly supplements the natural wind. These principles were only vaguely understood in the early days of iceboat racing, and the traditional rig with a stern-mounted rudder was the standard design despite the boat's forward thrust sometimes lifting the stern rudder from the ice and sending the whole boat into a spin.

Iceboating became less popular in Europe after World War II but remained popular in the United States and Canada, mainly in the Northeast, where the ruling body is the Eastern Ice Yachting Association (founded 1937), and in the Midwest, where clubs from Wisconsin, Illinois, Michigan, and Ontario founded the Northwestern Ice Yachting Association in 1912. The regional associations have approximately six boat classes, ranging from 75 to 350 square feet (7 to 32 square m) of sail.

Association, national, and international races are held. Iceboat racing is generally like regular yachting in terms of right-of-way and overtaking. Races are typically run on a windward-leeward course such that the boats are usually sailing across the wind.

icefish, any of several different fishes, among them certain members of the family Channichthyidae, or Chaenichthyidae (order Perciformes), sometimes called crocodile icefish because of the shape of the snout. They are also called white-blooded fish, because they lack red blood cells and hemoglobin. Their blood carries much less oxygen than that of red-blooded fish, but icefish have larger hearts and gill blood vessels to circulate a greater volume of blood, and this extracts sufficient oxygen from the oxygen-rich waters of the Southern Ocean. Most of the 16 species of crocodile icefishes occur in the Antarctic and feed on crustaceans and small fish.

Certain species of smelt and species of *Salanx,* or icicle fish, are also called icefish. These forms belong to separate families in the order Salmoniformes. *See also* icicle fish.



Iceland, officially REPUBLIC OF ICELAND, Icelandic LÝÐHVELDIÐH ÍSLAND, island country in the North Atlantic Ocean, lying between Norway and Greenland, and covering an area of 39,699 square miles (102,819 square km). The capital is Reykjavik. Iceland is bounded by latitudes 66°30′ and 63°15′ N and is about 220 miles (350 km) long from north to south; it is bounded by longitudes 24°15′ and 13°45′ W and is about 335 miles (540 km) from east to west. Iceland's nearest European neighbour is Scotland in the United Kingdom, lying about 500 miles (800 km) to the southeast. Its rugged coastline, of more than 3,000 miles (4,800 km), meets the Greenland Sea and the Arctic Circle on the north, the Norwegian Sea on the east, the Atlantic Ocean on the south and west, and the Denmark Strait (which separates it from Greenland by about 200 miles (320 km) on the northwest. The population in 1990 was estimated to be 256,000.

A brief treatment of Iceland follows. For full treatment, *see* MACROPAEDIA: Iceland.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Iceland may be divided into four regions that are defined by climate and coastal characteristics. The island's three northern regions are generally colder and have drier weather conditions, with rugged coastlines characterized by fjords; the southern region experiences higher precipitation and temperatures and has smoother coastlines, characterized by sandy beaches and lagoons formed by extensive offshore sandbars. Of the northern regions, the northwestern region is a peninsular plateau that is heavily dissected by steep valleys; the north-central region is characterized by broad valleys and grassy lowlands; and the northeastern region has numerous fjords, providing excellent harbours. The southern region is quite varied in its landscape, ranging from extensive lowlands to the country's highest peak, Mount Hvannadals, which rises to an elevation of 6,952 feet (2,119 m). The peak is situated on the southern edge of Vatna Glacier, the island's largest, which covers more than 3,240 square miles (8,390 square km) and is equal in area to all of continental Europe's glaciers combined. Of Iceland's approximately 200 volcanoes, at least 30 have erupted since the island's settlement, together accounting for more than 150 eruptions. Earthquakes occur often but seldom cause serious damage.

Iceland's longest river is the Thjórs (143 miles [230 km]), which also has the largest drainage basin (2,907 square miles [7,530 square km]). It originates, as do many of the country's nu-

Iceland

merous rivers, as a debris-laden glacial melt stream. Iceland utilizes only about one-tenth of its estimated hydroelectric potential. Hot springs occur at some 250 locations throughout the country and are one of the country's major natural resources; Reykjavik, for example, is heated entirely by hot water piped from nearby geothermal springs.

The climate of Iceland is controlled both by tropical and polar air currents and by two ocean currents, the Gulf Stream and the East Greenland Polar Current. While the latter current sometimes carries Arctic drift ice to the island, the ameliorating effects of the Gulf Stream keep Iceland much warmer than would otherwise be possible for a country so far north. The average July temperature for the country (except the mountainous interior) is about 52° F (11° C), and the average January temperature is a relatively moderate 32° F (0° C). Precipitation varies from more than 160 inches (4,100 mm) in parts of southeastern Iceland to 16 inches (406 mm) in the north-central region.

Of Iceland's total land area, less than 1 percent is considered arable, and forests, even

after reforestation programs in the decades of the 1960s and '70s, amounted to only slightly more than 1 percent of the total land area. Grazing land, however, exists in practically every coastal valley and accounts for more than one-fifth of the land area. Most of the remainder is either glaciated, covered with peat bogs, or lava desert. Salmon and trout abound in the country's many lakes and rivers.

The people. Iceland has an extremely homogeneous population. Historians differ as to their exact origin and ethnic composition but agree that between 60 and 80 percent were originally of Nordic stock, mostly from Norway. The remainder, from Scotland and Ireland, was largely of Celtic stock. The dominant language in the period of settlement (9th and 10th centuries AD) was Old Norse, which evolved into the modern Icelandic language now spoken throughout the country. Lutheranism has been the dominant religion since the mid-16th century, and today nearly all of the population belongs to the established Evangelical Lutheran Church.

Iceland's population has a relatively low annual growth rate similar to that of other Western industrialized countries. Life expectancy at birth in the late 20th century was one of the highest in the world, at 77 years for men and 81 years for women.

Iceland has experienced much country-to-city migration. The urban proportion of the population rose from about one-tenth in 1900 to about nine-tenths today. More than half the population lives in Reykjavík and the surrounding urban area. The centre of Iceland is uninhabited.

Economy. A free-market economy predominates in Iceland, although industry ownership by the government has increased gradually, especially in the fishing industry. The gross national product (GNP) is not growing as rapidly as the population. Iceland's GNP per capita is higher than the average for Europe.

What agricultural land there is requires heavy fertilization. Iceland is self-sufficient in meat and milk products, and a wool industry has developed. The fishing industry accounts for approximately one-sixth of the gross domestic product (GDP) and employs one-ninth of the workforce. Most of Iceland's exports, moreover, are fish products. More than two-thirds of the total catch is cod and capelin.

Most of Iceland's electricity is generated by hydroelectric plants. Geothermal energy from the waters of hot springs heats all of Reykjavík and several other communities. The island's many greenhouses, in which vegetables, flowers, and tropical fruits are grown, are also heated by geothermal sources.

The government encourages industrial growth through foreign exploitation of the country's energy resources, and both Norway and Switzerland have established energy-intensive processing plants on the island. Manufacturing accounts for one-tenth of the GDP and employs about one-tenth of the workforce. Major manufactures include aluminum, ferrosilicon, diatomite, and textile products.

Marine products dominate exports, and major imports include machinery and transport equipment and mineral fuels. Iceland's principal trading partners are the United Kingdom, Germany, and the United States.

Most of Iceland's main roads follow the coastline. Icelandair and local air services are important in compensating for the limited road system. Reykjavík is the country's principal seaport.

Government and social conditions. Iceland is a multiparty democracy. Its president is elected to a four-year term by universal adult suffrage; as the government's titular head, the president appoints a prime minister, who wields the country's real executive power. The prime minister is accountable to the Althing, Iceland's unicameral legislature, which is one of the oldest legislative assemblies in the world. Its members are elected to four-year terms by a mixed system of proportional representation. The constitution, adopted by referendum in 1944, vests the highest judicial authority in a Supreme Court. Iceland belongs to the North Atlantic Treaty Organization.

Because of its extensive compulsory health insurance, Iceland has one of the highest standards of public health in the world. Hospital services are provided entirely without charge, and the cost of other medical services is low. Welfare services include unemployment insurance, old age and disability pensions, family allowances, and sickness benefits.

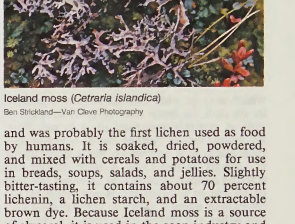
Almost all Icelandic schools from primary through university are free. Education is compulsory through age 16, and secondary and higher education are widely available. Students can enroll in four-year academic colleges at the age of 15 or 16. Graduation entitles the student to admission to the University of Iceland, founded in 1911, in Reykjavík.

History. It is possible that Mediterranean seafarers of the classical world knew of the existence of Iceland, and it appears that the earliest inhabitants of the island were Irish hermits. These hermits are reputed to have fled the island upon the arrival of the pagan Norwegians in the late 9th century AD.

According to early Icelandic sources, the first permanent Norwegian settlement was by Ingólfur Arnarson and his wife, who in 874 established a homestead on the site of present-day Reykjavík. The number of new settlers increased toward the end of the century, and most were of Norwegian origin. By about 930 the Icelandic Commonwealth had been formed, with its Althing. Christianity arrived in the 10th century, and the Althing is said to have assisted the missionary work. By 1000 the entire country was Christian.

Norway attempted to control Iceland from the 13th century onward, and when internal difficulties resulted in Icelandic civil war in the 13th century, the Icelandic nobles accepted Norwegian sovereignty (1262–64). The union of Denmark and Norway in 1380 resulted in the transfer of the governance of Iceland to Denmark. Until the Reformation, Iceland was relatively autonomous politically, but from the mid-17th century the Danish crown exercised increasing control. From this time the island's economy declined, partly because Denmark's absolutist rule allowed Danish merchants to monopolize foreign trade and permitted Icelandic landowners to monopolize the fishing industry. In the 1780s the country was plagued by famines that killed one-fifth of the population. The Althing was abolished in 1800.

During the 19th century an independence movement arose, largely through the efforts of Jón Sigurdsson. The Althing was reestablished and some modernization took place. In 1874 Christian IX of Denmark granted Iceland its own constitution. Some tensions continued, however, until 1904, when Iceland was granted its own national government in Reykjavík. This was followed by the Act of Union in 1918, when Iceland became a completely independent state, united with Denmark solely by the Danish monarchy and a common foreign policy.



During the German occupation of Denmark in the 1940s, British, then American, troops occupied Iceland and used it for a strategic air base. In 1944 the Althing established a republic, severing all formal ties with Denmark. The action was approved in a national plebiscite.

Iceland's postwar problems mostly concerned fishing rights in Icelandic waters. After skirmishes with neighbouring countries, particularly Great Britain, a 200-mile (320-kilometre) limit was finally established.

In 1980 the Icelanders elected a woman to the office of the presidency, the first elected female chief of state (*i.e.,* president as distinct from prime minister) in the world.

Iceland, National Church of: *see* National Church of Iceland.

Iceland moss (*Cetraria islandica*), a fruticose (branched, bushy) lichen with an upright thallus usually attached in one place. It varies in colour from deep brown to grayish white and may grow to a height of 7 cm (3 inches). The trough-shaped branches fork into flattened lobes that are edged with short hairs. Iceland moss grows in alpine areas of the Northern Hemisphere and on the lava slopes and plains of Iceland, whence it received its name. It is an important food for reindeer, caribou, musk-oxen, and moose. Iceland moss is also used as a food supplement for sheep and cattle

Iceland moss (*Cetraria islandica*)
Ben Strickland—Van Cleve Photography

and was probably the first lichen used as food by humans. It is soaked, dried, powdered, and mixed with cereals and potatoes for use in breads, soups, salads, and jellies. Slightly bitter-tasting, it contains about 70 percent lichenin, a lichen starch, and an extractable brown dye. Because Iceland moss is a source of glycerol, it is used in the soap industry and in the manufacture of cold creams.

Iceland spar, also called ICELAND CRYSTAL, a transparent calcite used for polariscope prisms. *See* calcite.

Icelanders' sagas, also called FAMILY SAGAS, the class of heroic prose narratives written 1200–20 about the great families who lived in Iceland from 930 to 1030. Among the most important such works are the *Njáls saga* and the *Gísla saga (qq.v.*). The family sagas are a unique contribution to Western literature and are far in advance of any medieval literature in their realism, their controlled, objective style, their powers of character delineation, and their overwhelming tragic dignity. The family sagas represent the highest development of the classical age of Icelandic saga writing. Their artistic unity, length, and complexity have convinced most modern scholars that they are written works by individual authors, although the theory that they were composed orally still has adherents. Their historicity has also been the subject of long debate; but whether or not they are true to history, they are true to the grim ethos of a vanished way of life, which they portray with dramatic power and laconic eloquence.

Icelandic language, Icelandic ISLENSK, national language of Iceland. It belongs (with Norwegian and Faeroese) to the West Scandinavian group of North Germanic languages and developed from the Norse speech brought by settlers from western Norway in the 9th and 10th centuries. Old Icelandic, usually called Old Norse, is the language in which the *Eddas*, sagas, and skaldic poems were written in the Middle Ages. By the time these works were written, several dialectal characteristics that differentiate Icelandic from Norwegian had emerged.

In grammar, vocabulary, and orthography, modern Icelandic is the most conservative of

the Scandinavian languages. It still has three genders (masculine, feminine, and neuter), four cases for nouns (nominative, genitive, dative, accusative), several declensions, and complicated pronoun and verb systems that have changed little since the classical period. For this reason, Icelanders today can still read the Old Icelandic sagas without difficulty. A great deal of change has taken place, however, in the pronunciation since the Old Norse times.

Although Icelandic borrowed words from Celtic, Danish, Latin, and Romance languages, most of these words have been replaced with totally Icelandic forms since the beginning of the 19th century, when a purist movement developed; now, all technical and abstract terms are formed only from Icelandic elements. *See also* Old Norse language.

Icelandic literature, body of writings in Icelandic, including those from Old Icelandic (also called Old Norse) through Modern Icelandic. It is best known for the richness of its classical period, which is equivalent in time to the early and medieval periods in western European literature. *See* Scandinavian literature; Edda; Icelanders' sagas; saga; skaldic poetry.

Icelandic low, large atmospheric low-pressure centre that forms between Iceland and southern Greenland. It causes many of the strong winter winds over the North Atlantic Ocean. In winter, the ocean is considerably warmer than the continents, and this difference is responsible for the location of the Icelandic low, which dominates the wind circulation over the North Atlantic. In summer, the low weakens and often divides into two separate cells. Its January mean sea-level pressure is 996 millibars (29.4 inches of mercury). The Gulf Stream displaces the Icelandic low northward.

Iceman, also spelled ICE MAN, also called ÖTZI, the oldest mummified human body ever found intact. It was found by a German tourist, Helmut Simon, on the Similaun Glacier in the Tirolean Ötztal Alps, on the Italian-Austrian border, on Sept. 19, 1991. Radiocarbon-dated to 3300 BC, the body is that of a man aged 25 to 35 who had been about 1.6 m (5 feet 2 inches) tall and had weighed about 50 kg (110 pounds). He apparently fell victim to exposure or exhaustion while crossing the Alps and died of freezing. The small rocky hollow in which he lay down to die was soon covered (and protected) by glacial ice that happened to be melting 5,300 years later when his body was discovered by modern humans. His nickname, Ötzi, stems from the Ötztal Alps, where he was found.

The Iceman's body showed no signs of disease, though he had a broken nose and several recently fractured ribs. His few remaining scalp hairs provide the earliest archaeological evidence of haircutting. The various clothes and accoutrements found with him are truly remarkable, since they formed the gear of a Neolithic traveler. The Iceman's basic piece of clothing was an unlined fur robe stitched together from pieces of ibex, chamois, and deer skin. A woven grass cape and a furry cap provided additional protection from the cold, and he wore shoes made of leather and stuffed with grass. The Iceman was equipped with a small copper-bladed ax and a flint dagger, both with wooden handles; 14 arrows made of viburnum and dogwood, two of which had flint points and feathers; a fur arrow quiver and a bow made of yew; a grass net that may have served as a sack; a leather pouch; and a U-shaped wooden frame that apparently served as a backpack to carry this gear. His scant food supply consisted of a sloeberry, mushrooms, and a few gnawed ibex bones.

Iceni, in ancient Britain, a tribe that occupied the territory of modern Norfolk and Suffolk and, under its queen Boudicca (Boadicea), revolted against Roman rule.

Having controlled the Iceni through a client-king, Prasutagus, the Romans attempted to annex his territory after his death (AD 60), thus provoking his queen to lead a revolt of all East Anglia. After several initial successes by the Britons, the Romans ultimately defeated them and regained the province. They severely punished the Iceni, who eventually became a small tribal community with a capital at Venta Icenorum (modern Caister St. Edmund in Norfolk).

Ichihara, city, Chiba *ken* (prefecture), Honshu, Japan. It lies on the east coast of Tokyo Bay. The city was formed by the amalgamation of the towns of Ichihara, Goi, Sanwa, Shizu, and Anegasaki in 1962. Except for the trade centre and railway station of Goi, the towns' economies before World War II were based on agriculture and fishing. Agriculture has deteriorated, and air pollution is a serious problem. Ichihara is now part of the Keihin Industrial Zone. Its coastal area has been reclaimed for use by petrochemical and steel industries. Pop. (1994 est.) 275,129.

Ichijitsu Shintō (Japanese religion): *see* Sannō Ichijitsu Shintō.

Ichikawa, city, Chiba *ken* (prefecture), Honshu, Japan. It lies along the Edo River east of Tokyo. The city is composed of the three towns of Ichikawa, Yawata, and Nakayama, which were salt-producing post towns on the Chiba Highway (Chiba-kaidō) during the Tokugawa period (1603–1867). Since the opening of two railway lines in 1894, the city has served as a commercial, industrial, and residential suburb of Tokyo. Ichikawa houses educational institutions. The cultivation of vegetables and fruit on the plateaus to the north is important. Pop. (1994 est.) 444,468.

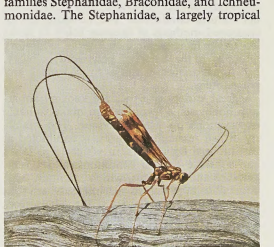
Ichikawa FAMILY, kabuki actors flourishing in Edo (modern Tokyo) from the 17th century to the present. The most famous names are Danjūrō, Ebizō, Danzō, and Ebijūrō, and, according to kabuki convention, these names were assumed by a natural or adopted son of the Ichikawa family when his skill entitled him to inherit the mantle of a famous ancestor. Thus, there have been 12 Danjūrōs (the highest honorific name) and 10 Ebizōs (the second highest). Among the best-known Ichikawas was Danjūrō I (1660–1704), the most famous actor of the Genroku period (1688–1703). He was also a playwright who originated the *aragoto* ("rough business") style of heroic drama, the specialty of the Ichikawa family. The heroic dramas feature bold, handsome, idealized warriors with exaggerated and magical powers and childlike, uncomplicated natures. The warrior's face is marked with red, blue, and black lines, and he carries a huge sword.

Danjūrō VII (1791–1859), the greatest actor of the late Tokugawa period (1603–1867), established the *Kabuki jūhachiban* ("18 Grand Plays of Kabuki"), the special repertoire of the Ichikawa family. Danjūrō IX (1838–1903), of the Meiji period (1868–1912), revitalized the theatre and participated in the first kabuki performance in the presence of the emperor.

Danjūrō XI (1909–65) was among the top kabuki actors in the post-World War II period. He performed in both traditional and contemporary plays. His performances as Prince Genji in an adaptation of *Genji monogatari* (*The Tale of Genji*) constituted a high point in postwar kabuki theatre. His son, who became Ebizō X, was one of Tokyo's "Great Five," the young kabuki actors on whom the future of kabuki depended following the deaths of many of the great actors of the previous generation. In 1985 Ebizō X took the name Danjūrō XII.

Ichikawa Kon (b. Nov. 20, 1915, Ise, Japan), Japanese motion-picture director who introduced sophisticated Western-style comedy to Japan in the 1950s. Later he became concerned with more serious subjects such as antiwar sentiment and modern man's search for identity.

Ichikawa graduated from the Ichioka Commercial School in Ōsaka. He worked in the animation department at the J.O. motion-picture studio in Kyōto and entered the Tōhō Motion Picture Company in 1942, when J.O. was merged with Tōhō. He made his first motion picture, *Musume Dojo-ji* (*The Girl at Dojo Temple*), in 1946 for the Shintōhō Motion Picture Company. *Sambyaku roku-jūgo ya* (1948; "Three Hundred and Sixty-five Nights") was his first big box-office success. He collaborated with his wife, Wada Natto, a screenwriter, on the screenplays for many of his early films.



In the 1950s, Ichikawa and Wada developed the genre of the verbally witty comedy in Japan in such pictures as *Ashi ni sawatta onna* (1953; "The Woman Who Touched the Legs"), a remake of an earlier silent comedy, and *Pū-san* (1953; "Mr. Pū"). Two of Ichikawa's later features, *Biruma no tategoto* (1956; *The Burmese Harp*) and *Nobi* (1959; *Fires on the Plain*), are strong antiwar statements. Of the films that followed, *Kagi* (1959; *Odd Obsession*), *Bonchi* (1960); *Kuroi jūnin no onna* (1961; "Ten Dark Women"), *Yukinojō henge* (1963; "The Revenge of Yukinojō"), and *Matatabi* (1973; "The Wanderers") are notable for Ichikawa's delicate treatment of the material and the strikingly beautiful visual composition of each scene.

One of his greatest achievements was the documentary *Tōkyō Orimpikku* (1965; *Tokyo Olympiad*), in which he emphasized the attitudes and responses of the spectators and competitors over the outcome of the events. His later work included a serialization of *The Tale of Genji* and a number of popular suspense melodramas.

Ichinomiya, city, Aichi *ken* (prefecture), central Honshu, Japan. It developed in the 7th century around the principal Shintō temple of the locality, the Masumida Shrine. During the Tokugawa period (1603–1867) it was an important transport centre on the Gifu Highway. Ichinomiya is now part of the Nagoya industrial area, specializing in woolen and cotton textiles for both kimonos and Western-style clothes. Pop. (1994 est.) 267,136.

ichneumon, small carnivorous mammal, a species of mongoose (*q.v.*).

ichneumon, any member of the family Ichneumonidae (order Hymenoptera), a large and widely distributed insect group of considerable economic importance. The name sometimes refers to any member of the superfamily Ichneumonoidea, which includes the families Stephanidae, Braconidae, and Ichneumonidae. The Stephanidae, a largely tropical

Ichneumon
J. Simon—Bruce Coleman Inc.

group, consists of several hundred species; the Braconidae is a large, widely distributed group.

About 40,000 ichneumon species are known. Adults vary considerably in shape, colour, and size, averaging about 1.2 centimetres (about ½ inch) long. The largest ichneumons of North America, those of the genus *Megarhyssa,* reach 5 cm in length. Most species resemble wasps in having a long, slender, curved abdomen. They usually differ from the stinging wasps in having longer antennae with more segments, or sections. The ovipositor, or egg-laying organ, is often longer than the body. Many species have a dark spot on the fore wing.

Ichneumons parasitize most insect groups—especially Lepidoptera (moths and butterflies) and other Hymenoptera, as well as spiders. Thus, the group as a whole is beneficial to man because it parasitizes many insect pests. A relatively small number of species parasitize beneficial insects.

The females lay their eggs in or on the larvae or pupae (rarely eggs or adults) of the host. The ichneumon larva feeds on the fats and body fluids of the host until fully grown, then usually spins a silken cocoon. The species that parasitize hosts in open habitats usually develop as internal parasites; those that attack hosts in concealed places, such as wood burrows, usually feed on the host externally. In most cases a single larva develops in one host; in some cases, however, many larvae develop in a single host.

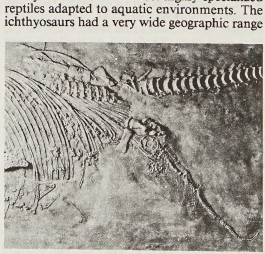
Consult the INDEX *first*

ichthyology, scientific study of fishes, including, as is usual with a science that is concerned with a large group of organisms, a number of specialized subdisciplines: *e.g.,* taxonomy, anatomy (or morphology), behavioral science (ethology), ecology, and physiology. Because of the great importance of fishes as human food, economic ichthyology is a significant segment of the field.

The ancient Greek naturalists, especially Aristotle, were highly knowledgeable about many aspects of fish biology, and until the end of the 19th century the main advances were in taxonomy, as new species were described and the relationships of those already known were clarified. In the mid-20th century a great increase in interest in oceanography, together with new techniques and equipment for underwater observations (especially the self-contained underwater breathing apparatus, or SCUBA), opened many new avenues for the study of fish behaviour and ecology under natural conditions. The development of improved methods of keeping fishes in tanks led to an increase in their use as laboratory animals in the fields of behaviour, ecology, functional anatomy, and even toxicology and parasitology.

A great variety of fishes are kept by aquarium hobbyists, a few of whom make valuable observations on fish behaviour. The majority of fish research, however, is conducted at institutional aquariums, in which large tanks can simulate natural conditions, and at universities and museums, which maintain large collections of preserved specimens. Much fishery research is conducted at the laboratories of government agencies, which are responsible for managing natural fish populations so as to maintain them as a renewable resource.

Ichthyornis, a genus of about six species of extinct birds found as fossils in the Upper Cretaceous deposits (about 66,400,000 to 97,500,000 years old) in the Great Plains area of the United States (Wyoming, Kansas, and Texas). The sole genus of the order Ichthyornithiformes, these flying birds, with strongly developed wings, were one of the notable discoveries of the American paleontologist Othniel Charles Marsh. The two best known species were about the size of the domestic pigeon.



Indications are that *Ichthyornis* (meaning "fish bird"), like its modern relatives, lacked teeth. Because it was formerly believed to have teeth, *Ichthyornis* was grouped with another extinct sea bird, *Hesperornis.* The brain of *Ichthyornis* showed greater development than that of *Hesperornis,* but it still was smaller than that of modern birds. Another primitive feature was the vertebrae, which were like those in primitive reptiles.

The breastbone (sternum) is large, with a strong keel; and the wing bones are long and well developed, with the shoulder girdle similar to that of living birds of strong flight. The legs were strong, with short shanks (tarsus), long anterior toes, and a small, slightly elevated hind toe. The tail had a well-developed terminal plate of bone (pygostyle).

The indication is that these were birds of active flight, probably with webbed feet and resembling in general form modern gulls and terns. The resemblance is considered superficial, as the species of *Ichthyornis* differ as indicated by the form of the vertebrae. They are, however, recognized as members of the subclass Neognathae, the modern birds.

The two groups of birds from Cretaceous time that have had most widespread attention because of their strange form are the divers, such as *Hesperornis,* and the strong-winged *Ichthyornis,* also probably of aquatic habit. Because of representatives of modern families found among the fossil species from the Paleocene and Eocene of early Tertiary time, it has seemed evident that groups other than *Hesperornis* and *Ichthyornis* must have existed in the preceding Cretaceous. Knowledge of these, based on fragments of fossil bone, has slowly come to light until there is fairly definite record from Cretaceous rock strata of other ancestral kinds of birds related to the living groups of loons, grebes, flamingos, cranes, and shorebirds, indicative of early diversity in the avian class.

ichthyosaur, any member of an extinct group of aquatic reptiles that were very porpoise-like in appearance and habits; the ichthyosaurs were the most highly specialized reptiles adapted to aquatic environments. The ichthyosaurs had a very wide geographic range

Probable birth of an ichthyosaurus, Lower Jurassic fossil from Württemberg, Ger.
Wolf Strache, Stuttgart

and span almost the entire Mesozoic Era (between 66,400,000 and 245,000,000 years ago), but they were most abundant and diverse during the Jurassic Period (208,000,000 to 144,000,000 years ago). Excellent fossil specimens occur in the fine-grained shales of Early Jurassic age of southern Germany, in which the outline of the body, including a well-developed fleshy dorsal fin, is preserved.

A representative genus is *Ichthyosaurus,* from which the group takes its name. *Ichthyosaurus,* very fishlike in appearance, is especially well known from Jurassic deposits. The body was streamlined; no distinct neck was present, and the head blended smoothly into the body. The limbs were modified into paddle-like organs used to steer the animal. The animal propelled itself by means of a well-developed, fish-like caudal fin and by undulations of the body. The vertebral column, which is formed from disklike elements, bent downward into the lower lobe of the caudal, or tail, fin; the upper lobe was unsupported by bone. Early reconstructions of ichthyosaurs showed them with the spinal column straightened, and it was not until well-preserved material was found that the bent nature of the backbone became apparent. The skull of *Ichthyosaurus* was long; the jaws were greatly lengthened and armed with numerous sharp teeth. The eyes were very large, and the nostrils were positioned far back on the top of the skull, another adaption to an aquatic existence. *Ichthyosaurus* was about 3 metres (10 feet) long and was probably able to move through the water at high speeds. It probably fed largely on fish and other marine animals.

The ichthyosaurs were so highly specialized for an aquatic existence that it is unlikely they ventured upon the land; if stranded upon a shore, they must have been as helpless as modern beached whales and porpoises are. It is apparent that the ichthyosaurs must have evolved a mechanism by which they could reproduce in the water. Several specimens are known in which the skeletal remains of small, immature ichthyosaurs are preserved within the bodies of larger individuals. Although it has been suggested that these smaller ichthyosaurs had been eaten by larger ones, it is more likely that the specimens are females and offspring that died during parturition.

The ancestry of the ichthyosaurs is uncertain at best. Certain Early Mesozoic representatives already possessed most of the specializations that characterize the group. Ichthyosaurs became adapted for different sorts of habits. One form fed on mollusks; its teeth were modified into flat, crushing structures. In another the lower jaw was shortened, while the upper jaw was long and pointed in a structure similar to that of the modern swordfish. The ichthyosaurs became progressively rarer toward the end of the Mesozoic and were extinct before the era ended.

ichthyosis, also called FISH-SKIN DISEASE, or XERODERMA, a hereditary condition involving dryness and scaliness of the skin brought about by excessive growth of the horny outermost covering of the skin. The dead cells of this horny layer do not slough off at the normal rate but tend instead to adhere to the skin surface to form scales; horny plaques and papules may also be present in more severe cases. The skin in this condition is intolerant of even the mildest irritants and is prone to severe chapping and fissuring in cold weather. Ichthyosis is usually not detected at birth, but, as the child grows older, dry branny scaling will appear, being most marked on the extensor surfaces of the extremities. Ichthyosis may sometimes be associated with a deficiency of the sweat glands and, less frequently, with irregularities in the growth of hair, teeth, and nails. In its mild and simplest form, ichthyosis is probably the most common of the hereditary skin disturbances.

Ichthyostega, genus of extinct amphibians found as fossils in Late Devonian rocks in eastern Greenland (the Devonian Period began about 408,000,000 years ago and lasted about 48,000,000 years). *Ichthyostega* is among the oldest known vertebrates that can be called amphibians; the genus retains many fishlike

Ichthyostega, model by J.S. Collard (H.R. Allen Studios)

By courtesy of the Royal Scottish Museum, Edinburgh, photograph, the Natural History Photographic Agency

characteristics. *Ichthyostega* was about one metre (three feet) long and had a small dorsal fin along the margin of its tail; the tail itself possessed a series of bony supports, typical of the tail supports that are found in fish. Other fishlike traits include the relatively short snout region, the presence of a preopercular bone in the cheek region (which serves as part of the gill cover in fish), and many small scales on the body. Advanced traits shared with more advanced amphibians include typical early amphibian limbs and limb supports, the lack of gills, and strong ribs. *Ichthyostega* and its relatives represent forms that appear to be near the evolutionary line leading to the more advanced amphibians. It is possible that the ichthyostegids persisted into the following Mississippian Period.

icicle fish, also called ICEFISH, or GLASSFISH (*Salanx*), any of several semitransparent fishes, family Salangidae, found in freshwaters and salt waters of eastern Asia and considered a delicacy by the Chinese. The numerous species are slender and troutlike in form, scaleless or finely scaled, and seldom more than 15 centimetres (6 inches) long. They are large-mouthed predators with large canine teeth.

Ickes, Harold L(eClair) (b. March 15, 1874, Frankstown Township, Pa., U.S.—d. Feb. 3, 1952, Washington, D.C.), U.S. social

Ickes

By courtesy of the Library of Congress, Washington, D.C.

activist who became a prominent member of the New Deal Democratic administration of Pres. Franklin D. Roosevelt.

Admitted to the Illinois bar in 1907, Ickes early developed an aroused social conscience; he worked as a volunteer in a settlement house, frequently handled civil liberties cases without pay, and fought for municipal reform and the curbing of public utilities. Vacillating for many years between the two major political parties, he helped swing liberal Republicans to the opposition in the 1932 elections; he was, therefore, a natural choice for secretary of the interior when Roosevelt was seeking a progressive Republican for his Cabinet. Ickes became one of the most energetic and dedicated New Dealers in Washington and a lifelong supporter of the President. In his new post he fought for the preservation of natural resources against exploitation by private interests.

Ickes won a wider reputation as head of the Public Works Administration (PWA; 1933–39). He spent money so carefully that many of his projects—ranging from highways and public buildings to huge Western dams—were slow getting under way, thereby failing to stimulate the depressed national economy as early as desired. Despite the expenditure of more than $5,000,000,000, however, Ickes' numerous PWA contracts were virtually graft-proof. One of his most valuable services to consumers was in establishing "yardsticks" for electric-power rates through federal and municipal power projects.

During presidential campaigns, Ickes became known as "Roosevelt's hatchet man" because of his colourful attacks upon Republican candidates; between campaigns he feuded with almost equal vigour with several of his Democratic colleagues, and his trenchant opinions of many others were recorded in his lively diary, published posthumously (*The Secret Diary of Harold L. Ickes,* 3 vol., 1953–54). He resigned in February 1946 after a dispute with Pres. Harry S. Truman.

Icknield Way, famous prehistoric trackway across England from Norfolk to Wiltshire, following dry ground along the East Anglian ridge, the Chiltern Hills, and the Berkshire Downs. In Wiltshire are the great foci of the prehistoric occupation of the county at Stonehenge and Avebury; on the Norfolk–Suffolk border near Brandon are the major flint mines known as Grime's Graves. The name, British in origin, was used first for the western sections in Berkshire but is now applied more generally to the track north of the Thames, which is crossed at the Goring Gap. In parts the track is doubled above and below the spring line of the escarpment, suggesting seasonal variation in use.

icon, in Eastern Christian tradition, a representation of sacred personages or events in mural painting, mosaic, or wood. After the iconoclastic controversy of the 8th–9th century, which disputed the religious function and meaning of icons, the Eastern Church formulated the doctrinal basis for their veneration: since God had assumed material form in the person of Jesus Christ, he also could be represented in pictures. Icons are considered an essential part of the church and are given special liturgical veneration. They also serve as mediums of instruction for the uneducated faithful through the

"Annunciation," reverse of a double-sided painted panel icon from Constantinople, early 14th century; in the Skopolije Museum, Skopje, Macedonia

iconostasis (*q.v.*), a screen shielding the altar, covered with icons depicting scenes from the New Testament, church feasts, and popular saints. In the classical Byzantine and Orthodox tradition, iconography is not a realistic but a symbolical art; its function is to express in line and colour the theological teaching of the church.

Iconium (Turkey): *see* Konya.

Iconoclastic Controversy, a dispute over the use of religious images (icons) in the Byzantine Empire in the 8th and 9th centuries. The Iconoclasts (those who rejected images) objected to icon worship for several reasons, including the Old Testament prohibition against images in the Ten Commandments (Ex. 20:4) and the possibility of idolatry. The defenders of icon worship insisted on the symbolic nature of images and on the dignity of created matter.

In the early church, the making and veneration of portraits of Christ and the saints were consistently opposed. The use of icons, nevertheless, steadily gained in popularity, especially in the eastern provinces of the Roman Empire. Toward the end of the 6th century and in the 7th, icons became the object of an officially encouraged cult, often implying a superstitious belief in their animation. Opposition to such practices became particularly strong in Asia Minor. In 726 the Byzantine emperor Leo III took a public stand against icons; in 730 their use was officially prohibited. This opened a persecution of icon worshippers that was severe in the reign of Leo's successor, Constantine V (741–775).

In 787, however, the empress Irene convoked the seventh ecumenical council at Nicaea at which Iconoclasm was condemned and the use of images was reestablished. The Iconoclasts regained power in 814 after Leo V's accession, and the use of icons was again forbidden at a council (815). The second Iconoclast period ended with the death of the emperor Theophilus in 842. In 843 his widow finally restored icon veneration, an event still celebrated in the Eastern Orthodox Church as the Feast of Orthodoxy.

iconography, the science of identification, description, classification, and interpretation of symbols, themes, and subject matter in the visual arts. The term can also refer to the artist's use of this imagery in a particular work. The earliest iconographical studies, published in the 16th century, were catalogs of emblems and symbols collected from antique literature and translated into pictorial terms for the use of artists. The most famous of these works is Cesare Ripa's *Iconologia* (1593). Extensive iconographical study did not begin in Europe until the 18th century, however, when, as a companion to archaeology, it consisted of the classification of subjects and motifs in ancient monuments.

In the 19th century, iconography became divorced from archaeology and was concerned primarily with the incidence and significance of religious symbolism in Christian art. In the 20th century, investigation of Christian iconography has continued, but the secular and classical iconography of European art has also been explored, as have the iconographic aspects of Eastern religious art.

iconostasis, in Eastern Christian churches of Byzantine tradition, a solid screen of stone, wood, or metal, usually separating the sanctuary from the nave. The iconostasis had originally been some sort of simple partition between the altar and the congregation; it then became a row of columns, and the spaces between them were eventually filled with icons. In later churches it extends the width of the sanctuary, though the height may vary, and

is covered with panel icons. The iconostasis is pierced by a large, or royal, door and curtain in the centre, in front of the altar, and two smaller doors on either side. It always includes the icon of the Incarnation (mother with child) on the left side of the royal door and the second coming of Christ the Pantocrator (Christ in majesty) on the right. The sacrament of the Eucharist, revealed through the doors between the two main icons, is thus the manifestation of Christ in the church during the time between his two comings. Icons of the four Evangelists, the Annunciation, and the Last Supper cover the royal doors themselves. Representations of the archangels Gabriel and Michael, the 12 Apostles, the feasts of the church, and the prophets of the Old Testament are arranged on the iconostasis in complicated patterns, with all figures facing the royal doors.

The veneration of icons came under attack during the Iconoclastic Controversy of 725–843, but the Eastern church finally recognized icons as the main form of representing divine revelation and as a pictorial history of the Christian mystery to be contemplated by the faithful while being performed behind the screen in the eucharistic sacrament.

In various parts of the modern Orthodox world, there is a tendency to restore the com-

Iconostasis, Archangel Cathedral, the Kremlin, Moscow, 1505–09

munal character of the Eucharist, which was partially broken by the development of the iconostasis, by either suppressing the iconostasis or giving it a lighter form.

ICSH (interstitial-cell stimulating hormone): *see* luteinizing hormone.

ictalurid, any fish of the family Ictaluridae, which includes about 35 species of North and Central American freshwater catfishes. Ictalurids are "typical" catfishes, with large, wide heads, tapering, scaleless bodies, and eight prominent mouth barbels. The family includes the channel and other North American catfishes (*see* catfish), as well as the madtom and bullhead (*qq.v.*) groups.

Icteridae, songbird family, order Passeriformes, consisting of 88 species of great diversity in size, habits, and diet, found throughout the Americas.

Members range in size from 16 to 54 cm (6 to 21 inches) long. They have conical bills, strong feet, and long, pointed wings. Most show black in varying degrees. The family includes

Troupial (*Icterus icterus*)
Des and Jen Bartlett—Bruce Coleman Ltd.

such common birds as blackbirds (*Agelaius*), grackles (*Quiscalus*), orioles (*Icterus*), meadowlarks (*Sturnella*), cowbirds (*Molothrus*), and bobolinks (*Dolichonyx oryzivorus*). Tropical members are the troupials (*Icterus icterus*), oropendolas (*Psarocolius*), and caciques (*Cacicus*).

Ornithologists refer to these birds as icterids. The Icteridae belongs to the songbird suborder (Passeres).

Ictinus, also spelled IKTINOS (fl. 5th century BC), Greek architect, one of the most celebrated of Athens, known for his work on the Parthenon on the Acropolis, the Temple of the Mysteries at Eleusis, and the Temple of Apollo Epicurius at Bassae.

According to Vitruvius (*Ten Books on Architecture,* preface to book seven), Ictinus designed the Parthenon with Callicrates, although there is some speculation that they were not collaborators but actually rivals—that Ictinus continued the work begun by Callicrates. Ictinus was also involved in the rebuilding and enlargement of the Telestrion hall at the temple to Demeter and Persephone at Eleusis in collaboration with Coroebus, Metagenes, and Xenocles. The Telestrion hall, where the Eleusian mysteries were performed, was a square hall with rock-cut seats. Ictinus probably worked at Eleusis about 430 BC, sometime after he had completed his work on the Parthenon.

The Temple of Apollo Epicurius at Bassae (in Arcadia, near Phigalia) was said to be after the Temple of Athena at Tegea (by Scopas), the most beautiful temple in the Peloponnese. Most of the columns from the temple still stand. A sculptured Ionic frieze from the Temple of Apollo at Bassae, which has remained in fairly good condition, is among the treasures of the British Museum.

id, in Freudian psychoanalytic theory, one of the three agencies of the human personality, along with the ego and superego (*qq.v.*). The oldest of these psychic realms in development, it contains the psychic content related to the primitive instincts of the body, notably sex and aggression, as well as all psychic material that is inherited and present at birth. The id (Latin for "it") is oblivious of the external world and unaware of the passage of time. Devoid of organization, knowing neither logic nor reason, it has the ability to harbour acutely conflicting or mutually contradictory impulses side by side. It functions entirely according to the pleasure-pain principle, its impulses either seeking immediate fulfillment or settling for a compromise fulfillment. The id supplies the energy for the development and continued functioning of conscious mental life, though the working processes of the id itself are completely unconscious in the adult (less unconscious in the child). In waking life it belies its content in slips of the tongue, wit, art, and other at least partly nonrational modes of expression. The primary methods for unmasking its content, according to Freud, are the analysis of dreams and free association.

Many psychoanalysts now consider the conception of an id overly simple, though still useful in drawing attention to the unconscious motivations and irrational impulses within even the most normal human being.

ʿid (Arabic), Syriac ʿIDA ("festival, holiday"), Turkish BAYRAM, either of the two canonical festivals of Islām. The first of these celebrations, according to the calendar, is the ʿId al-Fiṭr (al-ʿId aṣ-Ṣaghīr; Küçük Bayram; "Festival of Breaking Fast," or "Minor Festival"), which immediately follows the fasting month of Ramaḍān and occupies the first three days of the tenth month, Shawwāl. It is a time of official receptions and private visits, when friends congratulate one another, presents are given, new clothes are put on, and the graves of relatives are visited.

The second, the ʿId al-Aḍḥā (al-ʿId al-Kabīr; Kurban Bayram; "Sacrificial Feast," or "Major Festival"), falls on the tenth and the following three days of the last month of the year, Dhū al-Ḥijjah. Throughout the Muslim world, all who can afford it sacrifice at this time a legal animal (sheep, goats, camels, or cattle) and then divide the flesh equally among themselves, the poor, and friends and neighbours, to commemorate the ransom of Ismāʿīl (Ishmael) with a ram.

Ida (d. 559), king of Bernicia (from 547), soon after the foundation of the kingdom of Bernicia by the Angles in the British Isles. He built the fortress of Bebbanburh, the modern Bamborough; and after his death his kingdom, which did not extend south of the River Tees, passed in turn to six of his sons.

Ida (Greece): *see* Idi.

Ida, modern Turkish KAZ DAĞI, mountain range in northwestern Asia Minor (now Turkey), near the site of ancient Troy. A classic shrine, Ida was where Paris passed judgment on the rival goddesses and was the scene of the rape of Ganymede. From its highest peak, about 5,800 feet (1,800 m), the gods are said to have witnessed the Trojan War.

Ida (Ide, Idhi, or Psiloriti) is also the classical name of the highest mountain (8,058 feet [2,456 m]) of Crete, site of another classic shrine and the cave where Zeus was said to have been reared.

IDA: *see* International Development Association.

Idah, town, Kogi state, south-central Nigeria. It lies on a sandstone cliff on the east bank of the Niger River. The traditional capital of the Igala people, Idah was brought under the jurisdiction of the kingdom of Benin by Oba (King) Esigie in the early 16th century. From Benin the polity of Idah adopted both a system of kingship and the art of *cire perdue* ("lost wax") casting in bronze. Tsoede, the son of an early *ata* ("king"), left Idah and conquered and refounded the kingdom of Nupe (near the confluence of the Niger and Kaduna rivers); he is also said to have introduced bronze casting to the Nupe people (an art for which they later became well known).

During the 19th century Idah was a thriving port, trading palm oil and kernels and rubber to Europeans and staple crops, cotton, woven cloth, horses and other livestock, pots, and knives to the Ibo people just to the south. The Igala were able to maintain strict control over the Lower Niger trade north of Idah (no Ibo boats were allowed above the port), partially because just south of the town the Niger valley emerges from a narrow, rocky section to some wide, extensive floodplains.

Modern Idah remains a major trading centre (palm produce, yams, cassava, rice, fish) on the river. Besides trade and farming, the local population is engaged in making canoes, fishing nets, and soap; handicrafts and cotton weaving are also significant. There are limestone deposits in the vicinity and coal deposits near Ankpa, 68 miles (109 km) east-northeast.

Islām is the predominant religion of the town. Christian missionaries have been active among the Igala since the 1860s, and Idah's Roman Catholic community sponsors both a secondary school and a teacher-training college. A federal polytechnic, a government craft school, and a hospital also serve Idah. Roads from the town lead to Nsukka and Ayangba, and there is ferry service to Agenebode across the Niger River. Pop. (1991 prelim.) 44,828.

Idaho, constituent state of the United States of America, lying in the northwestern part of the country. It is bounded on the north by Canada, on the east by Montana and Wyoming, on the south by Utah and Nevada, and on the west by Oregon and Washington. The capital is Boise.

A brief treatment of Idaho follows. For full treatment, *see* MACROPAEDIA: United States of America: *Idaho.*

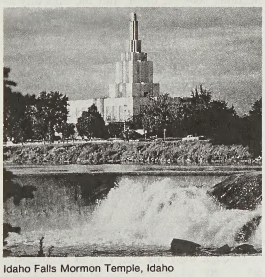
The area that is now Idaho was explored by Meriwether Lewis and William Clark in 1805. A trading post was established at Pend Oreille Lake in 1809, and other settlements followed. Idaho was a part of the disputed Oregon Country that passed to the United States when Britain relinquished its claims in 1846. The discovery of gold in 1860 led to an influx of settlers and was followed by a wave of Confederate refugees after the American Civil War. Mormons from Utah also settled there and frequently clashed with other Christian denominations. Idaho became the 43rd state of the United States in 1890.

Idaho's physical relief is dominated by the northern Rocky Mountains. The granite batholith of central Idaho, exposed in the Sawtooth Mountains, is one of the largest in North America. Nearly all of the state drains to the Pacific. The southern part of Idaho lies within the Columbia Plateau and is dominated by the Snake River, the course of which includes Hells Canyon, North America's deepest gorge (7,900 feet [2,400 m]). The valley of the Snake is a geologically complex sequence of lakes, lava beds, mesas, buttes, canyons, and desertscape, most notably symbolized by the barren craters and cones of the Craters of the Moon National Monument.

Indians, particularly the Kutenai, Salish (Kalispel), Coeur d'Alene, Nez Percé, and Shoshoni, were Idaho's first inhabitants. Living on reservations located in about the same areas as their ancestral homes, they now comprise only a tiny fraction of the state's population. The state is predominantly Mormon: the Church of Jesus Christ of Latter-day Saints has about half of the state's total church membership. Some cities in southeastern Idaho are more than 90 percent Mormon.

Idaho is sparsely populated, with an average of only about 12 persons per square mile (5 per square km). The urban population is slightly more than one-half of the total.

Potatoes have become almost synonymous with Idaho; wheat and sugar beets are also major crops. Cattle and sheep are raised in the prairies and mountain plateaus. Forestry is an important industry. Silver, lead, antimony, and molybdenum are mined.

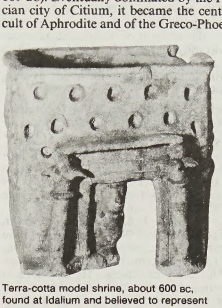


The manufacturing sector has only recently exceeded agriculture in terms of the state's personal income. Food processing, machinery manufacturing, and the production of chemicals are the leading industries.

Transportation is hindered by the mountains, and only one major highway connects north and south. Four transcontinental railroads cross Idaho, and Lewiston is connected to the Pacific Ocean by way of the navigable Snake and Columbia rivers.

Culture in Idaho is mainly the province of the schools and colleges. There are three major universities—Boise State University, Idaho State University in Pocatello, and the University of Idaho at Moscow—and several colleges. University education leans toward agriculture, mining, engineering, and forestry. Notable Idaho cultural figures include novelists Vardis Fisher and Carol Ryrie Brink. Area 83,564 square miles (216,432 square km). Pop. (2000) 1,293,953.

Idaho City, seat of Boise county, southwestern Idaho, U.S., above the confluence of Elk and Mores creeks, in a mountainous area (elevation 4,400 feet [1,340 m]) of the Boise National Forest, 24 miles (39 km) northeast of Boise. Perhaps the most famous of Idaho's early boomtowns, it was founded as Bannack City in 1862 during the great goldmining rush into the Boise Basin and in its heyday had a population of 30,000–40,000. It became the transportation, commercial, and social hub of central and southwestern Idaho and was named the territorial capital. Placer mining, however, quickly declined, and by 1869 the population had dwindled to 1,000. By 1918 almost all local mining activities had ceased. The town has been disfigured by fires, dredging, and decay. Surviving relics include the Masonic Hall, Gold Hill (once a rich placer ground), St. Joseph's Catholic Church, Boise Basin Museum, and Boot Hill Cemetery. Tourism (sightseeing, fishing, camping, hunting, and skiing) is the economic mainstay of the town's inhabitants. Pop. (2000) 458.



Idaho Falls, city, seat (1911) of Bonneville county, southeastern Idaho, U.S., on the upper Snake River. It originated as the Eagle Rock settlement at Taylor's Ferry (1863), later Taylor's Bridge. Renamed in 1890 for the low but wide (1,500 feet [460 m]) cataract in the river (now a source of hydropower), it developed first as a railroad division point and later as a centre of irrigated farming. The city

Idaho Falls Mormon Temple, Idaho
Herb and Dorothy McLaughlin

has diversified industry, but its main sources of income are potatoes, livestock, the nearby Idaho National Engineering Laboratory (nuclear-power testing), and tourism. The Idaho Falls Mormon Temple (1944) is a riverbank landmark. Inc. town, 1890; city, 1900. Pop. (2000) 50,730.

Idalium, also called IDALION, ancient city in southern Cyprus, near modern Dali. Of pre-Greek origin, Idalium was one of 10 Cypriot kingdoms listed on the prism (many-sided tablet) of the Assyrian king Esarhaddon (680–669 BC). Eventually dominated by the Phoenician city of Citium, it became the centre of a cult of Aphrodite and of the Greco-Phoenician

Terra-cotta model shrine, about 600 BC, found at Idalium and believed to represent the Resheph-Apollo temple; in the Louvre, Paris
Cliche Musees Nationaux, Paris

deity Resheph-Apollo. A terra-cotta model found there (now in the Louvre) is believed to represent the Resheph-Apollo temple.

Idar-Oberstein, city, Rhineland-Palatinate *Land* (state), southwestern Germany, on the Nahe River at the mouth of the Idarbach. The present city was formed in 1933 through the union of Idar, Oberstein (both chartered in

The Nahe River running through Idar-Oberstein, Ger.
Marburg/Art Resource, New York

1865), Algenrodt, and Tiefenstein. Until 1670 Idar and Oberstein belonged to the barons of Oberstein, later counts of Falkenstein; two ruined castles, the Alte Burg (*c.* 1197) and the Neues Schloss (*c.* 1330), date from that period. The towns changed hands several times before passing finally to the Birkenstein principality of Oldenburg in 1817. Idar-Oberstein has been important for precious-stone polishing, jewelry manufacture, and precious-metal working since the 17th century. There is a notable museum of gems in the city. Pop. (1998 est.) 34,238.

'iddah, a specified period of time that must elapse before a Muslim widow or divorcee may legitimately remarry. The Qur'ān (2:228) prescribes that a menstruating woman have three monthly periods before contracting a new marriage; the required delay for a non-menstruating woman is three lunar months. A widow's delay is 4 months and 10 days.

These stipulations serve to remove all ambiguity about paternity should pregnancy have occurred shortly before the couple's separation or the death of the husband. If a woman becomes pregnant before the divorce or separation, she may remarry after the birth of her child. The child's true father is consequently also the legal father. In the case of divorced partners, the concept of *'iddah* also provides an opportunity for reestablishing the marriage, but no reunion can take place until a period of waiting removes all doubt about existing pregnancy.

Iddesleigh, Stafford Henry Northcote, 1st Earl of: *see* Northcote, Sir Stafford Henry.

Iddings, Joseph Paxson (b. Jan. 21, 1857, Baltimore, Md., U.S.—d. Sept. 8, 1920, Brinklow, Md.), American geologist who demonstrated the genetic relationships of neighbouring igneous rocks formed during a single period of magmatic activity.

Iddings joined the U.S. Geological Survey in 1880. From 1883 to 1890 he worked with the team surveying Yellowstone National Park, and in 1895 he became professor of petrology at the University of Chicago. He collaborated in preparing the *Quantitative Classification of Igneous Rocks* (1903) and later published *Igneous Rocks* (1909–13), *Rock Minerals* (1906), and *The Problem of Volcanism* (1914).

From his studies of the graduation of texture and chemical composition among rocks, Iddings concluded that physical conditions affect the essential mineral composition as well as the crystal structure of rocks. He showed that crystalline variations depend upon temperature and rate of cooling, and he thus challenged the widely held opinion that granular rocks were produced only in large masses at great depths.

ide, also called ORFE (species *Idus idus*), common sport and food fish of the carp family, Cyprinidae, widely distributed in rivers and

Golden ides (*Idus idus*)
Jane Burton—Bruce Coleman Ltd.

lakes of Europe and western Siberia. An elongated, rather stout fish, the ide is blue-gray or blackish with silvery sides and belly, and is usually about 30–50 cm (12–20 inches) long. It eats fish and insects and other invertebrates. The golden ide is a hardy, reddish gold variety of the species commonly kept in pools and park lakes.

ideal gas (physics): *see* perfect gas.

ideal language, in analytic philosophy, a language that is precise, free of ambiguity, and clear in structure, on the model of symbolic logic, as contrasted with ordinary language, which is vague, misleading, and sometimes contradictory. In the *Tractatus Logico-Philosophicus* (1922), the Viennese-born philosopher Ludwig Wittgenstein viewed the role of language as providing a "picture of reality." Truth was seen as making logical propositions that correspond to reality. An ideal language was thus seen as the necessary criterion for determining the meaning, or meaninglessness, of statements about the world.

ideal solution, homogeneous mixture of substances that has physical properties linearly related to the properties of the pure components. The classic statement of this condition is Raoult's law, which is valid for many highly dilute solutions and for a limited class of concentrated solutions, namely, those in which the interactions between the molecules of solute and solvent are the same as those between the molecules of each substance by itself. Solutions of benzene and toluene, which have very similar molecular structures, are ideal: any mixture of the two has a volume equal to the sum of the volumes of the separate components, and the mixing process occurs without absorption or evolution of heat. The vapour pressures of the solutions are mathematically represented by a linear function of the molecular composition.

When the components of nonideal solutions are mixed, the volume of the mixture ordinarily differs from the sum of the volumes of the pure components, and heat is evolved or absorbed. The properties of such solutions often are described in terms of their deviations from those of ideal solutions. Mixtures of acetone and chloroform, for example, are said to show negative deviations from ideality: their vapour pressures are lower than those calculated on the assumption of a linear relationship to the molecular composition. Solutions of acetone and carbon disulfide, on the other hand, have higher vapour pressures than those that would characterize an ideal solution.

ideal type, in the social sciences, mental construct derived from observable reality although not conforming to it in detail because of deliberate simplification and exaggeration. It is not ideal in the sense that it is excellent, nor is it an average; it is, rather, a logical ideal used to order reality by selecting and accentuating certain elements.

The concept of the ideal type was developed by the early-20th-century German sociologist Max Weber, who used it in his historical studies. Some writers confine the use of ideal types to general, suprahistorical phenomena (*e.g.*, bureaucracy) that recur in different times and places, although Weber also used them for historically unique occurrences (*e.g.*, his famous Protestant ethic).

Problems in using the ideal type include its tendency to focus attention on extreme, or polar, phenomena, while overlooking the connections between them, and the difficulty of showing how the types and their elements fit into a conception of a total social system.

idealism, in philosophy, the theory or doctrine emphasizing the primacy of the spirit or consciousness in viewing the world. Idealists argue that abstract relations between entities are more real than objects apprehended through the senses, existence being principally in the realm of ideas; this last notion is called specifically metaphysical idealism. There is an epistemological type of idealism, which claims that the mind, in seeking knowledge, can apprehend only what is spiritual, or claims that at any rate the reality of objects resides in their perceptibility.

A brief treatment of idealism follows. For full treatment, *see* MACROPAEDIA: Philosophical Schools and Doctrines, Western.

Although there are many types of idealism, six tenets are shared by all of them: the existence of universals (qualities common to every member of a category); a transcendence of the here and now; the idea that relations between entities may transform those entities; a dialectical approach, building up systems that incorporate elements from sometimes contradictory constituents (most idealists hold that even bad can be transcended to produce good); and, finally, that the mind is considered superior to matter, particularly if expressed as spirit.

Idealists have tried to define ultimate reality; to delimit the basic data of human knowledge (which they have tended to see as a spirit force embracing the whole of world history); and to construct a philosophy of history that accounts for the fact of change and any purpose that may inhere in change.

Among individual idealist contentions are: that the essence of an object is its being perceived (formulated by the 18th-century British Bishop George Berkeley; Berkeley's brand is called subjective idealism); that the relationship of a subject and object is part of the fact about the subject's and object's existence; a tendency toward a mystical apprehension of the "absolute" (as in the case of Plato's embracing the idea of the good); and the ontological proof of God's existence set out by St. Anselm in the 11th century, arguing that because God is conceived of as perfect he must exist, since if he did not exist he would not be perfect.

Various strands of idealism exist; one such is the formalistic or transcendental idealism proposed in the late 18th century by Immanuel Kant (who himself actually preferred the term critical idealism). Kant argued that the human mind could make sense of its experience only on the basis of certain highly specific general conceptual features, such as the ability to locate and relocate objects in space and time. Still, from the fact that the human mind could make sense of its experience only if reality exhibited such features, it did not follow that reality was actually like that. Indeed, Kant believed that one renders reality intelligible by imposing on sensory experience those general conceptual features that are the essential preconditions of an intelligible reality, and that reality itself, although conceivable, was not directly receivable.

In contrast to Berkeley's subjective idealism was objective idealism, formulated by the three German successors of Kant. These were F.W.J. Schelling (aesthetic idealism), J.G. Fichte (moral idealism), and G.W.F. Hegel (dialectical idealism). Differences between subjective and objective idealism were not always clear-cut, however. For instance, Fichte's idealism was later called subjective in contrast to Schelling's objective variety, while Hegel's became known as absolute idealism.

Hegel in particular rejected Kant's version of idealism. He argued that the concept of the unknowable "things in themselves" was itself unintelligible. The central doctrine of absolute idealism is that reality can be known, and can be known to be ultimately spiritual in nature, but that "spirit" or "mind" can only realize itself in relation to the external world. Mind fulfills itself in its encounters with physical reality. This process of realization seems to consist in a historical progression whereby one inadequate but intellectually dominant concept eventually generates inconsistencies that lead to its being replaced by an opposing concept. This concept also displays inconsistency, however. Hence the solution is to combine these two concepts in a third, less inadequate concept. However, this concept in turn, although an improvement on previous concepts, itself displays inadequacies that generate a new thesis and antithesis (as Hegel called this pattern of concept progression). The process known as the dialectic gradually resulted in the concepts' reaching the one fully adequate concept, the "absolute idea," which would demonstrate that reality could only be understood as a totality that was spiritual in nature.

In the 19th and 20th centuries, idealism underwent numerous revivals and reinterpretations. Similar doctrines have played central roles in Indian, Chinese, and Islāmic metaphysics and epistemology.

Idealism, absolute (philosophy): *see* absolute Idealism.

Idealism, subjective (philosophy): *see* subjective Idealism.

Idealism, transcendental (philosophy): *see* transcendental Idealism.

Idelsohn, Abraham Zevi (b. July 14, 1882, Felixberg, Latvia, Russian Empire—d. Aug. 14, 1938, Johannesburg), Jewish cantor, composer, founder of the modern study of the history of Jewish music, and one of the first important ethnomusicologists.

Trained as a cantor from childhood, Idelsohn later studied music in Berlin and Leipzig. Before emigrating to Jerusalem in 1905, he was a cantor in Leipzig and Regensberg, Ger., and in Johannesburg. In Jerusalem he served as a cantor and in 1910 founded the Institute for Jewish Music. The previous year, funded by the Vienna Academy of Sciences, he had begun collecting from oral tradition the music of various European, Asian, and North African Jewish groups. The result was *Thesaurus of Hebrew Oriental Melodies*, 10 vol. (1914–32). This work and the more than 1,000 recordings made by Idelsohn provided a basis for the first comparative study of Jewish biblical cantillation (intoned recitation) and demonstrated an underlying unity in the religious chants even among geographically widely separated groups. His studies, especially those of the chants of the Yemenite Jews, also led to his further research demonstrating the close relationship of Jewish and early Christian chants. He also did important early studies of the nature of the *maqāmāt*, the melodic frameworks used in Islāmic music.

Idelsohn also composed the first Hebrew opera, *Yiftaḥ* (1922; "Jephthah"), which incorporates traditional melodies; an unfinished opera, *Eliyahu* ("Elijah"); and the song "Hava nagila" ("Come, Let's Rejoice"), a setting of his own text to a melody that he adapted from a Ḥasidic (a pietistic Jewish movement) melody. His books include *Jewish Music in Its Historical Development* (1929); *Jewish Liturgy* (1932); and *Sefer ha-shirim*, 2 vol. (1913–22; "Book of Songs"), the first Hebrew songbook published in Palestine.

Idemitsu Kōsan Co., Ltd., Japanese petrochemical corporation founded in 1911, as Idemitsu Shōkai, and reorganized and incorporated under its current name in 1940. Headquarters are in Tokyo.

The company as originally founded in Moji (now a part of Kita-Kyūshū), Japan, by Idemitsu Sazō was a general trading company, dealing in the distribution of various goods, including such commodities as grain and such bulk products as fuel and lubricating oils. By 1914 the company had embarked on a major expansion on the Asian mainland, opening an office in Darien, Manchuria, and extending a sales network first through North China, Korea, and Taiwan and later into South China. By the outbreak of World War II in Europe, the company was making sizable inroads into the territories once the exclusive trading grounds of Dutch, British, and American companies.

In 1945, however, with its overseas trade lost, Idemitsu Kōsan fell on hard times. In 1949, under the Allied occupation, it secured rights to distribute petroleum products. The company first expanded into marketing and distribution, creating a fleet of tankers and establishing depots and warehouses. By 1957 the company had begun refining oil and was importing crude oil from a variety of overseas sources. By 1976 it was also producing its own oil and gas in the offshore Aga Field in the Sea of Japan. Meanwhile, in 1964, with the creation of a subsidiary, Idemitsu Petrochemical Co., Ltd., the company began producing a wide range of petrochemical products, including plastics and synthetics.

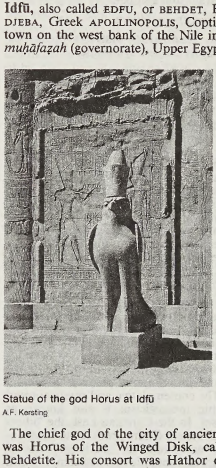
identity theory, in philosophy, one view of modern Materialism that asserts that mind and matter, however capable of being logically distinguished, are in actuality but different expressions of a single reality that is material. Strong emphasis is placed upon the empirical verification of such statements as: "Thought is reducible to motion in the brain."

The double-aspect theory is similar to this, with one notable exception: reality is not material; it is either mental or neutral. The latter case is illustrated by an undulating line that is both concave and convex at the same time; each aspect is an integral, but only a partial, expression of the total reality.

Idéologie, English IDEOLOGY, French philosophic movement of the late 18th and early 19th centuries that reduced epistemological problems (of the nature or grounds of knowledge) to those of psychology (as in the work of Condillac), before advancing to ethical and political problems. The Idéologues, by analysis of ideas, viewed the simple sensory elements of Condillac's sensationalism as generating, by successive composition, the totality of the psychic and spiritual sentiments and, finally, of the social, moral, and political sentiments as well. Named by Destutt de Tracy, the movement had as active members the Marquis de Condorcet, Maine de Biran, and P.-J.-G. Cabanis.

ideology, a systematic body of beliefs about the structure and working of society that includes a program of practical politics based on a comprehensive theory of human nature and requiring a protracted social struggle to enact. Such comprehensive and action-centred doctrines about society were characteristic of the 19th century in particular, which for that reason is sometimes referred to as the "age of ideology." Since then there have been many different definitions of ideology, and most original political and sociological thinkers have used the word in their own characteristic sense.

A brief treatment of ideology follows. For full treatment, *see* MACROPAEDIA: Ideology.



The word ideology was coined in 1796 by the French writer A.L.C. Destutt de Tracy as a name for his own "science of ideas." To establish this science Destutt de Tracy relied on the sensationalist epistemology of John Locke and Étienne Bonnot de Condillac, as well as on Francis Bacon's faith in the meliorative value of scientific knowledge. Human intellectual faculties are simply another aspect of our animal nature, he wrote, and "ideology is a part of zoology." Destutt de Tracy and his supporters called themselves *idéologistes,* and their program, adopted by the Directory as official doctrine between the years 1795 and 1799, aimed at the creation of a democratic, rational, and scientific society. The *idéologistes* quickly lost power with the rise of Napoleon, who reorganized the *idéologiste* stronghold in the Institut National in 1802–03 and began to heap scorn upon them as *idéologues.* It was then that the word first acquired a pejorative connotation.

Certain characteristics of Destutt de Tracy's thought were to prove to be true generally of ideologies: it presented a more or less comprehensive theory of society, it established a political program, it foresaw a struggle for the implementation of that program and required therefore followers who were committed to it, and it envisioned a leadership of intellectuals. Implicit in any ideology thus characterized is a challenge to established secular and religious leadership, and it is that challenge that has linked ideology with revolution both of the left and of the right. In the modern age Socialism, Communism, Fascism, and Nazism have been among the most fully articulated ideologies and among the most successful in winning recruits to their various programs. This connection of ideology with political activism and even extremism has added other, and generally pejorative, shades of meaning to the term.

The classical pejorative characterization of the concept of ideology is in the work of Karl Marx and Friedrich Engels. Their view of ideology stemmed from their materialistic conception of history. The ideas of the members of the bourgeois class, for instance, reflect their own class interests rather than an objectively true picture of society. The ideas of this particular class, however, are thrust upon the proletariat as well, serving to preserve the dominant position of the bourgeoisie. Certain ideas, as of social mobility, liberty, and even love, are myths whose passive acceptance by the proletariat serves to solidify the status quo. Ideology, in Marxist doctrine, is thus a system of illusions about the nature of society.

In more common political discourse, ideology is frequently contrasted unfavourably with pragmatism and ideologists with experienced and worldly practitioners of politics. To the extent that any ideology insists upon its particular encompassing theory of man and society and on a program predicated on that theory, it is, to be sure, at odds with the aims and practices of pluralistic societies. The similarities between ideology and militant religious belief have often been noted, as has the fact that the rise of ideologies occurred in an age also marked by rapidly increasing secularism.

Idfū, also called EDFU, or BEHDET, Egyptian DJEBA, Greek APOLLINOPOLIS, Coptic ATBO, town on the west bank of the Nile in Aswān *muḥāfaẓah* (governorate), Upper Egypt.

Statue of the god Horus at Idfū
A.F. Kersting

The chief god of the city of ancient times was Horus of the Winged Disk, called the Behdetite. His consort was Hathor of Dandarah, whose statue during the late empire was brought to Idfū annually by boat on a ceremonial visit. The chief monument of ancient Idfū is the great sandstone temple of Horus, 451 ft (138 m) long and 250 ft (76 m) wide, standing on the site of an earlier temple of the 18th-dynasty (1567–1320 BC) period. The present building was begun by Ptolemy III Euergetes I in 237 BC and completed by Ptolemy XI in 57 BC. The work was frequently interrupted by nationalistic revolts in Upper Egypt. The decoration of the walls consists of inscriptions and scenes in relief that form a unique collection of temple liturgy as well as nationalism cloaked in religious imagery. The temple's simple plan along one main axis

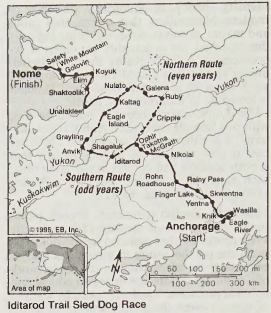
serves as the classic example of an Egyptian temple.

Excavation of extensive mounds covering the ancient city and cemeteries of Idfū has yielded a rich harvest of ostraka (inscribed pottery fragments) and papyri. In the necropolis west and north of the town were found mastaba tombs of Old Kingdom officials and a number of Middle Kingdom burials.

The modern town is a trading centre for grain, cotton, and dates, and it has a sugar factory. It is linked to the Cairo-Aswān railway by a bridge across the Nile River. Pop. (1986 prelim.) 45,737.

Idhi, also spelled IDI, IDA, OR IDHA (Doric Greek: "Timber Tree"), Modern Greek PSILORITIS, mountain riddled with caves, westcentral Crete, in the *nomós* (department) of Réthimnon, southern Greece. One of Idhi's two peaks, Timios Stavros, at 8,058 feet (2,456 m), is Crete's highest mountain. According to one legend Zeus was reared in the Idhiean cave on the peak's scrub-covered slopes. The well-known Kamares wares (Minoan polychrome pottery) are named for Kameres cave, where they were discovered. The limestone mass of Idhi acts as a large subterranean reservoir, supplying water to the springs of the surrounding villages, which can thereby practice year-round agriculture, including the raising of olives, citrus fruits, vegetables, wine grapes, barley, oats, and wheat. Goats and sheep are also raised on Idhi's slopes.

Idhra (Greece): *see* Hydra.



idiopathic respiratory distress (medicine): *see* respiratory distress syndrome.

idiophone, class of musical instruments in which a resonant solid material—such as wood, metal, or stone—vibrates to produce the initial sound. The eight basic types are concussion, friction, percussion, plucked, scraped, shaken, stamped, and stamping. In many cases, as in the gong, the vibrating material itself forms the instrument's body. Other examples include xylophones and rattles.

A plucked idiophone, such as a Jew's harp or a music box, is known as a linguaphone. The names idiophone and membranophone (membrane instruments, *e.g.,* drums) replace the looser term percussion instruments when a precise, acoustically based classification is required. *See also* aerophone; chordophone; electrophone; membranophone.

idiorrhythmic monasticism, also called EREMITIC MONASTICISM (from Greek *eremos,* "desert"), the original form of monastic life in Christianity, as exemplified by St. Anthony of Egypt (*c.* 250–355). It consisted of a total withdrawal from society, normally in the desert, and the constant practice of mental prayer. The contemplative and mystical trend of eremitic monasticism is also known as Hesychasm. In the Christian East, the "idiorrhythmic" system (from Greek *idios,* "particular"; *rhythmos,* "rule," or "discipline") always coexisted with cenobitic monasticism. It is still practiced on modern Mount Athos, Greece. *See also* cenobitic monasticism.

Iditarod Trail Sled Dog Race, annual dogsled race held in March between Anchorage and Nome, Alaska, U.S. Both men and women compete together. A short race of 56 miles (90 km) organized in 1967 evolved in 1973 into the current race. The course, roughly 1,100 miles (1,770 km) long, partially follows the old Iditarod Trail dogsled mail route blazed from Knik to Nome in 1910. (The Iditarod also commemorates an emergency mission to get medical supplies to Nome during a 1925 diphtheria epidemic.) The racecourse crosses two mountain ranges (the Alaska and the Kuskokwim), runs along

Iditarod Trail Sled Dog Race

the Yukon River for 150 miles (241 km), and crosses frozen waterways, including the pack ice of Norton Sound. The course length and route vary slightly from year to year, and the middle third takes alternate routes in odd and even years. The first race in 1973 took the winning musher about 20 days, but the winning time has been reduced by almost half. In 1976 the U.S. Congress designated the original Iditarod Trail as a National Historic Trail.

Idjil (Mauritania): *see* Fdérik.

Idkū, also spelled EDKOU, town, northern al-Buḥayrah *muḥāfaẓah* (governorate), Lower Egypt. It lies on a sandy strip behind Abū Qīr Bay, in the northwestern Nile River delta. Immediately south is Lake Idku, a 58-square-mile (150-square-kilometre) lagoon that stretches some 22 miles (35 km) behind and parallel to the coast and has a maximum width of 16 miles (26 km). Drained by al-Ma'addiyah Channel, connecting with the Mediterranean, the lagoon is reputed to be the ancient Canopic branch of the Nile. Idkū's isthmus position enables it to capitalize on the fisheries of both the lagoon and the Mediterranean. Other industries include rice milling and silk weaving. Idkū is linked by coastal road and railway to Alexandria, 26 miles (42 km) to the west-southwest, and Rosetta (Rashid), 12 miles (19 km) northeast. Pop. (1986 prelim.) 70,729.

Idlib, town, northwestern Syria. It is situated in a fertile basin midway between Aleppo and Latakia and is an important textile centre and a market for one of Syria's better agricultural districts. Major crops include cotton, cereals, olives, figs, grapes, tomatoes, sesame, and almonds. Local industries include spinning and olive-oil pressing. Pop. (1992 est.) 70,000.

Ido, artificial language constructed by the French logician and Esperantist Louis de Beaufront and presented at the Délégation pour l'Adoption d'une Langue Auxiliaire Internationale (Delegation for the Adoption of an International Auxiliary Language) of 1907. The language is a reworking of Esperanto (*q.v.*), intended by its originator to improve upon what he considered weak points in Esperanto. In fact, Ido takes its name from an Esperanto suffix meaning "derived from"—*i.e.,* derived from Esperanto. Ido allows spellings that are more natural to the average European than spellings in Esperanto, although they are less true to Esperanto's rule of one letter for each sound. It has excluded special accented letters found in Esperanto (*ĉ, ĵ, ŝ, ĝ, ĥ*) in favour of more familiar forms (*ch, j, sh;* sounds equivalent to Esperanto *ĝ* [English *j*] and *ĥ* [Greek *ch,* Russian *kh*] are not represented), and it allows *qu* for Esperanto *kw, x* for *ks,* and *y* for Esperanto *j.* Its grammar is also similar to Esperanto, but Ido incorporates rather more Romance features—*e.g.,* infinitives in *-ar, -er, -ir* as in Spanish, plurals of nouns in *-i* as in Italian, and verb inflections reminiscent of Latin or Interlingua. In the decade or two following its appearance, Ido acquired some popularity, which then declined.

idocrase (mineral): *see* vesuvianite.

idolatry, in Judaism and Christianity, the worship of someone or something other than God as though it were God. The first of the biblical Ten Commandments prohibits idolatry: "You shall have no other gods before me."

Several forms of idolatry have been distinguished. Gross, or overt, idolatry consists of explicit acts of reverence addressed to a person or an object—the sun, the king, an animal, a statue. This may exist alongside the acknowledgment of a supreme being; *e.g.,* Israel worshiped the golden calf at the foot of Mount Sinai, where it had encamped to receive the Law and the covenant of the one true God.

A person becomes guilty of a more subtle idolatry, however, when, although overt acts of adoration are avoided, he attaches to a creature the confidence, loyalty, and devotion that properly belong only to the Creator. Thus, the nation is a good creature of God, but it is to be loved and served with an affection appropriate to it, not with the ultimate devotion that must be reserved for the Lord of all nations. Even true doctrine (*e.g.,* true doctrine about idolatry) may become an idol if it fails to point beyond itself to God alone.

At the same time, Christian thought has insisted upon the principle of mediation and has rejected the charge that attachment to a mediating agency is automatically idolatrous. The Christian scriptures are called "the Holy Bible" not because they have an intrinsic holiness or are themselves the source of such holiness but because the God who alone is holy is mediated and disclosed to humans through the words of the Bible. Christians are not in agreement about the agents of mediation—*e.g.,* about the role of the Virgin Mary and of the other saints. But where such mediation is acknowledged to be present, it is also acknowledged that reverence shown toward it applies not to the agent of mediation in and of himself but to the one for whom the agent stands. A special instance is the human nature of Jesus Christ (which is worthy of divine worship because of its inseparable union with the Second Person of the Holy Trinity) and the consecrated Host in the Eucharist (which may properly be adored because it has been changed into the very body of Christ). Although the accusation of idolatry is thus a part of the polemic of Christian against Christian, so that Protestants are accused of bibliolatry and Roman Catholics of Mariolatry, the fundamental meaning of the term is the direct moral corollary of the Jewish-Christian avowal of the oneness of God: "Hear, O Israel: The Lord our God is one Lord."

See also aniconism.

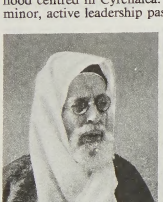
Idoma, inhabitants of the region east of the confluence of the Niger and Benue rivers in southern Nigeria. A number of peoples, including the Agala, Iyala, Okpoto, Nkum, and Iguwale, are classified as speakers of distinguishable Idoma dialects, which belong to the Kwa branch of the Niger-Congo family of languages. Within the dialect cluster there is a considerable degree of mutual intelligibility, though there is an absence of cultural and political unity among Idoma speakers.

The basic social unit is the extended family, usually a man, his wives, their children, and the wives and children of his sons. Descent and inheritance are in the male line, and lineages are settled on identifiable tracts of land; clans may be formed by the larger lineages. The ancestor cult has been fundamental in indigenous Idoma religions.

The land inhabited by the Idoma is nearly

all orchard bush (tropical uplands with open woodland), sometimes becoming open grassland or rain forest.

Idoma economy is characterized by rainy-season agriculture and dry-season hunting. Large and small markets are held in rotation within the various districts. Within the general area, crafts such as the weaving and dyeing of cotton cloth and blacksmithing have been developed.



Idomeneus, in Greek legend, son of Deucalion, grandson of Minos and Pasiphae, and king of Crete. He courted Helen and took a distinguished part in the Trojan War. According to the *Odyssey,* he returned home safely, but a later tradition relates that he was overtaken by a violent storm and vowed to sacrifice to Poseidon the first living thing that met him when he reached home. The first to greet him was his son, whom he thus slew; as a result, a plague developed, and Idomeneus was driven out. He fled to the district of Sallentum in Calabria and subsequently to Colophon in Asia Minor, where he settled near the Temple of the Clarian Apollo.

Idris, an immortal figure in Islāmic legend, mentioned in the Qur'ān (Islāmic sacred scriptures) as a prophet. According to the traditions of the Sunnah, the major sect of Islām, Idrīs appeared sometime between the prophets Adam and Noah and transmitted divine revelation through several books. He did not die but was taken bodily to paradise to spend eternity with God. Popular legend also credits him with the invention of writing and sewing and of several forms of divination. He is regarded as the patron saint of craftsmen and Muslim knights.

Scholars, however, have not been able to assign Idrīs a definite historical identity. On linguistic grounds he has been variously identified as the biblical Ezra, the Christian Apostle Andrew, Alexander the Great's cook Andreas, and sometimes as the biblical Elijah or Muslim al-Khiḍr. Parallels have also been drawn between the biblical Enoch and Idrīs, on the basis of several striking similarities: both are pious men taken physically to paradise, and both live a reputed 365 years, suggesting that they had originally been sun gods. Idrīs (and Enoch) has also been woven into the Islāmic mythology surrounding the Greco-Egyptian god Hermes Trismegistos as the first incarnation of the tripartite Hermes.

Idris I, in full SIDI MUḤAMMAD IDRĪS AL-MAHDI AS-SANŪSĪ (b. March 13, 1890, Jarabub, Cyrenaica, Libya—d. May 25, 1983, Cairo), the first king of Libya when that country gained its independence in 1951.

In 1902, Idris succeeded his father as head of the Sanūsiyah, an Islāmic mystical brotherhood centred in Cyrenaica. Because he was a minor, active leadership passed to his cousin,

Idris I
Central Press—Pictorial Parade/EB Inc.

Aḥmad ash-Sharīf. Ruling in his own right after 1916, Idris' first problem was to deal with the Italians, who in 1911 had invaded Libya in an effort to create a North African empire but were unable to extend their authority much beyond the coast. By the peace of Arcoma (1917), Idris secured a cease-fire and, in effect, confirmation of his own authority in inland Cyrenaica. A further agreement in 1919 established a Cyrenaician parliament and a financial grant to Idris and his followers. When Idris proved unable and unwilling to disarm his tribal supporters as Italy demanded, however, the Italians invaded the Tripolitanian hinterland in the spring of 1922. Tripolitanian tribesmen offered to submit to Idris' authority in the hope of securing greater unity and more effective resistance. Idris saw resistance as futile, however, and he went into exile in Egypt, where he remained until British forces occupied Libya in 1942 during World War II (1939–45).

Idris continued to direct his followers from Egypt, not returning to Libya permanently until 1947, when he could head an official government. His main support came from conservative tribesmen, who thought in terms of a Sanūsī government ruling over Cyrenaica, but younger and more urbanized elements looked to a union of the Libyan provinces. The issue was finally determined by the United Nations in November 1949, when the General Assembly resolved that the future of Cyrenaica, Fezzan, and Tripolitania should be decided upon by representatives of the three areas meeting in a national assembly. This assembly established a constitutional monarchy and offered the throne to Idris. Libya declared its independence in December 1951.

Under Idris the throne had a preponderance of influence over the parliament and absolute control over the army. The government was an oligarchy of wealthy townsmen and powerful tribal leaders, who divided the important administrative positions among themselves and supported the King. This situation, along with the external support of Western alliances and the internal military support of his loyal tribesmen, enabled Idris to guide the affairs of the central government strongly. Many of the younger army officers and members of the growing urban middle class, however, resented Idris' socially conservative policies and his aloofness from the growing currents of Arab nationalism. In September 1969, while Idris was at a Turkish spa for medical treatment, the army, led by Col Muammar al-Qaddafi, overthrew his government. He went first to Greece and then was given political asylum in Egypt. In 1974 he was tried in absentia on charges of corruption and found guilty. He remained in exile in Cairo.

Idris ibn Raja Iskandar, Sultan (b. 1849, Perak, Malaya—d. Jan. 14, 1916, Kuala Kangsar, Federated Malay States), sultan of Perak, 1887–1916.

Idris succeeded to the throne of Perak only 13 years after the British had declared a protectorate over the state. He reigned during a crucial and formative period in its history, during which it became a part of the unified Federated Malay States administration and saw vast increases in population, especially from immigrant Chinese and Indians, and in economic growth, from the export of tin and rubber. Of all the sultans in Malaya at the time, Idris was certainly the most influential and probably the most able. Though handicapped by his position as a ward of the British, and by his training as a Malay aristocrat of the old school, he strove to adapt himself to the times and to the needs of his rapidly changing state and its peoples. One of his principal concerns was education. It was no accident that the two leading higher educational institutions in the peninsula for Malays—the Malay College, providing education in English to the sons of the elite, and the Sultan Idris Training College for vernacular schoolteachers—had close associations with him; the first was established under his auspices in the royal town of Kuala Kangsar, and the second (also in Perak) was named after him.

Idris was noted as a strong defender of state, as opposed to federal, rights (resisting, for example, the institution of a common purse) and a staunch advocate of increased Malay participation in the ranks of the administration. He recognized, however, that his state was rapidly becoming multiracial, and the outpouring of addresses and other tributes offered to him by representatives of all communities and groups on the occasion of his silver jubilee in 1912 was testimony to the wide extent of the respect and affection in which he was held.

Idrīsī, ash-Sharīf al-, byname of ABŪ 'ABD ALLĀH MUḤAMMAD IBN MUḤAMMAD IBN 'ABD ALLĀH IBN IDRĪS AL-ḤAMMŪDĪ AL-ḤASANĪ AL-IDRĪSĪ (b. 1100, Sabtah, Mor.—d. 1165/66, Sicily, or Sabtah), Arab geographer, an adviser to Roger II, the Norman king of Sicily. He wrote one of the greatest works of medieval geography, *Kitāb nuzhat al-mushtāq fī ikhtirāq al-āfāq* ("The Pleasure Excursion of One Who Is Eager to Traverse the Regions of the World").

Al-Idrīsī traced his descent through a long line of princes, caliphs, and holy men to the Prophet Muḥammad. His immediate forebears, the Ḥammūdids of the short-lived caliphate (1016–58) in Spain and North Africa, were an offshoot of the Idrīsids of Morocco (789–985), a dynasty descended from Muḥammad's eldest grandson, al-Ḥasan ibn 'Alī.

Few facts are known about al-Idrīsī's life. He was born in Sabtah (now Ceuta, a Spanish exclave in Morocco), where his Ḥammūdī ancestors had fled after the fall of Málaga, their last foothold in Spain, in 1057. He spent much of his early life travelling in North Africa and Spain and seems to have acquired detailed and accurate information on both regions. He is known to have studied in Córdoba for a number of years and also to have lived in Marrakesh, Mor., and Qusṭanṭīnah (Constantine), Alg. Apparently his travels took him to many parts of western Europe, including Portugal, northern Spain, the French Atlantic coast, and southern England. He visited Asia Minor when he was barely 16 years old.

In about 1145, while still at the peak of his powers, al-Idrīsī entered the service of Roger II of Sicily—a step that marked a turning point in his career. Henceforward, all his great achievements were to be indissolubly linked to the Norman court at Palermo, where he lived and worked for the rest of his life. Some Western scholars have suggested that al-Idrīsī may have been regarded as a renegade by other Muslims for entering the service of a Christian king and praising him lavishly in his writings. Moreover, some writers have attributed the paucity of biographical information on al-Idrīsī in Muslim sources to these circumstances.

There has always been uncertainty about al-Idrīsī's reasons for going to Sicily. It has been suggested that he may have been induced to do so by some of his Ḥammūdī kinsmen, who are known to have settled there and who, according to the Spanish-Arab traveller Ibn Jubayr (1145–1217), enjoyed great power and prestige among Sicilian Muslims. According to the 14th-century Arab scholar aṣ-Ṣafadī, Roger II invited al-Idrīsī to Sicily to make a map of the world for him, telling him:

> You are a member of the caliphal family. For that reason, when you happen to be among Muslims, their kings will seek to kill you, whereas when you are with me you are assured of the safety of your person.

Al-Idrīsī agreed to stay, and Roger settled upon him a king's pension.

Al-Idrīsī's service in Sicily resulted in the

completion of three major geographic works: (1) a silver planisphere on which was depicted a map of the world, (2) a world map consisting of 70 sections formed by dividing the Earth north of the Equator into 7 climatic zones of equal width, each of which was subdivided into 10 equal parts by lines of longitude, and (3) a geographic text intended as a key to the planisphere. This was his great work of descriptive geography, known as *Kitāb nuzhat al-mushtāq fī ikhtirāq al-āfāq* and also as *Kitā Rujār*, or *Al-Kitāb ar-Rujārī* ("The Book of Roger"). In compiling it, al-Idrīsī combined material from Arabic and Greek geographic works with information obtained through first-hand observation and eyewitness reports. The king and his Arab geographer chose a number of persons, including men skilled in drawing, and dispatched them to various countries to observe and record what they saw. Al-Idrīsī completed the book in January 1154, shortly before Roger's death.

The silver planisphere has been lost, but the maps and book have survived. A German scholar, Konrad Miller, published the maps in his *Mappe Arabicae* (1926–31), and later an emended world map, based upon Miller's work, was published by the Iraq Academy (Baghdad, 1951). The first loose sections of a critical edition of Idrīsī's *Kitāb nuzhat al-mushtāq*, undertaken by a committee of Italian scholars in cooperation with a group of international experts, had begun to appear in the early 1970s.

Kitāb nuzhat al-mushtāq represents a serious attempt to combine descriptive and astronomical geography. That this effort was not an unqualified success apparently stems from the author's inadequate mastery of the physical and mathematical aspects of geography. He has been criticized not only for failing to make use of the important geographic contributions of other scientists of his times, such as the 11th-century Arab scholar al-Bīrūnī, but also for his uncritical use of earlier Greek and Arab sources. Nevertheless, al-Idrīsī's book is a major geographic monument. It is particularly valuable for its data on such regions as the Mediterranean basin and the Balkans.

A number of other geographic works are attributed to al-Idrīsī, including one (now lost) written for William I, Roger's son and successor who reigned from 1154 to 1166, as well as several critical revisions and abridgments. The Medici press in Rome published an abridgment of *Kitāb nuzhat al-mushtāq* in 1592; a Latin translation was published under the title *Geographia Nubiensis*. The only complete translation of the work in any language is P.A. Jaubert's two-volume *Géographie d'Édrisi* (1836–40); it is unreliable, however, because it was based on faulty manuscripts. Al-Idrīsī's scientific interests embraced medical matters as well, and his *Kitāb al-adwiya al-mufradah* ("Book of Simple Drugs"), in which he lists the names of drugs in as many as 12 languages, demonstrates the range of his linguistic abilities. Al-Idrīsī seems to have had a good knowledge of Arabic literature, and—judging by some of his verse that has survived—he was also an accomplished poet. No details are known about the last years of his life. (W.Jw.)

BIBLIOGRAPHY. G. Oman, "Al-Idrīsī," in *Encyclopaedia of Islam*, new ed., vol. 3, pp. 1032–35 (1971, reprinted 1986), provides compact coverage of al-Idrīsī and his work. Much interesting information on al-Idrīsī is given by S. Maqbul Ahmad in the introduction to an English translation of a part of al-Idrīsī's work, *India and the Neighbouring Territories in the Kitāb Nuzhat al-Mushtaq fi'Khtiraq al-'Afaq* (1960).

Idrisid DYNASTY, also called AL-IDRĪSIYŪN, Arab Muslim dynasty that ruled in the Berber areas of Morocco from 789 until 921.

The founder, Idrīs I (Idrīs ibn 'Abd Allāh ibn Ḥasan II), who reigned 789–791 at Walīla, was a sharīf, or princely descendant of Muḥammad, and was one of the few survivors of the battle of Fakhkh, in which many of the 'Alids were slain by the 'Abbāsids. He fled west and succeeded in conquering Berber tribes in northern Morocco and a part of the Atlantic plains. His son, Idrīs II (reigned 803–828), resumed his work without, however, succeeding in subduing the whole country. Nevertheless, in 808, Idrīs II founded as a capital for his little kingdom the town of Fez (modern Fès), which henceforth became a political and religious centre. The Idrisids were the first to organize, outside the Berber tribal system, a central government that was partly composed of Arabs. They established the sharifian tradition in Morocco and were also responsible for making a part of northern Morocco linguistically Arabic. After the death of Idrīs II, however, the kingdom was divided up, and the power of the Idrisids declined. They were eventually crushed between the Umayyad caliphs of Córdoba and the Fāṭimids of Cairo. The last Idrisid ruler was killed while a prisoner of the Umayyads in 985.

Idua Oron (Nigeria): *see* Oron.

Idukki, also spelled IDIKKI, town, southeastern Kerala state, southwestern India. It lies 81 miles (130 km) southeast of Cochin and 79 miles (127 km) northeast of Kottayam. It is known for its large hydroelectric project. The Idukki arch dam, 554 feet (169 m) high, on the Periyār River, was completed in 1974. It connects two huge rocks, Kurathi, 3,035 feet (925 m) high, and Kuravan, 2,753 feet (839 m) high. Together with the Cheruthoni dam (1976), on the Cheruthoni River, and the Kulamavu dam (1977), on the Muvattu Puzha River, the Idukki dam forms a large reservoir. The dam is used primarily for flood control and to provide electric power.

Short, swift-flowing streams cross the region surrounding the town of Idukki. Agriculture is the basis of the area's economy; crops include tea, cassava, pulse (legumes), sugarcane, ginger, oilseeds, millet, coconut, pepper, betel nuts, cardamom, and tea. Industries consist of processing cashew nuts, coffee, and tea; *bidi* (cigarette) making; paper milling; and sawmilling. Pop. (1991) town, 10,228.

Idun, also spelled IDUNN, or IDUNA, in Norse mythology, the goddess of spring or rejuvenation and the wife of Bragi, the god of poetry. She was the keeper of the magic apples of immortality, which the gods must eat to preserve their youth. When, through the cunning of Loki, the trickster god, she and her apples were seized by the giant Thiassi and taken to the realm of the giants, the gods quickly began to grow old. They then forced Loki to rescue Idun, which he did by taking the form of a falcon, changing Idun into a nut (in some sources, a sparrow), and flying off with her in his claws.

idyll, also spelled IDYL (from Greek *eidyllion*, "little picture"), a short poem of a pastoral or rural character in which something of the element of landscape is depicted or suggested. The term was used in Greco-Roman antiquity to designate a variety of brief poems on simple subjects in which the description of natural objects was introduced. The conventions of the pastoral were developed by the Alexandrian school of poetry, particularly by Theocritus, Bion, and Moschus, in the 3rd century BC, and the *Idylls* of Theocritus are the source of the popular idea of this type of poem.

The word was revived during the Renaissance, when some poets employed it to distinguish narrative pastorals from those in dialogue. The general use, or misuse, of the word arose in the 19th century from the popularity of two works, the *Idylles héroïques* (1858) of Victor-Richard de Laprade and the *Idylls of the King* (1859) of Alfred, Lord Tennyson, neither of which was related to the pastoral tradition. Thereafter the word was used indiscriminately to refer to works on a variety of subjects.

Although it is impossible to define the idyll as a definite literary form, the adjective idyllic has come to be synonymous with the rustic, pastoral, and tranquil, the mood first created by the Alexandrian poets. *See also* eclogue.

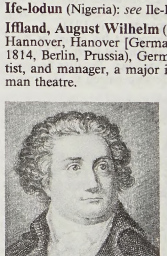
If, small Mediterranean island 2 miles (3.2 km) outside the port of Marseille, Fr. Its castle, built by the French king Francis I in 1524, was later used as a state prison. The castle was made famous when Alexandre Dumas *père*, the 19th-century French writer, used it as one of the settings in his novel *The Count of Monte Cristo* (1844–45).

Articles are alphabetized word by word, not letter by letter



Ifat, Muslim state that flourished in central Ethiopia from 1285 to 1415 in the fertile uplands of eastern Shewa. Toward the end of the 13th century a ruler whose dynastic title was Walashma gained an ascendancy over the Muslim kingdoms of eastern Shewa. By gradually winning over the newly formed states of Fatajar, Dawaro, and Bale and by subduing various Shewan and Afar regions, including the state of Adal, he finally succeeded in constituting the state of Ifat.

Alternately subject to the pagan kingdom of Damot and to the Christian kingdom of Ethiopia and sometimes independent, Ifat became—as the northernmost of several Muslim states—the buffer between them and sometimes suffered from the advance southward of Ethiopian authority. When its sultan, Hakk ad-Dīn, warring against the Ethiopian king Amda Tseyon, was conquered by him in 1328, Ifat was made tributary to Ethiopia. (At this time Ifat's dominion extended eastward to the port of Zeila.) Thereafter Ifat was continually in revolt against Ethiopia. It was finally destroyed in 1415, when its last attempt at independence under Sultan S'adad-Din was foiled by Yeshaq I of Ethiopia, who subsequently annexed Ifat to his kingdom.

Iffland, August Wilhelm (b. April 19, 1759, Hannover, Hanover [Germany]—d. Sept. 22, 1814, Berlin, Prussia), German actor, dramatist, and manager, a major influence on German theatre.

Iffland, engraving
Ullstein

Destined for the church, Iffland, at the age of 18, broke with parental authority and joined the Gotha court theatre to study acting under Konrad Ekhof's direction. In 1779, after Ekhof's death, Iffland went with the Gotha company to Mannheim, where he created the

part of Franz Moor in Friedrich von Schiller's *Die Räuber* ("The Robbers") and where his own plays achieved great popularity. He virtually controlled the Mannheim theatre and maintained a conservative policy and repertory. In 1796, on J.W. von Goethe's invitation, Iffland appeared as guest star on the Weimar court stage, charming his audiences with truthful and yet stylized portraits of pathetic and comic middle-class characters. His flights into tragedy (Lear, Wallenstein, Egmont) were less successful. As an author, Iffland achieved comparable fame in the fields of domestic drama and sentimental comedy. In 1798 he was appointed manager of the Berlin National Theatre, and in 1811 he became director-general of all the royal theatres in Prussia. His autobiography was *Meine theatralische Laufbahn* (1798; "My Career in the Theatre").

Ifni, former north African enclave of Spain and now part of the southwestern region of Morocco, along the Atlantic coast. An arid semidesert region of mountains and coastal plain, Ifni was first settled in 1476 by Diego García de Herrera, lord of the Canaries, as a fortified Spanish fishing, slaving, and trading locality. Abandoned in 1524 because of disease and Moorish hostility, it was reclaimed following a Spanish-Moroccan treaty in 1860. Effective Spanish reoccupation of the enclave, however, did not occur until 1934. The enclave became part of Spanish West Africa in 1946 and was reorganized as a province under a governor-general in 1958. In 1969, Ifni was ceded to Morocco. The predominantly Berber population is engaged in fishing and in the raising of sheep, camels, and goats. Sidi Ifni, the chief city, is a local handicrafts centre and small port trading primarily with the Canary Islands.

Ifrane, town, north-central Morocco. Founded in 1929, Ifrane is situated in the Moyen (Middle) Atlas Mountains and includes in its immediate environs Morocco's premier winter and summer resort areas. Located at an elevation of about 5,400 feet (1,650 m) above sea level, the modern town caters to international tourists. Nearby cedar-covered, extinct volcanic craters are equipped with alpine ski-runs. Azrou, 11 miles (17 km) southwest of Ifrane at an elevation of about 3,950 feet (1204 m), is an old Berber settlement that was developed into an all-seasons resort; trout fishing is especially popular. The local Beni Mguild tribe grazes sheep and produces quality carpets. Pop. (1982) 7,717.

ifrit, also spelled AFREET, AFRIT, AFRITE, or EFREET, Arabic (male) 'IFRĪT, or (female) 'IFRĪTAH, in Islāmic mythology, a class of infernal jinn (spirits below the level of angels and devils) noted for their strength and cunning. An ifrit is an enormous winged creature of smoke, either male or female, who lives underground and frequents ruins. Ifrits live in a society structured along ancient Arab tribal lines, complete with kings, tribes, and clans. They generally marry one another, but they can also marry humans. While ordinary weapons and forces have no power over them, they are susceptible to magic, which humans can use to kill them or to capture and enslave them. As with the jinn, an ifrit may be either a believer or an unbeliever, good or evil, but he is most often depicted as a wicked and ruthless being.

The rare appearance of the term ifrit in the Qur'ān (the sacred scripture of Islām) and in Hadīth (eyewitness narratives recounting Muḥammad's words, actions, or approbations) is always in the phrase "the ifrit of the jinn" and probably means "rebellious." The word subsequently came to refer to an entire class of formidable, rebellious beings, but, in the confused world of chthonic (underworld) spirits, it was difficult to differentiate one from another. The ifrit thus became virtually indistinguishable from the *mārid,* also a wicked and rebellious demon. *See also* jinni.

Ifugao, group of wet-rice agriculturalists occupying the mountainous area of northern Luzon, Philippines. They are of Malay stock and their language is Austronesian (Malayo-Polynesian), as is that of their neighbours, but they have developed a number of cultural characteristics that set them apart. They numbered nearly 70,000 in 1939, but World War II reduced their population to a figure (1948) of 50,000. By the late 20th century, their population had increased to about 190,000.

Their great system of irrigated rice terraces—steeply contoured, mountain-terraced walls of stone that lean slightly inward at the top—is world renowned and was developed with a simple technology. In addition to rice, the prestige crop, large amounts of sweet potatoes are grown on hillside plots and form the staple diet of the poorer class. Pigs and chickens are also raised, primarily for the numerous rituals and sacrifices.

The Ifugao live in small hamlets of 5 to 10 houses scattered among the rice terraces. Early Spanish missionaries were impressed with the construction of the Ifugao houses—achieved without saws or other such tools—and with the decorative carvings adorning the beams and moldings of each house.

Ifugao social organization is based almost exclusively on kinship. Each individual is the centre of a "kinship circle" which extends to the third cousin, and these units were all-important in the feuds and headhunting activities that formerly prevailed. The Ifugao lack political organization and have relied on marriage alliances and trading pacts; they recognize temporary go-betweens who settle disputes in terms of customary law. The aristocrats, who form an upper class, maintain their prestige by periodic feasts.

Ifugao religion has an elaborate cosmology and more than a thousand deities of various classes. Ancestral and other deities are invoked in the case of illness or other difficulties with the aid of rice wine and feasting.

IG Farben, in full INTERESSENGEMEINSCHAFT FARBENINDUSTRIE AKTIENGESELLSCHAFT (German: "Syndicate of Dyestuff-Industry Corporations"), world's largest chemical concern, or cartel, from its founding in Germany in 1925 until its dissolution by the Allies after World War II. The IG (*Interessengemeinschaft,* "syndicate" or, literally, "community of interests"), partly patterned after earlier U.S. trusts, grew out of a complex merger of German manufacturers of chemicals, pharmaceuticals, and dyestuffs (*Farben*). The major members were the companies known today as BASF Aktiengesellschaft, Bayer AG, Hoechst Aktiengesellschaft, Agfa-Gevaert Group (Agfa merged with Gevaert, a Belgian company, in 1964), and Cassella AG (from 1970 a subsidiary of Hoechst).

The movement toward association had begun in 1904, with the merger of Hoechst and Cassella—a merger that immediately prompted a rival merger by BASF and Bayer, later joined by Agfa. (This latter group was called the Dreibund, or "Triple Confederation.") In 1916, at the height of World War I, the rival groups joined forces and, with the addition of other firms, formed the Interessengemeinschaft der Deutschen Teerfarbenfabriken ("Syndicate of German Coal-Tar Dye Manufacturers"). This "little IG" was no more than a loose association: member companies remained independent, while dividing production and markets and sharing information. In 1925, after protracted legal and fiscal negotiations, the "big IG" was formed: assets of all constituent companies were merged, with all stock being exchanged for BASF shares; BASF, the holding company, changed its name to IG Farbenindustrie AG; headquarters were set up in Frankfurt; and central management was drawn from the executives of all constituent companies. (Cassella at first held out and was not absorbed by IG Farben until 1937.)

Policy-making was fused, but operations were decentralized. Regionally, production was split into five industrial zones—Upper Rhine, Middle Rhine, Lower Rhine, Middle Germany, and Berlin. In terms of vertical organization, the company's production was split among three "technical" commissions, each governing a different range of products. Marketing was split among four sales commissions. In the course of the late 1920s and '30s, IG Farben also became international, with trust arrangements and interests in major European countries, the United States, and elsewhere.

During World War II, IG Farben established a synthetic oil and rubber plant at Auschwitz in order to take advantage of slave labour; the company also conducted drug experiments on live inmates. After the war several company officials were convicted of war crimes (nine being found guilty of plunder and spoliation of property in occupied territory and four being found guilty of imposing slave labour and inhumane treatment on civilians and prisoners of war).

In 1945 IG Farben came under Allied authority; its industries (along with those of other German firms) were to be dismantled or dismembered with the stated intent "to render impossible any future threat to Germany's neighbours or to world peace." In the western zones of Germany, however, especially as the Cold War advanced, this disposition toward liquidation lessened. Eventually the Western powers and West Germans agreed to divide IG Farben into just three independent units: Hoechst, Bayer, and BASF (the first two being refounded in 1951; BASF in 1952).

Igala, also spelled IGARA, a largely Muslim people of Nigeria, living on the left bank of the Niger River below its junction with the Benue River. Their language belongs to the Kwa subgroup of the Niger-Congo family. Their ruler, the *ata,* traditionally also governed two other groups, the Bassa Nge and the Bass Nkome, who live between the Igala and the Benue River.

Traditional Igala society was politically organized as a despotic kingdom: kings were divine, held absolute power, and were surrounded by numerous taboos; they held elaborate courts attended by a host of officials and servants, many of them slaves and eunuchs. Human sacrifice and headhunting were practiced.

The Igala have been primarily an agricultural people, growing a wide range of crops typical of the area, including yams, taro, pumpkins, squash, corn (maize), manioc, and peanuts (groundnuts). Palm oil and kernels have become significant as cash crops.

Christian missionaries have worked among the Igala since 1865, converting many in the towns and larger villages; Islām, however, remains the stronger force.

Igarashi FAMILY (fl. 15th–17th century), Japanese lacquerware artists who specialized in the *maki-e* technique, wherein a design is made by sprinkling minute gold, silver, or copper flakes over a lacquer ground. The founder of the Igarashi family, Shinsai, contributed to the art by perfecting two techniques of lacquer design. The *taka-maki-e* technique employs a mixture of lacquer putty, white lead, lampblack, powder, camphor, and gold or silver foil in relief against a lacquer ground. In the *nashiji* method, numerous layers of lacquer, each sprinkled with tiny flakes of gold or silver, are superimposed and polished to produce an effect like that of the skin of a golden or

brown pear. Shinsai's son, Hosai, served the military ruler Toyotomi Hideyoshi, while his grandson Dōho worked for the Maeda family in Kaga province (now Ishikawa prefecture), creating the Kaga *maki-e* lacquer design. The name Dōho and the family's association with the Maeda clan were continued by Dōho's son and grandson.

Igarka, city, Krasnoyarsk *kray* (region), central Russia. It is 60 miles (100 km) north of the Arctic Circle and lies along the Yenisey River, 418 miles (673 km) from the sea, but is accessible to oceangoing vessels. It was founded in 1929. The city is an important wood-export port both to other parts of Russia and abroad and also serves as a sawmilling centre. A permafrost research station is located there. Pop. (1991 est.) 18,800.

Igbira, also spelled IGBIRRA, OR EBIRA, inhabitants of the areas lying northeast and southwest of the confluence of the Niger and Benue rivers in central Nigeria. Their language is sufficiently divergent from others nearby that some linguists classify it with the Nupe-Gbari language group, while others believe it to be a subgroup of the Kwa language group.

The two main habitats within the Igbira area are a dense, deciduous forest along the Niger and Benue rivers and a hilly savanna region away from the rivers. Most Igbira have traditionally engaged in agriculture; they grow mainly yams but also produce such crops as beans, millet, and corn (maize). The rivers are used for both fishing and transport. Women do most of the trading and sell both their own and their husbands' produce.

Igbira households were traditionally based on extended families composed of close patrilineal relatives under the authority of the oldest male member. Inheritance and clan membership were reckoned patrilineally. Igbira could marry outside of their clans, which were kinship groups represented by totemic animals such as the lion, the crocodile, the leopard, and the python. A key institution in enforcement was the *iregba,* a shrine where decisions on religious matters or social offenses were made.

Groups of Igbira villages (wards) drew their chiefs from branches of ruling families, in alternation. Village councils could settle disputes, sometimes in collaboration with the chiefs or with councils of other villages involved in cases. The specifics of chief selection or succession varied between areas within the Igbira region. The Igbira kingdoms of Panda and Koton Karifi were independent small states for about 100 years, until their conquest in the mid-19th century by the Fulani (Fulbe). British administration through traditional rulers began in the early 20th century.

The traditional beliefs of the Igbira centred on Hinegba, the supreme god, who is benevolent, resides in the sky, and controls the universe. Hinegba is approached through intermediary spirits, who are connected with such natural objects as trees. Igbira ancestors are also viewed as agents of Hinegba. Since the early 20th century an increasing number of Igbira have been converted to Islām and some to Christianity.

Igbo, also spelled IBO, people living chiefly in southeastern Nigeria who speak Igbo, a language of the Kwa branch of the Niger-Congo family. The Igbo may be grouped into the following main cultural divisions: northern (Onitsha), southern (Owerri), western (Ika), eastern (Cross River), and northeastern (Abakaliki). Before European colonization the Igbo were not united as a single people but lived in autonomous local communities. By the mid-20th century, however, a sense of ethnic identity was strongly developed, and the Igbo-dominated Eastern Region of Nigeria tried to unilaterally secede from Nigeria in 1967 as the independent nation of Biafra (*q.v.*). By the late 20th century the Igbo numbered more than 16 million.

Most Igbo have traditionally been subsistence farmers, the staples being yam, cassava, and taro. Other crops included corn (maize), melon, okra, pumpkin, and beans. Men were chiefly responsible for yam cultivation, women for other crops. Land was owned communally by groups of kinsmen and was made available to individuals for farming and building. Some livestock, important as a source of prestige and for use in sacrifices, was also kept. The principal exports were palm oil and kernels. Trading, local crafts, and wage labour are also important in the Igbo economy, and a high literacy rate has helped many Igbo to become civil servants and business entrepreneurs since Nigeria gained independence.

Except for the northeastern groups, the Igbo live in rain-forest country. Most Igbo occupy villages of dispersed compounds, but in some areas villages are compact. The compound is typically a cluster of huts belonging to individual household units. The village was traditionally usually occupied by a patrilineage.

Before the advent of colonial administration, the largest political unit was the village group, a federation of villages averaging about 5,000 persons. Members of the group shared a common market and meeting place, a common tutelary deity, and ancestral cults that supported a tradition of descent from a common ancestor or group of ancestors. Authority in the village group was vested in a council of lineage heads and influential and wealthy men. In the eastern regions these groups tended to form larger political units, usually referred to as tribes or clans.

Traditional Igbo religion included belief in a creator god, an earth goddess, and numerous other deities and spirits and a belief in ancestors who protect their living descendants. Revelation of the will of the deities was sought by divination and oracles. Many Igbo are now Christians.

Ighil Izane (Algeria): *see* Relizane.

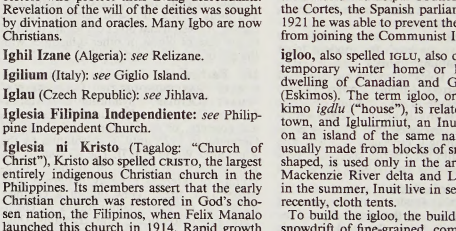
Igilium (Italy): *see* Giglio Island.

Iglau (Czech Republic): *see* Jihlava.

Iglesia Filipina Independiente: *see* Philippine Independent Church.

Iglesia ni Kristo (Tagalog: "Church of Christ"), Kristo also spelled CRISTO, the largest entirely indigenous Christian church in the Philippines. Its members assert that the early Christian church was restored in God's chosen nation, the Filipinos, when Felix Manalo launched this church in 1914. Rapid growth after 1945 produced some 600,000 members by the late 20th century, imposing chapels throughout the nation, and a wealthy centralized organization. Strong discipline from the leaders dictates a literal interpretation of the Bible and suggests individual contributions and the casting of votes, making the church a substantial political power. Unitarian in theology and Philippine in its languages, liturgy, and music, the church represents a popular Filipino nationalist movement for spiritual independence.

Iglesias, town and episcopal see, Cagliari *provincia,* southwestern Sardinia, Italy. It lies west-northwest of Cagliari city. The town's cathedral dates from 1288, and the 15th-century Church of San Francesco is a good example of Franciscan architecture in Sardinia. Iglesias is the centre of a region in which lead, zinc, and silver are mined and sulfuric acid is distilled. The local mining school houses a museum of mineralogy. Pop. (1991 prelim.) mun., 30,428.



Iglesias, Pablo (b. Oct. 18, 1850, El Ferrol, Spain—d. Dec. 9, 1925, Madrid), political leader who played a significant role in the development of Spanish democratic socialism and trade unionism.

Iglesias was brought up in a foundling home and eventually became a printer. He helped found the Spanish Socialist Party in May 1879 and soon became its secretary. In 1882 he organized the first strike in Spain after the 1875 restoration of the monarchy, and in 1885 he became president of the Socialist Party's central committee. The following year *El Socialistica,* the Socialist newspaper, was founded, with Iglesias as its editor. He also came to head the Socialist-affiliated Unión General de Trabajadores (General Union of Workers), organized in 1888.

An effective organizer, Iglesias guided the slowly expanding Spanish Socialist Party on a disciplined, austere, and evolutionary course. Though for many years he scorned alliance with non-working-class parties, he believed in parliamentary and municipal political action. He was one of the first Socialists elected to the Madrid Municipal Council (1905) and to the Cortes, the Spanish parliament (1910). In 1921 he was able to prevent the Socialist Party from joining the Communist International.

igloo, also spelled IGLU, also called APUTIAK, temporary winter home or hunting-ground dwelling of Canadian and Greenland Inuit (Eskimos). The term igloo, or iglu, from Eskimo *igdlu* ("house"), is related to Iglulik, a town, and Iglulirmiut, an Inuit people, both on an island of the same name. The igloo, usually made from blocks of snow and dome-shaped, is used only in the area between the Mackenzie River delta and Labrador where, in the summer, Inuit live in sealskin or, more recently, cloth tents.

To build the igloo, the builder takes a deep snowdrift of fine-grained, compact snow and cuts it into blocks with a snow knife, a sword-like instrument originally made of bone but now usually of metal. Each block is a rectangle measuring about 2 feet by 4 feet (60 cm by 120 cm) and 8 inches (20 cm) thick.

An Inuit building an igloo at a hunting site on ice in Jones Sound, Northwest Territories, Can.

© Fred Bruemmer

After a first row of these blocks has been laid out in a circle on a flat stretch of snow, the top surfaces of the blocks are shaved off in a sloping angle to form the first rung of a spiral. Additional blocks are added to the spiral to draw it inward until the dome is completed except for a hole left at the top for ventilation. Joints and crevices are filled with loose snow. A clear piece of ice or seal intestine is inserted for a window. A narrow, semicylindrical passageway about 10 feet (3 m) long, with vaults for storing supplies, leads into the igloo. Drafts are kept from the main room by a sealskin flap hung over the exterior entrance to the passageway and by a low, semicircular retaining wall that is sometimes built out a few feet from the end of the tube. The major furnishings are a shallow saucer to burn seal blubber for heat and light and a low sleeping platform of snow covered with willow twigs topped by caribou hides.

The dimensions of igloos vary, but they generally accommodate only one family. An experienced Inuit can build a snow igloo in between one and two hours.

Ignarro, Louis J., in full LOUIS JOSEPH IGNARRO (b. May 31, 1941, Brooklyn, N.Y., U.S.), American pharmacologist who, with Robert F. Furchgott and Ferid Murad, was awarded the 1998 Nobel Prize in Physiology or Medicine for the discovery that nitric oxide (NO) acts as a signaling molecule in the cardiovascular system. This work uncovered an entirely new mechanism by which blood vessels in the body relax and widen.

Ignarro earned a Ph.D. from the University of Minnesota in 1966. In 1979 he became a professor of pharmacology at Tulane University's School of Medicine in New Orleans, a position he held until joining the faculty at the University of California, Los Angeles, in 1985.

Studies on nitric oxide began to emerge in the 1970s and '80s. In 1977 Murad showed that nitroglycerin and several related heart drugs increase the diameter of blood vessels. Then, around 1980, Furchgott demonstrated that cells in the endothelium, or inner lining, of blood vessels produce an unknown signaling molecule, which he named endothelium-derived relaxing factor (EDRF). EDRF signals the smooth muscle cells in blood vessel walls to relax, thereby dilating the vessels.

Ignarro's role in the study of nitric oxide was a series of analyses that identified EDRF as nitric oxide. His work, conducted in 1986, was the first discovery that a gas could act as a signaling molecule in a living organism. The finding helped trigger an international boom in research on nitric oxide. Researchers suggested that it could be a key to improved treatments for heart disease, shock, and cancer.

Ignatius OF ANTIOCH, SAINT, also called IGNATIUS THEOPHOROS (Greek: "God Bearer") (d. *c.* 110, Rome), bishop of Antioch, Syria, known mainly from seven letters that he wrote during a trip to Rome, as a prisoner condemned to be executed for his beliefs. He was eager to counteract the teachings of the Judaizers, who did not accept the authority of the New Testament, and the Docetists, who held that Christ's sufferings and death were apparent but not real. The letters have often been cited as a source of knowledge of the Christian church at the beginning of the 2nd century.

Record of his life. Although an influential church leader and theologian, Ignatius is known almost entirely from his own writings, which reveal his personality and his impact on the Christianity of his time. Ignatius represented the Christian religion in transition from its Jewish origins to its assimilation in the Greco-Roman world. He laid the foundation for dogmas that would be formulated in succeeding generations. His advocacy of a hierarchical structure of the church with emphasis on episcopal authority, his insistence on the real humanity of Christ, and his ardent desire for martyrdom are subjects that have generated much discussion.

Eusebius of Caesarea reported that Ignatius' arrest and condemnation occurred during the reign of the Roman emperor Trajan (98–117). Eusebius, on unknown grounds, dates the event to 107 or 108. Ignatius' letters contain the only reliable information about him, but only the letter to the church in Rome is dated (August 24), and even then no year is given.

Ignatius was bishop of Antioch at the time of his arrest. Whether he was a native of the city is uncertain; his prose, however, does recall the Greek of that part of the world. His thought is influenced by the letters of St. Paul and also by the tradition connected with the apostle John, whom he may have known.

Journey to Rome. Ignatius was taken prisoner during a persecution of the Antioch church; he was escorted to Troas in northwestern Asia Minor for embarkation to Rome. By that time he must have been a well-known figure among Christians. All along his way delegations of churches accompanied him from town to town. At Smyrna (modern Izmir, Tur.), he was warmly received by the local Christians and their bishop, Polycarp, who was to become his beloved friend. There he was also met by representatives of the nearby churches of Ephesus, Magnesia on the Maeander, and Tralles, who looked after his needs. After these delegations left Smyrna, he wrote letters to their respective communities thanking them for their attentions and offering them guidelines for their lives as Christians. At his request the deacon Burrus of Ephesus was allowed to stay with him. Ignatius also wrote to Rome, urging his fellow Christians there not to prevent his martyrdom and commending to their charity Syrian Christians who had arrived there ahead of him.

From Smyrna his journey continued to the district of Troas, where he wrote to the congregations at Philadelphia and Smyrna and to Bishop Polycarp, asking him in a personal letter to write to other churches in his name. At Troas he was joined by the deacons Philo of Cilicia and Agathopus from Syria; they gave him the consoling news that Antioch was again "at peace." It is not certain whether this meant a lull in the persecution of Christians or perhaps—to judge from Ignatius' use of the word peace elsewhere—a return of the community to concord after some religious dissension. In his letter to Polycarp, Ignatius asked to have a deacon appointed to bring the people of Antioch the congratulations of the church of Smyrna and to encourage other churches to follow Smyrna's example. Some time later Polycarp wrote to the church of Philippi in Macedonia for news about Ignatius and his companions, who had recently passed through their city. His death in the Roman arena is recorded by Polycarp's disciple Irenaeus, who died about 200–203.

The letters: warnings against false teachings. The letters of Ignatius warn against false doctrines and false teachers and call for peace and concord by willing subordination in all religious matters to the clergy and, above all, to the bishop. Nevertheless, he assures his readers that their own church gives no cause for concern and that his words are prompted by pastoral solicitude. Only in his letter to the church of Philadelphia does he intimate that at least some of the community segregated, and, in the letter to the Smyrnaeans, he seems to imply that there had been dissenters.

Smyrna is the only place along his journey where Ignatius stayed for a sufficiently long time to have firsthand knowledge of the state of their church; he knew of the others from informants, who gave him little grounds for worry. Ignatius' anxiety, perhaps, had its roots in his experiences as a bishop at Antioch. If the peace that returned to Antioch after he left is to be understood as the restoration of concord within the Christian community, then the church of Antioch might have been divided on the very same issues about which Ignatius writes to the other churches.

Ignatius apparently fought two groups of heretics: (1) Judaizers, who did not accept the authority of the New Testament and clung to Jewish practices, and (2) Docetists (from the Greek *dokein,* "to seem"), who held that Christ had suffered and died only in appearance. Ignatius untiringly affirmed that the New Testament was the fulfillment of the Old Testament and insisted upon the reality of Christ's human nature. For him, Christ's Passion, death, and Resurrection were a guarantee of "life everlasting" in the risen Christ. Ignatius believed that, had Christ died only in appearance, his own suffering and his readiness to sacrifice his life for Christ would have no meaning.

Such sentiments are a strong argument against the proposition that Ignatius had come under the influence of some early form of Gnosticism—a dualistic religion that stressed salvation by esoteric knowledge, or *gnōsis.* Some of Ignatius' formulations possibly echo Gnostic language, and he seems to have made an impression on certain Gnostic sects. Nevertheless, there is no trace in his letters of the basic Gnostic equation of good and evil with spirit and matter. He does not even take up St. Paul's antinomy of flesh and spirit. For him, the spirit is above the flesh rather than against it; even what the "spiritual man" does "according to the flesh" is spiritual.

Martyrdom as union with Christ. Concern for the doctrine that Christ is man as well as God is the main reason that Ignatius insisted on "siding with the bishop." On this earth the bishop represents to his church the true bishop, Christ. Union with the bishop means union with Christ. Those who in a spirit of pride break away from the bishop destroy that union. The unity of the church is for Ignatius a realization already on earth of the future life in Christ; authority within the church has not yet become for him a principle of institutional discipline. Ignatius used, for the first time in Christian literature, the expression "catholic church," meaning the whole church that is one and the same wherever there is a Christian congregation.

Ignatius' letter to the church of Rome is by far the longest, and throughout his letter he speaks of the Roman Christians in terms of special distinction. But, even when he states that their church holds the first place in the whole Christian "community of love [*agapē*]," he acknowledges a position of preeminence rather than of jurisdiction.

Ignatius' desire to become a martyr is also linked with his understanding of union with Christ. To be a perfect disciple of Christ means to imitate Christ in his Passion, to be united with Christ in suffering. Many times in his letters Ignatius accuses himself of being imperfect because he has not yet been put to this test. Now, on his journey to Rome, he at last "begins to be a disciple," and his great fear is that his friends in Rome might obtain for him a pardon and so deprive him of his way to perfection. Although the language used by Ignatius in voicing this desire does sound exaggerated, his attitude was shared by many Christians of his time. For Ignatius, love of martyrdom springs from a conviction that only by union with Christ's Passion will he participate in Christ's glory. Even this belief does not free him from the fear that he might recoil in the face of death, and he asks the churches to pray for his strength and constancy.

Ignatius' personal relationships. Only rare glimpses of Ignatius' personal relations are possible from the letters. His greetings, in the manner of St. Paul, to individuals at the end of his letters seldom have a personal ring. In his letter to the church of Smyrna he singles out Tavia for special mention, but his reason seems to be pastoral. Another woman

of that town, Alke, is remembered twice as "a name dear to me," and a certain Attalus as "my beloved." Among the clergy Ignatius finds words of special warmth for the deacons. They are "most dear" to him, and he likes to speak of them as his "fellow-slaves." By his time deacons apparently were no longer mere dispensers of the church's charities, as they are depicted in the Acts of the Apostles. If the bishop represents Christ as shepherd, the deacons are images of Christ as "the servant of all." In emphasizing his fellowship with them, Ignatius insists on the common bond among all Christians in the service of God.

Among all the persons known from Ignatius' correspondence, Polycarp, bishop of Smyrna, stands out as his personal friend. Ignatius made the acquaintance of his younger colleague during his stay at Smyrna. He addresses him and generally speaks of him with an affection that is absent in his praise of other bishops. Polycarp received the only personal letter from Ignatius; it is a letter of advice from an experienced older man to a younger one who, for all the promise he shows for the future, still has to find his way. Polycarp, in turn, when writing to the Philippians, praises Ignatius as an example of patience and of willingness to suffer for Christ. Some 40 years later (perhaps in 155) Polycarp himself was to follow in his friend's footsteps to a martyr's death.

Preservation of the letters. Polycarp made a collection of Ignatius' letters and sent them to the church of Philippi, as he had been requested by the Philippians. The collection apparently contained some, if not all, of the seven letters that were known to Eusebius and are now commonly held to be genuine. The letter to the Romans was quoted as early as the 2nd century by Irenaeus, then bishop of Lugdunum (modern Lyon). In the 4th century these letters were corrupted by the heavy insertions of an interpolator, and the collection was augmented by six letters forged under Ignatius' name. This enlarged collection was commonly known in the European Middle Ages.

A single Latin version based on the original text of the seven genuine letters was, however, made in England in the 13th century, perhaps by the great scholar and translator Robert Grossetete. The genuine collection, freed from interpolations and forgeries, was restored by 17th-century scholarship. In the period after the Protestant Reformation, Ignatius' notion of the church, as found in the enlarged collection, was greatly emphasized by Roman Catholics and harshly criticized by Protestants; the rediscovery of the letters in their original form, however, has led to a just and objective assessment of his personality and his views against their historical background. (L.G.J.B.)

BIBLIOGRAPHY. English translations of the genuine letters are found in R.M. Grant, *Ignatius of Antioch* (1966), vol. 4 from the multivolume *The Apostolic Fathers: A New Translation and Commentary*. For analysis of historical background of the letters, and philological, philosophical, and cultural commentary, see Cyril Charles Richardson, *The Christianity of Ignatius of Antioch* (1935, reissued 1967); Johannes Quasten, *The Beginnings of Patristic Literature* (1950, reprinted 1983), vol. 1 of the multivolume *Patrology;* Virginia Corwin, *St. Ignatius and Christianity in Antioch* (1960); and William R. Schoedel, *Ignatius of Antioch: A Commentary on the Letters of Ignatius of Antioch* (1985).

Ignatius OF LOYOLA, SAINT: *see* Loyola, Saint Ignatius of.

Ignatyev, Nikolay Pavlovich, Graf (Count), Ignatyev also spelled IGNATIEV (b. Jan. 17 [Jan. 29, New Style], 1832, St. Petersburg, Russia—d. June 20 [July 3], 1908, Krupodernitsy estate, Kiev province [now in Ukraine]), pan-Slavist diplomat and statesman who played a major role in the administration of Russia's foreign policy in Asia under Tsar Alexander II (reigned 1855–81).

Ignatyev
Novosti Press Agency

Having become an officer in the Russian Guards at 17, Ignatyev began his diplomatic career in 1856 at the Congress of Paris, after the Crimean War. In 1858 he led a mission to Central Asia, where he concluded a treaty of friendship and trade with the khan of Bukhara. The following year he was sent to Peking to conclude a treaty defining the eastern Russo-Chinese border. His negotiations were at first unsuccessful, but, taking advantage of an Anglo-French siege of Peking (1860), he convinced the Chinese that Russia was a friendly power and succeeded in negotiating the Treaty of Peking (1860). In that treaty China recognized Russia as master of all the lands on the left bank of the Amur River as well as of those between the Ussuri River and the Pacific Ocean, thereby allowing Russia to construct the city of Vladivostok and become a major power in the northern Pacific region.

After returning from China, Ignatyev became head of the Ministry of Foreign Affairs' Asian department, which had jurisdiction over Russia's relations with the Ottoman Empire as well as with the Far East; in 1864 he was appointed ambassador to Constantinople (now Istanbul). Influenced greatly by pan-Slavism and hoping to liberate the Christian Slavs within the Ottoman Empire from Turkish rule, he encouraged the autonomous principality of Serbia to wage a war, which ended unsuccessfully, against the Turks (1876–77) and the Bulgarians to revolt, also unsuccessfully, against their Turk rulers (1876). In 1878, however, after Russia had defeated the Turks in the Russo-Turkish War of 1877–78, Ignatyev negotiated the Treaty of San Stefano, which granted Serbia complete independence from the Turks, created a state of Bulgaria, and was generally favourable to Russia. But the western European powers objected to this settlement; when Ignatyev was unable to prevent them from replacing it with the Treaty of Berlin (1878), which was distinctly less advantageous to Russia, he was forced to retire.

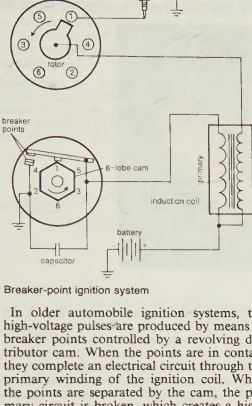
After Alexander III ascended the throne (1881), Ignatyev was named minister of interior. Although he was a conservative, who made provisions for extraordinary security measures to go into effect should revolutionary disorders occur, and also an extreme nationalist, who allowed pogroms against the Jews to be conducted unchecked (1881), Ignatyev also carried out liberal reforms planned by his predecessor, including implementations of the act that had emancipated the serfs in 1861.

He also retained his Slavophile ideals and in 1882 proposed that the tsar reestablish the 17th-century political institution—the *zemsky sobor* ("assembly of the land"). Alexander, mistakenly fearing that Ignatyev was suggesting the creation of a constitutional form of government, dismissed him (May 1882). Ignatyev later was chairman of a committee that developed a reform program for the government of Russia's Central Asian territories (1884), but he never again held a highly influential post.

igneous rock, any of various crystalline or glassy rocks formed by the cooling and solidification of molten earth material. Igneous rocks comprise one of the three principal classes of rocks, the others being metamorphic and sedimentary.

A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Igneous rocks occur as intrusions or extrusions. Plutonic intrusive rocks congeal far below the Earth's surface and occur as batholiths, bosses, laccoliths, and veins. They include granite, syenite, diorite, gabbro, and peridotite. The hypabyssal intrusive rocks (*i.e.,* those formed at a moderate distance below the surface) occur as dikes, sills, and other similar small bodies and are represented by porphyry, porphyrite, diabase, and lamprophyre. The extrusive igneous rocks are volcanic and found typically as lava flows. They include obsidian, perlite, rhyolite, trachyte, andesite, basalt, and tephrite. Igneous rocks may also occur as pyroclastic ejecta, which are the fragmented products of explosive volcanic eruptions. Examples of pyroclastic rocks are agglomerate and certain types of breccia and tuff.



Although the different types of igneous rocks vary widely in composition, the vast majority of them consist of fewer than a dozen groups of minerals. These are quartz, feldspars, pyroxenes, amphiboles, micas, olivines, nephelinite, leucite, and apatite. Igneous rocks also show considerable variation in texture and structure. For example, plutonic intrusive rocks cool slowly, and, as a result, their crystals are coarse, well-shaped, and approximately of equal size. Because crystallization is complete, there is no glassy matter present. Miarolitic cavities (irregular openings) commonly develop in plutonic rocks during the late stages of crystallization; they often are filled with vapour deposits. Extrusive igneous rocks, having cooled rapidly in contact with air, are as a rule finely crystalline or at least have a fine-grained groundmass representing that part of the viscous semicrystalline lava flow that was still liquid at the moment of eruption. At this time they were exposed only to atmospheric pressure, and the gases that they contained were free to escape. Various important modifications arise from this, the most striking being the presence of numerous steam cavities often drawn out to elongated shapes and subsequently filled up with minerals by infiltration. Because crystallization was going on while the lava was creeping forward over the surface, the latest formed minerals are commonly arranged in subparallel winding lines that follow the direction of movement. In some cases, the lava cooled at an extremely rapid rate, forming noncrystalline rock (*i.e.,* glassy rock such as obsidian and tachylyte). A common feature of glassy rock is the presence of rounded bodies (spherulites) consisting of fine divergent fibres of imperfect feldspar crystals radiating from the centre.

ignimbrite, rock composed of compacted volcanic ejecta (*see* tuff).

ignition system, in a gasoline engine, means employed for producing an electric spark to ignite the fuel-air mixture; the burning of this mixture in the cylinders produces the motive force.

The basic components in the ignition system are a storage battery, an induction coil, a device to produce timed high-voltage discharges from the induction coil, a distributor, and a set of spark plugs. The storage battery provides an electric current of low voltage (usually 12

volts) that is converted by the system to high voltage (some 40,000 volts). The distributor routes the successive bursts of high-voltage current to each spark plug in the firing order.

Breaker-point ignition system

In older automobile ignition systems, the high-voltage pulses are produced by means of breaker points controlled by a revolving distributor cam. When the points are in contact they complete an electrical circuit through the primary winding of the ignition coil. When the points are separated by the cam, the primary circuit is broken, which creates a high-voltage surge in the secondary windings of the induction coil. Breaker points have been largely replaced by electronic devices in newer automobiles. Most now use a magnetic device, called a reluctor, that is operated by the distributor shaft to produce timed electric signals, which are amplified and used to control the current to the induction coil. These newer ignition systems are more reliable than the old, permit better control of the engine, and produce higher-voltage output to the spark plugs.

During the evolution of solid-state ignition systems, there have been many modifications. Some ignition conversion systems, for example, extend breaker-point life by using transistors, devices in which a small current in the input (the breaker-point circuit) controls a much larger current in the output (the coil primary circuit).

ignitron, electron tube functioning as a rectifier to convert alternating current to direct current. Each conduction cycle is started by an external voltage applied to the igniter, a small element touching the tube's cathode, which is a pool of mercury. Electrons released by the igniter from the surface of the mercury initiate a conducting arc through the tube. The arc lasts until voltage on the ignitron's plate is reduced to the point that the arc can no longer be sustained.

Large ignitron devices may be built inside vacuum tanks instead of tube envelopes. Electrical welding equipment incorporates an ignitron as a heavy-duty relay.

Igor, also called INGVAR (b. *c.* 877—d. 945, Dereva region [Russia]), grand prince of Kiev and presumably the son of Rurik, prince of Novgorod, who is considered the founder of the dynasty that ruled Kievan Rus and, later, Muscovy until 1598. Igor, successor to the great warrior and diplomat Oleg (reigned *c.* 879–912), assumed the throne of Kiev in 912.

Depicted as a greedy, rapacious, and unsuccessful prince by the 12th-century *Russian Primary Chronicle,* Igor in 913–914 led an expedition into Transcaucasia that ended in total disaster for his forces. He also conducted two expeditions against Byzantium (941 and 944), but many of his ships were destroyed by the "Greek fire," and the treaty that he finally concluded in 944 was less advantageous to Kiev than the one obtained by Oleg in 911. Igor did manage to extend the authority of Kiev over the Pechenegs, a Turkic people inhabiting the steppes north of the Black Sea, as well as over the East Slavic tribe of Drevlyane. When he went to Dereva (the land of the Drevlyane located in the region of the Pripyat River) to collect tribute (945), however, his attempt to extort more than the customary amount provoked the Drevlyane into rebelling and killing him.

Igor SVYATOSLAVICH (b. 1150—d. 1202), prince of the Russian lands of Novgorod-Seversky after 1178 and of Chernigovsky (1198–1202), who led an unsuccessful campaign against the Cumans (Polovtsy) in 1185.

During the 12th century the southern and western Russian principalities were continually invaded and devastated by the nomadic Cumans. Svyatoslav III, cousin of Igor and prince of Kiev, inflicted a severe defeat upon them in 1183. But two years later Igor, the son of Svyatoslav, prince of Chernigovsky (d. 1164), led his son Vladimir of Putivl, his brother Vsevolod of Trubchevsk, and their nephew Svyatoslav Olgovich of Rylsk on another expedition against the nomads. After traveling from Novgorod-Seversky to the Donets River, they continued into the steppes, where they engaged the Cumans in a three-day battle (May 1185). Igor's forces were completely defeated; all four princes were captured, and the Cumans were able to resume their raids upon Russian territory.

In 1186 Igor escaped from captivity and returned to Novgorod-Seversky, where he resumed his rule but drifted into relative insignificance. His campaign was not only described in the Russian chronicle but also became the subject of a major epic poem of old Russian literature, *Slovo o polku Igoreve* ("The Song of Igor's Campaign"), presumably written by a member of Igor's force.

Igorot (Tagalog: "Mountaineer"), any of various ethnic groups in the mountains of northern Luzon, Philippines, all of whom keep, or have kept until recently, their traditional religion and way of life. Some live in the tropical forests of the foothills, but most live in rugged grassland and pine forest zones higher up. The Igorot numbered about 500,000 in the late 20th century. Their languages belong to the

Igorot headhunter's dance; northern Luzon, Philippines
H. Linker—Shostal/EB Inc.

northern Luzon subgroup of the Philippine languages, which belong to the Austronesian (Malayo-Polynesian) family.

The Igorot peoples are Austronesians of a Mongoloid stock. They were notorious in earlier days for their wars and headhunting; they were partially pacified by the Spanish, and the process was completed during the U.S. hegemony.

Ethnologists distinguish about 10 main ethnic groups, each with its own dialect and culture. There are also variations within these groups.

Two broader groupings may be made of the Igorot as a whole: one, by far the larger, comprises the peoples of the higher country who cultivate wet rice, mostly in steplike terraces on the mountainsides; the other comprises peoples of the lower rain-forest areas, who grow dry rice in seasonally shifting gardens. The first group (the Nabaloi or Ibaloi, Kankanai, Lepanto or northern Kankanai, Bontoc, southern Kalinga, Tinggian) nearly all live in populous villages, but one ethnic unit (the Ifugao) has small farmsteads of kinsmen dotted throughout the rice terraces. The second group (the Gaddang, northern Kalinga, and Isneg or Apayao) are sparsely settled in hamlets or farmsteads around which new gardens are cleared as the soil is worked out; some Gaddang live in tree houses.

Cultural elements common to the Igorot peoples as a whole include metalworking in iron and brass, weaving, and animal sacrifice. They believe in spirits, including those of ancestors, and have complex rituals to propitiate them. There are no clans or tribes, and political organization is generally limited to the village level. Kinship is traced on both the paternal and the maternal sides, extending as far as third cousins.

Igor's Campaign, The Song of, also translated LAY OF IGOR'S CAMPAIGN, Russian SLOVO O POLKU IGOREVE, masterpiece of Old Russian literature, an account of the unsuccessful campaign in 1185 of Prince Igor of Novgorod-Seversky against the Polovtsy (Kipchak, or Cumans). As in the great French epic *The Song of Roland,* Igor's heroic pride draws him into a combat in which the odds are too great for him. Though defeated, Igor escapes his captors and returns to his people. The tale was written anonymously (1185–87) and preserved in a single manuscript, which was discovered in 1795 by A.I. Musin-Pushkin, published in 1800, and lost during Napoleon's invasion of Russia in 1812.

The tale is not easily classified; neither lyric nor epic, it is a blend of both, with a suggestion of the political pamphlet as well. It is the product of a writer familiar with oral poetry, chronicles, and historical narratives. It is distinguished principally by its modernity. The author's worldview is secular; Christianity is incidental to events.

The *Song* alone of all Old Russian literature has become a national classic, one that is familiar to every educated Russian. An English translation of it by Vladimir Nabokov was published in 1960.

Iguaçu Falls, also spelled IGUASSÚ, or IGUAZÚ, Spanish CATARATAS DEL IGUAZÚ, Portuguese CATARATAS, OR SALTOS, DO IGUAÇU, cataract on the Iguaçu River, 14 miles (23 km) above its confluence with the Paraná, at the Argentina-Brazil border. The horseshoe-shaped falls are 269 feet (82 m) high and 2.5 miles (4 km) wide—four times the width of Niagara Falls in North America and somewhat greater than the width of Victoria Falls in Africa. Numerous rocky and wooded islands on the edge of the escarpment over which the Iguaçu River plunges divide the falls into some 275 separate waterfalls or cataracts, varying between 200 and 269 feet (60 and 82 m) in height. The name of the falls, like that of the river, is derived from a Guaraní word meaning "great water."

The rate of flow of the falls may rise to a

maximum of 450,000 cubic feet (12,750 cubic m) per second during the rainy season from November to March. Minimum flow occurs during the dry season from August to

Iguaçu Falls on the Iguaçu River at the Argentina-Brazil border
© R. Mankoy/Superstock

October. The mean annual rate of flow is about 62,000 cubic feet (1,756 cubic m) per second.

The falls occur along a wide span where the Iguaçu River, flowing westward and then northward, tumbles over the edge of the Paraná Plateau before continuing its course in a canyon. Above the falls, islands and islets spread the river out into numerous flows that feed the cataracts. A major portion of the river tumbles into a narrow, semicircular chasm called the Garganta del Diablo ("Devil's Throat"); the effect has been described as that of "an ocean plunging into an abyss." Excellent views of this section (called Union Falls) can be obtained from both the Brazilian and Argentine sides.

Many of the individual falls are broken midway by protruding ledges; the resultant deflection of the water, as well as the spray that arises, creates what appears to be a barrage of rainbows. From the foot of the falls, a curtain of mist rises some 500 feet (150 m) into the air, adding to the spectacular rainbow effect.

Among the many islands along the falls, the most notable is Grande San Martín Island, which is situated below and adjacent to several of the falls and downstream from the Garganta del Diablo. From this island, which is in the Argentine half of the river, a fine view of many of the cataracts may be had. Individual falls to be seen from vantage points on the Argentine side include those known as Dos Hermanas ("Two Sisters"), Bozzetti, San Martín, Escondido ("Hidden"), and Rivadavia. From the Brazilian shore, an impressive panorama of falls can be seen; among individual Brazilian falls are those known as Benjamin Constant, Deodoro, and Floriano.

The first Spanish explorer to visit the falls was Álvar Núñez Cabeza de Vaca in 1541. In 1897 Edmundo de Barros, a Brazilian army officer, envisaged the establishment of a national park at Iguaçu Falls. Following boundary rectifications between Brazil and Argentina, two separate national parks were established, one by each country—Iguaçu National Park in Brazil and Iguazú National Park in Argentina. Both parks were created to preserve the vegetation, wildlife, and scenic beauty associated with the falls. The area is served by three airports, in Argentina, Brazil, and Paraguay.

Iguaçu River, also spelled IGUASSÚ, Portuguese RIO IGUAÇU, Spanish RÍO IGUAZÚ, river flowing through Santa Catarina and Paraná states in southern Brazil. The Iguaçu is formed by headstreams rising in the Serra do Mar near Curitiba. It winds generally westward through the uplands for about 820 miles (1,320 km) before joining the Paraná River at the point where Argentina, Brazil, and Paraguay meet. It forms a small portion of the Brazilian-Argentine border. Although sections of the river are navigable, it is known chiefly for the spectacular Iguaçu Falls. Hydroelectric plants are located on the river at the Segredo, Osorio, and Santiago falls.

Iguala, in full IGUALA DE LA INDEPENDENCIA, city, north-central Guerrero *estado* ("state"), south-central Mexico. It was settled in 1750 and was named in honour of Agustín de Iturbide's Iguala Plan, proclaiming Mexico an independent monarchy (Feb. 24, 1821). Iguala lies along the Cocula River and is an important regional commerce and communications centre. Products from much of Guerrero, including corn (maize), beans, sugarcane, peanuts (groundnuts), lemons, and rice, are gathered there and distributed to inland plateau cities. There are some small-scale industrial activities, including the extraction of sesame-seed oil and the production of soap. Iguala is on both the Mexico City–Acapulco expressway and the Mexico City–Balsas River railroad. It is also served by domestic airlines. Pop. (1990 prelim.) mun., 101,170.

Iguala Plan, Spanish PLAN DE IGUALA (Feb. 24, 1821), appeal issued by Agustín de Iturbide, a creole landowner and a former officer in the Spanish army who had assumed leadership of the Mexican independence movement in 1820. His plan called for an independent Mexico ruled by a European prince (or by a Mexican—*i.e.,* Iturbide himself—if no European could be found), retention by the Roman Catholic church of all of its powers, equal rights for creoles and *peninsulares* (those of Spanish ancestry on both sides, born in Mexico and Spain, respectively), and elimination of property confiscations. The plan soon won the approval of virtually every influential group in Mexico, though it completely ignored the rights of the lower classes. Thus, the achievement of independence in Mexico stood in contrast to the independence movement in South America, where liberal elements predominated. The conservative upper classes, including the higher clergy, now sanctioned Mexican independence because it freed them from the newly installed Liberal government in Spain, which they feared would upset the social and economic status quo in Mexico. On Aug. 24, 1821, Iturbide and the Spanish viceroy, Juan O'Donojú, signed the Convention of Córdoba (a town in Veracruz state), by which Spain acquiesced in the Iguala Plan and agreed to withdraw its troops. The Spanish government subsequently refused to accept the Convention (1822), but Iturbide had already made himself emperor of Mexico.

iguana, any of about 13 species of the larger members of the lizard family Iguanidae. While the name "iguanid" encompasses all members of this family, "iguana" usually refers only to the larger species. The best-known species is the common iguana (*Iguana iguana*), which occurs from Mexico southward to Brazil and reaches a maximum length of 1.8 m (6 feet). The common iguana is arboreal, especially in trees overhanging water, into which it will plunge if disturbed. Its ground colour is greenish and is overlaid by brown bands that form regular rings on the tail. Its food consists largely of tender leaves and fruits, but the lizard will also eat small birds and mammals.

The closely related West Indian iguana (*I. delicatissima*) lives on several Caribbean islands. Other well-known relatives are the rhinoceros iguana (*Cyclura cornuta*) of Haiti, the desert iguana (*Dipsosaurus dorsalis*) of

Common iguana (*Iguana iguana*)
Willis Peterson

Mexico and the United States, and the marine (*Amblyrhynchus cristatus*) and land (*Conolophus*) iguanas of the Galapagos Islands.

iguanid, any of about 700 species of lizards in more than 50 genera that constitute the family Iguanidae. Iguanids are found throughout the Americas from southern Canada to the tip of South America. The only exceptions are one genus (*Brachylophus*) in Fiji and other Pacific islands and two genera (*Oplurus* and *Chalarodon*) in Madagascar. The family includes the common iguana (*Iguana*) of the American tropics, the marine iguana (*Amblyrhynchus*) of the Galapagos Islands, and the common genus *Anolis* with about 200 species. About 10 genera of iguanids are found in the United States, where they are by far the most conspicuous lizards of the Southwest.

Most iguanids have small scales and a large dewlap, or loose fold of skin, situated beneath the head and neck. In many species, a crest on the back and tail is composed of narrow, elongate scales that gradually diminish in size toward the tail. The tongue is short and cannot be thrust out. Iguanids can be regarded as New World analogues of the agamas (family Agamidae) of the Old World, which they closely resemble in structure and body modifications.

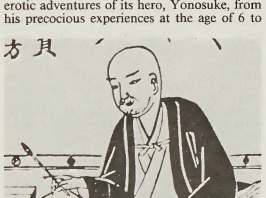
iguanodon, any member of a genus (*Iguanodon*) of large herbivorous dinosaurs found as fossils of the Late Jurassic and Early Cretaceous periods (163 to 97.5 million years ago) in a wide area of Europe, North Africa, and

Iguanodon

eastern Asia. The iguanodon was the largest, most abundant, and most widespread of all the iguanodonts (family Iguanodontidae). It was more than 10 m (30 feet) long, stood 5 m tall when erect, and weighed 4 to 5 tons. The animal probably spent its time grazing while moving about on four legs, though it could also walk on two legs. The iguanodon's forelimbs had unusual, five-fingered hands; the thumb projected upward perpendicular to the rest of the hand and was rigid, much like a sharp spike. The teeth were ridged and formed sloping surfaces whose grinding action could pulverize the low-growing ferns and horsetails the animal fed upon near streams and rivers.

The iguanodon was one of the first dinosaur species to be discovered and was scientifically described in 1825. It was named for its teeth, whose similarity to those of modern iguana lizards also provided the dinosaur's discoverer, the English physician Gideon Mantell, with the first clue that dinosaurs had been reptiles. Standard reconstructions of iguanodon fossil bones mistakenly placed the animal in an upright, bipedal stance with its tail on the ground, a misconception not corrected until late in the 20th century. The fossil remains of many individuals have been found, some in groups, suggesting that the iguanodon traveled in herds. Fossilized tracks and trackways of the iguanodon are also relatively common.

Iguassú, also spelled IGUAZÚ (South America): *see* Iguaçu Falls; Iguaçu River.



Iguvine Tables, a set of seven inscribed bronze tables found in 1444 at Iguvium (modern Gubbio, Italy), an Umbrian town. The tables are written in the Umbrian language, four and part of a fifth using the Umbrian script, the rest Latin characters. The earliest appear to date from the 3rd or 2nd century BC, the latest from the early part of the 1st century BC. These tables give the liturgy of the Fratres Atiedii, a brotherhood of priests, and are of great value for the study of ancient Italic language and religion.

The first table contains regulations for the purification of the sacred mount or citadel of Iguvium and for the lustration (purification) of the people. Tables six and seven contain essentially the same material as the first, but in greatly expanded form and in somewhat later language. The second, third, and fourth tables describe several different sacrifices, many of the details of which are quite obscure. The fifth table deals with administrative details of the brotherhood and ends with a statement of mutual obligations between the Fratres Atiedii and two of the (originally) 10 divisions of the Iguvine people.

Ihara Saikaku, Ihara also spelled IBARA, original name probably HIRAYAMA TŌGO (b. 1642, Ōsaka, Japan—d. Sept. 9, 1693, Ōsaka), poet and novelist, one of the most brilliant figures of the 17th-century revival of Japanese literature. He enchanted readers with racy accounts of the amorous and financial affairs of the merchant class and the demimonde.

Saikaku first won fame for his amazing facility in composing haikai, humorous renga (linked-verse) poems from which the 17-syllable haiku was derived. In 1671 he turned out, in "a day and a night," 1,600 verses. Not satisfied with composing at the rate of one verse a minute, he steadily increased his prowess, reaching 4,000 in 24 hours in 1680 and the incredible figure of 23,500 in 1684. This was somewhat more than 16 haikai per minute, and the performance earned him the nickname of the "20,000 poet." Saikaku continued to write verse at more normal speeds, but his style was considered so bizarre that rival poets called it "Dutch" to indicate its outlandishness.

Saikaku is best known, however, for his novels, written in a swift, allusive, elliptic style that stems from his training as a haikai poet. Their content reflects, from many angles, Japanese society in a time when the merchant class had risen to such prominence that its tastes prevailed in the arts and the licensed pleasure quarters catered to its whims. *Kōshoku ichidai otoko* (1682; *The Life of an Amorous Man*), the first of Saikaku's many novels concerned with the pleasure quarters, relates the erotic adventures of its hero, Yonosuke, from his precocious experiences at the age of 6 to his departure at 60 for an island of women. Of other works in a similar vein, the best is thought to be *Kōshoku gonin onna* (1686; *Five Women Who Loved Love*).

Ihara Saikaku, woodblock print from a playbook of the Tokugawa period (1603–1867)

By courtesy of the International Society for Educational Information, Tokyo

Saikaku also wrote novels about the samurai (aristocratic warrior caste), but they were generally considered inferior to his erotic tales or to such accounts of tradesmen's lives as *Nihon Eitaigura* (1688; *The Japanese Family Storehouse*), a collection of stories on how to make (or lose) a fortune. Whatever the subject, Saikaku's satiric humour and his knack of being able to seize the one detail that best evokes a person's character or milieu are always conspicuous. Although most at home in dealing with the lively atmosphere of Ōsaka, he wrote about all Japan. His *Saikaku Shokoku Banashi* (1685; "Saikaku's Tales from the Provinces") records many stories picked up on his travels. His popularity was enormous throughout Japan, and his influence on fiction continued after his death.

Ihering, Rudolf von: *see* Jhering, Rudolf von.

ihram, Arabic IḤRĀM, sacred state into which a Muslim must enter in order to perform the hajj (major pilgrimage) or the *'umrah* (minor pilgrimage). At the beginning of a pilgrimage, the Muslim stops at a designated station to perform certain ritual cleansing ceremonies; each male shaves his head, cuts his nails, and trims his beard before donning a white, seamless, two-piece garment. Women also wear white; although no particular dress is prescribed, by tradition they wear long robes. During the period of sanctification, sexual activity, shaving, and cutting one's nails all are forbidden in accordance with the pilgrim's special relationship to God during the ihram.

Pilgrim at prayer in the robe of ihram

Middle East Features—Black Star

The word is also used for the state of a worshiper during the performance of the salat, the ritual prayer repeated five times daily.

Ii Naosuke (b. Nov. 29, 1815, Hikone, Japan—d. March 24, 1860, Edo [now Tokyo]), Japanese feudal lord and statesman who was responsible for Japan's signing the first treaty of commerce with the United States (1858), opening the country to Western influence, and for the last attempt at reasserting the traditional political role of the Tokugawa (the dynasty of Japan's military rulers) before its fall in 1867.

Ii and his family. The Ii family, from which he was descended, ruled the fief of Hikone and played an important part in the administration of the shoguns—*i.e.*, the military dictators who had in effect ruled Japan since the 12th century. The family owed its prominent position to its standing among the

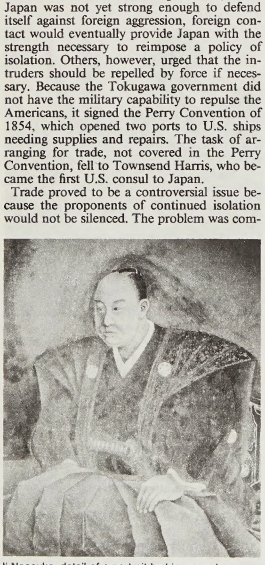
fudai daimyo, the barons who had helped the Tokugawa become shoguns in the early 17th century. When Ii Naosuke was born, the 14th son of Ii Naonaka, his father had already turned over power to his eldest son. After the father's death, all sons except the heir had by family custom to be adopted into other baronial families or else be reduced to the status of family retainer with a small stipend. The only son for whom an adoptive family could not be found, Ii devoted himself to his studies at an academy established by his family. As a samurai, a member of the warrior class, he was schooled in the arts of warfare, as well as in Japan's cultural traditions, and he developed into a strong-willed and independent individual.

At 31, Ii's fortunes suddenly brightened when his brother's son died, and, ironically, as he was the only brother who had not been adopted, he was made heir apparent. When his brother died in 1850, Ii, then 35 years old, became lord of Hikone and thus acquired a base from which to project himself into national politics.

Arrival of Perry. The arrival in 1853 of a U.S. flotilla under Commodore Matthew Perry produced a major crisis for the shogunate. Perry had been sent by his government to demand that the country abandon its traditional isolation and enter into relations with the outside world. The Tokugawa authorities, confronted with the display of superior U.S. power, broke with precedent and sought the advice of the feudal nobles. Ii Naosuke was among those who favoured developing relations with the West. He argued that, while Japan was not yet strong enough to defend itself against foreign aggression, foreign contact would eventually provide Japan with the strength necessary to reimpose a policy of isolation. Others, however, urged that the intruders should be repelled by force if necessary. Because the Tokugawa government did not have the military capability to repulse the Americans, it signed the Perry Convention of 1854, which opened two ports to U.S. ships needing supplies and repairs. The task of arranging for trade, not covered in the Perry Convention, fell to Townsend Harris, who became the first U.S. consul to Japan.

Trade proved to be a controversial issue because the proponents of continued isolation would not be silenced. The problem was compounded by a crisis in domestic politics centring on the choice of an heir apparent to the reigning shogun, Iesada, who was childless.

There were two candidates with strong support. One was the shogun's first cousin, who was still a child. The other was a grown man of demonstrated ability, the son of Tokugawa Nariaki, who was only collaterally related to the shogun and not a member of the ruling group but who assiduously promoted the candidacy of his son. The shogun's cousin, on the other hand, was supported by the senior councillors (*rōjū*), a small group of *fudai* daimyo who had acquired policy-making power in the shogunate. This group, anxious to preserve its power position, preferred a child shogun. The stage was thus set for a struggle.



Ii entered the conflict in 1858 when he assumed direct control of the government as honorary chief councillor (*tairō*), a position filled only intermittently, usually in crises. Before he took office, the shogunate had sought the imperial court's permission to sign the U.S. treaty, but antitreaty forces had succeeded in blocking approval. Ii authorized his negotiators to sign the treaty without waiting for Imperial permission. He had learned that, if it were delayed, Japan might have to make even greater concessions, since it appeared that Britain and France were likely to seek even more far-reaching treaties.

Succession to the shogunate. In the succession issue, Ii took a much more conservative position than in foreign affairs. Ignoring pressure from Nariaki and others to bring new groups into the policy-making machinery, he acted in favour of the *fudai* daimyo, who had appointed him, by promoting the shogun's cousin as heir apparent.

In response, an angry delegation of barons led by Nariaki criticized Ii for having signed the treaty without the emperor's consent and demanded that Nariaki's son be made heir apparent to the shogun. Ii rejected these complaints and demands and purged the opposition. He placed Nariaki under house arrest, stripped other barons of their rank, and arrested and even executed some officials.

Ii's victory proved short-lived. On March 24, 1860, Ii, accompanied by his retainers and bodyguards, was on his way to the shogun's castle when a band of armed followers of Nariaki waylaid them. Ii's bodyguards were unable to defend him, and the attackers cut off his head, ending his meteoric rise to power when he was only 45 years old. His bold leadership as *tairō* had secured for a time the stability of the shogunate and the continuity of Tokugawa rule; neither was to survive him for long. (N.I.)

BIBLIOGRAPHY. Two older books, Katsumaro Nakamura, *Lord Ii Naosuké and the New Japan* (1909); and H. Satoh, *Agitated Japan: The Life of Baron Ii Kamon-ko-kami Naosuké* (1896), both based on Japanese accounts, have not been superseded by more recent studies.

Iio Sōgi, also called SŌGI (b. 1421, Japan—d. Sept. 1, 1502, Hakone, Japan), Buddhist monk and greatest master of renga (linked verse), the supreme Japanese poet of his age.

Sōgi was born of humble stock, and nothing is known of his career before 1457. His later writings suggest that, after serving as a Zen monk in Kyōto, he became, in his 30s, a professional renga poet. His teachers included not only provincial renga masters but also court nobles, and though his training undoubtedly benefited his poetry, it also exerted an inhibiting influence. Sōgi's own selection of his best work shows him at his most ingenious in the aristocratic tradition; but his modern reputation is based on the deeply moving vein found in his simpler and more personal poems.

Sōgi is known as a traveler-poet. His life for 40 years was divided between the capital and the provinces. From 1466 to 1472, a period when warfare ravaged Kyōto, he lived mainly in eastern Japan. His return to Kyōto in 1473 ushered in his most fruitful period. His residence became the centre of literary activity in the city, and he compiled several collections of his poetry. In 1480 he made a journey to Kyushu (recorded in his *Tsukushi no michi no ki;* "A Record of the Road to Tsukushi"), not in the traditional manner as a wandering priest but as a celebrity, feted everywhere by his admirers.

Sōgi's reputation derives mainly from two renga sequences, *Minase Sangin Hyakuin* (1486; *Minase Sangin Hyakuin: A Poem of One Hundred Links Composed by Three Poets at Minase*) and *Yuyama Sangin Hyakuin* (1491; "One Hundred Poems Composed by Three Poets at Yuyama"); in each of these, three poets led by Sōgi took turns at composing short stanzas (links) to form a single poem with many shifts of mood and direction. Sōgi left over 90 works including renga anthologies, diaries, poetic criticism, and manuals.

iiwi (species *Vestiaria coccinea*), Hawaiian songbird, one of the commoner members of the Hawaiian honeycreeper family, Drepanidae, order Passeriformes. A nectar-feeder, named for its squeaky call ("ee-ee-vee"), it is 15 cm (6 inches) long, with a red body, black wings with small white patches, black tail, and sickle-shaped red bill.

Iiwi (*Vestiaria coccinea*)

Iizuka, city, Fukuoka *ken* (prefecture), Kyushu, Japan, on the upper Onga River. The city developed as a mining centre with the opening of the Chikuhō Coalfield and a railway from Wakamatsu in the 1890s. The mines were gradually closed after World War II, and Iizuka is now a commercial centre and railway hub. Pop. (1985) 81,868.

Ijaw (people): *see* Ijo.

Ijebu-Ode, town, Ogun state, southwestern Nigeria. It is situated along the highway between Shagamu and Benin City. Ijebu-Ode was by the 16th century established as the chief town of the Ijebu people (a subdivision of the Yoruba). As the seat of the *awujale,* the Ijebu political and spiritual ruler, it served as the capital of the Ijebu kingdom, which for several centuries dominated the trade between the ports of the Lagos Lagoon (including Lagos, 44 miles [70 km] west-southwest) and the Yoruba hinterland (especially Ibadan, 38 miles [60 km] north). During the Yoruba civil wars of the late 19th century, Ijebu opposed Ibadan and closed the trade routes to the coast. By defeating the *awujale* at Ijebu-Ode in 1892 and thus destroying the Ijebu trade monopoly, the British convinced the rest of Yorubaland to come to terms under their protection.

Modern Ijebu-Ode is a major collecting station for kola nuts, which are purchased for trucking to the northern states. Ijebu-Ode also serves as a collecting point for cocoa and palm oil and kernels, which are exported from Lagos. The town's industry includes a printing and publishing firm. Its artisans are known for their handiwork in iron. Local trade is primarily in yams, cassava, corn (maize), palm

produce, and oranges; and rubber and timber have become important commercial products of the area.

The town, whose *awujale* retains a position as the traditional Ijebu leader, is also headquarters of a local government council. It is the site of the Ogun State College of Education, Muslim and Christian primary teacher-training colleges, and a government vocational school. There are also a hospital for infectious diseases and a leprosy settlement. Pop. (1991 est.) 138,000.

Ijill (Mauritania): *see* Fdérik.

ijmāʿ (Arabic: "agreeing upon," or "consensus"), the universal and infallible agreement of the Muslim community, especially of Muslim scholars on any Islāmic principle, at any time. The consensus—based on the Ḥadīth (sayings of Muḥammad), "My people will never agree in an error"—constitutes the third of the four sources of Islāmic jurisprudence, the *uṣūl al-fiqh* (*q.v.*). In effect, *ijmāʿ* has been the most important factor in defining the meaning of the other *uṣūl* and thus in formulating the doctrine and practice of the Muslim community.

In Muslim history *ijmāʿ* has always had reference to consensuses reached in the past, near or remote, and never to contemporaneous agreement. It is thus a part of traditional authority and has from an early date represented the Muslim community's acknowledgment of the authority of the beliefs and practices of Muḥammad's city of Medina.

Ijmāʿ also has come to operate as a principle of toleration of different traditions within Islām. It thus allows, for example, the four legal schools (madhabs) equal authority and has probably validated many non-Muslim practices taken into Islām by converts.

In modern Muslim usage, *ijmāʿ* has lost its association with traditional authority and appears as a democratic institution and an instrument of reform.

IJmuiden, port of Amsterdam and part of the *gemeente* (commune) of Velsen, Noord-holland *provincie,* western Netherlands. The port is situated at the western end of the North Sea (Noordzee) Canal, which was opened in 1876. IJmuiden is also an industrial centre with fertilizer and cement factories, and it is an important fishing port with a government fish market. Three huge locks at IJmuiden link the canal to the North Sea. Two breakwaters project seaward from the canal mouth for nearly 1 mile (1.6 km). Used as a base for German torpedo boats in World War II, its facilities were damaged by Allied bombing but have since been rebuilt.

Ijo, also spelled IJAW, people of the forests of the Niger River delta in Nigeria comprising a large number of formerly autonomous groups. They speak a language of the Kwa branch of the Niger-Congo family.

West of the main Niger outlets each group occupies a cluster of villages linked by loose ties of cooperation, mainly against outsiders. Its members claim descent from a common ancestor. At group and village levels, government is by assemblies of elders, often presided over by priests. The economy is based on fishing, palm oil-collecting, and floodland agriculture.

Formerly, when the economy was based primarily on fishing, each group claimed a distinctive culture, as well as political autonomy. Following contact with European merchants about 1500, however, the communities of Bonny, Calabar, and Nemke began trading first in slaves and then in palm oil. Wealthy traders became very powerful and governed in council with a hereditary king. Each trader purchased numerous slaves for incorporation into his own section of the community; if the trader had no suitable heir, an able slave succeeded him. Competition with other groups over hinterland markets and stress on cultural separation rather than on links of common descent meant that ability was valued more than pedigree, permitting the emergence of slave-born leaders, such as George of Calabar and Jaja of Opobo.

ijolite, intrusive igneous rock that is composed essentially of nepheline and an alkali pyroxene, usually aegirinaugite. It is the plutonic equivalent of the volcanic nephelinites and nepheline dolerites. Typically, the pyroxene is well-crystallized and is surrounded by the nepheline. Accessory minerals include black garnet, titanite, perovskite, apatite, cancrinite, and calcite.

Ijolites form characteristic members of carbonatite–alkali igneous complexes, such as those of Alno, Swed.; Fen, Nor.; Kola Peninsula, Russia, where they contain abundant wollastonite; and Iron Hill, Colo., U.S. The ijolites of Magnet Cove, Ark., U.S.; Ice River, B.C., Can.; and Sekukuniland, Transvaal, S. Afr., are among the better-known representatives found in rock collections. The rocks known as urtite (Kola Peninsula) and melteigite (near Fen, Nor.) are essentially similar assemblages; in the former, nepheline largely predominates, whereas the latter is a variant with an excessive proportion of pyroxene.

IJssel River, river of The Netherlands, an important distributary of the Rhine River. It leaves the Lower Rhine (Neder Rijn) just southeast of Arnhem and flows northeastward for 70 miles (113 km) to enter the IJsselmeer (a lake formed from the old Zuiderzee) between the Northeast (Noordoost) and East Flevoland polders. The river is navigable and slow-moving and deposits much silt. Zutphen, Deventer, and Zwolle are important municipalities along its course.

IJsselmeer, shallow freshwater lake, northern and central Netherlands. It was formed from the southern part of the former Zuiderzee by the building of a dam (Afsluitdijk; completed 1932) separating the IJsselmeer from both the Waddenzee (the northern part of the former Zuiderzee) and the North Sea.

The dam that formed the IJsselmeer lies about 25 feet (8 m) above sea level and is 19 miles (31 km) long, extending between the provinces of Noordholland and Friesland. The dam was constructed of boulder clay

Part of the north dam (the Afsluitdijk) across the IJsselmeer, Neth.
Pierre Berger—Photo Researchers

backed by sand and is faced with stone to just below water level, on a base of boulders resting on mats of willow. There is a highway and bicycle path along the top of the dam; locks provide passage for barges and small seagoing craft. Regulated by sluices, the formerly brackish water has been replaced by fresh water, partly by inflow from the IJssel River, a branch of the Rhine River. This source of fresh water is valuable to Noordholland and Zuidholland and Friesland during occasional summer droughts and also helps to improve their brackish marshlands. The original fishing for herring, anchovies, and flounder has been replaced by freshwater fisheries, chiefly for eels. In spring, the eel larvae, born in the Sargasso Sea (a large tract of relatively still water in the North Atlantic Ocean) enter the lake through the locks.

Large parts of the lake's total area of 1,328 square miles (3,440 square km) have been reclaimed by constructing encircling dikes and pumping the water out. As a result, the land area of The Netherlands has been increased by 626 square miles (1,620 square km) of fertile polders.

IJsselmeer Polders, Dutch IJSSELMEERPOLDERS, group of four polders, central Netherlands, that were reclaimed from the IJsselmeer, a lake that used to be part of the former Zuiderzee. The polders are located in the lake's southern part and along its eastern shore (except for Wieringermeer in the northwest).

The Zuiderzee project, which involved the construction of a dam (Afsluitdijk; completed 1932) enclosing the IJsselmeer and the subsequent land reclamation of its rich marine clay, began in 1920, following the plans of engineer-statesman Cornelis Lely. The Wieringermeer Polder (75 square miles [193 square km]), the Northeast (Noordoost) Polder (181 square miles [469 square km]), and the East (Oostelijk) Flevoland Polder (204 square miles [528 square km]) were completed in 1930, 1942, and 1957, respectively. The South (Zuidelijk) Flevoland Polder (166 square miles [430 square km]) was completed in 1968. A fifth potential polder is the Markerwaard Polder in southwest IJsselmeer. Under construction since 1963, its diking was partially complete by the mid-1980s, but national debate regarding the future of the area based on concerns about recreational facilities, nature conservation, fishing, and increased costs has made empoldering less likely.

The Zuiderzee project is controlled by the Dutch government, which also administers the newly reclaimed areas and selects their prospective inhabitants. Many farmers in the Northeast Polder came from Zeeland and were originally victims of the devastation of World War II and the 1953 floods.

The Wieringermeer Polder, on the northeastern coast of Noordholland, has been incorporated into that province. The Northeast, East Flevoland, and South Flevoland polders were united in 1986 into one administrative unit called Flevoland province, centring on the new town of Lelystad.

The four polders reclaimed from the IJsselmeer increased the land area of The Netherlands by about 626 square miles (1,620 square km). Originally intended almost exclusively for agricultural production (corn [maize], wheat, oilseeds, sugar beets, potatoes), the polders are also used for industrial and recreational purposes and as residential areas.

ijtihād (Arabic: "effort") in Islāmic law, the independent or original interpretation of problems not precisely covered by the Qurʾān, Ḥadīth (traditions concerning the Prophet's life and utterances), and *ijmāʿ* (scholarly consensus). In the early Muslim community every adequately qualified jurist had the right to exercise such original thinking, mainly *raʾy* (personal judgment) and *qiyās* (analogical reasoning), and those who did so were termed *mujtahids.* But with the crystallization of legal schools (madhabs) under the ʿAbbāsids (reigned 750–1258), the Sunnites (the majority branch of Islām) held at the end of the 3rd century AH that the "gates of *ijtihād*" were closed and that no scholar could ever qualify

again as *mujtahid*. All subsequent generations of jurists were considered bound to *taqlīd*, the unquestioned acceptance of their great predecessors as authoritative and could, at most, issue legal opinions drawn from established precedents. The Shī'ites, the minority branch, never followed the Sunnites in this respect and still recognize their leading jurists as *mujtahids*, although in practice the Shī'ite law is little more flexible than that of the Sunnites. In Shī'ite Iran, the *mujtahids* act as guardians of the official doctrine, and in committee may veto any law that infringes on Islāmic ordinances.

Several prominent Sunnite scholars, such as Ibn Taymīah (1236–1328) and Jalāl ad-Dīn as-Suyūṭī (1445–1505), dared to declare themselves *mujtahids*. In the 19th and 20th centuries reformist movements clamored for the reinstatement of *ijtihād* as a means of freeing Islām from harmful innovations (*bid'ahs*) accrued through the centuries and as a reform tool capable of adapting Islām to the requirements of life in a modern world.

IJzer River (Europe): *see* Yser River.

Ikare, town, Ondo state, southwestern Nigeria. It lies in the Yoruba Hills, at the intersection of roads from Owo, Okene, Kabba, and Ado-Ekiti. An agricultural trade centre (yams, cassava, corn [maize], okra, pumpkins, rice) for the local Yoruba people, it is also a collecting point for cocoa, palm produce, tobacco, and cotton (which is sent to the textile mill at Ado-Ekiti, 37 miles [60 km] west). The town is the headquarters of a local government council and has Muslim and Christian secondary schools; it also has a trade school and government- and church-operated hospitals. Pop. (1991 est.) 124,300.

Ikbāl, Sir Mahomed (Indian poet): *see* Iqbāl, Sir Muḥammad.

Ike Taiga, original name MATAJIRŌ, also called IKENO TAIGA (b. June 6, 1723, Kyōto, Japan—d. May 30, 1776, Kyōto), painter of the mid-Tokugawa period (1603–1867) who, together with Yosa Buson, established the *bunjin-ga,* or literati, style of painting, which survives to this day in Japan. (The style had originated in China and was first called Nan-ga, or the Southern School, of Chinese art; it was closely related to scholarship and literature.)

The son of a farmer, Ike was taught calligraphy and the Chinese Classics from an early age and eventually became one of the leading calligraphers of the Tokugawa period. He first studied Nan-ga through an illustrated book of Chinese painting, *Pa-chung hua-p'u* (*c.* 1620), and was later influenced by such older Japanese Nan-ga painters as Ryū Rikyō and Gion Nankai, whom he first met about 1736 and 1752, respectively. Unlike most other *bunjin-ga* painters, who merely followed closely the style's models, he developed a more free and ample style, full of vitality and brightness.

Ike's works consist mostly of landscapes and portraits, usually on a larger scale than later *bunjin-ga* paintings. Among his representative large-scale works are the screen pictures "The Five Hundred Disciples of Buddha" and "The Western Lake," both for the Mapuku Temple at Uji, and "Chinese Recluses in a Mountain" (a 10-screen work) of the Henjōkō Temple on Mount Kōya. He collaborated with Yosa Buson to work on illustrations for *Jūben jūgichō* (1771; "Ten Advantages and Ten Pleasures"), albums based on the poems of Li Li-weng of the early Ch'ing dynasty (1644–1911). Ike did the illustrations for the 10 advantages, while Buson did the 10 pleasures. Ike taught his wife, Gyokuran, painting, and she became a famous painter herself.

Ikebana, traditionally, the classical art of Japanese flower arranging; the meaning of the term was later extended to encompass all the various styles of Japanese floral art. Ikebana was introduced in Japan in the 6th century by Chinese Buddhist missionaries who had formalized the ritual of offering flowers to the Buddha. The first school of flower arranging in Japan, Ikenobō (*q.v.*), was founded by Ono no Imoko in the early 7th century. Based on a harmony of simple linear construction and an appreciation of the subtle beauty of flowers and natural material, ikebana has separated into several major schools according to historical periods and differing theories of artistic composition. The other major schools, in addition to Ikenobō, are Ko (Koryū), Ohara, and Sogetsū. For individual styles, *see* rikka, shōka, nageire, moribana, and zen'ei ikebana.

Ikeda, city, Ōsaka *fu* (urban prefecture), Honshu, Japan. It lies on the Fukuchiyama Line (railway), northwest of Ōsaka. Settled in prehistoric times, Ikeda was a flourishing trade centre during the Tokugawa era (1603–1867). After the development of railway transport in the late 19th century, it served as a residential suburb of Ōsaka. The city's industries include brewing, woodworking, and the manufacture of automobiles and photographic equipment. Garden trees are cultivated in the surrounding area, where residential housing has replaced much farmland. Ōsaka International Airport adjoins the southern margins of the city. Pop. (1992 est.) 104,268.

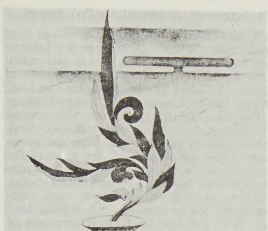
Ikeda Hayato (b. Dec. 3, 1899, Hiroshima prefecture, Japan—d. Aug. 13, 1965, Tokyo), prime minister of Japan from July 1960 until October 1964, who was instrumental in Japan's phenomenal economic growth in the years after World War II.

Born into a sake brewer's family, he graduated from Kyōto Imperial University law school in 1925 and began his career in the Ministry of Finance. After rising to the position of vice minister of finance, he won a House of Representatives seat in the January 1949 general election and became minister of finance in the government of Yoshida Shigeru. Eventually he and the future prime minister Satō Eisaku became known as leading exponents of the "Yoshida school" of conservative politics.

Ikeda
UPI

Ikeda sought to stabilize an economy wracked by inflation with the strong deflationary policy recommended by Joseph Dodge, a Detroit banker sent by the U.S. government to study the economic difficulties of occupied Japan. Ikeda's pursuit of "balanced financing" was helped along after 1950 by U.S. military contracts related to the Korean War. Under Prime Minister Yoshida, Ikeda played a leading role in peace treaty negotiations with the United States. In October 1952 he became international trade and industry minister, and for much of the rest of the decade he was either finance or international trade minister, or minister without portfolio. He also served terms as secretary-general of the Liberal Party (subsequently Liberal-Democratic Party) and as chairman of the party's political affairs research committee.

When Kishi Nobusuke resigned in July 1960, Ikeda became president of the party and began his four years as prime minister. With the stated goal of doubling Japan's national income in 10 years, Ikeda launched a high-rate economic-growth policy based on expanded public-sector spending, reduced taxes, and efforts to keep both inflation and interest rates low. He made determined efforts to break down trade barriers to Japanese goods in foreign markets. Ikeda maintained a lower profile in foreign affairs. While continuing to cultivate close relations with the United States on economic and security matters, he did favour expanding trade ties with the Soviet Union and China. Ikeda resigned in October 1964 because of ill health.



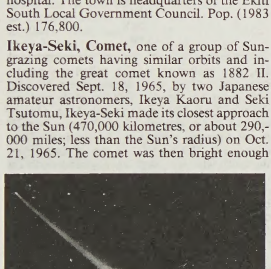
Consult the INDEX *first*

Ikeja, town and capital of Lagos state, 10.5 miles (17 km) northwest of Lagos, southwestern Nigeria. Originally settled by the Yoruba people, the locality was raided for slaves until the mid-19th century. Early in the 20th century it became an agricultural hinterland for Lagos; kola nuts were first grown in Nigeria in this area. The opening of the Lagos-Ibadan railway in 1901 and the growth of Lagos as a port transformed Ikeja into a residential and industrial suburb of that city. In the mid-1960s an industrial estate was established, and in 1975 Ikeja became the capital of the newly formed Lagos state.

The town's industrial estate contains cotton textile plants that are among Nigeria's largest, and there is also a wool textile plant. Other factories in Ikeja manufacture footwear, cosmetics, pharmaceuticals, plastics, paper and cork products, ceramics, paints, matches, and lightbulbs. There are a number of food processing plants and a large brewery in the town. Heavy industries include steel products, trailer-truck tanks, wire, aluminum, and rubber products. Several publishers and printers and import-export businesses are also centred at Ikeja.

The Lagos State Polytechnic (1977), the Federal Institute of Industrial Research (1955), a primary teachers' college, and a community nursing school are located in the town. The Lagos state radio broadcasting service also has its headquarters there. A housing project has been built in the town to help ease the overcrowding problems of Lagos. Murtala Muhammad international airport, serving Lagos, is located in Ikeja, and Nigeria Airways has its headquarters there. Pop. (1983 est.) 60,370.

Ikenobō, oldest school of floral art in Japan; the term Ikenobō later came to be used loosely to describe any classical Japanese flower arrangement. The Ikenobō (literally, "priest's residence by a pond") school was founded in the early 7th century by Ono no Imoko, a former Japanese envoy to China. After becoming a Buddhist priest, Ono no Imoko took up residence at Rokkaku-dō, a small temple in what was to become Kyōto. There, as part of Buddhist ritual, he began formulating the rules of arrangement for the *rikka* style of flower arrangement, a formal, vertically oriented style using a tall or tallish, narrow-mouthed vase. From its basic tristructure of branches representing heaven, man, and Earth, the freer,



Informal (so) Ikenobō arrangement, *surimono* print by Hiroshige, 19th century; in the Metropolitan Museum of Art, New York

By courtesy of the Metropolitan Museum of Art, New York, bequest of Mrs. H.O. Havemeyer, 1929

shōka style evolved. Ikenobō arrangements are divided into *shin* (formal), *gyō* (semi-formal), and *so* (informal).

Ikere-Ekiti, also called IKERE, or IKERRE, town, Ondo State, southwestern Nigeria, on the road from Akure to Ado-Ekiti. A major collecting point for coçoa, it also serves as an agricultural trade centre (yams, cassava [yuca], rice, corn [maize], palm oil and kernels, okra, pumpkins) for the Ekiti branch of the Yoruba people. Ikere-Ekiti has government and Christian teacher-training colleges; there is also a hospital. The town is headquarters of the Ekiti South Local Government Council. Pop. (1983 est.) 176,800.

Ikeya-Seki, Comet, one of a group of Sungrazing comets having similar orbits and including the great comet known as 1882 II. Discovered Sept. 18, 1965, by two Japanese amateur astronomers, Ikeya Kaoru and Seki Tsutomu, Ikeya-Seki made its closest approach to the Sun (470,000 kilometres, or about 290,000 miles; less than the Sun's radius) on Oct. 21, 1965. The comet was then bright enough

Comet Ikeya-Seki, 1965

By courtesy of Lick Observatory, California

to be seen with the naked eye in daylight. Like the similarly spectacular Comet 1882 II, it was fragmented by its proximity to the Sun; Ikeya-Seki gave astronomers their first chance since 1882 to study a comet in such conditions.

Ikhnaton (Egyptian king): *see* Akhenaton.

Ikhshīdids DYNASTY, Muslim Turkish dynasty from Fergana in Central Asia that ruled Egypt and Syria from 935 to 969. The founder, Muḥammad ibn Ṭughj, appointed governor of Egypt in 935, two years later obtained the title *ikhshīd* (Persian: "prince, ruler") from the 'Abbāsid caliph ar-Rāḍī; he then secured his position in Egypt and Syria against opposition from Muḥammad ibn Rā'iq, *'Abbāsid amīr al-umarā'* (commander in chief), and the Ḥamdānid Sayf ad-Dawlah of Aleppo. From 946 until 968, real governmental power rested in the hands of the vizier, Abū al-Misk Kāfūr, though Ibn Ṭughj's sons Ūnūjūr and 'Alī remained nominal rulers. Kāfūr, originally a black slave from either Ethiopia or the Sudan, successfully restrained Fāṭimid and Ḥamdānid intrusions into his territories; he also patronized learning and the arts, briefly boasting the presence of the eminent poet al-Mutanabbī in his court. In 969 the Fāṭimids overthrew the last of the Ikhshīdid rulers, a boy named Abū al-Fawāris Aḥmad, grandson of the founder, while the Ḥamdānids drove the Ikhshīdī governors from northern Syria.

ikhtilāf (Arabic: "disagreement"), in Islām, differences of opinion on religious matters. Such diversity is permissible as long as the basic principles of Islām are not affected. *Ikhtilāf* is thus the opposite of *ijmā'* (consensus). *Ikhtilāf* permits a Muslim to choose the interpretation of religious teachings that best suits his own circumstances and causes the least harm. Two famous sayings from Ḥadith in favour of *ikhtilāf* were attributed to the Prophet Muḥammad: "Difference of opinion in the Muslim community is a sign of divine favour"; and "It is a mercy of God that the theologians differ in opinion."

Ikhtilāf thus allowed Islām to develop four equally orthodox legal schools: the Mālikī, the Ḥanafī, the Shāfi'ī, and the Ḥanbalī, within each of which there have been diverse interpretations of the same religious texts. Disagreements among Muslim theologians usually focus on details of legal practices, which, though relatively minor when compared with the great tenets of the faith, are nevertheless most relevant in everyday life.

Ikhwān (Arabic: Brethren), in Arabia, members of a religious and military brotherhood that figured prominently in the unification of the Arabian Peninsula under Ibn Sa'ūd (1912–30); in modern Saudi Arabia they constitute the National Guard.

Ibn Sa'ūd began organizing the Ikhwān in 1912 with hopes of making them a reliable and stable source of an elite army corps. In order to break their traditional tribal allegiances and feuds, the Ikhwān were settled in colonies known as *hijrahs.* These settlements, established around desert oases to promote agricultural reclamation of the land, further forced the Bedouin to abandon their nomadic way of life. The *hijrahs,* whose populations ranged from 10 to 10,000, offered tribesmen living quarters, mosques, schools, agricultural equipment and instruction, and arms and ammunition. Most important, religious teachers were brought in to instruct the Bedouin in the fundamentalist precepts of Islām taught by the religious reformer Ibn 'Abd al-Wahhāb in the 19th century. As a result the Ikhwān became archtraditionalists. By 1918 they were ready to enter Ibn Sa'ūd's elite army.

In 1919 the Ikhwān began a campaign against the Hāshimid kingdom of the Hejaz on the northwestern coast of Arabia; they defeated King Ḥusayn ibn 'Alī at Turabah (1919), then conducted border raids against his sons 'Abd Allāh of Transjordan and Faysal of Iraq (1921–22). In 1924, when Ḥusayn was proclaimed caliph in Mecca, the Ikhwān labelled the act heretical and accused Ḥusayn of obstructing their performance of the pilgrimage to Mecca. They then moved against Transjordan, Iraq, and the Hejaz simultaneously, besieged aṭ-Ṭā'if outside Mecca, and massacred several hundred of its inhabitants. Mecca fell to the Ikhwān, and, with the subsequent surrenders (1925) of Jiddah and Medina, they won all of the Hejaz for Ibn Sa'ūd. The Ikhwān were also instrumental in securing the provinces of Asir, just south of the Hejaz on the coast (1920), and Ḥā'il, in the north of the peninsula, along the borders of Transjordan and Iraq (1921).

By 1926 the Ikhwān were becoming uncontrollable. They attacked Ibn Sa'ūd for introducing such innovations as telephones, automobiles, and the telegraph and for sending his son to a country of unbelievers (Egypt). Despite Ibn Sa'ūd's attempts to mollify the Ikhwān by submitting their accusations to the religious scholars (*'ulamā'*), they provoked an international incident by destroying an Iraqi force that had violated a neutral zone established by Great Britain and Ibn Sa'ūd between Iraq and Arabia (1927–28); the British bombed Najd in retaliation.

A congress convened by Ibn Sa'ūd in October 1928 deposed Ibn Ḥumayd, ad-Dawīsh, and Ibn Ḥithlayn, the leaders of the revolt. A massacre of Najd merchants by Ibn Ḥumayd in 1929, however, forced Ibn Sa'ūd to confront the rebellious Ikhwān militarily, and, in a major battle fought in March on the plain of as-Sabalah (near al-Arṭāwiyah), Ibn Ḥumayd was captured and ad-Dawīsh seriously wounded. Then in May 1929 Ibn Ḥithlayn was murdered. In retribution the Ikhwān killed his murderer, Fahd, the son of one of Ibn Sa'ūd's governors, and commandeered the road between Ibn Sa'ūd's capital, Riyadh, and the Persian Gulf. The rebels suffered a setback in August at the hands of 'Abd al-'Azīz ibn Musā'id; their leader, 'Uzayyiz, ad-Dawīsh's son, and hundreds of his soldiers were either killed in battle on the edge of an-Nafūd desert or died of thirst in the desert. Shortly afterward, an important Ikhwān faction defected, and Ibn Sa'ūd was able to surround the rebels and force them to surrender to the British in Kuwait in January 1930. The Ikhwān leaders, ad-Dawīsh and Ibn Ḥithlayn's cousin Nāyif, were subsequently imprisoned in Riyadh.

Not all of the Ikhwān had revolted. Those that had remained loyal to Ibn Sa'ūd stayed on the *hijrahs,* continuing to receive government support, and were still an influential religious force. They were eventually absorbed into the Saudi Arabian National Guard.

Ikhwān al-Muslimūn, al-: *see* Muslim Brotherhood.

Ikhwān aṣ-Ṣafā' (Arabic: Brethren of Purity), a secret Arab confraternity, founded at Basra, Iraq, that produced a philosophical and religious encyclopaedia, *Rasā'il ikhwān aṣ-ṣafā' wa khillān al-wafā'* ("Epistles of the Brethren of Purity and Loyal Friends"), sometime in the second half of the 10th century AD.

Neither the identity nor the period of the Ikhwān aṣ-Ṣafā' has been definitively established, but the various authors of the *Rasā'il* do seem to reflect the doctrinal position of the Ismā'īlīyah, a radical Shī'ī Muslim sect influenced by Manichaeism and Neoplatonism, which preached an esoteric interpretation of the Qur'ān open only to initiates (*see* Ismā'īlīyah). The Ikhwān aṣ-Ṣafā', like all other Islāmic philosophers, attempted to naturalize Greek philosophy in a way of their own; they chose to follow a fairly orthodox Neoplatonic position and admitted Hermetic, Gnostic, astrological, and occult sciences on a large scale in the belief that their absorption of ancient wisdom enabled them to fathom the esoteric meaning of revelation.

According to the Ikhwān aṣ-Ṣafā', individual human souls emanate from the universal soul and rejoin it after death; the universal soul in its turn will be united with God on the day of the Last Judgment. The *Rasā'il* are thus intended to purify the soul of misconceptions and lead it to a clear view of the essence of reality, which in turn will provide for happiness in the next life. To accomplish this enlightenment, the *Rasā'il* are structured

theoretically to lead the soul from concrete to abstract knowledge. There is also an important summary of the whole encyclopaedia, *ar-Risālah al-jāmi'ah.*

Iki, island, Nagasaki *ken* (prefecture), Japan, lying in the Eastern Channel, about 10 miles (16 km) off the coast of Kyushu. Most of its 52-square-mile (134-square-kilometre) area

Drying cuttlefish on Iki, Japan
Imperial Press—FPG

is tableland; cereals, oranges, and tobacco are the important crops. The fishing industry yields mackerel and cuttlefish. Anchorages are at Gōnoura (the chief town), Katsumoto, and Ashibe. The island served as a gateway for Chinese and Korean culture to enter Japan. Pop. (1995 prelim.) 35,089.

Ikire, town, Osun state, southwestern Nigeria. The town lies along the road from Ibadan to Ile-Ifẹ. A collecting point for local cash crops (cocoa and palm oil and kernels), it also serves as a trade centre for yams, maize (corn), cassava, palm produce, cotton, and kola nuts. Cotton weaving is a traditional industry of the Yoruba. Pop. (1991 prelim.) 111,435.

Ikirun, town, Osun state, southwestern Nigeria. It lies along the railroad from Lagos and at the intersection of roads from Oshogbo, Inisha (Inisa), Igbajo, and Ila (Illa). Mainly inhabited by Yoruba people, the town was raided for slaves in the 19th century by Fulani warriors from Ilorin (42 miles [68 km] north-northwest).

The modern town is a local trading centre (yams, corn [maize], cassava, pumpkins, beans, and okra) at the northern edge of the main cocoa belt; it serves as a collecting point for cotton and tobacco, the chief cash crops. Cotton weaving is a traditional local industry, but the town of Oshogbo, 14 miles (23 km) southeast, is the more important textile centre. Pop. (1991 prelim.) 76,565.

Ikorodu, town, Lagos state, southwestern Nigeria. It lies near the Lagos Lagoon, on the Bight of Benin, 14 miles (23 km) northwest of Lagos. A traditional settlement of the Awori people (a subgroup of the Yoruba), it became important in the mid-19th century as a trading post of the Remo (Ijebu-Remo) kingdom on the trade route from Lagos to Ibadan. During the Ibadan-Ijaiye wars (1860–65), the Ikorodu traders, encouraged by both Ibadan and Lagos, decided to break from their Ijebu overlords and smuggled arms across the Ijebu-Egba blockade to Ibadan (58 miles [93 km] north-northeast). In 1865, when the Egba decided to punish Ikorodu, British forces from Lagos intervened and decisively defeated the Egba army in a battle at Ikorodu.

Modern Ikorodu is a collecting point for locally produced fish, poultry, cassava, corn (maize), vegetables, palm oil and kernels, okra, cabbages, tomatoes, pineapples, and bananas that are shipped to Lagos. Many truck farms are located in the vicinity of the town. The commercial manufacture of pottery is a significant local industry. The town is served by highways between Lagos and Shagamu and between Lagos and Epe. Pop. (1991 prelim.) 184,674.

Ikot Abasi, also called OPOBO, formerly EGWANGA, port town, Akwa Ibom state, southern Nigeria. The town lies near the mouth of the Imo (Opobo) River. Situated at a break in the mangrove swamps and rain forest of the eastern Niger River delta, it served in the 19th century as a collecting point for slaves. In 1870 Jubo Jubogha, a former Igbo (Ibo) slave and ruler of the Anna Pepple house of Bonny (28 miles [45 km] west-southwest), came to Ikot Abasi and founded the kingdom of Opobo, which he named for Opobo the Great, a Pepple king (reigned 1792–1830). Also called Chief Jaja by Europeans, he destroyed the economic power of Bonny and made Opobo the leading power of the eastern Niger delta oil-palm trade until he was deported in 1887 by the British, who established a trading post at Opobo Town, 4 miles (6 km) southwest, on the west bank of the Imo River.

Modern Ikot Abasi serves as a trading centre for the yams, cassava, fish, palm produce, corn (maize), and taro produced by the Ibibio people of the area; it also is known for boatbuilding, although a sandbar partially blocks the entrance to its port from the Gulf of Guinea. The town is linked by highway to Aba and Port Harcourt. Pop. (1991 est.) 71,410.

Ikot Ekpene, town, Akwa Ibom state, southern Nigeria. The town lies along the coastal highway, between Calabar and Aba. It is the chief trade centre (yams, cassava, taro, corn [maize], and palm produce) for a densely populated area known for its export of palm oil and kernels. It is mainly inhabited by the Anang branch of the Ibibio people, who are noted for their cane furniture and basket handicrafts. Pop. (1991 prelim.) 119,402.

Iktinos: *see* Ictinus.

Il-76 (Soviet aircraft): *see* Ilyushin Il-76.

Il Domenichino (composer): *see* Sarti, Giuseppe.

Il-Khanid DYNASTY, also spelled IL-KHĀN (1256–1353), Mongol dynasty that ruled in Iran. Il-khan is Persian for "subordinate khan."

Hülegü, a grandson of Genghis Khan, was given the task of capturing Iran by the paramount Mongol chieftain Möngke. Hülegü set out in about 1253 with a Mongol army of about 130,000. He founded the Il-Khanid dynasty in 1256, and by 1258 he had captured Baghdad and all Iran. The Il-Khans consolidated their position in Iran and reunited the region as a political and territorial entity after several centuries of fragmented rule by petty dynasties. During the reign of the Il-Khan Maḥmūd Ghāzān (reigned 1295–1304), the Il-Khans lost all contact with the remaining Mongol chieftains of China. Maḥmūd Ghāzān himself embraced Sunnite Islām, and his reign saw an Iranian cultural renaissance in which such scholars as Rashīd ad-Dīn flourished under his patronage.

Ghāzān's brother Öljeitū (reigned 1304–16) converted to Shī'ite Islām in 1310. Öljeitū's conversion gave rise to great unrest, and civil war was imminent when he died in 1316. His son and successor, Abū Sa'īd (reigned 1317–35), reconverted to Sunnite Islām and thus averted war. But during Abū Sa'īd's reign factional disputes and internal disturbances continued and became rampant. Abū Sa'īd died without leaving an heir, and with his death the unity of the dynasty was fractured. Thereafter various Il-Khanid princes ruled as regional dynasts until 1353.

Il Zazzerino (composer): *see* Peri, Jacopo.

Ila, also called BAILA, SUKULUMBWE, or SHUKULUMBWE, a Bantu-speaking people inhabiting an area west of Lusaka, the national capital of Zambia. The Ila-Tonga cluster consists of about 12 dialect groups, including the Lozi, Koba, Lenje, Tonga, Totela, Ila, and others.

The Ila combine agriculture with animal husbandry. Men hunt, fish, and clear land, while women gather foods from the countryside and are responsible for most of the cultivation. Early in the 20th century, crops such as corn (maize), sorghum, millet, beans, peanuts (groundnuts), and yams were cultivated by hoe techniques and shifting land use. Since that time the Ila have overcome an aversion to forcing cattle into harnesses, and animal-drawn plowing has supplanted the hoe culture. They possess large numbers of cattle and consume a considerable amount of milk.

The Ila do not operate within a centralized political system; an autonomous *mwami* (chief) presides over each of a number of independent *shishi* (territories). Their villages are governed by headmen and councils of elders.

The Ila appear to recognize kinship by both male and female links, depending upon circumstances and purposes. Marriage expenses or bride price in cattle, blankets, shells, and hoes were provided primarily by the husband's matrilineal relations, but assistance was also given by patrilineal relations; after marriage the extended-family compound of the husband's father was the usual residence. The Ila traditionally worship Leza (the supreme being) and the spirits of family ancestors, but missionaries opened schools in the 1920s, and many of the Ila are now Christian.

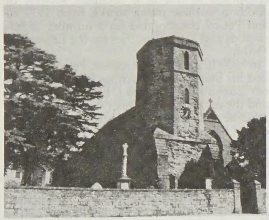
Consult the INDEX *first*

Ila, also spelled ILLA, also called ILA ORANGUN, town, Osun state, southwestern Nigeria. The town lies in the Yoruba Hills and on the road from Oshogbo to Omu-Aran. One of the oldest settlements of the Yoruba people, it was founded according to tradition by the *orangun* ("ruler") of Ila, a son of Oduduwa, the deity who is said to have spread earth on the primeval water. Modern Ila is a collecting centre for locally produced cotton and for tobacco, which is sent to the cigarette factories at Oshogbo, 28 miles (45 km) southwest, and Ibadan, 82 miles (132 km) southwest. Local trade is primarily in palm oil and kernels, yams, cassava, and corn (maize). Pop. (1991 prelim.) 89,900.

Ilacomilus: *see* Waldseemüller, Martin.

Īlām, city, western Iran. The city is rural in appearance and is located near the Iraq-Iran border. A number of roads emanate from Īlām, linking it with the border towns of Mehrān and Dehlorān. The city's population consists mostly of Kurds. Local industries produce bricks, woven cloth, coarse carpets, and sack cloth.

The surrounding region is a continuation of the valley of Mesopotamia and was formed by the deposition of sediments eroded from the Zagros Mountains. Economically backward, the region is populated by the Posht-e Huhi group of Lurs, many of whom are settled farmers. They are Shī'ite Muslims, and their periodic revolts were, in times past, a source of trouble for the Iranian government. Agriculture is the principal occupation of the region, and barley, wheat, rice, oilseeds, potatoes, and dates are grown. There are also a few oilfields in the region. A climatological station and a small thermoelectric-power plant are located at Īlām. Pop. (1996) 126,346.



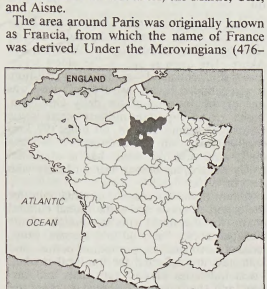
ilang-ilang (tree): *see* ylang-ylang.

Ilaro, town, western Ogun state, southwestern Nigeria. Located on the former trade route from the towns of the empire of Oyo to the port of Porto-Novo (now the capital of Benin), 40 miles (64 km) southwest, it was established by the late 18th century as the capital and chief trade centre of the Egbado people (a subgroup of the Yoruba). With the decline of Oyo in the early 19th century, the Egbado kingdom was raided for slaves by the Dahomeyans until it was absorbed in the 1840s and '50s by the more powerful Egba kingdom at Abeokuta (29 miles [47 km] northeast). As a subject town, Ilaro served the Egba as a trading post on the western route from Lagos to Ibadan. In the 1860s European missionaries arrived and established the Yoruba Anglican Mission in Ilaro. Following the 1890 delineation of colonial boundaries by the French and the British, the Egbado, who felt oppressed by Egba rule, asked for British protection and control of their territory. A British military garrison was built in Ilaro in the same year.

Modern Ilaro is a collecting point for cocoa, palm oil and kernels, kola nuts, vegetables (especially rice and okra), and fruits grown in the surrounding area. Yams, cassava, and corn (maize) are also cultivated by the town's farmers. Cotton weaving and dyeing (with locally grown indigo) are traditional industries. There are deposits of limestone (used by a cement plant at Ewekoro, 13 miles [21 km] east-northeast) and phosphate in the vicinity.

Ilaro is the site of a federal polytechnic college. It is located at the end of a spur on the Lagos-Nguru railway and lies at a junction of local roads. Pop. (1992 est.) 42,410.

Ilchester, town ("parish"), South Somerset district, county of Somerset, England. It lies along the River Yeo. Ilchester was known as Lindinis under Roman rule and was the northern tribal capital of the Durotriges, an early British people. A royal mint was established there in the 10th century and remained



Church of St. Mary Major, Ilchester, England
The J. Allan Cash Photolibrary

in operation until Henry II's reign (1154–89). The town's royal charter dates from the 12th century. From the 14th to the 19th century, the community was Somerset county's administrative centre. Of the medieval town's seven parish churches, only St. Mary Major remains. Pop. (1981) 1,768.

Ildigüzid DYNASTY, also spelled ILDEGÜZID, ILDEGIZID, or ILDENIZID: *see* Eldegüzid dynasty.

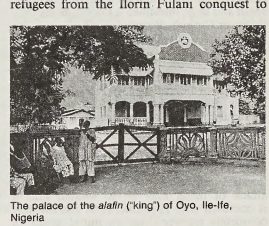
Île-de-France, *région* encompassing the north-central French *départements* of Val-d'Oise, Seine-et-Marne, Seine-Saint-Denis, Paris, Hauts-de-Seine, Val-de-Marne, Essonne, and Yvelines and roughly coextensive with the historical region of the Île-de-France. The capital is Paris. The *région* is bounded by the *départements* of Eure to the northwest, Oise and Aisne to the north, Marne, Aube, and Yonne to the east, Loiret to the south, and Eure-et-Loir to the west. The *région* lies in the central part of the Paris Basin and consists of limestone plains with a gently rolling relief. The principal rivers in the *région* are the Seine and its tributaries, the Marne, Oise, and Aisne.

The area around Paris was originally known as Francia, from which the name of France was derived. Under the Merovingians (476–

The *gouvernement* of Île-de-France in 1789

750), Francia meant the region between the Rhine and the Seine rivers; it was restricted under the Carolingians to the country bounded by the Aisne, Oise, and Seine rivers. In the 10th and 11th centuries it signified only the territory limited by the Seine, the Marne, the Beuvronne, the Oise, and the Nonette. It was from the nucleus of this territory that Hugh Capet, who became king of France in 987, and his successors consolidated the authority of the monarchy and thereby created the modern French state.

In the European Middle Ages, *île* ("island") often designated areas more or less bounded by rivers but was not given specifically to "France" before 1387. The name is not found in written documents before 1429; but in the second half of the 15th century it designated a wide military province of government, bounded on the north by Picardy, the west by Normandy, the south by Orléanais and Nivernais, and the east by Champagne. Its capital was Paris. In the 16th century, the *gouvernement* of Île-de-France was constituted under a *gouverneur,* or a lieutenant of the king; in the 18th century, it was divided between the *généralités,* or *intendances,* of Paris and Soissons. During the French Revolution the Île-de-France was divided into *départements.*



The Île-de-France is the most densely populated region in France. During a century (1850–1950) when most areas of France were losing population, the magnet of Paris attracted immigrants from all over the country. The population of the Île-de-France consequently increased more than fourfold between 1850 and 1968, but, with the central government's policy of decentralization from Paris, it lost potential immigrants to more distant regions; during the 1980s it increased at a rate slightly above the national average. Most of the communes belonging to the Île-de-France are still classified as rural despite their proximity to Paris.

The *région*'s fertile loams support the cultivation of wheat, corn (maize), and sugar beets, but owing to the great urban sprawl of Paris, agriculture is of negligible importance outside Seine-et-Marne, Val-d'Oise, and Yvelines. Agriculture in Seine-et-Marne tends to be highly mechanized and employs only a small percentage of the workforce; sugar beets are a major crop. Sugar beets and wheat are grown in Val-d'Oise, in the French Vexin, and in the plain of the Île-de-France.

The region's industries are highly developed; manufactures include electronic and aeronautical equipment. Industries, research laboratories, and institutions in the Île-de-France employ many of the nation's engineers and mathematics and computer specialists. Area 4,637 square miles (12,011 square km). Pop. (1991 est.) 10,788,318.

Ile-Ife, also called IFE, or IFE-LODUN, town, Osun state, southwestern Nigeria. The town lies at the intersection of roads from Ibadan (40 miles [64 km] west), Ilesha, and Ondo. It is one of the larger centres and probably the oldest town of the Yoruba people. Considered by the Yoruba to be a holy city and the legendary birthplace of mankind, it was held to have been founded by a son of the deity Oduduwa and was certainly the capital of a well-established kingdom (probably named for Ifa, the god of divination) by the early 11th century. By the late 12th or early 13th century, its artisans were producing the naturalistic terra-cotta heads and bronze pieces made by the *cire perdue* ("lost-wax") process for which the Ife kingdom is now well known. Ife had great political and cultural influence over the Edo kingdom of Benin to the southeast.

Although Benin and Old Oyo (Katunga) became the seats of more important political kingdoms than Ife, the town remained the chief religious centre for the Yoruba. In return for the *ida oranyan* ("sword of state," symbolizing spiritual authority) given to an *alafin* ("king") of Oyo upon his coronation, the *alafin* had to promise not to attack Ife. When Alafin Awole tried to raid Ife territory for slaves in 1793, it brought severe internal resistance and the series of wars that destroyed the Oyo empire. Although Ife managed to avoid the attacks by the Muslim Fulani that struck other parts of Yorubaland, it was weakened in the 1820s through struggles for control of the internal slave trade with Owu, to the southwest. After an *oni* ("king") of Ife allowed Yoruban Oyo refugees from the Ilorin Fulani conquest to

The palace of the *alafin* ("king") of Oyo, Ile-Ife, Nigeria
Konran Media, Inc.

build the walled town of Modakeke just outside Ife, he was poisoned. After Ife declared war (1882) against Ibadan, its forces were repulsed when they attacked Modakeke. Shortly afterward, a combined army from Ibadan and Modakeke nearly destroyed Ife.

In the centre of modern Ile-Ife is the Afin ("palace") of the present *oni,* the spiritual head of the Yoruba people, who has custody of the sacred staff of Oranmiyan (a king of Benin), an 18-foot (5.5-metre) granite monolith in the shape of an elephant's tusk. The palace compound is also the site of the Ife Museum (1954), which contains a collection of *cire perdue* bronze castings and terra-cotta sculptures that was partly acquired by the German archaeologist Leo Frobenius in 1910 and subsequently expanded through excavations at the Wunmonije compound (1938–39) and at nearby Ita Yemoo (1957).

Obafemi Awolowo University (formerly the University of Ife) was founded in 1961. One of

Nigeria's major universities, it is located north of the town; it operates a teaching hospital and has a major library. The affiliated Institute of Agricultural Research and Training operates the Moor Plantation for agricultural research and has the country's largest specialized agricultural library. Institutes of education (operating a mobile library service) and physical education are also centred in the town and affiliated with the university. Ile-Ife is the seat of the Historical Society of Nigeria (1955) and has several teacher-training colleges. In 1948 Ife was the site of the inaugural Conference of the Society of the Descendants of Oduduwa, a group of Yoruba nationalists who formed the core of the Action Group, a national political party.

Ile-Ife is a major collecting point for cocoa and cotton grown in the surrounding area. Palm oil and kernels, yams, cassava, corn (maize), pumpkins, and kola nuts are cultivated for local markets. Ile-Ife's inhabitants are primarily town-dwelling farmers. Pop. (1991 est.) 261,900.

Ilebo, formerly PORT-FRANCQUI, town, south-central Zaire. The town lies along the Kasai River near its junction with the Sankuru River. Ilebo is a river port and has rail connections with Kananga and Lubumbashi. It is an important transshipment point in the transport of copper and other minerals from the Shaba region to Kinshasa and Matadi. Ilebo is also a busy commercial, industrial, and agricultural centre. The large pavilion of the Hôtel des Palmes, built for an official visit by the Belgian king Albert I in the 1920s, dominates the town. Pop. (1991 est.) 67,075.

ileitis, chronic inflammation of one or more sections of the intestine. In its strict sense, the term refers to an inflammation of the lower, or terminal, portion of the small intestine, known as the ileum. A specific and more serious type of inflammation involving both the small and large intestines is known as regional ileitis, or Crohn's disease.

In general, ileitis can affect persons of both sexes of all ages but most commonly strikes those between age 20 and 50. The symptoms are extremely variable but basically consist of a chronic or intermittent diarrhea, sometimes bloody, that is accompanied by painful abdominal cramps. Fever, weakness, weight loss, and anemia may also occur and can produce a progressive physical deterioration in patients with Crohn's disease. Obstructions or fistulas (abnormal channels) between adjacent coils of intestine may also develop. The initial acute attack of ileitis may be so sudden that it is confused with appendicitis. A patient may competely recover from an initial attack of simple ileitis, but the usual course of Crohn's disease is one of gradual progression, with periods of remission and relapse continuing for many years.

Crohn's disease results in the thickening of the intestine, the narrowing of its channel, and the ulceration of its lining. Diagnosis of the disease is established through X-ray examination of the small (and perhaps large) intestine, in which the narrowing and ulceration of the intestine is evident. Simple ileitis can be caused by intestinal infections, irritations, or obstructions; faulty intestinal absorption of food; or even emotional stress. Crohn's disease may possibly be caused by a defect in the autoimmune system. Bed rest is useful in treatment, as are a few drugs, but Crohn's disease often persists until the affected part of the intestine must be surgically removed.

Ilek Khanid DYNASTY: *see* Qarakhanid dynasty.

ileostomy, the surgical formation of an artificial anus by making an opening from the ileum through the abdominal wall. *See* ostomy.

Îles du Salut (French Guiana): *see* Salut, Îles du.

Ilesha, town, Osun state, southwestern Nigeria. It lies in the Yoruba Hills and at the intersection of roads from Ile-Ife, Oshogbo, and Akure. The town is one of the oldest settlements in Yorubaland—according to tradition, it was founded by an *owa* ("king") who was one of the 16 sons of the deity Oduduwa. Ilesha was an important military centre in the campaigns against Ibadan, 60 miles (97 km) west-southwest, in the 19th-century Yoruba civil wars, and the town has a memorial to Ogedengbe, an Ilesha warrior-leader who died in 1910.

Modern Ilesha is a major collecting point for the export of cocoa and a traditional cultural centre for the Ilesha (Ijesha) branch of the Yoruba people. Palm oil and kernels, yams, cassava, corn (maize), pumpkins, cotton, and kola nuts are collected for the local market. Local industries manufacture nails and carpets, and the town has a brewery; there are also a recording company and a publishing firm. Several prominent quartzite ridges lie east of Ilesha, and gold mining is an important activity in the area.

Ilesha is the site of several teacher-training colleges. Near the Market Square are the traditional king's palace (the Afin), the central mosque, and the principal park. Pop. (1992 est.) 342,400.

Consult the INDEX *first*

ileum, final and longest segment of the small intestine. It is specifically responsible for the absorption of vitamin B_{12} and the reabsorption of conjugated bile salts. The ileum is about 4 m (13 feet) in length and extends from the jejunum (the middle section of the small intestine) to the ileocecal valve, which empties into the colon (large intestine). The ileum is suspended from the abdominal wall by the mesentery.

The smooth muscle of the ileum's walls is thinner than the walls of other parts of the intestines, and its peristaltic contractions are slower. The ileum's lining is also less permeable than that of the upper small intestine. Small collections of lymphatic tissue (Peyer's patches) are embedded in the ileal wall, and specific receptors for bile salts and vitamin B_{12} are contained exclusively in its lining; about 90 percent of the conjugated bile salts in the intestinal contents is absorbed by the ileum.

Two percent of all humans are born with a congenital ileum malformation, called Meckel's diverticulum, which consists of a side channel of up to 5 cm (2 inches) in length extending from the intestinal wall. The malformation occurs when the duct leading from the navel to the small intestine in the fetus fails to atrophy and close. It then causes intestinal bleeding and inflammation and is usually surgically removed when discovered. Injury or disease affecting the terminal ileum produces vitamin B_{12} deficiency and extensive diarrhea, the latter resulting from the interference of bile salts on water absorption in the large intestine.

Ilex, genus of plants commonly known collectively as holly (*q.v.*).

Ilf, Ilya; and Petrov, Yevgeny, pseudonyms, respectively, of ILYA ARNOLDOVICH FAYNZILBERG and YEVGENY PETROVICH KATAYEV (respectively b. Oct. 3 [Oct. 15, New Style], 1897, Odessa, Russian Empire [now in Ukraine]—d. April 13, 1937, Moscow; b. Nov. 30 [Dec. 13], 1903, Odessa—d. July 2, 1942, Crimea), Soviet humorists, whose intimate literary collaboration at the end of the 1920s and in the '30s resulted in a number of immensely popular satirical works.

Born into a poor Jewish family, Ilf worked at various trades while a youth, becoming a journalist in Odessa at the age of 18. He went to Moscow in 1923 to begin a career as a professional writer. Petrov, the son of a teacher, began his career as a news-service correspondent, worked briefly as a criminal investigator, and went to Moscow in 1923, where he became a professional journalist. Initially, Ilf worked on the staff of *Gudok* ("The Whistle"), the central rail-workers' newspaper, while Petrov worked on the satirical journal, *Krasny perets* ("Red Pepper"). In 1926 Petrov moved to "The Whistle," and he and Ilf formed their unique literary partnership.

In 1928 they published the first fruit of their collaboration, *Dvenadtsat stulyev* (*The Twelve Chairs*), a rollicking picaresque novel of farcical adventures within a framework of telling satire on Soviet life during the New Economic Policy (NEP) period. The work was an instant success, and its rogue-hero—became overnight, and remained, one of the most popular personages in Russian fiction. Killed off at the end of *The Twelve Chairs*, Bender was resurrected in a sequel. *Zolotoy telyonok* (1931; *The Little Golden Calf*), an equally humorous but more serious and trenchant satire centring upon pretenders who claim to be the son of a dead Soviet hero.

In 1936, following a tour of the United States, Ilf and Petrov wrote *Odnoetazhnaya Amerika* ("One-Storied America"), a witty account of their automobile trip across that country. In large part an exposé of the materialistic and uncultured character of American life, the work nevertheless indicates that many aspects of capitalist society appealed to the authors. A kind of sequel to this work was the long story *Tonya* (1937), which portrays with appropriate satirical touches the life of Soviet people compelled to live in a capitalist society. In addition to these major works, from 1932 Ilf and Petrov collaborated on a number of humorous and satiric sketches for the newspaper *Pravda*.

In 1937 Ilf died of tuberculosis. Petrov continued his literary work, writing for the newspaper *Literaturnaya gazeta* ("Literary Gazette") and the magazine *Ogonyok* ("Little Light"). In 1942 he was killed on a trip from the besieged city of Sevastopol to Moscow.

Ilha do Bazaruto (Mozambique): *see* Bazaruto Island.

Ilhéus, city, southeastern Bahia *estado* ("state"), northeastern Brazil. It is situated just east of Itabuna near the mouth of the Cachoeira River on Ilhéus Bay, an inlet of

Cathedral of São Sebastião, on the Atlantic shore in Ilhéus, Braz.
Dilson Martins

the Atlantic. An old Portuguese colonial settlement that was originally named São Jorge dos Ilhéos (1532), it was given city status in 1881. Most of Brazil's cacao is grown in the locality, and Ilhéus is consequently one of the world's most important cacao ports. Cocoa butter, rubber, chemicals, piassava, and timber are also exported. The city was used as a setting by the writer Jorge Amado in his writings on Brazilian society. Ilhéus has good road and air connections with Salvador, the state capital, 130 miles (210 km) north-northeast. A hydroelectric plant northwest of Ilhéus supplies energy to the area. Pop. (2000 prelim.) city, 161,898; mun., 221,883.

Iliad, epic poem on the Trojan War traditionally attributed to the ancient Greek poet Homer (*q.v.*).

Iliamna Lake, lake, southwestern Alaska, U.S., west of Cook Inlet (Gulf of Alaska). The second largest freshwater lake entirely within the United States (after Lake Michigan), it is 80 miles (129 km) long and 25 miles (40 km) wide and covers an area of 1,000 square miles (2,600 square km). It drains southwest through the Kvichak River into Bristol Bay and the Bering Sea. It is noted for its game fish, especially rainbow trout. The active Iliamna Volcano (10,016 feet [3,053 m]) lies northeast of the lake at the head of Tuxedni Glacier. Named by Tanaina Indians, the lake was said to be inhabited by a mythical giant blackfish that would bite holes in canoes.

Iliescu, Ion (b. March 3, 1930, Oltenita, Rom.), president of Romania (1990–96) during the collapse of the Soviet Union; he was re-elected in 2000.

Iliescu joined the Communist Party in 1953 and rose through the ranks as a protégé of Nicolae Ceaucescu, who became party general secretary in 1965. In 1971, however, he fell out of favour with Ceaucescu and in 1984 was expelled from the Central Committee.

Upon the overthrow and death of Ceaucescu in 1989, Iliescu became interim president and then won the office in free elections in 1990. Under a new constitution, he was reelected in 1992. Serving in a government that included many former communists, he followed a slow path to reform and lost the 1996 elections. Four years later, however, with the country continuing to suffer from economic problems and internal dissension, he regained the presidency, running as head of the Party of Social Democracy in Romania (PDSR).

Iligan, city, northern Mindanao, Philippines. On the southeastern shore of Iligan Bay, it is the island's major industrial city and an important port at the mouth of the Iligan River. Its growth has stemmed largely from the proximity of the Agus River, with its great hydropower potential harnessed at Maria Cristina Falls. Industries include steel, calcium carbide, and ferroalloy plants. Fertilizer, cement, and plywood are also manufactured. The city has an airport. Inc. city, 1950. Pop. (2000 prelim.) mun., 285,000.

Ilinsky, Igor (Vladimirovich) (b. July 11 [July 24, New Style], 1901, Moscow, Russia—d. Jan. 13, 1987, Moscow), Russian actor of stage and screen, especially well known for his comic portrayals of rogues and buffoons.

Although Ilinsky debuted at the Novy Theatre in William Shakespeare's *The Merry Wives of Windsor,* it was not until he became associated with the experimental productions of Vsevolod Yemilyevich Meyerhold during the 1920s that Ilinsky became prominent. Among the notable roles he created under Meyerhold's direction are Izden in Émile Verhaeren's *The Dawn* (1920), Bruno in Fernand Crommelynck's *Magnificent Cuckold* (1922), and Prisypkin in Vladimir Mayakovsky's *Bedbug* (1928). He is perhaps best remembered for his creation of the role of Chlestakov in Meyerhold's world-famous revival of Nikolay Gogol's *Inspector General* (1926). Ilinsky recreated the role in 1938 at the Maly Theatre, where he acted and directed until 1985.

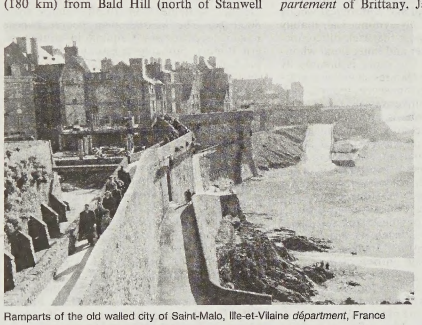
Ilinsky's film career paralleled his stage work, beginning in 1924, when he appeared as Krivcov, a private detective, in Yakov Protazanov's *Aelita.* Later works included *The Cigarette Girl of Mosselprom* (1924) and *Volga Volga* (1938).

In 1967 Ilinsky was awarded the Order of Lenin. He wrote an autobiography, *Sam O Sebe* (1961; "About Myself").

iliocostalis muscle, any of the deep muscles of the back that, as part of the erector spinae (sacrospinalis) muscle group, aid in extension (bending backward), lateral flexion (bending to the side), and rotation of the spinal column. The iliocostalis group consists of a lower part (iliocostalis lumborum) that extends from the ilium (upper part of the hipbone) to the lower ribs, a middle part (iliocostalis dorsi, or thoracis) that extends from the lower to the upper ribs, and an upper part (iliocostalis cervicis) that extends from the upper ribs to the transverse processes (side projections) of the cervical vertebrae (in the neck).

iliofemoral thrombophlebitis (medicine): *see* milk leg.

Ilium, also called ILION, or ILIOS (ancient city): *see* Troy.



Illa (Nigeria): *see* Ila.

Illahun (ancient Egyptian site): *see* Lāhūn, al-.

Illawarra, southern coastal district, New South Wales, Australia, extending 110 miles (180 km) from Bald Hill (north of Stanwell Park) south to the Shoalhaven River and Batemans Bay and from the shore west to the Illawarra Range of the Eastern Highlands, occupying an area of 2,200 square miles (5,800 square km). Its name derives from a corruption of the Aboriginal word *alowrie,* meaning "high pleasant place by the sea." Sighted in 1770 by the British navigator Captain James Cook, it was first explored in 1796 by Matthew Flinders and George Bass. In the 1820s the district supported a cedar-wood industry and now embraces the industrial city of Wollongong, the coal deposits at Bulli, rich dairylands in the south, beach resorts, and a prosperous offshore-fishing industry. Port Kembla, the chief port for the area, is a major centre of metal manufacturing, including iron and steel works. Lake Illawarra is a shallow lagoon located 50 miles (80 km) south of Sydney; the 8,500 acres (3,400 hectares) of Lake Illawarra provide good prawning grounds.

Ille-et-Vilaine, *département,* Bretagne *région,* northwestern France, created from the northeastern part of the historic province of Brittany. Bounded to the north by the English Channel and Manche *département,* it has an area of 2,616 square miles (6,775 square km). The coastline stretches eastward from an estuary 5 miles (8 km) west of Dinard to within 3 miles (5 km) of Mont-Saint-Michel; it includes part of the rocky Côte d'Émeraude, broken by the estuary of the Rance River, at the mouth of which are the towns of Dinard and Saint-Malo. In those areas in which a difference of more than 25 feet (8 m) exists between high and low tide, tidal power has been harnessed in the estuary to generate electricity. The north-flowing Rance is linked by the Ille et Rance Canal at Rennes, the departmental capital, with the Vilaine River, which flows southwestward to the Atlantic.

The climate is temperate and rainy. East of the Côte d'Émeraude, the Marais de Dol, the flat coastal strip of the bay of Mont-Saint-Michel, has been reclaimed and is used for sheep raising and market gardening. Oysters are cultivated near Cancale, on the coast. The coastal resorts have become more important than the fishing industry to the economy of the *département.* The Rennes basin, with its bocage landscape, is fertile and used for growing wheat and legumes and for raising dairy and beef cattle. Cider-apple orchards abound. Industrialization (automobiles, electronics) is relatively recent and is concentrated in and around Rennes, which is also an important centre of higher education and research. Ille-et-Vilaine is perhaps the most dynamic *département* of Brittany. Jacques Cartier, who explored Canada, was born in Saint-Malo, as was the writer Chateaubriand. The *département* is divided into four *arrondissements*—Rennes, Saint-Malo, Fougères, and Redon—and is in the educational division of Rennes. Pop. (1999) 867,818.

Ramparts of the old walled city of Saint-Malo, Ille-et-Vilaine *département,* France
Paul Almasy

Articles are alphabetized word by word, not letter by letter

illegitimacy, status of children begotten and born outside of wedlock. Many statutes either state, or are interpreted to mean, that usually a child born under a void marriage is not illegitimate if his parents clearly believed that they were legally married. Similarly, annulment of a marriage usually does not illegitimize the children.

The historical trend of legitimacy laws has been toward more humane treatment of illegitimate children. Under early Roman, Spanish, and English law, the inheritance rights of such children were curtailed. During the

Middle Ages, European countries regarded illegitimate children as virtual outlaws.

Legitimacy lawsuits usually concern either a child's inheritance or the matter of obtaining support payments from a father who refuses to acknowledge his paternity. Generally, legitimacy is presumed unless clearly contradicted. Evidence that the mother has a questionable reputation is insufficient to show lack of paternity.

The natural parents are usually given custody of their illegitimate offspring, the mother having priority. Formerly, fathers of illegitimate children had no obligation to support them, but many statutes have modified this. The mother's husband usually has no obligation to provide support, unless the marriage occurred after the birth of the child.

An illegitimate child's status may be changed by a legal action called legitimation, granting him all the rights of legitimate children—except that property or money already given to a naturally legitimate child cannot be transferred to a legitimated one who would otherwise have been entitled to part of it. In some places, legitimation automatically occurs if the parents subsequently marry, if the mother marries someone else, or if the father publicly acknowledges and supports the child. Many statutes authorize a court declaration of the legitimacy of the child. The modern trend is strongly toward legitimation.

Illiciales, order of primitive, dicotyledonous flowering plants comprising the families Illiciaceae and Schisandraceae, with three genera, of mostly tropical and subtropical woody plants. All have radially symmetrical, mainly beetle-pollinated flowers that lack differentiation between the outer and inner floral whorls (sepals and petals). The order is botanically significant in having features showing characteristics of ancient gymnosperm groups, such as wood with primitive vessels (water-conducting cells). The order is considered to have arisen from the ancestors of the magnolia order (Magnoliales) and to be related to the ancestors of the buttercup order (Ranunculales); thus, it occupies a key position in the evolution of flowering plants.

The family Illiciaceae has one genus, *Illicium*, with 42 species of shrubs and trees having evergreen, aromatic leaves and bisexual flowers, the inner petals of which grade gradually into stamens (male pollen-producing structures). The female portion of the flower consists of 7 to 15 carpels (ovule-bearing structures), usually in a single whorl. At maturity the flower produces a characteristic woody fruit composed of a ring of several joined pod-like follicles, each of which splits open along one seam to release a single seed. The star anise (*Illicium verum*), named for this characteristic fruit, is a shrub, the dried fruits of which are the source of oil of star anise, a volatile, aromatic oil used for flavouring candies, liqueurs, and perfumes.

The family Schisandraceae contains two genera: *Schisandra* with 25 species and *Kadsura* with 22 species of climbing vines with separate male and female flowers that are often found on separate plants. The fruits in this family produce one to five seeds each. A few species are occasionally cultivated as ornamentals—for example, the magnolia vine (*Schisandra chinensis*), for its fragrant white or pink flowers and attractive fruits, and *Kadsura japonica*, for its clusters of scarlet-coloured fruits.

Illinois, a confederation of small, Algonquian-speaking Indian tribes originally spread over what is now southern Wisconsin and northern Illinois and parts of Missouri and Iowa; the best-known tribes were the Cahokia, Kaskaskia, Michigamea, Peoria, and Tamaroa. The Illinois were primarily hunters; small parties took forest mammals throughout the year, and most of the village participated in communal winter bison hunts on the prairie. Corn (maize) and other vegetables cultivated by women added to their diet. Their villages consisted of dwellings covered with rush mats, in which several families were housed. Little is known of Illinois social organization, but it was probably similar to that of the Miami, with a civil chief elected from among a village council and a war chief chosen according to his ability to lead raids.

By the middle of the 17th century most of the Illinois had concentrated along the Illinois River from Starved Rock to the Mississippi, having moved there because of harassment by the Dakota, Fox, and other northern tribes. Iroquois raids greatly reduced their numbers, and the introduction of liquor by French traders further weakened the tribe. The murder of the Ottawa chief Pontiac by an Illinois provoked the vengeance of several northern Algonquian tribes, further reducing their population. The survivors took refuge with French settlers in Kaskaskia, in Illinois, while the Sauk, Fox, Kickapoo, and Potawatomi dispossessed them of most of their territory. In 1832 the remaining Illinois sold their lands, moving to Kansas and then to Oklahoma.

Illinois, constituent state of the United States of America, lying in the heart of the Midwest, bounded on the north by Wisconsin, on the east by Lake Michigan and Indiana, on the south by Kentucky, and on the west by Missouri and Iowa. The capital is Springfield.

A brief treatment of Illinois follows. For full treatment, *see* MACROPAEDIA: United States of America: *Illinois*.

Indian settlement in Illinois dates from 8000 BC. The Mississippian people, whose religious centre was Cahokia in southwestern Illinois, probably constituted the largest pre-Columbian (around AD 1300) community north of Mexico. All the Illinois tribes inhabiting the area at the time of European settlement were of Algonquian stock. The French explorers Marquette and Jolliet entered the territory in 1673. Illinois was controlled by the French until 1763, when it passed to the British. Illinois became a territory of the United States after 1783 and was made the 21st state in 1818. Some 250,000 Illinoisans fought for the Union during the American Civil War. After the war the state grew rapidly into an industrial centre. Despite the great fire of 1871, the city of Chicago grew to be one of the largest cities in the country.

Illinois consists primarily of flat prairie, although irregular plains cover some western, northern, and southern areas. Southernmost Illinois is characterized by open hills, but the hills of northwestern Illinois contain the state's highest point (1,235 feet [376 m] above sea level). The deep black soil of much of northern and central Illinois is among the finest in the world in terms of agricultural quality. The state's great length—equivalent to the distance from New England to Virginia—gives it an unusual variety of northern and southern plant life.

The climate is temperate with cold, snowy winters and hot summers. Mean winter temperatures are about 22° F (−6° C) in the north and 37° F (3° C) in the south; summer equivalents are 74° F (23° C) and 80° F (27° C). Mean annual precipitation in the north is about 34 inches (864 mm) and in the south about 46 inches (1,168 mm). Tornadoes can occur in the spring and summer.

The first white U.S. settlers of Illinois were of Anglo-Saxon origin. Settlers from Virginia, Kentucky, and Tennessee moved into southern Illinois, while New Englanders and New Yorkers moved into the northern parts by way of the Erie Canal and the Great Lakes. The great waves of European immigration that began in the 1840s and culminated after World War I left their mark on Illinois. Chicago still has numerous ethnic communities that preserve and maintain their native traditions. The migration of blacks to Illinois cities began during World War I, and by 1980 they constituted 15 percent of the total population of the state and 40 percent of Chicago's. The population of Illinois is highly urbanized—more than four-fifths—but its rate of growth has slowed considerably and has fallen well below the national average. Like other states in the North, Illinois has experienced the emigration of its people and industries to locations in the south and west.

Agriculture remains a major sector of the state's economy. Farms cover four-fifths of the land area, and most of them are family-owned. Illinois is a national leader in both soybean and corn (maize) production. Production of pork, milk and other dairy products, and beef are also important.

The state has large deposits of coal, but seams are thin and sulfur content is high. There are limited reserves of petroleum, and production, although down from the 1940 high, is still significant. Lead, zinc, limestone, and silica are also extracted. There are several nuclear power stations.

Illinois is one of the largest industrial centres of the nation. It ranks among the top states in the production of fabricated metals, food products, rubber products, and electrical-machinery manufacturing, as well as in its number of printing and publishing establishments. It is also among the top manufacturers of nonelectrical machinery, which accounts for the largest share of its foreign exports.

The state is also a major insurance centre and the home of the Chicago Board of Trade—the nation's oldest and largest commodity market—and the Chicago Mercantile Exchange.

Illinois is the focal point of many transportation networks. It has three navigable rivers, one of which connects, by canal, Lake Michigan with the Mississippi River. It ranks high among the states in railway mileage. Chicago is a major hub for Amtrak passenger service and is the freight centre of the country. Its O'Hare International Airport is one of the nation's and the world's busiest airports, and the state has an extensive network of roads.

Cultural activities are heavily concentrated in Chicago, with its many museums and theatres, its celebrated Chicago Symphony and other orchestras, its opera, and other cultural establishments. An extensive public university system brings cultural attractions to all corners of the state. Central Illinois is well known for its Lincoln landmarks and southern Illinois for the Shawnee National Forest. Western Illinois is known for its Spoon River country, immortalized by the poet Edgar Lee Masters. Architectural landmarks abound in Chicago, where Frank Lloyd Wright, Louis Sullivan, Daniel Burnham, and Ludwig Mies van der Rohe all worked. Area 56,345 square miles (145,934 square km). Pop. (2002 est.) 12,600,620.

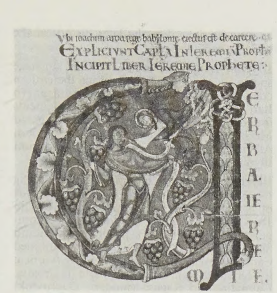
Illinois Central Railroad (IC), former U.S. railroad founded in 1851 that expanded service from Illinois to much of the Midwest before merging with the Canadian National Railway Company (CN) in 1999.

With its charter in 1851, the Illinois Central Railroad was the first of many railroads to receive a grant of land upon completion of its line. In 1856 the line from Chicago to Cairo, Ill., was opened, thereby earning the line 2.5 million acres. At Cairo passengers and freight transferred to Mississippi River steamers for further travel until a bridge across the Mississippi was opened in 1889. While it was expanding, the Illinois Central absorbed more than 100 smaller railroads, reaching Kansas City and Omaha to the west, Indianapolis and Louisville to the east, and the Gulf of Mexico to the south. In 1962 the Illinois Central had become a component of parent company IC

Industries, a holding company that eventually acquired interests in soft drink bottlers and auto parts companies, among others.

In 1971 all passenger service was assumed by Amtrak, which retained the City of New Orleans train route made famous by folksinger Steve Goodman's song of the same name. After a merger in 1972 with the Gulf, Mobile and Ohio, the newly renamed Illinois Central Gulf Railroad provided service from Chicago to the Gulf of Mexico and linked 13 states. In 1975 Illinois Central initiated piggyback (truck trailer) service as a means of competing with the trucking industry. The railroad, returning to the name Illinois Central in 1988, was eventually spun off from IC Industries and in 1990 continued operations as a public corporation, the Illinois Central Railroad Company, until its 1999 merger with CN.

Illinois River, navigable stream formed by the junction of the Des Plaines and Kankakee rivers in Grundy county, northeastern Illinois, U.S. It flows generally west across the state until it reaches Hennepin, where it turns abruptly south to join the Mississippi River at Grafton after a course of 273 miles (440 km). The Illinois drains an area of approximately 25,000 square miles (64,750 square km) and occasionally broadens into wide expanses such as Peoria Lake. The Illinois and Michigan Canal, constructed from the Chicago River to the Illinois River (1848) at a point near La Salle, made navigation between these streams possible, and when the Illinois Waterway was completed in 1933, shipping between the Great Lakes and the Gulf of Mexico via the waterway and the Mississippi River became practicable.



Cities that are situated along the river's course include Morris, Ottawa, La Salle, Peru, Peoria, Pekin, Havanna, and Beardstown. Its tributaries include the Spoon and Sangamon rivers and the Fox, Vermilion, Mackinaw, and La Moine rivers. State parks along the Illinois River include Starved Rock (near Ottawa), Fort Creve Coeur (near Peoria), and Pere Marquette (near the confluence with the Mississippi River).

illite, any of a group of mica-type clay minerals widely distributed in marine shales and related sediments. Illite contains more water and less potassium than true micas, but it has a micalike sheet structure and is poorly crystallized. It may form a chemical series with both muscovite and montmorillonite; it is a weathering product of muscovite and alters to montmorillonite under humid conditions. For chemical formula and detailed structure and physical properties, *see* clay mineral (table); mica (table).

illuminated manuscript, handwritten book that has been decorated with gold or silver, brilliant colours, or elaborate designs or miniature pictures. Though various Islāmic societies also practiced this art, Europe had the longest and probably the most highly developed tradition of illuminating manuscripts.

A brief treatment of illuminated manuscripts follows. For full treatment, *see* MACROPAEDIA: Painting, The History of Western: *Western Dark Ages and medieval Christendom.*

The term "illumination" originally denoted the embellishment of the text of handwritten books with gold or, more rarely, silver, giving the impression that the page had been literally illuminated. In medieval times, when the art was at its height, specialization within scriptoria or workshops called for differentiation between those who "historiated" (*i.e.,* illustrated texts by relevant paintings) and those who "illuminated" (*i.e.,* supplied the decorative work that embellished initial capital letters and often spilled into margins and borders and that almost invariably introduced gold in either leaf or powdered form). The two functions sometimes overlapped, particularly when drolleries

Illuminated initial "U" for "Uerba" (*i.e.,* "Verba") in the book of Jeremiah, from the Winchester Bible, English, 12th century; in the Cathedral Library, Winchester, England (MS. 17, fol. 148R)

By permission of the Dean and Chapter of Winchester, copyright The Warburg Institute, the University of London

and other irrelevancies began to populate initials and borders, and even in medieval times the distinction was often blurred. In modern times the term denotes the illustration and decoration of early manuscripts in general, whether or not with gold.

In the great era of the illuminated manuscript, the art of the illuminator often played an important role in the development of art. The portability of the manuscript made it a simple means for the transmission of ideas from one region to another, and even from one period to another. On the whole, the development of painting in manuscripts paralleled the development of monumental painting. After the development of printing in Europe in the second half of the 15th century, illumination was superseded by printed illustrations. *See also* miniature painting.

Illuminato, plural ILLUMINATI (Christian heretic): *see* Alumbrado.

illusion, false perceptual experience of actual stimuli. An illusion is not a simple error in perception; rather, it has features whose nature it is to evoke an incorrect perception. Illusions must be distinguished from hallucinations: the former, unlike the latter, result from some external perceptual stimulus.

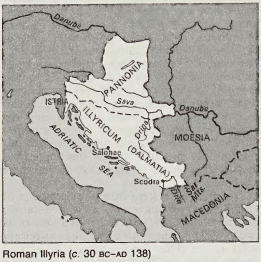
A brief treatment of illusion follows. For full treatment, *see* MACROPAEDIA: Perception, Human.

Illusions can be classified according to their sources. Some illusions are produced when the stimulus presented to the senses has been altered by some environmental condition; these are called stimulus-distortion illusions. A standard example is the stick that appears bent when part of it is immersed in water, an effect attributable to the refraction of light rays. A similar illusion is a mirage, in which, for example, a shimmering pool of water is perceived over a highway or desert heated by the sun. A familiar auditory stimulus-distortion illusion is the perception that the pitch of a siren changes as the siren moves. This is called the Doppler effect and is caused by the relative compression and expansion of the sound waves as the siren moves toward and then away from the listener.

When the mechanisms by which stimuli are received, processed, and interpreted are misled, so-called perceiver-distortion illusions can result. For example, paradoxical cold results when a spot on the skin that normally responds only to cold responds to something very warm, relaying an illusory sensation of cold. In responding to stimuli, human sense organs adapt themselves in certain ways, and this phenomenon can give rise to illusions. For example, the retina will adjust itself to a light of a given brightness, thus temporarily narrowing its range of sensitivity. If a second light of exactly the same intensity is seen immediately after the first, it will seem less bright because the eye is less sensitive.

Many illusions are generated by tricking the normal processes by which the brain interprets sense data. An illusion of this sort essentially brought about the development of the motion-picture industry. (*See* movement perception.) In a process called closure, the brain tends to perceive as whole slightly incomplete figures. For example, the brain compensates if part of the image of a figure falls on the blind spot of the retina, so that the viewer does not perceive a gap. In other cases, a drawing of a figure can include competing visual cues, causing the brain to misjudge the figure's visual properties. Such drawings include the many familiar optical illusions in which straight lines appear to be curved or shapes equal in size appear to be unequal.

Certain illusions stem from the ambiguity of visual cues. For example, in a well-known drawing that can be seen either as a vase or as two profiles facing each other, it is uncertain what is the figure and what is the ground against which the figure is set. Thus, the brain can choose, using the profiles as the ground to perceive the vase or the vase as the ground to perceive the profiles.



Some illusions involve two senses simultaneously. In the phenomenon called synesthesia, objects of one sense are experienced as objects of another. The most common instances of synesthesia involve sounds and colours, whereby a person might experience a colour when hearing a tone, or vice versa.

Illustrated London News, historic magazine of news and the arts, published in London, a forerunner in the use of various graphic arts. It was founded as a weekly in 1842 by Herbert Ingram and became a monthly in 1971. The magazine was London's first illustrated periodical, with 32 woodcuts in the 16 pages of its first issue. It was the first periodical to make extensive use of woodcuts and engravings and the first to use photographs. The *Illustrated London News* was an instant success, and when, shortly after it appeared, it won the approval of the archbishop of Canterbury, it also won the support of the churchgoing public. At first its illustrations focused mainly on English social life. Later, it broadened its scope to embrace general news and the arts and began to send its artists all over the world to record events as they occurred. In 1912 it became the first periodical using rotogravure to publish an integrated picture and text section. By the time the *Illustrated London News* became a monthly, it had gained note for its worldwide photographic coverage of cultural activities. In the early 21st century it was published twice yearly.

Illyria, northwestern part of the Balkan Peninsula, inhabited from about the 10th century BC onward by the Illyrians, an Indo-European people. At the height of their power the Illyrian frontiers extended from the Danube River southward to the Adriatic Sea and from there eastward to the Šar Mountains.

The Illyrians, bearers of the Hallstatt culture (*see* Hallstatt), were divided into tribes, each a self-governing community with a council of elders and a chosen leader. A strong tribal chieftain, however, could unite several tribes into a kingdom. The last and best-known Illyrian kingdom had its capital at Scodra (modern Shkodër, Albania). One of its most important rulers was King Agron (second half of the 3rd century BC), who, in alliance with Demetrius II of Macedonia, defeated the Aetolians (231). Agron, however, died suddenly, and during the minority of his son, his widow, Teuta, acted as regent. Queen Teuta attacked

Sicily and the Greek colonies of the coast with part of the Illyrian navy. Simultaneously, she antagonized Rome, which finally sent a large fleet to the eastern shores of the Adriatic. Although Teuta submitted in 228, the Illyrian kingdom of the interior was not destroyed,

Roman Illyria (c. 30 BC–AD 138)

Adapted from *Westermann Grosser Atlas zur Weltgeschichte*; Georg Westermann Verlag, Braunschweig

and a second naval expedition was sent against Illyria in 219. Philip V of Macedonia aided his Illyrian neighbours and thus started a protracted war that ended with the conquest of the whole Balkan Peninsula by the Romans. The last Illyrian king, Genthius, surrendered in 168 BC.

The Roman province of Illyricum stretched from the Drilon River (the Drin, in modern Albania) in the south to Istria (modern Slovenia and Croatia) in the north and to the Savus (Sava) River in the east; its administrative centre was Salonae (near present-day Split) in Dalmatia. With the extension of the Roman Empire along the Danube River valley, Illyricum was divided between the provinces of Dalmatia and Pannonia (*qq.v.*).

Under the empire Illyria enjoyed a high degree of prosperity. It was traversed by a Roman road, and Illyria's ports served as important trade and transit links between Rome and what is now eastern Europe. Copper, asphalt, and silver were mined in parts of the region, and Illyrian wine, oil, cheese, and fish were exported to Italy.

Since the semiautonomous clansmen of the Illyrian highlands were hardy warriors, it was inevitable that the emperors should recruit them to serve with the Roman legions and even the Praetorian Guard. When in the 3rd century AC the empire began to be threatened by the barbarian peoples of what are now eastern and central Europe, Illyricum became a principal military bulwark of Rome and its culture in the ancient world. Several of the most outstanding emperors of the late Roman Empire were of Illyrian origin, including Claudius II Gothicus, Aurelian, Diocletian, and Constantine the Great, most of whom were chosen by their own troops on the battlefield and later acclaimed by the Senate.

In AD 395 the empire was finally divided, and Illyria east of the Drinus River (the Drina, in modern Yugoslavia) became part of the Eastern Empire. Between the 3rd and the 5th century it was devastated by the Visigoths and the Huns, who, however, left no lasting mark on Illyria. But the Slavs, who started their incursions into the Balkan Peninsula in the 6th century, had by the end of the 7th century transformed the ethnic structure of all the Illyrian-speaking territories. Croatia, Serbia, Dalmatia, Bosnia, Montenegro, and parts of Macedonia lost their Illyrian language and were thoroughly Slavonized, so that only the Albanians remain as direct descendants of the ancient Illyrians. For the later history of the region, *see* Balkans.

Illyrian language, Indo-European language spoken in pre-Roman times along the eastern coast of the Adriatic Sea and in southeastern Italy. The language of the Illyrian fragments found in Italy is usually called Messapic, or Messapian. Some scholars believe the modern Albanian language (*q.v.*) to be descended from Illyrian. *See also* Messapic language.

Illyrian Provinces, stretch of territory along the Dalmatian coast that constituted a part of Napoleon's French Empire from 1809 to 1814. When the French victory of 1809 compelled Austria to cede a portion of its South Slav lands to France, Napoleon combined Carniola, western Carinthia, Görz (Gorica; modern Gorizia), Istria, and parts of Croatia, Dalmatia, and Ragusa (modern Dubrovnik) to form the Illyrian Provinces, which he incorporated into his empire. Napoleon's dominant interest in creating this political unit was to cut off Austria's access to Italy and the Mediterranean Sea. He also placed the capable marshal A.-F.-L. Viesse de Marmont in charge of the provinces.

Under Marmont's supervision, the provinces' government organization was revised; the Code Napoléon was introduced, and roads and schools were constructed. Local citizens were given administrative posts, and native languages were used to conduct official business. In addition, serfs were freed and given possession of the land they cultivated.

As a result of the French administration, which ended in 1814, when the French were forced to return the Illyrian Provinces to the Austrian Empire, the region not only made cultural and economic advances but also began to develop a sense of Slav unity and national awareness that matured and manifested itself in the 1830s and 1840s in the powerful literary and political Illyrian movement.

ʿilm al-ḥadīth, form of investigation established by Muslim traditionists in the 3rd century AH (9th century AD) to determine the validity of accounts (hadiths) of Muḥammad's statements, actions, and approbations as reported by various authorities.

In the first two centuries of Islām, during the period of territorial expansion, there arose a need to accommodate a great diversity of cultures in the Muslim community. The hadiths then multiplied in number and were often fabricated in order to create a normative past that could accommodate contemporary situations. Thus many early opinions on the religious law and dogma of Islām, as well as sectarian prophecies and other expectations, were cast in the form of hadiths. Once the Prophet's personal example, as recorded in hadiths, became established as the universal Muslim norm (*sunnah*), however, Muslim scholars attempted to determine forgeries or doubtful reports among the existing body of hadiths. They were bound in principle to accept any textually reliable hadith and had to restrict themselves principally to the scrutiny of isnads—*i.e.,* the chains of oral or written transmission by which the reliability of hadiths were determined (*see* isnād).

All acceptable hadiths therefore fall into three general categories: *ṣaḥīḥ* (sound), those with a reliable and uninterrupted chain of transmission and a *matn* (text) that does not contradict orthodox belief; *ḥasan* (good), those with an incomplete isnad or with transmitters of questionable authority; *daʿīf* (weak), those whose *matn* or transmitters are subject to serious criticism.

Isnads are further evaluated according to the completeness of their chains: they may be unbroken and reliable all the way back to Muḥammad (*musnad*) yet very short (*ʿālī*), implying less likelihood of error; they may lack one authority in the chain of transmitters or may be missing two or more transmitters (*muʿḍal*) or may have an obscure authority, referred to simply as "a man" (*mubham*).

The transmitters themselves, once established in the historical record as reliable men, determine further categories; the same tradition may have been handed down concurrently through several different isnads (*mutawātir*), indicating a long and sound history, or a hadith may have been quoted by three different trustworthy authorities (*mashhūr*) or by only one (*āḥād*).

Many scholars produced collections of hadiths, the earliest compilation being the great *Musnad* of Aḥmad ibn Ḥanbal, arranged by isnad. But only six collections, known as *al-kutub as-sittah* ("the six books"), arranged by *matn*—those of al-Bukhārī (d. 870), Muslim ibn al-Ḥajjāj (d. 875), Abū Dāʾūd (d. 888), at-Tirmidhī (d. 892), Ibn Mājāh (d. 886), and an-Nasāʾī (d. 915)—came to be recognized as canonical in orthodox Islām, though the books of al-Bukhārī and Muslim enjoy a prestige that virtually eclipses the other four.

Ilmen, Lake, lake in Novgorod *oblast* (province), northwestern Russia. Lake Ilmen occupies the centre of the Ilmen Plain, an undulating glacial lowland much of which is drained by rivers flowing into the lake; the lake in turn provides the headwaters of the Volkhov River. The lake occupies a shallow basin almost filled by riverine deposits, and its area varies vastly according to river flow—between 283 and 807 square miles (733 and 2,090 square km). The lake is navigable in summer months and has an average depth of 33 feet (10 m). Among the nearly 50 rivers that flow into Lake Ilmen, the largest are the Msta, Pola, Lovat, Psizha, and Shelon. The Volkhov flows out of the lake.

ilmenite, iron-black, heavy, metallic oxide mineral, composed of iron and titanium oxide ($FeTiO_3$), that is used as the major source of titanium. It forms solid-solution series with geikielite and pyrophanite in which magnesium and manganese, respectively, replace iron in the crystal structure. These three minerals are found disseminated or in veins in gabbro, diorite, or anorthosite, as in Quebec, New York, and Norway. Ilmenite also forms large masses, as in Iron Mountain, Wyo., and in the Ilmen Mountains, Russia, from which it derives its name. Smaller quantities are present in copper-ore veins, pegmatites, black beach sands, and placer deposits. For detailed physical properties, *see* oxide mineral (table).

ILO: *see* International Labour Organisation.

Ilobasco, town, north-central El Salvador. It is in a rich agricultural area (cattle, coffee, sugarcane, and indigo) but is known primarily for its clay dolls, a major item for sale to tourists, as well as for other types of pottery made from local clays. Since the completion in 1954 of a dam and hydroelectric complex on the Lempa River and the creation nearby of a lake recreation area, Ilobasco's tourist trade has grown. The town's population was swollen by refugees fleeing battles between government troops and leftist guerrillas in the early 1980s. Pop. (1987 est.) mun., 67,214.

Ilobu, town, Osun state, southwestern Nigeria. It lies along a tributary of the Oshun River and on the road from Ogbomosho to Oshogbo. Ilobu is a trade centre for the yams, corn (maize), cassava, oil palms, pumpkins, beans, and okra grown in a savanna area mainly inhabited by the Yoruba people. It also serves as a collecting point for locally produced cash crops (cotton, tobacco, and cocoa). Cotton weaving is a traditional local industry; but the town of Oshogbo, 8 miles (13 km) southeast, is the area's most important textile centre. Pop. (1991 est.) 175,600.

Ilocano, also spelled ILOKANO, or ILOKAN, also called ILOKO, or ILOCO, third largest cul-

tural-linguistic group in the Philippines. When discovered by the Spanish in the 16th century, they occupied the narrow coastal plain of northwestern Luzon, known as the Ilocos region. The growth of their population later led to much migration to neighbouring provinces, as well as to Mindanao and Hawaii. Their language is closely related to others of northern Luzon, all of which belong to the Austronesian (Malayo-Polynesian) family of languages. The Ilocano (Iloko) language in the mid-1970s was spoken by about 4,686,000 persons.

The major Ilocano provinces, Ilocos Norte, Ilocos Sur, and La Union, are among the most densely populated areas in the Philippines. Rice is the staple crop, grown on small fields and irrigated by rainfall during the rainy season. Vegetables and pigs, goats, and chickens are also raised. Tobacco is an important cash crop. Many Ilocano supplement their incomes by wage work or handicrafts.

The wealthier families generally reside in the cities and towns. Marriages are usually arranged so as to maintain class lines, the husband's family providing the *sabong*, or dowry of land. Most of the people are Roman Catholic.

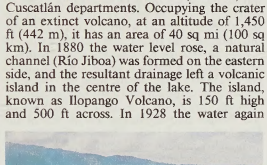
Ilocos Norte, province occupying the northwestern corner of Luzon, Philippines. It is 1,312 sq mi (3,399 sq km) in area. The province comprises a narrow coastal agricultural plain and the Ilocos (Malaya) Range paralleling the shore, which is bordered by the South China Sea (west) and the Luzon Strait (north). The province borders Ilocos Sur (south). The region is noted for its tobacco production. Rice and corn (maize) are other leading crops, and fishing and forestry are important. Laoag, the provincial capital, is the largest city in northern Luzon. Batac (a major trading centre), San Nicolas, Bacarra, Pasuquin, and Dingras are other population centres. There are two national parks in the province—Northern Luzon Heroes Hill and Paoay Lake. Ilocano is the dominant language and ethnic group. The mountainous regions are occupied by Tinggians and Apayos. Pop. (2000 prelim.) 514,000.

Ilocos Sur, province lying along the northwestern coast of Luzon, Philippines. With an area of 996 sq mi (2,580 sq km), it is bordered by the South China Sea (west) and the province of Ilocos Norte (northeast). The province does not have highly productive soil, and its low rate of population growth is due to steady migration, principally to the southern islands. Tobacco, rice, and corn (maize) are the main crops. Vigan, the provincial capital, and the towns of Candon, Narvacan, and Cabugao are on the coastal lowland. Bessang Pass National Park and the historic Tirad Pass, where the Filipinos made their last defense against the Americans in 1898, are also located in the province. The Ilocanos are the major ethnic group, and the Kankanay the largest minority. Pop. (2000 prelim.) 584,000.

Iloilo, province, eastern portion of the island of Panay, Philippines. It includes offshore islands in the Visayan Sea (east) and Guimaras Island in Guimaras Strait. The province has an area of 2,056 sq mi (5,324 sq km) and is mountainous in the west and hilly in the northeast, where the Bulabog-Putian National Park lies between Dingle and San Enrique. Its irregular coastline has productive fisheries based on the port of Estancia in the north. Drained by the Jalaud River, the central and coastal regions, constituting the Iloilo Basin, are level and fertile, and many areas annually harvest two rice crops. Other products include sugarcane, coconuts, bananas, and corn (maize). Forest products and textile manufacturing are also important.

Cabatuan and Janiuay (on the main north–south highway), Pototan and Santa Barbara (freight depots on the Iloilo Railroad), and Barotac Nuevo are important trading and rice-milling centres. Other population centres in addition to Iloilo City, a chartered city and the provincial capital, include Miagao, Lambunao, Dumangas, and Calinog. Pop. (2000 prelim.) 1,541,000.

Iloilo City, chartered city, capital of Iloilo province, on the southeastern coast of Panay, Philippines. At the mouth of the Jaro River on the Iloilo Strait and sheltered by the offshore Guimaras Island, it is the commercial centre of Panay and a regional centre for sugar exports.



Pre-Spanish settlement was extensive, but the seaport remained small until 1855, when it was opened to foreign trade. The huge sugar exports of the nearby island of Negros were an additional spur to its growth, and for a time Iloilo City rivalled Cebu City as the main port of the Visayan Islands. Although freight traffic dropped with the construction of artificial ports on Negros, passenger traffic has remained high. Thousands of migrant labourers annually journey through Iloilo City, which is linked by rail with Roxas, on the northern coast, to Negros' sugar plantations. Iloilo City is also a major fishing port, and it has a large airport.

The city has a compact urban core and several plaza and market centres. It did not include a large rural area upon chartering and is thus more urbanized than most Philippine cities. Buildings constructed after a fire in 1899 show marked Spanish influence. Iloilo City is known for its old churches and for *jusi* (raw silk) and *piña* (pineapple fibre) fabrics. It is the seat of Central Philippine University (1905), the University of San Agustín (1904), and West Visayas State College (1924). Inc. city, 1936. Pop. (2000 prelim.) 366,000.

Ilokano, also spelled ILOKAN, also called ILOKO (people): *see* Ilocano.

Ilongo (people): *see* Hiligayon.

Ilopango, Lake, Spanish LAGO DE ILOPANGO, lake, south central El Salvador, on the borders of San Salvador, La Paz, and Cuscatlán departments. Occupying the crater of an extinct volcano, at an altitude of 1,450 ft (442 m), it has an area of 40 sq mi (100 sq km). In 1880 the water level rose, a natural channel (Río Jiboa) was formed on the eastern side, and the resultant drainage left a volcanic island in the centre of the lake. The island, known as Ilopango Volcano, is 150 ft high and 500 ft across. In 1928 the water again

Lake Ilopango and Ilopango Volcano, El Salvador
Walter Aguiar—EB Inc.

rose, destroying houses along the shoreline. The lake has since become a popular tourist resort, with activity centred on the towns of Asino and Ilopango on the western shore.

Ilorin, city, traditional emirate, and capital of Kwara State, western Nigeria, on the Awun River, a minor tributary of the Niger. Founded in the late 18th century by Yoruba people, it became the capital of a kingdom that was a vassal state of the Oyo Empire. Oyo's commander at Ilorin, Kakanfo (Field Marshal) Afonja, led a rebellion in 1817 that destroyed the unity of the empire. He was aided by Mallam Alimi (a Fulani from Sokoto), by Fulani warriors and slaves, and by Hausa slaves. Afonja was increasingly dominated by the Muslim Fulani, and, upon his assassination, Alimi's son, Abd as-Salam (Abdul Salami), became emir of Ilorin and pledged

Packing kola nuts at Ilorin, Nigeria
© Armand Delever—Madeline Grimoldi

allegiance (*c.* 1829) to the Sokoto caliphate. As a Muslim emirate, Ilorin subjugated several towns in Yorubaland and destroyed Oyo Ile (Old Oyo, or Katunga), 40 mi (64 km) northwest, the Oyo capital, in 1837. Abd as-Salam conducted a *jihād* ("holy war") toward the sea and was only stopped by the Ibadan victory over his cavalrymen at Oshogbo in 1840.

Throughout the 19th century, Ilorin served as a major trade centre between the Hausa of the north and the Yoruba of the south. It strongly resisted British rule, and not until 1897, when the army of the Royal Niger Company arrived after conquering Bida (106 mi east-northeast), did Ilorin recognize British supremacy. In 1900 Ilorin emirate was the only part of Yorubaland to be included in the Northern Nigeria Protectorate. Ilorin's administrative association with the north continued until the creation of Kwara State in 1967.

Modern Ilorin is mainly inhabited by Muslim Yoruba people, although its traditional ruler is a Yoruba-speaking Fulani emir. It is the headquarters of the Ilorin Local Government Council. Surrounding the historic central district with its traditional single-story red-mud houses with thatched straw roofs and numerous mosques, all protected by a mud wall, the modern city is an industrial, commercial, and educational centre. It is a major market for locally raised crops (yams, cassava, corn [maize], sorghum, millet, rice, peppers, peanuts [groundnuts], shea nuts, kola nuts, cotton) and cattle, hides, and poultry. Local handicrafts include pottery making, wood carving, leather working, cloth weaving, and mat and basket weaving. The growing industrial sector now includes sugar refining, food processing, soft-drink bottling, match and soap manufacturing, and iron-working. There are several banks and insurance companies that serve the city and state.

The city is the site of the University College of Ilorin and Kwara State College of Technology, which also contains the headquarters of the Nigerian Library Association. The Federal Agricultural and Rural Management Institute, which operates a research farm, is located in the city. Teacher-training colleges and a vocational trade school also serve Ilorin. Health services include a number of government, private, and religious hospitals and a nursing home for the elderly.

Ilorin is served by the railway and highway from Lagos (160 mi south-southwest), via Ibadan, which intersect in the city, and it has

an international airport. Pop. (1991 est.) city, 420,000.

Ilos, in Greek mythology, the founder of Ilion (Troy). Ilos (or Zacynthus, a Cretan name) has been identified either as the brother of Erichthonius or as the son of Tros and grandson of Erichthonius. According to legend, the King of Phrygia gave Ilos a spotted cow as a wrestling prize, with the advice that he found a city wherever the cow first lay down. The animal chose the hill of Ate, where Ilos marked out the boundaries of Ilion. After praying for a sign from Zeus, Ilos was sent the Palladium, a statue of Pallas Athena, for which he built a temple. Ilos' son Laomedon succeeded him as ruler of the city, and his grandson Priam was the last king of Ilion.

iltizām, in the Ottoman Empire, taxation system carried out by farming of public revenue. The state auctioned taxation rights to the highest bidder (*mültazim,* plural *mültezim* or *mültazims*), who then collected the state taxes and made payments in fixed installments, keeping a part of the tax revenue for his own use. The *iltizām* system included the farming of land taxes, the farming of urban taxes, the production of certain goods (such as wine, salt, or senna), and the provision of certain services. It began during the reign of Sultan Mehmed II (1444–46, 1451–81) and was officially abolished in 1856. Various forms of *iltizām,* however, continued until the end of the empire in the early 20th century, when the system was replaced by methods of taxation that were supervised by public officials.

Iltutmish, also called SHAMS-UD-DĪN ILTUTMISH, Iltutmish also spelled ALTAMSH (d. April 29, 1236), third and greatest Delhi sultan of the so-called Slave dynasty.

Iltutmish was sold into slavery but married the daughter of his master Quṭb-ud-Dīn Aybak (*q.v.*), whom he succeeded in 1211. He strengthened and expanded the Muslim empire in northern India and moved the capital to Delhi, where he built the great victory tower, the Quṭb Mīnār.

A wise and patient statesman who had been trained as a trusted administrator under his predecessors Muḥammad of Ghūr and Quṭb-ud-Dīn, Iltutmish was faced upon his accession not only with the deterioration of Muslim rule but also with the claim of Tāj-ud-Dīn Yildiz, the Ghazna ruler, to succession to all of Muḥammad's conquests and with the attempts by the Hindus to recover portions of their lost territory. In 1215 he captured Yildiz, who died in prison. In 1225 he forced the unruly Bengali governor to acknowledge the authority of Delhi, and shortly thereafter he consolidated again the Muslim holdings. Iltutmish was able to preserve his kingdom against the ravages of the Mongol invasions that coincided with his reign, and he succeeded in building an administrative machinery for the empire. He sought out 11th-century Islāmic classics on the art of government; and the *Ādāb-ul-Muluk,* the first Indo-Muslim classic on the art of government and warfare, was written for him.

He was tolerant of the Hindus despite the urgings of his advisers and built up the waterworks, mosques, and amenities at Delhi to make it for the first time a fitting seat of government. His reign and his advisers, especially the Wazīr Junaydī, were praised by contemporaries.

Iltutmish's eldest son had died before him, and his other sons were incompetent. He gave an excellent education to his daughter Raziyya (Raziyyat-ud-Dīn) and desired that she should succeed him. His wishes were offensive to the administrative Council of Forty, Iltutmish's personal slaves who had served as his advisers. Raziyya did succeed briefly to the throne, but her appointment of an African to an important position was considered insulting to the council, which shortly brought about her downfall. This marked the beginning of the decline of the line of Iltutmish.

Ilulíssat (Greenland): *see* Jakobshavn.

Ilumquh (Arabic: "God Is Power"), also called WADD, 'AMM, and SIN, Arabian god of pre-Islāmic times who was associated with the Moon and was greater than the two other principal astral deities of South Arabia, the goddess Shams and the god 'Athtar, who were associated with the Sun and the planet Venus, respectively. Ilumquh, protector of cities and the patron god of South Arabia's capital cities, is linked to various temples and is called father in reference to 'Athtar Venus and to each of the peoples of South Arabia. Ilumquh had many names and epithets, sometimes more than one in a single district. He was, for example, called Wadd ("Love") in Ma'in, 'Amm ("Uncle") in Qatabān, and Sin (a name also used in Babylonia) in Ḥaḍramawt.

Although knowledge of Ilumquh's cult is incomplete, it is known that there were pilgrimages to his temples, where ablutions and offerings were made and certain rules of abstinence and purity were followed. Divine guidance from the three gods was sought and later acknowledged in writing, and undertakings were determined by the response of the oracles. Sometimes documents were deposited in the temples for safekeeping.

Ilya OF MUROM, Russian ILYA MUROMETS, a hero of the oldest known Old Russian *byliny,* traditional heroic folk chants. He is presented as the principal *bogatyr* (knight-errant) at the 10th-century court of Saint Vladimir I of Kiev, although with characteristic epic vagueness he often participates in historical events of the 12th century.

Unlike the aristocratic heroes of most epics, Ilya was of peasant origin. He was a decidedly unpromising child who could not walk and who lived the life of a stay-at-home, sitting on top of the stove until he was more than 30 years old, when he discovered the use of his legs through the miraculous advice of some pilgrims. He was then given a splendid magic horse that became his inseparable companion, and he left his parents' home for Vladimir's court. There he became the head of Vladimir's retainers and performed astonishing feats of strength. He killed the monster Nightingale the Robber and drove the Tatars out of the kingdom.

Though generous and devoted, Ilya was always independent and showed little of the deference of vassal to lord. Once when Vladimir gave a party without inviting him, Ilya knocked down all the church steeples in Kiev in a fit of anger. When Vladimir sent for him, however, his anger was immediately mollified. Because of his simple heart, rough honesty, and obstinate strength, Ilya has remained a durable symbol to the eastern Slavs. His legend was the basis of the *Symphony No. 3* (1909–11; *Ilya Muromets*) by Reinhold Glière.

Ilyushin, Sergey Vladimirovich (b. March 30 [March 18, Old Style], 1894, Dilyalevo, Vologda province, Russia—d. Feb. 9, 1977, Moscow), Soviet aircraft designer who created the famous Il-2 Stormovik armoured attack aircraft used by the Soviet air force during World War II. After the war he designed civil aircraft: the Il-12 twin-engined passenger aircraft (1946), the Il-18 Moskva four-engined turboprop transport (1957), the Il-62 turbojet passenger carrier (1962), and the Il-86 airbus, which made its first flight in 1976.

Ilyushin was mobilized in the Russian army in 1914. He transferred to the army air arm and received a pilot's certificate in 1917. He later joined the Red Army, and in 1922 he entered the Zhukovsky Air Force Engineering Academy, Moscow, graduating in 1926. He then served as chief of design at various military and civilian aviation institutes. On April 21, 1938, while commuting by plane, he was forced to make a solo emergency landing, suffering injuries that left his forehead permanently scarred. He eventually became a lieutenant general in the Soviet Red Army engineering technical service and a professor at his old academy. He was awarded three Hero of Soviet Labour medals as well as the Order of Lenin.

Ilyushin Il-2, also called STORMOVIK, single-seat assault bomber that was a mainstay of the Soviet air force during World War II. The Il-2 is generally considered the finest ground-attack aircraft produced by any nation during World War II. It was designed by Sergey Ilyushin beginning in 1938 and went into production in 1940. The Il-2 was a single-engine, low-wing monoplane 38 feet (11.6 m) long and 48 feet (14.6 m) in wingspan. The early version was armed with two 23-millimetre cannons and two 7.6-millimetre machine guns mounted in the wings. The aircraft could also carry about 1,000 pounds (450 kg) of bombs or a lesser quantity of rockets. Later versions mounted two 37-millimetre cannons, and a two-seat version had provision for a tail gunner. The entire forward part of the aircraft was constructed of a single armour-plated shell that afforded maximum protection to the pilot. The Il-2's cannons and other weapons made it particularly effective at destroying tanks, and its use against the German panzer divisions in 1941–43 helped turn the tide of battle in the Soviets' favour. Stalin said of the Il-2 that it was "as necessary to the Red Army as air or bread." Approximately 36,000 Stormoviks were produced during the war, more than any other aircraft in history.

Ilyushin Il-76, also called IL-76, Soviet military transport aircraft, first flown in 1971 and first produced in 1975. It was designed by the Ilyushin design bureau under G.V. Novozhilov. The Il-76 was a heavy transport plane, capable of handling a payload of more than 88,000 pounds (40,000 kilograms). It was equipped with two cranes that traveled on overhead tracks, and its rear ramp doubled as a hoist. Unlike most military transports, the Il-76 was armed, with two guns in a rear turret. Its four turbofan engines produced 26,455 pounds of thrust each. Its maximum speed in level flight was 528 miles per hour (850 km per hour), and its ceiling was 50,850 feet (15,500 m). From 30 to 90 passengers could be accommodated.

Imabari, city, Ehime *ken* (prefecture), Shikoku, Japan, facing the Kurushima Strait on the Inland Sea. Imabari, founded as a castle town, was the first port in Shikoku to be opened to foreign trade. In 1922 the Taka-

Towel factory, Imabari, Japan
FPG

matsu–Matsuyama Line (railway) was opened through the city.

The cotton textile industry was introduced to Imabari in the early 18th century, and the city now contains about 150 factories producing much of Japan's cotton cloth. The port handles a brisk trade with cities on Honshu and Kyushu; there are ferry services to neighbouring islands. Pop. (1988 est.) 123,314.

'Imād ad-Dawlah, also called 'ALĪ IBN BŪYEH (b. 892—d. 949), one of the founders of the Būyid dynasty of Iran. 'Alī and his brothers Aḥmad and Ḥasan were followers of Mardāvīz ebn Zeyār of northern Iran. In 934 'Alī revolted against local Zeyārid rulers and conquered Fārs province in southern Iran. He made Shīrāz his capital, ruling there until his death. After Aḥmad established control over the 'Abbāsid caliphate in Baghdad in 946, 'Alī assumed the dynastic title 'Imād ad-Dawlah.

'Imād ad-Dīn Ismā'īl ibn 'Umar ibn Kathīr: *see* Ibn Kathīr.

'Imād ad-Dīn Zangī ibn Aq Sonqur (Iraqi ruler): *see* Zangī.

imaginary number, any product of the form ai, in which a is a real number and i is the imaginary unit defined as $\sqrt{-1}$. *See* number system.

imaging, diagnostic, also called MEDICAL IMAGING: *see* diagnostic imaging.

Imaginism, Russian poetic movement of the post-Revolutionary period that advocated poetry based on a series of arresting and unusual images. It is sometimes called Imagism but is unrelated to the 20th-century Anglo-American movement of that name. The Imaginist movement was founded in 1919 by its leading poet, Sergey Yesenin (*q.v.*), who rivaled the leading Futurist poet, Vladimir Mayakovsky, in popularity. Like the Futurists, the Imaginists read poetry in cafés during a time of social upheaval when few books were published, but, unlike the Futurists, they were unable to adapt to the demands of Soviet life. Instead they expressed their alienation in acts of irresponsible bohemianism. The Imaginists dissolved at the time of Yesenin's suicide in 1925, and their techniques had little lasting effect on Soviet poetry, although Yesenin himself remained a popular poet and cultural hero.

Imagist, any of a group of American and English poets whose poetic program was formulated about 1912 by Ezra Pound—in conjunction with fellow poets Hilda Doolittle (H.D.), Richard Aldington, and F.S. Flint—and was inspired by the critical views of T.E. Hulme, in revolt against the careless thinking and Romantic optimism he saw prevailing.

The Imagists wrote succinct verse of dry clarity and hard outline in which an exact visual image made a total poetic statement. Imagism was a successor to the French Symbolist movement, but, whereas Symbolism had an affinity with music, Imagism sought analogy with sculpture. In 1914 Pound turned to Vorticism, and Amy Lowell largely took over leadership of the group. Among others who wrote Imagist poetry were John Gould Fletcher and Harriet Monroe; and Conrad Aiken, Marianne Moore, Wallace Stevens, D.H. Lawrence, and T.S. Eliot were influenced by it in their own poetry.

The four Imagist anthologies (*Des Imagistes,* 1914; *Some Imagists,* 1915, 1916, 1917), and the magazines *Poetry* (from 1912) and *The Egoist* (from 1914), in the United States and England, respectively, published the work of a dozen Imagist poets.

BIBLIOGRAPHY. Studies are found in Glenn Hughes, *Imagism & the Imagist* (1931, reprinted 1972); and John T. Gage, *In the Arresting Eye: The Rhetoric of Imagism* (1981).

Imalayan, Fatima-Zohra: *see* Djebar, Assia.

imam, Arabic IMĀM ("leader," "pattern"), the head of the Muslim community; the title is used in the Qur'ān several times to refer to leaders and to Abraham. The origin and basis of the office of imam was conceived differently by various sections of the Muslim community, this difference providing part of the political and religious basis for the split into Sunnite and Shī'ite Islām. Among Sunnites, imam was synonymous with caliph (*khalīfah*), designating the successor of Muḥammad, who assumed his administrative and political, but not religious, functions. He was appointed by men and, although liable to error, was to be obeyed even though he personally sinned, provided he maintained the ordinances of Islām.

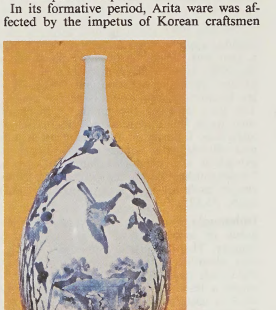
Political disagreement over succession to his office after the death (661) of 'Alī, the fourth caliph and Muḥammad's son-in-law, propelled the Shī'ite imam along a separate course of development, as partisans of 'Alī attempted to preserve leadership of the entire Muslim community among the descendants of 'Alī. In Shī'ite Islām, the imam became a figure of absolute spiritual authority and fundamental importance. 'Alī and the successive imams, who are believed by Shī'ism to be the sole possessors of secret insights into the Qur'ān given them by Muḥammad, under Neoplatonic influences of the 9th–10th centuries AD became viewed as men illumined by the Primeval Light, God, and as divinely appointed and preserved from sin. They alone, and not the general consensus of the community (*ijmā'*) essential to Sunnite Islām, determined matters of doctrinal importance and interpreted revelation. With the historical disappearance (*ghaybah*) of the last imam—there has been no consistency in the number legitimized: among the major sects, Sab'īyah Ismā'īlīs acknowledge 7 imams and Ithnā 'Asharī (Twelvers) 12—there arose a belief in the hidden imam, who is identified with the *mahdī.*

Imam has also been used as an honorary title, applied to such figures as the caliph 'Alī ibn Abī Ṭālib and the theologians Abū Ḥanīfah, ash-Shāfi'ī, Mālik ibn Anas, Aḥmad ibn Ḥanbal, al-Ghazālī, and Muḥammad 'Abduh. The title imam also is sometimes given to the specially trained Muslims who lead prayers in the mosques.

Imam Bondjol, also called MUHAMMAD SAHAB, PETO SJARIF, MALIM BASA, TUANKU (Master) MUDA, TUANKU IMAM, or TUANKA IMAM BONDJOL (b. 1772, Kampung Tandjung Bunga, Sumatra [now in Indonesia]—d. Nov. 6, 1864, Manado, Celebes), Minangkabau religious leader, key member of the Padri faction in the religious Padri War, which divided the Minangkabau people of Sumatra in the 19th century.

When in about 1803 three pilgrims inspired by the ideas of the puritan Wahhābī sect returned from Mecca and launched a campaign to reform and purify Islām as practiced by the Minangkabau, Imam Bondjol, then known as Tuanku Muda, was an early and enthusiastic convert. In his home valley of Alahanpandjang, he established the fortified community of Bondjol, from which he took his name, as a centre for waging a "holy war" to spread the Padri doctrines. Civil war followed, with Imam Bondjol providing political and military leadership for the Padri community. Two issues were at stake: the internal struggle between extremist religious reformers and traditional secular leaders and an attempt by Minangkabau leaders to wrest their trade from foreign control.

In 1821 Dutch forces intervened, responding to a request for aid from the secular leaders but also seeking to cut off Minangkabau trade with the British at Benkulen (Bengkulu in modern Sumatra) and on Penang Island. The Java War (1825–30), however, diverted Dutch energies, and Imam Bondjol's forces expanded the area under their control. Their military success continued until 1831, when Dutch reinforcements turned the tide. In the following years the Dutch steadily cut into the Padri-controlled area and in 1837 captured Bondjol itself. Iman Bondjol escaped, but in October of that year he surrendered and was sent into exile. The fall of the Padris marked not only the end of the war but also the end of Minangkabau independence and the addition of their territory to the Dutch colonial holdings.



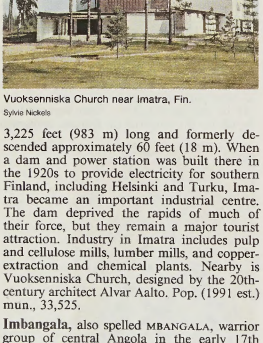
Imāmīs (Islām): *see* Ithnā 'Asharīyah.

Imari, city, Saga *ken* (prefecture), Kyushu, Japan, facing Imari Bay. The two islands of Taka and Fuku form a natural mole, protecting the city's harbour. Imari was once a base for Japanese pirates. By the Tokugawa era (1603–1867) it had become the trade and shipping centre for the fine porcelain manufactured at Arita, 6 miles (10 km) south. Porcelain has since been produced at Okawachiyama, the southern part of Imari. The city also contains lumber, marine products, and petrochemical industries. Pop. (1985) 62,044.

Imari ware, also called ARITA WARE, Japanese porcelain made at the Arita kilns in Hizen province. Among the Arita porcelains are white glazed wares, pale gray-blue or gray-green glazed wares known as celadons, black wares, and blue-and-white wares with underglaze painting, as well as overglaze enamels. Following the late 16th-century expansion of glazed ceramic production, porcelain-like wares were introduced. Manufacture is said to date from 1616, when porcelain clays were discovered in Arita by Korean craftsmen under the master potter Ri Sampei (Yi Sam-p'yong). An advanced type of continuous step-chamber kiln, necessary for porcelain production, made it possible to achieve an efficient method of mass production.

Porcelain manufacturing soon became a major industry in the region, fostered by the protection and strict monopoly policies of the Saga fief. The wares were shipped throughout the country and widely exported from the port of Imari by the Dutch East India Company to other parts of the world. Sometime before 1800, porcelain production had finally spread to other parts of Japan.

In its formative period, Arita ware was affected by the impetus of Korean craftsmen



Imari blue-and-white ware sake bottle, Edo period (1603–1867); in the Museum of Fine Arts, Boston

By courtesy of the Museum of Fine Arts, Boston, Hoyt Collection

and by the popularity of Chinese wares; but by the mid-17th century, native Japanese designs began to predominate, especially in the development of such overglaze enameled wares as Nabeshima, Kakiemon, and Old Imari.

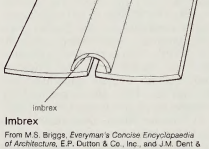
Nabeshima ware first appeared in the late 17th century. It is characterized by pictorial decoration deriving from fabrics, the use of subjects favoured by the Kanō and Tosa schools of painting, and the employment of fashionable Edo-period decorative motifs. It is poised and highly refined, though sometimes rather lacking in vigour. Kakiemon, dating from the mid-17th century, was the first enameled ware to appear. Its designs are derived from the intimate, classical, purely Japanese style of painting known as Yamato-e. Old Imari, appearing in the 1640s, is perhaps the most striking for the sumptuousness of its ornamental colours and designs. Pictorial decoration generally covers the vessel completely. Purely decorative patterns deriving from fabric designs also appear, sometimes in combination with pictorial motifs.

Imatra, town, Kymi *lääni* (province), southeastern Finland, on the Vuoksi River (Russian Vuoksa), near the Russian border, northeast of Lappeenranta. Imatra was formed in 1948 from parts of the communes of Ruokolahti, Joutsmo, and Jääski. The Imatra Rapids are

Vuoksenniska Church near Imatra, Fin.
Sylvie Nickels

3,225 feet (983 m) long and formerly descended approximately 60 feet (18 m). When a dam and power station was built there in the 1920s to provide electricity for southern Finland, including Helsinki and Turku, Imatra became an important industrial centre. The dam deprived the rapids of much of their force, but they remain a major tourist attraction. Industry in Imatra includes pulp and cellulose mills, lumber mills, and copper-extraction and chemical plants. Nearby is Vuoksenniska Church, designed by the 20th-century architect Alvar Aalto. Pop. (1991 est.) mun., 33,525.

Imbangala, also spelled MBANGALA, warrior group of central Angola in the early 17th century. The Imbangala, sometimes mistakenly identified with the Jaga, probably left the Lunda state of Shaba in the 15th century under a leader entitled *kinguri.* From their base in eastern Angola, they contacted the Portuguese on the coast in about 1563 and by the second decade of the 17th century had become allied to them in the slave trade. About 1618 the Imbangala established the kingdom of Kasanje between the Kwango and Kwanza rivers and became key intermediaries in the trade between the city of Luanda and the Lunda. Later an opponent of Portuguese penetration of the interior, Kasanje was finally overthrown militarily (1911–13).



Imbe ware (Japanese pottery): *see* Bizen ware.

Imber, Naphtali Herz (b. 1856, Galicia—d. 1909, U.S.), itinerant Hebrew poet whose poem "Ha-Tiqva" ("The Hope"), set to music, was the official Zionist-movement anthem from 1933 and Israel's unofficial national anthem from 1948.

A collection of his poems, *Barkai* (1886; *Morning Star*), includes "Ha-Tiqva" and another popular Zionist song, "Mishmar ha-Yarden" ("The Watch on the Jordan").

Imbize, Jan van (Flemish Calvinist leader): *see* Hembyze, Jan van.

imbrex, plural IMBRICES, in ancient Greek and Roman architecture, a raised roofing tile used to cover the joint between the flat tiles. Used in a series, they formed continuous ridges over the aligned flat tiles.

Imbrex

From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture,* E.P. Dutton & Co., Inc., and J.M. Dent & Sons Ltd.

Imbrices were generally of two types. In the more commonly used form, the tile was approximately semicircular; and in the monumental marble examples, the imbrex had vertical sides and an angular top. At the lower end of each row of imbrex tiles was an antefix, or decorative terminal.

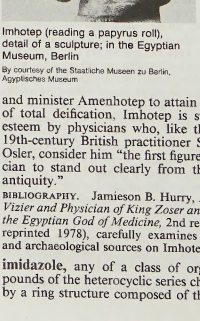
Imhoff, Gustaaf Willem, baron van (b. Aug. 8, 1705, Leer, Neth.—d. Nov. 1, 1750, Batavia, Dutch East Indies [now Jakarta, Indonesia]), governor-general of the Dutch East Indies (1743–50), a reformer who tried in vain to restore the decaying Dutch East India Company to prosperity.

Son of a Dutch nobleman, van Imhoff went to the Indies in 1725 as a servant of the company. By 1732 he was a member of the chiefly advisory Council of the Indies and in 1736 became governor of Ceylon. Because of his opposition to the ruthless repression of a Chinese uprising, he was sent back (1740) to Holland, where the company's directors took his part, however, and made him governor-general of the Indies.



Van Imhoff's plan for reform was set forth in his tract "Considerations on the Present State of the Dutch East India Company." To encourage the development of the company as a territorial power, he wanted to confine its activities to the eastern part of the archipelago and to settle Dutchmen in colonies to raise crops and to trade. He eased the restrictions on free trade with Asia but not enough to make it profitable.

In his dealings with Indonesians van Imhoff was tactless. He intervened in a quarrel between the ruler of the Mataram kingdom of Java and his brother, thus touching off the Third Javanese War of Succession (1749–57), which left Mataram split into two kingdoms. In Bantam, another kingdom of Java, van Imhoff lent his support to the unpopular faction of a dynastic dispute, bringing on a popular uprising. The rebels were seeking English help when van Imhoff died, leaving his successor to solve the problem.

Imhotep, Greek IMOUTHES (fl. 27th century BC, Memphis, Egypt), vizier, sage, architect, astrologer, and chief minister to Djoser (reigned 2630–2611 BC), the second king of Egypt's third dynasty, who was later worshiped as the god of medicine in Egypt and in Greece, where he was identified with the Greek god of medicine Asclepius. Considered the designer of the first temple of Edfu, on the upper Nile, he is credited with initiating the Old Kingdom (*c.* 2575–*c.* 2130 BC) as the architect of the step pyramid built at the necropolis of Ṣaqqārah in the city of Memphis. The oldest extant monument of hewn stone known to the world, the pyramid consists of six steps and attains a height of 200 feet (61 m).

Although no contemporary account has been found that refers to Imhotep as a practicing physician, ancient documents illustrating Egyptian society and medicine during the Old Kingdom show that the chief magician of the pharaoh's court also frequently served as the nation's chief physician. Imhotep's reputation as the reigning genius of the time, his position in the court, his training as a scribe, and his becoming known as a medical demigod only 100 years after his death are strong indications that he must have been a physician of considerable skill.

Not until the Persian conquest of Egypt in 525 BC was Imhotep elevated to the position of a full deity, replacing Nefertum in the great triad of Memphis, shared with his mythological parents Ptah, the creator of the universe, and Sekhmet, the goddess of war and pestilence. Imhotep's cult reached its zenith during Greco-Roman times, when his temples in Memphis and on the island of Philae (Arabic: Jazirat Filah) in the Nile were often crowded with sufferers who prayed and slept there with the conviction that the god would reveal remedies to them in their dreams. The only Egyptian mortal besides the 18th-dynasty sage

Imhotep (reading a papyrus roll), detail of a sculpture; in the Egyptian Museum, Berlin

By courtesy of the Staatliche Museen zu Berlin, Ägyptisches Museum

and minister Amenhotep to attain the honour of total deification. Imhotep is still held in esteem by physicians who, like the eminent 19th-century British practitioner Sir William Osler, consider him "the first figure of a physician to stand out clearly from the mists of antiquity."

BIBLIOGRAPHY. Jamieson B. Hurry, *Imhotep, the Vizier and Physician of King Zoser and Afterwards the Egyptian God of Medicine,* 2nd rev. ed. (1928, reprinted 1978), carefully examines the literary and archaeological sources on Imhotep.

imidazole, any of a class of organic compounds of the heterocyclic series characterized by a ring structure composed of three carbon

atoms and two nitrogen atoms at nonadjacent positions. The simplest member of the imidazole family is imidazole itself, a compound with molecular formula $C_3H_4N_2$.

Imidazole was first prepared in 1858. Other imidazole compounds have been known longer: allantom (discovered in 1800) and parabanic acid were prepared in 1837 from uric acid. The amino acid histidine and its decomposition product histamine have the imidazole structure, as does biotin, a growth factor for both humans and yeast.

iminoglycinuria, inborn impairment of the transport system of the kidney tubules, which normally reabsorb the amino acids glycine, proline, and hydroxyproline. In young children in whom this transport system fails to develop, high urinary levels of glycine, proline, and hydroxyproline have sometimes been observed in conjunction with convulsions, high cerebrospinal fluid protein, and mental retardation. Other hereditary disorders affecting the transport of specific amino acids include the tryptophan malabsorption syndrome (or "blue diaper syndrome"), and the methionine malabsorption syndrome (or "oasthouse urine disease"). They are characterized by poor absorption of the amino acids tryptophan and methionine, respectively, from the small intestine. For other hereditary disorders of amino acid transport, *see also* cystinuria; Hartnup disease; de Toni-Fanconi syndrome.

imipramine, synthetic drug introduced into medicine in the 1960s, and considered among the most effective antidepressant drugs known. Imipramine was the first antidepressant drug of its kind (called tricyclic antidepressants because the molecular structure is based upon a system of three rings). It was studied as an antischizophrenic tranquillizer before its use to treat mental depression. It is usually administered orally but may be given by intramuscular injection.

Imipramine and closely related tricyclic antidepressant drugs are called dibenzazepines or dibenzazepine derivatives. Other dibenzazepines and derivatives in use are amitriptyline, desmethylimipramine (desipramine), nortriptyline, and protriptyline.

imitation, in psychology, the reproduction or performance of an act the stimulus for which is the perception of a similar act of another animal or person. Essentially, it involves a model to which the attention and response of the imitator are directed. As a descriptive term it covers a wide range of social adaptation. Observers of mammals in their native habitat report the duplication of the activities of the older by the younger members of the species, or of the young of each other in play.

Among human beings imitation has been used to describe a wide range of behaviours. It includes such everyday experiences as yawning when others yawn, as well as a whole host of unconsciously and passively learned reproductions of social conduct, and the deliberate adoption of the ideas and habits of others.

Studies of infants show that in the second half of the first year they imitate the expressive movements of those about them—for example, raising of the arms, smiling, and attempts at speech. In the second year they begin imitating other people's reactions to objects. As the child grows up, all kinds of models are set before him, most of them determined by his culture—physical posture, language, basic skills, prejudices and pleasures, and moral ideals and taboos. His copying these is determined chiefly by the manner in which his drives are socially and culturally directed and controlled in terms of reward and punishment.

The facts of imitation are well established. Uniformity or similarity of thoughts and acts among people does not necessarily mean, however, that these are caused by the same or similar psychological motives or mechanisms. Variations in situations, in drives, and in learned ways of adaptation are often too complicated to be easily explained as imitation.

Many earlier psychologists took it for granted that imitation was caused by an instinct or at least by an inherited predisposition. Later writers have viewed the mechanisms of imitation as those of social learning. It is usual, however, to distinguish between imitation caused by simple conditioned reflex, that caused by common trial-and-error learning, and that involving the higher thought processes. *See also* learning.

Imitation of Christ, Latin IMITATIO CHRISTI, a Christian devotional book written between 1390 and 1440. Although its authorship is a matter of controversy, the book is linked to the name of Thomas à Kempis. Whatever the identity of the author, he was a representative of the *devotio moderna* (*q.v.*) and its two offshoots, the Brethren of the Common Life and the Congregation of Windsheim.

The *Imitation of Christ* in part I gives "exhortations useful for spiritual living," in part II admonishes man to be concerned with the spiritual side of life rather than with the materialistic, and in part III affirms the comfort that results from being centred in Christ. Finally, in part IV it shows how an individual's faith has to be strengthened through the Eucharist, or Holy Communion.

The simplicity of the book's language and the direct appeal to the religious sensitivity of the individual in an uncomplicated way are perhaps the primary reasons why this little book has been so widely received and so deeply influential.

Imittós, Óros (Greece): see Hymettus, Mount.

Immaculate Conception, Roman Catholic dogma asserting that Mary, the mother of Jesus, was preserved free from the effects of the sin of Adam (usually referred to as "original sin") from the first instant of her conception. Although various texts in both the Old and the New Testaments have been cited in defense of the doctrine, it seems to have arisen from a general acceptance in the early church of Mary's holiness. Especially after Mary had been solemnly declared to be the mother of God at the Council of Ephesus in 431, most theologians doubted that one who had been so close to God could have actually experienced sinful acts.

The view that Mary had been spared also from the disposition to evil inherent in original sin was not clearly articulated until the 12th century, when considerable debate was centred on an English celebration of Mary's conception. The discussion was clouded by medieval views of the biological aspects of conception and by a concern that the belief in the universal redemption effected by Jesus should not be threatened. The latter concern (particularly associated with St. Thomas Aquinas in the 13th century) was countered not long after by the Franciscan theologian John Duns Scotus, who argued that Christ's redemptive grace was applied to Mary to prevent sin from reaching her soul and that this special intervention resulted in a more perfect redemption in her case. Mary's privilege, thus, was the result of God's grace and not of any intrinsic merit on her part. A gradual acceptance of the Franciscan's views over the next several centuries was reflected in the teaching of various popes (especially Sixtus IV in the late 15th century) and the councils of Basel (1439) and Trent (1546). It was not, however, until Dec. 8, 1854, that Pius IX, urged by the majority of Catholic bishops throughout the world, solemnly declared in the bull *Ineffabilis Deus* that the doctrine was revealed by God and hence was to be firmly believed as such by all Catholics. The feast of the Immaculate Conception is celebrated on December 8.

Immanuel (personal name): *see under* Emmanuel, or Manuel, except as below.

Immanuel Ben Solomon, also called MANOELLO GIUDEO (b. *c.* 1260—d. *c.* 1328), Hebrew poet who lived mainly in Rome, considered the founder of secular poetic writing in Hebrew. Probably a wandering teacher by profession, he was a prolific writer of Hebrew verse, sacred and secular (some of the latter being highly erotic), which he collected within a rough narrative framework in *Maḥbarot Immanuel* ("The Compositions of Immanuel"), frequently published from 1491. The last section of this work consists of a vision of heaven and hell in the style of Dante, composed immediately after the latter's death in 1321. As Manoello Giudeo (Immanuel the Jew), he was known also as a writer of Italian poetry, including an interchange of sonnets with Bosone da Gubbio on Dante's death. Immanuel also wrote philosophical commentaries on certain books of the Bible and introduced the sonnet form, thereafter very popular, into Hebrew.

immediate constituent analysis, also called IC ANALYSIS, in linguistics, a system of grammatical analysis that divides sentences into successive layers, or constituents, until, in the final layer, each constituent consists of only a word or meaningful part of a word. (A constituent is any word or construction that enters into some larger construction.) In the sentence "The old man ran away," the first division into immediate constituents would be between "the old man" and "ran away." The immediate constituents of "the old man" are "the" and "old man." At the next level "old man" is divided into "old" and "man." The term was introduced by the United States linguist Leonard Bloomfield in 1933, though the underlying principle is common both to the traditional practice of parsing and to many modern systems of grammatical analysis.

Immermann, Karl Leberecht (b. April 24, 1796, Magdeburg, Saxony—d. Aug. 25, 1840, Düsseldorf, Prussia), dramatist and novelist whose works included two forerunners in German literary history: *Die Epigonen* as a novel of the contemporary social scene and *Der Oberhof* as a realistic story of village life.

The son of a civil servant, Immermann interrupted his legal studies in Halle (1813–17) to fight in the last phase of the Napoleonic Wars. While working in the military court in Münster (1819–24), he fell in love with Elisa von Lützow, the wife of the Prussian general Adolf, Freiherr von Lützow. Their passionate love affair ended 14 years after the Lützow

Immermann, engraving by Franz Stüber, after a painting by Karl Friedrich Lessing

By courtesy of the Staatsbibliothek, Berlin

divorce (1825) because Elisa unwaveringly refused to enter upon a second marriage. At the beginning of 1824, Immermann became judge in the criminal court at Magdeburg, moving to the provincial court at Düsseldorf three years

later. In Düsseldorf he designed and built a "model" theatre where, in accordance with Goethe's theories, he especially cultivated ensemble. In 1839 Immermann was married to the 20-year-old Marianne Niemeyer, and the new life and new happiness that his marriage gave him found expression in his epic *Tristan und Isolde,* which was left unfinished at his death.

Immermann's writing is deeply marked by the transitional nature of his time. He was an eyewitness of the decline of the old aristocracy, the rise of the bourgeoisie, and the spread of industrialism and liberalism. His dramatic works include *Das Trauerspiel in Tyrol* (1828; remodeled in 1835 as *Andreas Hofer*); *Merlin* (1832); the trilogy *Alexis* (1832); and the comic epic *Tulifäntchen* (1830), a witty parody of the decline of the nobility and of romantic chivalry. Immermann's novels, however, with their acute diagnosis of the period, are more important than his plays. *Die Epigonen* (1836) gives a cross section of the society of his own period, deploring both the nobility's decay and the dangers posed by radicalism and moneyworship. The convoluted tale is a pessimistic picture of society on the brink of a painful adjustment to industrialized mass society. The novel *Münchhausen* (1838–39) consists of two parts: a highly satirical and ludicrous portrayal of an idle and mendacious aristocrat, and a solidly visualized portrayal of peasants rooted in their work and in their countryside. In this latter section Immermann glorifies the sturdy respectability of the peasantry, in whom he saw the strength of the German national heritage and the means for its regeneration.

immersed tube, also called SUNKEN TUBE, technique of underwater tunneling used principally for underwater crossings. The method was pioneered by the American engineer W.J. Wilgus in the Detroit River in 1903 for the Michigan Central Railroad. Wilgus dredged a trench in the riverbed, floated segments of steel tube into position, and sank them; the segments were locked together by divers and pumped out and could then be covered with excavated material. Though the technique has been refined since, it remains basically the same and has been used for many underwater tunnels all over the world.

immersion foot, also called TRENCH FOOT, a painful disorder of the foot involving damage to the skin, nerves, and muscle that is caused by prolonged exposure to cold dampness or by prolonged immersion in cold water. *See* frostbite.

Immigration Restriction Act (1901), in Australian history, fundamental legislation of the new Commonwealth of Australia that effectively stopped all non-European immigration into the country and that contributed to the development of a racially insulated white society. Representing a widespread sentiment in all of the Australian colonies, the desire for a coordinated immigration bar against nonwhites was a primary spur in the 1890s toward Australian federation. Thus, the act was among the first pieces of commonwealth legislation enacted. It was directed primarily against Asians, who, because of Europeans' experience with influxes of Chinese labourers, were thought to be unassimilable and a threat to the European standard of living. The act practically excluded Africans as well. The essential clause of the act, rather than naming particular races or groups for exclusion, provided for a dictation test in a European language to be administered to prospective immigrants; an East Indian with a knowledge of English could be given a test in French, German, or, if need be, Lithuanian.

While still in effect, the Immigration Restriction Act has undergone considerable revision since World War II, and between 1947 and 1981 the number of persons in Australia of non-European descent more than doubled. In the late 20th century about 40 percent of all new immigrants to Australia were Asians.

immortality, in philosophy and religion, the continuity of human spiritual existence after the death of the body. The concept of immortality is to be distinguished from that of bodily resurrection.

The earlier anthropologists, such as Sir E.B. Tylor and Sir James Frazer, assembled convincing evidence that the belief in a future life was widespread in the regions of primitive culture. Among most peoples the belief has continued through the centuries. But the nature of future existence has been conceived in very different ways. As Tylor showed, in the earliest known times there was little, often no, ethical relation between conduct on earth and the life beyond. M. Jastrow wrote of "the almost complete absence of all ethical considerations in connection with the dead" in ancient Babylonia and Assyria.

In some regions and early religious traditions it came to be declared that warriors who died in battle went to a place of happiness. Later, there was a general development of the ethical idea that the afterlife would be one of rewards and punishments for conduct on earth. So in ancient Egypt at death the individual was represented as coming before judges as to that conduct. The Persian followers of Zoroaster accepted the notion of Chinvat, a bridge to be crossed after death, broad for the righteous, narrow for the wicked, who fell from it into hell. In India the steps upward—or downward—in the series of future incarnated lives have been (and still are) regarded as consequences of conduct and attitudes in the present life. The idea of future rewards and punishments dominated many Christians in the European Middle Ages and is held today by many Christians of all denominations. In contrast, many secular thinkers maintain that the morally good is to be sought for itself, and evil shunned on its own account, irrespective of any belief in a future life.

That the belief in immortality has been widespread through history is no proof of its truth. It may be a superstition that arose from dreams or other natural experiences. Thus, the question of its validity has been raised philosophically from the earliest times that people began to engage in intelligent reflection. In the Hindu *Katha Upanisad,* Naciketas says: "This doubt there is about a man departed—some say: He is; some: He does not exist. Of this would I know." The *Upanisads,* the basis of most philosophy in India, are predominantly a discussion of the nature of man and his ultimate destiny. Immortality was also one of the chief problems of Plato's thought. With the contention that reality, as such, is fundamentally spiritual, he tried to prove immortality, maintaining that nothing could destroy the soul. Aristotle conceived of reason as eternal but did not defend personal immortality, as he thought the soul could not exist disembodied. The Epicureans, from a materialistic standpoint, held that there is no consciousness after death, and thus it is not to be feared. The Stoics mostly considered that it is the rational universe as a whole that persists. Individual men, as the Roman emperor Marcus Aurelius wrote, simply have their allotted periods in the drama of existence. However, the Roman orator Cicero finally accepted personal immortality. The Christian St. Augustine, following Neoplatonism, regarded human beings' souls as being in essence eternal.

The Muslim philosopher Avicenna declared the soul immortal, but his coreligionist Averroës, keeping closer to Aristotle, accepted the eternity only of universal reason. Albertus Magnus defended immortality on the ground that the soul, in itself a cause, is an independent reality. Johannes Scotus Erigena contended that personal immortality cannot be proved or disproved by reason. Benedict de Spinoza, taking God as ultimate reality, as a whole maintained his eternity, but not the immortality of individual persons within him. The German philosopher Gottfried Wilhelm Leibniz contended that reality is constituted of spiritual monads. Human beings, as finite monads, not capable of origination by composition, are created by God. He could also annihilate them. However, in that he has planted in men a striving for spiritual perfection, there may be faith that he will ensure their continued existence, thus giving them the possibility to achieve it.

The German metaphysician Immanuel Kant, admitting that the soul cannot cease by disintegration, suggested that it might end by the loss of its own power. Immortality cannot be demonstrated by pure reason, but it may be believed as a postulate of morality. Holiness, "the perfect accordance of the will with the moral law," demands endless progress "only possible on the supposition of an endless duration of the existence and personality of the same rational being (which is called the immortality of the soul)." Joseph Butler, insisting that probability is the guide to life, urged, on ethical grounds similar to those of Kant, that immortality should be accepted as probable. G.W.F. Hegel's philosophy has been interpreted by some as pointing to a cessation of finite individualities in the absolute, and by others as pointing to their persistence as constituents of the absolute. Arthur Schopenhauer conceived ultimate redemption from the misery of life as a lapse from conscious personality into the unconscious universal will.

During the 20th century, the concept of immortality waned as a philosophical preoccupation.

immovable (legal concept): *see* movable and immovable.

immunity, in biology, ability of an organism to resist attack by antigens (invasive foreign bodies). The concept also encompasses the body's response to any foreign macromolecule that invades or is introduced into its tissues.

A brief treatment of immunity follows. For full treatment, *see* MACROPAEDIA: Immunity.

Each animal and plant has a natural immunity, peculiar to a species or wider group, that is dependent upon the chemistry of its tissues. Natural immunity is based on physical barriers, such as skin and mucous membranes, and biological processes. Body secretions, such as those of sebaceous and sweat glands, urine, stomach acid, bile salts, and bile acids, all contain proteins that inhibit or destroy invading microorganisms. Lysozyme, for example, is an antibacterial agent found in tears.

If these nonspecific natural barriers are penetrated, a sequence of responses by cells and tissues of the immune system produce recognizable changes to body tissues. Granulocytes, or polymorphonuclear leukocytes, immediately flood the area of infection, phagocytizing (consuming by engulfing and destroying) the invading microbes. Macrophages, which are found in an intermediate stage called monocytes in the circulation, also move to the region and also begin to phagocytize the microbes. The result is inflammation, redness, swelling, and pus (collection of fluid, dead cells, and microorganisms). This immune response, while local, may develop into a systemic response, in which there is a general increase in white blood cells and often fever. Natural immunity does not confer lasting resistance, or immunity, to the body.

If a natural immune response is insufficient to stem further invasion by microbes, a second level of immune response (called acquired, or adaptive, immunity) is initiated by the interaction of sensitized macrophages and lympho-

cytes. The purpose of acquired immunity is to stimulate the formation of antibodies, conferring short- or long-term immunity to further infection. Antibodies, among other things, increase the degree of phagocytosis taking place, neutralize microbial toxins and viruses, and form complexes with activated complement to cause the lysis (disintegration or dissolution) of invading microbes. Such immunity can be long-lasting (as with measles) or short-lived (as with influenza).

Among the principal components of the immune system are lymphocytes, which are white blood cells produced in the bone marrow and circulated in the blood to the lymphoid tissues and organs, mainly the lymph nodes, spleen, and tonsils. They give the body its capacity to respond to a virtually limitless range of antigens. One type is the B lymphocyte, or B cell. When stimulated by an appropriate antigen, a B cell rapidly reproduces, forming a group (clone) of identical cells that all generate a particular antibody (also called immunoglobulin) designed to neutralize the triggering antigen. The antibody is circulated in the humours, or body fluids, giving the type of protection called humoral immunity. T cells, which are processed in the thymus before proceeding to the lymphoid tissue, do not produce antibodies. Instead, they attack the antigens directly, providing what is called cell-mediated immunity. Specialized T cells also regulate the action of B cells. Other white blood cells, called macrophages, act nonspecifically, enhancing the ability of antigens to stimulate the lymphocytes and engulfing and eliminating the antigens themselves. In addition, a system of proteins called complement, present in the blood, works in combination with antibodies to destroy antigens.

T cells also recognize and destroy foreign tissue grafts, unless they have been carefully matched with those of the recipient. It is also possible that they monitor the appearance of cancer cells and eliminate them.

Immunity may be either passive or active. Passive immunity is a temporary phenomenon because the immune system is not stimulated and antibodies are present only briefly. Passive immunity may be conferred, for example, by a mother to her fetus through the placental wall or to an infant with the mother's first milk (colostrum). Active immunity substantially stimulates the immune system through the production of antibodies and lymphocytes. Active immunity is conferred through immunization or after being exposed to, and infected with, a disease-causing pathogen.

The body's immunological machinery does not usually attack its own constituents. If the normal constraints on the body attacking its own tissues fail, the result will be an autoimmune disease such as rheumatoid arthritis. Other types of failure make the body unduly prone to infection; acquired immune deficiency syndrome (AIDS) has become the leading immune-system disease of this type.

See also antibody; antigen; immunization.

immunity, in law, exemption or freedom from liability. In England and the United States a legislator is immune from civil liability for statements made during legislative debate. He is also immune from criminal arrest, although he is subject to legal action for crime. French law and practice prohibits the arrest of a member of the legislature during a session without authorization by his chamber. This practice prevails in many European and other nations (*e.g.,* Belgium, Switzerland, Italy, Spain, and Japan).

Under international treaty, a diplomatic representative is exempt from local jurisdiction, both civil and criminal. This immunity extends to his places of office and residence.

A public prosecutor may grant immunity from prosecution to a witness who is suspected of criminal activity in return for his aid in testifying against other suspected criminals. In U.S. law, there are two types of criminal immunity—transactional immunity and use immunity. Transactional immunity, when granted, means that the recipient may not be prosecuted for any aspect of the criminal act in which he was involved. Use immunity means only that the testimony of the immunized person, given in return for immunization, may not be used against that person or coconspirators in a criminal act unknown to the prosecutor prior to the granting of immunity.

immunization, process of acquiring or inducing resistance to infection in a human, animal, or plant. The fundamental purpose of immunization is to initiate the production of antibodies. (An antibody is a protein molecule that recognizes and binds to specific receptors on the surface of an invasive antigen, a foreign complex macromolecule able to recognize and bind with an antibody specific for its surface receptor sites.) The antibody-antigen interaction takes place in the blood, in the extracellular fluid, at mucosal surfaces, or in viruses, before initial intracellular penetration or before the virus moves from the entry site to the target tissue. This interaction causes either the modulation or the destruction of the antigen. Immunization may also initiate the mobilization of lymphocytes and macrophages in a process called cellular immune response (or immunity).

Immunization may be either passive or active. In passive immunization a susceptible individual is given a vaccine that contains preformed sensitized serum collected from previously infected or immunized individuals or animals. Passive immunity imparts immediate protection during the period required for antibodies to be formed after active immunization. Natural passive immunization is acquired by human fetuses from their mothers through the placenta and confers immunity to many common infections for a period of several months. The mother's first milk (colostrum) also contains antibodies and thus serves the same function for the newborn.

Active immunization (also called vaccination) induces specific immunity to a particular antigen. Naturally acquired active immunization results from infection by a disease. An individual who recovers from the first attack of the disease may henceforth be immune to it because of the natural development of antibodies that specifically recognize and neutralize the disease-causing microorganism. Artificially induced active immunization, or vaccination, consists in introducing antigenically active but weakened microorganisms or their metabolic by-products (toxins) into the body that will trigger antibody production but will not make the individual seriously ill. The British physician Edward Jenner clearly established the principle of vaccination in 1796, although vaccination was used before that time. He made use of a rare case in which immunity against one virus (cowpox) does protect that individual against another viral disease (smallpox). This was the first documented case of a vaccine employed against specific diseases.

Vaccines used in active immunization are of two types. The first uses structural components of the antigen to induce antibody formation and prevent infection. Such a vaccine contains either living, attenuated (weakened) microorganisms or killed microorganisms. Vaccines containing live, attenuated microbes are generally better at fighting infection. The second vaccine type uses detoxified toxins from the antigen to induce the formation of antitoxins; it prevents illness without actually inhibiting the antigen. Active immunization, to be effective, should be performed before exposure to the antigen to permit the incubation period required to produce antibodies. Active immunization is long-lasting and may be reactivated quickly by a later recurrence of the same infection or by revaccination. *See also* antibody; antigen; vaccine.

immunoglobulin: *see* antibody.

immunology, the scientific study of the body's resistance to invasion by other organisms (*i.e.,* immunity). In a medical sense, immunology deals with the body's system of defense against disease-causing microorganisms and with disorders in that system's functioning. The artificial induction of immunity against disease has been known in the West at least since Edward Jenner used cowpox injections to protect people from smallpox in 1796. But the scientific basis for immunology was not established until a century later, when it was recognized that: (1) proliferating microorganisms in the body cause many infectious diseases and (2) the body has certain chemical and cellular components that recognize and destroy foreign substances (antigens) within the body. This new understanding led to highly successful techniques of immunization (*q.v.*) that could mobilize and stimulate the body's natural defenses against infectious disease.

It was only in the 20th century, however, that a comprehensive understanding was gained of the formation, mobilization, action, and interaction of antibodies and antigen-reactive lymphocytes, which are the two main active elements of the immune system. Modern immunology, besides using such basic techniques as vaccination, has become increasingly selective and sophisticated in its manipulation of the body's immune system through drugs and other agents in efforts to achieve a desired therapeutic goal. Immunologic understanding is crucial to the treatment of allergies, which are themselves hypersensitive reactions by the body's immune system to the presence of harmless antigens such as pollen grains. Immunosuppressive techniques use drugs to suppress the immune system's tendency to reject and attack antigenic bone grafts and organ transplants that have been medically introduced into the host tissue. Immunology also encompasses the increasingly important study of autoimmune diseases, in which the body's immune system attacks some constituent of its own tissues as if it were a foreign body. The study of immune deficiencies has become an area of intensive research since the appearance of AIDS (acquired immune deficiency syndrome), a disease that destroys the body's immune system and for which there is currently no cure.

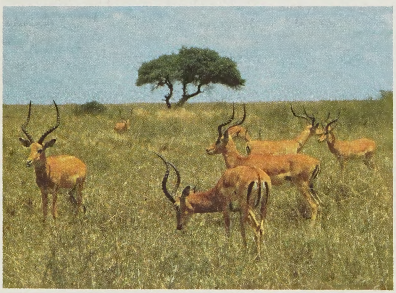
Imo, state, southern Nigeria. Imo is bordered by the states of Anambra to the north, Abia (until 1991 part of Imo state) to the east, and Rivers to the south and west. The British first entered the territory in 1901, when they established a military post in the region. Imo consists of coastal lowlands to the east of the Niger River. Most of the state's original tropical rain forest vegetation has been replaced by more open areas of oil-palm bush. Imo state is mainly inhabited by the Igbo (Ibo) people and is one of the most densely populated areas in Nigeria. The population is mostly engaged in agriculture; yams, taro, corn (maize), rice, and cassava are the staple crops, and oil palm is the main cash crop. Imo is also one of the chief onshore petroleum-producing areas in the country; other mineral resources include coal and natural gas.

Owerri, the state capital, is an industrial and educational centre that manufactures beverages, galvanized sheet-iron, leather products, and soap. The state capital is also the seat of the Federal University of Technology, Owerri (founded 1980). The main highway network serves Owerri and Okigwi. Pop. (1991) 2,485,499.

IMO: *see* International Maritime Organization.

Imola, town and episcopal see, Bologna *provincia,* Emilia-Romagna *regione,* northern Italy. Imola lies along the Santerno River, southeast of Bologna. Its Forum Cornelii was a station on the Roman road Via Aemilia. The town was devastated in the 6th century by the Byzantine emperor Justinian I but was rebuilt and fortified by the Lombards. An independent commune from 1084, it was ruled by a succession of lords from the 13th century until it was taken by Cesare Borgia in 1499 and incorporated with the Papal States.

Imola's notable landmarks include the medieval citadel; the 15th-century Sersanti, Calderini, and Della Volpe palaces; the Church of San Domenico with a Gothic portal of 1430; and the Romanesque-style Cathedral of San Cassiano (rebuilt 18th century). It has a notable museum and a library with a fine collection of incunabula and manuscripts. Lying on the main railway from Bologna to Bari, Imola is an industrial centre and produces pottery, glassware, agricultural machinery, and natural gas. Fruit, especially strawberries, is cultivated in the environs. Pop. (1991 prelim.) mun., 61,700.



imou pine: *see* rimu.

Imouthes (Egyptian vizier): *see* Imhotep.

impact (physics): *see* collision.

impala (*Aepyceros melampus*), swift-running antelope, family Bovidae (order Artiodactyla), that is found in large herds, usually near water, on the savannas and open woodlands of central and southern Africa.

Impalas are noted for their grace and their ability to jump; when alarmed, they bound off in leaps up to 9 m (30 feet) in length and 3 m high. A lightly built animal, the impala stands

Herd of male impalas (*Aepyceros melampus*) in Nairobi National Park, Kenya
James P. Rowan

75–100 cm (29.5–39 inches) at the shoulder. It has a golden to reddish brown coat, white underparts, a vertical black stripe on each thigh, and a black tuft behind each hind hoof. The male has long, lyre-shaped horns.

impasto, paint that is applied to a canvas or panel in quantities that make it stand out from the surface. Impasto was used frequently to mimic the broken-textured quality of highlights—*i.e.,* the surfaces of objects that are struck by an intense light. Impasto came into its own in the 17th century, when such Baroque painters as Rembrandt, Frans Hals, and Diego Velázquez used skillfully and minutely worked impastos to depict lined and wrinkled skin or the sparkle of elaborately crafted armour, jewelry, and rich fabrics. The 19th-century painter Vincent van Gogh made notable use of impastos, building up and defining the forms in his paintings

Detail of "Sunflowers," oil painting by Vincent van Gogh, 1888, in which the artist used the impasto technique; in the Neue Pinakothek, Munich
SCALA/Art Resource, N.Y.

with thick, nervous dabs of paint. Twentieth-century painters such as Jackson Pollock and Willem de Kooning often applied impastos with a dynamism and a gestural bravura that emphasized the physical qualities of the paint itself. Since then, raw pigments applied thickly to a canvas have become a staple technique of modern abstract and semifigurative painting.

Impatiens, large genus of herbaceous plants, belonging to the balsam family (Balsaminaceae), that are widely distributed in Asia, Africa, and North America. Some are regarded as weeds but others are popular garden plants. The name, meaning "impatient," refers to the readiness with which the plants' seeds are dispersed. The ripe seedpod bursts upon slight pressure, thus scattering the seeds.

Impatiens' simple leaves are usually alternate, the upper ones often being whorled (*i.e.,* three or more arising in a circle from the stem). The flowers, which may be purple, yellow, pink, red, or white, are irregular in shape and arise from the leaf axils; they may be solitary or in small clusters.

Impatiens balsamina, the garden balsam, is native to the tropics of Asia but has long been cultivated in temperate regions of the world. In its many horticultural forms it is one of the showiest of garden flowers and is relatively easy to cultivate. *I. biflora, I. nolitangere,* and *I. pallida,* all known variously as touch-me-not, snapweed, and jewelweed, are common weeds native to extensive regions of eastern North America.

Impatiens balsamina, an annual that grows about 75 cm (30 inches) in height, has flowers of almost every colour except blue. *I. biflora,* which grows 60–90 cm tall, is an annual with orange, brown-spotted flowers. *I. capensis,* which grows 120–150 cm tall, is an annual

Impatiens capensis
S. Rannels—Grant Heilman Photography

with orange, red-spotted flowers. *I. pallida* closely resembles *I. capensis* but has larger, yellower flowers.

impeachment, in common law, a criminal proceeding instituted against a public official by a legislative body. In Great Britain the House of Commons serves as prosecutor and the House of Lords as judge in an impeachment proceeding. In the federal government of the United States the House of Representatives institutes the impeachment proceedings, and the Senate acts as judge. In Great Britain conviction on an impeachment has resulted in fine and imprisonment, and even in execution, whereas in the United States the penalties extend no further than removal and disqualification from office.

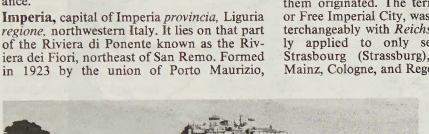
In England impeachment originated in the 14th century, when it became a means of initiating criminal proceedings based on "clamour," or outcry. The Good Parliament of 1376 produced the first recognized cases of impeachment, the most important being that of William, 4th Baron Latimer, who had been closely associated with the government of Edward III. Subsequent subjects of impeachment have often been political figures, usually royal ministers. Latimer's case also marks the point at which impeachment became not merely a means of initiating criminal proceedings but also a method of trial.

After the mid-15th century, impeachment fell out of use until the 17th century, when it was revived as a means by which Parliament could get rid of unpopular ministers, usually court favourites protected by the king. From 1621 until 1679, many of the chief officers of the crown were brought down or at least jeopardized by this powerful parliamentary weapon, among them the Duke of Buckingham (1626), the Earl of Strafford (1640), Archbishop William Laud (1642), the Earl of Clarendon (1667), and Thomas Osborne, Earl of Danby (1678). In the last case it was decided that the king's power to pardon could not stop an impeachment against his minister.

The use of impeachment gradually waned as the 18th century progressed, mainly because it proved too blunt a political instrument by which to attack the king's ministers. The proceeding's limitations were clearly evident in the unsuccessful impeachment trial (1788–95) of Warren Hastings. The acceptance of the

principle that cabinet ministers are responsible to Parliament (rather than to the sovereign) in the early 19th century made impeachment unnecessary, and the procedure fell into disuse after the unsuccessful trial of Lord Melville in 1806.

Andrew Johnson was the first U.S. president to be impeached. In 1868 he was charged with attempting to remove, contrary to statute, the secretary of war, Edwin M. Stanton; with inducing a general of the army to violate an act of Congress; and with contempt of Congress. Johnson was acquitted by a single vote. (A two-thirds vote is required to convict.) In 1974 the Judiciary Committee of the House of Representatives voted three articles of impeachment against President Richard M. Nixon, but he resigned before impeachment proceedings began in the full House. In December 1998 the House impeached President William J. Clinton, charging him with perjury and obstruction of justice in investigations of his relationship with a White House intern, Monica Lewinsky. The Senate acquitted Clinton on both the perjury charge (55–45) and the obstruction of justice charge (50–50).



Although procedures vary, all U.S. states provide for the removal of executive and judicial officers by impeachment.

impedance, acoustic (physics): *see* acoustic impedance.

impedance, electrical: *see* electrical impedance.

Imperia, capital of Imperia *provincia,* Liguria *regione,* northwestern Italy. It lies on that part of the Riviera di Ponente known as the Riviera dei Fiori, northeast of San Remo. Formed in 1923 by the union of Porto Maurizio, Oneglia, and several villages, the town took its name from the Torrente Impero ("Impero Stream") that crosses the town. Porto Maurizio, once a Roman port, became the seat of a Genoese vicar in 1276 and, with Genoa, fell to the French in 1797. Joined to the kingdom of Sardinia in 1814, it was made a provincial capital in 1860. Oneglia originated in 935 from a Roman coastal castle, Castelvecchio, and was a tenure of the Albenga episcopacy from 1100. Sold to the Doria family in 1298, it passed to the house of Savoy in 1576 and was captured by France in 1792. Passing to Piedmont in 1814, it was a provincial capital until 1859.

Imperia's Neoclassical-style Cathedral of San Maurizio (1779–81) is notable, as are the province building (1910) and city hall (1932). Imperia is an industrial and commercial centre and port on the Genoa-Ventimiglia-Nice railway and road. The town is noted for the production and export of olive oil and flowers. Tourism and the manufacture of spaghetti, perfume, drugs, and cement are also important. Pop. (1991 prelim.) mun., 40,171.

Imperia, Italy

Imperial Chemical Industries PLC (ICI), major British corporation that was founded in 1926 as Imperial Chemical Industries Ltd. to amalgamate four major British chemical companies: Brunner, Mond & Co. Ltd., Nobel Industries Ltd., United Alkali Company Ltd., and British Dyestuffs Corporation Ltd. Between World Wars I and II, ICI was a major competitor of Germany's IG Farben, the cartel formed in 1925 (and dissolved by the Allies after World War II). By the late 1970s, ICI ranked below all three successors to IG Farben (Hoechst, BASF, and Bayer corporations) in terms of sales but was still the largest chemical concern in the United Kingdom. ICI's headquarters are in London.

ICI's constituent companies in 1926 produced chemicals, dyes, explosives, fertilizers, fibres, nonferrous metals, and paints, and the group went on to produce a wider range of chemicals, paints, pharmaceuticals, synthetic fibres (especially polyesters and nylon), and plastics. In 1993 ICI split off its drug, pesticide, and specialty chemical concerns into a new corporation named Zeneca Group PLC. The parent company continued to produce industrial chemicals, paints, and explosives.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

imperial city, also called FREE IMPERIAL CITY, German REICHSSTADT, OR FREIE REICHSSTADT, any of the cities and towns of the Holy Roman Empire that were subject only to the authority of the emperor, or German king, on whose demesne (personal estate) the earliest of them originated. The term *freie Reichsstadt,* or Free Imperial City, was sometimes used interchangeably with *Reichsstadt* but was rightly applied to only seven cities—Basel, Strasbourg (Strassburg), Speyer, Worms, Mainz, Cologne, and Regensburg—which had won independence from ecclesiastical lords and thus obtained a position indistinguishable from that of the *Reichsstadt.*

In the European Middle Ages many other places won the coveted position of *Reichsstadt.* Some gained the status by gift and others by purchase; some won it by force of arms, others usurped it during times of anarchy. There were many more free towns in southern than in northern Germany. Some free towns fell into the hands of various princes of the empire, and others placed themselves voluntarily under such protection. Mainz was conquered and subjected to the archbishop in 1462. Some towns, such as Trier, declined independence because of the inescapable financial burdens. When Trier later tried to reassert its position as an imperial city, the emperor in 1580 assigned the city explicitly to the archbishop. Similarly Donauwörth in 1607–08 was handed over to Bavaria by the emperor's judgment. Other free towns were separated from the empire by conquest. Besançon passed into the possession of Spain in 1648; Basel had already thrown in its lot with the Swiss Confederation, while Strasbourg, Colmar, Haguenau, and other free towns were seized by Louis XIV of France.

Meanwhile the free towns had been winning valuable privileges in addition to those they already possessed, and the more wealthy among them, such as Lübeck, Nürnberg, and Augsburg, were practically *imperia in imperio,* waging war and making peace, and ruling their people without any outside interference. But they had also learned that union is strength. They formed alliances among themselves, both for offense and for defense, and these leagues (*Städtebünde*) had an important influence on the course of German history from the 13th to the 15th century. The right of the free towns to be represented in the Imperial diet was formally recognized in 1489 at the diet of Frankfurt, and about the same time, they divided themselves into two groups, or benches, the Rhenish and the Swabian. By the Peace of Westphalia in 1648 they were formally constituted as the third college of the diet and later as the third estate of the empire. A list drawn up in 1422 mentions 75 free cities, and another drawn up in 1521 mentions 84, but at the time of the French Revolution in 1789 the number had decreased to 51.

The internal constitutions of different imperial cities varied, but all of them were ruled by a town council (*Rat*) of a generally oligarchic composition, sometimes confined to a small number of patrician families, and sometimes diluted by the entry of representatives of the trade guilds.

During the Napoleonic era the number of *Reichsstädte* was radically reduced. When the German Confederation was established in 1815, only Hamburg, Lübeck, Bremen, and Frankfurt were recognized as free cities, and the first three continued to hold that position in the later German Empire; but after the war of 1866 Frankfurt am Main was forcibly incorporated in the newly formed Hesse-Nassau province of Prussia. Hitler incorporated Lübeck in the Prussian province (after 1946 the state) of Schleswig-Holstein in 1937; only Hamburg and Bremen survive as independent entities in the form of German *Lander* ("states").

Imperial Crown, also called CROWN OF CHARLEMAGNE, crown created in the 10th century for coronations of the Holy Roman emperors. Although made for Otto the Great (912–973), it was named for Charlemagne, the first Holy Roman emperor.

Imperial Crown of the Holy Roman Empire, 10th century; in the treasury of Hofburg palace, Vienna
Lessing–Magnum

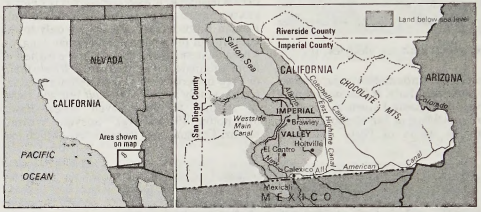
The crown is made of eight round-topped plaques of gold hinged together and kept rigid by an interior ring of iron; it is decorated with jewels and enamel in the Byzantine style. It was designed to surmount or incorporate a mitre, which was worn with the points at the

sides, and therefore is crossed only by a single arch, from front to back. In the 11th century the present arch, with its cresting of small round-topped plaques, replaced the original, and a jeweled cross, meant originally to hang upon the breast, was fastened to the front plate of the crown. The rim was adorned with side pendants that have been lost.

Another crown, more in keeping with Renaissance taste, was made for the emperor in 1602. It incorporates the imperial mitre in the form of two plates of gold, which rise up within the circlet on each side of the central arch and curve in toward it, giving the crown the appearance of a helmet or kamelaukion. Both crowns are preserved in the national treasury in Vienna.

Imperial Group, PLC, leading British manufacturer of tobacco products, including Player and Embassy cigarettes, Wilson's snuff, and several brands of cigars. Its other products included beer, prepared foods, and packaging. Corporate headquarters are in London.

The company was founded as the Imperial Tobacco Company in 1901 by a consortium of British tobacco manufacturers seeking strength through unity following an attempt by James Buchanan Duke of the American Tobacco Company to take over the British tobacco industry. Tobacco long dominated the company's product line, contributing 90 percent of its profits as recently as 1968. After that time the company diversified, and the word "tobacco" was dropped from the corporate name in 1973 to reflect the changes. The company reregistered as a public limited company in 1981, the year that it assumed the name Imperial Group. In 1986 Imperial Group was purchased by Hanson Trust PLC, a diversified manufacturer, of which it became a subsidiary. Imperial also produced and distributed a number of food products.



imperial preference, commercial arrangement in which preferential rates (*i.e.*, rates below the general level of the tariff) are granted to one another by the constituent units of an empire. It may also include other sorts of preference, such as favourable consideration in the allocation of public contracts, indirect subsidies to shipping, and preferential access to the capital market. Such arrangements were enforced in the first half of the 20th century by most countries with dependent colonies; of these, the British imperial preference introduced in 1932 may be considered as the most important.

With a radical change in tariff policy in 1931 and 1932, Great Britain removed the ban on the taxation of food imports, opening the way for a systematic policy of imperial preference. Such a policy, based on the principle of "home producers first, empire producers second, and foreign producers last," was negotiated at the Imperial Economic Conference in Ottawa in 1932 and took the form of a series of bilateral agreements intended to extend for five years (though they ran on after 1937 without formal renewal).

The agreements pledged the United Kingdom to allow the continued free entry of most empire goods and to impose new tariffs on certain food and metal imports from foreign countries. The dominions were to use their tariffs against U.K. produce only in order to protect efficient producers, and both sides were to maintain certain margins of preference. Although the political reasons for the agreements were strong, the effect of the Great Depression, the search for "sheltered markets," and the spread of the protectionist spirit (evidenced by the Hawley–Smoot Tariff Act of the United States in 1930) were probably more important. Trade within the empire increased after the Ottawa conference. But other factors also contributed to the upswing; they included the recovery of prices of primary products and the existence of the sterling bloc.

During and after World War II, exchange problems, commodity agreements, and other factors had more effect on trade than did preferential tariffs. The signature of the General Agreement on Tariffs and Trade (GATT) in 1947—to which the partners of the Ottawa agreements subscribed—prohibited the extension of existing preferences, and in subsequent negotiations Great Britain and its partners agreed to some reductions of preferential margins. Inflation and trade liberalization, meanwhile, reduced the value of remaining preferences. At the same time, many newly independent members of the Commonwealth also canceled preferences formerly given to British goods.

Imperial Valley, intensively irrigated part of the Colorado Desert, mainly in Imperial County, southeastern California, U.S., extending southward for 50 miles (80 km) from the southern end of the Salton Sea (a saline lake) into Mexico. Part of a trough stretching from the Coachella Valley to the Gulf of California, it is almost entirely below sea level (235 feet [72 m] below at the edge of the Salton Sea) and has a hot desert climate characterized by daily temperature extremes. It was once part of the Gulf, from which it was cut off by the damlike deposits of the Colorado River Delta Fan. Bordered by sand dunes and barren mountains, it was an uninhabited wasteland until the Imperial Canal was opened in 1901 and diverted Colorado River water into the valley through Mexico. Floodwaters in 1905–07 destroyed the irrigation channels and created the Salton Sea (now maintained by irrigation runoff).

Imperial Valley region

Development of the region languished until the completion of the Hoover Dam in 1935 and the All-American Canal in 1940. The valley, with 3,000 miles of irrigation canals, contains about 500,000 acres (200,000 hectares) of cultivated land. Products include truck crops, alfalfa, cotton, sugar beets, and livestock. El Centro, Brawley, Calexico, and Mexicali, Mex., are commercial centres.

imperialism, state policy, practice, or advocacy of extending power and dominion, especially by direct territorial acquisition or by gaining political and economic control of other areas. Because it always involves the use of power, whether military force or some subtler form, imperialism has often been considered morally reprehensible and the term is frequently employed in international propaganda to denounce and discredit an opponent's foreign policy.

Imperialism in ancient times is clear in the history of China and in the history of western Asia and the Mediterranean—an unending succession of empires. The tyrannical empire of the Assyrians was replaced (6th–4th century BC) by that of the Persians, in strong contrast to the Assyrian in its liberal treatment of subjected peoples, assuring it long duration. It eventually gave way to the imperialism of Greece. When Greek imperialism reached an apex under Alexander the Great (356–323 BC), a union of the eastern Mediterranean with western Asia was achieved. But the cosmopolis, in which all citizens of the world would live harmoniously together in equality, remained a dream of Alexander. It was partially realized when the Romans built their empire from Britain to Egypt.

This idea of empire as a unifying force was never again realized after the fall of Rome. The nations arising from the ashes of the Roman Empire in Europe, and in Asia on the common basis of Islāmic civilization, pursued their individual imperialist policies. Imperialism became a divisive force among the peoples of the world.

Three periods in the modern era witnessed the creation of vast empires, primarily colonial. Between the 15th century and the middle of the 18th, England, France, the Netherlands, Portugal, and Spain built empires in the Americas, India, and the East Indies. For almost a century thereafter, relative calm in empire building reigned as the result of a strong reaction against imperialism. Then the decades between the middle of the 19th century and World War I were again characterized by intense imperialistic policies.

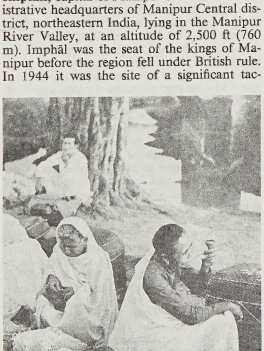
Russia, Italy, Germany, the United States, and Japan were added as newcomers among the imperialistic states and indirect, especially financial, control became a preferred form of imperialism. For a decade after World War I the great expectations for a better world inspired by the League of Nations put the problem of imperialism once more in abeyance. Then Japan renewed its empire building with an attack in 1931 upon China, and under the leadership of the totalitarian states, Japan, Fascist Italy, Nazi Germany, and the Soviet Union, a new period of imperialism was inaugurated in the 1930s and 1940s.

In their modern form, arguments about the causes and value of imperialism can be classified into four main groups. The first group contains economic arguments and often turns around the question of whether or not imperialism pays. Those who argue that it does point to the human and material resources and the outlets for goods, investment capital, and surplus population provided by an empire. Their opponents, among them Adam Smith, David Ricardo, and J.A. Hobson, often admit that imperialism may benefit a small, favoured group but never the nation as a whole. Marxist theoreticians interpret imperialism as a late stage of capitalism when the national capitalist economy has become monopolistic and is forced to conquer outlets for its overproduction and surplus capital in competition with other capitalist states. This is the view held, for instance, by Vladimir Lenin and N.I. Bukharin, to whom capitalism and imperialism are identical. The weakness in that view is that historical evidence does not support it and that it fails to explain precapitalist imperialism and Communist imperialism.

A second group of arguments relates imperialism to the nature of human beings and human groups, such as the state. Such different personalities as Machiavelli, Sir Francis Bacon, Ludwig Gumplowicz, Adolf Hitler, and Benito Mussolini, reasoning on different grounds, nevertheless arrived at similar conclusions. Imperialism to them is part of the natural struggle for survival. Those endowed with superior qualities are destined to rule all others.

The third group of arguments has to do with strategy and security. Nations are urged, proponents of this viewpoint say, to obtain bases, strategic materials, buffer states, "natural" frontiers, control of communication lines for reasons of security, or to prevent other states from obtaining them. Those who deny the value of imperialism for these purposes point out that security is not achieved. Expansion of a state's control over territories and peoples beyond its borders is likely to lead to friction, hence insecurity, because the safety zones and spheres of influence of competing nations are bound to overlap sooner or later. Related to the security argument is the argument that nations are imperialistic in the search for power and prestige for their own sake.

The fourth group of arguments is based on moral grounds, sometimes with strong missionary implications. Imperialism is excused as the means of liberating peoples from tyrannical rule or of bringing them the blessings of a superior way of life. Imperialism results from a complex of causes in which in varying degrees economic pressures, human aggressiveness and greed, search for security, drive for power and prestige, nationalist emotions, humanitarianism, and many other factors are effective. This mixture of motivations makes it difficult to eliminate imperialism but also easy for states considering themselves potential victims to suspect it in policies not intended to be imperialistic. Some states of the Third World have accused the former colonial powers and other nations of neocolonialism. Their fear is that the granting of aid or the supply of skilled personnel for economic and technical development might be an imperialist guise.



Under international organizations, attempts have been made to satisfy by peaceful means the legitimate aspirations of nations and to contain their illegitimate ones. Among the measures for these purposes are collective security arrangements, the mandate and the trusteeship system for dependent areas, the stimulation of cultural relations between nations, aid to developing countries, and the improvement of health and welfare everywhere. *See also* colonialism.

imperium (Latin: "command." "empire"), the supreme executive power in the Roman state, involving both military and judicial authority. It was exercised first by the kings of Rome; under the republic (*c.* 509 BC–27 BC) it was held by the chief magistrates (consuls, dictators, praetors, military tribunes with consular power, and masters of the cavalry) and private citizens entrusted with a special command. In the later republic, proconsuls, propraetors, second members of certain commissions also possessed the imperium. Restrictions on its use were instituted from the inception of the republic. The principle of collegiality provided that each of the magistrates of the same level (*e.g.*, the two consuls) who held it should hold it to the same degree. Down to the 2nd century BC, a series of laws was passed requiring trials for Roman citizens in capital cases, and also the right of appeal to the people (*jus provocandi ad populum*). The same rights were conventionally extended to Roman citizens in the military or other official service outside Rome. Magistrates were required to exercise imperium within the limits of their office (*provincia*). Imperium was officially conferred by the Comitia Curiata (a popular assembly) for one year or until the official completed his commission. Only in the last years of the republic was the imperium granted for specific terms beyond one year.

Caesar's opponent Pompey was the first to receive such a commission, specifically for three years by the Lex Gabinia (67 BC). Octavian obtained the imperium as holder of various offices under the republic before he became the first emperor, under the name of Augustus, in 27 BC. From then on he was granted imperium for 10- or 5-year periods by the Senate throughout his tenure of office. The Senate thereafter voted the imperium to each succeeding emperor upon his accession. Some emperors, such as Augustus, had it voted to their chosen successor. Under the empire the title *imperator* (emperor), which had been used by victorious Roman generals under the republic, was reserved as an exclusive title for the head of state. The emperors received their first acclamation as emperor at their accession and thereafter each time a Roman general won a victory. Imperium was sometimes given to others in cases of special military commands, such as that of Germanicus in AD 17. When it was granted with no special duties, as in the case of Tiberius in AD 13, it implied that the recipient was an appropriate successor to the princeps, the unofficial title used by Augustus and subsequent emperors. With the expansion of Roman power during and after the reign of Augustus, imperium took on the meaning of "empire."

impetigo, bacterial inflammatory skin disease that begins as a superficial vesicle (blister), which then ruptures and gives rise to a weeping spot on which the fluid dries to form a crust. Impetigo is caused by staphylococcal or streptococcal bacteria. It is seldom contagious in adults, a little more so in children, and very contagious in newborn infants. Except for impetigo herpetiformis, a rare form of impetigo that affects pregnant women, the lesions of uncomplicated impetigo can be effectively treated with a topical (locally applied) broad-spectrum antibiotic; in more extensive impetiginous involvement, especially in infants, the early use of a systemic antibiotic may be advisable.

Imphāl, capital of Manipur state and administrative headquarters of Manipur Central district, northeastern India, lying in the Manipur River Valley, at an altitude of 2,500 ft (760 m). Imphāl was the seat of the kings of Manipur before the region fell under British rule. In 1944 it was the site of a significant tactical victory for the Anglo-Indian forces over the Japanese on the Burmese front of World War II. The town is a major trade centre, noted for its weaving, brassware, bronzeware, and other cottage industries. Imphāl College, Imphāl Training Centre, Dhana Manjari College, and a technical school are located there. Imphāl is connected with the North-Eastern Railway at Dimāpur, Assam, and with Burma by hard-surface roads. It has an airfield with regular service to Calcutta (400 mi [650 km] west-southwest) and Gauhāti. The population is mainly Manipuri. Pop. (1981) 156,622.

implantation, in reproduction physiology, the adherence of a fertilized egg to a surface in the reproductive tract, usually to the uterine wall (*see* uterus), so that the egg may have a suitable environment for growth and development into a new offspring. Fertilization of the egg usually occurs after the egg has left the ovary and is being transported through the fallopian tubes. Male sperm cells deposited in the female reproductive tract travel up to the fallopian tubes to unite with the egg. Once fertilized, the egg begins to undergo a series of cell divisions. The egg takes up to seven days to reach the uterus; by this time the single-celled egg has divided numerous times, so that it is a ball of approximately 200 cells.

The uterus has thick walls suitable for egg attachment and growth. A female hormone known as progesterone, secreted by the corpus luteum in the ovary, influences the readiness of the uterine wall for egg implantation. It increases the blood supply in the wall, water content, and secretion of glycogen, a nutrient for the surrounding tissue and developing egg. If the uterus is not first prepared by progesterone, the egg will not attach itself. Progesterone also inhibits muscular contractions in the uterine wall that would tend to reject the adhering egg.

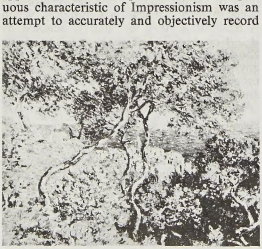
When the egg reaches the uterus, it usually remains free in the uterine cavity for about a day. It then attaches to the uterine lining (the endometrium). Cells in the outer surface of the egg grow rapidly once contact is made with the uterine wall. The egg disrupts the surface of the endometrium and actively burrows into the deeper tissue. By the 11th day after fertilization, the egg has completely embedded itself into the endometrium. The product of conception—first the fertilized egg and then the developing child and the placenta—normally remains implanted in the human uterus for nine months.

impleader (law): *see* joinder and impleader.

implication, in logic, a relationship between two propositions in which the second is a logical consequence of the first. In most systems of formal logic, a broader relationship called material implication is employed, which is read "If A, then B," and is denoted by $A \supset B$ or $A \rightarrow B$. The truth or falsity of the compound proposition $A \supset B$ depends not on any relationship between the meanings of the propositions but only on the truth-values of A and B; $A \supset B$ is false when A is true and B is false, and it is true in all other cases. Equivalently, $A \supset B$ is often defined as $\sim(A \cdot \sim B)$ or as $\sim A \vee B$ (in which $\sim$ means "not," $\cdot$ means "and," and $\vee$ means "or"). This way of interpreting $\supset$ leads to the so-called paradoxes of material implication: "grass is red $\supset$ ice is cold" is a true proposition according to this definition of $\supset$.

In an attempt to construct a formal relationship more closely akin to the intuitive notion of implication, Clarence Irving Lewis, known for his conceptual pragmatism, introduced in 1932 the notion of strict implication. Strict implication was defined as $\sim\Diamond(A \cdot \sim B)$, in which $\Diamond$ means "is possible" or "is not self-

contradictory." Thus A strictly implies B if it is impossible for both A and $\sim B$ to be true. This conception of implication is based upon the meanings of the propositions, not merely upon their truth or falsity.



Finally, in intuitionistic mathematics and logic, a form of implication is introduced that is primitive (not defined in terms of other basic connectives): $A \supset B$ is true here if there exists a proof (*q.v.*) that, if conjoined to a proof of A, would produce a proof of B. *See also* deduction; inference.

impotence, also called ERECTILE DYSFUNCTION, the inability of a man to achieve or maintain penile erection and hence the inability to participate fully in sexual intercourse. Because of its pejorative connotation in lay usage and because of confusion about its definition, the word *impotence* has been eliminated from the technical vocabulary in favour of the term *erectile dysfunction.*

Traditionally, erectile impotence (the classical definition of impotence) is the failure to achieve penile erection during intercourse. It may have either physical causes (*e.g.,* alcoholism, endocrine disease, or neurological disorders) or psychological causes (*e.g.,* anxiety, negative feelings toward the partner, stress, or depression). Erectile impotence occasionally occurs with age, but, rather than being a result of the aging process, it is usually secondary to disorders of aging, such as faulty blood circulation or prostate disease. In ejaculatory impotence the male achieves an erection but cannot reach orgasm in the partner's vagina. This form of impotence usually has an emotional rather than a physical cause.

Psychotherapy, marital counseling, or sex therapy may be helpful in treating cases of impotence that have a psychological or emotional cause. The range of treatments for impotence resulting from physical causes includes vacuum devices, penile implants, and penile injections, but most of these mechanical or physically invasive approaches have been superseded by the drug sildenafil (trade name Viagra), which is taken in pill form. This drug works by enhancing the effects of nitric oxide, a chemical that, upon sexual stimulation, is normally released to widen the blood vessels supplying the penis. The increased flow of blood into certain tissues in the penis causes an erection. *See also* sexual dysfunction.

Impressionism, French IMPRESSIONNISME, a major movement, first in painting and later in music, that developed chiefly in France during the late 19th and early 20th centuries. Impressionist painting comprises the work produced between about 1867 and 1886 by a group of artists who shared a set of related approaches and techniques. The most conspicuous characteristic of Impressionism was an attempt to accurately and objectively record visual reality in terms of transient effects of light and colour. The principal Impressionist painters were Claude Monet, Pierre Auguste Renoir, Camille Pissarro, Alfred Sisley, Berthe Morisot, Armand Guillaumin, and Frédéric Bazille, who worked together, influenced each other, and exhibited together independently. Edgar Degas and Paul Cézanne also painted in an Impressionist style for a time in the early 1870s. The established painter Édouard Manet, whose work in the 1860s greatly influenced Monet and others of the group, himself adopted the Impressionist approach about 1873.

"Bordighera," Impressionist painting by Claude Monet, oil on canvas, 1884; in the Art Institute of Chicago

By courtesy of the Art Institute of Chicago, Potter Palmer Collection

These artists became dissatisfied early in their careers with academic teaching's emphasis on depicting a historical or mythological subject matter with literary or anecdotal overtones. They also rejected the conventional imaginative or idealizing treatments of academic painting. By the late 1860s, Manet's art reflected a new aesthetic—which was to be a guiding force in Impressionist work—in which the importance of the traditional subject matter was downgraded and attention was shifted to the artist's manipulation of colour, tone, and texture as ends in themselves. In Manet's painting the subject became a vehicle for the artful composition of areas of flat colour, and perspectival depth was minimized so that the viewer would look at the surface patterns and relationships of the picture rather than into the illusory three-dimensional space it created. About the same time, Monet was influenced by the innovative painters Eugene Boudin and J.R. Jongkind, who depicted fleeting effects of sea and sky by means of highly coloured and texturally varied methods of paint application. The Impressionists also adopted Boudin's practice of painting entirely out-of-doors while looking at the actual scene, instead of finishing up his painting from sketches in the studio, as was the conventional practice.

In the late 1860s Monet, Pissarro, Renoir, and others began painting landscapes and river scenes in which they tried to dispassionately record the colours and forms of objects as they appeared in natural light at a given time. These artists abandoned the traditional landscape palette of muted greens, browns, and grays and instead painted in a lighter, sunnier, more brilliant key. They began by painting the play of light upon water and the reflected colours of its ripples, trying to reproduce the manifold and animated effects of sunlight and shadow and of direct and reflected light that they observed. In their efforts to reproduce immediate visual impressions as registered on the retina, they abandoned the use of grays and blacks in shadows as inaccurate and used complementary colours instead. More importantly, they learned to build up objects out of discrete flecks and dabs of pure harmonizing or contrasting colour, thus evoking the broken-hued brilliance and the variations of hue produced by sunlight and its reflections. Forms in their pictures lost their clear outlines and became dematerialized, shimmering and vibrating in a re-creation of actual outdoor conditions. And finally, traditional formal compositions were abandoned in favour of a more casual and less contrived disposition of objects within the picture frame. The Impressionists extended their new techniques to depict landscapes, trees, houses, and even urban street scenes and railroad stations.

In 1874 the group held its first show, independent of the official Salon of the French Academy, which had consistently rejected most of their works. Monet's painting "Impression: Sunrise" (1872; Musée Marmottan, Paris) earned them the initially derisive name "Impressionists" from the journalist Louis Leroy writing in the satirical magazine *Le Charivari* in 1874. The artists themselves soon adopted the name as descriptive of their intention to accurately convey visual "impressions." They held seven subsequent shows, the last in 1886. During that time they continued to develop their own personal and individual styles. All, however, affirmed in their work the principles of freedom of technique, a personal rather than a conventional approach to subject matter, and the truthful reproduction of nature.

By the mid-1880s the Impressionist group had begun to dissolve as each painter increasingly pursued his own aesthetic interests and principles. In its short existence, however, it had accomplished a revolution in the history of art, providing a technical starting point for the Postimpressionist artists Paul Cézanne, Edgar Degas, Paul Gauguin, Vincent van Gogh, and Georges Seurat and freeing all subsequent Western painting from traditional techniques and approaches to subject matter.

In music, Claude Debussy has always been considered the principal Impressionist. Even though Debussy was influenced by the general aesthetic attitudes of Impressionist painters, he made no attempts to compose with musical techniques that were closely analogous to techniques of painting. Furthermore, the characteristics of Debussy's music are so variable from the first through the last of his compositions that even a general sense of Impressionism might best be restricted to most of his music composed between about 1892 to 1903 and to certain specific later compositions strongly resembling those works in style. Some of these Impressionist works would be the opera *Pelléas et Mélisande* (first performed in 1902), the orchestral piece "Nuages" ("Clouds," from *Nocturnes,* completed in 1899), and the piano piece "Voiles" ("Sails," from *Douze Préludes,* Book I, 1910). Other composers considered Impressionistic include Maurice Ravel, Frederick Delius, Ottorino Respighi, Karol Szymanowski, and Charles Griffes.

Musical Impressionism is often thought to refer to subtle fragility, amorphous passivity, and vague mood music. A more accurate characterization of Impressionist music would include restraint and understatement, a static quality, and a provocatively colourful effect resulting from composers' fascination with pure sound as a beautiful and mysterious end in itself. Technically, these characteristics often result from a static use of harmony, ambiguous tonality, a lack of sharp formal contrasts and of onward rhythmic drive, and a blurring of the distinction between melody and accompaniment. Although Impressionism has been considered a movement away from the excesses of Romanticism, the sources of many of its characteristics may be found in the works of composers who are also considered to be the Romantic precursors of Expressionism—*e.g.,* Franz Liszt, Richard Wagner, and Aleksandr Scriabin.

impressment, also called CRIMPING, enforcement of military or naval service on able-bodied but unwilling men through crude and violent methods. Until the early 19th century this practice flourished in port towns throughout the world. Generally impressment could provide effective crews only when patriotism was not an essential of military success. Impressed men were held to their duty by uncompromising and brutal discipline, although in war they seem to have fought with no less spirit and courage than those who served voluntarily.

The "recruiters" preyed to a great extent upon men from the lower classes who were, more often than not, vagabonds or even prisoners. Sources of supply were waterfront boardinghouses, brothels, and taverns whose owners victimized their own clientele. In the early 19th century the Royal Navy would halt U.S. vessels to search for British deserters and in the process would not infrequently impress naturalized American citizens who were on board. This practice was among the grievances that helped bring about the War of 1812.

Through the 19th century there was a gradual decline in the practice of impressment. As the manpower needs of the military continued to increase, more systematic methods of recruitment became necessary.

imprimatur (Latin: "let it be printed"), in the Roman Catholic church, a permission, required by contemporary canon law and granted by a bishop, for the publication of any work on Scripture or, in general, any writing containing something of peculiar significance to religion, theology, or morality. Strictly speaking, the *imprimatur* is nothing more than the permission. But because its concession must be preceded by the favourable judgment of a censor (*nihil obstat*: "nothing hinders [it from being printed]"), the term has come to imply ecclesiastical approval of the publication itself. Nevertheless, the *imprimatur* is not an episcopal endorsement of the content, nor is it a guarantee of doctrinal integrity. It does indicate that nothing offensive to faith or morals has been discovered in the work.

imprinting, in psychobiology, a form of learning in which a very young animal fixes its attention on the first object with which it has visual, auditory, or tactile experience and thereafter follows that object. In nature the object is almost invariably a parent; in experiments, other animals and inanimate objects have been used. Imprinting has been intensively studied only in birds, especially chickens, ducks, and geese, but a comparable form of learning apparently occurs in the young of many mammals and some fishes and insects.

In mallard ducklings and domestic chicks, imprinting can be accomplished in a few hours, but receptivity to imprinting stimuli vanishes at the age of about 30 hours.

impromptu, a 19th-century piano composition intended to produce the illusion of spontaneous improvisation. In keeping with this fundamental premise, there is no particular form associated with the impromptu, although ternary and rondo schemes are common. The style of the music is similar to that of other compositions of the period, with such designations as fantasie, caprice, and bagatelle.

The name impromptu first appeared in 1822 as the title of piano pieces by the Bohemian composer Jan Hugo Voříšek and the German Heinrich Marschner. Among the best-known impromptus are those by Franz Schubert (Opuses 90 and 142) and Frédéric Chopin (Opuses 29, 36, and 51). Impromptus were also written by Ludwig van Beethoven, Robert Schumann, Franz Liszt, Gabriel Fauré, and Aleksandr Scriabin.

improvisation, also called EXTEMPORIZATION, in music, the extemporaneous composition or free performance of a musical passage, usually in a manner conforming to certain stylistic norms but unfettered by the prescriptive features of a specific musical text. Music originated as improvisation and is still extensively improvised in Eastern traditions and in the modern Western tradition of jazz.

Many of the great composers of Western classical music were masters of improvisation, especially on keyboard instruments, which offered such celebrated composer-performers as Johann Sebastian Bach, W.A. Mozart, Felix Mendelssohn, and Frédéric Chopin virtually boundless opportunities for the spontaneous unfolding of their rich musical imaginations. Many an idea so generated eventually appeared in a written composition. Some composers have regarded improvisation as an indispensable warm-up for their creative task.

Prior to the instrumental era in the West, improvisation within the systematized musical context was largely limited to ornamental variants of vocal parts in polyphonic compositions and to instrumental adaptations of vocal compositions, especially by lute and keyboard virtuosos. The monodic textures that originated about 1600, on the other hand, were ready-made, indeed in large measure intended, for improvisational enhancement, not only of the treble parts but also, almost by definition, of the bass, which was figured to suggest no more than a minimal chordal outline.

In essentially monophonic musical cultures, whether Western or non-Western, improvisation has been of paramount importance, if only because successful improvisation is always more readily achieved by soloists than by groups. A monophonic oral musical tradition, however, does not necessarily imply the prevalence of improvisational practices. Quite to the contrary, oral traditions have been prone to preserve the integrity of particular songs and dances from generation to generation with a degree of precision virtually unknown in literate musical contexts.

It is generally assumed that early European music from Roman Catholic chant to medieval polyphony was rooted in such improvisational practices as the exploration of motivic possibilities in the church modes (*see* church mode) and the addition of a second melody to a preexisting melody or cantus firmus. Modal improvisations have remained central to much non-Western music, including the chant of the Jewish synagogue, Islāmic *maqām* elaborations, and Indian raga performances.

In the West, cantus firmus improvisation inspired a great deal of instrumental music as well, beginning with late Renaissance improvisations over ostinato basses (relatively short repeated bass patterns) and maintained through the centuries especially by organists who embraced such popular ostinato genres as the passacaglia and chaconne. Organists have remained in the forefront of improvisation as a primary musical activity in no way at odds with written composition, while keyboard improvisation in turn has been responsible for compositions of a freely associative character of the sort found among hundreds of preludes, toccatas, and fantasies written during the past three centuries. Improvisations on Protestant hymn tunes gave birth to the important 17th- and 18th-century genre the chorale prelude. In the later 18th century, improvisation, often based on variation techniques but not excluding the strictly polyphonic procedures of canon and fugue, challenged the ingenuity of virtuoso-composers repeatedly in public improvisational contests, such as those that pitted Mozart against Muzio Clementi and Ludwig van Beethoven against Joseph Wölfl.

In modern times, improvisation survives as one of the chief distinguishing characteristics of jazz. Here, too, the process is usually inspired by, and structured (however loosely) in accordance with, salient characteristics of the model in question, be it a well-known show tune or a ground bass. During the second half of the 20th century, there arose among certain avant-garde composers and performers a tendency away from any vestige of traditional structure. A "composition" from this experimental school might be entirely devoid of conventional notation, consisting rather of a verbal instruction, a prescription for duration, or an idiosyncratic graphic code. Some works required performers to combine at random "building blocks" of brief musical phrases or entire sections presented by the composer; it has been asserted that such a process embodies a more profound creative collaboration between composer and performer than does the interpretation of a fully notated work or the express but limited freedom accorded performers at crucial moments in certain fixed compositions (*e.g.*, the da capo section of an 18th-century aria or the cadenza near the end of a solo concerto movement). *See also* aleatory music.

improvisation, in theatre, the playing of dramatic scenes without written dialogue and with minimal or no predetermined dramatic activity. The method has been used for different purposes in theatrical history. The theatrical form known as the commedia dell'arte was highly improvisational, although through repeated performances its characters developed stock speeches and stage business and its scenarios gained fairly standard form. Much of Asian dance and theatrical activity comprises improvised arrangements of stock scenes, movements, and speech.

In the 20th century a number of groups have used improvisation, usually working in intimate cabaret theatres and sometimes performing impromptu scenes based on ideas from the audience. Among the most prominent of these is The Second City company in Chicago, whose origins date to the 1950s. Other major uses of improvisation are in theatrical rehearsals, to discover new nuances of interpretation, and in acting schools, to allow students to explore and broaden their emotional responsiveness to imaginative situations.

ímram (Old Irish Gaelic: "rowing about," or "voyaging"), plural IMRAMHA, in early Irish literature, a story about an adventurous voyage. This type of story includes tales of Irish saints traveling to Iceland or Greenland, as well as fabulous tales of pagan heroes journeying to the otherworld (*echtrae*). An outstanding example of an *ímram* is *Imram Brain,* or *The Voyage of Brân,* which describes a trip to the enchanted Land of Women. After what seems to be a year, Brân and his colleagues return home to discover that their voyage had lasted longer than any memories and was recorded only in ancient sources.

Imrédy, Béla (b. Dec. 29, 1891, Budapest, Hung.—d. Feb. 28, 1946, Budapest), right-wing politician and premier of Hungary (1938–39), whose close collaboration with the Nazis during World War II led to his execution as a war criminal.

After being trained in law, Imrédy began working for the Ministry of Finances. In 1928 he became director of the National Bank of Hungary and participated in several international monetary conferences. He then served as finance minister (1932–35) under the extreme rightist Gyula Gömbös. After Gömbös died (Oct. 6, 1936) Imrédy resigned and became president of the National Bank.

Nazi Germany annexed Austria in March 1938, and Imrédy was made premier of Hungary on May 14, 1938. Although he took measures against the extreme right and made several unsuccessful attempts to win support from the Western powers, Imrédy oversaw the passage of many laws supported by the right wing, including two measures limiting the activity of Jews in business and the professions as well as laws restricting the right of assembly and freedom of the press. He also ultimately adopted a more definite pro-Axis foreign policy for Hungary. On Feb. 16, 1939, he resigned after the opposition had documented his Jewish ancestry; he retained leadership, however, in numerous rightist organizations and as minister of the economy in 1944 was instrumental in subordinating Hungarian economy to the German war effort. After the war Imrédy was sentenced for war crimes by the People's Tribunal and executed.

Imru' al-Qays, in full IMRU' AL-QAYS IBN ḤUJR (d. *c.* 550), Arab poet, acknowledged as the most distinguished poet of pre-Islāmic times by the Prophet Muḥammad, by 'Alī, the fourth caliph, and by Arab critics of the

ancient Basra school. He is author of one of the seven odes in the famed collection of pre-Islāmic poetry *Al-Mu'allaqāt*.

There is no agreement as to his genealogy, but the predominant legend cites Imru' al-Qays as the youngest son of Ḥujr, the last king of Kindah. He was twice expelled from his father's court for the erotic poetry he was fond of writing, and he assumed the life of a vagabond. After his father was murdered by a rebel Bedouin tribe, the Banū Asad, Imru' al-Qays was single-minded in his pursuit of revenge. He successfully attacked and routed the Banū Asad, but, unsatisfied, he went from tribe to tribe fruitlessly seeking further help. Through King al-Ḥārith of Ghassān (northern Arabia), Imru' al-Qays was introduced to the Byzantine emperor Justinian I, who agreed to supply him with the troops that he needed to regain his kingdom. Legend has it that on his return to Arabia the emperor sent him a poisoned cloak, which caused his death at Ancyra (modern Ankara).

The philologists of the Basra school regarded Imru' al-Qays not only as the greatest of the poets of the *Mu'allaqāt* but also as the inventor of the form of the classical ode, or qasida. There were at least three collections (divans) of his poetry made by medieval Arab scholars, numbering as many as 68 poems; the authenticity of the greater part of them, however, is doubtful.

in medias res (Latin: "in the midst of things"), in narrative technique, the recommended practice of beginning an epic or other fictional form by plunging into a crucial situation that is part of a related chain of events; the situation is an extension of previous events and will be developed in later action. The narrative then goes directly forward, and exposition of earlier events is supplied by flashbacks. The principle is based on the practice of Homer in the *Iliad* and the *Odyssey.* The *Iliad,* for example, begins dramatically with the quarrel between Achilles and Agamemnon. The Latin poet and critic Horace has pointed out the immediate interest created by this opening in contrast to beginning the story *ab ovo* ("from the egg"), *i.e.,* from the birth of Achilles.

in nomine, in music, English instrumental genre of the 16th and 17th centuries, named after the setting by John Taverner (*c.* 1490–1545) of the *In nomine Domini* ("In the name of the Lord") section from the Benedictus of the *Missa Gloria tibi Trinitas.* Taverner's work served as a model for similar compositions based on the plainsong melody of the antiphon (a verse originally sung before and after a psalm) "Gloria tibi Trinitas" ("Glory to Thee, O Trinity") from the Vesper service for Trinity Sunday. Although instrumental styles changed, the title and cantus firmus remained in use until the time of Henry Purcell (*c.* 1659–95).

In Ruad Ro-fhessa (Celtic religion): *see* Dagda.

in vitro fertilization (IVF), also called TEST-TUBE CONCEPTION, medical procedure in which mature egg cells are removed from a woman, fertilized with male sperm outside the body, and inserted into the uterus of the same or another woman for normal gestation. Although in vitro fertilization with reimplantation of fertilized eggs (ova) has long been widely used in animal breeding, the first successful birth of a human child from in vitro fertilization, carried out by Patrick Steptoe and R.G. Edwards of Britain, did not take place until 1978.

In vitro fertilization is generally undertaken only after an exhaustive evaluation of infertility has been made. A number of the candidates for IVF are women who suffer from blocked or absent fallopian tubes; others are men with low sperm counts or couples whose infertility is unexplained. IVF procedure includes the recovery (by needle aspiration) of mature eggs and the incubation of the eggs in a culture medium, as well as the collection and preparation of sperm and its addition to the medium. Fertilization generally occurs within 12 to 48 hours. The potential embryo is then placed in a growth medium, where it is observed periodically for division into two-cell, four-cell, and eight-cell stages. During this period the mother receives progesterone to prepare her uterine lining for implantation of the embryo. The embryo, which at this point is known as a blastocyst, is introduced through the cervix into the uterus, in which the blastocyst seems to float free for about three-and-a-half days. If the procedure is successful, the embryo implants itself in the uterine wall, and pregnancy begins.

Of the problems that have been noted in IVF procedure, successful implantation seems to be the weakest link. One possible explanation for this problem is that the in vitro zygote develops at a slower rate than the embryo in vivo (*i.e.,* within the body), and hence, the growth of the in vitro zygote and the development of the endometrial tissue are not perfectly synchronized.

In vitro fertilization has been a source of moral, ethical, and religious controversy since its development. Although members of all religious groups can be found on both sides of the issues, the major opposition has come from the Roman Catholic church, which in 1987 issued a doctrinal statement opposing IVF on three grounds: the destruction of human embryos not used for implantation; the possibility of in vitro fertilization by a donor other than the husband, thus removing reproduction from the marital context; and the severing of an essential connection between the conjugal act and procreation.

Other ethical questions raised more generally have involved the fear of experimentation with human fetuses. Related techniques, such as the freezing of eggs, sperm, or embryos for future implantation, have also raised a number of as yet unresolved moral issues.

Inanna (Mesopotamian deity): *see* Ishtar.

Inari, in Japanese mythology, god primarily known as the protector of rice cultivation. The god also furthers prosperity and is worshiped particularly by merchants and tradesmen, is the patron deity of swordsmiths and is associated with brothels and entertainers.

In Shintō legends Inari is identified with Uka no Mitama no Kami ("August Spirit of Food"), son of the impetuous storm god, Susanoo. The rice god is also associated in some Shintō shrines with the goddess of food, Ukemochi no Kami; and there is considerable variation in the way in which Inari is depicted, as a bearded man riding a white fox or as a woman with long, flowing hair, carrying sheaves of rice.

The fox, symbolizing both benevolence and malevolence, is sometimes identified with the messenger of Inari, and statues of foxes are found in great numbers both inside and outside shrines dedicated to the rice god. Other characteristics of Inari shrines are their deep red buildings, long rows of votive *torii* (gateways), and the *hōshu-no-tama* (a pear-shaped

Inari, wood figurine, Tokugawa period (1603–1867); in the Musée Guimet, Paris

By courtesy of the Musee Guimet, Paris

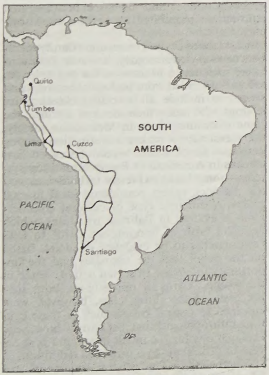
emblem surmounted by flamelike symbols). Most renowned among the numerous Inari shrines throughout Japan is the Fushimi Inari Shrine near Kyōto.

Inari, Lake, largest lake in Lapin (Lappi) *lääni* (province), northern Finland, lying near the Russian border. At an elevation of 389 feet (119 m), it is approximately 50 miles (80 km) long and 25 miles wide at its farthest points, has an area of 425 square miles (1,102 square km), and is about 200 feet (61 m) deep. The lake is fed by the Ivalo River from the southwest and drained by the Paats River on the east to the Arctic Ocean. The town of Inari, a Lapp trading centre, is on the southwestern shore. The lake's excellent fishing and boating attract many tourists.

Inazawa, city, Aichi *ken* (prefecture), Honshu, Japan, in the Owari plain. It was a small rural town during the Tokugawa period (1603–1867), producing vegetables for the market of nearby Nagoya. Increased urbanization in the area since World War II, however, sparked Inazawa's growth as a residential and industrial suburb of Nagoya. Textiles and machinery are produced. Pop. (1990) 96,277.

inbreeding, the mating of individuals or organisms that are closely related through common ancestry, as opposed to outbreeding, which is the mating of unrelated organisms. Inbreeding is useful in the retention of desirable characteristics or the elimination of undesirable ones, but it often results in decreased vigour, size, and fertility of the offspring because of the combined effect of harmful genes that were recessive in both parents.

The closest type of inbreeding is selfing, or self-fertilization, the union of male and female sex cells produced by the same organism. Linebreeding is a form of inbreeding that involves selection of mates on the basis of their relationships to a certain superior ancestor. The backcross (crossing a first-generation hybrid with one of the parental types) is a common method of inbreeding.



Inca, also spelled INKA, South American Indians who, at the time of the Spanish conquest in 1532, ruled an empire that extended along the Pacific coast and Andean highlands from the northern border of modern Ecuador to the Maule River in central Chile. The Inca established their capital at Cuzco (Peru) in the 12th century. They began their conquests in the early 15th century and within 100 years had gained control of an Andean population of about 12,000,000 people.

A brief treatment of the Inca follows. For full treatment, *see* MACROPAEDIA: Pre-Columbian Civilizations.

In common with other Andean cultures, the Inca left no written records. Their history is known chiefly from the oral tradition that has been preserved through the generations by official "memorizers" and from the written records composed from them after the Spanish conquest. According to their tradition, the Inca originated in the village of Paqari-tampu, about 15 miles (24 km) south of Cuzco. The founder of the Inca dynasty, Manco Capac, led the tribe to settle in Cuzco, which remained thereafter their capital. Until the reign of the fourth emperor, Mayta Capac, in the 14th century, there was little to distinguish the Inca from the many other tribes inhabiting small domains throughout the Andes. Under Mayta Capac the Inca began to expand, attacking and looting the villages of neighbouring peoples and probably assessing some sort of tribute. Under Capac Yupanqui, the next emperor, the Inca first extended their influence beyond the Cuzco valley, and under Viracocha Inca, the eighth, they began a program of permanent conquest by establishing garrisons among the settlements of the peoples whom they had conquered.

The earliest date that can be confidently assigned to Incan dynastic history is 1438, when Pachacuti Inca Yupanqui, a son of Viracocha Inca, usurped the throne from his brother Inca Urcon. Under Pachacuti Inca Yupanqui (1438–71) the Inca conquered territory south to the Titicaca Basin and north to present-day Quito, making subject peoples of the powerful Chancas, the Quechua, and the kingdom of Chimú. A policy of forced resettlement of large contingents from each conquered people helped ensure political stability by distributing ethnic groups throughout the empire and thus making the organization of revolt very difficult. Local governors were responsible for exacting the labour tax on which the empire was based; the tax could be paid by service in the army, on public works, or in agricultural work.

Under Topa Inca Yupanqui (1471–93) the empire reached its southernmost extent in central Chile, and the last vestiges of resistance on the southern Peruvian coast were eliminated. His death was followed by a struggle for the succession, from which Huayna Capac (1493–1525) emerged successful. Huayna Capac pushed the northern boundary of the empire to the Ancasmayo River before dying in an epidemic that may have been brought by a tribe from the east that had picked it up from the Spanish at La Plata. His death set off another struggle for succession, which was still unresolved in 1532, when the Spanish arrived in Peru; by 1535 the empire was lost.

Principal portions of the Inca highway system

Inca society was highly stratified. The emperor ruled with the aid of an aristocratic bureaucracy, exercising authority with harsh and often repressive controls. Inca technology and architecture were highly developed, although not strikingly original. Their irrigation systems, palaces, temples, and fortifications can still be seen throughout the Andes. The economy was based on agriculture, its staples being corn (maize), white and sweet potatoes, squash, tomatoes, peanuts (groundnuts), chili peppers, coca, cassava, and cotton. They raised guinea pigs, ducks, llamas, alpacas, and dogs. Clothing was made of llama wool and cotton. Houses were of stone or adobe mud. Practically every man was a farmer, producing his own food and clothing.

The Inca built a vast network of roads throughout this empire. It comprised two north–south roads, one running along the coast for about 2,250 miles (3,600 km), the other inland along the Andes for a comparable distance, with many interconnecting links. Many short rock tunnels and vine-supported suspension bridges were constructed. Use of the system was strictly limited to government and military business; a well-organized relay service carried messages in the form of knotted cords at a rate of 150 miles (240 km) a day. The network greatly facilitated the Spanish conquest of the Inca Empire.

The Inca religion combined features of animism, fetishism, and the worship of nature gods. The pantheon was headed by Inti, the sun god, and included also Viracocha, a creator god and culture hero, and Apu Illapu, the rain god. Under the empire the Inca religion was a highly organized state religion, but, while worship of the sun god and the rendering of service were required of subject peoples, their native religions were tolerated. Inca rituals included elaborate forms of divination and the sacrifice of humans and animals. These religious institutions were destroyed by the Spanish conquerors' campaign against idolatry.

The descendants of the Inca are the present-day Quechua-speaking peasants of the Andes, who constitute perhaps 45 percent of the population of Peru. They combine farming and herding with simple traditional technology. Rural settlements are of three kinds: families living in the midst of their fields, true village communities with fields outside of the inhabited centres, and a combination of these two patterns. Towns are centres of mestizo (mixed-blood) population. An Indian community is close-knit, its families usually intermarrying. Much of the agricultural work is done cooperatively. Religion is a kind of Roman Catholicism infused with the pagan hierarchy of spirits and deities.

incandescent lamp, any of various devices that produce light by heating a suitable material to a high temperature. When any solid or gas is heated, commonly by combustion or resistance to an electric current, it gives off light of a colour (spectral balance) characteristic of the material.

In 1801 Sir Humphrey Davy demonstrated the incandescence of platinum strips heated in the open air by electricity; but the strips did not last long. Frederick de Moleyns of England was granted the first patent for an incandescent lamp in 1841; he used powdered charcoal heated between two platinum wires.

The first practical incandescent lamps became possible after the invention of good vacuum pumps. The Englishman Sir Joseph Wilson Swan in 1878 and the American inventor Thomas Alva Edison in the following year independently produced lamps with carbon filaments in evacuated glass bulbs. Edison has received the major credit because of his development of the power lines and other equipment needed to establish the incandescent lamp in a practical lighting system.

In 1911 the drawn tungsten filament was introduced; in 1913 filaments were coiled, and bulbs were filled with inert gas. Nitrogen alone was used first, and, later, nitrogen and argon in proportions varied to suit the wattage. These steps increased efficiency. Beginning in 1925, bulbs were "frosted" on the inside with hydrofluoric acid to provide a diffused light instead of the glaring brightness of the unconcealed filament.

The carbon-arc lamp, a very bright electric lamp used for spotlights and in motion-picture projection, consists of two carbon electrodes with a high-current arc passing between them. The light comes from heating of the electrodes and from the ionized gases in the arc.

Nonelectric incandescent lamps include the gas-mantle lamp. The mantle is a mesh bag of fabric impregnated with a solution of nitrates of cerium and one or more of the following metals: thorium, beryllium, aluminum, or magnesium. The mantle is fixed over an orifice carrying a flammable gas such as natural gas, coal gas, propane, or vaporized benzene or other fuel. When the gas is ignited, the mantle fabric burns away, leaving a brittle residual lattice of metal oxides. Light is produced when this lattice is heated to glowing by the gas combustion, although the mantle itself does not burn. Gas lamps may operate without mantles.

The limelight is a very bright gas lamp, invented in 1825 and widely used for theatrical lighting until about 1900. It consists of a block of lime (calcium oxide) heated in an oxyhydrogen flame.

Incarnation, central Christian doctrine that God became flesh, that God assumed a human nature and became a man in the form of Jesus Christ, the Son of God and the second Person of the Trinity. Christ was then truly God and truly man. The doctrine maintains that the divine and human natures of Jesus do not exist beside one another in an unconnected way but rather are joined in him in a personal unity that has traditionally been referred to as the hypostatic union. The union of the two natures has not resulted in their diminution or mixture; rather, the identity of each is believed to have been preserved.

The word Incarnation (from the Latin *caro,* "flesh") may refer to the moment when this union of the divine nature of the second Person of the Trinity with the human nature became operative in the womb of the Virgin Mary or to the permanent reality of that union in the person of Jesus. The term may be most closely related to the claim in the prologue of the Gospel According to John that the Word became flesh, that is, assumed human nature. (*See* logos.) The essence of the doctrine of the Incarnation is that the preexistent Word has been embodied in the man Jesus of Nazareth, who is presented in the Gospel According to John as being in close personal union with the Father, whose words Jesus is speaking when he preaches the gospel.

Belief in the preexistence of Christ is indicated in various letters of the New Testament but particularly in the Letter of Paul to the Philippians in which the Incarnation is presented as the emptying of Christ Jesus, who was by nature God and equal to God (*i.e.,* the Father) but who took on the nature of a slave and was later glorified by God.

The development of a more refined theology of the Incarnation resulted from the response of the early church to various misinterpretations concerning the question of the divinity of Jesus and the relationship of the divine and human natures of Jesus. The Council of Nicaea (AD 325) determined that Christ was

"begotten, not made" and that he was therefore not creature but Creator. The basis for this claim was the doctrine that he was "of the same substance as the Father." The doctrine was further defined by the Council of Chalcedon (AD 451), at which it was declared that Jesus was perfect in deity and in humanity and that the identity of each nature was preserved in the person of Jesus Christ. The affirmation of the oneness of Christ with God and with humanity was made while maintaining the oneness of his person.

Subsequent theology has worked out the implications of this definition, although there have been various tendencies emphasizing either the divinity or the humanity of Jesus. It has commonly been accepted that the union of the human nature of Christ with his divine nature had significant consequences for his human nature—for example, the grace of great sanctity. The union of the two natures has been viewed by theologians as a gift for other men, both in terms of its benefit for their redemption from sin and in terms of the appreciation of the potential goodness inherent in human activity that can be derived from the doctrine of the Incarnation.

Ince, Thomas H(arper) (b. Nov. 16, 1882, Newport, R.I., U.S.—d. Nov. 19, 1924, Hollywood, Calif.), pioneer American motion-picture director, who was the first to organize production methods into a disciplined system of filmmaking.

The son of a comedian, Ince was Daniel Frohman's office boy and first appeared on stage in 1894. In 1910 Ince began his career at D.W. Griffith's Biograph studio as an actor and director of one-reel shorts. Within five years he was internationally famous as the director of westerns starring William S. Hart, the first film-cowboy hero.

In 1915 Ince formed Triangle Pictures Production Company in partnership with two prominent directors, Mack Sennett and D.W. Griffith. At Inceville studios he initiated the system of production by which the staff was divided into units. Each unit was headed by a production manager who supervised the filming from a detailed shooting script approved by Ince in its final form. Ince also did most of the final editing on his films. By this system he controlled many pictures at one time. After 1915 his only personally directed film was *Civilization* (1916).

The story was the preeminent aspect of Ince's pictures. Films such as *The Gangsters and the Girl* (1914), *The Italian* (1915), and *The Clodhopper* (1917) are excellent examples of the tight dramatic structure that resulted from his masterful editing.

After Triangle Pictures closed at the end of World War I, Ince continued directing for other studios.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

incense, grains of resins (sometimes mixed with spices) that burn with a fragrant odour, widely used as an oblation. It is commonly sprinkled on lighted charcoal contained in a censer, or thurible.

Incense-bearing trees were imported from the Arabian and Somali coasts into ancient Egypt, where incense was prominent in religious ritual—*e.g.,* at the daily liturgy before the cult image of the sun god Amon-Re and in the mortuary rites, when the souls of the dead were thought to ascend to heaven in the flame. Incense was employed to counteract disagreeable odours and drive away demons and was said both to manifest the presence of the gods (fragrance being a divine attribute) and to gratify them. The Babylonians used it extensively while offering prayer or divining oracles. It was imported into Israel before the Babylonian Exile (586–538 BC) and was assigned miraculous powers; later, in the 5th century BC, altars were set apart for incense offerings. Incense no longer has any role in the Jewish liturgy, however.

Hindus, especially the Śaivas, use incense for ritual and domestic offerings, and so do Buddhists, who burn it at festivals and initiations as well as at daily rites. In China incense was burned during festivals and processions to honour ancestors and household gods, and in Japan it was incorporated into Shintō ritual.

In Greece from the 8th century BC, woods and resins were burned as an oblation and for protection against demons, a practice adopted by the Orphics. In Rome fragrant woods were replaced by imported incense, which became important in public and private sacrifices and in the cult of the emperor.

In the 4th century AD the early Christian church began to use incense in eucharistic ceremonial, in which it came to symbolize the ascent of the prayers of the faithful and the merits of the saints. Until the European Middle Ages its use was more restrained in the West than in the East. After the Reformation incense was employed sporadically in the Church of England until widely restored under the influence of the Oxford Movement in the 19th century. Elsewhere in both Eastern and Western Catholic Christendom, its use during divine worship and during processions has been continuous.

Historically, the chief substances used as incense were such resins as frankincense and myrrh (*qq.v.*), along with aromatic wood and bark, seeds, roots, and flowers. The incense used by the ancient Israelites in their liturgy was a mixture of frankincense, storax, onycha, and galbanum, with salt added as a preservative. In the 17th and 18th centuries, natural substances began to be supplanted by chemicals used in the perfume industry, and this trend toward the use of synthetic substitutes in incense continues to the present day.

incense burner, container generally of bronze or pottery, fitted with a perforated lid, in which incense is burnt. Although incense burners were used in Europe, they were far more widespread in the East. In China during the Han dynasty (206 BC–AD 220), a type of vessel known as a hill censer was used. It consisted of a shallow, circular pan, in the centre of which was an incense container with a pierced lid constructed as a three-dimensional representation of the Taoist Isles of the Blest. Incense burners of the Ming dynasty (1368–1644) were made in two basic forms: a square vessel on four feet, fitted with two handles and a pierced lid, and a circular tripod vessel, also fitted with a perforated lid. If the original lids were lost, it was customary to replace them with wooden lids carved in imitation of the original metal piercing. In Japan in the 19th century a number of large, bronze incense burners were made for export. Their decorative designs, often incorporating dragons, are distinguished by high relief, and the vessels were usually given artificial patinas. *See also* thurible.

incense cedar, also called WHITE CEDAR (species *Calocedrus decurrens*), ornamental and timber evergreen conifer of the cypress family (Cupressaceae). It is native primarily to the western slopes of the Cascade and Sierra Nevada mountain ranges of North America, at altitudes of 900 to 2,500 m (2,950 to 8,200 feet). The incense cedar, named for the odour its leaves emit when bruised, may grow 30 to 45 m (100 to 150 feet) tall and up to 5.5 m (18 feet) in diameter. The tree has a straight trunk, with reddish, furrowed bark, and spreading branches that end in sprays of branchlets, covered with dark green leaves. Both juvenile and mature leaves are usually present. Timber from incense cedar is used

Incense cedar (*Calocedrus decurrens*)

for carpentry, pencils, storage chests, interiors, and fence posts.

inceptisol, soil type in which soil horizons are just beginning to develop. Ranked third, in terms of land area, among the 10 world-wide soil orders, inceptisols are found in every climatic zone but are especially prevalent in the Arctic tundras of North America, Europe, and Asia. In many places they are permanently frozen below a certain depth and display microrelief forms at the surface, caused by repeated freezing and thawing. Inceptisols are also found on volcanic ash in the tropics. These soils are considered to be forerunners of ultisols, altisols, and oxisols and are extensively used in the tropics for the cultivation of sugarcane and coffee.

incest, sexual relations between persons who, because of the nature of their kin relationships, are prohibited by law or custom from intermarrying. Because, cross-culturally, incest is more an emotional than a legal issue, the term taboo is generally preferred over prohibition. The incest taboo is acknowledged in anthropology as universal, although it is imposed differently in different societies and knowledge of its breach provokes widely different reactions from society to society.

Generally speaking, the closer the genetic relationship between two people, the stronger and more highly charged is the taboo prohibiting or discouraging sexual relations between them. Thus, sexual intercourse between a father and daughter, a mother and son, or a brother and sister is almost universally forbidden. Sexual relations between an uncle and niece or between an aunt and nephew are also generally taboo, and relations between first cousins are prohibited as well in some societies.

Incest taboos beyond immediate family members can vary enormously, however. In matrilineal societies in Melanesia, for example, the taboo is extended from biological brothers and sisters to include all so-called classificatory siblings who trace their descent through the same matriline. Thus, in Melanesian society, the incest taboo makes a distinction among persons—all of whom would be called first cousins in American or European kinship systems—some being expressly forbidden as sexual partners, others considered ideal marital mates. A different type of cultural consideration is evident in Balinese traditions, which held the birth of opposite-sex twins to low-caste parents to be evidence of incest, based on the belief that the neonates had the opportunity to engage in sexual activity while in the womb. Twins of opposite-sex born into the caste of the ruling class, however, were enjoined to marry. Beliefs such as these caution anthropologists against narrow biogenetic explanations for the incest taboo and pose severe impediments to a universal definition.

Nonetheless, a few general statements can be made: (1) incest is almost universally con-

demned and is usually viewed with horror; (2) rare, culturally sanctioned abrogations of the incest taboo are known, one of the foremost being the mandatory marital union of royal siblings; (3) as the immediacy of biological relationship decreases, sanctions against sexual intimacy may be relaxed or disappear.

In anthropology, most research on incest consists of analysis and interpretation of the structure, function, and, to a lesser degree, origin of incest taboos. For sociobiologically oriented anthropologists, the question of incest, and the related questions of exogamous and endogamous marriage, are primarily a matter of genetics. Highly inbred populations have diminished reproductive success and become gene pools for hereditary disorders.

In functional terms, some scholars view the incest taboo as preserving the nuclear family from the disharmony engendered by sexual jealousy, and this argument is extended in its application to explain rules of exogamy. Evolutionary theorists argue that the prohibition on incest within a group and the corresponding rules of exogamy require males to seek sexual and marital partners outside the group, thereby establishing functional alliances with the men of other groups with whom they have exchanged women.

Another theory, emphasizing socialization, argues that the taboo is an important method of regulating the erotic impulse in children, preparing them to function with mature restraint in adult society. The psychoanalytic explanation of Sigmund Freud speculated that the horror of incest derived from the combination of ambivalent emotions toward one's immediate family and repressed forbidden desires to commit sexual acts with family members of the opposite sex.

Contemporary scholars, in their attempts to account for either the origin or the perpetuation of the incest taboo, have been careful to avoid monistic explanations, whether genetic, historical, or social. The question has also been raised whether a unitary phenomenon of incest exists, suggesting that brother-sister, mother-son, and father-daughter sexual unions might be better understood as theoretically distinct.

inch, unit of British Imperial and U.S. Customary measure equal to $^1/_{36}$ of a yard. The unit derives from the old English *unce,* or *ynche,* which in turn came from the Latin unit *uncia,* which was "one-twelfth" of a Latin foot, or *pes.* (The Latin word *uncia* was the source of the name of another English unit, the ounce.) The old English *ynche* was defined by King David I of Scotland about 1150 as the breadth of a man's thumb at the base of the nail. To help maintain consistency of the unit, the measure was usually achieved by adding the thumb breadth of three men—one small, one medium, and one large—and then dividing the figure by three. During the reign of King Edward II, in the early 14th century, the inch was defined as "three grains of barley, dry and round, placed end to end lengthwise." At various times the inch has also been defined as the combined lengths of 12 poppyseeds. Since 1959 the inch has been defined officially as 2.54 centimetres.

Inchbald, Elizabeth, *née* SIMPSON (b. Oct. 16, 1753, Suffolk, Eng.—d. Aug. 1, 1821, London), English novelist, playwright, and actress whose successful prose romances, *A Simple Story* (1791) and *Nature and Art* (1796), are early examples of the novel of passion.

At 18 Simpson ran away to London to seek her fortune on the stage, married Joseph Inchbald, an actor, and played the provincial theatres with him. She continued to act after his death in 1779 and also began to adapt plays and write original farces and comedies, *e.g., I'll Tell You What* (1785). She was not a great actress but was greatly admired for her beauty and personality.

Inchcape Rock (reef, North Sea): *see* Bell Rock.

Inch'ŏn, port city, Kyŏnggi *do* (province), northwestern South Korea. It lies near the mouth of the Han River, 25 miles (40 km) west-southwest of Seoul, with which it is connected by highway and railroad. It serves as the capital's chief seaport. In 1981 Inch'ŏn was given the status of a special city (area, 80 square miles [208 square km]) under the direct control of the home minister, with administrative status equal to a province.

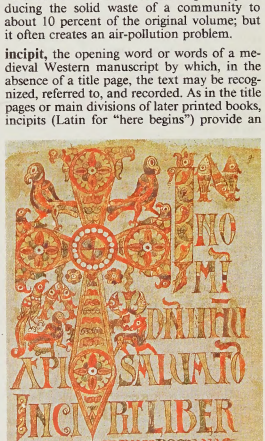
A fishing port since the Yi dynasty (1392–1910), Inch'ŏn became one of three Korean treaty ports in 1883 and developed as an international commercial port before the Japanese occupation (1910–45). During the occupation, modern industries and port facilities were developed and tidal basins constructed to overcome the 33-foot (10-metre) difference in tide level. During the Korean War, a successful United Nations troop landing at Inch'ŏn in mid-September 1950 crippled the North Korean invasion, and, to commemorate it, a huge statue of General Douglas MacArthur was erected in the city park. After the Korean War, a plate-glass factory, an iron and steel plant, an oil refinery factory, and a new dock were built at Inch'ŏn. The city's other industries are chemicals, lumber, and salt manufacturing, and the Inha University (1954) is also located there. Part of Inch'ŏn's seaside and nearby islands are used for bathing and other public recreation. Pop. (2000) 2,466,338.

inchworm: *see* measuring worm.

incidental music, music written to accompany or point up the action or mood of a dramatic performance on stage, film, radio, television, or recording; to serve as a transition between parts of the action; or to introduce or close the performance. Because it is written to enhance a nonmusical medium, most incidental music makes little impression on public taste. But some incidental music survives in its own right. Significant examples of such lasting work are Ludwig van Beethoven's music for J.W. von Goethe's *Egmont* (1810), Felix Mendelssohn's music for William Shakespeare's *A Midsummer Night's Dream,* Georges Bizet's *L'Arlésienne* suite for Alphonse Daudet's play, and Edvard Grieg's incidental music for Henrik Ibsen's *Peer Gynt.*

The origin of incidental music cannot be firmly established. It is possible that it dates to ancient Greek or Roman theatre, but there is not enough evidence to support such an assertion. It is known that 16th-century English drama, such as Nicholas Udall's *Ralph Roister Doister* (about 1535), began to include songs and music to connect one act to another; music also served as an essential accompaniment to the 16th- and 17th-century form of dramatic entertainment known as the masque. Many of Shakespeare's works, *e.g., Much Ado About Nothing, The Tempest, The Merchant of Venice,* and *As You Like It,* incorporated incidental music—mostly popular tunes, improvised instrumental flourishes, or other music assembled for the purpose of a given performance. The great Restoration composer Henry Purcell (1659–95) owes his reputation largely to the incidental music he wrote for plays and adaptations of plays by Shakespeare, John Dryden, Francis Beaumont and John Fletcher, and William Congreve, among many others. In France, Jean-Baptiste Lully (1632–87) composed incidental music for the royal *comédies-ballets,* anticipating the development of the French opera and opéra-comique.

The 19th century contributed greatly to the orchestral repertoire in the genre of incidental music and established a tradition that carried into the 20th century and interlinked such figures as the poet and playwright Paul Claudel with the composer Darius Milhaud (*Christophe Colomb,* 1928) and the composer Benjamin Britten with the poet W.H. Auden.



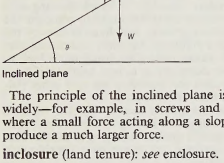
But most important to the expansion of incidental music in the 20th century has been the development, first, of the motion picture and, second, of television, both mediums that rely heavily on fragmented music to aid in story development or in setting a mood. For example, Stanley Kubrick's movie *2001: A Space Odyssey* blended the opening bars of Richard Strauss's symphonic poem *Also sprach Zarathustra,* Johann Strauss the Younger's waltz *The Blue Danube,* and electronically mixed sounds to produce moods of grandeur, delicacy, and timelessness. Much contemporary incidental music is trivial, and there has been a trend in movies and television to do without incidental music altogether. Nonetheless, it remains a field of broadening opportunity for experimentation and creativity.

incinerator, container for burning refuse, or plant designed for large-scale refuse combustion. In the second sense, an incinerator consists of a furnace into which the refuse is charged and ignited (usually by a gas burner), a secondary chamber in which burning at a high temperature is continued to complete the combustion process, and flues to convey the gases to a chimney. Auxiliary equipment may include steam boilers for using waste heat to generate electricity or to heat nearby buildings and devices for removing ash and other pollutants from the flue gases.

Incinerator plants usually include facilities for unloading and storing refuse for short periods to permit uniform charging of the furnaces and, sometimes, rough sorting or classification of the refuse.

Incineration facilitates refuse disposal by reducing the solid waste of a community to about 10 percent of the original volume; but it often creates an air-pollution problem.

incipit, the opening word or words of a medieval Western manuscript by which, in the absence of a title page, the text may be recognized, referred to, and recorded. As in the title pages or main divisions of later printed books, incipits (Latin for "here begins") provide an



Incipit page from the *Sacramentary of Gelasius,* Frankish, 750–770; in the Vatican Library (MS. Reg. Lat. 316, fol. 4r)
Biblioteca Apostolica Vaticana

occasion for display letters and a fanfare of calligraphic ornament.

The end of the text in a medieval manuscript was announced by the word *explicit* (Latin for "unrolled"), a reminder of the scroll form of the book used in the West before the codex format was adopted in about AD 700.

Consult the INDEX *first*

inclined plane, simple machine consisting of a sloping surface, used for raising heavy bodies. The force required to move an object up the incline is less than the weight being raised, discounting friction. The steeper the slope, or incline, the more nearly the required force approaches the actual weight. Expressed mathematically, the force F required to move a block D up an inclined plane without friction is equal to its weight W times the sine of the angle the inclined plane makes with the horizontal. Referring to the Figure, $F = W \sin \theta$.

Inclined plane

The principle of the inclined plane is used widely—for example, in screws and bolts, where a small force acting along a slope can produce a much larger force.

income and employment theory, a body of economic analysis concerned primarily with understanding how the level of operation of the economy, *i.e.,* the relative levels of output, employment, and prices, is determined. The practical aim of understanding the interrelation of these factors is to furnish predictions on which policies of economic stabilization can be based.

A brief treatment of income and employment theory follows. For full treatment, *see* MACROPAEDIA: Economic Theory.

Modern income and employment theory has developed since the publication of J.M. Keynes's *General Theory of Employment, Interest and Money* in 1936. Interest in the subject was triggered by the severity of the Great Depression in the United States and in Europe and the failure of the economic analyses of the time to explain the persistence of high levels of unemployment and the low levels at which business was operating. Classical economic thinking failed to explain the paradox and, indeed, aggravated the problem by recommending that taxes be raised steeply and the money supply be allowed to fall sharply.

To understand fluctuations in the level of economic activity, one must examine the relationship between income, output, and expenditure. Since transactions are two-sided, in that one person's income is another person's expenditure, the relationship could be expressed in the form of a simple equation: $Y = O = D$, where Y is the national income, O is the value national output, and D is national expenditure. What this equation means is that effective demand is equal to income (*i.e.,* purchasing power) as well as to output. Since consumers can either spend or save their income, $Y = C + S$, where C is consumption and S is savings. Similarly, on the output side, production is either sold to final customers or invested in inventory or new capital equipment and plant. So $O = C + I$, where C represents sales to final customers and I investment. Thus, $C + S = C + I$ and, therefore, $S = I$. However, while savings and investment may thus be equated from an accounting standpoint, in fact actual planned savings and planned investment may differ. Within this discrepancy lie the seeds of economic instability.

Suppose that in a given period savings rise above the previous level; the effect of this is a reduction in present demand with the prospect of increased future demand. If by coincidence additional capital formation (investment, such as in inventory) rises by the same amount, productive resources will continue to operate at capacity; there will be no change in the level of activity, and the economy will remain in equilibrium. However, if capital formation does not rise, then productive resources are wasted or idled; *i.e.,* workers become unemployed and lose their current income. The fall in incomes further reduces consumer demand and also the rate of savings. Provided manufacturers do not alter their investment plans, equilibrium will eventually be achieved at a lower level of income. In reality it is not savings that are unstable but the level of investment, and a fall in investment will produce exactly the same kind of reaction as an increase in savings; conversely, a rise in investment or an increase in consumer spending will have the opposite effect.

This simple income model explains the changes in national income in response to a change in planned savings or investment, but it does not show the extent of the change. The degree of change is determined by what Keynes called the "consumption function," *i.e.,* the marginal proportion of income spent. For illustration assume that, on average, consumers save 10 percent of their income. If the equilibrium is disturbed by an unplanned rise in investment, additional income and additional savings would be generated as described previously until a new equilibrium is reached at a higher level. At each stage the increase in savings will be 10 percent of the increase in income. The increase in income will eventually be 10 times the expansion of investment. This factor of 10 is called the multiplier, and it is the reciprocal of the ratio of savings to income (the marginal propensity to save).

Keynes's primary aim in developing his theory was to show that, under certain conditions, the economy could become stuck in a disequilibrium, with productive resources in surplus (*i.e.,* high level of unemployment) but income and output unable to rise sufficiently to reach an equilibrium. Put simply, his argument was that when business was unwilling or unable to increase investment because of ineffective (unfunded) demand, additional government spending would have the same effect of pulling the economy away from the point of disequilibrium. The use of fiscal policy (*q.v.*), such as an increase in government expenditure or a reduction in taxation, was the remedy prescribed to offset the lack of private demand.

A competing theory of income and employment places the quantity of money in the controlling role. The analysis of the effects of increasing or decreasing the money supply is approximately parallel to that of the consumption-and-savings relation. The rules of thumb derived from the two theories may, in fact, be combined: an excess demand for goods or an excess supply of money (two phenomena that may be seen as aspects of but one) is associated with rising income; an excess supply of goods or an excess demand for money (similarly) is associated with falling income. Proponents of the money, or quantity, theory advocate monetary policy (*q.v.*) as the proper countercyclical tool of government.

A third theory, far more complex even in its simplest form, relates the previous two through the nexus of the financial market and its principal characteristic, the market rate of interest.

income tax, a levy imposed by public authority on the incomes of persons or corporations within its jurisdiction. In advanced private-enterprise nations, the income tax is the chief source of revenue for government.

A brief treatment of income tax follows. For full treatment, *see* MACROPAEDIA: Taxation.

While they share some general features, corporate and personal income taxes are so different in rationale, application, and difficulties that they are best treated separately.

Corporation income tax. Virtually all countries assess income taxes on the net profits of corporations, although they differ widely in details and rates. In the United States the federal corporation income tax was adopted in 1909. Until World War II the corporation tax usually yielded more revenue than the individual income tax, but the individual tax thereafter surpassed the corporation tax and by the 1960s produced more than twice as much revenue. Three-fourths of the states also levy corporation income taxes.

Corporation income taxes are mainly flat-rate levies, rather than extensively graduated taxes with rates rising according to income. Rates on the order of 50 percent are common in industrialized nations, sometimes with reduced rates for small corporations. Corporation taxes may be graduated according to the rate of return on invested capital, rather than the absolute size of profits. This is accomplished by an excess-profits tax. Serious difficulties arise, however, in determining accurately the value of invested capital and in selecting an appropriate normal rate of return.

The economic effects of the corporation income tax are a matter of controversy. The traditional view is that the tax is not reflected in prices in the short run and hence must be paid out of profits. If firms try to maximize their profits, which in classical theory depend on prices alone, the tax will give them no reason to change their prices. This reasoning applies equally to competitive and to less competitive or wholly monopolized industries. This theory, however, does not specify what the long-run effects of the tax would be. An alternative view holds that in many industries prices are decisively influenced by the actions of a few leading firms, which have as their objective not maximum profits in the short run but a target rate of return over a period of years. When the rate of corporation income tax is increased, the leading firms will raise their prices in order to maintain the target return, and other firms will follow. This debate has not been resolved by empirical research. If the corporation income tax falls on the returns on capital, it will be generally progressive; to the extent that the tax is shifted through higher prices, it will fall mainly on consumers and be regressive with respect to income.

The adverse effect of the corporation income tax on investment can be lessened by accelerating the rate at which the cost of new machinery and buildings is written off against taxable income through depreciation allowances. The tax credit reduces the income tax payable by a certain percentage of the cost of eligible forms of new investment. Investment allowances, tax credits, and similar schemes reduce the cost of new plants and equipment and thus make investment more attractive. Outlays for research and development are intended to yield returns over a period of years and are frequently given special treatment. In the United States, corporations and individual taxpayers may choose between deducting research-and-development expenditures in full when made or capitalizing them and writing them off over their useful life. Such incentive provisions can be enhanced by permitting net

accounting losses incurred in one year to be carried back against income of prior years or carried forward to future years.

Personal income tax. Personal income taxes are levied on individuals or family units on the basis of income received. They are usually classified as direct taxes because the burden is on the individuals who pay them.

The first country to enact a general income tax was Great Britain in 1799 to finance the Napoleonic Wars. It was alternately repealed and reimposed until the 1880s, by which time it was generally accepted as a permanent levy. In the United States an income tax was first tried during the Civil War. Although it had already expired, it was held to be constitutional by the Supreme Court in 1881. Another income tax imposed in 1894 was, however, declared unconstitutional by the court. In 1913 the 16th Amendment to the Constitution was ratified, and the personal income tax was made permanent.

The fairness of personal income taxation is based on the premise that an individual's income is the best single index of his ability to contribute to the support of the government. Before a tax on personal income can be considered completely fair, it must meet the tests of horizontal and vertical equity. Horizontal equity provides that persons with the same income will, under like circumstances, pay the same amount of tax. Vertical equity considers how much graduation there should be in taxes paid by individuals at different income levels and over what range of personal incomes such graduation should extend. Progressive tax rates have been variously justified. The benefit theory holds that the taxes a person pays ought to bear some close relation to the benefits he enjoys from the operation of government. The sacrifice theory holds that an equitable tax is one that imposes equal sacrifices on individuals at different income levels. Horizontal equity requires that when persons are not similarly situated, their tax liabilities should differ. To accomplish this, the income tax statutes usually provide for personal allowances or exemptions, which differentiate between small and large family units, and deductions that give preferential treatment to certain types of expenditures. Practice with respect to deductions varies widely. In the United States, for example, individual income tax deductions include interest paid on home mortgage debt, abnormal medical expenses, philanthropic contributions, and state and local income and property taxes. In Great Britain, on the other hand, virtually no deductions are granted that do not bear some direct relation to the production of earned income. Some countries allow deductions for certain kinds and limited amounts of personal saving.

It has been argued that an income tax is less favourable to economic growth than a tax on expenditures because an income tax does (and an expenditure tax does not) fall on income that is saved and thus available for investment. It is also argued that a steeply progressive income tax reduces the incentive to work. Progressive income taxes are sometimes said to have an adverse effect on investment in risky ventures, but, so long as the tax is basically one on realized income and does not require an assessment to be made of unrealized capital gains and losses, it is generally held to be an easier tax to administer than either an expenditure tax or a wealth tax. The enforcement of the income tax in many countries, such as the United States, has been made easier by the practice of withholding the tax from wages and salaries.

incomes policy, collective governmental effort to control the incomes of labour and capital, usually by limiting increases in wages and prices. The term often refers to policies directed at the control of inflation, but it may also indicate efforts to alter the distribution of income among workers, industries, locations, or occupational groups.

Countries with highly centralized methods of setting wages tend to have the greatest degree of public or collective regulation of wage and price levels. In The Netherlands, wage settlements are subject to government approval before becoming operative, and price increases are investigated by the Ministry of Economic Affairs. Centralized wage negotiation in the Scandinavian countries functions to set limits for local bargaining rather than to fix the actual wage rate paid; as a result, local wage rates tend to drift away from the centrally determined one. In Norway and Sweden the government has no formal role in bargaining procedures, but its influence is nevertheless felt in negotiations.

France, the United Kingdom, Germany, Austria, and the United States have also sought ways of restraining wage and price increases. They have usually preferred to seek the voluntary cooperation of management and labour rather than to establish administrative machinery. Incomes policies are generally unpopular among trade unionists because they are thought to bear more heavily upon wages than upon other forms of income.

incompatible mating: *see* heterospecific mating.

incongruent melting, liquefaction of a solid accompanied by decomposition or by reaction with the melt to produce another solid and a liquid that differs in composition from the original solid. For example, enstatite, a magnesium silicate ($MgSiO_3$), melts incongruently at low pressures to form forsterite, which is another magnesium silicate (Mg_2SiO_4), and a liquid enriched in silica (SiO_2). At pressures between 2.5 and 5.5 kilobars, the melting of enstatite is congruent.

incrusted cameo (glass): *see* crystallo ceramie.

incubation, the maintenance of uniform conditions of temperature and humidity to ensure the development of eggs or, under laboratory conditions, of certain experimental organisms, especially bacteria. The phrase incubation period designates the time from the commencement of incubation to hatching. It also is the time between the infection of an animal by a disease organism and the first appearance of symptoms.

Controlled incubation is practiced by a few snakes (*i.e.,* pythons), all birds, and monotremes (platypus and echidna). Usually the temperature of the eggs is maintained by body heat, but a few species use decaying vegetation, solar heat, or even volcanic heat.

incubator, an insulated enclosure in which temperature, humidity, and other environmental conditions can be regulated at levels optimal for growth, hatching, or reproduction. There are three principal kinds of incubators: poultry incubators, infant incubators, and bacteriological incubators.

Poultry incubators are used to keep the fertilized eggs of chickens warm until they are ready to hatch. These are the oldest type of incubators; rooms heated by fires were used by the ancient Egyptians and Chinese to hatch chicken eggs, and later incubators used kerosene lamps to heat air or water in proximity to the eggs. Modern incubators are rooms heated by electricity. Large electric fans circulate the air to maintain uniform temperatures, and the eggs are turned automatically at least eight times daily. The larger commercial incubators may hold as many as 75,000 eggs at one time.

Infant incubators are used to provide a warm environment for babies born prematurely or for other infants who are unable to maintain a normal body temperature. The infant incubator is a relatively small, glass-walled box that may have portholes fitted with long rubber gloves through which nurses can handle and care for the infant. Most infant incubators are fitted with special devices that can control the concentration of oxygen inside the incubator; this is necessary because some infants need either greater or lesser amounts of oxygen owing to particular diseases they may have. Infant incubators also regulate the humidity inside the enclosure.

Bacteriological incubators provide a controlled environment in order to promote the growth of bacteria or other microorganisms in various culture media. They are insulated enclosures that are thermostatically regulated to maintain a constant temperature. Hot air is circulated over racks or shelves containing the Petri dishes, flasks, or other culture media. In medicine, such incubators are used to identify disease-causing microorganisms taken from patients. A sample of the patient's blood, sputum, mucus, or other secretion is placed in a culture medium inside the incubator, and, after the microorganisms in the sample have multiplied, they can be identified with greater certainty. Bacteriological incubators are also used in microbiology and biochemistry, in the dairy and other food-processing industries, and in water and sewage treatment plants.

incubator bird: *see* megapode.

incubus, demon in male form that seeks to have sexual intercourse with sleeping women; the corresponding spirit in female form is called a succubus. In medieval Europe, union with an incubus was supposed by some to result in the birth of witches, demons, and deformed human offspring. The legendary magician Merlin was said to have been fathered by an incubus. Parallels exist in many cultures. The word incubus is derived from the Latin *incubus* ("nightmare") and *incubare* ("to lie upon, weigh upon, brood"). In modern psychological usage, the term has been applied to the type of nightmare that gives one the feeling of a heavy weight or oppression on the chest and stomach.

incunabula (Latin: "cradles"), books printed during the earliest period of typography—*i.e.,* from the invention of the art in Europe in the 1450s to the end of the 15th century. The word seems to have been first used of early printing generally in 1653. The limit is convenient but arbitrary, since no special development in the printing art can be connected with it.

The first comprehensive attempt to catalog incunabula in general was made by Georg Wolfgang Panzer in the five volumes of his *Annales Typographici ab Artis Inventae Origine ad Annum MD.* (Nürnberg, 1793–97); this listed the books chronologically under printing centres, which were alphabetically arranged. Many others followed in all languages as interest in book collecting developed.

The total number of editions produced by the 15th-century European presses is generally put at about 35,000 or upward, to which must be added a considerable percentage for ephemeral literature (*e.g.,* single sheets, cheap romances, ballads, and devotional tracts), which has either perished completely or exists only in fragments of waste lining bindings and in other hiding places.

Indefatigable Island (Galápagos Islands): *see* Santa Cruz Island.

Independence, city, seat (1870) of Montgomery county, southeastern Kansas, U.S., on the Verdigris River, near Elk City Lake (dammed for flood control and irrigation). It was founded in 1869 by a company that purchased a portion of an Osage Indian reservation. The town had temporary economic booms with the discoveries of natural gas in

1881 and oil fields in 1903. Independence is now a trade and processing centre for agricultural products (wheat and beef and dairy cattle) and for the production of oil and natural gas. Cement, boats, machinery, and electronic equipment are manufactured. Independence Community Junior College was established in 1925. Nearby is Montgomery State Fishing Lake. Former residents include Alfred M. Landon, presidential candidate in 1936, and playwright William Inge. Inc. 1870. Pop. (1990) 9,942.

Independence, city, seat of Jackson county, western Missouri, U.S., immediately east of Kansas City. It is the hometown of President Harry S. Truman (who was born at Lamar [*q.v.*], 100 miles [160 km] south). Settled in 1827, the county was named for Andrew Jackson, and the city recalled his love of independence. Near the western terminus of transportation on the Missouri River, Independence was the starting point for the Santa Fe, Oregon, and California trails and later became a rendezvous for wagon trains to the California gold mines. Mormon settlers arrived in 1831, but local resentment drove them out in 1833. During the American Civil War, the town was occupied by Union troops and was the scene of two skirmishes with Confederates.

The crescent-shaped Harry S. Truman Library and Museum (1957), housing the former

Harry S. Truman Library and Museum, Independence, Mo.
Josef Muench

president's private papers and mementos, has a Thomas Hart Benton mural, "Independence and the Opening of the West"; Truman's grave is in the courtyard. His mid-19th century Victorian home and his courtroom and office are preserved. The Auditorium in Independence (completed 1962) is the centerpiece of the World Headquarters of the (Mormon) Reorganized Church of Jesus Christ of Latter Day Saints. A balanced agricultural and manufacturing economy prevails. Inc. 1849. Pop. (1990) 112,301.

Independence, Declaration of, in U.S. history, document that was approved by the Continental Congress on July 4, 1776, and that announced the separation of 13 North American British colonies from Great Britain. It explained why the Congress on July 2 "unanimously" by the votes of 12 colonies (with New York abstaining) had resolved that "these United Colonies are, and of right ought to be Free and Independent States." Accordingly, the day on which final separation was officially voted was July 2, although the 4th, the day on which the Declaration of Independence was adopted, has always been celebrated in the United States as the great national holiday—the Fourth of July, or Independence Day.

On April 19, 1775, when armed conflict began between Britain and the 13 colonies (the nucleus of the future United States), the Americans claimed that they sought only their rights within the British Empire. At that time few of the colonists consciously desired to separate from Britain. As the War of Independence proceeded during 1775–76 and Britain undertook to assert its sovereignty by means of large armed forces, making only a gesture toward conciliation, the majority of Americans increasingly came to believe that they must secure their rights outside the empire. The losses and restrictions that came from the war greatly widened the breach between the colonies and the mother country; moreover, it was necessary to assert independence in order to secure as much French aid as possible.

On April 12, 1776, the revolutionary convention of North Carolina specifically authorized its delegates in Congress to vote for independence; and on May 15 the Virginia convention instructed its deputies to offer the motion that was finally adopted on July 2. The motion was brought forward in the Congress by Richard Henry Lee on June 7. By that time the Congress had already taken long steps toward severing ties with Britain. It had denied Parliamentary sovereignty over the colonies as early as Dec. 6, 1775, and it had declared on May 10, 1776, that the authority of the king ought to be "totally suppressed," advising all the several colonies to establish governments of their own choice.

The passage of Lee's resolution was delayed for several reasons. Some of the delegates had not yet received authorization to vote for separation; a few were opposed to taking the final step; and several men, among them John Dickinson, believed that the formation of a central government, together with attempts to secure foreign aid, should precede it. However, a committee consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston was promptly chosen on June 11 to prepare a statement justifying the decision to assert independence, should it be taken. The document was prepared, and on July 1 nine delegations voted for separation, despite warm opposition on the part of Dickinson. On the following day, with the New York delegation abstaining only because it lacked permission to act, the Lee resolution was adopted. (The convention of New York gave its consent on July 9, and the New York delegates voted affirmatively on July 15.) On July 19 the Congress ordered the document to be engrossed as "The Unanimous Declaration of the Thirteen United States of America." It was accordingly put on parchment, probably by Timothy Matlack of Philadelphia. Members of the Congress present on August 2 affixed their signatures to this parchment copy on that day, and others later. The last signer was Thomas McKean of Delaware, whose name was not placed on the document before 1777.

The Declaration of Independence was written largely by Jefferson, who had displayed talent as a political philosopher and polemicist in his *A Summary View of the Rights of British America,* published in 1774. At the request of his fellow committee members he wrote the first draft. The members of the committee made a number of merely verbal changes, and they also expanded somewhat the list of charges against the king. The Congress made more substantial changes, deleting a condemnation of the British people, a reference to "Scotch & foreign mercenaries" (there were Scots in the Congress), and a denunciation of the African slave trade (this being offensive to some Southern and New England delegates).

It can be said, as John Adams did, that the declaration contained nothing really novel in its political philosophy, which was derived from John Locke, Algernon Sidney, and other English theorists. It may also be asserted that the argument offered was not without flaws in history and logic. Substantially abandoning contention on the basis of the rights of Englishmen, the declaration put forth the more fundamental doctrines of natural rights and of government under social contract. Claiming that Parliament never truly possessed sovereignty over the colonies and that the crown of right exercised it only under contract, the declaration contended that George III, with the support of a "pretended" legislature, had persistently violated the agreement between himself as governor and the Americans as the governed. A long list of accusations was offered toward proving this contention. The right and duty of revolution were then invoked.

Few will now claim that government arose among men as Locke and Jefferson said it did, and the social-contract theory has lost vogue among political scientists. It is likewise true, from a British viewpoint, that Parliament and crown could not be separated and that the history of the colonies after 1607 was not entirely consistent with the assertion that Parliament had never as of right possessed sovereignty over them. Furthermore, the specific charges brought against the king were partisan and not uniformly defensible, and the general accusation that he intended to establish an "absolute Despotism" is hardly warranted. It should be added that several of the heaviest specific complaints condemned actions of the British government taken after the beginning of hostilities.

The defects in the Declaration of Independence are not sufficient to force the conclusion that the document is unsound. On the contrary, it was in essence morally just and politically valid. If the right of revolution cannot be established on historical grounds, it nevertheless rests solidly upon ethical ones. The right of the colonists to government ultimately of their own choice is valid. Some of the phrases of the declaration have steadily exerted profound influence in the United States, especially the proclamation that, "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness." Although the meanings of these phrases, together with conclusions drawn from them, have been endlessly debated, the declaration has served to justify the extension of American political and social democracy.

The Declaration of Independence has also been a source of inspiration outside the United States. It encouraged Antonio de Nariño and Francisco de Miranda to strive toward overthrowing the Spanish empire in South America, and it was quoted with enthusiasm by the Marquis de Mirabeau during the French Revolution. It remains a great historical landmark in that it contained the first formal assertion by a whole people of their right to a government of their own choice. What Locke had contended for as an individual, the Americans proclaimed as a body politic; moreover, they made good the argument by force of arms.

Since 1952 the original parchment document of the Declaration of Independence has resided in the National Archives exhibition hall in Washington, D.C.

Independence, United States War of: *see* United States War of Independence.

Independence Day, also called FOURTH OF JULY, in the United States, anniversary of the adoption of the Declaration of Independence by the Second Continental Congress (July 4, 1776); it is the greatest secular holiday of the United States. Although Congress actually approved the resolution of independence from Britain on July 2 and the Declaration was not publicly read until July 8, it was on July 4 that the Declaration was drafted by Congress. The first anniversary of the Declaration was marked by a festive impromptu celebration in Philadelphia, but celebration became common only after the War of 1812. Thereafter, civic-minded groups worked to link the ideals of democracy and citizenship to the pa-

Declaration of Independence [1776]

In Congress, July 4, 1776

The Unanimous Declaration of the Thirteen United States of America

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.—We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.—He has refused his Assent to Laws, the most wholesome and necessary for the public good.—He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.—He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.—He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures.—He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.—He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.—He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new Appropriations of Lands.—He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers.—He has made judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.—He has erected a multitude of New Offices, and sent hither swarms of Officers to harrass our people, and eat out their substance.—He has kept among us, in times of peace, Standing Armies, without the Consent of our legislatures.—He has affected to render the Military independent of and superior to the Civil power.—He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation:—For quartering large bodies of armed troops among us:—For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:—For cutting off our Trade with all parts of the world:—For imposing Taxes on us without our Consent:—For depriving us in many cases, of the benefits of Trial by Jury:—For transporting us beyond Seas to be tried for pretended offences:—For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:—For taking away our Charters, abolishing our most valuable Laws, and altering fundamentally the Forms of our Governments:—For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.—He has abdicated Government here, by declaring us out of his Protection and waging War against us.—He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.—He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.—He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands.—He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our Brittish brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which, would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind. Enemies in War, in Peace Friends.—

We, therefore, the Representatives of the United States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

Note.—Mr. Ferdinand Jefferson, Keeper of the Rolls in the Department of State, at Washington, says: "The names of the signers are spelt above as in the facsimile of the original, but the punctuation of them is not always the same; neither do the names of the States appear in the facsimile of the original. The names of the signers of each State are grouped together in the facsimile of the original, except the name of Matthew Thornton, which follows that of Oliver Wolcott."—*Revised Statutes of the United States*, 2nd edition, 1878, p. 6.

triotic spirit of the day. Many undertakings of public interest have been initiated on July 4: digging the Erie Canal, 1817; building the Baltimore and Ohio Railroad (first railway in the country), 1828; laying the cornerstone of the Washington Monument, 1850; and formal recognition of the Philippines' independence, 1946.

Independence Island (Kiribati): *see* Malden Island.

Independent, also called SEPARATIST, any of the English Christians in the 16th and 17th centuries who wished to separate from the Church of England and form independent local churches. They were eventually called Congregationalists. Independents were most influential politically in England during the time of the Commonwealth (1649–60) under Oliver Cromwell, the lord protector, who was himself an Independent. Subsequently, they survived repression and gradually became an important religious minority in England.

One group of Separatists left England for Holland in 1608, and in 1620 some of them, the Pilgrims, settled at Plymouth, Mass. The Plymouth Separatists cooperated with the Puritans (nonseparating Independents) who settled Massachusetts Bay (1630). In England the Puritans had hoped to purify the Church of England, but in New England they accepted the congregational form of church government in which each local church was independent. Thus, the churches of the Separatists and the Puritans became the Congregationalists of the United States.

A fundamental belief of the Independents was the idea of the gathered church, which was in contrast to the territorial basis of the Church of England whereby everyone in a certain area was assigned to the parish church. Independents believed that the foundation of the church was God's Spirit, not man or the state. Those who were definitely Christian believers, therefore, should seek out other Christians and gather together to make up a particular church. This belief was the basis for the autonomous local church of the Independents, which became a principal tenet of Congregationalism.

Independent Christian Churches: *see* Undenominational Fellowship of Christian Churches and Churches of Christ.

Independent Television (ITV), in the United Kingdom, television network consisting of a consortium of private companies in competition with the British Broadcasting Corporation. It is regulated by the Independent Broadcasting Authority, which was originally the Independent Television Authority. The ITV network was authorized by act of Parliament in 1954, when the BBC's monopoly over radio and television broadcasting was modified to permit a single channel to operate by selling airtime to advertisers.

The innovation came into existence amid fierce political controversy. ITV differed from the American commercial-television model in that there was only one channel for the independent facility, and its broadcasts were subject to much greater regulation of advertising and involved a greater range of variety and program content.

There were four original contractors who were to share ITV's single network: Rediffusion, Granada, ATV, and ABC. All were based on established cinema and show-business interests, and they quickly set about providing the popular peak-time viewing: variety shows, big-money quizzes, pop-music programs, and open-ended drama serials, or "soap operas." ATV's *Sunday Night at the London Palladium* remained a staple of the weekend viewing diet for 13 years; Granada's *Coronation Street,* a twice-weekly saga of working-class life in Northern England, achieved great popularity. ATV in particular, under the dynamic leadership of Lew Grade (later Lord Grade), embarked on a series of fast-moving adventure programs, beginning with *The Saint* and *Danger Man.*

The immediate popularity of ITV had a devastating effect on the BBC, and ITV revenues soared from an initial £2,000,000 to more than £60,000,000. The BBC reacted by adding popular programming in prime viewing hours, and ITV programmers greatly enhanced their reputation by developing superiority in coverage of current affairs and in some documentary areas.

Indes, Compagnie Française des (French: "French Company of the Indies"), one of the companies known as the French East India Company (*q.v.*).

Indes Orientales, Compagnie Française des (French: "French Company of the East Indies"), one of the companies known as the French East India Company (*q.v.*).

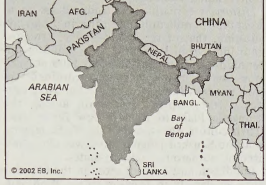
indeterminacy principle (physics): *see* uncertainty principle.

indeterminate sentence, in law, term of imprisonment with no definite duration within a prescribed maximum. Eligibility for parole is determined by the parole authority. In this respect, an indeterminate sentence differs from a definite one in that statutes prescribing the latter usually provide for parole eligibility after a specified fraction of the full term—in most countries, from one-half to two-thirds of the original sentence.

Indeterminate sentences were pioneered in the reformatory movement of the last quarter of the 19th century. Release was determined by progress made under the program of training rather than by a judicially established sentence. In current practice, release on parole from an indeterminate sentence is initiated by the recommendation of prison staff personnel, field parole officers, and the parole authorities. Evaluation of the offender's conduct in prison, the nature of his offense, his life history, his prospects in the community,

his general personality, and his attitude determine his suitability for parole.

index fossil, any animal or plant preserved in the rock record of the Earth that is characteristic of a particular span of geologic time or environment. A useful index fossil must be distinctive or easily recognizable, abundant, and have a wide geographic distribution and a short range through time. Index fossils are the basis for defining boundaries in the geologic time scale and for the correlation of strata. In marine strata, index fossils that are commonly used include the single-celled Protista with hard body parts and larger forms such as ammonoids. In terrestrial sediments of the Cenozoic Era, which began about 66.4 million years ago, mammals are widely used to date deposits. All of these animal forms have hard body parts, such as shells, bones, and teeth, and evolved rapidly.



Index Librorum Prohibitorum (Latin: "Index of Forbidden Books"), list of books once forbidden by Roman Catholic church authority as dangerous to the faith or morals of Roman Catholics. Publication of the list ceased in 1966, and it was relegated to the status of a historic document.

Compiled by official censors, the *Index* was an implementation of one part of the teaching function of the Roman Catholic church: to prevent the contamination of the faith or the corruption of morals through the reading of theologically erroneous or immoral books. It was not, therefore, equivalent to the total legislation of the church regulating reading by Roman Catholics; nor was it ever a complete catalog of forbidden reading. Until 1966, canon law prescribed two main forms of control over literature: the censorship of books by Roman Catholics in advance of publication, in regard to matters of faith and morals (a practice still followed); and the condemnation of published books that were judged to be harmful. The works appearing on the *Index* are only those that ecclesiastical authority was asked to act upon.

The origin of the church's legislation concerning the censorship of books is unclear, but books were a source of concern as early as the scriptural account of the burning of superstitious books at Ephesus by the new converts of St. Paul (Acts 19:19). The decree of Pope Gelasius I about 496, which contained lists of recommended as well as banned books, has been described as the first Roman Index. The first catalog of forbidden books to include in its title the word index, however, was published in 1559 by the Sacred Congregation of the Roman Inquisition (a precursor to the Congregation for the Doctrine of the Faith). The last and 20th edition of the *Index* appeared in 1948.

indexation, in fiscal policy, a means of offsetting the effect of inflation or deflation on social security payments and taxes by measuring the "real value" of money from a fixed point of reference, usually a price index. Without indexing, recipients of social security benefits, for example, would suffer during times of inflation if their benefits remained at a fixed rate. Indexation in this case would also apply to taxes levied to support the program. Indexation is used in some countries to offset "bracket creep," which occurs in any progressive tax (*q.v.*) system when inflation pushes taxpayers into higher income tax brackets. Indexation may also refer to the linking of wage rates and financial instruments to a price index.

India, officially REPUBLIC OF INDIA, Hindi BHĀRAT, or BHĀRATAVARSHA, republic of southern Asia, the seventh largest and second most populous nation in the world. India is bordered to the northwest by Pakistan; to the northeast by China, Nepal, and Bhutan; and to the east by Myanmar (Burma). Its northeastern portion encloses Bangladesh on three sides. It fronts the Bay of Bengal on the southeast and the Arabian Sea on the southwest. Offshore to the southeast lies the island republic of Sri Lanka. The capital is New Delhi. Area 1,222,243 square miles (3,165,596 square km). Pop. (2000 est.) 1,014,004,000.

India

A brief treatment of India follows. For full treatment, *see* MACROPAEDIA: India.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. India consists of three major physiographic provinces from north to south: the Himalayas and associated mountain ranges; the northern plain; and a diverse southern region of highlands and plains.

The Himalayas extend in a great arc, from northwest to southeast, across India's northern marches and include many peaks with elevations above 25,000 feet (7,600 m). The northern plain, which lies almost entirely below 1,000 feet (300 m) in elevation, is formed mainly by the alluvial deposits of three great river systems: the Indus in the west (mainly in Pakistan and represented chiefly by tributaries on the plains of India); the Ganges, which is the plain's central component and the most important river in India; and the Brahmaputra in the east. The delta of the Ganges straddles India's border with Bangladesh, where it merges with the delta of the Brahmaputra. An extension of the plain in the west is the Great Indian, or Thar, Desert, which extends into Pakistan. The chief feature of the southern region is the Deccan Plateau, which includes the geologically oldest portions of the country and consists mainly of subdued highlands, with few crests more than 3,300 feet (1,000 m) in elevation. The south's other principal highlands are the Arāvali Range forming its northwestern flank, the east-west-trending Vindhyas, and the Western and Eastern Ghāts; the latter are chains of low mountains running parallel to the coasts. The adjacent coastal plains are generally narrow.

All the great rivers of the northern plain originate in or north of the Himalayas. They are characterized by more stable flow regimes than those of the rivers of peninsular (*i.e.*, central and southern) India, in which peak flows occur in association with the rains of the summer monsoon. Most of the rivers of peninsular India, including, from north to south, the Mahānadi, Godāvari, Krishna, and Cauvery (Kāveri), flow eastward; the two most important westward-flowing rivers are the Narmada and the Tāpi (Tāpti).

The tropical monsoon climate of India is characterized by three main seasons: a hot, dry season from March to May; a hot, wet season from June to September, during which time most of the annual rainfall occurs; and a cool, dry season from October to February. Mean annual precipitation varies from about 450 inches (11,430 mm) in Cherrapunji in Meghālaya to less than 4 inches (100 mm) in the Thar Desert. Over most of the country rainfall diminishes from east to west, mainly within a range from 60 to 20 inches (1,500 to 500 mm), but the windward west coast of peninsular India forms a belt of much higher rainfall.

Almost three-fifths of India's total land area is arable, and about one-fourth of the cultivated land is irrigated. Nearly one-fourth of the country is nominally forested, but much of the area so classified consists of degraded scrub. The remaining wooded areas support a variety of wildlife including several species of monkeys, tiger, leopard, buffalo, antelope, elephant, and rhinoceros.

The people. The peoples of India comprise widely varying mixtures of ethnic strains drawn from peoples settled in the subcontinent before the dawn of history or from invaders whose history is well known. Northern India is the hearth within which Hinduism, Buddhism, Jainism, and, much later, Sikhism originated. These indigenous faiths have been supplemented by Islām and Christianity as a result of external contacts over the last two millennia. Hinduism, whose roots in India run deepest, accounts for approximately four-fifths of the population, while Muslims, India's largest minority, constitute about one-ninth of the population, followed by Christians, Sikhs, Buddhists, and Jains. Tribal animists, though numerous, are for the most part counted as Hindus.

India is linguistically diverse. Three-fourths of the population speak languages belonging to the Indo-Aryan group of the Indo-European family, which are all ultimately descended from Sanskrit. These include the national language, Hindī, as well as Assamese, Bengali, Gujarātī, Kashmirī, Marāṭhī, Oṛiyā, Punjābī, Sindhī, and Urdū, all enjoying official status. Nearly one-fourth of all Indians speak languages belonging to the Dravidian family, among which Kannaḍa, Malayālam, Tamil, and Telugu have official status. English, an auxiliary official language, serves as an all-Indian lingua franca.

Changed attitudes in respect to family planning and birth control, partly in response to government programs, have led to a reduction in the population's rate of natural increase, but this rate is still too high for the expanding economy to provide marked gains in living standards for much of the population. The shift of population from rural to urban areas is slower in India than in most developing countries, but more than one-fourth of the total population is now urban. The chief cities, in descending order of population, are Bombay (Mumbai), Calcutta (Kolkata), Delhi, Madras (Chennai), Hyderābād, and Bangalore.

The economy. India has a developing mixed economy in which both the public and private sectors participate. Agriculture still accounts for about two-thirds of the labour force but for only one-third of the gross domestic product (GDP). The service sector yields two-fifths of the GDP; and the steadily expanding manufacturing sector provides about one-fifth of the GDP. High technology, including information systems and software development, is an important and growing sector of the economy. India's economic growth, though fairly steady since independence in 1947, has nevertheless been undramatic, and its gross national product (GNP) per capita remains among the lowest in the world. Despite the existence of a substantial and expanding middle class, a large proportion of the population still lives below the poverty line.

Less than half the country's peasantry own their own land, and most peasants are still subsistence cultivators. Landlessness, tenant farming, and debt remain serious problems. The Green Revolution, however, has brought about remarkable transformations in several favoured agricultural regions and has increased production sufficiently to allow India

to weather a number of bad monsoons without succumbing, as in the past, to famine. Rice and wheat are the principal staple crops, followed by various millets, pulses, corn (maize), and oilseeds, while the chief cash crops are cotton, sugarcane, coconut, spices, jute, tobacco, tea, coffee, and rubber. India's combined population of cattle and water buffalo is by far the world's largest, and goats, sheep, and camels are also numerous. The government manages most of the rapidly diminishing forests. Despite advances in responsible forestry, however, timber-cutting is not carried out on a sustainable basis.

The central government controls most mineral industries. Reserves of coal are widespread and abundant, and its extraction employs most mine workers in India. Petroleum comes from several scattered fields, but production accounts for less than half of the country's rapidly growing needs. Iron ore, bauxite, and ferroalloys are among the other minerals produced.

India's manufacturing sector is highly diversified and includes a range of heavy, high-technology, and consumer-goods industries. The country's chief manufactures include textiles, iron and steel, cement, fertilizers, other chemicals, automotive vehicles, ships, bicycles, textile and other machinery, electrical appliances and electronics, and pharmaceuticals. Electricity is generated mainly by thermal plants with some hydroelectric installations. Labour unions, generally affiliated with various political parties, are important in the modern sectors of the economy. India's chief trading partners include the United States, countries of the European Union, and Japan.

Government and social conditions. India is a democratic republic made up of 28 states, 6 union territories, and the national capital territory of Delhi. Its 1950 constitution is based largely on the British model of parliamentary government. Legislative power is vested in a bicameral Parliament; its Council of States (Rājya Sabhā) has no more than 250 members, most of whom are indirectly elected to six-year terms, one-third every two years. The House of the People (Lok Sabhā) has no more than 550 members, who are directly elected to five-year terms. The president, the constitutional head of state, is elected to a five-year term by an electoral college. The president's duties are largely nominal except in times of national emergency, when he can declare direct rule over states and territories and dissolve the Parliament. Executive power is exercised by the appointed Council of Ministers under the leadership of the prime minister, who is designated by the majority party or coalition in Parliament. From independence to 1977 the government was dominated by the Congress Party, but since then other parties or coalitions have also governed.

Health conditions remain poor for many; the average life expectancy is about 64 years. The country is plagued by such diseases as dysentery, malaria, tuberculosis, cholera, and filariasis. Intestinal ailments are the leading cause of child mortality, largely because of the lack of safe drinking water. Malnutrition is also a serious and widespread problem.

Education is primarily the responsibility of the state governments. Some three-fifths of the population is literate, but the rate is much lower among women than among men. The pace of expansion of university education, which is still conducted mainly in English, has far outstripped that at lower levels, despite the fact that primary schooling, conducted mainly in local vernacular languages, is free.

India's press has generally enjoyed a high degree of freedom. Newspapers appear in all the major languages of the country, but those in English remain most influential. Radio and television ownership is increasing, and growing numbers have access to telephones, cellular phones, and personal computers.

Cultural life. The cultural heritage of India is one of the richest and most ancient in the world. (*See* Indian architecture; Indian dance; Indian literature; Indian music; Indian philosophy; Indian sculpture.)

History. Agriculture in India dates to at least the 7th millennium BC, and an urban civilization, that of the Indus Valley, extended into India from Pakistan by the mid-3rd millennium BC. Between 1500 and 1200 BC various Aryan tribes became prominent in northwestern India, and in the following centuries they spread eastward across the Gangetic Plain to what is now Bihār state. Their culture was rooted in the Vedic religion and the Sanskrit language and was characterized by numerous small city-states.

Buddhism and Jainism arose in the 6th century BC, largely in reaction to the Brahman-dominated caste-based society that had arisen out of Vedism and its successor religion, Hinduism. By the mid-5th century, the Bihār-based Magadhan state had conquered the whole of the Gangetic Plain, laying the foundation for the Mauryan empire (*c.* 321–185 BC). That pan-Indian state reached its zenith under the emperor Aśoka (d. 238 BC). For most of the ensuing 18 centuries, political fragmentation was the norm, though the period of the Gupta empire (AD *c.* 320–540), characterized by the flowering of classical Indian culture, was an exception to this rule.

The Muslim invasions began about AD 1000, and in 1206 the long-lived Delhi sultanate was established, reaching its apogee under the Tughluq dynasty in the early 14th century. Areas conquered by the Tughluqs in the south then broke away and waged a long struggle for supremacy with the kingdom of Vijayanagar, which was the principal surviving Hindu state until its collapse in the early 17th century. The greatest of all the Muslim states in India was the Mughal Empire, which supplanted the Delhi sultanate in 1526. By the late 17th century it encompassed most of India.

Vasco da Gama's voyage to India in 1498 initiated several centuries of commercial rivalry among the Portuguese, Dutch, English, and French. Territorial acquisition was not a prominent concern until Great Britain's victory over a combined Mughal and French force in 1757, which resulted in British supremacy in Bengal. Thereafter British conquests spread rapidly, and by 1818 the British had defeated the Hindu Marāṭhās, who had risen up against the Mughals in the late 17th century and carved out their own large empire. By the time of the defeat of the Sikh kingdom in 1849, virtually the whole of India was under British rule. The tranquillity of the latter was shattered, however, by the Indian Mutiny (1857–58), which led the British government in 1858 to institute its direct rule over India in place of that of the British East India Company.

Indian nationalist sentiments crystallized in the establishment of the Indian National Congress in 1885, which was initially loyal to the British but which pressed, with increasing stridency, for a greater Indian voice in government. Muslim Indians' fears that their interests would be subordinated to those of the dominant Hindu population led to the establishment of the Muslim League in 1906. Although India was granted limited self-government under the Government of India Act of 1919, the Congress sanctioned a series of noncooperation and civil-disobedience campaigns, beginning in 1920 under the leadership of Mohandas K. Gandhi. The Government of India Act of 1935 expanded the powers of the elected provincial and national legislatures and helped lay the groundwork for full independence.

By 1947, when Britain finally granted full independence, the rift between the Muslim League and the Hindu-dominated Congress had become unbridgeable. Britain and Congress together had to acquiesce to the Muslims' demand for a separate state of Pakistan, which was created out of the predominantly Muslim northwestern and northeastern portions of India (the latter region becoming independent as Bangladesh in 1971). This partition was accompanied by fighting between the two new states over the status of the Kashmir region, which was claimed by both sides and was to remain a point of contention.

Prime ministers of India

name	party	term
Jawaharlal Nehru	Congress	1947–64
Lal Bahadur Shastri	Congress	1964–66
Indira Gandhi	Congress	1966–77
Morarji Desai	Janata	1977–79
Charan Singh	Janata	1979–80
Indira Gandhi	Congress (I)	1980–84
Rajiv Gandhi	Congress (I)	1984–89
V.P. Singh	Janata Dal	1989–90
Chandra Shekhar	Janata Dal (S)	1990–91
P.V. Narasimha Rao	Congress (I)	1991–96
Atal Behari Vajpayee	Bharatiya Janata	1996
H.D. Deve Gowda	Janata Dal	1996–97
Inder Kumar Gujral	Janata Dal	1997–98
Atal Behari Vajpayee	Bharatiya Janata	1998–2004
Manmohan Singh	Congress	2004–

Jawaharlal Nehru, his daughter Indira Gandhi, and his grandson Rajiv Gandhi each successively led the long-dominant Congress Party. During those years, secular and democratic India made much progress as a political and economic leader of the postcolonial nonaligned states, engaged in military conflicts with neighbouring Pakistan and China, and responded to numerous independence movements within its diverse, multiethnic population. Other political parties have risen to power since the late 1970s, and India also has had to contend with a rise in Hindu nationalism that has challenged the secular basis on which the country was established.

India, Air- (airline): *see* Air-India.

India, House of, also called HOUSE OF GUINEA, HOUSE OF GUINEA AND MINA, or HOUSE OF MINA, Portuguese CASA DA INDIA, CASA DA GUINÉ, CASA DE GUINÉ E MINA, or CASA DA MINA, 15th-century Portuguese establishment that managed the trade in products from overseas colonies. It was called House of Guinea because it began by processing products from Guinea. Originally housed in a warehouse at Lagos in southern Portugal, it was reestablished in Lisbon with the death of Prince Henry the Navigator (in 1460). As trade from São Jorge da Mina (now Elmina, Ghana) on the African Gold Coast increased, it became known as the House of Guinea and Mina.

Until 1499, the House of Guinea represented, in embryonic form, a colonial ministry in Portugal. Portugal's overseas trade grew tremendously as contact with the Orient was established after Vasco da Gama rounded the Cape of Good Hope in 1497–98. The establishment was renamed House of India and subsequently divided into *mesas* (boards) to handle the spice trade, finances, ship scheduling and maintenance, training of seamen, documentation and correspondence, and legal and juridical matters. It later also controlled the colonization of Brazil and eventually evolved into the government colonial ministry.

India ink, also called CHINESE INK, black pigment in the form of sticks that are moistened before use in drawing and lettering, or the fluid ink consisting of this pigment finely suspended in a liquid medium, such as water, and a glutinous binder. The sticks or cakes

consist of specially prepared lampblack, or carbon black, mixed with a gum or glue and sometimes perfume. India ink was used in China and Egypt centuries before the Christian era and is still valued for the opacity and durability that make it one of the finest of inks.

In India, the carbon black from which India ink is produced is obtained by burning bones, tar, pitch, and other substances.

India rubber plant, also called INDIA RUBBER TREE (species *Ficus elastica*), large tree in its native Southeast Asia and in other warm areas but a common indoor pot plant elsewhere. It has large, thick, oblong leaves, up to 30 cm (12 inches) long and figlike fruits in pairs along the branches. The milky sap, or latex, was once an important source of an inferior natural rubber.

Young plants available in the florist's trade are durable and grow well under less-than-ideal indoor conditions. Among the cultivated varieties offered are Decora, with broader and darker green leaves, and a few variegated strains, with marbled gray, cream, and white leaves or green leaves with white or yellow margins.

Indian architecture, the past and present building traditions of the Indian subcontinent.

A brief treatment of Indian architecture follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

Indian architecture dates back to at least the 2nd millennium BC and has been primarily religious in function, serving Buddhism, Hinduism, Islām, and Jainism. The earliest Indian buildings were Buddhist and Hindu temples made of wood and then of brick; other temples were carved out of solid rock and are called cave temples. By the 4th century BC, stone had become the accepted material for buildings, and successive Indian cultures acquired great skill in the carving and construction of stone buildings. Large stupas, or dome-shaped Buddhist shrines, and rectilinear temples and monasteries were built during the the Maurya period (4th–2nd century BC), along with cave temples. The Gupta period (4th–6th century AD) marked the beginning of the zenith of Indian architecture and the emergence of its most characteristic structure, a temple with a square base and a pyramidal tower that has either a straight or curving outline and is heavily decorated with architectural and figural ornament. This temple form was brought to its stylistic height during the 7th to 11th centuries AD, and the Hindu temple complexes themselves became larger and more elaborate in plan, layout, and building type. A rich variety of regional building styles developed at this time, all concentrating on the temple complex.

The extension of Islām into India in the 11th and 12th centuries introduced typical Muslim architectural forms such as the dome, the pointed arch, and Islāmic decoration into mosques, tombs, and other structures. This period is viewed by some scholars as a decline relative to the splendour of the previous indigenous architecture, but such marvels as the Taj Mahal resulted from the rule of the Muslim Mughal dynasty in the 16th–18th century. The period of European colonization and then of British rule in India resulted in the introduction and imitation of European building styles in India, and, by the time of Indian independence in the mid-20th century, Indian architecture was almost entirely modern in its form, style, and materials.

Indian Association, nationalist political group in India that favoured local self-government and served as a preparatory agent for the more truly national Indian National Congress. The association was founded in Bengal in 1876 by Surendranath Banerjea and Ananda Mohan Bose; it soon displaced the Indian League, which had been founded the year before, and rivaled the long-standing British Indian Association, which it regarded as a reactionary body of landlords and industrialists. The association was supported mainly by younger professional men among the Bengali intelligentsia. It spread beyond Bengal to other parts of India but remained Bengali in character, using expatriate Bengali communities as centres for its provincial branches.

The association found an issue in opposing the lowering of the age limit for civil service examinations (1877), which was disadvantageous to Indian candidates; and in 1878 it objected to the Vernacular Press Act, which stifled the Indian press. It advocated local self-government and tenant rights, and, when the Bengal Tenancy Act was finally passed in 1885, it demanded representative government. After the Indian National Congress was founded in 1885, the association gradually lost ground; it was not heard of after 1888.

Indian Botanic Garden, formerly ROYAL BOTANIC GARDEN, botanical garden in Calcutta, famous for its enormous collections of orchids, bamboos, palms, and plants of the screw pine genus (*Pandanus*). The garden covers more than 109 hectares (270 acres), on which about 1,700 plant species are cultivated. It was founded in 1787 by the East India Company, primarily for the purpose of acclimatizing new plants of commercial value and growing spices for trade. A major change in policy, however, was introduced by the botanist William Roxburgh after he became superintendent of the garden in 1793. Roxburgh brought in plants from all over India and developed an extensive herbarium. This collection of dried plant specimens eventually became the Central National Herbarium of the Botanical Survey of India, which comprises 2,500,000 items. Over the years attractive display gardens for the public have been developed and many kinds of plants have been cultivated for scientific observation. During the 1970s the garden initiated a program to introduce improved food plants and other varieties of economic benefit to the people of India. The best-known landmark of the garden is an enormous banyan tree that is more than 300 m (1,000 feet) in circumference and thought to be two centuries old.

Indian buffalo: *see* water buffalo.

Indian dance, the dance traditions and styles of India.

A brief treatment of Indian dance follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

Indian dance can be divided into classical, folk, and modern types. The classical tradition is at least 2,000 years old, and in the course of history its influence has diffused throughout much of Southeast Asia. India evolved a type of classical dance drama that combines movement, gesture, singing, music, and costumes. The dancer dances out the story by using stylized gestures that are both highly symbolic and emotionally suggestive. The stories that are enacted are based on Hindu religion and mythology. The classical dance drama is both aesthetically appealing and highly psychological in its approach. It has attained world recognition as one of the most exquisite forms of classical dance.

Indian folk dancing is highly varied, differing as it does from region to region and from one ethnolinguistic group to another. Dance is also an integral, even an indispensable, element in many of the productions of India's vast motion-picture industry.

Indian grass (species *Sorghastrum nutans*), tall perennial forage grass of the family Poaceae and one of the important constituents of the North American tall grass prairie. It bears narrow, greatly branched flower clusters. Each

Indian grass (*Sorghastrum nutans*)
Douglas David Dawn

yellow spikelet is fringed with white hairs, giving the plant a silver-and-gold appearance. It is a close relative of *S. elliottii* and *S. secundum*.

Indian hemp (plant of the pea family): *see* sunn.

Indian hemp, also called HEMP DOGBANE (species *Apocynum cannabinum*), North American plant of the dogbane family Apocynaceae (order Gentianales). It is a branched perennial that grows up to 1.5 m (5 feet) tall and has smooth opposite leaves and small greenish white flowers. Indians used the fibres from the stem to make bags, mats, nets, and cordage. Its milky juice, or latex, yields rubber, and the dried roots of Indian hemp and a related plant (*A. androsoemifolium*) make a drug that acts as a heart stimulant. True hemp (*Cannabis sativa*) is sometimes called Indian hemp.

Indian languages, languages spoken in the Indian subcontinent. The languages of the region are generally classified as belonging to the following families: Indo-European (the Indo-Iranian branch in particular), Dravidian, Austro-Asiatic (Munḍā in particular), and Sino-Tibetan. Fourteen languages are mentioned in the constitution of India: Hindi, Urdū, Punjābi, Bengali, Oṛiyā, Marāṭhī, Gujarāṭi, Sanskrit, and Assamese, all belonging to the Indo-Aryan group of the Indo-Iranian branch of Indo-European; Kashmirī, belonging to the Dardic group of the Indo-Iranian branch of Indo-European; and Telugu, Tamil, Kannaḍa (or Kanarese), and Malayāḷam, belonging to the Dravidian language family. The Manipurī language of Assam and the Newārī language of Nepal are usually classified, along with languages of the Bodo group, as belonging to the Tibeto-Burman branch of the Sino-Tibetan language family. Among the Munḍā languages (classified as a branch of the Austro-Asiatic language family), Santhālī and Khāsi have the most speakers.

Languages used in Pakistan include the Sindhī, Punjābī, and Urdū languages, which belong to the Indo-Aryan group, and Brāhūī, which is a Dravidian language. Bengali is the language of Bangladesh. *See* Indo-Aryan languages; Indo-Iranian languages.

Indian law, the legal practices and institutions of India. The general history of law in India is a well-documented case of reception as well as of grafting. Foreign laws have been "received" into the Indian subcontinent—for

example, in the demand by the Hindus of Goa for Portuguese civil law; and the enactment by independent India of statutes such as the Estate Duty Act (1953), the Copyright Act (1957), and the Merchant Shipping Act (1958), which substantially reproduce English models. Foreign laws have also frequently been "grafted" upon indigenous laws, as is seen in both Anglo-Muslim and Hindu law. Legal institutions introduced by foreign governments were accepted readily by the Indians, either because they were compatible with existing trends or because they met new needs. Independence in 1947 brought an intensification of these processes.

Indian law thus draws on a number of sources. The Hindu law system began with the Vedas and contemporary non-Aryan customs 3,000 years ago. Slowly, it evolved through blending, comparison, and analysis. After the Arab invasions in the 8th century AD, Islāmic law was introduced in some areas, particularly in the north. The English common law is the residual law in the high courts of Bombay, Calcutta, and Madras; and, at times with the aid of relevant British statutes, it is the residual law also in all other jurisdictions representing the old East India Company's courts, in which, since 1781, "justice, equity and good conscience" have supplied the rule of law when no Indian statute or rule of personal law (*e.g.*, Hindu law) covered the point. The Portuguese and French used their own laws in their colonies. In British India some British statutes applied, and a few have remained in force. All powers adapted their laws to local conditions, and the famous Anglo-Indian codes, passed in India at intervals from 1860 to 1882, reflected the influence of French and American as well as English and Anglo-Indian models. During that period Roman, or civil, law and continental juridical theory were widely cited, particularly in the Madras high court, to give India the benefit of the best law available; but through codification and other influences this source was soon exhausted. Interpretation of the constitution has resulted in the introduction of some American principles, and welfare and industrial statutes are construed in the light of case law decided elsewhere in the Commonwealth. Western influence is also present in the treatment of personal law.

Generally speaking, Hindu law is the personal law applying to 85 percent of the population and constituting the main juridical product of Indian civilization. The word Hindu does not imply a strict religious orthodoxy and is more ethnic than creedal in its emphasis. Nevertheless, since independence India has aimed at abolishing the personal laws in favour of a civil code (constitution, article 44), which would unify, as far as practicable, the diverse Hindu schools and customs applicable to the various communities. Modern Hindu law is the creation of the Hindu Marriage Act (1955), and of the Hindu Minority and Guardianship Act, Hindu Succession Act, and Hindu Adoptions and Maintenance Act (all of 1956). Until 1955–56 Hindus were entitled to claim exemption from the personal law if a custom could be proved of sufficient certainty, continuity, and age and was not contrary to public policy. Very little scope is now allowed to custom. As an example of the changes, the Special Marriage Act (1954) provided that any couple might marry, irrespective of community, in a civil, Western-type manner, and their personal law of divorce and succession automatically would become inapplicable. In the new divorce law they have, in addition, a right of divorce by mutual consent after they have lived apart for a year and have waited an additional year.

Indian criminal law, on the other hand, has been very little changed since the Indian Penal Code was enacted in 1861. Thomas Babington Macaulay's original draft of that code, which remains its nucleus, was not based on the contemporary English law alone, and many of the definitions and distinctions are unknown to English law, while later developments in English law are not represented. Yet Indian courts frequently consult English decisions in order to construe sections of the code. In spite of the fact that the wording of the code, when strictly construed, enables many wrongdoers to escape, India has modified it in only marginal respects. This is remarkable in view of the extreme rarity of the code's coincidence with the criminal laws in force in India prior to 1861. The Criminal Procedure Code (1898), by contrast, is a true Anglo-Indian amalgam and has been amended further to suit peculiarly Indian conditions and the climate of opinion.

Indian literature, writings of the Indian subcontinent, produced there in a variety of languages, including Sanskrit, Prākrit, Pāli, Bengali, Bihārī, Gujarati, Hindi, Kannada, Kashmiri, Malayalam, Oriya, Punjabi, Rājasthānī, Tamil, Telugu, Urdu, and Sindhi.

A brief treatment of Indian literature follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

The earliest Indian literature took the form of the canonical Hindu sacred writings, known as the Veda, which were written in Sanskrit. To the Veda were added prose commentaries such as the Brāhmanas and the Upanishads. The production of Sanskrit literature extended from about 1400 BC to AD 1200 and reached its height of development in the 1st to 7th centuries AD. In addition to sacred and philosophical writings, such genres as erotic and devotional lyrics, court poetry, plays, and narrative folktales emerged.

Because Sanskrit was identified with the Brahminical religion of the Vedas, reform movements such as Buddhism and Jainism adopted other literary languages, *e.g.*, Pāli and Ardhamāgadhī, respectively. Out of these and other derivative languages there evolved the modern languages of northern India. The literature of those languages depended largely on the ancient Indian background, which includes the Sanskrit epics, the *Mahābhārata* and *Rāmāyana*, the Krishna story as told in the *Bhāgavata-Purāna*, the other Puranic legends, and the fable anthologies. In addition, the Sanskrit philosophies were the source of philosophical writing in the later literatures, and the Sanskrit schools of rhetoric were of great importance for the development of court poetry in many of the modern literatures. The South Indian language of Tamil is an exception to this pattern of Sanskrit influence because it had a classical tradition of its own. Urdu and Sindhi are other exceptions, having arisen out of an Islāmic background.

Beginning in the 19th century, British and Western literary models in general had a great impact on Indian literature, the most striking result being the introduction of the use of vernacular prose on a major scale. Such previously unknown forms as the novel and short story began to be adopted by Indian writers, as did realism and a new interest in social questions and psychological description. *See also* specific Indian literatures.

Indian Museum, in Calcutta, oldest museum in India and one of the most comprehensive in the Orient; its collections depict the cultural history of India from prehistoric to Muslim times. The present building, opened in 1875, comprises sections devoted to geology, zoology, industry, archaeology, art, and ethnology. The coin room contains the largest collection of Indian coins in the world.

The art section is noted for its textiles, carpets, lacquer-work, glass and pottery. The gallery displays examples of Persian and Indian paintings, and the geological section is the largest in Asia and one of the most important in the world. There is a large collection of statues and bronzes from various Asian civilizations, including life-size models of people and animals of the regions of India.

Indian music, the musical traditions, forms, and styles of the peoples of the Indian subcontinent.

A brief treatment of Indian music follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

Indian music comprises a wide variety of instrumental and vocal traditions, among which are classical, religious, popular, theatrical, and modern ones. The best-known of these internationally is classical music, however; that of North India (and Pakistan) is called Hindustani music, and that of South India is called Karnatic music.

Indian classical music is based on the raga, which is a melodic framework for improvisation based on a given set of notes; and on tala, which is a concept that can be equated with time measure or metre. The music is generally performed by small ensembles of not more than five or six musicians. Improvisation plays a major part in the performance, the most characteristic feature of which is the gradual acceleration of tempo leading to a final climax. The melodic improvisation can be produced by a variety of plucked string instruments such as the sitar or vina; violins; oboe-like instruments; or flutes. A droning lutelike instrument called the tambura meanwhile establishes and maintains the tonic, or ground note, of the composition, while tablas or other small finger-played drums provide a rhythmic accompaniment. Classical music also encompasses a variety of vocal forms, and these too make use of improvisation.

Indian Mutiny, also called SEPOY MUTINY, (1857–58), widespread but unsuccessful rebellion against British rule in India begun by Indian troops (sepoys) in the service of the British East India Company. It began in Meerut and then spread to Delhi, Āgra, Cawnpore, and Lucknow.

To regard the rebellion merely as a sepoy mutiny is to underestimate the increasing pace of Westernization after the establishment of British paramountcy in India in 1818. Hindu society was being affected by the introduction of Western ideas. Missionaries were challenging the religious beliefs of the Hindus. The humanitarian movement led to reforms that went deeper than the political superstructure. Lord Dalhousie had made efforts for the emancipation of women and had introduced a bill to remove all legal obstacles to the remarriage of Hindu widows. Converts to Christianity were to share with their Hindu brethren in the property of the family estate. There was a widespread belief that the British aimed at breaking down the caste system. The introduction of western methods of education was a direct challenge to orthodoxy, both Hindu and Muslim. To these problems may be added the growing discontent of the noble Brahmans, many of whom had been dispossessed of their revenues or had lost lucrative positions. Everywhere the old Indian aristocracy was being replaced by British officials.

The mutiny broke out in the Bengal army because it was only in the military sphere that Indians were organized. The pretext for revolt was the introduction of the new Enfield rifle; to load it the sepoys had to bite off the ends of lubricated cartridges. There appears to be some foundation for the sepoys' belief that the grease used to lubricate the cartridges was a mixture of pigs' and cows' lard; thus, to have oral contact with it was an insult to both Muslims and Hindus. Late in April 1857, sepoy troopers at Meerut refused the cartridges; as punishment, they were given long prison terms, fettered, and put in jail. This pun-

ishment incensed their comrades, who rose on May 10, shot their British officers, and marched to Delhi, where there were no European troops. There the local sepoy garrison joined the Meerut men, and by nightfall the aged pensionary Mughal emperor Bahādur Shāh II had been nominally restored to power by a tumultuous soldiery.

The seizure of Delhi provided a focus and set the pattern for the whole mutiny, which then spread throughout northern India. With few exceptions, none of the important Indian princes joined the mutineers.

The British operations to suppress the mutiny were divided into three parts. First came the desperate struggles at Delhi, Cawnpore, and Lucknow during the summer; then the operations around Lucknow in the winter of 1857–58 directed by Sir Colin Campbell; and finally the "mopping up" campaigns of Sir Hugh Rose in early 1858. Peace was officially declared on July 8, 1858.

A grim feature of the mutiny was the ferocity that accompanied it. The mutineers commonly shot their British officers on rising and were responsible for massacres at Delhi, Cawnpore, and elsewhere. The murder of women and children enraged the British, but in fact some British officers began to take severe measures before they knew that any such murders had occurred. In the end the reprisals far outweighed the original excesses. Hundreds of sepoys were shot from cannons.

As a result of the mutiny, the East India Company was abolished in favour of the direct rule of India by the British government. In concrete terms this did not mean much, but it introduced a more personal note into the government and removed the unimaginative commercialism that had lingered in the Court of Directors. The financial crisis caused by the mutiny led to a reorganization of the Indian administration's finances. The Indian army was also reorganized.

Another significant result of the mutiny was the beginning of the policy of consultation with Indians. The Legislative Council of 1853 had contained only Europeans. It was widely felt that lack of communication with Indian opinion had helped to precipitate the crisis. Accordingly, the new council of 1861 was given an Indian-nominated element. The educational and public works programs, roads, railways, telegraphs, and irrigation continued with little interruption; in fact some were stimulated by the thought of their value for the transport of troops in a crisis. But insensitive, British-imposed social measures that affected Hindu society came to an abrupt end.

Finally, there was the effect of the mutiny on the people of India themselves. Traditional society had made its protest against the incoming alien influences, and it had failed; the princes and other natural leaders had either held aloof from the mutiny or had proved incompetent. From this time all serious hope of a revival of the past or an exclusion of the West diminished. The traditional structure of Indian society was eventually superseded by a westernized class system, from which emerged a strong middle class with a heightened sense of Indian nationalism.

Indian National Congress, byname CONGRESS PARTY, broadly based political party of India. Formed in 1885, the Indian National Congress dominated the Indian movement for independence from Great Britain.

The Indian National Congress first convened in December 1885. It passed fairly moderate reform resolutions during its first several decades, though many members became radicalized by India's increasing poverty under British rule. In the early 20th century the *swadeshi* (native) movement within the organization called for the boycott of imported British goods. By 1917 the influence of the "extremist" Home Rule wing was significant.

In the 1920s and '30s the Congress, led by Mohandas Gandhi, promoted nonviolent noncooperation. Much of this civil disobedience was carried out through the All India Congress Committee, formed in 1929. Another wing of the organization, which believed in working within the existing system, contested elections in 1923 and 1937 as the Swaraj (Home Rule) Party, with particular success in the latter year.

When World War II began, Britain made India a belligerent without consulting Indian elected councils; this angered Indian officials and prompted the Congress to declare that India would not support the war effort until it had been granted complete independence. In 1942 the organization sponsored mass civil disobedience to support the demand that the British "quit India." The British government passed an independence bill in July 1947, and the constitution of independent India was promulgated in January 1950.

From 1951 until his death in 1964, Jawaharlal Nehru dominated the Congress Party, which won overwhelming victories in the elections of 1951–52, 1957, and 1962. In 1964 the party united to elect Lal Bahadur Shastri party leader and prime minister; in 1966 it elected Indira Gandhi (Nehru's daughter) to the same posts. In 1967 Indira Gandhi faced open revolt within the party, and in 1969 she was expelled by a group called the "Syndicate." Nevertheless, her New Congress Party scored a landslide victory in the elections of 1971.

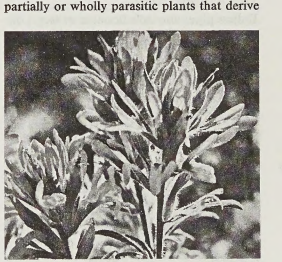
From 1975 Mrs. Gandhi's government grew increasingly more authoritarian. In 1977 the opposition Janata Party scored a landslide victory over the Congress Party. On Jan. 2, 1978, Mrs. Gandhi and her followers seceded and formed a new opposition party, popularly called Congress (I)—"I" signifying Indira—which soon became the official opposition. (In 1996 the "I" designation was dropped.) In 1980 Mrs. Gandhi was again elected prime minister. Upon Indira's assassination in October 1984, her son Rajiv Gandhi became prime minister. In December Rajiv led the Congress Party to an overwhelming victory in which it secured 401 seats in the Lok Sabhā.

In 1989 Rajiv Gandhi was unseated as prime minister by a coalition of opposition parties. While campaigning to regain power in May 1991, he was assassinated. He was succeeded as party leader by P.V. Narasimha Rao, who was elected prime minister in June 1991. Departing from the party's traditional socialist policies, Rao embraced economic liberalization. By 1996 the party's image was suffering from reports of corruption, and in elections that year the number of seats held by the Congress Party in the Lok Sabhā was reduced to a historic low.

Following elections in 1998, Sonia Gandhi—the Italian-born widow of Rajiv Gandhi—became leader of the Congress Party, a move designed to increase the party's mass appeal. However, the Congress Party's performance in the 1999 elections was its worst ever. In national elections in 2004, however, the party scored a surprising victory and returned to power. Gandhi, however, declined an invitation to become prime minister and instead supported Manmohan Singh, a former finance minister, who in May 2004 became the country's first Sikh prime minister.

Indian Ocean, body of salt water, covering approximately one-seventh of the Earth's surface and extending between Africa in the west, Australia in the east, Asia in the north, and Antarctica in the south.

A brief treatment of the Indian Ocean follows. For full treatment, *see* MACROPAEDIA: Indian Ocean.



The Indian Ocean constitutes the world's third largest ocean after the Pacific and Atlantic oceans and, excluding its marginal seas, has an area of about 28,360,000 square miles (73,440,000 square km). It meets the Atlantic Ocean in the southwest and the Pacific Ocean in the east and southeast. The Indian Ocean has an average depth of 12,760 feet (3,890 m); the greatest depth (24,442 feet [7,450 m] below sea level) is in the Java Trench, south of Java. The chief marginal seas include the Red Sea, Arabian Sea, Persian Gulf, Andaman Sea, Bay of Bengal, and the Great Australian Bight. Its major islands and island groups include Madagascar, Sri Lanka, and the Mascarenes (Mauritius, Réunion, and related islands).

The continental shelf of the Indian Ocean consists of a narrow, flat surface that averages 75 miles (120 km) in width and broadens to about 190 miles (300 km) off Bombay and northwestern Australia. The major oceanic-ridge system forms an inverted Y of seismically active mountains, which extends southeast and south from the Arabian Sea and splits into southwestern and southeastern branches in midocean. Notable among several major aseismic ridges is the Ninetyeast Ridge, which runs north-south for 2,800 miles (4,500 km) along the 90° E meridian.

The surface-water movement of the Indian Ocean is governed by the prevailing winds. Two main water-circulation systems dominate the ocean, a northern system (between latitudes 2° and 10° S) where currents are directly related to the seasonal change of the monsoon winds, and a southern system (between 10° and 20° S) where several major currents comprise a regular counterclockwise system.

The Indian Ocean is rich in minerals. Petroleum and natural gas are found on the continental shelves of the Persian Gulf, the Gulf of Cambay (near Bombay), and off northwestern Australia. Sediments containing iron ore and copper have been discovered in the Red Sea, and huge accumulations of nodules containing manganese and other metals have been located on the ocean bed.

Indian paint brush, also called PAINTED CUP, PAINTED LADY, or PAINT BRUSH, any plant of the genus *Castilleja* (family Scrophulariaceae), which contains about 200 species of partially or wholly parasitic plants that derive

Indian paint brush (*Castilleja*)
Franklin K. Anderson

nourishment from the roots of other plants. The small, tubular flowers are irregular (two-lipped). They are surrounded by upper leaves that are brightly coloured either throughout or at the ends only, giving the plant an appearance of having been dipped in a pot of red, orange, yellow, pink, or white paint.

Indian philosophy, the systems of thought and reflection that were developed by the civilizations of the Indian subcontinent.

A brief treatment of Indian philosophy follows. For full treatment, *see* MACROPAEDIA: Indian Philosophy.

Three basic concepts form the cornerstone

of Indian philosophical thought: the self, or soul (atman), the moral efficacy of human actions (karma), and salvation (moksha) as the highest ideal. Indian philosophy is composed of six orthodox schools, or systems of thought; Mīmāṃsā, Vedānta, Nyāya, Vaiśeṣika, Saṃkhyā, and Yoga. There are also unorthodox schools, such as those of Buddhism and Jainism. The sacred texts of Hindu culture, principally the Vedas, the Upanishads, and the *Mahābhārata*, have long influenced Indian philosophical thinking, even after the creation of the six orthodox schools. Each of these schools of thought was systematized by sets of sutras, which reduced the doctrines of a particular system of thought into a number of brief but memorable aphorisms, formulas, or rules.

Of the six orthodox schools, Mīmāṃsā, or Pūrva-mīmāṃsā, is the system that gives rules for the interpretation of the Vedas and provides a philosophical justification for the observance of Vedic ritual. (The Vedas are the earliest sacred writings of India.) Vedānta forms the basis of most modern schools of Hinduism; it is concerned with the philosophical interpretation of the Vedas, rather than with their ritualistic aspects as is Mīmāṃsā. Vedānta is concerned with brahman, or the ultimate reality, and the relation between it and the finite individual. Its major texts are the Upanishads and the *Bhagavadgītā*. Nyāya worked out in profound detail the method of reasoning known as inference; this school is important for its analysis of logic and epistemology. Vaiśeṣika is important for its attempts to identify, inventory, and classify the entities of reality that present themselves to human perception. Saṃkhyā adopts a consistent dualism between the orders of matter and that of the self, or soul. In the Saṃkhyā school, right knowledge consists of the ability of self to distinguish itself from matter. Yoga has greatly influenced several of the other schools through its prescription of practical disciplines for intuitively realizing the metaphysical knowledge put forth by the Saṃkhyā system, to which Yoga is closely related.

Indian pipe, also called CORPSE PLANT, CONVULSION ROOT, or FITS ROOT (*Monotropa uniflora*), nongreen herb, of the family Monotropaceae, that is saprophytic in habit; *i.e.,* it lives upon the remains of dead plants. It occurs in Asia and throughout North America and is commonly found in moist, shady areas.

The plant arises from a tangled mass of rootlets, grows 15–25 cm (6–10 inches) tall, and is white, pinkish, or (rarely) red; if it dries out, it turns black. A single, odourless, drooping, cup-shaped flower with four or five petals is borne at the tip of the stalk. The leaves are represented only by small scales, and the fruit is an oval capsule.

Indian pipe (*Monotropa uniflora*)

Indian region (zoographic area): *see* Oriental region.

Indian Removal Act (May 28, 1830), first major legislative departure from the U.S. policy of respecting the legal and political rights of the American Indians. The act authorized the president to grant Indian tribes unsettled western prairie land in exchange for their desirable territories within state borders (especially in the Southeast), from which the tribes would be removed. The rapid settlement of land east of the Mississippi River made it clear by the mid-1820s that the white man would not tolerate the presence of even peaceful Indians there. President Andrew Jackson (served 1829–37) vigorously promoted this new policy, which became incorporated in the Indian Removal Act of 1830. Although the bill provided only for the negotiation with tribes east of the Mississippi on the basis of payment for their lands, trouble arose when the United States resorted to force to gain the Indians' compliance with its demand that they accept the land exchange and move west.

A number of northern tribes were peacefully resettled in western lands considered undesirable for the white man. The problem lay in the Southeast, where members of what were known as the Five Civilized Tribes (Chickasaw, Choctaw, Seminole, Cherokee, and Creek) refused to trade their cultivated farms for the promise of strange land in the Indian Territory with a so-called permanent title to that land. Many of these Indians had homes, representative government, children in missionary schools, and trades other than farming. Some 70,000 tribesmen were forced to march westward under U.S. military coercion in the 1830s; up to 25 percent of the Indians, many in manacles, perished en route. The trek of the Cherokee in 1838–39 became known as the infamous "Trail of Tears" (*see* Cherokee). Even more reluctant to leave their native lands were the Florida Indians, who fought resettlement for seven years (1835–42) in the second of the Seminole Wars.

The frontier began to be pushed aggressively westward in the years that followed, upsetting the "guaranteed" titles of the displaced tribes and further reducing their relocated holdings.

Indian Reorganization Act (June 18, 1934), also called WHEELER–HOWARD ACT, measure enacted by the U.S. Congress, aimed at decreasing federal control of American Indian affairs and increasing Indian self-government and responsibility. In gratitude for the Indians' services to the country in World War I, Congress in 1924 authorized the Meriam Survey of the state of life on the reservations. The shocking conditions under the regimen established by the Dawes General Allotment Act (1887), as detailed in the Meriam report of 1928, spurred demands for reform.

Many of the Meriam report's recommendations for reform were incorporated in the Indian Reorganization Act. The act curtailed the future allotment of tribal communal lands to individuals and provided for the return of surplus lands to the tribes rather than to homesteaders. It also encouraged written constitutions and charters giving Indians the power to manage their internal affairs. Finally, funds were authorized for the establishment of a revolving credit program for tribal land purchases, for educational assistance, and for aiding tribal organization.

About 160 tribes or villages adopted written constitutions under the act's provisions. Through the revolving credit fund, many Indians improved their economic position. With the funds for purchase of land, millions of additional acres were added to the reservations. Greatly improved staffs and services were provided in health and education, with more than half of all Indian children in public school by 1950. The act awakened a wider interest in civic affairs, and Indians began asking for the franchise, which they had been technically granted in 1924.

The Reorganization Act remains the basis of federal legislation concerning Indian affairs. The act's basic aims were reinforced in the 1960s and '70s by the further transfer of administrative responsibility for reservation services to the Indians themselves, who continued to depend on the federal government to finance those services.

Indian sculpture, the sculptural traditions, forms, and styles of the civilizations of the Indian subcontinent.

A brief treatment of Indian sculpture follows. For full treatment, *see* MACROPAEDIA: South Asian Arts.

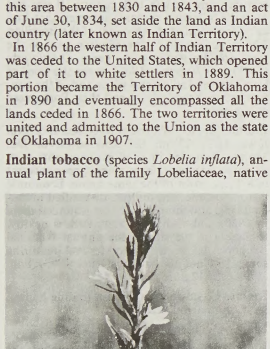
Sculpture was the favoured medium of artistic expression on the Indian subcontinent. Indian buildings were profusely adorned with it and indeed are often inseparable from it. The subject matter of Indian sculpture was almost invariably abstracted human forms that were used to instruct people in the truths of the Hindu, Buddhist, or Jain religions. The nude was used both to represent the body as a symbol of spirit and to reveal the imagined shapes of the gods. There is an almost complete suppression of individuality in Indian sculpture; this is because the figures are conceived of as shapes that are more perfect and final than anything to be found in the merely transitory appearance of human models. The multiple heads and arms of sculptured Hindu divinities were thought necessary to display the manifold attributes of these gods' power.

The tradition of Indian sculpture extends from the Indus Valley civilization of 2500 to 1800 BC, during which time small terra cotta figurines were produced. The great circular stone pillars and carved lions of the Maurya period (3rd century BC) gave way to mature Indian figurative sculpture in the 2nd and 1st centuries BC, in which Hindu and Buddhist themes were already well-established. A wide range of styles and traditions subsequently flourished in different parts of India over the succeeding centuries, but by the 9th–10th centuries AD, Indian sculpture had reached a form that has lasted with little change up to the present day. This sculpture is distinguished not by a sense of plastic volume and fullness but rather by its linear character; the figure is conceived from the standpoint of its outline, and the figure itself is graceful, slender, and has supple limbs. From the 10th century this sculpture was used mainly as a part of architectural decoration, with vast numbers of relatively small figures of mediocre quality being produced for this purpose.

Indian Shaker Church, Christianized prophet cult among Northwest American Indians; it is not connected with the Shaker communities developed from the teachings of Ann Lee. In 1881 near Olympia, Wash., John Slocum, a Squaxon logger and a baptized Roman Catholic, reported that he had visited heaven while in a coma and was commissioned to preach a new way of life. The following year his wife, Mary, experienced a shaking paroxysm, which was interpreted as the Spirit of God curing John of a further illness. The Shaker Church they founded effected reforms and replaced traditional Indian curing methods with spiritual healing through shaking and dancing rituals.

Christian elements of the Indian Shaker Church include belief in the Trinity and Sunday worship in plain churches furnished with a prayer table, handbells, and many crosses; Christian sacraments and festivals are not observed. Direct revelations replace the Bible, but a secession group cooperating with white

evangelicals accepted the Bible and the preaching of sermons. Earlier persecutions ceased after the church was incorporated in Oregon (1907), Washington (1910), and California (1932). A loose organization in the late 20th century united more than 20 congregations with some 2,000 adherents.



Indian summer, period of dry, unseasonably warm weather in late October or November in the central and eastern United States. The term originated in New England and probably arose from the Indians' practice of gathering winter stores at this time. This autumn warm period also occurs in Europe, where in Britain it is called All-hallown summer or Old Wives' summer. Indian summer may occur several times in some years and not at all in others; it often persists for a week or longer. The nights are cool and may bring frost, and the days have hazy skies and light winds. The lack of clouds causes the daytime hours to be warmer each succeeding day.

In the United States, an Indian summer period occurs when a cool, shallow polar air mass stagnates and becomes a deep, warm high-pressure centre. This centre is characterized by a strong low-level temperature inversion that produces a stable air stratification. As a result, vertical air motions are inhibited, and smoke and dust are concentrated near the ground, which accounts for the haziness.

Indian Territory, originally "all of that part of the United States west of the Mississippi, and not within the States of Missouri and Louisiana, or the Territory of Arkansas." Never an organized territory, it was soon restricted to the present state of Oklahoma, excepting the panhandle and Greer county. The Choctaw, Creek, Seminole, Cherokee, and Chickasaw tribes were forcibly moved to this area between 1830 and 1843, and an act of June 30, 1834, set aside the land as Indian country (later known as Indian Territory).

In 1866 the western half of Indian Territory was ceded to the United States, which opened part of it to white settlers in 1889. This portion became the Territory of Oklahoma in 1890 and eventually encompassed all the lands ceded in 1866. The two territories were united and admitted to the Union as the state of Oklahoma in 1907.

Indian tobacco (species *Lobelia inflata*), annual plant of the family Lobeliaceae, native to open woodlands of North America. It was once considered a medicinal plant because of the emetic alkaloid present in the plant parts, especially the roots, but is now regarded as poisonous.

Indian tobacco (*Lobelia inflata*)
William D. Griffin

The Indian tobacco's leafy flower spike, about 1 m (3 feet) tall, begins blooming at the bottom and at maturity produces inflated, oval fruits. Its flowers are small, pale blue, and bilaterally symmetrical. Basal leaves are toothed and broadly oval; stem leaves are narrower. The plant is a lawn weed in some areas.

Indiana, constituent state of the United States of America, one of the Midwestern states lying in the north-central United States, bounded on the north by Lake Michigan and the state of Michigan, on the east by Ohio, on the south by Kentucky, and on the west by Illinois. The capital is Indianapolis.

A brief treatment of Indiana follows. For full treatment, *see* MACROPAEDIA: United States of America.

Indiana was originally inhabited by Algonquian-speaking Indians whose major tribes included the Miami, the Potawatomi, and the Delaware. The French claimed the area in the late 17th century and established several forts. In 1763 the area passed to the British, then to the United States in 1783. The struggle with the Indians lasted until 1811, when General William Henry Harrison defeated them at the Battle of Tippecanoe, near present-day Lafayette. Indiana was admitted to the Union in 1816 as the 19th state. In 1820 Indiana University was founded, and in 1825 Robert Owen established his utopian settlement, New Harmony, on the lower Wabash River. The major Indian tribes left the area in 1820–40. Industrialization accelerated after the American Civil War, and the steel-making city of Gary was founded in 1906.

Indiana forms part of the east-central lowlands that slope downward from the Appalachian Mountains to the Mississippi River. The north, modified in recent geologic time by glacial action, presents a gently rolling landscape; the central plain is flat and extremely fertile; and the south hilly and eroded. The highest elevation is along the Ohio border, at 1,257 feet (383 m) above sea level. The general slope and drainage pattern is toward the southwest; an almost imperceptible groundswell in the northeast forms a St. Lawrence-Mississippi divide. Among the notable features of Indiana's landscape are the sand dunes along Lake Michigan in the northwest.

The climate of Indiana is temperate, with four distinct seasons. January mean temperatures range from 37° F (3° C) in southern Jeffersonville to 25° F (−4° C) in northern South Bend. The corresponding July range is 78° F (26° C) to 73° F (23° C). Annual precipitation varies from an average of 44 inches (1,120 mm) in the south to 35 inches (890 mm) in the north. Northern cities in the snowbelt of Lake Michigan often report more than 100 inches (2,540 mm) of snow during the winter.

The people of Indiana are predominantly white, native-born Americans of native-born parents, most of whom trace their ancestry to England, Scotland, Ireland, and Germany. Blacks predominate in Gary, Poles in South Bend. Amish and Mennonite communities are found in and around Middlebury, Nappanee, and Goshen. The state's rate of population growth was slower than the national average for much of the late 20th century.

Agriculture employs only a small percentage of the state's labour force, but agricultural output is high, and Indiana ranks in the top quarter nationally in cash receipts from farm marketings. Major crops include corn (maize), soybeans, and wheat, with tomatoes the principal vegetable crop. Hogs continue to be the most numerous livestock. Natural resources include coal in the southwest and quarry stone in the centre.

Manufacturing industries are the dominant source of income in the state and employ approximately one-third of the work force. The steel industry is a major component. Musical instruments are made in Elkhart and diamond cutting tools in Fort Wayne.

Indiana's transportation network is highly developed. The Ohio River carries large amounts of freight at low costs. The Port of Indiana on Lake Michigan, like all Great Lakes ports, connects with the St. Lawrence Seaway. Indiana ranks high nationally in road mileage per square mile of area, and virtually all of its roads are paved. There is a relatively dense network of railway track. Indianapolis is served by more major highways than any other American city, and it is headquarters for some of the nation's largest moving companies.

The Indianapolis Civic Theater is the nation's oldest continuously operating theatrical organization. There is a well-known art colony in Nashville, and Columbus is acclaimed for its rich and varied architecture. Indiana has turned out an exceptionally high number of popular entertainers, songwriters, and authors, including Cole Porter, Hoagy Carmichael, James Whitcomb Riley, Booth Tarkington, George Ade, Theodore Dreiser, Ernie Pyle, Red Skelton, James Dean, and Kurt Vonnegut, Jr. The Indianapolis 500 is one of the world's most famous auto races. The University of Notre Dame, near South Bend, is widely regarded as the leading Roman Catholic university in the United States. Area 36,413 square miles (94,309 square km). Pop. (2000) 6,080,485.

Indiana Dunes, state park and national lakeshore, lying along the south shore of Lake Michigan in northern Indiana, U.S.

The state park, established in 1925, comprises 2,182 acres (883 hectares) of shoreline, marshland, dunes, and forests near Chesterton. In addition to a 3-mile (5-kilometre) white sand beach, it has facilities for camping, picnicking, fishing, and hiking. An outstanding feature is the Big Blowout in the east end of the park, where lake winds constantly drift sands over a wooded area, creating a "graveyard of trees." Shifting dunes, like Mount Tom, may reach heights of 200 feet (60 m).

The authorization of Indiana Dunes National Lakeshore in 1966 was the culmination of a 50-year fight to save the dunes from the encroachment of industrialization. It provided for the acquisition of 8,329 acres (3,370 hectares) of dunes and wetland. The national lakeshore—which is on a bird migratory route and surrounds the state park on three sides—features long beaches, high dunes, deep swales, wooded ravines, and interdunal lagoons and swamps; unique features include fens and bogs that are remnants of Ice Age glaciers. In the dunes is found an unusual flora ranging widely in climatic type from Arctic mosses to tropical orchids and from wetlands loosestrife to desert cactus.

In the 1980s further dune acreage was acquired through the efforts of conservation groups, increasing the total federal and nonfederal area to 12,857 acres (5,205 hectares), and development of the national lakeshore continued.

Indianapolis, city, capital of Indiana, U.S., and seat (1822) of Marion county, on the White River, near the centre of the state. A planned radial city (similar to Washington, D.C.), it was founded in 1821 as the state capital, which it officially became in 1825. Some impetus for growth was given by the routing of the Cumberland (or National) Road (Wash-

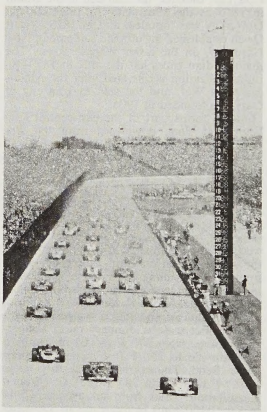
ington Street) across the city in 1830 and later by the arrival of the railroads. Indianapolis became a major rail centre at the start of the American Civil War. Starting in the 1880s meatpacking and metalworking emerged as major industries; an outgrowth of the latter, automobile manufacturing, became central to the city's economy. The need to test these automobiles led to the construction of the Indianapolis Motor Speedway, which held the first annual Indianapolis 500 auto race in 1911.

Indianapolis is one of the most populous cities in the world not located on navigable water, although it is a hub of road, rail, and air transportation. These facilities, and the city's position in the midst of the Corn Belt, near large coalfields and consumer markets, have combined to make it an important commercial, financial, and industrial centre. Pharmaceuticals and chemicals, machinery, plastics, wood and paper products, and transportation and electrical equipment, including televisions and audio equipment, are major products. It is a leading grain market.

A major educational and cultural centre, it is the seat of Butler University (1855), Christian Theological Seminary (1925), Ivy Tech State College (1963), Lincoln Technical Institute (1926), Marian College (1851), Martin University (1979), University of Indianapolis (1902), and Indiana University–Purdue University Indianapolis (1969), including Herron School of Art (1902) and an internationally renowned medical centre. The hub of the city is Monument Circle (1902), site of the 284.5-foot (87-m) Indiana Soldiers' and Sailors' Monument. The Indiana War Memorial Plaza (1927) is a five-block area honouring Indiana's war dead and includes the American Legion National Headquarters building (1950).

Clowes Memorial Hall (1963) is a centre for the performing arts, and the Indianapolis Symphony Orchestra has its home in the Hilbert Circle Theatre (1916). The city has a modern convention-exposition centre and museum of art. The Children's Museum of Indianapolis (1926) is the largest of its kind in the world and is one of the most frequently visited museums in the United States. The State Capitol was constructed (1878–88) of Indiana limestone and has a central rotunda 239 feet (75 m) high.

Professional sports venues in Indianapolis include the RCA Dome (1984), home of the Colts, the city's National League Football franchise; Conseco Fieldhouse (1999), which houses the National Basketball Association Indiana Pacers; and Victory Field (1996), home to the city's minor league baseball team. Fort Benjamin Harrison (built 1903–10; decommissioned 1996), a former U.S. Army post and prisoner-of-war camp, has been converted into a state park.



Indiana Soldiers' and Sailors' Monument, Indianapolis, Ind.
By courtesy of the Indiana Department of Commerce

The Indiana State Fairgrounds, with some 50 permanent buildings, including the Coliseum (1939), is a focus of trade and social activities; the fair takes place in August. The Indianapolis home (1875) of U.S. President Benjamin Harrison has been preserved. The poet James Whitcomb Riley and the author Booth Tarkington also lived in the city. Author Kurt Vonnegut, Jr., was born there.

Uni-Gov, a unique city–county metropolitan government system, was introduced in 1970. Inc. town, 1836; city, 1847. Pop. (1999 est.) city, 738,907; Indianapolis MSA, 1,536,665.

Indianapolis 500, byname INDY 500, U.S. automobile race held annually from 1911, except for the war years 1917–18 and 1942–45. The race is always run at Indianapolis Motor Speedway in Indianapolis, Indiana. Drawing crowds of over 400,000 during the 1990s, the race is among the world's best-attended single-day sporting events. The race is held on the weekend of the American holiday of Memorial Day.

Indianapolis 500 race, 1971
Authenticated News International

The Indianapolis Motor Speedway was built in 1909 as a testing facility for the local automotive industry. The track was first paved with crushed rock and tar but was soon repaved with brick; hence the speedway is often called "the Brickyard." Resurfacing with asphalt has covered all but a 36-in. (91-cm) strip of bricks at the start/finish line. The 2½-mi (4.023-km) track has two 3,300-ft (1,006-m) straightaways, two 660-ft (201-m) straightaways, and four quarter-mile (402-m) turns each banked to around 9 degrees. The Speedway is also home to the Brickyard 400, a NASCAR (National Association for Stock Car Auto Racing) race.

After qualifying in a four-lap time trial, a field of 33 cars begins the Indy 500 in rows of three. For 2000, the approved Indy car was an open-wheel, low-slung, open-cockpit chassis with a 3.5-litre V-8 engine placed at the back of the car. Racers compete over 500 miles (or 200 laps). American Ray Harroun won the first 500 in a little over 6 hours and 42 minutes with an average speed of 74.602 mph; he received winnings of $14,250. In 2000 Colombian Juan Montoya won the 500 averaging 167.496 mph; he earned $1,235,690. Since 1936 tradition holds that winners of the race celebrate with a bottle of milk.

In the early decades of the Indianapolis 500, the race was sanctioned by the American Automobile Association (AAA). From 1956 to 1997 the race was under the aegis of the United States Auto Club (USAC). A rival open-wheel racing series known as Championship Auto Racing Teams (CART) was formed in 1979. By the mid-1990s CART had successfully replaced USAC as the leading power in Indy car racing. In 1996 Indianapolis Motor Speedway owner Tony George formed the Indy Racing League (IRL) in order to counteract the influence of CART. The IRL has overseen the 500 since 1997. Disagreements between CART and IRL hindered the growth of Indy car racing in the 1990s.

For winners, *see* Sporting Record: *Automobile racing.*

Articles are alphabetized word by word, not letter by letter

Indianista novel, Brazilian literary genre of the 19th century that idealizes the simple life of the South American Indian. The tone of the *Indianista* novel is one of languid nostalgia and *saudade,* a brooding melancholy and reverence for nature characteristic of Portuguese and Brazilian literature. The Indian had appeared as a fictional character in Brazilian literature from the late 18th century. It was not until the following century, however, that José de Alencar initiated the vogue of the Brazilian *Indianista* novel by contributing two of the most popular works to the genre, *O Guarany* (1857) and *Iracema* (1865), romantic tales of love between Indian and white and of the conflict between the Indians and their Portuguese conquerors.

Indianola, city, Warren county, south-central Iowa, U.S., 17 mi (27 km) south of Des Moines. Founded in 1849 as the county seat, its name was taken from a newspaper account of a Texas town of the same name. Economic factors include feed milling, diversified manufacturing, and Simpson College (founded there in 1860). Lake Ahquabi State Park is nearby. Indianola is the site of the annual National Balloon Classic, a 10-day festival featuring some 100 hot-air balloons. Inc. 1863. Pop. (1999 est.) 12,865.

Indias Occidentales: *see* West Indies.

Indic writing systems, those that include the syllabic Kharoṣṭī and semi-alphabetic Brāhmī scripts of ancient India. No systems of writing subsequently developed from the Kharoṣṭī script. Brāhmī, however, is thought to be the forerunner of all of the scripts used for writing the languages of India, Tibet, Southeast Asia, and Indonesia (exceptions include those areas in which native writing systems have been replaced by the Latin or Arabic alphabet or by Chinese).

A northern form of Brāhmī developed into the Gupta scripts, from which derived the Tibetan and Khotanese systems. (Khotanese was also influenced by the Kharoṣṭī script.) From the Tibetan script were derived the writing system of the Lepchā (Rong)—the aboriginal inhabitants of Sikkim—and the Passepa writing system of the Chinese Imperial chancery under the Yüan dynasty

(1279–1368); the Passepa system is no longer in use.

A southern form of Brāhmī developed into the Grantha alphabet, from which in turn the writing systems of the Dravidian languages of southern India (*e.g.,* Tamil, Malayalam, Telugu, and Kannada) as well as the writing systems of the Sinhalese language of Ceylon, the Khmer and Mon languages of Southeast Asia, and the Kavi, or Old Javanese, system of Indonesia were developed. The Thai writing system is thought by scholars to be derived from that of the Khmer, the Burmese and Lao systems from that of Mon, and the Buginese and Batak systems of Indonesia from that of Kavi. The scripts used by speakers of the Tai dialects other than Shan and Lao are derived from the Burmese writing system. The ancient Cham inscriptions of the Austronesian (Malayo-Polynesian) speakers who formerly inhabited southern Vietnam are also written in a script of South Indic origin. *See also* Brāhmī; Grantha alphabet; Gupta scripts; Kharoṣṭī.

indicator (economics): *see* economic indicator.

indicator species, organism—often a microorganism or a plant—that serves as a measure of the environmental conditions that exist in a given locale. For example, greasewood indicates saline soil; mosses often indicate acid soil. Tubifex worms indicate oxygen-poor and stagnant water unfit to drink. The presence of certain species of plants suggests how well other species might grow in the same place.

Indicopleustes (ancient geographer): *see* Cosmas.

indiction, in ancient Rome, the fiscal year. During the inflation of the 3rd century AD the Roman government supplied court and army employees by ordering the requisition, or by compulsory purchase (*indictio*), of food and clothing. Such *indictiones* were irregular, often oppressive, and inequitable. Reform measures under Diocletian (AD 284–305) provided for the annual levy of *indictio* based on land and population censuses; hence, the institution of indiction, or fiscal year. Assessed over a 15-year cycle, indiction was reckoned from September 1, contrary to the civil (consular) year, which began January 1.

Roman Catholic popes until 1087 used the indictional year, generally reckoned from September 1, except in Italy after the 7th century, when indictional and civil years coincided. The indictional year, as adapted by the Anglo-Saxons, began on September 24, the autumnal equinox. After adoption by Charlemagne in the late 8th century, the indictional system was transmitted to France. It fell into disuse after the 16th century, although it still appears in some almanacs.

indictment, in the United States (and, until recently, in England), a formal written accusation of crime affirmed by a grand jury and presented by it to the court for trial of the accused. The grand jury system was eliminated in England in the mid-20th century, and current law there provides for a bill of indictment to be presented to the court when the person accused has been committed to trial by a magistrate and in certain other cases.

An indictment must establish the jurisdiction of the court to try the case, provide adequate notice to the defendant of the charges against him, enable the court to pronounce judgment upon conviction, and prevent a second prosecution for the same offense. The indictment at common law was an instrument of remarkable prolixity, and formal requirements concerning caption, commencement, and conclusion of the document and the modes of alleging elements of the offense were strictly enforced; amendments were not permitted. Modern indictments in England have been simplified as to form and language and consist of three parts: commencement, statement of the offense, and particulars of the offense. Each charge must be in a separate count, but any number of felonies and misdemeanours may be joined in the same indictment. A defective indictment may be amended unless "the required amendments cannot be made without injustice."

In the United States, the Federal Rules of Criminal Procedure (1946), applicable to federal district courts, provide that the indictment "shall be a plain, concise, and definite written statement of the essential facts constituting the offense charged." No formal requirements as to commencement or conclusion are made. The federal procedure, as well as that of many states, authorizes the granting of "bills of particulars" to defendants when additional details about matters alleged in the indictment are required in the interest of justice. In the United States, as in England, the indictment may contain several counts. Each count must adequately allege a single offense. Several counts may allege different versions of the same offense, but counts alleging different offenses may be joined in the same indictment. If the offenses charged are alleged to have been committed by more than one person, all persons charged may be tried on the same indictment.

Attacks on the indictment may include assertions that a count is duplicative (*i.e.,* charges more than one offense), that various formal errors were committed in drafting the instrument, that the language of the indictment does not sufficiently allege commission of the offense, and many others. Failure to raise objections to the indictment at the appropriate time ordinarily constitutes waiver of the objections except when the defects are fundamental; *e.g.,* when there is failure to show the jurisdiction of the court or to charge an offense.

In England, crimes are classified as indictable or summary offenses. Indictable offenses include treason, felonies, and some misdemeanours. Under modern English law, crimes designated as summary offenses may be tried on indictment if the prescribed penalties include imprisonment for more than three months. In the United States the indictment is only one of three principal methods of charging offenses, the others being the information (*i.e.,* a written accusation resembling an indictment, prepared and presented to the court by a prosecuting official) and, for petty offense, a complaint of the aggrieved party or of a police officer.

In the United States, there is disagreement as to when an accused may or must be tried by indictment. The Fifth Amendment to the Constitution provides that trial of "capital or otherwise infamous" crimes be based on indictment by the grand jury. "Infamous crimes" have been defined as offenses punishable by death or imprisonment in a penitentiary or by hard labour. Some, but not all, of the states permit waiver of the indictment by the defendant. Beginning in the 19th century, many states eliminated grand juries and authorized, with various regulations, the prosecution of all crimes by information.

Indies, Council of the, Spanish CONSEJO DE INDIAS, supreme governing body of Spain's colonies in America (1524–1834). Composed of between 6 and 10 councillors appointed by the king, the council prepared and issued all legislation governing the colonies in the king's name, approved all important acts and expenditures by colonial officials, and acted as a court of last resort in civil suits appealed from colonial courts. It lost much of its importance in the 18th century.

Indies, Laws of the, the entire body of law promulgated by the Spanish crown during the 16th, 17th, and 18th centuries for the government of its kingdoms (colonies) outside Europe, chiefly in the Americas; more specifically, a series of collections of decrees (cedulas) compiled and published by royal authorization, culminating in the *Recopilación de las leyes de los reinos de Indias* (1680). From the beginning of the colonization of the Americas, Castilian law constituted the basic private law in the colonies, but, because special conditions prevailed there, the Spanish crown legislated specifically for the Indies (America), in the area of public law. Thus, an important aspect of such legislation was the adaptation of Castilian administrative and judicial institutions to the governmental needs of the New World. The Laws of Burgos issued on Dec. 27, 1512, by Ferdinand II, the Catholic, of Aragon, regulated relations between Spaniards and the conquered Indians, particularly to ensure the spiritual and material welfare of the latter, who were often severely treated. The New Laws of the Indies (1542) of Charles I, which sought to correct the inadequacies of the previous code, met with armed resistance from the American colonists and were reissued in a weaker version in 1552. In the same year a commercial code was promulgated for the Casa de Contratación (Board of Trade). In 1563 the powers and procedures of the colonial *audiencias* (courts) were defined. The Ordinances Concerning Discoveries, issued in 1573, forbade unauthorized operations against independent Indian peoples.

Attempts at general codification in the 16th century proved inadequate. In 1624 work was begun on the code, which finally emerged as the *Recopilación.* The undertaking was supervised by two noted jurists: Rodrigo de Aguiar y Acuña and, later, Juan Solórzano Pereira. Before its eventual promulgation in 1681, it was further edited and abbreviated by Fernando Jiménez Paniagua. It contains 6,377 laws in nine books of uneven length, subdivided into 218 *títulos,* or chapters. In brief, the contents of the books are: (1) church government and education; (2) the Council of the Indies and the *audiencias;* (3) political and military administration—viceroys and captains general; (4) discoveries, colonization, and municipal government; (5) provincial government and lower courts; (6) Indians; (7) penal law; (8) public finance; and (9) navigation and commerce. Subsequent new legislation, especially that issued in the later 18th century under Charles III (1759–88) concerning commerce and administration, made the *Recopilación* obsolete. Recodification was begun in 1805 but never finished; instead, the last two editions printed in the 19th century (three were printed in the 18th century) contained only supplementary sections of revised legislation. In this form the code was applied to the remnants of Spain's old colonial empire (Cuba, Puerto Rico, and the Philippines) until their loss in 1898.

The *Recopilación* has been criticized for its many inconsistencies, periodic inexactness in phrasing, and excessive attention to trivial and ceremonial matters and to commercial regulations, which were virtually unenforcible, and for depriving colonials of a responsible role in government and commerce. Yet it was the most comprehensive law code ever instituted for a colonial empire and set forth humane (if often ignored) principles for treatment of Indians.

indifference, in the mathematical theory of probability, classical principle stated by Bernoulli and formulated (and named) by the English economist John Maynard Keynes in *A Treatise on Probability* (1921): two cases are equally likely if no reason is known why either case should be the preferable one. this principle being introduced in order to deal with problems concerning the range theory of probability, which dealt with all possible alter-

natives of a situation only by the number of such alternatives and not necessarily by their relative frequencies or probabilities.

indifference curve, in economics, graph showing various combinations of two things (usually consumer goods) that yield equal satisfaction or utility to an individual. Developed by the British economist Francis Y. Edgeworth, it is widely used as an analytical tool in the study of consumer behaviour, particularly as related to consumer demand. It is also utilized in welfare economics, a field that focusses on the effect of different actions on individual and general well-being.

The classic indifference curve is so drawn—downward from left to right and convex to the origin—that if a consumer were given his choice between any two points on it, he would not prefer one over the other. Because all of the combinations of goods represented by the points are equally desirable to him, he would be indifferent to the combination actually received. It is also possible to plot indifference curves for combinations of desirable and undesirable entities, which curves do not have the shape described above. An indifference curve is always constructed on the assumption that, other things being equal, certain factors remain constant.

Indigenismo, movement in Latin America advocating a dominant social and political role for Indians in countries in which they constitute a majority of the population. A sharp distinction is drawn by its members between Indians and Europeans, or those of European ancestry, who have dominated the Indian majorities since the Spanish conquest in the early 16th century. In Mexico, beginning with the Revolution of 1911, the movement became very influential, particularly during the presidency of Lázaro Cárdenas (1934–40), when serious efforts were made to reconstitute the nation according to its Indian heritage. In Peru, where the movement is called Aprismo, its members have proposed that Latin America be renamed Indo-America.

Consult the INDEX *first*

indigestion, also called DYSPEPSIA, any or all of the unpleasant feelings and manifestations—abdominal discomfort, belching, flatulence, aversion to eating, nausea, vomiting, diarrhea, constipation, heartburn—that sufferers associate with the malfunctioning of their digestive apparatus. The causes are as varied as the symptoms: organic disease outside the digestive tract—*e.g.*, anemia, pulmonary tuberculosis, heart failure, urinary tract infections; organic disease within the digestive tract—*e.g.*, pancreatitis, gallbladder disease, cancer of the stomach, chronic appendicitis; or functional disorders—*e.g.*, psychogenic indigestion (indigestion associated with worry or fear, for example) or indigestion due to improper eating habits, excessive smoking, drinking excessive quantities of coffee or alcohol, or hypersensitivity to particular foods.

Indigirka River, river, Yakutiya (Yakut-Sakha) republic, far eastern Russia. It is one of the major rivers of northeastern Siberia. The Indigirka rises in the Verkhoyansk Mountains and flows 1,072 mi (1,726 km) north through the Chersky Range into the broad Indigirka lowland, most of which is in tundra vegetation, to enter the East Siberian Sea through an extensive delta. Its two main tributaries are the Moma and Selennyach. The Indigirka is navigable for 650 mi to Khonu on the Arctic Circle, but only from June to September, when it is free of ice. The Indigirka valley is sparsely populated, but fur, lumber, and other natural resources are being developed. There is a goldfield in its upper part.

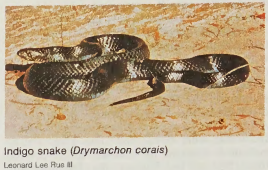
indigo, in botany, any shrub or herb of the genus *Indigofera* within the pea family (Fabaceae). Most species occur in warm climates and are generally silky or hairy. The leaves are usually divided into smaller leaflets. The small rose, purple, or white flowers are borne in spikes or clusters. The fruit is a pod, usually with a thin partition between the seeds.

Some species, particularly *I. sumatrana* and *I. arrecta,* were once an important source of indigo dye. The cultivation of indigo plants and the extraction of the dyestuff were an

Indigo (*Indigofera*)
A to Z Botanical Collection

important industry in India up to the beginning of the 20th century. Synthetic indigo, developed about that time, gradually replaced natural indigo as a dyestuff.

indigo, an important and valuable vat dyestuff, obtained until about 1900 entirely from plants of the genera *Indigofera* and *Isatis.* Indigo was known to the ancients of Asia, Egypt, Greece, Rome, Britain, and Peru. It is used in the U.S. mainly for dyeing cotton for work clothes; for a long time it was used to produce heavy (navy blue) shades on wool.



The naturally occurring precursor of indigo is indican, a colourless, water-soluble substance that is easily hydrolyzed to glucose and indoxyl; the latter is converted to indigo by mild oxidation, such as exposure to air.

The chemical structure of indigo was announced in 1883 by Adolf von Baeyer; a commercially feasible manufacturing process was in use by the late 1890s. The method, still in use throughout the world, consists of a synthesis of indoxyl by fusion of sodium phenylglycinate in a mixture of caustic soda and sodamide.

Indigo can be converted to numerous simpler compounds, but the only chemical reaction of practical importance is its reduction to the soluble yellow leucoindigo, in which form it is applied to textile fibres and reoxidized to indigo.

Tyrian purple, a dyestuff of great importance in antiquity, was obtained from a secretion of a sea snail (*Murex brandaris*) common in the Mediterranean. Its structure is very similar to that of indigo. It has never been produced synthetically on a commercial basis.

indigo snake (*Drymarchon corais*), docile, nonvenomous member of the family Colubridae found from the southeastern United States to Brazil. It is the largest snake in the United States—record length is 2.8 metres (9.2 feet)—and one of the largest of all colubrids. In the United States its colour is blue-black; southward it may have brown foreparts, and in the tropics members of the genus often are called brown snakes. It kills small vertebrate animals,

Indigo snake (*Drymarchon corais*)
Leonard Lee Rue III

including venomous snakes, by crushing with its jaws and the weight of its coils but is not a constrictor.

In defense the indigo snake hisses and vibrates its tail but is loath to strike. It may share a burrow with a gopher tortoise (*Gopherus*) and is often called gopher snake. It had become so rare by the late 1970s that it was listed as an endangered species.

Indio, city, Riverside county, southern California, U.S., in the Coachella Valley, between Palm Springs (northwest) and the Salton Sea (southeast). Founded (1876) as Indian Wells, on the site of Palte-Wat Indian village by the Southern Pacific Railroad, it was later renamed Indio (Spanish: Indian). In the 1850s local artesian wells were utilized for irrigation and C.P. Huntington, president of the railway, successfully introduced Algerian date shoots. Indio developed as a desert spa and shipping point for agricultural produce, especially dates (a national date festival is held each February), citrus, grapes, vegetables, and cotton. After 1949 water via the All-American Canal gave added impetus to growth. The Giannini Research Institute (applied physics), and electronic and refrigeration industries were established there in the 1960s. The Joshua Tree National Monument is 25 mi (40 km) east. Inc. 1930. Pop. (1990) 36,793.

indirect relief printing: *see* dry offset.

indium (In), chemical element, rare metal of main Group IIIa, or boron group, of the periodic table. Of a brilliant, silvery-white lustre, indium was discovered (1863) by Ferdinand Reich and Theodor Richter while they were examining zinc ore samples. The presence of a predominant indigo spectral line suggested the name. Softer than lead and quite plastic, indium can be scratched with a fingernail and can undergo almost limitless deformation. Like tin, the pure metal emits a high-pitched "cry" when bent. Indium is about as rare as silver. The Earth's crust contains on the average about 0.05 part per million indium by weight. The element does not occur uncombined nor in independent minerals but as a trace in many minerals, particularly those of zinc and lead, from which it is obtained as a by-product.

Indium has the unusual property when molten of clinging to or wetting clean glass and other surfaces, which makes it valuable for producing hermetic seals between glass, metals, quartz, ceramics, and marble. Indium is used in coating aircraft engine bearings because it improves corrosion resistance and enables the surface to retain a more adherent oil film. Indium is an ingredient in some low-melting alloys used in sprinkler heads, fire-door links, and fusible plugs. The metal is extensively employed in the manufacture of semiconductor devices and for soldering various parts of germanium transistors and rectifiers. Indium also is used to measure the thermal neutron flux of nuclear reactors and to monitor neutrons for the protection of personnel and equipment. Natural indium is a mixture of two isotopes: indium-113 (4.28 percent) and indium-115 (95.72 percent).

Indium metal is unaffected by air at ordinary temperatures, but at a red heat it burns with a blue-violet flame to form the yellow oxide

In_2O_3. The metal dissolves in mineral acids but is unaffected by potassium hydroxide or boiling water. When heated in the presence of the halogens or sulfur, direct combination takes place. Though a few authentic indium(I) compounds have been prepared (*e.g.*, halides), indium is commonly trivalent in its compounds. With the main Group V elements, indium forms compounds (indium phosphide, arsenide, antimonide) that have semiconductor properties.

individual psychology, body of theories of the Austrian psychiatrist Alfred Adler, who held that the main motives of human thought and behaviour are individual man's striving for superiority and power, partly in compensation for his feeling of inferiority. Every individual, in this view, is unique, and his personality structure—including his unique goal and ways of striving for it—finds expression in his style of life, this life-style being the product of his own creativity. Nevertheless, the individual cannot be considered apart from society; all important problems, including problems of general human relations, occupation, and love, are social.

This theory led to explanations of psychological normality and abnormality: although the normal person with a well-developed social interest will compensate by striving on the useful side of life (that is, by contributing to the common welfare and thus helping to overcome common feelings of inferiority), the neurotically disposed person is characterized by increased inferiority feelings, underdeveloped social interest, and an exaggerated, uncooperative goal of superiority, these symptoms manifesting themselves as anxiety and more or less open aggression. Accordingly, he solves his problems in a self-centred, private fashion (rather than a task-centred, common-sense fashion), leading to failure. All forms of maladjustment share this constellation. Therapy consists in providing the patient with insight into his mistaken life-style through material furnished by him in the psychiatric interview.

individualism, political and social philosophy that places high value on the freedom of the individual and generally stresses the self-directed, self-contained, and comparatively unrestrained individual or ego. The French political commentator Alexis de Tocqueville, who coined the word, described it in terms of a kind of moderate selfishness, disposing human beings to be concerned only with their own small circle of family and friends.

As a philosophy, individualism involves a value system, a theory of human nature, a general attitude or temper, and belief in certain political, economic, social, and religious arrangements. The value system may be described in terms of three propositions: all values are man-centred—that is, they are experienced (but not necessarily created) by human beings; the individual is an end in himself and is of supreme value, society being only a means to individual ends; and all individuals are in some sense morally equal, this equality being best expressed by the proposition that no one should ever be treated solely as a means to the well-being of another person.

The individualistic theory of human nature holds that the interests of the normal adult are best served by allowing him maximum freedom and responsibility for choosing his objectives and the means for obtaining them, and acting accordingly. This belief follows from the conviction that each person is the best judge of his own interests and, granted educational opportunities, can discover how to advance them. It is also based upon the assumption that the act of making these choices contributes to the development of the individual and to the welfare of society—the latter because individualism is thought to provide the most effective incentive to productive endeavour. Society, from this point of view, is seen as only a collection of individuals, each of which is a self-contained and ideally almost self-sufficient entity.

As a general attitude, then, individualism embraces a high valuation on self-reliance, on privacy, and on respect for other individuals. Negatively, it embodies opposition to authority and to all manner of controls over the individual, especially when they are exercised by the state. It also anticipates and values "progress" and, as a means to this end, subscribes to the right of the individual to be different from, to compete with, and to get ahead of (or fall behind) others.

The institutional embodiment of individualism follows from these principles. Only the most extreme individualists believe in anarchy, but all believe that government should keep its interference with human lives at a minimum and that it should confine itself largely to maintaining law and order, preventing individuals from interfering with others, and enforcing agreements (contracts) voluntarily arrived at. The state tends to be viewed as a necessary evil, and the slogan "That government that governs least governs best" is applauded.

Individualism also implies a property system according to which each person (or family) enjoys the maximum of opportunity to acquire property and to manage and dispose of it as he sees fit. Freedom of association extends to the right to join (or to refuse to join) any organization.

Although instances of individualism have occurred throughout history in many cultures and times, full-fledged individualism, as it is usually conceived to be, seems to have emerged first in England, especially after the publication of the ideas of Adam Smith and Jeremy Bentham and their followers in economic and political theory. Smith's doctrine of laissez-faire, based upon a profound belief in the natural harmony of individual wills and Bentham's utilitarianism, with the basic rule of "each to count for one and none for more than one," set the stage for these developments. On the economic side, Smith's "obvious and simple system of natural liberty" pictured exchange of goods and services in free and competitive markets as the ideal system of cooperation for mutual advantage. Such an organization should maximize efficiency as well as freedom, secure for each participant the largest yield from his resources to be had without injury to others, and achieve a just distribution, meaning a sharing of the social product in proportion to individual contributions.

Although economic individualism and political individualism in the form of democracy advanced together for a while, eventually they proved incompatible as newly enfranchised voters increasingly came to demand, in the course of the 19th century, governmental intervention in the economic process. In point of fact the reasons for the growing demand for intervention were inherent in the attempt to adhere rigorously to an economic theory based almost solely on individualistic assumptions. In economics as in all other phases of life, these assumptions are inadequate. Man is a social animal. His nature, his wants, and his capacities are to a great extent the product of society and its institutions. His most effective behaviour is often through groups and organizations, running the gamut from the family through all manner of voluntary social and economically motivated associations to the state and international organizations. These units in varying ways interfere with the individualistic ideals of perfectly free association and of atomistic competition. Problems of monopoly and of technology, seasonal and cyclical unemployment, frequently associated in the public mind with individualistic economic theory, caused widespread dissatisfaction.

The prestige of individualistic ideas declined during the latter part of the 19th century and the first part of the 20th with the rise of large-scale social organization. One consequence of this was the emergence of theories calling for the organization of society on principles diametrically opposed to those of individualism (*see* collectivism). In liberal democracies, however, the notion of the importance of the individual has survived, providing a check on the tendency toward depersonalization that, some say, is a consequence of collectivist trends.

Indlandsis (Greenland): *see* Greenland Ice Sheet.

Indo-Aryan languages, also called INDIC, subgroup of the Indo-Iranian branch of the Indo-European language family, spoken in India, Sri Lanka, Pakistan, and Bangladesh. The earliest records of an Indo-Aryan language are of Sanskrit, now a classical and sacred language of the Hindus. From Sanskrit or related dialects, numerous Middle Indo-Aryan languages, the Prākrits, evolved. These in turn gave rise to the modern Indo-Aryan languages after about 1100.

The modern Indo-Aryan languages may be divided into five major groups. In the eastern group are Assamese, Bengali, and Oriya. The northwestern group includes Punjabi, Lahnda, Sindhi, Pahari, and Dardic. In the western and southwestern group are Gujarati, Marathi, Konkani, Maldivian, and Sinhalese, the official language of Sri Lanka. The midland group consists of the Hindi dialects, including Hindi, the national language of India; Urdu, the official language of Pakistan; and a variety of dialects classed as Eastern Hindi and Western Hindi. Shading from Western Hindi into Sindhi and Gujarati are dialects of Rajasthani, the fifth major group.

The Indo-Aryan languages have a long and rich literary history dating from the Rigveda, a collection of hymns written in Vedic Sanskrit (*c.* 1500 BC).

Indo-Esfahān carpet, also spelled INDO-ISFAHAN, type of floor covering ranging from small to extremely large, handmade in India, primarily in the 17th century, as free imitations of Herāt designs (*see* Herāt carpet). The name Esfahān was applied in the belief that Persian carpets sold better than Indian. They appear to have been exported in quantity to Europe, especially to Portugal and the Low Countries, by the various East India companies and are frequently seen in 17th-century Dutch paintings. The usual field design consists of elaborate vine-leaf and floral palmettes in pairs, pointing in opposite directions and connected by scrolling vines, together with curving, feathery lancet leaves, cloud bands, and a host of small floral motifs on a ground of slightly purplish wine red. A blue or blue-green border often shows similar palmettes placed transversely in alternation with groups of five small palmettes.

These carpets may have been made in Āgra, where similar ones were still being produced in the 19th century. More fanciful patterns may have been produced in the Deccan and not exported. The borders introduce varied arrangements of arabesques and of lancet leaves. The term Indo-Esfahān has also been used for a group of 19th-century Indian carpets with rather arid and impoverished patterns derived from those of the 17th century.

Indo-European languages, family of languages spoken in most of Europe and areas of European settlement and in much of Southwest and South Asia.

A brief treatment of the Indo-European languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World: *Indo-European languages*.

The Indo-European languages are the descendants of a single unrecorded language that is believed to have been spoken more than 5,000 years ago in the steppe regions north of the Black Sea and to have split into a number of dialects by the beginning of the 3rd millennium BC. These dialects, carried by migrating tribes to Europe and Asia, developed in time into separate languages, a number of which have left written records of their various stages. The main branches, past and present, are Anatolian, the major representative of which is Hittite; Indo-Iranian, including Sanskrit, Avestan, and modern Hindi and Persian; Greek; Italic, including Latin and its modern representatives, the Romance languages, namely French, Italian, Spanish, Portuguese, Romanian, and others; Germanic, including English, German, Dutch, and the Scandinavian languages; Armenian; Celtic, including Irish and Welsh; Albanian; the extinct Tocharian languages; Baltic, including the extinct Old Prussian and modern Latvian and Lithuanian; and Slavic, including Old Church Slavonic, Russian, Czech, Polish, Serbo-Croatian, and others.

In a genetic classification of languages, words suspected of being cognates are compared, and a system of regular sound correspondences is established. For each set of correspondences, a proto-segment is posited, and by the application of "sound laws," or phonetic rules, its development is traced down through the daughter languages. Similarity of sound or written form is in itself not diagnostic in establishing cognates: the French *feu* ('fire') and German *Feuer* ('fire') are unrelated, while Armenian *erku* ('two') is related in a very systematic way to English *two*.

The idea of a genetic relationship between certain of the Indo-European languages (Greek, Latin, Sanskrit, Germanic, and Celtic) was first proposed in 1786 by the British orientalist Sir William Jones, who suggested that these languages all derive from some single "common source." In the following century the detailed evidence underlying Jones's assertion was presented, and a number of other languages were shown to be members of the Indo-European family. A genetic relationship based on a phonological comparison was established in the early 19th century by the Dane Rasmus Rask and the German Jacob Grimm, who set up correspondences between the sounds of equivalent words in Germanic, on the one hand, and Greek and Latin, on the other.

In the course of the 19th century, statements of sound changes accounting for relationships between the parent language and the daughter languages became more accurate and refined. Previously unmotivated exceptions to rules were shown to be regular themselves. Thus Grimm's Law, which establishes a correspondence between stop and spirant consonants in Germanic and the consonants of other Indo-European languages (for example, the stop in *p* in Latin *pater* corresponds to the spirant *f* in English *father*), leaves a number of forms unaccounted for. These residues, however, were later explained by Grassmann's Law, which treated the dissimilation of aspirates in Greek and Sanskrit, and Verner's Law, which demonstrated the influence of the original place of stress on the reflexes of Indo-European consonants in Germanic. Encouraged by the apparent regularity of sound change, there arose a new school of linguists in the 1870s, the so-called Neogrammarians (*Junggrammatiker*). The latest full-scale treatment of the Indo-European family is found in the multivolume work of the Neogrammarian Karl Brugmann, *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (1897–1916; "Outline of Comparative Indo-European Grammar").

The Indo-European parent language possessed a rich, well-developed system of labial, dental, palatal, velar, and labiovelar stops, with voiceless, voiced, and voiced aspirate articulations. Other consonants included the sibilant *s* (with a voiced variant *z*) and the three "laryngeals" H_1, H_2, and H_3, which sometimes lengthened and "coloured" neighbouring vowels but themselves usually disappeared outside Anatolian. There were also the six sonorants *r*, *l*, *y*, *w*, *m*, and *n*, which had the syllabic variants *ṛ*, *ḷ*, *i*, *u*, *ṃ*, and *ṇ* in some phonetic environments. The vowel system included *a*, *e*, *o*, *i*, and *u*, of which the first three, and probably all five, occurred both long and short. A characteristic feature of Proto-Indo-European was the pattern of grammatically conditioned vowel alternation called "ablaut," by which the basic vowel *e* (normal grade) of a root or suffix could be lost (zero-grade), lengthened to *ē* (lengthened grade), changed to *o* (*o*-grade), or changed to *o* and lengthened (lengthened *o*-grade).

Proto-Indo-European was a highly inflected language. Nouns, adjectives, and most pronouns made use of ablaut and suffixed endings to distinguish eight cases and three numbers (singular, dual, and plural); there were also three grammatical genders (masculine, feminine, and neuter). Verbs were inflected not only for person and number but also for aspect (imperfective, perfective, stative), tense (past, non-past), voice (active, mediopassive), and mood (indicative, imperative, subjunctive, optative). The complex morphological system of the parent language was considerably simplified in the later history of the family, partly as a result of the reduction and loss of final syllables through phonetic change.

Indo-Gangetic Plain, also called NORTH INDIAN PLAIN, extensive north-central section of the Indian subcontinent, stretching westward from (and including) the Brahmaputra River valley and the Ganges Delta to the Indus River valley. The region contains the subcontinent's richest and most densely populated areas. The greater part of the plain is made up of alluvial soil, deposited by the Ganges and Brahmaputra rivers in the east and the Indus River in the west. The eastern part of the plain has light rains or drought in the winter, but in summer rainfall is so heavy that vast areas become swamps or shallow lakes. The plain becomes progressively drier toward the west where it incorporates the Thar (Great Indian) Desert.

Indo-Hittite languages, hypothetical family of languages composed of the Indo-European and Anatolian languages. The term Indo-Hittite was proposed by scholars who believed that Hittite and the other closely related Anatolian languages represented a language branch coordinate with all the other Indo-European languages combined, rather than forming another branch coordinate with the individual Indo-European branches (Celtic, Germanic, etc.). In other words, they proposed that at one time there existed a protolanguage (Indo-Hittite) that split into two branches, Anatolian and Indo-European (from which the various branches of Indo-European later evolved). Most scholars, however, consider the Anatolian languages, including Hittite, to be simply a branch of Indo-European.

Indo-Iranian languages, group of languages constituting the easternmost major branch of the Indo-European language family. The Indo-Iranian languages are usually divided into two major groups: Indo-Aryan (or Indic), spoken primarily in India, Pakistan, Bangladesh, Sri Lanka, and Nepal and other areas of the Himalayan region (the Gypsy, or Romany, dialects are also Indo-Aryan); and Iranian, spoken primarily in Pakistan, Iran, Afghanistan, and Tajikistan.

A brief treatment of the Indo-Iranian languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World: *Indo-Iranian languages*.

Indo-Aryan and Iranian languages are closely related in grammar and vocabulary, sharing characteristic features that set them apart as a subgroup of the Indo-European language family. The original location of the Indo-Iranian group was probably north of modern Afghanistan in the area now known as Turkistan, where Iranian languages are still spoken. From there, some Iranians migrated south and west, while the Indo-Aryans migrated south and east. Reasons for the split of the Indo-Aryans and Iranians, which probably occurred before the beginning of the second millennium BC, are not known. Indo-Iranian languages have been used as both administrative and literary languages from at least the 1st millennium BC. Sacred texts of Buddhism, Jainism, and Hinduism are in Indo-Aryan languages, while Zoroastrian and Manichaean texts are in Iranian languages.

Indo-Aryan languages. Indo-Aryan languages are assigned to three major periods: Old, Middle, and New Indo-Aryan. Old Indo-Aryan dialects are referred to in common as Sanskrit. Middle Indo-Aryan includes Prākrit and Apabhraṃśa. New Indo-Aryan includes such modern vernaculars as Hindi and Bengali, which began to take shape about the 10th century AD.

The most archaic Sanskrit is that of the *Vedas* (*c.* 1500–1200 BC). One of the most distinctive features of Vedic Sanskrit is its accentual system, in which vowels have low, high, or circumflex pitch. As the Vedic language developed, vowel accent and other features fell into disuse, and the language became somewhat simpler. Classical Sanskrit is the result of such development. Approximately in the 6th century BC the grammarian Pāṇini composed a treatise that became the standard for correct usage of Classical Sanskrit. Major poetic works (*kāvya*), drama (*nāṭaka*), narratives, and technical treatises were composed in Sanskrit for centuries thereafter and even to the present day.

Saṃskṛta ("polished") was the language of the educated elite, but flourishing alongside it were the *Prākṛta* ("natural") languages, *i.e.,* the vernaculars, which are grouped under the heading of Middle Indo-Aryan. Prākrit languages were used in inscriptions from the 3rd century BC through the 4th century AD and in literature as well. The most archaic literary Prākrit is Pāli, in which the Buddhist canon was composed about the 5th century BC. The early Jaina canonical texts are in Ardhamāgadhī, while later Jaina texts are in Apabhraṃśa, and noncanonical Jaina texts are in Mahārāṣṭri. Epic poems, dramas, and narratives are extant in various Prākrits.

New Indo-Aryan languages developed regionally from Middle and Old Indo-Aryan, and some have literary traditions stretching back to the 10th century AD. Bengali, Assamese, Hindi, Marathi, Gujarati, and Kashmiri all have extant literary works from the 14th century or earlier. The recent creation of nations in South Asia, as well as states in India, that are based on linguistic groups has reinforced the use of standard dialects for more widespread communication. Linguistic diversity continues to thrive, however; India's attempt to establish Hindi as the single national language has been thwarted by speakers of other languages.

In general, the tendency of linguistic devel-

opment from Old and Middle to New Indo-Aryan was toward simplification. The number of nominal cases was reduced, but in Hindi and some other languages, post-positions have appeared. The dual number was dropped, and some verbal tenses were eliminated.

Iranian languages. Iranian languages are divided into three categories: Ancient, Middle, and Modern Iranian.

Two Ancient Iranian languages are known from texts and inscriptions dating from the 6th century BC: Avestan and Old Persian. Avestan was probably spoken in northeastern Iran, and Old Persian in southwestern Iran. Evidence indicates that other Ancient Iranian languages also existed, *e.g.*, Median. Avestan is the language in which the sacred texts of the Zoroastrians were written. The poems composed by Zoroaster (or Zarathustra) in the 7th or 6th century BC constitute the oldest portion of the extant Ancient Iranian. Old Persian was the language of the Achaemenian court and is known primarily from the cuneiform inscriptions of Darius I and Xerxes I. While Avestan was no longer spoken after the Ancient period, considerable continuity exists between Old and Middle Persian.

Middle Iranian languages include Middle Persian and Parthian. Middle Persian, the official language of the Sāsānian court (3rd to 7th century AD), was also used in Zoroastrian and Manichaean texts of the 3rd to 10th century. Parthian was spoken in northeastern and northwestern Iran, but little record of it has survived. These two languages were mutually intelligible; but very different from them were other Middle Iranian languages including Sogdian, Saka, Khotanese, Khwārezmian, Bactrian, and Old Ossetic.

Of the Modern Iranian languages, by far the most widely spoken is Persian, which developed from a Middle Persian dialect as the standard form and includes many words from other languages. Persian (Fārsī) is the official language of Iran and is recognized as the second language of Afghanistan, where the eastern Iranian language Pashto is the national language. Kurdish and Baluchi are other Modern Iranian languages spoken by millions of people scattered over several nations.

In general, Iranian languages have simplified the inherited Indo-European inflectional system by reducing the number of cases and similarly reducing the conjugational system for verbs. Many different scripts have been used in writing Iranian languages.

Indo-Scyth (ancient Asian people): *see* Yüehchih.

Indochina, also called (until 1950) FRENCH INDOCHINA, French INDOCHINE FRANÇAISE, the three states of Vietnam, Laos, and Cambodia formerly associated with France, first within its empire and later within the French Union. The term Indochina refers to the intermingling of Indian and Chinese influences in the culture of the region.

After gradually establishing suzerainty over Indochina between 1858 and 1893, the French created the first Indochinese Union to govern it. Except in Cochinchina (French: Cochinchine), the southernmost portion of Vietnam, the original Vietnamese, Cambodian, and Laotian royal houses continued under a federal-type central government that had exclusive authority in foreign affairs, finance, defense, customs, and public works and was headed by a French governor-general responsible to the French minister for trade. In Cochinchina the administration was under a prefect and a French bureaucracy.

In 1940 the Japanese occupied the Tonkin area of northern Vietnam and in the following year the rest of Indochina. But, except for Vietnam and the western provinces of Cambodia, which the Japanese ceded to their Thai ally, Indochina was unaffected by the Japanese invasion. The local French Vichy government was even allowed to remain in office until March 1945, when the Japanese interned the local French personnel and proclaimed the autonomous state of Vietnam.

This regime collapsed after the Japanese surrender in August 1945, and in the north a party called the Viet Minh under the Vietnamese nationalist leader Ho Chi Minh at once proclaimed a Democratic Republic of Vietnam and assumed power. The monarchies in Laos and Cambodia hesitated to follow suit, and they were soon reoccupied by the French. The French then founded the Indochinese Federation, which was to be part of a new, greater French Union and in which the Democratic Republic of Vietnam was to be treated as an independent state. The French Union, however, was not established for several years, and then it provided for control of the area from Paris.

Hôtel de Ville (Town Hall), in French Colonial Style, 1901–08, Ho Chi Minh City, Vietnam

©John Elk III

The conflict known as the First Indochina War soon erupted, and, during a lull in the fighting in 1949–50, the French, in an attempt to retain their holdings in the area, ratified separate treaties that recognized Vietnam, Laos, and Cambodia as independent, self-governing states within the French Union. Thus ended the conception that these states were united to form "French Indochina." The leaders of the states were puppet rulers; real independence did not come to the region until after the Geneva Conference of 1954, which finally ended the fighting between the French and the Viet Minh.

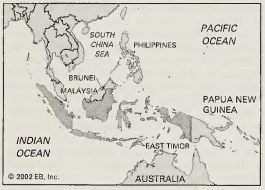
Indochina wars, 20th-century conflicts in Vietnam, Laos, and Cambodia, with the principal involvement of France (1946–54) and later the United States (beginning in the 1950s). The wars are often called the French Indochina War and the Vietnam War (*q.v.*), or the First and Second Indochina wars. The latter conflict ended in April 1975.

In the latter half of the 19th century, Vietnam was gradually conquered by the French, who controlled it as a protectorate (1883–1939) and then as a possession (1939–45). Vietnamese rule did not return to the country until Sept. 2, 1945, when the Nationalist leader Ho Chi Minh proclaimed its independence. From 1946 to 1954, the French opposed independence, and Ho Chi Minh led guerrilla warfare against them in the first Indochina War that ended in the Vietnamese victory at Dien Bien Phu on May 7, 1954. An agreement was signed at Geneva on July 21, 1954, providing for a temporary division of the country, at the 17th parallel of latitude, between a communist-dominated north and a U.S.-supported south. Activities of pro-communist rebels in South Vietnam led to heavy U.S. intervention in the mid-1960s and the Second Indochina War, or Vietnam War, which caused great destruction and loss of life. It came to a brief halt in 1973, when a cease-fire agreement was signed (January 27) and the remaining U.S. troops in South Vietnam began to be withdrawn. The war was soon resumed. In 1975 the South Vietnamese government collapsed and was replaced (April 30) by a regime dominated by the communists. On July 2, 1976, the two Vietnams were reunited as the Socialist Republic of Vietnam.

Cambodia had been a French protectorate since 1863 and achieved independence in 1953 under the leadership of Prince Norodom Sihanouk. Sihanouk adopted a position of neutrality in the Vietnam conflict and tacitly permitted Vietnamese communists to use sanctuaries inside Cambodia. On March 18, 1970, however, he was deposed in a coup by right-wing elements in the armed forces. On May 1, 1970, U.S. and South Vietnamese forces invaded Cambodia in an effort to destroy communist sanctuaries along the Cambodia-Vietnam border. Cambodia's new leaders by then faced a growing threat from Cambodian communists called the Khmer Rouge ("Red Khmers"). The U.S. launched a series of intensive bombing raids of rural areas of Cambodia until 1973 in an effort to disrupt Khmer Rouge activities; but, after a five-year civil war, the Cambodian capital, Phnom Penh, fell to the Khmer Rouge on April 17, 1975. Vietnamese forces invaded Cambodia in January 1979 and installed a puppet government soon afterward.

Laos had been a French protectorate since the turn of the century. It achieved independence in a series of steps between 1946 and 1954. Control of the government changed hands between rightists and neutralists several times until 1962, when a coalition government between them and the Laotian communists called the Pathet Lao ("Lao Country") was formed under the leadership of Prince Souvanna Phouma. The coalition continued to govern while communists and noncommunists vied for control of the outlying provinces of the country. After the fall of South Vietnam in 1975, the Pathet Lao, supported by the North Vietnamese, established control over the whole of Laos.

indole, also called BENZOPYRROLE, a heterocyclic organic compound occurring in some flower oils, such as jasmine and orange blossom, in coal tar, and in fecal matter. It is used in perfumery and in making tryptophan, an essential amino acid, and indoleacetic acid (heteroauxin), a hormone that promotes the development of roots in plant cuttings.



Indole, first isolated in 1866, has the molecular formula C_8H_7N, and it is commonly synthesized from phenylhydrazine and pyruvic acid, although several other procedures have been discovered.

In addition to tryptophan, indigo, and indoleacetic acid, numerous compounds obtainable from plant or animal sources contain the indole molecular structure. The best-known group of these compounds is the indole alkaloids, members of which have been isolated from plants representing more than 30 families. Psilocin, psilocybin, reserpine, and strychnine belong to this group.

Indole is a colourless solid having a pleasant fragrance in highly dilute solutions. It melts at 52.5° C (126.5° F).

indomethacin, analgesic with potent action against inflammation. Effective in the treatment of rheumatoid arthritis and gout, indomethacin is indicated for individuals whose pain cannot be controlled successfully with aspirin. Among the side effects associated with its use, however, are gastrointestinal disturbances, mental confusion, and severe morning headache.

Indonesia, officially REPUBLIC OF INDONESIA, Indonesian REPUBLIK INDONESIA, island republic lying off the coast of mainland Southeast Asia and composed of some 13,670 islands. Indonesia extends approximately 3,200 miles (5,100 km) from the island of Sumatra in the west to that of New Guinea in the east, and roughly 1,000 miles (1,600 km) from north to south. It is bordered by Papua New Guinea and the Arafura Sea to the east, the Indian Ocean to the south and west, the Andaman Sea to the northwest, and the Strait of Malacca, the South China Sea, the Sulu Sea, the Celebes Sea, and the western Pacific Ocean to the north. Indonesia is the fourth most populous country in the world. The capital is Jakarta. Area 742,308 square miles (1,922,570 square km). Pop. (2000 est.) 209,342,000.

Indonesia

A brief treatment of Indonesia follows. For full treatment, *see* MACROPAEDIA: Indonesia.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. The Indonesian islands consist of volcanic mountains covered by dense tropical forests. The outer, or southern, side of the chain of islands (west to east) includes Sumatra, Java, Bali, Lombok, Sumbawa, Flores, and the western half of Timor. North of the chain is Borneo, the Indonesian portion of which is called Kalimantan. It is the third largest island in the world and is hilly and mountainous. The curiously shaped island of Celebes (Sulawesi) lies to the east of Borneo. To the east of Celebes are the northern Moluccas, and farther east lies the island of New Guinea, the western half of which is the part of Indonesia called Irian Jaya. Indonesia has some 220 active volcanoes, including the world-famous Krakatoa (Krakatau), which erupted in 1883 from the seabed of the Sunda Strait between Sumatra and Java.

Indonesia's tropical climate is generally hot and humid. Average temperatures are highest along the coasts, ranging from 74° to 88° F (23° to 31° C). There is heavy precipitation throughout the year, much of it in afternoon thunderstorms due to the monsoon.

Only about one-tenth of the country's land area is arable, and half of this portion is devoted to wet-rice cultivation, including some double-cropping in north-central Java and southwestern Sumatra. Tropical rainforests occupy about two-thirds of Indonesia's land area. Temperate upland forests are found above 5,000 feet (1,500 m), and mangrove swamps along the coastlines of Sumatra, Kalimantan, and southeastern Irian Jaya.

Indonesia belongs to two faunal regions, the Asian in the west and the Australian in the east. The Asian animal community includes the rhinoceros, orangutan, tapir, tiger, and elephant. Animals related to Australian fauna include such birds as the cockatoo, the bowerbird, and the bird of paradise.

The people. Within the Indonesian population are more than 300 different ethnic groups speaking 250 distinct languages. Most of the people, however, are of Malay ancestry, speak languages that have an Austronesian (Malayo-Polynesian) base, and profess Islām. The largest of the subgroups is the Javanese, whose language is also the most dominant.

The country's diverse ethnic populations may be grouped into three broad divisions. The first group, the strongly Hinduized Muslim wet-rice growers of Java and neighbouring islands, makes up more than two-thirds of the population and includes the Javanese, Sundanese, Madurese, and Balinese peoples. The second group, of Islāmic coastal peoples, includes the Malays of Sumatra and the Makasarese of southern Celebes. The third group consists of small numbers of Dayak and other tribal peoples. The largest nonindigenous group is the Chinese, who have been present in Indonesia for generations.

The official language, Bahasa Indonesia, evolved from a Malay dialect spoken in the Jambi area of eastern Sumatra. The major religions were introduced on the coast and, except in such open areas as Java and southern Sumatra, penetrated inland. More than four-fifths of the population professes Islām, which is influenced by Hinduism, Buddhism, and older, animistic beliefs. Hindus live mainly on Bali, and most Chinese practice Buddhism and Confucianism. In remote areas some tribal religions are practiced.

The densely settled island of Java alone accounts for more than half of Indonesia's population. Madura, Bali, and parts of Sumatra and Celebes also have high population densities. Overall, the population more than doubled between 1960 and 2000, with a moderately high rate of growth, but fertility rates have declined since the 1970s because of later marriages and the introduction of birth control and family planning. Lower fertility has been especially conspicuous in central Java. The rates of infant and child mortality have also declined, largely because of improved health care and rising standards of living. Two-fifths of the population is under 15 years of age. Life expectancy at birth is about 66 years for males and 70 years for females.

Economy. Indonesia has a developing, mixed economy based largely on agriculture and manufacturing. The gross national product (GNP) is growing more rapidly than the population; the GNP per capita, however, is low.

Agriculture accounts for almost one-fifth of the gross domestic product (GDP) but employs more than two-fifths of the workforce. The staple crop is rice, and government efforts at estate modernization have increased rice yields substantially. Independent peasant farmers account for most of the country's agricultural production, although there is an important estate sector that produces cash crops mainly for export. Indonesia is a major supplier of natural rubber; other cash crops include coffee, tea, tobacco, copra, spices (cloves and nutmeg), and oil palm products.

Indonesia's timber industry has grown, and wood products are major export items, along with petroleum and natural gas. Rapid exploitation has reduced the country's vast rainforests and has prompted the Indonesian government to curtail clear cutting of trees and implement reforestation programs.

Indonesia's mining sector is dominated by the production of petroleum and natural gas, mainly in Sumatra and Kalimantan. The government owns petroleum resources, and foreign oil companies act as development contractors, supplying the necessary skilled labour and capital. Refinery production is in the hands of Pertamina, the state oil company. Natural gas, particularly in liquefied form, is an increasingly important export item, and production facilities are expanding. Indonesia is one of the world's leading producers of tin. Other minerals extracted include nickel, bauxite, gold, copper, and iron ore.

Manufacturing expanded from the mid-1980s and is becoming a major sector of the economy. Many of the largest industries, such as those producing capital goods or processing minerals, are state-owned, while consumer goods are manufactured mostly by private companies. Chief manufactures include chemicals, electronic components, cement, rubber tires, paper, and textiles. A well-developed commercial sector, dominated by the Chinese community, has been formed. An effort has been made to deregulate the economy and encourage private enterprise.

In general, Indonesia exports raw materials in return for manufactured goods. Oil, natural gas, timber products, garments, and rubber are the country's major exports. Imports largely consist of capital equipment, consumer goods, and foodstuffs. Indonesia's most important trading partners are Japan, the United States, Singapore, and Germany.

Government and social conditions. Indonesia is a republic based on a 1945 constitution. Executive power is vested in the president, who is elected every five years by the People's Consultative Assembly (Majelis Permusyawaratan Rakyat), the highest authority in the state, which meets at least once every five years and formulates the principles of the government. The House of People's Representatives (Dewan Perwakilan Rakyat), about one-fifth of its 500 members appointed by the government and the rest directly elected, exercises legislative authority. The major political parties are the Joint Secretariat of Functional Groups (Sekretariat Bersama Golongan Karya, also called Sekber Golkar, or Golkar), a government-sponsored organization that supported former president Suharto; the Indonesian Democratic Party of Struggle, led by Megawati Sukarnoputri; and the National Awakening Party, led by Muslim leader Abdurrahman Wahid. The Supreme Court of Indonesia is the final court of appeal.

Indonesia suffers from a shortage of medical personnel. The country also faces a problem of malnutrition, especially among children. The educational system provides six years of compulsory primary education, followed by three years of junior and three years of senior secondary, which are not compulsory. More than four-fifths of the population is literate. Higher education is conducted in numerous public and private universities, institutes, and teacher-training colleges.

There are numerous daily and weekly newspapers. Radio and television are mainly controlled by the government, but there is some independent radio and television broadcasting locally. Indonesia's communications satellites handle radio, telephone, and television signals and effectively link all communications systems in the nation.

Cultural life. Centuries of cultural assimilation has produced a rich diversity of cultural forms. From the 8th through the 10th century AD, extensive Hindu temple complexes, as well as the great Mahāyāna Buddhist monument, Borobudur, were built in central Java. Music, dance, and drama are combined in a notable puppet show (wayang) on Java and Bali. Decorative arts include metalwork and carving in stone, wood, bone, and ivory; batik is a traditional fabric-dyeing technique in which pigment-resistant wax is used to create complex designs. The country's literary tradi-

tion includes both oral and written literature.

History. During the Neolithic Period until about 1000 BC, Proto-Malay peoples who spoke Austronesian languages migrated to the islands of Indonesia from mainland Asia. These were the ancestors of much of Indonesia's present population. Commercial relations with China began about 2,000 years ago, and Hindu and Buddhist cultural influences from India started to take hold in the islands. Between the 7th and the 13th century the Malay kingdom of Śrivijaya flourished in the Malay Peninsula, western Java, and Sumatra. By the end of the 12th century, Śrivijaya was reduced to a small kingdom, and the Javanese Majapahit kingdom began to dominate Indonesia.

In the 13th century Islām was brought to northern Sumatra by Indian Muslim traders, and this religion spread to the other islands in the ensuing two centuries, except for Bali, which retained its Hindu religion and culture. The Majapahit era had ended by the late 15th century. During the 16th century newly founded Muslim trading kingdoms contended among themselves and with inland aristocracies for supremacy in the islands. When the Portuguese arrived in the Moluccas (Spice Islands) in 1511, followed by Spaniards, Dutch, and British, they easily seized control by setting local rulers against each other. The Dutch East India Company, intent on trade, eventually acquired colonial control over Java, Sumatra, and the Moluccas, and its headquarters were established in Batavia (now Jakarta).

By the end of the 17th century the Dutch had established economic and political control over most of the islands. The Dutch controlled Indonesia with only a brief interruption (1811–16) until the mid-20th century. In 1927 the Indonesia Nationalist Party was formed by Sukarno. In their pursuit of national independence from The Netherlands, Sukarno and other leaders were arrested in 1929. In 1942 the Japanese invaded Indonesia with only limited opposition because they were regarded as liberators from Dutch colonialism, but they proved to be as brutal as the Dutch.

After the Japanese surrendered in 1945, Sukarno declared independence for Indonesia. During the next four years the Dutch tried to regain control, but in 1949 they granted Indonesia independence with nominal union to The Netherlands. The United States of Indonesia were formed, and Sukarno became president. The future of Irian Barat (later called Irian Jaya; since 2002 Papua) was left unresolved in the 1949 agreement and proved detrimental to Dutch-Indonesian relations. Continued Dutch control of Irian Barat led Indonesia to dissolve the union with The Netherlands in 1954. In 1962 the Dutch transferred Irian Barat to the United Nations, and in 1969 it was annexed to Indonesia.

In 1965 a coup d'état put General Suharto in power, and he became president in 1968. The Suharto government forcibly incorporated the former Portuguese East Timor into Indonesia in 1975–76, with much loss of life. Suharto resigned in 1998 and was succeeded by B.J. Habibie. In 1999 Indonesia rescinded its annexation of East Timor, and Abdurrahman Wahid became president. He was removed from office in 2001 and replaced by his vice president, Megawati Sukarnoputri, the daughter of Sukarno. In 2004, in the country's first-ever direct presidential election, Sukarnoputri was defeated by Susilo Bambang Yudhoyono, her former security minister.

Indonesian language: *see* Malay language.

Indonesian languages, broadly, the Austronesian languages of island Southeast Asia as a whole, including the languages of Indonesia, Malaysia, Brunei, the Philippines, and Taiwan, and the outlying areas of Madagascar and of Palau and the Mariana Islands of western Micronesia. A more restricted core area includes only the languages of Indonesia, Malaysia, and Brunei. The term has been used in the broader sense by Japanese and Chinese linguists concerned with the aboriginal languages of Taiwan, as well as by European scholars such as Wilhelm Schmidt and Otto Dempwolff in the first half of the 20th century. In its narrower sense the term Indonesian language has been used primarily by Dutch scholars. Most scholars have avoided this expression in connection with the Chamic languages of mainland Southeast Asia, despite the close relationship of this group to Malay and some other languages of western Indonesia. Although it remains a convenient label for languages of a certain type and geographic area, the term Indonesian language does not appear to refer to any definable subgroup within the Austronesian family.

Indonesian literatures, the poetry and prose writings in Javanese, Malay, Sundanese, and other languages of the peoples of Indonesia. They include works orally transmitted and then preserved in written form by the Indonesian peoples, oral literature recorded by Western anthropologists and ethnologists, and the modern literatures that began to emerge in the early 20th century as the result of Western influence.

Many of the Indonesian songs, or poems, that were orally transmitted by professional priest-singers embody traditions that have a religious function. Improvisation played a great part in this kind of poetry, and there is reason to believe that in its present form much of it is of no great age. Indonesian orally transmitted prose forms are highly varied and include myths, animal stories and "beast fables," fairy tales, legends, puzzles and riddles, and anecdotes and adventure stories. The divine heroes and epic animals of these tales show the influence of Indian literature and the written literatures of other neighbouring cultures.

Written literature in Indonesia has been preserved in the various languages of Sumatra (Achinese, Batak, Redjang, Lampong, and Malay), in the languages of Java (Sundanese and Madurese as well as Javanese), in Bali and Lombok, and in the more important languages of South Celebes (Makasarese and Buginese). By far the most important in both quantity and quality are the literatures in Javanese and Malay.

The earliest extant examples of Javanese literature date from the 9th or 10th century AD. An important position in this early literature is occupied by Javanese prose and poetic versions of the two great Hindu epics, the *Mahābhārata* and the *Rāmāyaṇa*. The Javanese also borrowed from India's sophisticated court poetry in Sanskrit, in the process making it Javanese in expression, form, and feeling.

When Islām reached Java in the 15th century, the mystical tendencies in it were incorporated by the Javanese into their own markedly mystical religious literature. Muslim influence was especially fertile during the early 17th century in Aceh, where Malay for the first time became an important written literary language. In Java, Muslim legends of saints were combined with Hindu-derived mythologies and cosmologies to produce strangely imaginative works of historical narrative in which magico-mystical elements play a prominent role.

The Javanese and Malayan literatures declined under the impact of Dutch colonial domination in the 18th and 19th centuries. Only in the 20th century did a modern Indonesian literature arise, closely linked as it was to the nationalist movement and to the new ideal of a national language, Bahasa Indonesia. After 1920 a modern Indonesian literature rapidly came into existence. Muhammad Yamin and other prominent poets at this time were influenced by the forms and expressive modes of Romantic, Parnassian, and Symbolist verse from Europe. The first Indonesian novels also appeared in the 1920s and '30s; these were typical regional works by Abdul Muis and others in which the central theme is the struggle between the generations, between the stifling burden of traditionalism and the impulse for modern progress.

In 1933, with the appearance of the review *Pudjangga Baru* ("The New Writer"), a new generation of intellectuals began to assess whether to maintain traditional values or to consciously accept Western norms in the effort to establish a modern but genuinely Indonesian culture. This discussion was interrupted by the Japanese occupation of Indonesia in 1942, which eventually broke up a generation that was still closely bound to Indonesia's colonial situation.

With the Indonesian nationalist revolution of 1945, a new generation of fervently nationalistic and idealistic young writers who professed a universal humanism came to the forefront. Their inspiration and leader was the great poet Chairil Anwar, who died in 1949 at the age of 27.

Under the rule of Sukarno during the 1950s and early '60s, free literary expression was curtailed. The political coup of 1965 removed many of the limitations on the country's writers, and by the late 1960s more attention was being given to rediscovering the traditional roots of Indonesian literature and culture.

Indonesian Union (student organization): *see* Perhimpunan Indonesia.

Indore, also spelled INDUR, city, western Madhya Pradesh state, central India. The city is a major trunk road and rail junction and is located on the Saraswatī and Khān streams, which are tributaries of the Siprā River.

Indore was founded in 1715 as a trade market on the Narmada River valley route by local landowners, who erected Indreshwar Temple (1741), from which the name Indore is derived. It became the capital of the former Indore princely state of the Marāṭhā Holkars, and it was the headquarters of the British Central India Agency and the summer capital of Madhya Bhārat (1948–56).

The largest city in the state, Indore is the chief collecting and distributing centre for western Madhya Pradesh as well as a commercial and industrial centre. Major industries include the manufacture of textiles, tile, cement, chemicals, tents, furniture, and sporting goods; grain milling; and metalworking. There are auto and cycle workshops and engineering works.

Indore is the seat of Devi Ahilya University (founded in 1964 as the University of Indore), with numerous constituent and affiliated colleges in the city. Pop. (2001 prelim.) 1,597,441.

Indra, chief of the Vedic gods of India. A warlike, typically Aryan god, he conquered innumerable human and demon enemies, vanquished the sun, and killed the dragon Vṛtra, who had prevented the monsoon from breaking.

His weapons are lightning and the thunderbolt, and he is strengthened for these feats by drinks of the elixir soma, the offering of the sacrifice. Among his allies are the Rudras (or Maruts), who ride the clouds and direct storms; the Aśvins, twin horsemen; and Vishnu, who later evolved into one of the three principal gods of Hinduism. In later Hinduism, Indra plays little part except in his role as god of rain, regent of the heavens, and guardian of the east. The *Purāṇas* record some rivalry between Indra and Krishna, who persuaded the cowherders of Vraja (Braja, in modern Uttar Pradesh) to stop their worship of Indra. Enraged, he sent down torrents of rain, but Krishna lifted Mount Govardhana

on his fingertip and gave the people shelter under it for seven days until Indra relented and paid him homage. Indra is father to Arjuna, hero of the *Mahābhārata* war. Indra is sometimes referred to as "the thousand-eyed," because of the thousand marks on his body resembling eyes (actually yonis, or symbols of the female sexual organ), a result of a curse by a sage whose wife Indra seduced. In painting and sculpture he is often depicted riding on his white elephant Airāvata.

Indra also plays a part in the Jaina and Buddhist mythology of India. As chief of the gods he received into his hands the hair of the Jaina prophet Mahāvīra when he cut it off to signify his renunciation of the world.

Indraditya, also called INDRAPATINDRADITYA (Thai king of Sukhothai): *see* Sri Indraditya.

Indravarman I (fl. 9th century, Cambodia), ruler of the Khmer kingdom of Angkor (Cambodia) from 877 to about 890.

Indravarman probably usurped the throne from his cousin Jayavarman III. During his reign a large reservoir was constructed around the capital city of Roluos (near modern Phumĭ Rôluŏs). The lake was the first part of a vast system of reservoirs, canals, and irrigation channels eventually built to control the river system of the region and to permit the cultivation of rice on lands that would otherwise have remained unproductive. This vast irrigation system later enabled the Khmers at Angkor to maintain a densely populated and highly centralized state in a relatively limited area. The system eventually made it possible to feed the immense labour force that was necessary for the construction of the temples at Angkor. At Roluos, Indravarman built Bakong, which was the first Cambodian temple built mainly of stone and was the model from which the later Angkor temples developed.

Indre, *département,* Centre region, central France. It was created from the western part of the historic province of Berry (*q.v.*) and from small areas of Orléanais, Marche, and Touraine (*qq.v.*). Its terrain slopes northwestward from the Massif Central and is drained primarily by the Indre River, a tributary of the Loire River. The Indre flows from the southeast through Châteauroux (*q.v.*), Indre's capital, and past Buzançais to Châtillon in the northwest corner of the *département.* The Creuse River, to the south, flows roughly parallel to the Indre. The western part of the *département,* known as Brenne, is covered with small lakes and marshland. The centre and north are wooded, while the northeast is agricultural land. The hilly, wooded south, known as Boischaut, embraces the Creuse River valley, which has a dam and hydroelectric plant near Éguzon. Most of the economic activity of Indre is agricultural. Industry (aircraft, textiles, metalworks, plastics, tobacco) is dispersed but is mainly in the Châteauroux area. The valley of the Creuse River is much frequented by tourists, who also visit the north near the châteaus of the Loire. Valençay has a magnificent Renaissance château that belonged to the statesman Talleyrand. At Neuvy-Saint-Sépulchre is an 11th-century circular church, and other medieval churches are located in the west and centre. The *département* has four *arrondissements*—Châteauroux, Le Blanc, La Châtre, and Issoudun—and is in the educational division of Orléans. Area 2,622 square miles (6,791 square km). Pop. (1993 est.) 236,000.

Indre-et-Loire, *département,* Centre region, west-central France. Indre-et-Loire occupies most of the historic province of Touraine (*q.v.*) and fragments of Orléanais and Anjou and is known as the "Garden of France." It is crossed by the Loire River, which flows through Tours (*q.v.*), the departmental capital, and is joined from the southeast by the Cher, Indre, and Vienne rivers. The contrast is striking between the fertile valleys and the sparsely wooded plateaus that separate them, especially in the Gâtine de Touraine between the Loire and Loir rivers.

The climate is temperate, with warm summers and mild winters. The valleys, displaying lush pastures, orchards, vineyards, and market gardens, abound with France's most famous châteaus, among them Amboise, Chenonceaux, Loches, Azay-le-Rideau, Chinon (*qq.v.*), and Langeais. Tours is the centre of tourism for the château country. The vineyards produce such well-known wines as Vouvray, Bourgueil, and Montlouis. Industry (chemical, pharmaceutical, electrical) has developed in the Tours region, and, indeed, overdeveloped to the point that planning for the Tours region emphasizes decentralization. A nuclear power station is located in Avoine. The *département* has three *arrondissements*—Tours, Chinon, and Loches—and is in the educational divisions of Orléans and Poitiers. Area 2,366 square miles (6,127 square km). Pop. (1993 est.) 538,600.

Indre River, river, west-central France, a left-bank tributary of the Loire River. Rising on the northern flanks of the Massif Central, it flows 165 miles (265 km) northwestward through Indre and Indre-et-Loire *départements,* joining the Loire northwest of Chinon and draining a basin of about 5,200 square miles (13,500 square km). It flows exclusively through agricultural regions, crossing La Châtre, and passing near Nohant where George Sand, the French 19th-century novelist who described the countryside in her novels, resided. The river loops through Châteauroux, then flows through the gentle countryside of Touraine, below the medieval castle of Loches. At Montbazon, south of Tours, the Indre veers westward past woods and lush meadows, encircling the 16th-century château of Azay-le-Rideau and passing the 15th-century château of Ussé before joining the Loire River at the Avoine-Chinon nuclear power station.

indri (*Indri indri*), slender, long-limbed primate of the family Indriidae, found in Madagascan forests. The largest of existing Madagascan lemurs, the indri is about 70 cm (28 inches) long and has a rudimentary tail, large hands and feet, and a round head with pointed face and round, furry ears. Its colour is usually black with white on the head, throat, forearms, and buttocks. Diurnal and thoroughly

Indri (*Indri indri*)
Painting by Don Meighan

arboreal, the indri clings and climbs in an upright position and feeds, presumably, on shoots, fruit, and other plant material.

The indri, which is now limited to remote parts of the northeastern forests of Madagascar, is listed in the *Red Data Book* as being in immediate danger of extinction. It is protected by law.

Indricotherium, formerly BALUCHITHERIUM, genus of giant browsing perissodactyls found as fossils in Asian deposits of the Late Oligocene and Early Miocene epochs (30 to 16.6 million years ago). The indricotherium, which was related to the modern rhinoceros but was hornless, was the largest land mammal that ever existed. It stood about 5.5 m (18 feet) high at the shoulder, was 8 m (26 feet) long, and weighed an estimated 30 tons, which is more than four times the weight of the modern elephant. Its skull, small in proportion to its body, was more than 1.2 m (4 feet) in length. Indricotherium had relatively long front legs and a long neck; thus, it was probably able to

browse on the leaves and branches of trees. Its limbs were massive and strongly constructed.

Indriidae, family of arboreal Madagascan primates. *See* avahi; indri; sifaka.

indriya (Sanskrit: "faculty"), according to Indian philosophy, the instruments of a person's direct perception of the outside world. They are of two kinds, motoric and sensory. The motoric faculties are those of speaking, grasping, walking, ejaculating, and evacuating. The sensory faculties, or senses, are hearing, touching, seeing, tasting, and smelling. Both sets of faculties are correlated with the five elements, respectively: ether, wind, fire, water, and earth. Simultaneous separate impressions of the senses are coordinated in the "mind," which is often called the 11th faculty.

inductance, property of a conductor (often in the shape of a coil) that is measured by the size of the electromotive force, or voltage, induced in it, compared with the rate of change of the electric current that produces the voltage. A steady current produces a stationary magnetic field; a steadily changing current, alternating current, or fluctuating direct current produces a varying magnetic field, which, in turn, induces an electromotive force in a conductor that is present in the field. The size of the induced electromotive force is proportional to the rate of change of the electric current. The proportionality factor is called the inductance and is defined as the value of the electromotive force induced in a conductor divided by the magnitude of the rate of change of the current causing the induction.

If the electromotive force is induced in a conductor that is different from the one in which the current is changing, the phenomenon is called mutual induction, exemplified in a transformer. A changing magnetic field caused by a varying current in a conductor, however, also induces an electromotive force in the very conductor that carries the changing current.

Such a phenomenon is called self-induction, and the quotient of the induced electromotive force and the rate of change of the current is specified as self-inductance.

A self-induced electromotive force opposes the change that brings it about. Consequently, when a current begins to flow through a coil of wire, it undergoes an opposition to its flow in addition to the resistance of the metal wire. On the other hand, when an electric circuit carrying a steady current and containing a coil is suddenly opened, the collapsing, and hence diminishing, magnetic field causes an induced electromotive force that tends to maintain the current and the magnetic field and may cause a spark between the contacts of the switch. The self-inductance of a coil, or simply its inductance, may thus be thought of as electromagnetic inertia, a property that opposes changes both in currents and in magnetic fields.

Inductance depends on the size and shape of a given conductor, the number of turns if it is a coil, and the kind of material near the conductor. A coil wound on a soft iron core far more effectively chokes the increase of a current than the same coil with an air core. The iron core increases the inductance; for the same rate of change of the current in the coil, a greater opposing electromotive force (back emf) is present to choke the current.

The unit of magnetic inductance is the henry, named in honour of the 19th-century American physicist Joseph Henry, who first recognized the phenomenon of self-induction. One henry is equivalent to one volt divided by one ampere per second. If a current changing at the rate of one ampere per second induces an electromotive force of one volt, the circuit has an inductance of one henry, a relatively large inductance.

induction, in embryology, process by which the presence of one tissue influences the development of others. Certain tissues, especially in very young embryos, apparently have the potential to direct the differentiation of adjacent cells. Absence of the inducing tissue results in lack of or improper development of the induced tissue. The converse is often true as well; *i.e.,* the addition of extra inducing tissue in an abnormal position in an embryo often results in aberrantly located induced tissue.

An example of induction is the development of the eye lens from epidermis under influence of the eye cup, which grows toward the skin from the brain. As the eye cup comes into contact with any neighbouring epidermis, it transforms that particular region into a lens. The exact nature of the stimulus for lens induction is not known, although ribonucleic acid (RNA) has been implicated as a messenger.

The range of the inductive effect is not unlimited, for only certain tissues are capable of being induced by a given structure and then only at certain times.

induction, in enzymology, a metabolic control mechanism with the effect of increasing the rate of synthesis of an enzyme. In induction, synthesis of a specific enzyme, called an inducible enzyme (*e.g., β*-galactosidase in *Escherichia coli*), occurs when cells are exposed to the substance (substrate) upon which the enzyme acts to form a product.

Formation of *β*-galactosidase has been shown to be controlled by a so-called regulator gene presumed to specify a protein, called a repressor protein, that binds to the region of deoxyribonucleic acid (DNA) responsible for directing the synthesis of the enzyme. If substrate is present, it acts as an inducer by combining with the repressor so as to prevent its binding to DNA. As a result, the enzyme is synthesized; *i.e.,* its formation by the microorganism is induced.

Such mechanisms are important in the cell because they prevent the synthesis of enzymes that a cell cannot use; *e.g., β*-galactosidase is needed only when its substrate (lactose or galactose) is present.

induction, in logic, method of reasoning from a part to a whole, from particulars to generals, or from the individual to the universal. As it applies to logic in systems of the 20th century, the term is obsolete. Traditionally, logicians distinguished between deductive logic (inference in which the conclusion follows necessarily from the premise, or drawing new propositions out of premises in which they lie latent) and inductive logic, but the problems earlier subsumed under induction are considered to be concerns of the methodology of the natural sciences, and logic is generally taken to mean deductive logic.

induction, electromagnetic, in physics, the induction of an electromotive force in a circuit by varying the magnetic flux linked with the circuit. *See* Faraday's law of induction.

induction, electrostatic: *see* electrostatic induction.

induction heating, method of raising the temperature of an electrically conductive material by subjecting it to an alternating electromagnetic field. The electric currents induced in the object (although it is electrically isolated from the source of the field) bring about dissipation of power in the form of heat. Induction-heating methods are applied most widely in metalworking to heat metals for soldering, tempering, and annealing. The method is also employed in induction furnaces for melting and processing metals.

The principle of the induction-heating process resembles that of the transformer. A water-cooled coil, or inductor, acting as the primary winding of a transformer, surrounds the material to be heated (the workpiece), which acts as the secondary winding. Alternating current flowing in the primary coil induces eddy currents in the workpiece, causing it to become heated. The depth to which the eddy currents penetrate, and therefore the distribution of heat within the object, depends on the frequency of the primary alternating current and the magnetic permeability, as well as the resistivity, of the material. Induction hardening, widely used to increase the resistance of steel objects to wear, can be effected by brief exposure to a high-frequency field.

The related method of producing heat in nonconductors is called dielectric heating.

indulgence, in Roman Catholicism, a partial remission of temporal punishment due for a sin after the sin has been forgiven through the sacrament of penance. The theology of indulgences is based upon the concept that sin is always evil and that, even though the crime and the eternal punishment are forgiven in the sacrament of penance, divine charity and justice demand that the sinner pay for his crime. The fault and the eternal guilt, once forgiven sacramentally, are wiped away; yet some punishment remains to be satisfied in this life or in purgatory.

The history of indulgences is intimately bound up with the penitential discipline of the early Christian church. The sacrament of penance was frequently referred to as a second and more laborious baptism in which the penitent endeavoured to free himself not only of the guilt of sin but of the temporal punishment as well. To this end fixed penances (canonical) were assigned that were calculated to compensate the debt of punishment contracted by sin. The penitent was not, however, left to his own resources; he was encouraged to enlist the aid of the church, acting in behalf of the whole Christian community. Later, in the early European Middle Ages, there developed procedures to commute the protracted canonical penance by substituting periods of fasting (usually of 40 days, a quarantine), special private prayers, almsgiving, and payments of money that was to be used for religious purposes. The first to grant a plenary, or absolute, indulgence was Pope Urban II on the occasion of the First Crusade (1095). The pertinent section of the indulgence decree reads: "Whosoever out of pure devotion and not for the sake of gaining honour or money, shall go to Jerusalem to liberate the Church of God, may count that journey in lieu of all penance."

After the 12th century, references to indulgences became more frequent. Innocent II granted a 40-day indulgence for visiting and contributing to the adornment of the great church at Cluny (1132), and soon every church of any importance had its own indulgence to further the work of construction. The evident lack of proportion between the small sums of money contributed and the debt of punishment remitted posed a problem for the great speculative theologians of the age. Their solution fixed the doctrine that was regarded as implicit in contemporary practice. Money contributions and other pious works were not to be considered as substitutes for the canonical penance but rather as conditions for gaining the indulgence. The debt of punishment was paid from the church's treasury.

While the doctrine of indulgences was sound enough, the practice of demanding an offering as a necessary condition for certain indulgences inevitably prepared the way for serious abuses. The magnificent cathedrals of Europe and its older universities, hospitals, bridges, and other social and cultural projects are evidence enough that much of the money collected on the occasion of an indulgence was actually directed toward legitimate purposes; not a little, however, found its way into the pockets of greedy ecclesiastics and professional collectors (*quaestores*). And it is at least possible that preachers in their zeal for the church (edifice) of God went beyond the limits of the doctrine, misleading the more credulous into believing that the indulgence was a substitute for true sorrow and confession. It would appear also that the frequently used expression *ab omni culpa et poena*—"from all guilt and punishment"—contributed to the misconception. Whatever the original significance of this misleading phrase, it is noteworthy that during the rebuilding of the imperial cathedral in Speyer (1451) there was written on the church doors in big letters, "In this place is full pardon of all sins for punishment and guilt."

Martin Luther's Ninety-five Theses (*q.v.*), posted on the door of All Saints Church (Castle Church), Wittenberg, in 1517, were in part a protest against the wayward employment of indulgences and helped spark the Indulgence Controversy. Not until the great reformist Council of Trent (1563), however, was an end put to abuses connected with the practice of indulgences. The name and office of *quaestor* was abolished and with the office the privileges attached. Five years later, Pius V revoked all indulgences for which money payments or alms were prescribed and ordered the bishops to destroy all briefs in which such indulgences were granted. The Roman Catholic church nevetheless still held to its doctrinal position that the debt of punishment could be paid from the church's treasury. Insisting on this point, the church kept before the minds of the faithful the consoling doctrine of the communion of saints and of that solidarity of all its members in Christ's mystical body, which is basic to the doctrine of indulgences.

In current Roman Catholic doctrine and practice, in order to gain an indulgence the person must be in the state of grace (*i.e.,* he must have no unabsolved mortal sin upon his conscience), he must have the intention of gaining the indulgence, and he must per-

sonally fulfill the prescribed good work. Indulgences may be applied to the souls of the dead. In such cases, however, the church cannot grant directly; indulgences can be offered for the dead only *per modum suffragii* (*i.e.*, in supplication), not *per modum absolutionis* (*i.e.*, as a grant).

Indur (Andhra Pradesh, India): *see* Nizāmābād.

induration, hardening of rocks by heat or baking; also the hardening of sediments through cementation or compaction, or both, without the introduction of heat. The classic example is the rock called hornfels, which is formed at contacts with igneous intrusions and in which heat and fluids from the intruding magma reconstitute the original wall rock into a hardened, flinty rock with a dense texture; it also is commonly formed by induration of carbonate sedimentary rocks and shales.

Indus civilization, also called INDUS VALLEY CIVILIZATION, or HARAPPĀN CIVILIZATION, the earliest known urban culture of the Indian subcontinent, first identified in 1921 at Harappā in the Punjab and then in 1922 at Mohenjo-daro, near the Indus River in the Sindh, now both in Pakistan. Subsequently, vestiges of the civilization were found as far apart as Sutkāgen Dor, near the shore of the Arabian Sea 300 miles (480 km) west of Karāchi, and Rūpar at the foot of the Simla Hills, 1,000 miles (1,600 km) to the northeast. Later exploration established its existence southward down the west coast as far as the Gulf of Cambay, 500 miles (800 km) southeast of Karāchi and as far east as the Yamuna Basin, 30 miles (50 km) north of Delhi. It is thus decidedly the most extensive of the three earliest civilizations, the other two being those of Mesopotamia and Egypt, both of which began somewhat before it.

A brief treatment of the Indus civilization follows. For full treatment, *see* MACROPAEDIA: India: *The Indus civilization*.

The civilization is known to have comprised two large cities, Harappā and Mohenjo-daro, and over 100 towns and villages, often of relatively small size. The two cities were each over 3 miles (5 km) in circuit, and their outstanding magnitude suggests political centralization, either in two large states or in a single great empire with alternative capitals, a practice having analogies in Indian history. Or it may be that Harappā succeeded Mohenjo-daro, which is known to have been devastated more than once by exceptional floods. The southern region of the civilization in Kāthiāwār and beyond appears to be of later origin than the major Indus sites. The civilization was literate, and its script, with some 250 to 500 characters, has been partly and tentatively deciphered; the language has been tentatively identified as Dravidian. The nuclear dates of the civilization appear to be about 2500–1700 BC, though southern sites may have lasted later in the 2nd millennium BC.

The Indus civilization apparently evolved from the villages of neighbours or predecessors, using the Mesopotamian model of irrigated agriculture with sufficient skill to reap the advantages of the spacious and fertile Indus River valley while controlling the formidable annual flood that simultaneously fertilizes and destroys. Having once obtained a secure foothold on the plain and mastered its more immediate problems, the new civilization, doubtless with a well-nourished and increasing population, would find expansion along the flanks of the great waterways an inevitable sequel. The civilization subsisted primarily by farming supplemented by an appreciable but often elusive commerce. Wheat and six-rowed barley were grown; field peas, mustard, sesame, and a few date stones have also been found, as well as some of the earliest traces of cotton known. Domesticated animals included dogs and cats, humped cattle, shorthorns, domestic fowl, and possibly pigs, camels, and buffaloes. The elephant was probably also domesticated, and its ivory was freely used. Minerals, unavailable from the alluvial plain, were brought in sometimes from far afield. Gold was imported from southern India or Afghanistan, silver and copper from Afghanistan or northwestern India (now Rājasthān), lapis lazuli from Afghanistan, turquoise from Iran (Persia), and a jadelike fuchsite from southern India.

Perhaps the best-known artifacts of the Indus civilization are a number of small seals, generally made of steatite, which are distinctive in kind and unique in quality, depicting a wide variety of animals, both real—such as elephants, tigers, rhinoceros, and antelopes—and fantastic, often composite, creatures. Sometimes human forms are included. A few examples of Indus stone sculpture have also been found, usually small and representing humans or gods. There are great numbers of small terra-cotta figures of animals and humans.

How and when the civilization came to an end remains uncertain. In fact, no uniform ending need be postulated for a culture so widely distributed. But the end at Mohenjo-daro is known and was dramatic and sudden. It was attacked toward the middle of the 2nd millennium BC by raiders who swept over the city and then passed on, leaving the dead lying where they fell. Who the attackers were is matter for conjecture. The episode would appear to be consistent in time and place with the earlier Aryan onslaught upon the Indus region as reflected in the older books of the Rigveda, in which the newcomers are represented as attacking the "walled cities" or "citadels" of the aborigines and the Aryan war-god Indra as rending "forts as age consumes a garment." However, one thing is clear: the city was already in an advanced stage of economic and social decline before it received the coup de grace. Deep floods had more than once submerged large tracts of it. Houses had become increasingly shoddy in construction and showed signs of overcrowding. The final blow seems to have been sudden, but the city was already dying. As the evidence stands, the civilization was succeeded in the Indus valley by poverty-stricken cultures, deriving a little from a sub-Indus heritage but also drawing elements from the direction of Iran and the Caucasus—from the general direction, in fact, of the Aryan invasions. For many centuries urban civilization was dead in the northwest of the Indian subcontinent.

In the south, however, in Kāthiāwār and beyond, the situation appears to have been very different. Here it would seem that there was a real cultural continuity between the late Indus phase and the Copper Age cultures that characterized central and western India between 1700 BC and the first millennium. These cultures form a material bridge between the end of the Indus civilization proper and the developed Iron Age civilization that arose in India in about 1000 BC.

Indus River, great trans-Himalayan river of South Asia and one of the world's longest rivers, with a length of 1,800 miles (2,900 km).

A brief treatment of the Indus River follows. For full treatment, *see* MACROPAEDIA: Asia: *Indus River*.

The Indus rises in southwestern Tibet at an elevation of about 18,000 feet (5,500 m) and flows in a northwesterly direction along the slopes of the Himalayas, crossing into Jammu and Kashmir from the southeast. The Zāskār, Shyok, Shigar, Gilgit, Astor, and other streams carry snow and glacial meltwaters to the Indus from the main Himalayan range, the Karakoram Range, the Nānga Parbat massif, and the Kohistān highlands. The river crosses the western Kashmir border and then turns south and southwest to enter Pakistan. In Pakistan it emerges from the highlands and flows as a rapid stream between the Swāt and Hazāra regions and across the Salt Range to enter the semiarid Punjab Plain. The Indus receives its most notable tributaries from the Punjab ("Land of Five Rivers") to the east, including the Jhelum, Chenāb, Rāvi, Beās, and Sutlej rivers. After receiving the waters of the Punjab rivers, the Indus becomes much wider and flows at a slow speed, depositing large quantities of silt along its course. Embankments have been built to prevent flooding, but occasionally these give way and large areas are damaged by overflow. Near Thatta (Tatta) the Indus begins its deltaic stage and breaks into distributaries that reach the Arabian Sea at various points southeast of Karāchi.

The Indus drains an area of 450,000 square miles (1,165,500 square km), and its annual flow is twice that of the Nile. Because the principal rivers of the Indus drainage network are snow-fed, their flow varies greatly at different times of the year. While the discharge is at a minimum during the winter months, there is a rise of water in spring and summer, and floods occur in the rainy monsoon season from July to September. Their flow is at a maximum where they emerge from the foothills, and little surface water is added in the plains, where much water is lost by evaporation and seepage.

The Indus is moderately rich in fish. The best-known and most important edible variety is called the *palla*. Thatta, Kotri, and Sukkur, all in the Pakistani province of Sindh, are the leading fishing centres. Irrigation from the Indus waters has provided the basis for successful agriculture on the semiarid plains of Pakistan since early times. One of the great modern canal irrigation systems in the world was created by the British administration after 1850. Experience has proved, however, that unless it is carefully controlled, canal irrigation can cause much damage to cultivated land through waterlogging and salinity. Until about 1880 the Indus network carried some navigation, but the advent of the railways and expansion of irrigation works eliminated all but small craft on the lower Indus.

Industrial Bank of Japan, Ltd., former Japanese commercial bank that merged with The Dai-Ichi Kangyo Bank, Ltd., and the Fuji Bank, Ltd., in April 2002 to create Mizuho Bank, Ltd., and Mizuho Corporate Bank, Ltd.

Established in Tokyo in 1902, the bank had specialized in medium- and long-term financing of industrial development. Its main office and foreign branches were active in the foreign-exchange markets, while its subsidiaries developed businesses in commercial banking, international banking, trust services, and finance.

industrial design, design of products made by large-scale industry for mass distribution. Designing such products means, first, planning their structure, operation, and appearance and then planning these to fit efficient production, distribution, and selling procedures. Clearly, appearance is but one factor in such a complex process. Nevertheless, in consumer goods especially, appearance design is widely accepted as the principal virtue of industrial design; it is that portion of the whole least subject to rational analysis and, like craft secrets of the past, most advantageous in commercial competition. On the other hand, design of equipment for production, for services, and for sports is expected to demonstrate utility; but in these products, too, appearance design is increasingly important.

Industrial design is supplied to manufacturers by three kinds of designers: staff designers, fully employed by one firm; designers under

contract, who may serve several clients simultaneously, generally avoiding conflicts of interest; and free-lancers, who sell designs, often with royalty agreements, to the best-paying manufacturer.

The first industrial designer recognized as such worked under admirable conditions: Peter Behrens (1868–1940) in 1907 was hired by the Allgemeine Elektrizitäts-Gesellschaft in Germany to be their architect, industrial designer, and graphic designer—in fact, to give unified visible character to the numerous activities of a giant enterprise. Behrens had other clients and professional duties besides. A member of the architectural profession, Behrens applied its standards and ethics to his work as industrial designer, founding in 1907, with others, an important association of designers and businessmen, the Deutscher Werkbund. As a direct result, a number of these German and Swiss associations became well-established professional organizations of industrial designers. In the United States and Great Britain industrial designers initiated legally recognized professional associations, with codes of conduct, educational standards, etc. In London the Royal Society of Arts designates qualifying practitioners as Royal Designers for Industry; in the United States the Industrial Designers Society of America grants memberships only to those subscribing to codes and limitations of practice. In Britain the Council of Industrial Design was established in 1944 to advise on design, recommend designers, and provide courses in design appreciation for trade and exhibitions for the public. The International Council of Societies of Industrial Design was founded in London in 1957, and within 25 years it had members in more than 40 countries.

Industrial design has evolved no unified style, even for industries in which handwork is minimized. There have been, however, four significant style trends. The first of these is an emphasis on impersonality that Behrens was the first to establish. Design for industry, whether determined by an individual or by a group, shows a certain neutrality of expression. Impersonality has, on the one hand, been acclaimed as a natural aspect of mass production and marketing, of average taste in a democratic community; on the other hand, it has been criticized as submission to the machine, contradictory to free, individual expression. The style has, so far, persisted.

A second trend in industrial design is packaging, such that the designer provides a protective case for a product, leaving the inner workings to engineers. Complicated mechanical and electronic assemblies that have come into common use require protective shells for safety, cleanliness, and orderly appearance. In this instance, industrial designers are sometimes accused of superficial embellishment of a sort suitable to package design and fashion.

The third trend is streamlining, a design principle pioneered by Raymond Loewy and others in the 1930s and still widely employed, although the term itself has fallen out of fashion. As the name suggests, streamlining is characterized by contours designed to minimize resistance to motion through a fluid (as air). Originally associated with trains, automobiles, and other vehicles, the bullet shapes and sleek lines of streamlining were seized by industrial designers and applied to objects (*e.g.*, toasters) intrinsically unassociated with speed.

The fourth trend is artificially accelerated obsolescence, that is, design changes that intentionally tempt owners to replace goods with new purchases more frequently than would be necessary as a result of normal wear and tear or established custom. Beginning in the field of fashion, artificial obsolescence has become something of a custom itself in industrialized countries. It operates through public opinion molded by advertising, through price changes, and through improvement and change in utility as well as through appearance change provided by designers. Its assessment must be established on wide social and economic considerations, not on design values alone. Especially in the design of automobiles and large home appliances, artificial obsolescence has aroused strong criticism; yet, because of its demonstrable economic effectiveness, it is used increasingly. It is an essential aspect of fashion and has met with wide approval in the form of disposability in health and hygiene products.

Industrial design is a growing force, influencing and influenced by world economy, private efficacy and enjoyment, the arts, engineering, and, not least, education. It has contributed more to economic activity than to aesthetic achievement, and many see the latter as its greatest challenge. The Museum of Modern Art, New York City, among other institutions, has sought to recognize outstanding contributions to industrial design.

industrial diamond, any diamond that is designated for industrial use, principally as a cutting tool or abrasive. In general, industrial diamonds are too badly flawed, irregularly shaped, poorly coloured, or small to be of value as gems, but they are of vital importance in the modern metalworking and mining industries. Their utility stems from the fact that diamond is the hardest natural substance known.

Industrial diamonds can be mined from natural deposits, or they can be produced synthetically. Among the naturally occurring diamonds, three varieties exist: ballas, bort, and carbonado.

Ballas, or shot bort, is composed of concentrically arranged, spherical masses of minute diamond crystals. Ballas is extremely hard, tough, and difficult to cleave. Principal sources are Brazil and South Africa. Brazilian ballas is said to be the harder of the two.

Bort is a gray to black massive diamond, the colour of which is caused by inclusions and impurities. The name is also applied to badly coloured, flawed, or irregularly shaped diamond crystals that are unsuited for gem purposes. Drilling bort is composed of small, round stones averaging 20 to the carat and is used in diamond drill bits. Crushing bort, the lowest grade of diamond, is crushed in steel mortars and graded into abrasive grits of various sizes; 75 percent of the world's crushing bort comes from Zaire. Its chief use is in the manufacture of grinding wheels for sharpening cemented carbide metal-cutting tools, but it also is used as loose grains suspended in oil or water for lapping and polishing.

Carbonado, known in the trade as carbon, is black, opaque diamond. It is as hard as crystallized diamond but less brittle, and, because its structure is slightly porous, it has a lower specific gravity (3.51 to 3.29). Carbonado has no cleavage and therefore is valuable for use in diamond-set tools. It usually occurs in small masses in the diamond-bearing gravels of Bahia, Brazil, and in Borneo. Rock-coring drills, widely used in exploring for new mineral deposits, are made by mounting diamonds around the rim of a hollow metal drill crown. Other important applications include saws for cutting rock and other hard materials, lathes and other types of cutting tools, glass cutters, phonograph needles, hardness testers, and wire-drawing dies.

See also synthetic diamond.

industrial engineering, application of engineering principles and techniques of scientific management to the maintenance of a high level of productivity at optimum cost in industrial enterprises.

A brief treatment of industrial engineering follows. For full treatment, *see* MACROPAEDIA: Industrial Engineering and Production Management; Engineering; Work and Employment.

In the 1880s Frederick W. Taylor, considered the father of modern industrial engineering, pioneered in the scientific measurement of work. After numerous work studies he presented his company with a formula for obtaining maximum production, which was later applied to many manufacturing concerns. About the same time, Frank and Lillian Gilbreth were refining their time-and-motion studies. As a result of these studies (in which the procedures of production were minutely analyzed), unnecessary motions or steps were eliminated, and essential steps were simplified to require as little time as possible. Thus the production process was simplified, enabling workers to increase production.

The industrial, or management, engineer draws upon the fields of systems engineering, management science, operations research, and human-factors engineering. Among his responsibilities are the selection of tools and materials for production that are most efficient and least costly to the company. The industrial engineer may also determine the sequence of production and the design of plant facilities or factories.

Many of the decisions of an industrial engineer draw upon management expertise. For example, it is this engineer who conducts time-and-motion studies, who determines wage scales based on an assessment of job skills, and who institutes the quality-control procedures necessary for production of a competitive product.

industrial espionage, acquisition of trade secrets from business competitors. A by-product of the technological revolution, industrial espionage is a reaction to the efforts of many businessmen to keep secret their designs, formulas, manufacturing processes, research, and future plans in order to protect or expand their shares of the market.

A considerable amount of data on what the competition is doing comes from routine and undramatic sources. Some large retail chains, for example, employ corps of agents to check on prices and products of competitors by comparative shopping. Equally fruitful are regular lines of communication, such as salesmen's reports, trade magazines, newsletters, business conventions, trade fairs and exhibits, and contacts with suppliers. Analysis of competitor products is yet another source of important commercial intelligence.

Actual trade secrets may find their way into the open market through several channels. The disloyal employee may furtively seek out competitors and peddle confidential data to the highest bidder. A more common technique is the group conspiracy: several employees, usually technicians and others of high managerial calibre, leave a company and set up a competitive firm capitalizing on confidences they gained while on the payroll of their former employer. A variation of this practice occurs when a competitor lures away a valuable employee with offers of more money and benefits, in the hope that the pirated worker will make his store of secrets available to his new employer.

An employer who discovers that his trade secrets have been adopted by a competitor usually takes legal steps to prevent further invasions of his commercial privacy. The penalties against companies found guilty of usurping trade secrets may be an injunction against further use of the knowledge, an accounting and payment of all profits made from the utilization of pilfered information, or additional punitive damages if a violation of the company's rights has been flagrant.

industrial medicine, also called OCCUPATIONAL MEDICINE, the branch of medicine concerned with the maintenance of health and

the prevention and treatment of diseases and accidental injuries in working populations in the workplace.

Historically, industrial medicine was limited to the treatment of injuries and diseases occurring to production workers while at work. Over the years this has changed, and everyone at a plant, factory, or office may now be eligible for medical services. College or school health programs might be considered as extensions of occupational medicine.

Diseases directly related to occupations were recognized by early Egyptian and Roman physicians. Modern industrial medicine may be said to have started with Bernardino Ramazzini, an Italian physician of the 17th century, who strongly advised that the physician inquire into the occupations of his patient if he wished to learn about the causation of the patient's complaint. With the Industrial Revolution the number of persons exposed to potential hazards at work increased rapidly. Traumatic injuries became frequent, and diseases due to inhaled dusts and noxious gases and vapours were recognized, often by non-medical persons.

Initially, industrial medical programs were directed toward the treatment of injuries or diseases that resulted from or during work. It was soon apparent that prevention was more economical than treatment. Protective devices were developed and placed around moving parts of machinery. Control programs were developed by engineers to remove harmful dusts and vapours by proper ventilation of work areas or by substitution of less toxic materials. When the engineers could not control the environment the process was contained to prevent or at least minimize the exposure of workers. As a last resort protective devices such as masks and special clothing were worn by the workers.

With the development of preventive controls the amount of industrial disease decreased. The development of new processes and new materials, however, produced new hazards at an ever-increasing rate, and constant vigilance was necessary. For example, the recognition that a pulmonary disease can result from exposure to beryllium demonstrated the need for a continued awareness of potentially toxic materials. It also demonstrated that a material once believed nontoxic may actually be toxic; this shift may be caused by a change in the physical or chemical characteristics of the material, an alteration in the method by which the material is used, a change in the amount of exposure of individuals to the material, and possible synergism with other materials.

The concern with diseases due to occupation led to concern with the general health of the workers, not only because of an interest in their welfare but also because it was good business. A good industrial medical program improved labour-management relations and reduced absenteeism; labour turnover decreased and productivity increased. In many instances the savings produced by the reduction in premiums paid for workmen's compensation insurance paid for the occupational medical program. The types of programs varied greatly; some of the large industries had broad coverage, while small plants usually had no medical program. The comprehensive programs, in addition to providing treatment of diseases and injuries, might include preemployment examinations and periodic examinations during employment.

Throughout the world there is inadequate knowledge and reporting of industrial disease, and the data are suspect. Published figures for occupational illnesses, for instance, are smaller than for injuries because occurrence of job-related illness is less spectacular than, for example, an explosion of a mine causing a number of deaths. It may take a number of years of observation and research to discover that some particular dust, chemical, or type of physical energy is harmful.

In addition, physicians may have difficulty in deciding that an illness is attributable to the job. Many industrial diseases mimic sickness from other causes, and little is known of the ill effects and signs of continued small exposures to toxic chemicals. Another difficulty arises from the fact that although job-related disease may be suspected, doctors often lack tests to identify such disease as specific. As a result, against every diagnosed case of occupational disease there may be many incipient or unrecognized cases from the same causes. Introduction of materials of unknown toxicity, as well as changes in industrial operations, may create unrecognized problems in preventing harmful effects until after workers have been affected.

industrial melanism, the darkness—of the skin, feathers, or fur—acquired by a population of animals living in an industrial region where the environment is soot-darkened. The melanization of a population increases the probability that its members will survive and reproduce; it takes place over the course of many generations as the result of natural selection of the lighter, more conspicuous animals by predators.

Industrial Organizations, Congress of: *see* American Federation of Labor–Congress of Industrial Organizations.

industrial psychology, also called OCCUPATIONAL PSYCHOLOGY, application of the concepts and methods of experimental, clinical, and social psychology to industry. The primary concern of industrial psychology is with the basic relations in industry between worker and machine and the organization.

Industrial psychology was first developed in the United States in the early 1900s and has come to be applied, usually through personnel and office administrations, to industrial management in industries in other parts of the world, particularly in those countries where a concern has developed for the systematic and scientific examination of the problems of workers in industry.

industrial relations, also called ORGANIZATIONAL RELATIONS, the study of human behaviour in the workplace, with an emphasis on the influence such relations have on an organization's productivity.

A brief treatment of industrial relations follows. For full treatment, *see* MACROPAEDIA: Work and Employment.

Classical economists treated workers as an instrument of production, subject to the same economic laws of supply and demand as raw materials and finished goods. In the 1890s the American industrial engineer Frederick Winslow Taylor devised a system of "scientific management" that carried this conception to its logical extreme. Taylor used time and motion studies to analyze jobs by breaking them down into their constituent tasks and timing each movement. From such studies Taylor derived the most efficient approach to both individual tasks and the organization of a factory as a whole. This individualistic approach did not consider how workers might be encouraged to work together more efficiently.

In the late 1920s Elton Mayo studied productivity at Western Electric Company's Hawthorne Works in Cicero, Ill., U.S. Mayo hoped to discover optimum levels of plant illumination and proper timing of rest periods by experimenting with selected groups of workers. He discovered that it did not matter how the workers' environment was altered; merely being chosen for an experiment improved their productivity (the Hawthorne effect). Although this conclusion has been challenged, it nonetheless marked the beginning of the systematic study of industrial relations. Workers came to be seen as responding to psychosocial, as well as economic, stimuli.

The Industrial Revolution brought large numbers of workers together under anonymous, frequently unpleasant circumstances. As industrial firms grew larger, a hierarchy of managers and foremen became increasingly necessary to discipline and coordinate workers. A variety of management strategies evolved.

Management styles fall into two major schools, the laissez-faire and the paternal. The former is characterized by a devotion to the rigours of the free market; such managers feel no obligation to their employees outside the workplace, since the primary aim of a firm is the maximization of profit. The paternal style of management, however, assumes that the firm has obligations to its workers outside the workplace and to the larger community.

Cultural factors influence management styles as well. Many North American firms are characterized by managerial decentralization, reflecting the population's mobility and a cultural preference for individualistic self-reliance. In Latin America and Europe, decision making is more centralized, and hierarchy is comparatively rigid. Japanese managers emphasize cooperation and consultation; workers often think of their firm and fellow workers as a second family. Japan's economic success has forced American managers to encourage more cooperation among workers and managers, although cultural differences make this difficult.

Workers are motivated by a number of factors besides wages and fringe benefits. Incentive systems, which adjust pay according to productivity, can be important spurs to worker performance. Management discipline is an important variable; the amount of direct supervision and the ratio of supervisors to workers varies from firm to firm.

The relations of management with labour unions involve elements of both conflict and cooperation. Most unions have been organized to demand from management improvement in pay scales and working conditions. Negotiation has become a chief function of union representatives, and most negotiators are willing to compromise, especially if management moves to temper conflicts. Some firms continue to fight unions, from the first stirrings of organization through every subsequent negotiation.

The relations between managers of different divisions of a firm and the relations of managers to their superiors are as complex as manager-worker relations. For example, sales executives must be concerned with quality control, production schedules, and customer service; plant managers must answer to vice presidents as well as foremen. Thus, managers find themselves subject to a complicated set of demands.

An individual firm's style of management is determined on every level by the nature of the industry as a whole; the firm's profitability, competitive situation, and "culture" or style; the personalities and preferences of senior managers; and the characteristics of the firm's home country or region.

Industrial Revolution, in modern history, the process of change from an agrarian, handicraft economy to one dominated by industry and machine manufacture. This process began in England in the 18th century and from there spread to other parts of the world. Although used earlier by French writers, the term Industrial Revolution was first popularized by the English economic historian Arnold Toynbee (1852–83) to describe England's economic development from 1760 to 1840. Since Toynbee's time the term has been more broadly applied.

A brief treatment of the Industrial Revolution

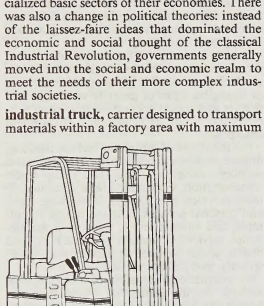
follows. For full treatment, *see* MACROPAEDIA: European History and Culture.

The main features involved in the Industrial Revolution were technological, socioeconomic, and cultural. The technological changes included the following: (1) the use of new basic materials, chiefly iron and steel, (2) the use of new energy sources, including both fuels and motive power, such as coal, the steam engine, electricity, petroleum, and the internal-combustion engine, (3) the invention of new machines, such as the spinning jenny and the power loom that permitted increased production with a smaller expenditure of human energy, (4) a new organization of work known as the factory system, which entailed increased division of labour and specialization of function, (5) important developments in transportation and communication, including the steam locomotive, steamship, automobile, airplane, telegraph, and radio, and (6) the increasing application of science to industry. These technological changes made possible a tremendously increased use of natural resources and the mass production of manufactured goods.

There were also many new developments in nonindustrial spheres, including the following: (1) agricultural improvements that made possible the provision of food for a larger nonagricultural population, (2) economic changes that resulted in a wider distribution of wealth, the decline of land as a source of wealth in the face of rising industrial production, and increased international trade, (3) political changes reflecting the shift in economic power, as well as new state policies corresponding to the needs of an industrialized society, (4) sweeping social changes, including the growth of cities, the development of working-class movements, and the emergence of new patterns of authority, and (5) cultural transformations of a broad order. The worker acquired new and distinctive skills, and his relation to his task shifted; instead of being a craftsman working with hand tools, he became a machine operator, subject to factory discipline. Finally, there was a psychological change: man's confidence in his ability to use resources and to master nature was heightened.

The First Industrial Revolution. In the period 1760 to 1830 the Industrial Revolution was largely confined to Britain. Aware of their head start, the British forbade the export of machinery, skilled workers, and manufacturing techniques. The British monopoly could not last forever, especially since some Britons saw profitable industrial opportunities abroad, while continental European businessmen sought to lure British know-how to their countries. Two Englishmen, William and John Cockerill, brought the Industrial Revolution to Belgium by developing machine shops at Liège (*c.* 1807), and Belgium became the first country in continental Europe to be transformed economically. Like its English progenitor, the Belgian Industrial Revolution centred in iron, coal, and textiles.

France was more slowly and less thoroughly industrialized than either Britain or Belgium. While Britain was establishing its industrial leadership, France was immersed in its Revolution, and the uncertain political situation discouraged large investments in industrial innovations. By 1848 France had become an industrial power, but, despite great growth under the Second Empire, it remained behind England.



Other European countries lagged far behind. Their bourgeoisie lacked the wealth, power, and opportunities of their British, French, and Belgian counterparts. Political conditions in the other nations also hindered industrial expansion. Germany, for example, despite vast resources of coal and iron, did not begin its industrial expansion until after national unity was achieved in 1870. Once begun, Germany's industrial production grew so rapidly that by the turn of the century that nation was outproducing Britain in steel and had become the world leader in the chemical industries. The rise of U.S. industrial power in the 19th and 20th centuries also far outstripped European efforts. And Japan too joined the Industrial Revolution with striking success.

The eastern European countries were behind early in the 20th century. It was not until the five-year plans that the Soviet Union became a major industrial power, telescoping into a few decades the industrialization that had taken a century and a half in Britain. The mid-20th century witnessed the spread of the Industrial Revolution into hitherto nonindustrialized areas such as China and India.

The Second Industrial Revolution. Despite considerable overlapping with the "old," there is mounting evidence for a "new" Industrial Revolution in the late 19th and 20th centuries. In terms of basic materials, modern industry has begun to exploit many natural and synthetic resources not hitherto utilized: lighter metals, new alloys, and synthetic products such as plastics, as well as new energy sources. Combined with these are developments in machines, tools, and computers that have given rise to the automatic factory. Although some segments of industry were almost completely mechanized in the early to mid-19th century, automatic operation, as distinct from the assembly line, first achieved major significance in the second half of the 20th century.

Ownership of the means of production also underwent changes. The oligarchical ownership of the means of production that characterized the Industrial Revolution in the early to mid-19th century gave way to a wider distribution of ownership through purchase of common stocks by individuals and by institutions such as insurance companies. In the 20th century, many countries of Europe socialized basic sectors of their economies. There was also a change in political theories: instead of the laissez-faire ideas that dominated the economic and social thought of the classical Industrial Revolution, governments generally moved into the social and economic realm to meet the needs of their more complex industrial societies.

industrial truck, carrier designed to transport materials within a factory area with maximum flexibility in making moves. Most industrial trucks permit mechanized pickup and deposit of the loads, eliminating manual work in lifting as well as transporting. Depending on their means of locomotion, industrial trucks may be classified as hand trucks or power trucks.

Forklift type of industrial truck
By courtesy of Allis Chalmers, Industrial Truck Division

Hand trucks with two wheels permit most of the load to be carried on the wheels, but some of the load must be assumed by the operator to balance the truck during movement. Common two-wheel hand trucks include the barrel, box, drum, hopper, refrigerator, paper-roll, and tote-box trucks. Four-wheel hand trucks are found in many more varieties, including dollies, high- and low-bed flat trucks, carts, rack carriers, wagons, and various hand-lift trucks having mechanical or hydraulic lifting mechanisms for raising and lowering a load.

Power trucks are propelled by batteries and an electric-motor drive or by an internal-combustion engine with either a mechanical drive or a generator and electric-motor drive. Propane and diesel engines are used in place of gasoline engines on some types. The nonlift platform truck is used simply for hauling, but other power trucks are provided with mechanisms, usually hydraulic, for lifting the loads. Forklift trucks are equipped with a forklike mechanism on the front end designed to pick up loads on specially designed platforms, called pallets, elevate the load to the desired height, transport it, and deposit it at the desired location and height. Ram trucks have a single protruding ram for handling coiled material. The crane truck is a portable boom crane mounted on an industrial truck; it may be used with hooks, grabs, and slings for bundled or coiled material. The straddle truck resembles a gantry crane on four pneumatic-tired wheels; the operator rides above the inverted U-frame, within which the load—lumber, bar steel, or pipe—is carried on elevating bolsters. Other common types include high- and low-lift platform trucks, motorized pedestrian-led, side-clamp, tractor, and side-loading trucks.

industrial union, trade union that combines all workers, both skilled and unskilled, employed in one industry. Excluded from the early unions of skilled craftsmen, the semiskilled and unskilled workers in the mass production industries began organizing around the end of the 19th century in Great Britain; similar developments occurred a little later in other countries. In their struggle for recognition the new unions tended to employ more aggressive tactics than the craft unions.

Today few unions are organized uniquely on a craft or industrial basis; large industrial unions may set up special divisions for particular occupational groups within their jurisdictions, or craft unions may become industrial as they organize additional nonskilled workers in new industries. *See* craft union.

Industrial Workers of the World (IWW), byname WOBBLIES, radical labour organization founded in Chicago in 1905 by representatives of 43 groups in opposition to such policies of the American Federation of Labor as its acceptance of capitalism and its refusal to include unskilled workers in craft unions. Among the founders of the IWW were William D. Haywood of the Western Federation of Miners, Daniel DeLeon of the Socialist Labor Party, and Eugene V. Debs of the Socialist Party. In 1908 the IWW split into two factions, one advocating political action to attain its goals, the other eschewing politics and advocating general strikes, boycotts, and sabotage. The latter faction, under the leadership of Haywood, prevailed, and the IWW became a revolutionary organization dedicated to gaining control of the means of production by the workers. Its tactics often led to arrests and sensational publicity; when IWW organizer Joe Hill was executed in 1915 on a disputed murder charge, he became a martyr and folk hero in the labour movement. The organization won its greatest victories in the mining and lumbering industries of the Pacific Northwest.

The IWW was the only labour organization to oppose U.S. participation in World War I,

and during the war IWW leaders sought to tie up copper production in western states. The federal government responded by prosecuting and convicting some of those leaders under newly enacted Sabotage and Espionage Acts. In the postwar years, the IWW was subject to harassment and further prosecution by local officials responding to widespread antiradical sentiments. By 1925 membership in the IWW had dwindled to insignificance.

industrialization, the process of converting to a socioeconomic order in which industry is dominant.

A brief treatment of industrialization follows. For full treatment, *see* MACROPAEDIA: Modernization and Industrialization.

How or why some agrarian societies have evolved into industrial states is not always fully understood. What is certainly known, though, is that the changes that took place in Britain during the Industrial Revolution of the late 18th and 19th centuries provided a prototype for the early industrializing nations of western Europe and North America. Along with its technological components (*e.g.,* the mechanization of labour and the reliance upon inanimate sources of energy), the process of industrialization entailed profound social developments. The freeing of the labourer from feudal and customary obligations created a free market in labour, with a pivotal role for a specific social type, the entrepreneur. Cities drew large numbers of people off the land, massing workers in the new industrial towns and factories.

Later industrializers attempted to manipulate some of these elements. The Soviet Union, for instance, industrialized largely on the basis of forced labour and eliminated the entrepreneur, while in Japan strong state involvement stimulated and sustained the entrepreneur's role. Other states, notably Denmark and New Zealand, industrialized primarily by commercializing and mechanizing agriculture.

Although urban-industrial life offers unprecedented opportunites for individual mobility and personal freedom, it can exact high social and psychological tolls. Such various observers as Karl Marx and Émile Durkheim cited the "alienation" and "anomie" of individual workers faced by seemingly meaningless tasks and rapidly altering goals. The fragmentation of the extended family and community tended to isolate individuals and to countervail traditional values. By the very mechanism of growth, industrialism appears to create a new strain of poverty, whose victims for a variety of reasons are unable to compete according to the rules of the industrial order. In the major industrialized nations of the late 20th century, such developments as automated technology, an expanding service sector, and increasing suburbanization signaled what some observers called the emergence of a postindustrial society.

industry, a group of productive enterprises or organizations that produce or supply goods, services, or sources of income. In economics, industries are customarily classified as primary, secondary, and tertiary; secondary industries are further classified as heavy and light.

Primary industry. This sector of a nation's economy includes agriculture, forestry, fishing, mining, quarrying, and the extraction of minerals. It may be divided into two categories: genetic industry, including the production of raw materials that may be increased by human intervention in the production process; and extractive industry, including the production of exhaustible raw materials that cannot be augmented through cultivation.

The genetic industries include agriculture, forestry, and livestock management and fishing—all of which are subject to scientific and technological improvement of renewable resources. The extractive industries include the mining of mineral ores, the quarrying of stone, and the extraction of mineral fuels.

Primary industry tends to dominate the economies of undeveloped and developing nations, but as secondary and tertiary industries are developed, its share of the economic output tends to decrease.

Secondary industry. This sector, also called manufacturing industry, (1) takes the raw materials supplied by primary industries and processes them into consumer goods, or (2) further processes goods that other secondary industries have transformed into products, or (3) builds capital goods used to manufacture consumer and nonconsumer goods. Secondary industry also includes energy-producing industries (*e.g.,* hydroelectric industries) as well as the construction industry.

Secondary industry may be divided into heavy, or large-scale, and light, or small-scale, industry. Large-scale industry generally requires heavy capital investment in plants and machinery, serves a large and diverse market including other manufacturing industries, has a complex industrial organization and frequently a skilled specialized labour force, and generates a large volume of output. Examples would include petroleum refining, steel and iron manufacturing, motor vehicle and heavy machinery manufacture, cement production, nonferrous metal refining, meat-packing, and hydroelectric power generation.

Light, or small-scale, industry may be characterized by the nondurability of manufactured products and a smaller capital investment in plants and equipment, and it may involve nonstandard products, such as customized or craft work. The labour force may be either low skilled, as in textile work and clothing manufacture, food processing, and plastics manufacture, or highly skilled, as in electronics and computer hardware manufacture, precision instrument manufacture, gemstone cutting, and craft work.

Tertiary industry. This sector, also called service industry, includes industries that, while producing no tangible goods, provide services or intangible gains or generate wealth. In free market and mixed economies this sector generally has a mix of private and government enterprise.

The industries of this sector include banking, finance, insurance, investment, and real estate services; wholesale, retail, and resale trade; transportation, information, and communications services; professional, consulting, legal, and personal services; tourism, hotels, restaurants, and entertainment; repair and maintenance services; education and teaching; and health, social welfare, administrative, police, security, and defense services.

For international statistical data on industrial activity, *see* the *Britannica World Data* section in the BRITANNICA BOOK OF THE YEAR.

Indy, (Paul-Marie-Theodore-) Vincent d' (b. March 27, 1851, Paris, Fr.—d. Dec. 1, 1931, Paris), French composer and teacher, remarkable for his attempted, and partially successful, reform of French symphonic and dramatic music along lines indicated by César Franck.

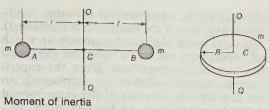
D'Indy studied under Albert Lavignac, Antoine Marmontel, and Franck (for composition). In 1874 he was admitted to the organ class of the Paris Conservatoire, and in the same year his second *Wallenstein Overture* was performed. He considered French 19th-century music and the tradition of the Paris Opéra, of the Paris Conservatoire, and of French "decorative" symphony to be superficial, frivolous, and unworthy to compete with the Teutonic Bach-Beethoven-Wagner tradition. The character of his own music revealed meticulous construction but also a certain lyricism. His harmony and counterpoint were laboriously worked out, but in his later work, free and unorthodox rhythms came easily and fluidly.

D'Indy's most important stage works were *Le Chant de le Cloche* (1883; "The Song of the Clock"), *Fervaal* (1895), *Le Légende de Saint Christophe* (1915; "The Legend of Saint Christopher"), and *Le Rêve de Cinyras* (1923; "The Dream of Cinyras"). Among his symphonic works, *Symphonie sur un chant montagnard français* (1886; "Symphony on a French Mountaineer's Chant"), with solo piano, based entirely on one of the folk songs d'Indy had collected in the Ardeche district, and *Istar* (variations; 1896) represent his highest achievements. His 105 scores also include keyboard works, secular and religious choral writings, and chamber music. Among the latter are some of his best compositions: *Quintette* (1924); a suite for flute, string trio, and harp (1927); and the *Third String Quartet* (1928–29). He also made arrangements of the hundreds of folk songs that he collected in the Vivarais.

In 1894 d'Indy became one of the founders of the Schola Cantorum in Paris. It was through courses at this academy that he spread his theories and initiated the revival of interest in Gregorian plainchant and music of the 16th and 17th centuries. D'Indy also published studies of Franck (1906), Ludwig van Beethoven (1911), and Richard Wagner (1930). In France, Paul Dukas, Albert Roussel, and Déodat de Sévérac were among his disciples. Outside France, particularly in Greece, Bulgaria, Portugal, and Brazil, his influence was lasting upon composers interested in shaping folk music into symphonic forms.

Indy 500 (motor race): *see* Indianapolis 500.

Ine, also spelled INI (d. 726 or after), Anglo-Saxon king of the West Saxons, or Wessex, from 688 to 726. One of the most powerful West Saxon rulers before Alfred the Great, Ine was the first West Saxon king to issue a code of laws, which are an important source for the structure of early English society.



Ine succeeded to the throne upon the retirement of King Caedwalla, and in 694 he forced the men of Kent to pay compensation for slaying Caedwalla's brother Mul. In 710 Nunna, the king of the South Saxons, or Sussex, lent Ine aid against the Cornish Britons, but in 722 and 725 Ine took up arms against the South Saxons, who were harbouring a rival claimant to his throne. He abdicated and retired to Rome in 726.

Ine's code, preserved as an appendix to Alfred's laws, deals mainly with judicial procedures, listing the punishments to be inflicted for various offenses. His laws show that people of British origin had been incorporated into the West Saxon social system.

inertia, property of a body by virtue of which it opposes any agency that attempts to put it in motion or, if it is moving, to change the magnitude or direction of its velocity. Inertia is a passive property and does not enable a body to do anything except oppose such active agents as forces and torques. A moving body keeps moving not because of its inertia but only because of the absence of a force to slow it down, change its course, or speed it up.

There are two numerical measures of the inertia of a body: its mass, which governs its resistance to the action of a force, and its moment of inertia (*q.v.*) about a specified axis, which measures its resistance to the action of a torque about the same axis.

inertia, moment of, in physics, quantitative measure of the rotational inertia of a body—*i.e.,* the opposition that the body exhibits to having its speed of rotation about an axis altered by the application of a torque (turning force). The axis may be internal or external

Moment of inertia

and may or may not be fixed. The moment of inertia (I), however, is always specified with respect to that line and is defined as the sum of the products obtained by multiplying the mass of each particle of matter in a given body by the square of its distance from the line. The Figure shows two steel balls that are welded to a rod AB that is attached to a bar OQ at C. Neglecting the mass of AB and assuming that all particles of the mass m of each ball are concentrated at a distance r from OQ, the moment of inertia I equals the product of those, and the arrangement is $I = 2mr^2$.

The unit of moment of inertia is a composite unit of measure. In the International System (SI), m is expressed in kilograms and r in centimetres, with I having the dimension kilogram-centimetre square. In the U.S. customary system, m is in slugs (1 slug = 32.2 pounds) and r in feet, with I expressed in terms of slug-foot square.

The moment of inertia of any body having a shape that can be described by a mathematical formula is commonly calculated by the integral calculus. The moment of inertia of the disk in the Figure about OQ could be approximated by cutting it into a number of thin concentric rings, finding their masses, multiplying the masses by the squares of their distances from OQ, and adding up these products. Using the integral calculus, the summation process is carried out automatically; the answer is $I = (mR^2)/2$.

For a body with a mathematically indescribable shape, the moment of inertia can be obtained by experiment. One of the experimental procedures employs the relation between the period (time) of oscillation of a torsion pendulum and the moment of inertia of the suspended mass. If the disk in the Figure were suspended by a wire OC fixed at O, it would oscillate about OC if twisted and released. The time for one complete oscillation would depend on the stiffness of the wire and the moment of inertia of the disk; the larger the inertia, the longer the time.

inertial guidance system, electronic system that continuously monitors the position and acceleration of a vehicle, usually a submarine or a missile, and thus provides navigational data or control without need for communicating with a base station.

The basic components of an inertial guidance system are gyroscopes, accelerometers, and a computer. The gyroscopes provide fixed reference directions, and accelerometers measure changes in the velocity of the system. The computer processes information on changes in direction and acceleration of the vehicle and feeds its results to the vehicle's navigation system.

A typical inertial guidance system, such as might be used on board a missile, uses three gyroscopes and three accelerometers. The three gimbal-mounted gyroscopes establish a reference frame in terms of the vehicle's roll, pitch, and yaw for the orientation of the three accelerometers. The accelerometers measure velocity changes in each of these three directions. The computer performs two separate integrations on the data it receives from the inertial guidance system. First, it integrates the acceleration data to get the current velocity of the vehicle; then, it integrates the computed velocity to determine the current position. This information is compared continuously to the desired (predetermined and programmed) course.

Minute errors in the measuring capabilities of the accelerometers or in the balance of the gyroscopes can introduce large errors into the information that the inertial guidance system provides. These instruments must, therefore, be constructed and maintained to strict tolerances.

INF Treaty: *see* Intermediate-Range Nuclear Forces Treaty.

infallibility, papal: *see* papal infallibility.

infamy, public disgrace or loss of reputation, particularly as a consequence of criminal conviction. In early common law, conviction for an infamous crime resulted in disqualification to testify as a witness. The criterion for considering a crime infamous was whether or not it stamped the offender as untrustworthy. The concept was, therefore, at first limited to so-called *crimen falsi*, originally perjury, but was extended to any crime involving fraud or corruption. Eventually, all felonies came to be treated as infamous. Testimonial incompetency for infamy, however, has been abolished by statute in England and generally in the United States as well.

The Fifth Amendment to the U.S. Constitution requires grand jury indictment for any "capital or otherwise infamous crime." Infamy, for this purpose, depends on the character of the punishment that may be imposed rather than on the nature of the crime. In general, any crime punishable by imprisonment in a state penitentiary is infamous, and any federal crime that may be punished by imprisonment for more than a year is also an infamous crime.

infancy, among humans, the period of life between birth and the acquisition of language approximately one to two years later.

A brief treatment of infancy follows. For a full treatment of human mental development during infancy, *see* MACROPAEDIA: Behaviour, The Development of Human.

The average newborn infant weighs 3.4 kg (7.5 pounds) and is about 51 cm (20 inches) long. The newborn gains weight at an average of 170 to 200 g (6 to 7 ounces) per week for the first three months. Growth continues, but the rate gradually declines to an average of 60 g per week after 12 months.

Newborns typically sleep for about 16–18 hours a day, but the total amount of time spent sleeping gradually decreases to about 9–12 hours a day by age two years. At birth infants display a set of inherited reflexes involving such acts as sucking, blinking, grasping, and limb withdrawal. Infants' vision improves from 20/800 (in Snellen notation) among two-week-olds to 20/70 vision in five-month-olds to 20/20 at five years. Even newborns are sensitive to certain visual patterns, chiefly movement and light-dark contrasts and show a noticeable preference for gazing at the human face; by the first or second month they can discriminate between different faces, and by the third they can identify their mother by sight. Young infants also show a predilection for the tones of their mother's voice, and they manifest a surprising sensitivity to the tones, rhythmic flow, and sounds that together make up human speech.

The ideal food for the young infant is human milk, though infant formula is an adequate substitute. Babies can usually be weaned after they are six months old, and the appearance of teeth allows them to switch from soft foods to coarser ones by the end of the first year. The first tooth usually erupts at about six months. By the end of the first year, six teeth usually have erupted—four upper incisors and two lower incisors.

Every normal, healthy infant proceeds through a sequence of motor development that occurs spontaneously and needs no special training. By four months of age the baby can reach for and grasp an object, and by the 10th month he can grasp a small object between thumb and forefinger. By four months most babies are able to sit up for a minute or so without support, and by nine months they can do so without support for 10 minutes or more. Most infants begin crawling between 7 and 10 months, and by 12 months they can stand up alone. The average baby is able to walk with help by 12 months and can walk unaided by 14 months, at which time he is often referred to as a toddler.

The infant's understanding and mastery of the physical world begins with the reflex movements of newborns. These movements progress within three months to such actions as sucking, grasping, throwing, kicking, and banging, though these are purposeless and repeated for their own sake. During the 4th to the 8th month, the infant begins to repeat those actions that produce interesting effects, and from the 8th to the 12th month he begins coordinating his actions to attain an external goal—*e.g.*, knocking down a pillow to obtain a toy hidden behind it. The infant's physical actions thus begin to show greater intentionality, and he eventually begins to invent new actions in a form of trial-and-error experimentation. By the 18th month the child has begun trying to solve problems involving physical objects by mentally imagining certain events and outcomes, rather than by simple physical trial-and-error experimentation.

Infants display behavioral reactions suggestive of emotional states as early as the first three or four months of life. The four earliest emotional states they seem to experience are surprise, distress (in response to discomfort), relaxation, and excitement. New emotional states such as anxiety, fear, and sadness have appeared by one year of age. Infants' central emotional feat, however, is probably the establishment of enduring emotional bonds with their parents or other caregivers. They are biologically predisposed to form such attachments, which in turn form the basis for healthy emotional and social development through childhood. It is through the reciprocal interactions between child and parent that the child learns to love, trust, and depend on other human beings. By two months of age, all normal infants show a social smile that invites adults to interact with them, and at about six months of age infants begin to respond socially to particular people to whom they have become emotionally attached.

Crying is basic to infants from birth, and the cooing sounds they have begun making by about eight weeks progress to babbling and ultimately become part of meaningful speech. Virtually all infants begin to comprehend some words several months before they themselves speak their first meaningful words. By 11 to 12 months of age they are producing clear consonant-vowel utterances such as "mama" or "dada." The subsequent expansion of vocabulary and the acquisition of grammar and syntax mark the end of infancy and the beginning of child development.

infant school: *see* kindergarten.

infante (masculine), feminine INFANTA, the title borne from the 13th century by the children of the Spanish and Portuguese monarchs. The title infante was borne by the sons of the sovereign, and the title infanta was given to the daughters and to the wife of an infante. From the reign of John I of Castile (1379–90) there began the custom of calling the sovereign's eldest son *príncipe* (prince) *de Asturias* and not infante. Correspondingly, until the severance of Brazil from the Portuguese monarchy, the eldest son was *príncipe de Brasil*. Although a son or daughter of the sovereign of Spain was by right infante or infanta of Spain, the sovereign could grant the title, alone, to other members of the blood royal.

infanticide, the killing of the newborn. It has often been interpreted as a primitive method of birth control and a means of ridding a group of its weak and deformed children; but most societies actively desire children and put them to death (or allow them to die) only under exceptional circumstances. Among the Eskimo, for example, conditions of life were so severe that it was sometimes the practice to kill female children shortly after birth, lest there not be husbands able to support them. In Polynesia, where populations often reached high density, similar practices prevailed. Children also have been allowed to die or have been killed with cultural sanction because of irregular mating (such as incest or conception out of wedlock), or abnormal births, or for similar reasons. In many advanced societies, children have been killed in the belief that it would ensure health, good fortune, and general fertility. Religious offerings, especially of the firstborn, are known from the Bible, as well as from the histories of Egypt, Greece, and Rome. Firstborn sacrifice was once common among many peoples in India; here the motive was the offering of one's most precious possession to the deities. In modern societies the regulation of population with contraceptives or through abortion has tended to greatly reduce the frequency of infanticide.

infantile cortical hyperostosis, also called CAFFEY'S SYNDROME, a disease of infants, characterized by swellings of the periosteum (the bone layer where new bone is produced) and cortex of bones of the upper arms, shoulder girdle, and lower jaw. It is accompanied by fever and irritability; after a series of periodic exacerbations, it subsides spontaneously. Infantile cortical hyperostosis is a heritable disease.

infantile paralysis: *see* poliomyelitis.

infantry, troops who fight on foot, even though transported to the battlefield by horses, ships, aircraft, tanks and other motorized vehicles, skis, or other means. The term applies equally to troops armed with such hand weapons as the spear and sword in ancient times and with automatic rifles and rocket launchers in modern times. As foot soldiers their objective has always been to seize and hold ground and, when necessary, to occupy enemy territory. The infantry has been the largest single element in Western armies since ancient times, though during the feudal period cavalry attained a temporary dominance.

infarction, death of a section of tissue when blood supply to the section fails as the result of obstruction of a blood vessel. The obstruction may be due to a blood clot or may result from narrowing of the blood vessel channel. The dead tissue is called an infarct or an infarction. Myocardial infarction (*q.v.*), death of a section of heart muscle, results from obstruction of a coronary artery; the condition often accompanies coronary thrombosis. Other serious infarctions occur in the lungs—pulmonary infarction—and the brain (*see* stroke). Poor circulation in the mother during pregnancy can result in placental infarction (*q.v.*); usually the baby is not harmed.

infection, in medicine, the invasion of the body by any of various infectious agents—including bacteria, viruses, fungi, protozoans, and worms—and the reaction of the body to them or to their toxins. When health is not altered, the process is termed a subclinical infection. When health is altered, the process is called an infectious disease.

A brief treatment of infections and infectious diseases follows. For full treatment, *see* MACROPAEDIA: Infectious Diseases.

There are various routes that infectious agents can take into the human body. Conditions such as influenza and the common cold occur when their respective viruses attack the mucous membranes that line the upper respiratory tract. Pneumonias, diseases of the lower respiratory tract, can be caused by almost any infectious agent. If bacteria, viruses, or other agents get into the bloodstream, they can attack the cardiovascular and central nervous systems, producing such diseases as rheumatic fever or meningitis. Gastrointestinal diseases, ranging from salmonella food poisoning to life-threatening typhoid fever and cholera, generally result from the ingestion of contaminated food or water. Sexually transmitted diseases are acquired during intercourse or other sexual activity. Bacteria can invade the bones and joints, causing osteomyelitis or septic arthritis, or they can invade the skin, causing impetigo or leprosy. Other diseases, such as tetanus, occur when a skin wound is contaminated—in this case, with soil carrying tetanus bacilli. A few diseases can arise via more than one route. Different forms of anthrax, for example, are produced when anthrax bacilli are breathed in, acquired through skin abrasions, or ingested.

Insects are responsible for injecting some infectious agents through the skin into the human bloodstream. The plasmodia that cause malaria and the viruses that cause yellow fever are transmitted by mosquitoes. Typhoid fever and several other diseases can be spread by human carriers who harbour the microbes long after they have recovered from infection. Animals also act as reservoirs for microbes. Rabies virus can be contracted from the bite of a rabid animal, and leptospirosis is caused by bacteria that pass between human beings and other mammals.

Following local infection or entrance of a microorganism into the bloodstream, white blood cells attack the invader, and antibodies or antitoxins are produced as needed. The resulting active immunity can be lifelong, as that against measles, or short-lived. This process provides the theoretical basis for long-lasting active immunization by vaccination with a variety of antigens. Passive immunity, the introduction of antibodies or antitoxins into the body, is temporary because the body eventually eliminates them as foreign substances. Body temperature often rises in response to infection.

Although newly recognized microbes emerge occasionally (such as *Legionella pneumophila,* the cause of Legionnaire's disease, in 1976 or the HIV virus, the cause of AIDS, in the early 1980s), and although there are serious difficulties in arresting the spread of some conditions (particularly sexually transmitted ones), some diseases have largely been conquered. Smallpox became virtually extinct in the late 1970s, and diseases such as measles, diphtheria, and poliomyelitis are rare in regions in which modern medical techniques are available. Still, the burden of illness and death attributable to infectious organisms remains massive, particularly in regions of poor sanitation, poor nutrition, and crowding.

infectious enteritis (disease of cats): *see* feline distemper.

infectious jaundice: *see* leptospirosis.

infectious mononucleosis (disease): *see* mononucleosis.

infectious myxomatosis (disease of rabbits): *see* myxomatosis.

inference, in statistics, the process of drawing conclusions about a particular parameter of a statistical distribution. One principal approach of statistical inference is the Bayesian estimation, in which conclusions are based upon posterior judgments about the parameter given an experimental outcome (that is, prior judgments about the parameter and about the chances of the experimental outcome conditional to values of the parameter are assumed). A second is the likelihood approach, in which all conclusions are based upon the likelihood function of the parameter given the experimental outcome—that is, the emphasis is on the distribution function of the experimental outcome conditioned on the parameter considered as a function of the possible parameter values, instead of considering the distribution function as a function of the experimental outcome.

In nonparametric inference, estimators of information about the distribution function do not depend on the mathematical form of the distribution function; hence they are called nonparametric in contrast to parametric estimators, which are used to estimate parameter values of an unknown distribution having an unknown functional form.

inferiority complex, a feeling of inferiority that is wholly or partly unconscious. The term has been used by some psychiatrists and psychologists, particularly the followers of the early psychoanalyst Alfred Adler, who held that many outstanding achievements, some antisocial behaviour, and other continuing aspects of the personality could be traced to overcompensation for this feeling. The use of "complex" later gained acceptance to denote the group of emotionally toned ideas, partially or even wholly repressed, organized around and related to such feelings of inferiority. The term inferiority complex has lost much of its significance through imprecise, popular misuse—for example, as an attempt at a facile explanation of any show of ambition by a person of small physical stature.

infertility (reproduction): *see* fertility and infertility.

infinite series, the sum of infinitely many numbers related in a given way and listed in a given order. Infinite series are useful in mathematics and in such disciplines as physics, chemistry, biology, and engineering.

A brief treatment of infinite series follows. For full treatment, *see* MACROPAEDIA: Analysis (in Mathematics).

If $a_1 + a_2 + a_3 + \dots$ is an infinite series, then a quantity $s_n = a_1 + a_2 + \dots + a_n$ (n is any chosen natural number), which involves adding only finitely many terms, is called a partial sum of the series. If these numbers s_n approach a fixed number S as n becomes larger and larger, the series is said to converge. In this case, S is called the sum of the series. An infinite series that does not converge is said to diverge. In the case of divergence, no value of a sum is assigned. For example, in the infinite series $1 + 1 + 1 + \dots$, the nth partial sum, the result of adding the first n terms, is $s_n = n$. As more terms are added, the partial sums fail to approach any finite value (they grow without bound). Thus, the series diverges. A basic example of a convergent series is

$$1 + \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^n} \text{ for which } s_n = 2 - \frac{1}{2^{n-1}}.$$

As n becomes large, these s_n approach 2, which is the sum of this infinite series. In fact, the series $1 + r + r^2 + r^3 + \dots$ converges to the sum $1/(1 - r)$ if $0 < r < 1$ and diverges if $r \geq 1$. This series is called the geometric series with ratio r and is one of the most important in mathematics.

Certain standard tests can be applied to determine the convergence or divergence of a given series, but such a determination is not always possible. In general, if the series $a_1 + a_2 + \dots$ converges, then it must be true that the number a_n approaches 0 as n becomes large. Furthermore, adding or deleting a finite number of terms from a series never affects whether or not the series converges. If, in a series $a_1 + a_2 + \dots$, all the a_n are positive, then the partial sums will increase, either ap-

proaching a finite quantity or growing without bound. This observation leads to what is called the comparison test: if $0 \le a_n \le b_n$ for all n, and if $b_1 + b_2 + \dots$ converges, then so does $a_1 + a_2 + \dots$. If the comparison test is applied to a geometric series, then the operation, reformulated slightly, is called the ratio test: if $a_n > 0$ and if $a_{n+1}/a_n \le r$ for some $r < 1$ for every n, then $a_1 + a_2 + \dots$ converges. For example, the ratio test proves the convergence of the series $1 + \frac{1}{2} + \frac{1}{3 \cdot 2} + \frac{1}{4 \cdot 3 \cdot 2} + \cdots$ since $\frac{a_{n+1}}{a_n} = \frac{1}{n+1} \le \frac{1}{2}$ for all n. Other tests determine convergence or divergence of series whose terms are not all positive.

One of the most important applications of series is the expansion of certain mathematical functions. The trigonometric functions $f_1(x) = \cos x$, $f_2(x) = \cos 2x, \dots, f_k(x) = \cos kx$, and $g_1(x) = \sin x$, $g_2(x) = \sin 2x, \dots, g_k(x) = \sin kx$, are 2π-periodic, which means that $f_k(x + 2\pi) = f_k(x)$ and $g_k(x + 2\pi) = g_k(x)$ for all values of x. If $a_0, a_1, \dots$ and $b_1, b_2, \dots$ are given numbers, then the equation

$$f(x) = a_0 + (a_1 \cos x + b_1 \sin x) + (a_2 \cos 2x + b_2 \sin 2x) + \cdots$$

defines a function $f(x)$ provided that the infinite series in question converges for every x. Essentially any function whatsoever, as long as it is 2π-periodic, can be written as such an infinite sum of sines and cosines. Many mathematical problems depending on a given function can be solved directly and easily when the given function is a sine or cosine function. The process of breaking up a rather arbitrary function into a series like $f(x)$ is called Fourier analysis and has numerous applications in the study of various wave phenomena.

infinitesimal, in mathematics, quantity less than any finite quantity, yet not zero. Even though no such quantity can exist in the real number system, many early attempts at the calculus were based on sometimes dubious reasoning about infinitesimals: derivatives were defined as ultimate ratios of infinitesimals, and integrals were calculated by summing rectangles of infinitesimal width. As a result, differential and integral calculus was originally referred to as the infinitesimal calculus. This terminology gradually disappeared as the concepts of limit, continuity, and real numbers became clarified.

inflammation, in general, the local reaction of living tissues—especially the small blood vessels, their contents, and their associated structures—to injury. The passage of blood constituents through the vessel walls into the tissues is the hallmark of inflammation, and the tissue collection so formed is termed the exudate. Any noxious process that damages living tissue—infection with bacteria, excessive heat, cold, mechanical injury such as crushing, acids, alkalis, irradiation, or infection with viruses—can cause inflammation. The organ or tissue involved makes only minor differences to the inflammatory process.

Although the number and diversity of diseases of animals and man classed as inflammatory would seem to exceed the limits of even so broad a definition, it may be shown that tissue reactions ranging from burns to pneumonia, leprosy, tuberculosis, and rheumatoid arthritis, all examples of inflammation, do in fact fit within this description. In ancient times inflammation was recognized as an entity by virtue of simple observation. Thus Celsus (Roman physician of 1st century AD) listed the four cardinal signs of inflammation as *calor, rubor, turgor,* and *dolor* (heat, redness, swelling, and pain). As a description it still cannot be bettered, although a fifth, loss of function, is sometimes added.

The inflammatory process. The first event after injury to a tissue occurs is a fleeting constriction, or narrowing, of the nearby arterioles, *i.e.,* the tiny blood vessels that carry blood from the larger arteries to the network of microscopic vessels called capillaries. This constriction soon wears off, however, and is replaced by a dilation, or widening, of the arterioles, and the resulting increase in blood flow flushes the entire network of capillaries with blood. White blood cells, called leukocytes, then leave their normal position in the centre of the arterial bloodstream and adhere to the walls of the blood vessels. These leukocytes then somehow penetrate the walls of the vessels, pass through them to the exterior, and come to lie in the injured tissues near the vessel walls.

Long before the migration of white cells forms a cellular exudate, however, a fluid exudate has collected. The walls of the small vessels concerned are normally freely permeable to water and salts but allow only small quantities of the proteins in blood plasma to pass through them. In inflammation the walls of venules and capillaries lose their relative impermeability to plasma proteins, which, as a result, escape from the blood into the tissues. There, because of the proteins' ability to take up and hold water, it leads to an accumulation of fluid (edema) at the site of the injury. The increase of the permeability of blood vessel walls is triggered and mediated by substances such as histamine and leukotaxine, which are released by the tissue cells that have been injured.

It is thus possible to provide an explanation of the four cardinal signs of inflammation. Redness is due to dilated blood vessels; swelling results partly from vessel dilation but mainly from exudate formation; heat is produced by an increased blood flow; pain is caused in part by local swelling and pressure and also by the chemical substances that are liberated in the inflammatory process and that act on nerve endings.

The cellular and fluid constituents of the exudate perform a variety of therapeutic functions at the site of the tissue injury. The leukocytes attack and ingest any bacteria and other foreign particles (antigens) and cellular debris at the site of the damage. Fibrinogen, a constituent of the blood plasma proteins accumulating at the site, is transformed at the wound into fibrin, which coagulates and clots the blood when bleeding occurs. Gamma globulins, another blood plasma protein, contain antibodies, which react specifically with an antigen. The antibodies leaked into tissues infected by bacteria help to clump the bacteria and to dissolve them or accelerate their ingestion by leukocytes. The leaked blood plasma also delivers oxygen and food materials to the injured tissues and may also dilute or wash away toxic substances at the site.

All inflammation begins as simple acute, "short-lived," inflammation, which proceeds in one of four directions: resolution, organization (building up of new tissue), suppuration (formation of pus), or chronic—long-lasting—inflammation.

The essence of uncomplicated acute inflammation is that the injury should not be sufficiently severe to cause abscess formation or scarring, nor should it be sufficiently difficult to eradicate as to lead to chronicity. Mild burns, mechanical injury, frostbite, chemical irritation, bacterial or viral infection, or hypersensitivity (allergy) all come within this compass. (*See* allergy.)

Acute inflammation is commonly accompanied by a rise in the number of leukocytes circulating in the blood (leukocytosis), by fever, and by an increase in the rate at which the red corpuscles of the blood settle under gravity (raised ESR, or erythrocyte sedimentation rate). All three are widely used as diagnostic tests in medical practice.

The expected fate of simple acute inflammation is resolution, a term that implies disappearance of the exudate and the return of the affected part to normal function and structure. An important preliminary change in resolution is the gradual replacement within the exudate of polymorphonuclear leukocytes, or granulocytes (characterized by the irregular or polymorphic nature of the nucleus and by the presence of digestive and bactericidal granules), by mononuclear leukocytes. These latter cells begin as monocytes, which are large phagocytic cells with a plain round, oval, or slightly indented nucleus. Usually their emigration from the blood commences at the same time or shortly after that of the granulocytes. When the injurious stimulus ceases or is overcome by the body's defenses, emigration comes to a stop. The granulocytes have a short life span and are highly motile so that they die, disintegrate, or leave the site of inflammation within a few hours. The monocytes, on the other hand, mature into macrophages once they have entered the tissue. Macrophages have greater phagocytic capabilities and can live as long as 75 days. They are thus ideally suited to clear the area of debris and restore a normal picture.

When an acute inflammatory reaction progresses to the local formation of pus, an abscess is said to be formed and the process is known as suppuration. Pus is a viscous liquid formed of the digested bodies of dead leukocytes and tissue cells. Pus is usually creamy yellow or green in colour but may be tinged with blood or mixed with clear mucus. Pus is formed whenever the injurious stimulus is such that it induces large numbers of granulocytes to emigrate into the affected area and whenever the injurious stimulus, because of its toxicity, leads to massive killing of these leukocytes and of tissue cells. The commonest cause of suppuration is infection of the tissues with certain bacteria, notably the so-called pyogenic cocci. Of these bacteria, *Staphylococcus aureus* is perhaps the most important. There are many other pus-producing microorganisms, however. The killing of the leukocytes and tissue cells is accomplished by toxins within the bacteria or produced by them. The liquefaction of the dead cells is brought about by enzymes either of bacterial origin or derived from the dead cells themselves.

When injury damages a part of the body sufficiently to cause not only inflammation but also destruction of tissue, it is necessary for the site of damage to be repaired. This is accomplished by the dual processes of regeneration and organization, which together constitute healing. Regeneration involves the repeated division of surviving tissue cells until the breach is made good. Tissues vary widely in their regenerative capacity and some, notably the brain and other nervous system components, totally lack this ability. In other instances of damage there is a large defect of connective tissue or a mass of blood clot or exudate to be replaced by some form of permanent structure. Organization deals with these problems and is the process whereby new blood vessels and connective-tissue-forming cells (fibroblasts) grow into such an area to form first vascularized connective tissue and then scar tissue. Even trivial inflammation—*e.g.,* infected lesions of acne vulgaris—may lead to organization and scarring, but the most dramatic scarring is seen after the extensive destruction of connective tissue that occurs after burns or trauma.

Chronic inflammation denotes a reaction that is long lasting, but because such persistence has characteristic microscopic features, it is these as much as the patient's history that are used by pathologists as a criterion. Chronic inflammation is a category into which fall some of the greatest scourges of humankind, such as tuberculosis, leprosy, yaws, syphilis, and

rheumatoid arthritis. Other conditions such as chronic nephritis or cirrhosis of the liver or chronic cholecystitis should also properly be included.

The essence of chronic inflammation is that the cause of tissue injury, whether it be the bacillus of tuberculosis or leprosy or a "foreign body" (*i.e.*, irritant solid material of extraneous origin), or a fungus, or of unknown nature, be such that it neither quickly kills the patient nor is itself rapidly destroyed or removed by the body's defenses. In the case of living microorganisms—*e.g.*, those of tuberculosis or leprosy—a symbiotic relationship is thus established between invader and host.

The main pathological feature of chronic inflammation, the more severe varieties of which for historical reasons are termed granulomatous, is infiltration of the affected area by certain types of cells. These are macrophages, epithelioid cells, lymphocytes, plasma cells, giant cells, and fibroblasts, the nature of the exudate varying ith the cause of inflammation. Thus in tuberculosis, epithelioid cells are prominent, and in syphilis, plasma cells.

The main reason for inflammation's becoming chronic is failure of macrophages to digest and thereby eliminate the irritant (*e.g.*, bacilli) that they have ingested. In some cases bacilli thrive and multiply within macrophages, as in leprosy and tuberculosis. The cause of the failure is unknown; it may lie in the chemical composition of certain microorganisms or in deficiencies in the digestive apparatus of some or all of the phagocytes, or in some immunological defect or allergic mechanism as yet obscure. It is possible that, even in foreign body reactions, the body may become hypersensitive to some of its own inflammatory products and that the reaction is prolonged and aggravated as a result.

Therapy. Wherever possible, treatment is aimed at eliminating the cause of inflammation. Thus bacterial inflammation is dealt with by the administration of antibiotics such as penicillin or tetracycline. Such therapy is usually effective but has become increasingly hampered by the appearance of antibiotic-resistant strains of microorganisms. Chronic infections such as tuberculosis are also treated by antibiotics such as streptomycin, sometimes in combination with other antituberculous drugs such as isoniazid. Foreign-body reactions are dealt with by surgical removal of the irritant object.

When the cause of inflammation is unknown or not amenable to such specific therapy it is the practice to use anti-inflammatory drugs—*i.e.*, substances that lessen the signs and symptoms of inflammation without necessarily affecting the cause. Such drugs may be given by mouth or by injection, or applied locally. They include, among others, the corticosteroids such as cortisone and the salicylates such as aspirin. Simpler symptomatic treatment of inflammation hallowed by long usage includes the use of hot or cold compresses or hot poultices, or local application of anodynes or counterirritants. Although it is desirable to lessen pain and tissue destruction, no therapy should disregard the defensive role of the inflammatory response.

inflation, in economics, collective increases in the supply of money, in money incomes, or in prices. Inflation is generally thought of as an inordinate rise in the general level of prices.

From a theoretical view, at least four basic schemata commonly used in considerations of inflation can be distinguished.

The quantity theory. The first of these and the oldest is the view that the level of prices is determined by the quantity of money. The ratio of the stock of money that people want to hold to the value of the transactions they perform each year (or the inverse of this ratio, called the velocity of circulation) is supposed, in the simplest version of this view, to be fixed by such factors as the frequency of wage payments, the structure of the economy, and saving and shopping habits. So long as these remain constant, the price level will be directly proportional to the supply of money and inversely proportional to the physical volume of production. This is the celebrated quantity theory, going back at least as far as David Hume in the 18th century. But the theory assumes that productive capacity is fully employed, or nearly so. Because, in fact, the extent to which productive capacity is used varies a great deal—indeed, sometimes more than the level of prices—the quantity theory fell into disfavour between World Wars I and II, when the level of activity provided more reasons for anxiety than did the long-run movement of prices.

In a refined version, the quantity theory was revived by Milton Friedman and other University of Chicago economists in the 1950s and '60s. Their basic contentions were that short-period changes of the money supply are, in fact, followed (after a varying interval) by changes in money income and that the velocity of circulation, though it fluctuates to some extent with the money supply, tends to be fairly stable, especially over long periods. From this, they concluded that the money supply, while not a reliable instrument for controlling short-term movements in the economy, can be effective in controlling longer term movements of the price level and that the prescription for stable prices is to increase the money supply regularly at a rate equal to that at which the economy is estimated to be expanding.

Against this, it has been argued that in highly developed economies the supply of money varies largely with the demand for it and that the authorities have little power to vary the supply through purely monetary controls. The correlations observed by this so-called Chicago school between money supply and money income are attributed by their critics to variations in the demand for money to spend, which elicit partial responses from supply and are followed after an interval by corresponding changes in money income. The relative stability of the velocity of circulation is attributed by them to the facility with which the supply of money accommodates itself to demand; they argue that insofar as supply may be restricted in the face of rising demand, velocity will increase, or (what really amounts to the same thing) new sources of credit, such as trade credit, will be exploited.

The Keynesian theory. The second basic approach is represented by J.M. Keynes's theory of income determination. The key to it is the assumption that consumers tend to spend a fixed proportion of any increases they receive in their incomes. For any level of national income, therefore, there is a gap of a predictable size between income and consumption expenditure, and to establish and maintain that level of national income it is only necessary to fix expenditure on all nonconsumption goods and services at such a level as to fill the gap. Apart from government outlays, the main constituent of this nonconsumption expenditure is private investment. Keynes supposed investment to be fairly sensitive to the rate of interest. The latter, in turn, he supposed to be negatively related, up to a point, to the stocks of "idle" money in existence—in effect, positively related to the velocity of circulation of money. He held, moreover, that there is a floor below which long-term interest rates will not fall, however low the velocity of circulation. These relationships between interest and idle money (or the velocity of circulation) have been pretty well supported empirically.

The chief importance of the Keynesian approach and various elaborations of it is that they provide a framework in which governments can endeavour to manage the level of activity in the economy by varying their own expenditures and receipts or by influencing the level of private investment. This has been a principal basis of policy in many industrialized countries in recent decades. Difficulties in practice have sprung from uncertainty about, or changes in, the underlying quantitative relationships and the existence of uncertain time lags in their operation, which make it hard to deal effectively with unforeseen contingencies. The uncertainty and weakness of the relation between interest rates and private investment are another source of difficulty. Many economists believe, however, that the approach has led to better control over short-term changes in employment and real income.

In the form in which it has just been stated, however, the Keynesian approach does not offer much insight into movements of the price level. The simplest variant of it that will do so is based on the view that inflation arises entirely from attempts to buy more goods and services than can be supplied—*i.e.*, more than can be produced at the "full employment" level of activity. If, for example, government expenditure is higher than the difference between production and consumption at the level corresponding to full employment, there is an "inflationary gap." The market process closes this gap by a bidding up of prices to the point at which the difference between income and consumption, in money terms, is big enough to accommodate the government expenditure. (In an economy open to foreign trade, the gap may be closed wholly or in part by the creation of an import surplus). The theory fails to account for the experience in the decades after World War II of continuous inflation in conditions that do not suggest the existence of an inflationary gap.

The "cost-push" theory. A third approach in the analysis of inflation assumes that prices of goods are basically determined by their costs, whereas supplies of money are responsive to demand. In these circumstances, increasing costs may create an inflationary pressure that becomes continuous through the operation of the "price–wage spiral." The supposition is that wage earners and profit receivers (neglecting for the moment other groups in the economy) aspire to incomes that add up to more than the total value of their production at full employment. One or both groups must, therefore, be dissatisfied at any given time. The wage earners, if dissatisfied, demand wage increases. These are conceded (at least in part) by employers in the course of the bargaining process, initially at the expense of profits. Later, employers increase prices to reflect their higher costs, and, while this restores profits, it also reduces wage earners' real incomes, sowing the seeds of a further round of wage demands. If the supply of money were fixed, this process would lead to increasing monetary stringency; it would become increasingly difficult to finance increases in wages and purchases of goods the prices of which had just been raised or, indeed, to finance production and distribution generally—though, as noted earlier, there are some circumstances in which the velocity of circulation can rise drastically and make a limited money stock go a long way. In practice, money supply responds to demand, partly because monetary authorities do not wish to see the dislocation of capital markets that would follow if monetary stringency produced very large rises in rates of interest.

In the 1960s there was much discussion of a relation named after the British economist A.W. Phillips (though in a rudimentary form it can be traced to earlier writers), whereby the rate of increase of wages was shown to vary negatively with the level of unemployment. This can be interpreted as signifying that the price-wage spiral proceeds more rapidly at high levels of economic activity than at low levels. The empirical evidence for the "Phillips curve" was not entirely satisfactory, and the hopes that had been excited in some quarters that a higher but still politically tolerable level of unemployment would reduce or end inflation were shaken by the rapid wage inflation that occurred during the severe recessions in later decades.

The structural theory. The fourth basic approach to the inflationary process is not entirely independent of some of those just discussed; its distinguishing feature is its emphasis on structural maladjustment in the economy. One version of it depends upon the simple proposition that resistance to reductions of money wages is so strong that they hardly ever take place. If this is so, then all adjustments of wages to take account of relative changes in the supply of, and demand for, labour in different industries or occupations have to be accomplished through the absolute raising of all wages except those of the group of workers whose market position is weakest. The rate of wage inflation as a whole is then seen as proportional to the rate of structural change in the economy.

Another version, held to be appropriate to some developing countries, focuses on the gap between imports and exports. Imports tend to increase faster in those countries (because of the rising demand for manufactured goods) than the ability of the traditional exporting industries to pay for them. Difficulty is experienced in substituting home manufactures for imports, partly because home markets are often too small to support the required industries and partly because the development of manufacturing itself requires extensive imports of machinery and structural materials. Consequently, there is a continuous downward pressure on the international value of the country's currency; this is felt in a continuous upward pressure on the country's internal prices.

Alternatively, inflation in such countries may result from social and political pressures to provide employment for the overflow into the towns of a rapidly growing rural population; since there is a shortage of savings, this leads to excessive creation of new credit in one way or another and thus to a straightforward "demand-pull" inflation. The chronic inflationary tendencies in some Latin American countries have been attributed to mechanisms of these kinds.

inflection, also called FLECTION, formerly ACCIDENCE, in linguistics, the change in the form of a word (in English, usually the addition of endings) to mark such distinctions as tense, person, number, gender, mood, voice, and case. English inflection indicates noun plural (*cat, cats*), third person singular present tense (*I, you, we, they buy; he buys*), past tense (*we walk, we walked*), verbals (*called, calling*), and comparatives (*big, bigger, biggest*). Changes within the stem, or main word part, are another type of inflection, as in *sing, sang, sung* and *goose, geese.* The paradigm of the Old Icelandic *u*-stem noun *skjoldr* ("shield"), for example, includes forms with both internal change and suffixation; the nominative singular form is *skjoldr,* the genitive singular is *skjaldar,* and the nominative plural is *skildir.* Many languages, such as Latin, Spanish, French, and German, have a much more extensive system of inflection. For example, Spanish shows verb distinction for person and number, "I, you, he, they live," *vivo, vives, vive, viven* ("I live," "you live," "he lives," "they live"). A number of languages, especially non-Indo-European ones, inflect with prefixes and infixes, word parts added before a main part or within the main part. Inflection differs from derivation in that it does not change the part of speech. Derivation uses prefixes and suffixes (*e.g., in-, -tion*) to form new words (*e.g., inform, deletion*), which can then take inflections.

The terms inflecting and inflectional are sometimes used more narrowly in the typological classification of languages to refer to a subtype of synthetic language, such as Latin. All synthetic languages have inflection in the broader and more widespread sense of the term.

inflorescence, in a flowering plant, a cluster of flowers on a branch or a system of branches. An inflorescence is categorized on the basis of the arrangement of flowers on a main axis (peduncle) and by the timing of its flowering (determinate and indeterminate).

Determinate inflorescence. In determinate (cymose) inflorescences, the youngest flowers are at the bottom of an elongated axis or on the outside of a truncated axis. At the time of flowering, the apical meristem (the terminal point of cell division) produces a flower bud, thus arresting the growth of the peduncle.

A cyme is a flat-topped inflorescence in which the central flowers open first, followed by the peripheral flowers, as in the onion (genus *Allium*).

A dichasium is one unit of a cyme and is characterized by a stunted central flower and two lateral flowers on elongated pedicels, as in the wood stichwort (species *Stellaria nemorum*).

Indeterminate inflorescence. In indeterminate inflorescences, the youngest flowers are at the top of an elongated axis or on the centre of a truncated axis. An indeterminate inflorescence may be a raceme, panicle, spike, catkin, corymb, umbel, spadix, or head.

In a raceme a flower develops at the upper angle (axil) between the stem and branch of each leaf along a long, unbranched axis. Each flower is borne on a short stalk, called a pedicel. An example of a raceme is found in the snapdragon (*Antirrhinum majus*).

A panicle is a branched raceme in which each branch has more than one flower, as in the astilbe (*Astilbe*).

A spike is a raceme, but the flowers develop directly from the stem and are not borne on pedicels, as in barley (*Hordeum*).

A catkin (or ament) is a spike in which the flowers are either male (staminate) or female (carpellate). It is usually pendulous, and the perianth may be reduced or absent, as in oaks (*Quercus*).

A corymb is a raceme in which the pedicels of the lower flowers are longer than those of the upper flowers so that the inflorescence has a flat-topped appearance overall, as in hawthorn (*Crataegus*).

In an umbel, each of the pedicels initiates from about the same point at the tip of the peduncle, giving the appearance of an umbrella-like shape, as in the wax flowers (*Hoya*).

A spadix is a spike borne on a fleshy stem and is common in the family Araceae (*e.g., Philodendron*). The subtending bract is called a spathe.

A head (capitulum) is a short dense spike in which the flowers are borne directly on a broad, flat peduncle, giving the inflorescence the appearance of a single flower, as in the dandelion (*Taraxacum*).

influence, sphere of, in international politics, the claim by a state to exclusive or predominant control over a foreign area or territory. The term may refer to a political claim to exclusive control, which other nations may or may not recognize as a matter of fact, or it may refer to a legal agreement by which another state or states pledge themselves to refrain from interference within the sphere of influence.

It is in the latter, legal significance that the term first gained currency in the 1880s when the colonial expansion of the European powers in Africa and Asia was nearing its completion. The last stage of that expansion was characterized by the endeavour of all major colonial powers to carry on the mutual competition for colonies peacefully through agreed-upon procedures. Agreements on spheres of influence served this purpose. Thus, the agreement between Great Britain and Germany in May 1885, the first to make use of the term, provided for "a separation and definition of their respective spheres of influence in the territories on the Gulf of Guinea." This agreement was followed by many of a similar nature, of which article VII of the agreement between Great Britain and Germany of July 1, 1890, concerning East Africa may be regarded as typical. Its text is as follows:

> The two Powers engage that neither will interfere with any sphere of influence assigned to the other by Articles I to IV. One Power will not in the sphere of the other make acquisitions, conclude Treaties, accept sovereign rights or Protectorates, nor hinder the extension of influence of the other. It is understood that no Companies nor individuals subject to one Power can exercise sovereign rights in a sphere assigned to the other, except with the assent of the latter.

When colonial expansion came to a close after World War I, spheres of influence in the legal sense lost much of their importance. From then on the term was used more for the unilateral political claims of great powers to a predominant position in the territories of other nations, especially those adjacent to their own. Thus, it can be said that the United States' Monroe Doctrine, especially in its application since the presidency of Theodore Roosevelt (1901–09), established the Western Hemisphere as a sphere of influence for the United States. In the aftermath of World War II, the Soviet Union created a sphere of influence as a political fact in the territories of the nations of eastern Europe.

influenza, also called GRIPPE, or FLU, an acute viral infection of the upper or lower respiratory tracts that is marked by fever, chills, and a generalized feeling of weakness and pain in muscles, together with varying signs of soreness in the respiratory tract, head, and abdomen.

Influenza is caused by any of several strains of orthomyxoviruses, categorized as types A, B, and C. The A viruses cause the great influenza epidemics, and the B viruses cause smaller localized outbreaks; the C viruses are not important causes of disease in humans. The viruses undergo constant, rapid evolution (a process called antigenic drift), and periodically they undergo major evolutionary change by acquiring a new genome segment from another influenza virus (antigenic shift).

The A virus occurs in numerous strains or subtypes differentiated mainly by two surface proteins, hemagglutinin (H) and neuraminidase (N). An antigenic shift in the virus can produce a pandemic affecting most of the world within a matter of months. For instance, influenza A subtype H2N2, or Asian flu, apparently began in East Asia early in 1957, and by midyear it had circled the globe. After 10 years of evolution that produced annual epidemics, the Asian flu disappeared in 1968, only to be replaced by a new subtype, H3N2, known as Hong Kong flu. Since 1997 a type of avian influenza, or bird flu, virus called H5N1 has appeared periodically in chicken flocks in Southeast Asia, infecting some people fatally.

Influenza may affect individuals of all ages, though the highest incidence of the disease is

among children and young adults. Influenza is generally more frequent during the colder months of the year. The influenza infection is transmitted from person to person through the respiratory tract, by such means as inhalation of infected droplets resulting from coughing and sneezing. As the virus particles gain entrance to the body, they selectively attack and destroy the ciliated epithelial cells that line the upper respiratory tract, bronchial tubes, and trachea. The incubation period of the disease is one to two days, after which the onset of symptoms is abrupt, with sudden and distinct chills, fatigue, and muscular aches. The temperature rises rapidly to 38° C (101° to 104° F). A diffuse headache and severe muscular aches throughout the body are experienced, often accompanied by irritation or a sense of rawness in the throat. In three to four days the temperature begins to fall and the patient begins to recover. Symptoms associated with respiratory tract infection, such as coughing and nasal discharge, become more prominent and may be accompanied by lingering feelings of weakness and debility. Mortality from the disease is often high because so many people are affected. Death is caused, in most cases, by complications such as pneumonia or bronchitis, usually among older people who are weakened by other debilitating disorders.

The antiviral drug amantadine has a beneficial effect on cases of influenza involving the A virus type. A newer class of antiviral drugs, the neuraminidase inhibitors, was introduced in the late 1990s; these drugs inhibit both the influenza A and B viruses. Other than this, bed rest and the use of analgesics to control fever remain the standard treatment. Individual protection against influenza may be bolstered by injection of an inactivated vaccine containing two or more circulating influenza viruses. These viruses are produced in chick embryos and rendered noninfective; standard commercial preparations ordinarily include the type B influenza virus and several of the A subtypes. Protection from one vaccination seldom lasts more than a year, and yearly vaccination may be recommended, particularly for those individuals who are unusually susceptible to influenza or whose weak condition could lead to serious complications in case of infection. Routine immunization in healthy people, however, is also recommended. In order to prevent human-infecting bird flu viruses from mutating into more dangerous subtypes, public health authorities try to limit the viral "reservoir" where antigenic shift may take place by ordering the destruction of infected poultry flocks.

Influenza Epidemic of 1918–19, also called SPANISH INFLUENZA EPIDEMIC, the most severe influenza outbreak of the 20th century and, in terms of total numbers of deaths, among the most devastating epidemics in human history.

Influenza is caused by a virus that is transmitted from person to person through airborne respiratory secretions. An outbreak can occur if a new strain of influenza virus emerges against which the population has no immunity. The influenza epidemic of 1918–19—which is more precisely called a pandemic because it affected populations throughout the world—resulted from such an occurrence. The cause of the extreme mortality of this pandemic is not known.

The pandemic occurred in three waves. The first apparently originated during World War I in Camp Funston, Kansas, U.S., in early March 1918. American troops who arrived in western Europe in April are thought to have brought the virus with them, and by July it had spread to Poland. The first wave of influenza was comparatively mild; however, during the summer a more lethal type of disease was recognized, and this form fully emerged in August 1918. Pneumonia often developed quickly, with death usually coming two days after the first indications of the flu. For example, at Camp Devens, Massachusetts, U.S., six days after the first case of influenza was reported, there were 6,674 cases. The third wave of the epidemic occurred in the following winter, and by the spring the virus had run its course. In the two later waves about half the deaths were among 20- to 40-year-olds, an unusual mortality-age pattern for influenza.

Outbreaks of the flu occurred in nearly every inhabited part of the world, first in ports, then spreading from city to city along the main transportation routes. India is believed to have suffered at least 12,500,000 deaths during the pandemic. In the United States about 550,000 people died. Altogether an estimated 25 million persons throughout the world perished, most during the brutal second and third waves. Other outbreaks of Spanish influenza occurred in the 1920s, but with declining virulence.

information processing, the acquisition, recording, organization, retrieval, display, and dissemination of information. In recent years, the term has often been applied to computer-based operations specifically.

A brief treatment of information processing follows. For full treatment, *see* MACROPAEDIA: Information Processing.

Computers, together with their peripheral equipment, provide an extremely efficient means of manipulating and modifying stored data. They can, for example, perform scientific and engineering calculations, translate technical material from one natural language to another, conduct searches of bibliographic literature, provide tutorial instruction in various subjects, assist in design and manufacturing activities, or make decisions for solving complex nonnumerical problems (*e.g.,* those related to medical diagnosis or mineral exploration) with so-called expert software systems. Moreover, the utility of computer systems is greatly enhanced by their ability to communicate with one another through computer networks, provided that the proper communications connections have been established and the computer data files and programs have been modified to agree with a common communications protocol.

information science, discipline that deals with the processes of storing and transferring information. It attempts to bring together concepts and methods from various disciplines such as library science, computer science and engineering, linguistics, psychology, and other technologies in order to develop techniques and devices to aid in the handling—that is, in the collection, organization, storage, retrieval, interpretation, and use—of information.

In its early stages during the 1960s, information science was primarily concerned with applying the then-new computer technology to the processing and managing of documents. The applied computer technologies—and more recently, the theoretical areas of study—of information science have since permeated many other disciplines and have even been appropriated by new fields, each preferring a more descriptive designation of its subject domain. The institutionalization of information science as a discrete discipline thus has not occurred, and the number of its scientist-practitioners is low.

information system, an integrated set of components for collecting, storing, processing, and communicating information. In recent years, the term has come to be applied almost exclusively to computer-based systems.

A brief treatment of information systems follows. For full treatment, *see* MACROPAEDIA: Information Systems.

The typical information system consists of: one or more computers, along with various data storage and input/output devices; computer software, including an operating system and various applications for handling data; a database, the repository for interrelated data, or records; and telecommunications equipment, used to link machines and users. In addition, procedures and trained personnel are needed for inputting, retrieving, and disseminating information.

By the beginning of the 21st century, information systems had become ubiquitous in managing operations, financial assets, and human resources in large corporations and government agencies.

information theory, a mathematical representation of the conditions and parameters affecting the transmission and processing of information. The theory stems from pioneering work done by the American electrical engineer Claude E. Shannon, who published his seminal work in 1948. Since then, information theory has developed rapidly, affecting not only the design of communications systems but also such areas as automation, information science, psychology, linguistics, and thermodynamics.

A brief treatment of information theory follows. For full treatment, *see* MACROPAEDIA: Information Theory.

The basic elements of any general communications system include a source of information; a transmitting device that transforms the information, or "message," into a form suitable for transmission by a particular means; the means, or channel, over which the message is transmitted; a receiving device, which decodes the message back into some approximation of its original form; the destination or intended recipient of the message; and a source of noise (*i.e.,* interference or distortion), which changes the message in unpredictable ways during transmission. It is important to note that "information" as understood in information theory has nothing to do with any inherent meaning in a message; it is rather a degree of order, or nonrandomness, that can be measured and treated mathematically much as mass or energy or other physical quantities are.

A mathematical characterization of the generalized communication system yields a number of important quantities, including the rate at which information is produced at the source, the capacity of the channel for handling information, and the average amount of information in a message of any particular type. To a large extent the techniques used with information theory are drawn from the mathematical science of probability. Estimates of the accuracy of a given transmission of information under known conditions of noise interference, for example, are probabilistic, as are the numerous approaches to encoding and decoding that have been developed to reduce uncertainty or error to minimal levels.

infrared astronomy, study of astronomical objects through observations of the infrared radiation that they emit. Various types of celestial objects—including the planets of the solar system, stars, nebulae, and galaxies—give off energy at wavelengths in the infrared region of the electromagnetic spectrum (*i.e.,* from about one micrometre to one millimetre). The techniques of infrared astronomy enable investigators to examine many such objects that cannot otherwise be seen from the Earth because the light of optical wavelengths that they emit is blocked by intervening dust particles.

Infrared astronomy originated in the early 1800s with the work of the British astronomer Sir William Herschel, who discovered the existence of infrared radiation while studying sunlight. The first systematic infrared observations of stellar objects were made by the

American astronomers W.W. Coblentz, Edison Pettit, and Seth B. Nicholson in the 1920s. Modern infrared techniques, such as the use of cryogenic detector systems (to eliminate obstruction by infrared radiation released by the detection equipment itself) and special interference filters for ground-based telescopes, were introduced during the early 1960s. By the end of the decade, Gerry Neugebauer and Robert Leighton of the United States had surveyed the sky at the relatively short infrared wavelength of 2.2 micrometres and identified approximately 20,000 sources in the northern hemispheric sky alone. Since that time, balloons, rockets, and spacecraft have been employed to make observations of infrared wavelengths from 35 to 350 micrometres. Radiation at such wavelengths is absorbed by water vapour in the atmosphere, and so telescopes and spectrographs have to be carried to high altitudes above most of the absorbing molecules. Specially instrumented high-flying aircraft such as the Kuiper Airborne Observatory (*q.v.*) have been designed to facilitate infrared observations near microwave frequencies.

In January 1983 the United States, in collaboration with the United Kingdom and The Netherlands, launched the Infrared Astronomical Satellite (IRAS), an unmanned orbiting observatory equipped with a 57-centimetre (22-inch) infrared telescope sensitive to wavelengths of 8 to 100 micrometres in the infrared spectrum. At these wavelengths, IRAS made a number of unexpected discoveries. The most significant of these were clouds of solid debris around Vega, Fomalhaut, and several other stars, the presence of which strongly suggests the formation of planetary systems similar to that of the Sun. Other important findings included various clouds of interstellar gas and dust where new stars are being formed and an object, designated 1983TB, thought to be the parent body for the swarm of meteoroids known as Geminids.

infrared radiation, that portion of the electromagnetic spectrum that extends from the long wavelength, or red, end of the visible-light range to the microwave range. Invisible to the eye, it can be detected as a sensation of warmth on the skin. The infrared range is usually divided into three regions: near infrared (nearest the visible spectrum), with wavelengths 0.78 to about 2.5 micrometres (a micrometre, or micron, is 10^{-6} metre); middle infrared, with wavelengths 2.5 to about 50 micrometres; and far infrared, with wavelengths 50 to 1,000 micrometres. Most of the radiation emitted by a moderately heated surface is infrared; it forms a continuous spectrum. Molecular excitation also produces copious infrared radiation but in a discrete spectrum of lines or bands.

infrared source, in astronomy, any of various celestial objects that radiate measurable quantities of energy in the infrared region of the electromagnetic spectrum. Such objects include the Sun and the planets, certain stars, nebulae, and galaxies. A number of known infrared sources can be observed at the wavelengths of visible light and in certain cases at radio and X-ray wavelengths as well.

The Sun emits roughly half its energy in the form of infrared rays, with the rest mainly as visible light. Its radiation heats up the planets and renders them bright infrared sources. Jupiter, Saturn, and Neptune also have their own internal heat source, which doubles their infrared brightness.

At short infrared wavelengths of about 2 micrometres, the brightest objects observed beyond the solar system are the large, cool red supergiant stars such as Betelgeuse in the constellation Orion. They are true infrared sources, but investigators have also detected stars emitting at these wavelengths that are not in fact cool. Such stellar objects are brilliant at all wavelengths and are naturally brightest in the visible or ultraviolet. The dust in the interstellar medium, however, blocks their radiation of shorter wavelengths, so that they can only be detected by their infrared emissions, which flow around the dust particles.

Most infrared sources that emit at wavelengths of 10 to 20 micrometres are clouds of dust warmed by neighbouring stars from the average ambient temperature of interstellar space (−270° C) to about room temperature. Such sources fall into two categories. One type consists of a shell of dust ejected from a very old supergiant. The other is a denser patch of dust that lies within a nebula from which stars are forming and is heated by adjacent newly born stars. The disk of the Milky Way Galaxy includes many such regions of active star formation. A notable example is the Orion Nebula, an HII region (one of ionized hydrogen) in the constellation Orion. Interestingly, this nebula is associated with one of the most curious infrared sources yet discovered, the so-called Becklin–Neugebauer object. Located in a giant molecular cloud behind the Orion Nebula, it radiates very intensely in the infrared but scarcely at all in the optical. Many investigators hypothesize that the object may be an incipient massive star.

Investigators have observed rapidly moving clouds of ionized gas near the nucleus of the Milky Way system at a wavelength of 10 micrometres. The velocities of these hot gaseous clouds strongly suggest the presence of a supermassive object, perhaps a black hole (*q.v.*), at the galactic centre. Strong infrared emissions also are evident at the centres of many external galaxies, notably spiral systems with active nuclei (*e.g.*, Seyfert galaxies). This has fueled speculation that the hot accretion disk that surrounds a black hole may be the source of the infrared radiation from such galaxies, as is the case of the Milky Way.

Infrared radiation of longer wavelength—about 100 micrometres—has been detected from dust diffusely spread throughout the Milky Way system. Measurements indicate that at least as much mass is present in this very cold dust as there is in the interstellar dust analyzed by scattered starlight in the visible portion of the spectrum. Depending on its ultimate mass, this large cold dust component could very well prove to constitute a fairly substantial portion of the "missing mass" of the Milky Way that astronomers have long sought.

infrasonics, vibrational or stress waves in elastic media, having a frequency below those of sound waves that can be detected by the human ear—*i.e.*, below 20 hertz. The range of frequencies extends down to geologic vibrations that complete one cycle in 100 seconds or longer.

A brief treatment of infrasonics follows. For full treatment, *see* MACROPAEDIA: Sound.

Naturally occurring infrasonic vibrations take the form of tidal motion or earth tremors. The monitoring of very small earth tremors using a seismograph has value as a means of providing early warning of volcanic activity or of serious earthquake shocks. Artificial tremors may be generated with underground explosions in order to identify and map underlying rock structures. With an array of seismic detectors, a computational form of holography may be achieved. The development of extremely sensitive detectors has provided a means of monitoring underground nuclear-explosion tests, thus contributing to the maintenance of the nuclear test ban treaty. Often associated with severe earthquakes are infrasonic disturbances of the atmosphere that may extend to 50 km (30 miles) above the Earth's surface. These waves can travel considerable distances around the globe.

Human perception of low-frequency sound waves propagating in air does not have a well-defined cutoff point. Above about 18 hertz sound waves appear to have tonality; below this frequency the individual compression waves may be distinguished. Driving an automobile with an open window may generate an infrasonic resonance. The sonic boom of supersonic aircraft contains significant levels of infrasound. In certain circumstances occupational exposure to infrasound may be severe: transformer rooms, compressor plants, and engine rooms may all produce levels that are extremely high and cause discomfort. The mechanisms by which infrasonics may be perceived by humans and their physiological effects are incompletely understood.

Inga Falls, rapids on the lower Congo (Zaire) River and site of one of the world's largest hydroelectric-dam projects, in western Zaire, about 25 miles (40 km) above the port of Matadi. At a sharp bend in the river between Sikila Island and the mouth of the Bundi River (a Congo River tributary), the Congo falls 315 feet (96 m) in 9 miles (14 km) and flows at a rate of about 1,500,000 cubic feet (43,000 cubic m) per second. The first phase of the hydroelectric project, completed in 1972, provides power for a uranium-enrichment facility at the site. The second phase, constructed in conjunction with a high-tension transmission line to Shaba region in southeastern Zaire and completed in 1979, was designed to supply electricity for Shaba's industries. The third and most ambitious phase was to involve blocking the river's flow and creating a large reservoir.

Ingalik, Athabascan-speaking Indian tribe of interior Alaska, in the basins of the upper Kuskokwim and lower Yukon rivers. Their region is mountainous, with both woodlands and tundra, and is fairly rich in fish, caribou, bear, moose, and other game on which the Ingalik subsisted—fish, fresh or dried, being central to their diet. Much of their culture was strongly influenced by Eskimo customs and technology: they wore parkas, trousers, and other Eskimo apparel; built semisubterranean sod houses similar to those of the western Eskimo; and used harpoons, spear throwers, and other weapons like those of the Eskimo. They favoured birch canoes over skin-covered boats.

The various groups of Ingalik lived in villages, some permanent and some seasonal, such as summer fish camps for one or two families and winter settlements for an entire group. The centre of village life was a large semisubterranean lodge called a kashim, which served primarily as a sweathouse for daily use by the men but which also served as a council chamber, entertainment club, funeral home, religious house for the rituals of medicine men or shamans, and a centre for various other public activities—largely for men only. Women remained in the several family dwellings. The Ingalik were much given to games and sports, ceremonies, and potlatches, the last being gift-giving festivities for marking such events as marriage and death and especially for acquiring prestige.

Although the Ingalik believed in a creator, in a devil, and in other worlds beyond the living, they were more concerned with a kind of supernatural spirit that pervaded all things animate and inanimate in the world. There were several ceremonies, taboos, and superstitions relating to animals and the hunt and to the care of tools and other economic items; survival and success required good relations with the things of nature.

Only a few hundred Ingalik remain, mostly assimilated to modern Western culture.

Ingavi (Paraguay): *see* Mayor Pablo Lagerenza.

Inge I HARALDSSON, Inge also spelled INGI, byname INGE THE HUNCHBACK, Norwegian INGE KROKRYGG (b. 1135, Norway—d. Feb. 1, 1161, Norway), king of Norway (1136–61), who maintained his claim to the throne against the illegitimate sons of his father, the Norwegian king Harald IV Gille (reigned 1130–36), and represented the interests of the higher nobles and clergy in the second part of the Norwegian civil wars.

The only legitimate son of Harald IV, Inge succeeded to the throne as an infant jointly with his half brother, Sigurd II, at their father's death. The brothers and their supporters then defeated the forces of Sigurd Slembi and the former ruler Magnus IV the Blind, who were both pretenders to the throne. In 1142 Inge and Sigurd II were joined by Eystein, who also claimed to be a son of Harald IV and was given a third of his kingdom. Inge soon became the most powerful of the three rulers because of his strong ties with the higher nobles and clergy.

In 1150 Inge called a meeting at Bergen of all secular and religious leaders, anticipating the founding of an archbishopric at Nidaros (Trondheim) in 1152 by the English cardinal Nicholas Breakspear (later Pope Adrian IV). The archbishopric included five dioceses in Norway and six in Norwegian colonies, all previously under the jurisdiction of the archbishopric of Lund, Denmark.

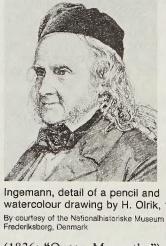
In 1155 Inge's half brothers Sigurd II and Eystein plotted to overthrow him, but both were killed within the next two years by Inge's supporters. Between 1157 and 1161 Inge fought off the challenge of the pretender Haakon, an illegitimate son of Sigurd II (later king as Haakon II the Broadshouldered), in what is now called the second phase of the Norwegian civil wars. Their struggle, essentially a class conflict in which Inge represented the higher nobility and Haakon the freeholders, differed from the earlier phase of the civil war period, in which various pretenders competed for the throne. Inge was finally defeated and killed by Haakon's forces.

Inge, William (Motter) (b. May 3, 1913, Independence, Kan., U.S.—d. June 10, 1973, Hollywood Hills, Calif.), American playwright best known for his plays *Come Back, Little Sheba* (1950; filmed 1952); *Picnic* (1953; filmed 1956), for which he won a Pulitzer Prize; and *Bus Stop* (1955; filmed 1956).

Inge was educated at the University of Kansas at Lawrence and at the George Peabody College for Teachers in Nashville, Tenn. He taught school from 1937 to 1949, also serving as drama editor of the *Star-Times* in St. Louis, Mo., from 1943 to 1946. His first play, *Farther Off from Heaven* (1947), was produced in Dallas, Texas, at the recommendation of Tennessee Williams, to whom Inge had sent the script; 10 years later it was revised for Broadway as *The Dark at the Top of the Stairs* (filmed 1960).

Inge was one of the first American dramatists to deal with the quality of life in the small towns of the Midwest, and he achieved notable success throughout the 1950s. His later plays—*A Loss of Roses* (1960; filmed as *The Stripper,* 1963), *Natural Affection* (1963), *Where's Daddy?* (1966), and *The Last Pad* (1970)—were less successful. Inge received an Academy Award for his original screenplay *Splendor in the Grass* (1961). His shorter works included *Glory in the Flower* (1958), *To Bobolink, for Her Spirit* (1962), *The Boy in the Basement* (1962), and *Bus Riley's Back in Town* (1962).

Inge, William Ralph (b. June 6, 1860, Crayke, Yorkshire, Eng.—d. Feb. 26, 1954, Wallingford, Berkshire), British divine, Christian Platonist, and dean of St. Paul's Cathedral, London. He was noted for his keen intellect and for his pessimistic views, which earned him the title "gloomy dean."



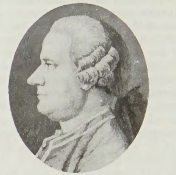
Inge was educated at Eton and at King's College, Cambridge. He became assistant master at Eton (1884–88), a fellow of King's College (1886–88), a tutor of Latin and Greek and fellow of Hertford College, Oxford (1889–1904), and Lady Margaret professor of divinity and fellow of Jesus College, Cambridge (1907–11). By 1911, when appointed dean of St. Paul's, he had already written several books, including *Christian Mysticism* (1899), *Truth and Falsehood in Religion* (1906), and *Faith* (1909), which were to become theological classics. At St. Paul's, where he remained until his retirement in 1934, he became a national figure, and for 25 years he contributed to the London *Evening Standard.*

Of Inge's dozens of books, probably the most important was *The Philosophy of Plotinus* (1918), a collection of his lectures. *Outspoken Essays,* 2 vol. (1919 and 1922), and *Lay Thoughts of a Dean,* 2 vol. (1926 and 1931), are also notable.

BIBLIOGRAPHY. Biographies include Adam Fox, *Dean Inge* (1960); and Robert M. Helm, *The Gloomy Dean* (1962).

Ingemann, Bernhard Severin (b. May 28, 1789, Torkilstrup, Den.—d. Feb. 24, 1862, Sorø), historical novelist and poet whose works glorifying Denmark's medieval past were popular for generations. Most of Ingemann's works have not won enduring acclaim, but his simple *Morgen og aftensange* (1837–39; "Morning and Evening Songs") and his patriotic verse cycle *Holger Danske* (1837; "Holger the Dane") are much admired in Denmark.

Ingemann studied at the University of Copenhagen, traveled in Germany and Italy, and later settled at Sorø Academy as a teacher (1822) and director (from 1846). There he produced a series of six historical novels, of which the first, *Valdemar den store og hans Mænd* (1824; "Waldemar the Great and his Men"), and the last, *Dronning Margrethe*



Ingemann, detail of a pencil and watercolour drawing by H. Olrik, 1860

(1836; "Queen Margrethe"), are in verse, the other four in prose. He is also the author of a hymn, "Through the Night of Doubt and Sorrow," well-known in English translation.

Ingenhousz, Jan (b. Dec. 8, 1730, Breda, Neth.—d. Sept. 7, 1799, Bowood, Wiltshire, Eng.), Dutch-born British physician and scientist who is best known for his discovery of the process of photosynthesis, by which green plants in sunlight absorb carbon dioxide and release oxygen.

As a physician in London (1765–68), Ingenhousz was an early proponent of variolation, or the inoculation against smallpox through the use of live, unmodified virus taken from patients with mild cases of the disease. In 1768 he traveled to Vienna to inoculate the family of the Austrian empress Maria Theresa and subsequently served as court physician. Returning to London in 1779, he published the results of an ingenious study on the chemical effects of plant physiology, *Experiments Upon Vegetables, Discovering Their Great Power of Purifying the Common Air in Sunshine, and of Injuring It in the Shade and at Night.* The English chemist Joseph Priestley had already shown that plants restore to the air a property

Ingenhousz, detail of an engraving
BBC Hulton Picture Library

necessary to—but destroyed by—animal life. Ingenhousz found that (1) light is necessary for this restoration (photosynthesis); (2) only the green parts of the plant actually perform photosynthesis; and (3) all living parts of the plant "damage" the air (respire), but the extent of air restoration by a green plant far exceeds its damaging effect.

A man of varied scientific interests, Ingenhousz also invented an improved apparatus for generating large amounts of static electricity (1766) and made the first quantitative measurements of heat conduction in metal rods (1789).

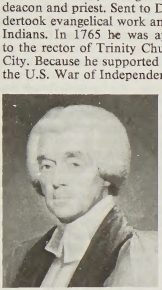
Ingersoll, Robert G(reen) (b. Aug. 11, 1833, Dresden, N.Y., U.S.—d. July 21, 1899, Dobbs Ferry, N.Y.), American politician and orator known as "the great agnostic" who popularized the higher criticism of the Bible, as well as a humanistic philosophy and a scientific rationalism.

Although he had little formal education, Ingersoll was admitted to the Illinois bar in 1854, and he subsequently enjoyed a lucrative law practice in Peoria, Ill., New York City, and Washington, D.C. After service in the American Civil War (1861–65), he became a staunch Republican, serving as Illinois attorney general (1867–69) and as a party spokesman in presidential campaigns. In spite of his outstanding contribution to his political party, his unorthodox religious views deterred Republican administrations from appointing him to the Cabinet or to the diplomatic posts that he desired. Nationally known as a lecturer, Ingersoll was in great demand and received as much as $3,500 for a single evening's performance, in which with brilliant oratory and wit he sought to expose the orthodox superstitions of the times.

Ingersoll's principal lectures and speeches, published as *Some Mistakes of Moses* (1879) and *Why I Am Agnostic* (1896), are found in *The Works of Robert G. Ingersoll,* 12 vol. (1902), edited by Clinton P. Farrell.

Ingham, town, northeastern Queensland, Australia, 19 miles (31 km) upstream from the mouth of the Herbert River. Founded in 1864, it was gazetted a shire in 1879. On a rail line and the Bruce Highway from Brisbane (745 miles [1,199 km] southeast), the town serves important sugarcane plantations, pioneered in the 1870s by William Ingham, for whom the town is named. The area also yields tobacco, beef, and timber. Pop. (1986) 5,202.

Ingi I (Norwegian king): *see* Inge I.



inglenook, wooden seat or settle built into the space on either side of the wide fireplaces common in 17th-century English houses and cottages. The word is of Scottish origin, "ingle" meaning a housefire burning on a hearth. This type of built-in furniture fell out of favour

upon the introduction of more sophisticated flues, which allowed for a smaller fire-burning area, but it was reintroduced with the revival of cottage-style architecture in the late 19th century, though in this context it was a deliberate archaism.

Inglewood, city, Los Angeles county, California, U.S. It lies southwest of downtown Los Angeles. Settled by Daniel Freeman in 1873, it was laid out by the Centinela-Inglewood Land Company in 1887 and became a poultry-raising centre. It developed with the Los Angeles metropolitan area and is the site of the Hollywood Park racetrack. La Casa de la Centinela Adobe (built in 1836) is a historical landmark. Los Angeles International Airport is adjacent (southwest). Inc. city, 1908. Pop. (1994 est.) 110,085.

Inglis, Charles (b. 1734, Glencolumbkille, County Donegal, Ire.—d. Feb. 24, 1816, near Halifax, Nova Scotia [now in Canada]), Canadian clergyman and educator who became the first Anglican bishop of Nova Scotia.

Inglis went to North America and became a master in a church school in Lancaster, Pa., in 1757. In 1758, in England, he was ordained deacon and priest. Sent to Dover, Del., he undertook evangelical work among the Mohawk Indians. In 1765 he was appointed assistant to the rector of Trinity Church in New York City. Because he supported the British during the U.S. War of Independence (1775–83), his

Inglis, detail of an oil painting by Robert Field, 1810; in the National Portrait Gallery, London

church was burned and his property confiscated; in 1783 he went to Nova Scotia.

In 1787 Inglis was consecrated the first Anglican bishop of Nova Scotia and its dependencies—Newfoundland, Prince Edward Island, Quebec, and Bermuda. The church academy he founded at Windsor, Nova Scotia, in 1789 was granted a royal charter in 1802 and later became the University of King's College (located since 1923 in Halifax). In 1796 Inglis retired to a farm near Halifax to write, and in 1809 he was made a member of the council of Nova Scotia.

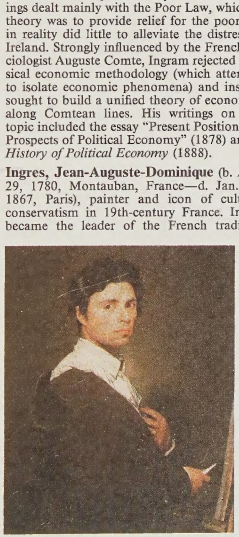
Ingolstadt, city, Bavaria *Land* (state), southern Germany. It lies along the Danube and Schutter rivers. First mentioned in 806 as a crown estate, villa Ingoldestat, it was chartered in 1250 and became a ducal seat in 1392. The duchy of Bavaria-Ingolstadt passed to the Bavaria-Landshut line in 1447 and to the Bavaria-Munich line of the Wittelsbachs in 1503. The University of Munich, which was important in the German humanist movement and in the Counter-Reformation, was founded in Ingolstadt in 1472 but was moved to Landshut in 1800 and to Munich in 1826. A garrison and fortress town in the 19th century, Ingolstadt was damaged considerably in World War II but, with reconstruction, has expanded rapidly.

The old town is partly surrounded by 14th-century walls, including the picturesque Cross Gate, and there are many medieval houses and churches. The city's notable landmarks are the massive brick late Gothic Cathedral of Our Lady (1425–1500), the ducal castle (1420), which houses a military museum, the former university buildings, and the late Baroque Church of Maria de Victoria (1732–36). A ring of parks separates the old town from the surrounding industrial and residential districts.

Ingolstadt is a centre for heavy industry, rail traffic, and petroleum refining. Oil pipelines link it to Genoa and Trieste (Italy) and Marseilles (France). Pop. (1995 est.) 110,910.

ingot, mass of metal cast into a size and shape such as a bar, plate, or sheet convenient to store, transport, and work into a semifinished or finished product; it also refers to a mold in which metal is so cast. Gold, silver, and steel, particularly, are cast into ingots for further processing.

Steel ingots range in size from small rectangular blocks weighing a few pounds to huge, tapered, octagonal masses weighing more than 500 tons.



Tin ingots are the starting material for many products, whether the tin is to be alloyed with other metals, converted to other physical forms, applied to other metal surfaces, or converted to chemical compounds.

Ingram, John Kells (b. July 7, 1823, Temple Carne, County Donegal, Ire.—d. May 1, 1907, Dublin), Irish economic historian who also achieved fame as a scholar and poet.

Ingram graduated from Trinity College, Dublin, in 1843. He showed considerable promise in both mathematics and classics and achieved early popularity as a poet. In 1852 he became professor of oratory at Trinity College and wrote extensively on Shakespeare's plays. He then became Regius professor of Greek (1866–77), librarian (1879–87), and vice provost (1898–99).

In 1847 Ingram helped to found the Dublin Statistical Society. His early economic writings dealt mainly with the Poor Law, which in theory was to provide relief for the poor but in reality did little to alleviate the distress in Ireland. Strongly influenced by the French sociologist Auguste Comte, Ingram rejected classical economic methodology (which attempts to isolate economic phenomena) and instead sought to build a unified theory of economics along Comtean lines. His writings on this topic included the essay "Present Position and Prospects of Political Economy" (1878) and *A History of Political Economy* (1888).

Ingres, Jean-Auguste-Dominique (b. Aug. 29, 1780, Montauban, France—d. Jan. 14, 1867, Paris), painter and icon of cultural conservatism in 19th-century France. Ingres became the leader of the French tradition

Ingres, self-portrait, oil on canvas, c. 1800; in the Condé Museum, Chantilly, Fr.

Giraudon/Art Resource, New York City

of Neoclassical painting after the death of Jacques-Louis David. He was also one of the finest portraitists of his century. Ingres's cool, meticulously drawn works were the antithesis of the contemporary Romantic school. His historical paintings display his lifelong obsession with line and contour, while his female nudes reveal a sensuality unique to Neoclassicism.

Early life and works. Ingres received his first artistic instruction from his father, Jean-Marie-Joseph Ingres (1755–1814), an artistic jack-of-all-trades of modest talent but considerable professional and social pretensions. Ingres's formal education at the school of the Brothers of Christian Doctrine was cut short by the abolition of religious orders in France in 1791, during the Revolution. So he was sent to study at the fine arts academy in Toulouse instead. Six years later, in 1797, he set out for Paris, where he entered the studio of the most celebrated artist in France, the Neoclassical painter Jacques-Louis David. Two years later Ingres was accepted into the École des Beaux-Arts ("School of Fine Arts"). The culmination of his artistic education occurred in 1801, when he was awarded the coveted Prix de Rome. Ingres's prizewinning painting, "The Envoys of Agamemnon," demonstrates his mastery of the standard academic pictorial vocabulary as well as his attraction to modish stylistic archaisms.

Because the French treasury, strained by Napoleon's wars, was unable to pay for his scholarship in Rome, Ingres was forced to remain in Paris, where he began to distinguish himself as a portraitist. In 1804 he fulfilled his first official commission in this genre, "Bonaparte as First Consul" (Museum of Fine Arts, Liège). In 1806 he attracted public attention with a display of five portraits at the official exhibition of contemporary art known as the Salon. Four of these paintings were standard exercises in Davidian Neoclassicism—a trio of portraits of members of the Rivière family (now in the Louvre Museum, Paris) and a rather swaggering "Self-Portrait" (Condé Museum, Chantilly). Much more original was a portrait of "Napoleon on his Imperial Throne" (1804; Museum of the Army, Paris), an intimidating effigy of absolutism incarnate that is executed in a willfully stiff and archaic style reminiscent of 15th-century Flemish masters. The critics were unanimous in their condemnation of this work and branded Ingres's self-consciously primitivizing manner as "Gothic." It would take the artist two decades to shake this pejorative label.

In 1806 Ingres finally set off for Italy, where he did little to counter his burgeoning reputation as an enfant terrible. The academicians were disconcerted by the linear severity and the restrained colours of the two paintings he sent back to Paris in 1808: the famous "Valpinçon Bather" (Louvre Museum, Paris) and "Oedipus and the Sphinx" (Louvre). The culminating production of Ingres's student years in Rome, the large mythological painting "Jupiter and Thetis" (1811; Granet Museum, Aix-en-Provence), proved no less provocative. In the fantastically fluid, seemingly boneless body of the sea nymph Thetis, Ingres prominently displayed what would become one of the most distinguishing features of his mature art: an audacious reconfiguration of the female anatomy.

Mature life and works. When Ingres's tenure as a student at the French Academy in Rome expired in 1810, he opted to remain in Italy, where he had begun to establish himself as a portraitist of Napoleonic officials and dignitaries. He also received occasional commissions in the more prestigious genre of history painting. In 1811 he was invited to participate in the redecoration of the Quiri-

nal Palace, which was in the process of being transformed into Napoleon's official residence in Rome. Ingres's contribution consisted of two monumental canvases: "Romulus, Conqueror of Acron" (1812) and "The Dream of Ossian" (1813).

This period of relative prosperity ended abruptly in 1815 with the fall of the Napoleonic empire and the evacuation of Rome by the French. Desperate for work, Ingres resorted to executing small-scale portrait drawings of English and other tourists. An almost uncanny control of delicate yet firm line, and an unending inventiveness in posing his sitters in a manner to reveal personality through shrewdly observed characteristic gestures, combined with a capacity to record an exact likeness, make this category of Ingres's drawings unique. Though these pencil portrait drawings are among Ingres's most widely admired works, he himself scorned them as mere potboilers. Despite his supreme gifts as a portraitist, Ingres throughout his life professed to disdain portraiture and strove instead to establish his credentials as a creator of grand historical paintings.

But commissions for monumental works were hard to come by, so Ingres contented himself with subject painting on a more restrained scale. It was during this period that he emerged as a master of medieval and Renaissance subjects executed in a purposefully primitivizing style recalling the artistic mannerisms of the age of the scenes being depicted. These canvases did little to shield him from the attacks of the critics, however, who continued to portray him as a kind of savage primitive intent on taking art back to its infancy. A hostile response likewise greeted what would become one of the artist's most celebrated canvases, the "Grande Odalisque" (1814; Louvre). Exhibited in the 1819 Salon, this painting elicited outrage from critics, who ridiculed its lack of conventional modeling as well as Ingres's habitual anatomical distortions of the female nude.

It was as a religious painter that Ingres, who moved from Rome to Florence in 1820, finally began to turn the critical tide in his favour. The artist adopted a more conventional classicizing style—one based directly on the example of his hero Raphael—for "The Vow of Louis XIII" (1824; Notre-Dame Cathedral, Montauban), a blatant piece of pro-Bourbon propaganda celebrating the union of church and state. This picture was a spectacular success at the 1824 Salon, earning the artist his first critical accolades as well as election to the Academy of Fine Arts. Thus, in the span of a single exhibition, Ingres went from being one of the most vilified artists in France to one of the most celebrated.

Heartened by the success of "The Vow of Louis XIII," Ingres, who had accompanied the picture to Paris, resolved to remain in France. In 1825 he opened a teaching studio, which quickly became one of the largest and most important in Paris. Two years later, at the Salon of 1827, Ingres followed up the success of the "Vow" with his most ambitious history painting, "The Apotheosis of Homer" (Louvre). The "Apotheosis" is a vast historical group portrait that summarizes the development of classical culture in the West. This work is not only a resounding manifesto of Neoclassicism but also a memorial to the narrow-minded, prejudicial brand of cultural conservatism with which Ingres would be linked for the rest of his career.

Despite having achieved his first real success under the stewardship of the Bourbon kings of France, Ingres rallied to the more liberal Orléanist regime that arose out of the Revolution of 1830. In 1832 he produced the "Portrait of Monsieur Bertin" (Louvre), a pictorial paean to the utter tenacity of the newly empowered middle class. Ingres's masterful characterization of his pugnacious sitter, along with the portrait's mesmerizing realism, won the artist great popular success at the 1833 Salon.

In 1829 Ingres had been named professor at the École des Beaux-Arts, and in 1834 and 1850 he served as president of that institution. But already by 1833 he stood accused of artistic imperialism—of attempting to impose his personal style on the entire French school of painting. Such charges dominated the critical discourse in 1834, when the artist exhibited the "Martyrdom of Saint-Symphorien" (St. Lazare Cathedral, Autun). Rumoured beforehand to be his definitive masterpiece, this monumental religious canvas was violently attacked by critics on the political and cultural left and was defended no less vehemently by Ingres's allies on the right. Deeply wounded by the lack of universal approbation, the notoriously hypersensitive Ingres announced his intention never again to exhibit at the Salon. He also solicited and received the post of director of the French Academy in Rome, and set off for Italy in 1834.

Ingres's tenure as director of the French Academy in Rome was dominated by administrative and teaching duties. During his six-year stint in Rome, he completed only three major canvases: the so-called "Virgin with the Host" (1841), the "Odalisque with Slave" (1840; Fogg Art Museum, Cambridge, Mass.), and "Antiochus and Stratonice" (1840). The exhibition of the latter painting turned the critical tide in Ingres's favour once more. Primed by this success, Ingres in 1841 made a triumphal return to Paris, where he dined with the king and was publicly feted at a banquet attended by more than 400 political and cultural dignitaries.

Late life and works. Ingres had finally secured his status as the greatest living artist in France. The darling of the Orléanist elite, he continued to showcase his works in a series of exclusive, semipublic exhibitions and also received several prestigious decorative commissions, none of which, however, he ever fulfilled. Terrified by the spectre of social and political chaos during the Revolution of 1848, Ingres welcomed the declaration of the Second Empire under Napoleon III in 1852.

It is ironic that, given his pretensions as a history painter, Ingres's major accomplishment during his later years continued to be in the genre of portraiture. By the mid-1850s he was the most sought-after society portraitist in Paris. Ingres was particularly adept at capturing the grace and splendour—as well as the ostentation and vulgarity—of the feminine elite. Among his most beautiful portraits in this genre are the "Comtesse d'Haussonville" (1845; Frick Collection, New York), the "Baronne de Rothschild" (1848), the "Princesse de Broglie" (1853; Metropolitan Museum, New York), and two portraits of the renowned beauty Mme. Inès Moitessier that he painted in 1851 and 1856 (now in the National Gallery, Washington, D.C., and the National Gallery, London, respectively).

After having boycotted the Salon for more than two decades, Ingres was coaxed into entering an official public exhibition once again on the occasion of the Universal Exposition in Paris in 1855. The critical reaction to the 69 works he displayed there was predictably mixed: conservative reviewers hailed him as a kind of artistic messiah, while more progressive critics denounced his hackneyed style as utterly irrelevant to the modern age. The government mollified the wounded artist by elevating him to the rank of Grand Officer of the Legion of Honour; he was the first literary or artistic figure to achieve this lofty honour. In 1862 Ingres became one of the first professional painters to be appointed to the Senate.

The most notable works Ingres painted late in his career are female nudes. In 1856 he completed "The Source" (Orsay Museum, Paris), a disturbingly vacuous representation of an adolescent girl that became one of his most celebrated canvases during his lifetime. But his culminating achievement in the genre of the female nude was the much more complex, multifigure "Turkish Bath" (1862; Louvre).

Ingres died in 1867. He bequeathed to Montauban, his native city, the contents of his studio. In addition to about 4,000 drawings (the studies, sketches, and working drawings of a lifetime), the bequest included several of his own paintings, the paintings in his private collection, and his reference library. All of this is now housed in the Ingres Museum at Montauban.

Assessment. For most of the first half of the 19th century, Ingres was a champion of line and of firm contour, of subtly graded, clear colour, and of carefully balanced composition. He viewed with contempt the dramatic chiaroscuro, the turbulent movement, and the tense emotional context of his chief rival, the Romantic painter Eugene Delacroix. Ingres's death marked the symbolic end of the tradition of monumental history painting in French art. By this time contemporary life, rather than the exploits of the ancient Greeks and Romans, had already begun emerging as the dominant subject matter of modern painting. The finality of Ingres's passing was rendered all the more evident by his lack of talented pupils; despite having been surrounded by a group of fanatical devotees, the artist left no one behind to carry the torch. Time has dimmed the acrimony of the quarrels of Ingres's epoch and made clearer the quality of his genuine, if rather self-contradictory, genius. His position as one of the truly great painters of the 19th century is now secure, and his considerable influence on Edgar Degas, Pierre-Auguste Renoir, Pablo Picasso, and other modernists is now generally acknowledged. (A.C.S.)

BIBLIOGRAPHY. The most authoritative account of Ingres's life and career remains the work by Henry Lapauze, *Ingres: sa vie & son oeuvre (1780–1867) d'après des documents inédits* (1911). Georges Vigne, *Ingres* (1995; originally published in French, 1995), provides an informative, lavishly illustrated biography in English. The principal catalogues are Georges Wildenstein, *Ingres* (1954), a catalogue-raisonné of the paintings; and Hans Naef, *Die Bildniszeichnungen von J.-A.-D. Ingres*, 5 vol. (1977–80), on the portrait drawings. A stimulating critical appraisal is Robert Rosenblum, *Jean-Auguste-Dominique Ingres* (1967). Carol Ockman, *Ingres's Eroticized Bodies: Retracing the Serpentine Line* (1995), presents a provocative critique of the artist's work from a feminist perspective.

ingress, in astronomy, the apparent entrance of a smaller body upon the disk of a larger one as the smaller passes between the larger and the observer—*e.g.,* the entrance of a satellite or its shadow on the disk of a planet. The term is also applied to the Moon's entrance into the Earth's shadow at the start of a lunar eclipse and to the Sun's entrance into a zodiacal constellation.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Inguri Dam, world's highest arch dam (completed 1980), located on the Inguri River in western Georgia near the point at which the river leaves the Caucasus Mountains on its way to the Black Sea. It is a huge 892-foot-(272-metre-) tall double-curvature arch dam with a crest length of 2,231 feet (680 m). The dam was built of interlocking stacks of concrete monoliths laid over reinforced limestone bedrock. The five-unit power plant associated with the dam has a planned power capacity of 1,300 megawatts.

Ingushetia, republic in southwestern Russia. The crest line of the Great Caucasus Range

forms its southern boundary with Georgia; the Russian republic of Chechenia lies to the east, and that of North Ossetia to the west and north. The capital city is Nazran.

The northern lowland region, which merges into the southern extreme of the Nogay Steppe, is only 650 feet (200 m) above sea level in some places, but much of Ingushetia is at least 1,650 feet (500 m) above, with scattered peaks of the Caucasus in the mountainous southern region rising to 9,850 feet (3,000 m) and higher. The Sunzha River, a tributary of the Terek, crosses the northern area of Ingushetia from west to east; the Assa, a tributary of the Sunzha, is the main stream in the region. The climate varies with the relief but generally approximates the dry continental type.

The majority of the population is Ingush, one of the many Muslim mountain peoples in the Caucasus. Their society is based on clan and tribal relations. Traditionally, the chief occupations were farming in the lowlands and cattle raising in the mountain areas. Petroleum drilling has become increasingly important, especially in the area around Malgobek.

The Ingush became Russian subjects in 1810 and, unlike most of their neighbours, did not participate in the mid-19th-century war against the Russian occupation of the Caucasus or in the rebellion against Soviet Russia in 1920–22. In 1924 the Ingush autonomous *oblast* (province) was created. It was later combined with the Chechen autonomous *oblast*, inhabited primarily by the Chechen mountain peoples, who are also Muslim and whose language is closely related to Ingush; the autonomous republic of Checheno-Ingushetiya was established in 1936. During World War II Checheno-Ingushetiya was abolished, and its ethnic inhabitants, who had been accused of collaborating with the Germans, were deported to Soviet Asia. The republic was reestablished in 1957 and the exiles allowed to return. After the 1991 breakup of the Soviet Union, the Ingush and the Chechen dissolved the union that had been imposed on them and formed two separate republics: Ingushetia and Chechenia (*q.v.*).

Inhambane, town, southeastern Mozambique. The town is a commercial seaport on Inhambane Bay, an inlet of the Mozambique Channel (Indian Ocean). It is a market centre, and industry consists mainly in the processing of cashew nuts.

The surrounding region, with its subtropical climate and its physiography of littoral lowland, marshy rivers, and small lakes provides suitable conditions for rice production. Cashew trees and mafura trees (used for soap production) are commercially exploited. South of the Save River, grasses abound and cattle are raised by the Tsonga people, the dominant ethnic group in the region. The Chopi, another ethnic group, live primarily along the coast. Apart from rice and cashew nuts, the principal agricultural products of the region are copra, beans, and corn (maize). Pop. (1991 est.) 47,764.

inheritance, also called SUCCESSION, the devolution of property on an heir or heirs upon the death of its owner. The term inheritance also designates the property itself.

A brief treatment of the law of inheritance follows. For full treatment, *see* MACROPAEDIA: Inheritance and Succession.

The laws of inheritance are a body of principles and regulations governing the means by which assets and liabilities may be transferred, after death, to designated successors to the decedent's estate. In civil-law countries this area of law is referred to as law of succession, while in the Anglo-American system it is known as probate law, law of decedents' estates, or, more generally, law of inheritance.

The concept of inheritance depends upon a common acceptance of the notion of private ownership of goods and property. In early societies a dead man's relics were buried with him as a ritual practice or apportioned to relatives and other tribesmen. Under many systems, including some contemporary socialist governments, land is considered communal property, and rights to it are redistributed, rather than bequeathed, upon the death of a community member.

A will, sometimes called a testament, refers either to the actual process by which the posthumous apportionment of an estate is legally specified or to the document that serves as an authorized record of it. Though an oral will is acceptable under limited circumstances, the more common written form is either holographic—written entirely in the testator's hand and unwitnessed—or printed or typed and attested to by witnesses who are not beneficiaries or by a notary. A will whose execution meets all formal legal standards cannot be invalidated unless it is proved that the testator was coerced into making it or was mentally incompetent when he made it. A will can be revoked before the testator's death by destroying the document itself or by replacing it with a revised version.

Freedom to bequeath by will has traditionally been limited in order to protect beneficiaries from unreasonable conditions of succession and to prevent complete and unjustified disinheritance of surviving dependents. In many countries, though not all, this is provided for by the indefeasible share system, which specifies a minimum portion of the estate that must be assigned to the surviving spouse and, often, to the progeny as well. In the United States, common-law states allow the spouse to take action against the will, guaranteeing that spouse a specific percentage of the property.

The practice of primogeniture, in regard to the passing of real property to a single heir, dominated English inheritance law for most of its history. Because this system was commonly used by the aristocracy as a means of maintaining family estates intact, the institution of entails was established, which prohibited the distribution or other disposal of real property by the heir; thus the land would stay within the family. The inflexibility and economic inefficiency of this practice in modern times resulted in its complete collapse.

Intestacy laws, which govern the succession of estates whose distribution is not directed by a will, universally view kinship between the decedent and the beneficiary as a primary consideration. The Roman system codified by the emperor Justinian, a strong influence on later English law, followed a hierarchy of successors that began with the decedent's offspring and continued from his ascendants to full-blood, then half-blood siblings; English law provided more substantially for the surviving spouse and abandoned the distinction between full- and half-blood siblings. Recent trends in Anglo-American common-law practice have deemphasized traditional concerns with strictly familial succession and have for the most part ceased to distinguish between legitimate and illegitimate offspring as legal heirs.

The regulations governing the succession of a decedent's debts along with his estate are referred to generally as laws of transfer. Under the civil-law system that prevails in much of continental Europe, rightful heirs may decline succession to an estate if its assets are not sufficient to cover its liabilities: in the event of an heir's acceptance, responsibility for inherited debts is limited to the value of the estate. Under the system presently in use in England, a personal representative specified in the will is granted responsibility for its fulfillment by the probate division of the High Court, while in the United States the administrator of the will is appointed by the probate court and is authorized to act only under its close scrutiny. As a result of the enactment of the Uniform Probate Code of 1969, some of the formalities of court supervision can be eliminated by selecting one of several procedures suited for inheritance cases of varying degrees of complexity.

inheritance tax, levy on the property accruing to each beneficiary of the estate of a deceased person. It is usually calculated by reference to the amount received and the relationship (if any) of the beneficiary to the deceased. In some systems the value of the property already owned by the beneficiary also enters into the calculation. Inheritance tax may be more difficult to administer than estate tax because the value passing to each beneficiary must be fixed, and this often requires complex actuarial calculations.

Inheritance taxes are one of the oldest forms of taxation, dating back to the Roman Empire, which levied a one-twentieth-portion tax on inherited property in order to pay pensions of veteran soldiers. The basis of the modern inheritance tax, however, was established during the Middle Ages in the feudal arrangement whereby all land and property was ultimately owned by the sovereign, whose permission was required to transfer any property upon death of the owner. If there were no direct descendants, relatives of the deceased could obtain the property through payment of a "relief." In many European countries, including England, The Netherlands, Spain, and Portugal, modern inheritance taxes can be traced back directly to these "reliefs."

In the United States, inheritance taxes have always been collected by the individual states, while the federal government has imposed an estate tax. The first state inheritance tax was imposed by Pennsylvania in 1826. Since then, state inheritance taxes have grown considerably, although some moves toward reduction have been made in recent years.

Opponents of inheritance taxes claim that they hurt business incentives, reduce savings, and are an attachment against the nation's capital. Proponents argue that the tax is small and occurs only once, reduces savings much less than income taxes of equal yield, and is a useful tool for redistributing wealth. *Compare* estate tax.

inhibition, in enzymology, a phenomenon in which a compound, called an inhibitor, in most cases similar in structure to the substance (substrate) upon which an enzyme acts to form a product, interacts with the enzyme so that the resulting complex either cannot undergo the usual reaction or cannot form the usual product. The inhibitor may function by combining with the enzyme at the site at which the substrate usually combines (competitive inhibition) or at some other site (noncompetitive inhibition). In the latter, the inhibitor does not prevent binding of the substrate to the enzyme but sufficiently changes the shape of the site at which catalytic activity occurs so as to prevent it.

inhibition, in psychology, conscious or unconscious constraint or curtailment of a process or behaviour, especially of impulses or desires. Inhibition serves necessary social functions, abating or preventing certain impulses from being acted on (*e.g.,* the desire to hit someone in the heat of anger) and enabling the delay of gratification from pleasurable activities. Conscious inhibition is a common occurrence in daily life and is present whenever two conflicting desires are experienced (*e.g.,* the desire to eat a rich dessert versus the desire to lose weight).

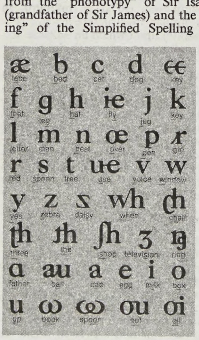
Psychoanalytic theory views inhibition as a largely unconscious mechanism that mediates between the superego (the conscience) and the id (primitive desires). Taboos, such as those against incest or murder, are those socially imposed inhibitions which are raised to the level of unwritten laws.

An extreme lack of inhibition may be antisocial and a symptom of certain mental disorders, particularly behaviour disorders, sociopathic personality disorders, and schizophrenic disorders. Conversely, too much inhibition can be personally destructive, resulting in the neurotic inability to feel or express certain emotions, or in sexual frigidity or impotence.

The ingestion of alcohol and certain drugs, particularly sedative-tranquilizers (*e.g.*, chlordiazepoxide and diazepam), hypnotics (*e.g.*, flurazepam), and certain narcotics, may reduce inhibitions. The effects will vary from person to person.

Inhibition also plays an important role in conditioning and learning, because an organism must learn to restrain certain instinctual behaviours or previously learned patterns in order to master new patterns.

In physiological psychology, the term inhibition refers to the suppression of neural electrical activity.



Ini (Anglo-Saxon ruler): *see* Ine.

Inis (Ireland): *see* Ennis.

Inis Ceithleann (Northern Ireland): *see* Enniskillen.

Inisa, town, Oyo state, southwestern Nigeria, near a station on the railroad from Lagos, some 135 miles (215 km) to the southwest. Situated on the road from Ikirun to Offa and Ilorin, Inisa is a local market centre (yams, cassava, corn [maize], pumpkins, beans, okra) for a savanna region that is mainly inhabited by the Yoruba people. It also serves as a collecting point for cash crops (cotton and tobacco). Inisa has a government secondary school and a health office and maternity clinic. Pop. (1988 est.) 97,140.

Initial Teaching Alphabet, alphabet of 44 characters designed by Sir James Pitman to help children learn to read English more effectively. The Initial Teaching Alphabet is based on the phonemic (sound) system of English and uses the Roman alphabet, augmented by 14 additional characters, to represent each distinct sound with a separate symbol. It evolved from the "phonotypy" of Sir Isaac Pitman (grandfather of Sir James) and the "Nue Spelling" of the Simplified Spelling Society of Great Britain. The Initial Teaching Alphabet adheres closely to traditional orthography but contains lowercase characters only; it retains certain conventions of English spelling, such as *c* and *k* to represent the same sound and double consonants. The Initial Teaching Alphabet was adopted on an experimental basis in some schools in England (beginning in 1960) and in the United States (beginning in 1963).

Pitman's Initial Teaching Alphabet; 44 symbols and words illustrate the sounds the symbols represent

initiative (electoral process): *see* referendum and initiative.

initiator, a source of any chemical species that reacts with a monomer (single molecule that can form chemical bonds) to form an intermediate compound capable of linking successively with a large number of other monomers into a polymeric compound.

The most widely used initiators produce free radicals (reactive atoms or groups of atoms that contain odd numbers of electrons); examples include peroxides and aliphatic azo compounds used to polymerize vinyl chloride, methyl methacrylate, and other monomers.

Acid-forming systems such as boron trifluoride with traces of water react with a monomer to produce a positively charged (cationic) intermediate. Such initiation is used in the conversion of isobutylene to butyl rubber.

Reaction of metallic sodium and biphenyl produces an anionic initiator that causes formation of polymer chains with reactive sites at both ends; these may be further treated with a different monomer to yield block copolymers.

Polypropylene and high-density polyethylene are prepared by use of Ziegler catalysts, which are initiators composed of organometallic compounds and metallic halides, such as triethylaluminum and titanium tetrachloride.

injunction, order of a court, in civil proceedings, requiring a party to do or not to do a specified act or acts. An injunction is prohibitory if it forbids the doing of an act and mandatory if it orders an act to be done. Disobedience to the order is punishable by imprisonment for contempt of court.

Injunctions may be perpetual or temporary. A temporary injunction is normally granted until the hearing of the action is held, or for some lesser period; it is intended to preserve the status quo or prevent irreparable harm before the case can be fully heard.

By the end of the 14th century the English Court of Chancery had begun to grant injunctions as a remedy for the inadequacy of decisions in the common-law courts. It often happened that an award of damages would not fully protect the plaintiff—for example, if the defendant intended to continue a trespass or a breach of covenant despite the payment of damages. When England's courts of common law and equity were merged in the 19th century into one system, the new system was empowered to grant all remedies, legal or equitable.

Injunctions may be granted to restrain a wide range of acts: a breach of contract, such as a contract against engaging in a competing business; the commission of a tort, such as a nuisance or a libel; an injury to property, such as erecting a wall standing on the plaintiff's land; wrongful expulsion, as from a club or trade union; or wrongful disclosure of confidential information.

In the United States the injunction retains its essentially equitable character and, as in England, covers a wide spectrum of types of injurious or potentially injurious conduct. The most significant U.S. developments have been in connection with labour disputes, governmental regulation, and the protection of constitutional rights. The broadest extension of the injunction remedy has been in the field of governmental regulation. Many federal and state statutes specifically authorize the use of the injunction as an alternative to seeking criminal conviction. In the enforcement of federal and state statutes, injunctions are sought with far greater frequency than are criminal penalties as a means of obtaining effective compliance. Injunctions have also been used increasingly in the protection of rights guaranteed by the U.S. Constitution, particularly to prevent violations of the rights of free assembly and speech, violations of religious freedom, and denial of equal rights and opportunity on racial grounds alone.

In civil-law countries the injunction has been relatively little used, except in Germany. There, injunctions are used to protect against interference with property and to supplement the very weak slander laws.

Consult the INDEX *first*

ink, fluid or paste of various colours, but usually black or dark blue, used for writing and printing. It is composed of a pigment or dye dissolved or dispersed in a liquid called the vehicle.

Writing inks date from about 2500 BC and were used in ancient Egypt and China. They consisted of lampblack ground with a solution of glue or gums, molded into sticks, and allowed to dry. Before use, the sticks were mixed with water. Various coloured juices, extracts, and suspensions of substances from plants, animals, and minerals also have been used as inks, including alizarin, indigo, pokeberries, cochineal, and sepia. For many centuries, a mixture of a soluble iron salt with an extract of tannin was used as a writing ink and is the basis of modern blue-black inks. The modern inks usually contain ferrous sulfate as the iron salt with a small amount of mineral organic acid. The resulting solution is light bluish black and, if used alone on paper, appears only faintly. After standing it becomes darker and insoluble in water, which gives it a permanent quality. To make the writing darker and more legible at the outset, dyes are added. Modern coloured inks and washable inks contain soluble synthetic dyes as the sole colouring matter. The writing fades in strong light and rinses out of washable fabrics but lasts for many years if not subjected to such effects.

India ink is a dispersion of carbon black in water; the suspension is stabilized with various substances, including shellac in borax solution, soap, gelatin, glue, gum arabic, and dextrin. It is used mainly for drawing.

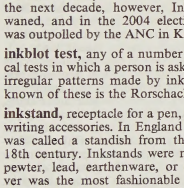
Modern printing inks are usually less fluid than writing inks. The composition, viscosity, density, volatility, and diffusibility of ink are variable.

The Chinese experimented with printing at least as early as AD 500, with inks from plant substances mixed with coloured earths and soot or lampblack. When Johannes Gutenberg invented printing with movable type in Germany in about 1440, inks were made by mixing varnish or boiled linseed oil with lampblack. For more than 300 years such inks continued to be used with little modification in their composition.

In 1772 the first patent was issued in England for making coloured inks, and in the 19th century chemical drying agents appeared, making possible the use of a wide variety of pigments for coloured inks. Later, varnishes of varying stiffness were developed to make inks for different papers and presses. Varnish was replaced by mineral oil in inks when high-speed newspaper presses were introduced. The oil base penetrated rapidly into newsprint and dried quickly. It was not until the beginning of the 20th century that ink-making became a complicated chemical-industrial process.

The manufacture of modern inks takes into

account the surface to be imprinted, the printing process, and special requirements for the job, such as colour, opacity, transparency, brilliance, lightfastness, surface hardness, pliability, wettability, purity, and odourlessness. Inks for low-speed letterpress printing—the process usually used in book production—are compounded of carbon black, a heavy varnish, and a drier to reduce the drying time. Many other vehicles, pigments, and modifiers may be used. Intaglio inks are composed of petroleum naphthas, resins, and coal-tar solvents. The intaglio printing process is used chiefly in printing rotogravure newspaper supplements and cartons, labels, and wrappers. Plastic materials are usually printed with aniline inks, which contain methyl alcohol, synthetic resins, and shellac.



Inkatha Freedom Party, black political movement in South Africa that derives its main support from the Zulu people. Inkatha was founded about 1975 in the black homeland of KwaZulu by Mangosuthu Gatsha Buthelezi, chief of the Zulu people and the chief minister of the homeland. Its purpose was to work against apartheid and to encourage the political and cultural aspirations of South African blacks. Under Buthelezi's leadership, Inkatha advocated an evolutionary struggle against apartheid and declared its willingness to accept special power-sharing arrangements that would fall short of majority rule in a post-apartheid South Africa.

By the early 21st century, Inkatha claimed to have more than 1.5 million members. Inkatha did not expand beyond its Zulu tribal base, however, and the organization was criticized as being collaborationist and ethnically divisive by members of the African National Congress (ANC) and other more radical black antiapartheid organizations. In the late 1980s and the '90s followers of the two movements were regularly involved in bloody clashes that had strong ethnic overtones. In 1991 the South African government admitted that it had secretly subsidized Inkatha in the latter's deepening rivalry with the ANC.

In South Africa's first post-apartheid elections (1994), Inkatha won 10.5 percent of the vote and 43 seats in the National Assembly. Buthelezi was subsequently named home affairs minister by Pres. Nelson Mandela. Over the next decade, however, Inkatha's power waned, and in the 2004 elections the party was outpolled by the ANC in KwaZulu/Natal.

inkblot test, any of a number of psychological tests in which a person is asked to interpret irregular patterns made by inkblots; the best known of these is the Rorschach Test (*q.v.*).

inkstand, receptacle for a pen, ink, and other writing accessories. In England such a utensil was called a standish from the 15th to the 18th century. Inkstands were made of silver, pewter, lead, earthenware, or porcelain. Silver was the most fashionable material used throughout the 18th century. Later inkstands

Silver inkstand with wafer-box (left), pounce box (centre), and inkwell (right) by John Coney, Boston, early 18th century; in the Metropolitan Museum of Art, New York City

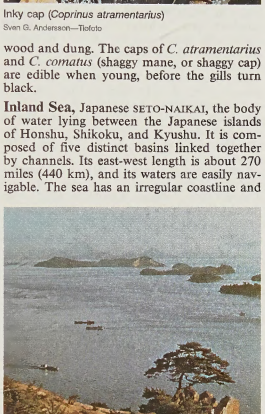
contain a wide variety of accessories, such as a pounce box (for sprinkling pounce, a powdered gum that fixed ink to paper), wafer-box (to hold wafers used to seal letters), a penknife, and quills. The use of inkstands gradually disappeared after fountain pens were perfected early in the 20th century.



inky cap (genus *Coprinus*), any member of a group of about 100 cosmopolitan mushroom species belonging to the order Agaricales. They are so called because, after spore discharge, the cap disintegrates into an inklike liquid that has been used for writing. They grow on

Inky cap (*Coprinus atramentarius*)
Sven G. Andersson—Tiofoto

wood and dung. The caps of *C. atramentarius* and *C. comatus* (shaggy mane, or shaggy cap) are edible when young, before the gills turn black.

Inland Sea, Japanese SETO-NAIKAI, the body of water lying between the Japanese islands of Honshu, Shikoku, and Kyushu. It is composed of five distinct basins linked together by channels. Its east-west length is about 270 miles (440 km), and its waters are easily navigable. The sea has an irregular coastline and

The Inland Sea of Japan from the coast of Okayama prefecture, Japan
Centphoto—FPG

is dotted with hundreds of small islands, the largest of which is Awaji Island in the east. Entrance to the Inland Sea from the Philippine Sea and the Pacific Ocean is afforded by the Bungo Strait and the Kii Strait. The narrow Shimonoseki Strait at the western end leads to the East China Sea. The Inland Sea is a major transportation route between the Asian continent and Kyushu's Kansai area. Industries along the sea flourish together with trading and fishing ports and the commercial centre of Ōsaka-Kōbe. The shores of the Inland Sea were Japan's leading salt-producing region until industrialization was given priority after World War II. The salt fields are no longer used, but a petrochemical industry is flourishing. The entire Inland Sea region is included in the Inland Sea National Park.

inlay, in the visual arts, any decorative technique used to create an ornamental design, pattern, or scene by inserting or setting into a shallow or depressed ground or surface a material of a different colour or type. Inlay techniques are used in enamelwork, furniture decoration, lacquerwork, and metalwork. Although not strictly inlay, marquetry and boulle work are often included techniques. Veneering is also closely allied.

Inman, Henry (b. Oct. 28, 1801, Utica, N.Y., U.S.—d. Jan. 17, 1846, New York, N.Y.), the leading American portraitist of his time.

Inman studied with the portraitist John W. Jarvis before establishing his own studio. Inman worked in New York City, Philadelphia, and, in 1844, in England, where his subjects included the lord chancellor (earl of Cottenham), William Wordsworth, Thomas Chalmers, and Lord Macaulay. Among his American subjects were President Martin Van Buren and Chief Justice John Marshall. Inman's remarkable technical facility enabled him to work quickly and confidently, imparting to his portraits an easy, gracious quality.

inn, building that affords public lodging, and sometimes meals and entertainment, to travelers. Inns have been largely superseded by hotels and motels, though the term is often still used to suggest traditional hospitality.

Inns developed in the ancient world wherever there was traveling for trading purposes. Ancient Persia's extensive highway system featured inns. Along caravan routes, caravansaries appeared. These were placed approximately eight miles apart and were often constructed as forts with watchtowers. A smaller-scale structure, the khan, developed in towns.

Roman inns apparently were laid out in the same manner as ancient villas. Stables and accommodations for sleeping and eating were placed around one or more centralized courtyards. During the early Middle Ages, accommodations for travelers were usually found only in monasteries; but, with the revival of commerce in the late medieval period, the Crusades, and an increase in the popularity of pilgrimages, lodging houses were built by monasteries, guilds, and private entrepreneurs.

In Great Britain inns numbered about 6,000 by the late 16th century. European inns of that period were planned around the sides of a courtyard, were several stories high, and featured arcaded or balustraded galleries above the ground level.

Inn River, Latin AENUS, a major right-(south-) bank tributary of the Danube River. The Inn River is 317 miles (510 km) long. It rises in Lake Lughino in Switzerland and flows northeast across western Austria and southern Germany. The river's Swiss section is called the Engadin (*q.v.*). In Austria the river first enters the narrow Oberinntal (upper Inn Valley) lying above Zirl and then the Unterinntal (lower Inn Valley), which includes Innsbruck. In the Unterinntal the river is wide, except at Kufstein, where it cuts between the Bavarian Alps on the west and the Kaisergebirge on the east. Entering Bavaria in Germany, the Inn flows north and then east before receiving its major tributary, the Salzach River. A short distance downstream it forms part of the Austro-German border to its confluence with the Danube at Passau, Ger. The river is harnessed at points for hydroelectric power.

innate idea, in philosophy, an idea allegedly inborn in the human mind, as contrasted with those received or compiled from experience. The doctrine that at least certain ideas (*e.g.*, those of God, infinity, substance) must be innate, because no satisfactory empirical origin of them could be conceived, flourished in the 17th century and found in René Descartes its most prominent exponent. The theory took many forms: some held that a newborn child has an explicit awareness of such ideas; others,

more commonly, maintained that innate ideas have some implicit form, either as a tendency or as a dormant capacity for their formulation, which in either case would require favourable experiential conditions for their development.

John Locke's vigorous criticism later in the century was directed against innate principles (supposed axioms, both theoretical and practical, implanted in the mind by nature) and the innate ideas claimed as the terms of the principles. But Locke's empiricism had difficulty with certain key concepts, such as substance, "which we neither have nor can have by sensation or reflection," and cause, about which he largely anticipated David Hume's difficulties in the 18th century. Locke seems to have shared some of the assumptions of his opponents (*e.g.*, that if an idea is innate it cannot be wrong) and to have sensed that the issue is one of logic (of the status of a priori propositions) and not of genetic psychology. Completing this distinction, the 18th-century philosopher Immanuel Kant replaced the doctrine of innate ideas with questions about a priori concepts, which he characterized in terms not of their origin but of their necessity as conditions of human experience of an objective world. In the 20th century, Noam Chomsky argued the necessity for postulating innate ideas to explain the possibility of language.

inner ear, also called LABYRINTH OF THE EAR, part of the ear that contains organs of the senses of hearing and equilibrium. The bony labyrinth, a cavity in the temporal bone, is divided into three sections: the vestibule, the semicircular canals, and the cochlea. Within the bony labyrinth is a membranous labyrinth, which is also divided into three parts: the semicircular ducts; two saclike structures, the saccule and utricle, located in the vestibule; and the cochlear duct, which is the only part of the inner ear involved in hearing. The cochlear duct forms a shelf across the cochlea dividing it into two sections, the scala vestibuli and the scala tympani. The entire inner ear is bathed in a cushioning fluid, called the endolymph when it lies within the membranous labyrinth and the perilymph when it separates the bony and membranous labyrinths.

Hearing. In the cochlea, both the bony labyrinth and the cochlear duct are coiled in a shape resembling that of a snail shell. Resting along the basilar membrane, which forms the base of the cochlear duct, is an arrangement of sensory cells and supporting cells known as the organ of Corti. This cluster of cells varies in thickness, so that different regions within the cochlea are sensitive to different wavelengths of sound. When sound waves are conducted across the bones of the middle ear, they cause the oval window (a membranous opening between the middle and inner ears) to move in and out along with the stapes of the middle ear, to which it is attached. The motion of the oval window sets up a wave in the perilymph filling the scala vestibuli of the cochlea. This wave is transmitted across Reissner's membrane (the roof of the cochlear duct) into the endolymph of the cochlear duct. It then passes through the tectorial membrane—which forms a roof to protect the organ of Corti—into the organ of Corti. The organ of Corti contains sensory cells with hairlike projections, called hair cells, that are deformed by the progress of the wave. The hair cells trigger nerve impulses that travel along the cochlear nerve, a branch of the auditory nerve, to the brain, where they are interpreted as sound. The sound wave then passes into the perilymph of the scala tympani, where it causes a second membrane-covered opening into the middle ear, the round window, to bulge outward and dampen the wave in the perilymph.

Equilibrium. The other divisions of the inner ear—the vestibule and the semicircular canals—are involved in the sense of equilibrium. Each has an organ containing hair cells similar to those of the organ of Corti. The utricle and saccule each contain a macula, an organ consisting of a patch of hair cells covered by a gelatinous membrane containing particles of calcium carbonate, called otoliths. Motions of the head cause the otoliths to pull on the hair cells, stimulating another auditory nerve branch, the vestibular nerve, which signals the position of the head with respect to the rest of the body.

The three semicircular canals are arranged at right angles to each other, so that they measure motions in all three planes. Within each semicircular canal is a semicircular duct. Each duct ends in a swelling called an ampulla, which houses a ridge called the ampullary crest (or crista), containing still more hair cells. These cells respond to motion of the endolymph fluid caused by motion of the head in any direction; they transmit signals indicating changes of position through the vestibular nerve.

Inner Hebrides, islands off the western coast of Scotland, divided between Skye and Lochalsh and Lochaber districts of Highland region and Argyll and Bute district of Strathclyde region. As their name suggests, the Inner Hebrides lie close to the west coast of Scotland. They stretch 150 miles (240 km) from Skye in the north to Islay in the south and are separated from the Outer Hebrides (Western Isles) by the Little Minch and the Sea of the Hebrides. The largest islands of the Inner Hebrides are Skye, Mull, Jura, and Islay (*qq v.*).

The small island of Rum (Rhum), Lochaber district, Highland region, became a Nature Conservancy Research Centre in 1957, with special interests in botanical and geologic research and the study of the local red deer, wild goats, and local Highland cattle and ponies. The other islands that, with Rum, constitute the Small Islands Parish—Canna, Eigg, and Muck—have small working communities.

Tiree, 50 miles (80 km) west of Oban, the most westerly of the Inner Hebrides, is administratively part of Argyll and Bute district, Strathclyde region. It has an economy based on crofting (tenant farming), bulb growing, cattle raising, fishing, tourism, and the quarrying of marble.

Islay, the most southerly island of the Inner Hebrides, Argyll and Bute district, Strathclyde region, was the ancient seat of the Macdonalds, lords of the Isles, until they were displaced by the Campbells in 1616. The island's economy is based on farming, stock raising, cheese making, the distilling of malt whiskey, and tourism. Bowmore is the chief town and administrative centre.

Other islands of the Inner Hebrides include Coll, Colonsay, Gigha, Iona, Kerrera, Lismore, Luing, Lunga, Oronsay, Seil, Scarba, and the 71-acre island of Staffa, which is the site of Fingal's Cave.

Inner Himalayas (mountains, Asia): *see* Lesser Himalayas.

Inner Light, also called INWARD LIGHT, the distinctive theme of the Society of Friends (Quakers), the direct awareness of God that allows a person to know God's will for him. It was expressed in the 17th century in the teachings of George Fox, founder of the Friends, who had failed to find spiritual truth in the English churches and who finally experienced a voice saying, "There is one, even Christ Jesus, that can speak to thy condition." A phrase used by Fox, "that of God in every man," has often been used to describe the Inner Light. Robert Barclay, Scottish author of the influential systematic statement of the doctrines of the Friends, *An Apology for the True Christian Divinity* (1678), stated that "the Inner Light is never separated from God nor Christ; but wherever it is, God and Christ are as wrapped up therein."

Most Friends believe, however, that the Inner Light should not simply be a mystical experience but should result in a person's working for the good of others.

Inner Mongolia, in full INNER MONGOLIA AUTONOMOUS REGION, Wade-Giles NEI-MENG-KU TZU-CHIH-CH'Ü, Pinyin NEI MONGOL ZIZHIQU, one of the five *tzu-chih-ch'ü* (autonomous regions) of the People's Republic of China, a territory 1,800 miles (2,900 km) long in northern and northeastern China. Inner Mongolia is bordered to the north by Mongolia; by the Chinese provinces of Heilungkiang, Kirin, and Liaoning to the east; by the provinces of Hopeh, Shansi, and Shensi and the autonomous region of Ningsia to the south; and by the province of Kansu to the west.

A brief treatment of Inner Mongolia follows. For full treatment, *see* MACROPAEDIA: China.

Inner Mongolia and Mongolia (or Outer Mongolia) have been separate entities since the 17th century. The Inner Mongolia Autonomous Region was founded by the Chinese communist regime in 1947, more than two years prior to the establishment of its national government at Peking in 1949. Since 1954 the region's capital has been Hohhot (Hu-ho-hao-t').

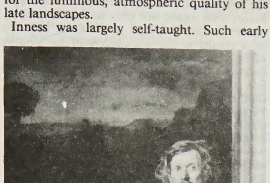
Inner Mongolia is essentially an inland plateau with a flat surface lying at an elevation of about 3,000 feet (900 m) and fringed by mountains and valleys. The plateau's southern boundary is formed by a series of high ridges. To the northwest, the land falls away toward the centre of the Gobi Desert. The Huang Ho (Yellow River) provides major irrigation in the southwestern part of the region. In the centre and the northwest, rainfall and snow are absorbed by the desert. The forested Greater Khingan Range in northeastern Inner Mongolia extends some 750 miles (1,200 km) north to south and has an average elevation of 4,100 feet (1,250 m). The seasons in Inner Mongolia are marked by sharp fluctuations in the climate. Winter is bitterly cold, with strong icy winds blowing out of Siberia. Rainfall is meagre.

Mongols and Chinese compose the bulk of the population, which is unevenly distributed, with most of it concentrated in the agricultural southern belt near the Huang Ho.

The three major urban population centres in the south are Pao-t'ou, a large steel and iron complex and the terminal of two major railways connecting Kansu province and Peking; Hohhot, a newly developed cultural and political centre; and Chi-ning, a commercial centre and the terminal of the Chi-ning–Erh-lien railway. Ch'ih-feng is a shipping point for pastoral products, as is T'ung-liao in the east and Hailar (Hai-la-erh) in the far northwest.

Inner Mongolia's harsh climate severely restricts intensive agriculture. In some areas, particularly around the great bend of the Huang Ho, oats, spring wheat, *liangkao* (sorghum), millet, and other grains are cultivated. In irrigated areas crops of sugar beets and oilseeds are grown.

There has been a good deal of industrial development in the region, especially around Pao-t'ou, which is one of the most significant industrial bases north of the Huang Ho.



Inner Mongolia has extensive rail and highway networks. Inland-waterway navigation is limited, and there is some local air service. Area 454,600 square miles (1,177,500 square km). Pop. (1993 est.) 22,070,000.

Innes, Michael (Scottish writer): *see* Stewart, J.I.M.

Innes, Ralph Hammond: *see* Hammond Innes, Ralph.

Inness, George (b. May 1, 1825, Newburgh, N.Y., U.S.—d. Aug. 3, 1894, Bridge of Allen, Stirling, Scot.), U.S. painter especially known for the luminous, atmospheric quality of his late landscapes.

Inness was largely self-taught. Such early

Peter A. Juley & Son

works as "The Lackawanna Valley" (1855; National Gallery of Art, Washington, D.C.) show the influence of Asher B. Durand and Thomas Cole, painters of the Hudson River school. But the sweeping, loosely painted panoramas of the Dutch landscapists Jacob van Ruisdael and Meindert Hobbema turned him away from the Hudson River school's preoccupation with carefully rendered detail; and a third trip to Europe (1854) ended his initial period of experiment in subject and struggle against technical tightness. This stay abroad confirmed the already discernible influence of the French Barbizon school, led by Théodore Rousseau. It was through the two decades of his middle period (1855–74), including a stay in Rome and Paris (1870–74), that Inness ascended to the height of his powers with such works as the "Delaware Water Gap" (1861) and the "Delaware Valley" (1865; both in the Metropolitan Museum of Art, New York City). The impressive "Peace and Plenty" (1865; Metropolitan Museum of Art) remains exceptional in his work for physical dimensions; his more characteristic smaller canvases depict both far-reaching expanses and lesser areas intimately rendered, exhibiting the influence of J.-B.-C. Corot. Inness' increasing control over space relations and scale, drawing, and colour was directed toward achieving the idyllic and the tranquil. His own temperament, by contrast, was stormy and passionate. He was interested in social questions, and argued heatedly for the single tax and for the abolition of slavery, but the deepest effect on him and his art came from his conversion to Swedenborgianism.

The early works of his late period (1875–94), such as "Autumn Oaks" (*c.* 1875; Metropolitan Museum of Art), were marked by great concentration of feeling presaging the later ascendancy of colour over form. As his nature mysticism intensified, his pictures dissolved into shimmering colour, magnificent in itself and no longer supported by formal construction.

His painter son, George Inness, Jr. (1854–1926), remained faithful to the practices of Barbizon and resisted Impressionism in obedience to his father's strongly expressed convictions.

Innisfail, town, northeastern Queensland, Australia, at the confluence of the North and South Johnstone rivers, between the coast and Mt. Bartle Frere. It is located in a region of heavy rainfall (144 in. [3,658 mm] annually), mainly supporting sugarcane, dairy products, and tropical fruits. The port of Mourilyan, with bulk-handling installations, is immediately south, and Palmerston National Park is nearby. The Johnstone River area was explored in 1873 by George E. Dalrymple, the former Queensland colonial secretary, and was settled in 1880 by Thomas Fitzgerald, who planted sugarcane and pioneered the state's sugar industry. The community became a shire in 1910 and was called Geraldton but in 1911 adopted Innisfail, a poetic name for Ireland. Pop. (1981) 7,933.

Inniskilling (Northern Ireland): *see* Enniskillen.

Innitzer, Theodor (b. Dec. 25, 1875, Weipert, Bohemia—d. Oct. 9, 1955, Vienna), cardinal and primate of Austria who withdrew his original support of the Nazi regime and became devoted to the reconstruction of the Austrian Church.

The son of a lace maker, Innitzer was ordained priest in 1902. He taught at a Viennese seminary and later (1910) lectured on New Testament exegesis at the University of Vienna, where, in 1918, he became head of the theological faculty; he was appointed rector of the university in 1928. Under Johann Schober, chancellor of Austria, Innitzer was federal minister of social welfare. On Sept. 20, 1932, he was consecrated archbishop of Vienna, becoming cardinal in March 1933.

Innitzer upheld the authoritarian policies of Engelbert Dollfuss, prime minister of Austria (1932–34), a representative of the Christian Socialists. When Germany occupied Austria in 1938, Innitzer first supported the Nazi regime but was rapidly disillusioned by various secularizing measures of the new government and by attacks on his archiepiscopal palace by Nazi mobs (Oct. 8, 1938). After a rebuke by Pope Pius XI, Innitzer ceased to approve Nazism. His home subsequently became a refuge for Jews, while he strove to alleviate public distress and to restore the Austrian Church, dissociating himself from politics. In 1945 he founded the Vienna Catholic Academy for the training of the laity. Johann Kosnetter's *Theodor Kardinal Innitzer zum Gedächtnis* appeared in 1957.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Innocent, Latin INNOCENTIUS, name of Roman Catholic popes, grouped below chronologically and indicated by the symbol •.

• Innocent I, SAINT (b. Albano, Campania—d. March 12, 417, Rome; feast day July 28), pope from 401 to 417, who condemned Pelagianism, a heresy concerning the role of grace and free will.

Probably a Roman deacon, Innocent was possibly the son of St. Anastasius I, whom he succeeded in the papacy on Dec. 22, 401. In 404 Innocent ordered a synod to reinstate Patriarch St. John Chrysostom of Constantinople, who had been illegally deposed (403) by Patriarch Theophilus of Alexandria. The synod never convened because Innocent's envoys were imprisoned at Constantinople, but John was posthumously restored (407).

Innocent's papacy was endangered by the Visigothic chief Alaric, who besieged Rome (408–410) because the West Roman emperor Flavius Honorius refused to appease him. Honorius withdrew to Ravenna, where Innocent went to negotiate peace (410). Innocent returned to Rome in 412. His acknowledgment of Alexander as bishop of Antioch (414) restored communications between the sees and ended the Meletian schism, a complex 4th-century controversy about the nature of the Trinity. In January 417 Innocent condemned Pelagianism and excommunicated its proponent, Pelagius. In settling church disputes, Innocent invariably invoked Roman primacy.

• Innocent II, original name GREGORIO PAPARESCHI (b. Rome—d. Sept. 24, 1143, Rome), pope from 1130 to 1143.

A cardinal by 1116, Innocent was appointed in 1122 by Pope Calixtus II as one of the ambassadors who drafted the Concordat of Worms, an agreement ending disputes between the pope and the Holy Roman emperor Henry V over the right of investiture; *i.e.,* whether the papacy or temporal rulers had the right to install bishops and other clergy. In 1123 Gre-

gorio became papal emissary in France. On the night of Pope Honorius II's death (Feb. 13, 1130), a minority elected Gregorio (who took the name of Innocent II), while a majority soon after elected Cardinal Pietro Pierleoni as Anacletus II. Innocent was hastily consecrated, but by June 1130 Anacletus forced him to flee to France. The vindication of Innocent's title owes its success to Archbishop St. Norbert of Magdeburg, Saxony, and to Abbot St. Bernard of Clairvaux, Champagne. Bernard swayed the French Church and also King Henry I of England to Innocent's side. Norbert won over the German Church (October 1130) and the German king Lothair II/III.

In March 1131 Innocent met Lothair at Liège and induced him to fight Anacletus. The German army invaded Italy in August 1132 and by the following June occupied all of Rome except the area held by Anacletus' faction. Innocent then crowned Lothair emperor and refused to revise the Concordat of Worms to give civil authorities the right to install clergy. But when Lothair left Italy, Innocent had to flee to Pisa, where he called a council to condemn Anacletus. Lothair reinvaded southern Italy (1136–37) and expelled Anacletus' chief supporter, King Roger II of Sicily. After a quarrel with Innocent over the rulership of the region of Apulia, Lothair died (Dec. 3/4, 1137).

The death of Anacletus in January 1138 endangered Roger's position, and, although a successor, Antipope Victor IV, was swiftly elected, Bernard persuaded Victor to resign on May 29, 1138. Innocent convoked the second Lateran Council in April 1139 to end the schism, excommunicate Roger, and sustain his own endorsement (made on Easter 1136) of King Stephen over Empress Matilda as rightful ruler of England. On July 22, 1139, Roger captured Innocent and on July 25 forced the

Pope to recognize him as king of Sicily. The two then acknowledged each other's titles in the same year.

Innocent confirmed the rule and customs of the Templars, one of the three orders of knighthood founded during the Crusades. At the Council of Sens (1140), Innocent supported Bernard's prosecution of the theologian-philosopher Abbot Peter Abélard and his supporter, Arnold of Brescia, by condemning them as heretics. The remainder of his pontificate dealt chiefly with two struggles. He fought for church independence when the Romans established a commune with a senate free from papal authority. Innocent also placed France under the interdict—a denial of the sacraments—when King Louis VII of France refused to accept the papal choice for archbishop of Bourges.

• **Innocent (III),** original name LANDO DI SEZZE (b. Sezze, Papal States—d. La Cava, Apulia), last of four antipopes (1179–80) during the pontificate of Alexander III. A member of a family of German origin, he was a cardinal when elected on Sept. 29, 1179, by a faction opposing Alexander, who, in January 1180, relegated Innocent to the southern Italian monastery of La Cava.

• **Innocent III,** original name LOTHAIR OF SEGNI, Italian LOTARIO DI SEGNI (b. 1160/61, Gavignano Castle, Campagna di Roma, Papal States—d. July 16, 1216, Perugia), pope from 1198 to 1216, under whom the medieval papacy reached the height of its prestige and power. He presided over the Fourth Crusade and the Albigensian Crusade (against French heretics). By approving the proposed work of St. Dominic and St. Francis of Assisi and their followers, he gave legitimate standing to itinerant preaching and apostolic poverty, hitherto regarded as signs of heresy, and convoked the important fourth Lateran Council of 1215.

Innocent III, detail of a fresco, 13th century; in the lower church of Sacro Speco, Subiaco, Italy

Early career. Through his mother, Claricia Scotti, Lothair of Segni was related to many noble Roman families. As a young man, he studied theology in Paris and canon law in Bologna under the great canonist Huguccio of Pisa, whose moderate doctrines on the relationship between the spiritual and temporal authorities provided a long lasting influence on the future pope. In 1190 Pope Clement III, possibly a relative of Lothair, raised the young subdeacon to the status of cardinal deacon of St. Sergius and St. Bacchus. Lothair played no prominent part in the government of the church during the pontificate of Celestine III and had time to write several theological works; two of them "On the Miserable Condition of Man" and "On the Mysteries of the Mass," are significant expressions of the ascetic-liturgical inspiration by which this pope, who was so active politically, was animated.

Election as pope. On the very day of Celestine III's death, Jan. 8, 1198, Lothair was unanimously elected pope after only two ballots; he was ordained priest on February 21 and on the next day was consecrated as bishop of Rome. He reigned as pope until 1216.

Innocent III's very exalted conception of the role of the papacy in the Christian world and his success in making his conception a reality would have been unthinkable without the preparations of the age of Gregory VII, which resulted in an increase of the role of the church and the prestige of the papacy. Innocent's sermons on the day and on the anniversaries of his coronation, as well as the vast corpus of his official letters, blended the legal and philosophical-theological thought of the scholastic age with new expressions of mystical fervour. Thus, he created a language and ideology of unprecedented splendour and majesty for the glorification of the papal office.

At the same time, the political constellations within Christendom during his pontificate allowed the Pope to exercise his spiritual authority not only in the inner precincts of the church but also in all vital political questions of the day. Yet he explicitly disclaimed the right and the intention to intervene in temporal affairs as such, with the exception of the Papal States and of those kingdoms that had voluntarily recognized the feudal suzerainty of the papacy. As far as Germany was concerned, Innocent felt that he had very special rights, since the king of Germany was also the emperor of the Holy Roman Empire and, as such, was meant to be the protector of the Roman and universal church. Because the special position of the German king–emperor ipso facto affected the pope's spiritual realm, Innocent believed he had the right to approve or reject dubious elections to the German throne and acted accordingly in the contest over the succession to Henry VI. Otherwise, he was careful to limit his intervention in temporal matters (again, outside the Papal States and the vassal kingdoms) to cases in which political actions had either infringed upon spiritual rights or raised serious moral questions.

Nevertheless, the combined authority claimed by the Pope on these various grounds was very great indeed; and he himself often spoke of the pope's sovereign power, though he considered this always as rooted in a spiritual power, the power given to Peter by Christ of binding and loosing souls. Papal plenitude of power was for him essentially spiritual sovereignty, however much it could branch out into the temporal sphere for spiritual reasons. It is this claim, not a claim to temporal world rulership, that stands behind some of Innocent's most striking assertions of papal supremacy. They are properly understood, in the whole context of his reign, only as assertions of the ultimate competency of the supreme spiritual authority in any matter whatsoever by which the spiritual concerns of the church (that is to say, faith and morals) are affected.

Problems faced by Innocent. At the beginning of his reign, Innocent III was confronted with three problems: the insecurity of papal sovereignty in the Papal States; the election of two German kings; and the French-English or, to be more exact, the Capetian-Angevin war. At the time of his accession, Rome was practically independent of papal government, but Innocent soon succeeded in reasserting papal rights there. Within a few years, though not without a struggle, he had pacified the rival aristocratic factions and won over most of the people. Moreover, he had been very successful in his policy of recuperation of the Papal States with regard not only to the reestablishment of effective papal government but also with regard to the acquisition of the Duchy of Spoleto and the March of Ancona, which together stretched from Rome to the Adriatic Sea and which he claimed on the strength of the heretofore never fulfilled promises of Pepin and Charlemagne. For Innocent, as for the popes of the 12th century, the existence of strong Papal States in the centre of Italy was a vital prerequisite for the independence of the papacy from secular power, and doubly so after the experiences of the last decade, when the union of the Holy Roman Empire with the Sicilian kingdom under Henry VI had nearly paralyzed the papacy's freedom of action.

The German crisis. The problem of Italy also governed Innocent's policy in the German crisis, when the princes of the Holy Roman Empire, ignoring the claims of Henry VI's son Frederick II, had split over the election of a new German king. One party elected the brother of the deceased emperor, Philip of Hohenstaufen, duke of Swabia; the other elected the duke of Brunswick (son of the great Guelph Henry the Lion and nephew of the English kings Richard the Lion Heart and John), who was to be known as Otto IV. Innocent, fearing the Hohenstaufen tradition, favoured Otto, and the initial actions of Philip and his followers were not calculated to allay his fears; Frederick he hoped to restrict to his Sicilian inheritance and thus to avoid a reunion of the empire with Sicily. Philip, however, was so successful against Otto that Innocent after a few years found it necessary to resume negotiations with him, which might have led to his recognition and to the resignation of Otto or even to the Pope's rejection of the latter, since he already had misgivings about him. Yet Philip unexpectedly disappeared from the scene: he was murdered in 1208 by Otto of Wittelsbach, who had a private grievance against him. Otto IV was then crowned emperor by Innocent III.

In a surprisingly short time, Otto managed to alienate the Pope by his blatant pursuit of plans and actions hostile to papal sovereignty in the Papal States and aiming at the reunion of the empire and Sicily. Innocent excommunicated him after he had embarked, in a flagrant breach of his promises, on the conquest of the Sicilian kingdom and turned to the only other possible candidate for the German and imperial crowns, the young Frederick of Sicily. The Pope had in fact no other choice; he also could hope that he would be able to prevail upon Frederick to keep Germany and Sicily permanently separate. A promise to that effect was no doubt a condition of his support in the German election of 1212 and in 1216 Frederick II, as king of Germany, solemnly promised to transfer full rule over Sicily to his infant son Henry.

French-English conflicts. Meanwhile, Frederick, with the help of King Philip II Augustus of France, had triumphed over Otto IV and over Otto's uncle and ally, King John of England, at the Battle of Bouvines (1214). Innocent, who previously had tried to end the war between France and England and had temporarily succeeded in doing so, had at this crucial moment been unable to prevent the fusion of the German throne contest with the French-English (Capetian-Angevin) dynastic conflict.

His relationship to both western kings was also complex in other respects. Philip Augustus, who had at all times opposed Otto IV, the relative of his Angevin enemies, had only after a resistance of 12 years obeyed the Pope's demand for reinstatement of his rightful queen, whom he had repudiated. John of England had

been excommunicated by Innocent because of his refusal to recognize as archbishop of Canterbury Cardinal Stephen Langton, who had been elected by the monks of the cathedral in accordance with the Pope's wishes. Not until the last moment had John submitted to the Pope and, in order to forestall French invasion of England, declared England a fief of the Holy See (1213).

While Innocent did in fact protect John from this latest French design, he could neither deprive his own protégé, Frederick II, of Philip Augustus' military help nor could he expect John to abandon his ally and nephew, Otto. However, when John was forced to sign the Magna Carta and then complained to the Pope as to his feudal overlord, Innocent annulled the charter as having been extorted without his consent. Innocent did not and could not see in the Magna Carta what later ages were to see in it, an assertion of law against tyranny; he considered it, not altogether without justification, as an attempt at feudal insurrection against royal authority, which he could not ignore.

Fourth and Albigensian Crusades. Of the two Crusades that took place during the pontificate of Innocent III, one—the Fourth Crusade of 1202–04—was diverted to Constantinople, chiefly to suit Venetian interests and against the will of the Pope. Innocent nevertheless accepted the fait accompli because he mistakenly believed that the establishment of the Latin Empire and patriarchate of Constantinople would bring about a lasting reunion between the Eastern and Western churches. The other crusade was launched, with Innocent's approval, against the Albigensian heretics, who denied the sacraments and the authority of the ecclesiastical hierarchy. The Pope's decision opened an unhappy chapter in the history of the church by placing under supreme ecclesiastical leadership the repression of heresy by force. It is true that the Albigensian Crusade achieved what two generations of missionaries had been unable to do: it led to the extirpation of heresy in southern France. But the price was much bloodshed, devastation, and injustice, which the Pope, who never demanded the death sentence against heretics, did his best to reduce to smaller proportions, though without much success.

Accomplishments within the church. Innocent recognized that the successes of the Albigensian heretics had been due in part to the fact that not a few of them tried to live in evangelic and apostolic poverty. Innocent, who in his personal life was frugal, encouraged this spirit wherever he found it among the Catholic clergy and laity. In granting lay and clerical communities—such as those of the northern Italian Humiliati (an order devoted to a life of mortification and care of the poor), the Catholic Poor of Durandus of Huesca, the Dominicans, and, above all, the first community of St. Francis of Assisi—permission to preach and teach, Innocent went far beyond what the popes of the 12th century had thought possible and inaugurated the Mendicant orders.

The fourth Lateran Council (1215) constituted the culmination not only of his pontificate but also of the whole medieval papacy with regard to brilliant attendance and representation of the whole church and, above all, as regards the importance of its decrees. The council promulgated, for instance, the dogma of transubstantiation (the belief that the substance of the bread and wine of the Lord's Supper is changed into the body and blood of Christ), bound every Catholic to confession at least once a year and communion at Easter time, forbade clerical participation in ordeals such as trial by combat and other "judgments of God," and enacted important reforms of clergy and laity without which the medieval church would hardly have withstood internal and external dangers for another 300 years.

In awareness of the importance of Innocent's legislation in all fields of the church's life, the canonists began to collect and publish his decretals during his pontificate; one of these collections, the so-called *Compilatio Tertia* by Petrus Collivaccinus, received the Pope's official approval. A great number of Innocent III's decretals were later to enter the second part of the *Corpus Juris Canonici* (Body of Canon Law); i.e., Gregory IX's *Liber Decretalium*, or *Liber Extra*. The far-reaching centralization of church government is reflected by Innocent's legislation in general and also by his unlimited claim to fill all vacancies of ecclesiastical offices. The great majority of these provisions, however, were used by Innocent III to support the numerous poor clerics who had been ordained by the bishops but who were either not adequately or not at all supported by them, the rather unhappy stratum of *clerici vagantes* (wandering clerics) well known from the history of literature. Innocent was not successful in his attempt to induce the prelates assembled at the fourth Lateran Council to secure once and for all the support of the Roman Curia by the reservation of a part of their revenues; the plan, if successful, might have prevented the fiscal policies of his successors that were to do so much harm to the papacy's reputation.

In the midst of vast preparations for a new Crusade that he hoped would liberate the Holy Land, Innocent III died suddenly, in 1216, from one of his frequent attacks of fever, almost certainly malaria. It is hardly possible to refrain from surmising that, had he lived longer, the Fifth Crusade would have had a less unfortunate end or that the all-out struggle between Frederick II and the papacy might have been prevented. No other pope of the 13th century possessed the exceptional blend of strength and profound humaneness that the contemporary sources show Innocent III to have had. (G.B.L.)

• **Innocent IV**, original name SINIBALDO FIESCHI (b. end of 12th century, Genoa—d. Dec. 7, 1254, Naples), one of the great pontiffs of the Middle Ages (reigned 1243–54), whose clash with Holy Roman emperor Frederick II formed an important chapter in the conflict between papacy and empire. His belief in universal responsibility of the papacy led him to attempt the evangelization of the East and the unification of the Christian churches.

Early life and early career. Sinibaldo Fieschi's father, Hugo, called Fliscus, was the count of Lavagna and member of a rising family in both the economic and ecclesiastical realms. Sinibaldo, the 6th of 10 children, studied at Parma under the direction of one of three uncles who were bishops and then at Bologna in the school of the most illustrious canonists of the age, where he himself became a master of canon law. He was a canon of the cathedral of Genoa and later of Parma. He was consecrated bishop of Albenga, Italy, in 1225; in 1227 he was made vice chancellor of the Roman Church and cardinal priest of St. Lawrence in Lucina by Pope Gregory IX. He continued the work and, in great part, the spirit of Gregory IX, first as rector to the March of Ancona (1235–40), where he took up the side of the Guelphs at Camerino and at Ravenna, and later during his own reign as pope.

His study and experience in the field of law (testimony of his expertise exists in his celebrated commentary on canon law, *Apparatus in quinque libros Decretalium*) prepared him to enter as one of the key figures into the conflict between the church and the empire. The emperor Frederick II sought to restructure the imperial authority, with a strong state in Italy as the basis; he was convinced that he had the right to exercise autocratically his imperial power, the *imperialis potestas*. He thus came into head-on collision with the church's claim to universal power, the *universalis potestas*, theoretically elaborated by the canonists of that time, including Sinibaldo Fieschi. According to their theory, the pope possessed universal dominion, which in the abstract juridical order extended to all kingdoms, although in the practical order he had to leave the temporal rule to the emperor and to the kings. On the basis of these two antithetical conceptions, the interests of different parties came into conflict time after time. The last phase of his conflict, which began under Gregory IX, reached its zenith under Innocent IV.

Pontificate. Frederick II was encouraged by the election of Cardinal Fieschi on June 25, 1243, after the see of Rome had been vacant for 18 months following the brief reign of Celestine IV. He immediately entered into negotiations with the new pope, who took the name Innocent IV, to have the excommunication imposed on him by Gregory IX lifted. The Pope, however, did not trust Frederick, despite an agreement reached on March 31, 1244. He felt unsafe in Rome and secretly fled the city, interrupting the negotiations with the Emperor. Genoese galleys prepared by his relatives were waiting for him at the port of Civitavecchia to take him to Genoa and then to Lyon. Although Lyon was nominally subject to the empire, Innocent IV was under the protection of Louis IX of France.

Late in 1244 the Pope called a general council to meet in Lyon the following summer. Gregory IX had earlier announced such a council, but Frederick II had impeded it by holding as prisoners more than 100 bishops who had fallen into the hands of the Pisans in the naval battle of Meloria. Three themes were to be treated in the council: the question of the Emperor, the liberation of the Holy Sepulchre, and the defense of Christianity against the advance of the Mongols. Thaddeus of Suessa tried in vain to defend the Emperor before the council. Frederick II was solemnly condemned, his subjects were freed from their bond of loyalty to him, and he was deposed on the basis of the triple charge of perjury, sacrilege, and suspicion of heresy. The Pope himself admonished the German princes to elect a new emperor. They named Henry Raspe, landgrave of Thuringia, and, at his death in 1247, William of Holland. The condemnation of Frederick II did not obtain the desired political effects in Germany, but it did show the effectiveness of the network of ties

that the papal family had succeeded in tightening in northern Italy, which contributed to the Emperor's defeat at Parma (1247).

Frederick II died on Dec. 13, 1250. The Pope left Lyon and triumphantly returned to Rome in 1253. Meanwhile, he had to continue the struggle against Frederick II's son Conrad IV and also to find a king to whom he could entrust the Kingdom of Sicily as a fief. The Pope offered Sicily first to Richard of Cornwall, then to Charles of Anjou, both of whom refused, and later to Henry III of England, who accepted for his son Edmund. After the death of Conrad IV in May 1254, the papal army was defeated by Manfred, Frederick II's illegitimate son, who had become regent for Conradin, the infant son of Conrad IV. The Pope died soon after at Naples in December 1254.

Assessment. The struggle against Frederick II brings to light a striking characteristic of Innocent's pontificate and of the period as a whole. A close relationship existed between the political activity and the personal and family fortunes of the Pope and the cardinals. Only relatives and those who received benefices could be counted upon to maintain their political loyalty beyond ideological motivations. That explains the constant presence of Innocent's family in his ecclesiastical, political, and military affairs and his frequent recourse to the distribution of ecclesiastical benefices in their behalf. He took steps to return the expenses incurred by his nephews in their combat with Frederick II, distributed the bishoprics of England and the East to cousins, and supported the creation of a strong family estate at the foot of the Ligurian Apennines, provoking opposition from bishops and lay lords in that area.

In this policy of giving church offices to his relatives, Innocent went far beyond what his predecessors had done and established a pattern of nepotism that came to be recognized as a normal papal prerogative as time went on. In addition, it was his habit to systematically intervene in the affairs of local churches, disposing of ecclesiastical posts in order to settle disputes, to help university students, to reward devout persons, or to help needy clergy. This long-distance intervention often made situations worse, because the Pope ended up promising people more benefices than were available. Innocent's successor, Alexander IV, condemned the practice.

Innocent IV's attention to all parts of Christendom and his interventions carried him beyond his conflict with the Emperor to a vivid awareness of other problems that agitated Europe even to its borders. Echoing the appeals of the Christians in Palestine, he induced Louis IX to undertake a crusade, which ended dramatically with the King's imprisonment (1250); he sent a mission (1245–47) to the Grand Khan of the Mongols, led by Giovanni Carpini, in the hope of arresting the advance of the Mongols on eastern Europe; he established contacts with the Eastern Church to prepare for ecumenical union with Russia and the Ukraine. None of these missions attained its desired success, yet he deserves credit for ferreting out the problems in the church and establishing the bases for resolving future conflicts.

The judgment of historians about Innocent IV has been conditioned by their opinion about his struggle against Frederick II. Those who see in Frederick the forerunner of the modern lay state (Jacob Burckhardt and Hermann Kantorowicz) condemn the universalistic claims of the Pope. In general, it is still difficult for German historiographers to form a dispassionate judgment. On the part of ecclesiastics, the tendency is to emphasize Innocent IV's missionary projects and his indisputable qualities as a canonist—his acuteness, openness, and solicitude for human dignity.

(F.Gu.)

Martin (eds.), *Histoire de l'église depuis les origines jusqu'à nos jours*, vol. 10 (1950). On Innocent's political relations with the Emperor, see J.M. Powell, "Frederick II and the Church: A Revisionist View," *Catholic Historical Review*, 48:487–497 (1963). An important English-language source dealing with the period of Innocent IV is J.A. Watt, *The Theory of Papal Monarchy in the Thirteenth Century: The Contribution of the Canonists* (1966).

• **Innocent V,** BLESSED, original name PIERRE DE TARENTAISE (b. *c.* 1224, Tarentaise, Savoy—d. June 22, 1276, Rome; beatified March 13, 1898; feast day June 22), pope during 1276, the first Dominican pontiff. He collaborated with SS. Albertus Magnus and Thomas Aquinas in drafting a rule of studies for the Dominican order.

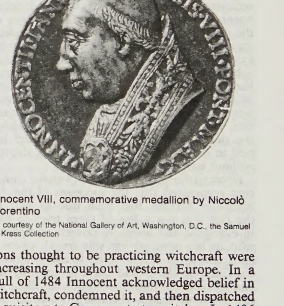
Innocent V became a Dominican (*c.* 1240) and studied at the University of Paris (1255–59), where he taught from 1259 to 1264 and from 1267 to 1269. After administering the French province of the Dominicans (*c.* 1264–67 and 1269–72), he was appointed archbishop of Lyon in 1272 by Pope Gregory X, who made him cardinal bishop of Ostia Antica, Papal States (*c.* 1273), and whom he succeeded as pope on Jan. 21, 1276.

During his short pontificate, Innocent V continued Gregory's efforts to initiate a crusade, reunite the Greek and Roman churches, and pacify Italy's warring states. Among his most important writings is his commentary on the *Sentences* by the 12th-century theologian Peter Lombard.

• **Innocent VI,** original name ÉTIENNE AUBERT (b. Monts, Fr.—d. Sept. 12, 1362, Avignon, Provence), pope from 1352 to 1362.

A professor of civil law at Toulouse, Fr., Innocent VI took holy orders and was appointed to the French bishoprics of Noyon (1338) and Clermont (1340). A cardinal priest in 1342, he was made cardinal bishop of Ostia, Papal States, in 1352 by Pope Clement VI, whom he succeeded on Dec. 18, 1352. As pope, Innocent prohibited the granting of innumerable benefices to one recipient, urged prelates to reside in their sees, and reformed the papal Curia at Avignon, where the papacy resided from 1309 to 1377. In August 1352 he released the Roman tribune Cola di Rienzo, who had been excommunicated by Clement for heresy because of his rebellion against the Holy Roman Empire and imprisoned by Archbishop Ernest of Prague. Innocent used Rienzo in 1353 to assist Cardinal Albornoz, vicar general of the Papal States, in restoring papal power at Rome, thus making possible a return of the papacy from Avignon to Rome. Rienzo, however, was killed on Oct. 8, 1354, in a Roman riot.

Innocent maintained Clement's alliance with King Charles IV of Bohemia, whom he caused to be crowned emperor at Rome in 1355. The following year Charles published the Golden Bull, excluding papal intervention in the election of the German ruler, but Innocent raised no objection. In 1360 he arranged the Treaty of Brétigny between England and France, which ended the first phase of the Hundred Years' War. The last years of his pontificate were occupied with preparations for a crusade and with negotiations for the reunion of the Roman and Eastern churches.



• **Innocent VII,** original name COSIMO DE' MIGLIORATI (b. 1336, Sulmona, Kingdom of Sicily—d. Nov. 6, 1406, Rome), pope from 1404 to 1406.

Appointed archbishop of Ravenna (1387) by Pope Urban VI and, in 1389, bishop of Bologna, he was made cardinal by Pope Boniface IX, whom he succeeded on Oct. 17, 1404. Innocent's election was opposed at Rome, where it caused considerable strife, and at Avignon, Fr., where the Western Schism (1378–1417) was perpetuated by the rival election of Antipope Benedict XIII. King Ladislas of Naples went to Rome and suppressed the revolutionaries who were opposing the Pope's temporal authority. In appreciation, Innocent nominated Ladislas as "defender" of the church and promised the King not to negotiate with Benedict unless the Antipope recognized Ladislas' claims to Naples.

In late 1404 Innocent summoned a general council at Rome to heal the Schism, but the council never assembled because the Romans again rebelled when Innocent's nephew, Cardinal Ludovico de' Migliorati, murdered some of the leaders of the insurrection that Ladislas had quashed. Innocent was forced to flee to Viterbo, Papal States, on Aug. 6, 1405. Later realizing that the Pope was not guilty, the Romans submitted. In March 1406 Innocent returned to Rome, where he died in the midst of plans to restore the Roman University.

• **Innocent VIII,** original name GIOVANNI BATTISTA CIBO (b. 1432, Genoa—d. July 25/26, 1492, Rome), pope from 1484 to 1492.

Named bishop of Savona, Italy, in 1467 by Pope Paul II, he was made cardinal in 1473 by Pope Sixtus IV, whom he succeeded. His election was manipulated by Cardinal Giuliano della Rovere (later Pope Julius II), whose tool Innocent remained. The executions of per-

sons thought to be practicing witchcraft were increasing throughout western Europe. In a bull of 1484 Innocent acknowledged belief in witchcraft, condemned it, and then dispatched inquisitors to Germany to try witches. In 1486 he persecuted one of the chief exponents of Renaissance Platonism, Pico della Mirandola, by condemning his theses and prohibiting his defense.

When his call for a crusade against the Turks failed, Innocent made an agreement in 1489 with Sultan Bayezid II to keep Prince Jem, Bayezid's fugitive brother and pretender to the Turkish throne, confined to the Vatican in return for an annual payment and the gift of the Holy Lance, the spear thrust into Christ's body at the crucifixion. Innocent's manoeuvres in Italian politics were equally unscrupulous: he deposed King Ferdinand of Naples in 1489 for failure to pay debts of tribute; and his wars with several Italian states, especially Naples, depleted the papal treasury, which he replenished by creating and selling new posts. Generally regarded as unworthy and of low private morals, Innocent left the Papal States in anarchy.

• **Innocent IX,** original name GIOVANNI ANTONIO FACCHINETTI (b. July 20, 1519, Bologna, Papal States—d. Dec. 30, 1591,

Rome), pope from Oct. 29 to Dec. 30, 1591. As bishop of Nicastro, Kingdom of Naples, he participated in the Council of Trent in

Innocent IX, commemorative medallion, 1591

1562. In 1566 he was a papal ambassador at Venice. He was later employed in the Roman Inquisition (to combat Protestantism) by Pope Gregory XIII, who appointed him patriarch of Jerusalem (1576) and later made him a cardinal (1583). He assumed practically all administration under the ailing pope Gregory XIV, whom he was chosen to succeed as pope. He died two months later.

• Innocent X, original name GIOVANNI BATTISTA PAMPHILI, or GIAMBATTISTA PAMFILI (b. May 7, 1574, Rome—d. Jan. 7, 1655, Rome), pope from 1644 to 1655.

Pamphili was a church judge under Pope Clement VIII and a papal representative at Naples for Pope Gregory XV. He was made ambassador to Spain and cardinal (1626) by Pope Urban VIII, whom he succeeded on Sept. 15, 1644. Having been supported by cardinals who had opposed his predecessor, Innocent reversed Urban's policies, as demonstrated by his condemnation of the Peace of Westphalia—the collective name for the settlements of 1648, which brought to an end the Eighty Years' War between Spain and the Dutch and the German phase of the Thirty Years' War and alienated Catholic lands. But he reigned at a time when popes were no longer consulted by nations in settling war or making peace, and his protest went unnoticed by both sides.

Innocent's relationship with his relatives was questionable, for he was guilty of nepotism, and much of his pontificate was dominated by his avaricious sister-in-law, Olimpia Maidalchini. Innocent supported the Spanish Habsburgs—a branch of one of the great sovereign dynasties of Europe—by refusing to recognize the independence of Portugal, then at war with Spain. In Rome, Innocent attacked Urban's relatives, the Barberini, for extortion and confiscated their property. He clashed with France when the Barberini took refuge in Paris with Cardinal Mazarin, whose threat to invade Italy forced Innocent to yield. In theological matters he intervened in the quarrel between the Jesuits and the Jansenists and in a bull of 1653 condemned five propositions concerning the nature of grace as interpreted by Bishop Cornelius Jansen, the founder of Jansenism. A century of controversy with the Jansenists ensued, which was particularly damaging to the French Church. By the time of Innocent's death, papal prestige had seriously declined.

• Innocent XI, BLESSED, original name BENEDETTO ODESCALCHI (b. May 19, 1611, Como, Duchy of Milan—d. Aug. 12, 1689, Rome; beatified Oct. 7, 1956; feast day August 13), pope from 1676 to 1689.

Odescalchi studied law at the University of Naples and entered the Curia under Pope Urban VIII. Pope Innocent X made him cardinal (1645), emissary to Ferrara, Italy, and bishop of Novara, Italy (1650).

He was elected pope on Sept. 21, 1676, against the opposition of King Louis XIV of France, who proved to be an enemy of ecclesiastical privileges during Innocent's pontificate. He inherited an insolvent papal treasury but averted bankruptcy through wise taxation, rigid economizing, and financial support from Catholic powers. Innocent aided the war against the Turks by subsidizing King John III of Poland and the Holy Roman emperor Leopold I in a campaign that led to the relief of Vienna (1683) from the Turkish siege.

Innocent quarrelled with Louis when two French bishops resisted the edict of 1673 that extended the king's right to administer vacant sees. Louis then convoked a French synod, which issued the famous Gallican Articles, four statements in support of Gallicanism, a French ecclesiastical doctrine that advocated restriction of papal power. In response, Innocent refused to confirm the promotion of clergymen involved in the synod, and the deadlock worsened.

Realizing that Protestantism had to be tolerated to maintain peace, Innocent opposed Louis's persecution of the Huguenots. In May 1685 he furthered the threat of a break between France and the Holy See by acting against the French embassy in Rome for extending political asylum in such an abusive way that the neighbourhood adjacent to the embassy became a haven for criminals. The situation deteriorated further when Innocent opposed Louis's candidate for the archbishopric of Cologne (1688).

In doctrinal matters, Innocent sympathized somewhat with the Jansenists, followers of a nonorthodox ecclesiastical movement created by Bishop Cornelius Jansen of Ypres, which opposed Louis's religious policies. Although a friend of Miguel de Molinos, the Spanish mystic and proponent of the doctrine of Christian perfection known as Quietism, Innocent allowed Molinos to be arrested by the papal police and tried for personal immorality and heresy. He was sentenced to life imprisonment, and Innocent condemned his propositions in 1687.

Innocent is considered the outstanding pope of the 17th century, largely because of his high moral character. In a time of frequent papal corruption he was free from nepotism and his integrity was unquestioned. Louis O'Brien's *Innocent XI and the Revocation of the Edict of Nantes* was published in 1930.

• Innocent XII, original name ANTONIO PIGNATELLI (b. March 13, 1615, Spinazzola, Kingdom of the Two Sicilies—d. Sept. 27, 1700, Rome), pope from 1691 to 1700.

After studying at the Jesuit College, Rome, Pignatelli joined the Curia under Pope Urban VIII, becoming successively governor of Viterbo and papal ambassador to Tuscany and

Innocent XII, detail from a monument by Filippo Valle, 1746; in St. Peter's, Rome

Alinari—Art Resource/EB Inc.

to Poland and Austria. He was made cardinal in 1681 by Pope Innocent XI, whose pontificate Pignatelli emulated after being elected pope on July 12, 1691, as Innocent XII. In 1693 he broke the politico-religious deadlock between King Louis XIV of France and the Holy See by influencing Louis to disavow the four Gallican Articles of 1682 issued against Innocent XI. In exchange, Innocent agreed to extend the king's right to administer vacant sees. Upon Louis's insistence in 1699, Innocent condemned *Maximes des saints* ("Maxims of the Saints") compiled by the eminent French mystic archbishop Fénelon of Cambrai, whose work was one of the key issues in the controversy over a heretical doctrine of Christian perfection known as Quietism. Fénelon submitted immediately.

• Innocent XIII, original name MICHELANGIOLO, or MICHELANGELO, DEI CONTI (b. May 13, 1655, Poli, near Palestrina, Papal States—d. March 7, 1724, Rome), pope from 1721 to 1724.

Of noble birth, Dei Conti was papal ambassador to Switzerland and to Portugal before Pope Clement XI made him cardinal (1706) and bishop of Osimo, Papal States (1709). He

Innocent XIII, commemorative medallion, 1721

was elected pope on May 8, 1721. In the following year he invested the Holy Roman emperor Charles VI with sovereignty over the Kingdom of Naples. Innocent recognized James (the Old Pretender) as the king of England and promised him subsidies conditional upon the reestablishment of Roman Catholicism in England. Distrusting the Jesuits and their missionaries in China, who modified Christian usage (in the "Chinese rites") to attract converts, Innocent commanded the Society of Jesus to obey Clement's bull of 1713, which prohibited these rites and practices.

Innocent VENIAMINOV, SAINT, Russian INNOKENTY VENIAMINOV, original name IVAN YEVSEYEVICH VENIAMINOV (b. Sept. 6 [Aug. 26, old style], 1797, Anginskoye, Irkutsk Province, Russian Empire—d. April 12 [March 31, O.S.] 1879, Moscow; canonized Oct. 6, 1977), the most famous Russian Orthodox missionary priest of the 19th century, who later became Metropolitan Innocent of Moscow. He was canonized in the Russian Church.

Veniaminov began his career, from 1824 until 1839, as a parish priest, first in Irkutsk, the capital of Eastern Siberia, and then in Alaska, which was part of the Russian Empire until 1867. While in Alaska, Veniaminov learned the Aleut language, for which he invented an alphabet and charted a grammar. His book *The Way to the Kingdom of Heaven*, written in Aleut in 1841, gained wide appeal. After spending 10 years in the Aleutians, he moved on to Novo Arkhangelsk (now Sitka) on Baronov Island and, in 1836, began to baptize the Kolosh Indians.

In 1840, while Veniaminov was in St. Petersburg to recruit support for the Alaska Mission, his wife died; he subsequently entered the novitiate, took the name Innocent, and was ordained bishop of the new Diocese of Kamchatka, which extended from the Kamchatka Peninsula to the Alaska Peninsula, including the Kuril and the Aleutian islands and the region of Yakutsk. For 28 years he travelled this region, learning the local languages, converting the inhabitants to Orthodoxy, and ultimately establishing four separate dioceses. He was rewarded with election to the position of metropolitan of Moscow in 1868, and in this role he established the Orthodox Missionary Society, which continued his work of conversion until the Russian Revolution.

Innocents' Day: *see* Holy Innocents, Feast of the.

Innoko River, river, west central Alaska, U.S., the westernmost major tributary of the Yukon River. It rises in the Kuskokwim Mountains west of the town of McGraw and flows north, then southwest for about 500 mi (800 km) before joining the Yukon near Holy Cross. The name Innoko, first used by the Russian explorer Lavrenty Zagoskin during his 1842–44 expedition, is probably an Ingalik Indian word, but its meaning is unknown. During the 1907 gold rush, prospectors rushed into the valley and set up several mining camps, which included Ophir, Poorman, and Cripple. The streams, however, never produced much alluvial gold, and the Innoko Valley remains largely wilderness.

Innoshima, city, Hiroshima Prefecture (*ken*), western Honshu, Japan. Innoshima is a small offshore island in the Inland Sea, originally settled by pirates. After the decline of piracy in the 17th century, the island was left to fishermen. After the Russo-Japanese War, Hitachi Shipbuilding established a dockyard. In 1964 the 100,800-ton supertanker Ōimaru, then the largest ship ever built on a building slip, was launched. Innoshima was named a city in 1953. Pop. (1995 prelim.) island/city, 30,300.

Inns of Court, Lincoln's Inn, Gray's Inn, Inner Temple, and Middle Temple, a group of institutions of considerable antiquity, located in London, that have historically been responsible for legal education. Their respective governing bodies, the benches, exercise the exclusive right of admitting persons to practice by a formal call to the bar.

The Inns of Court are voluntary societies, unchartered, unincorporated, and unendowed. Hence, their early history is obscure. Since their inception in the Middle Ages, however, they have been devoted to the technical study of English law, rather than Roman law, which was taught in the universities (*see* Doctors' Commons). Previously, law was learned in the course of service, the first rudiments possibly in private clerkship to some official. By the mid-13th century, when the common law had become extensive and intricate, there arose a class of men, literate but lay, who created and dominated the legal profession and set up the Inns of Court as an answer to the problem of legal education. Manuals and books were produced in French rather than Latin. The students listened to arguments in court and discussed law among themselves.

In addition to those who practiced in the courts, there was also a large demand for stewards and legal advisers to landowners to conduct general business and keep manorial courts. These men needed the rudiments but not the refinements of common law. Such, too, was the case with the large class of attorneys and a growing class of bookkeepers and correspondence clerks. They gained most of their knowledge through an Inn of Chancery, an institution for training in the framing of writs and other legal documents used in the courts of chancery.

In the 14th century many of the household clerks (clergy with at least minor orders) of the chancellor's office combined in Inns and appear to have taken students for training. By the end of the century these Inns were in danger of being submerged by a flood of attorneys-to-be and students who used an Inn of Chancery as a preparation for entering an Inn of Court. Eventually, each Inn of Court secured control of one or more Inns of Chancery and supervised its affairs, appointed readers to teach in it, and later often bought its premises, becoming its landlord.

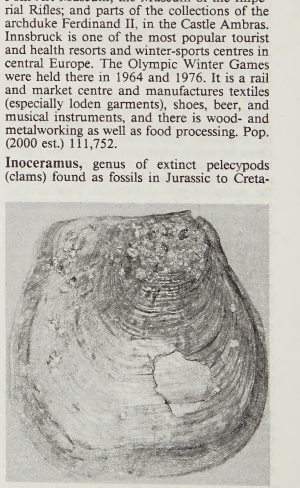
By the 15th century the Inns of Court were governed by their benchers, who had previously given at least two courses of lectures (readings) and who presided over mock arguments (moots) in which students argued difficult points of law before them.

Because the law was highly technical, proficiency could be acquired only by following the demanding studies of the Inns. In practice, the Inns thus had a monopoly over legal education. In the 15th and 16th centuries, however, many students joined the Inns for the purpose of getting a general education, rather than legal training. By the end of the 16th century the Inns of Court had begun to exclude attorneys and solicitors and refused to call them to the bar, with the result that attorneys especially fell back on the Inns of Chancery and finally came to form a profession distinct from that of the barristers (*see* solicitor).

By the beginning of the 16th century, the Inns had acquired the actual ownership of their sites and began building splendid halls, a process that continued through the century. Various causes brought on the decline of this system of education. For one thing, the great activity of the printing press led students to rely more upon printed material, and as a result they neglected attendance at readings and moots. The system broke down completely during the English Civil War; readings ceased in 1677, and only the fees survived. Having paid them, the student was deemed to have fulfilled his duties. With no readers to recommend students for call to the bar, the four Inns in the 18th century finally agreed to call students who had been in residence a stated number of terms. Later, it was settled that eating three dinners was equivalent to attending for the whole term. Meanwhile, the Inns of Chancery were no longer adequate for so large a group as the attorneys and solicitors, and these latter, therefore, created their own society.

In the 19th century the common law commissioners investigated the Inns of Court, which as a result took steps to resume their educational functions. Readerships were reestablished, and lawyers were engaged in teaching with a view to examinations conducted by the Council of Legal Education, representing all four Inns.

Innsbruck, city, capital of *Bundesland* (federal province) Tirol, western Austria, on the Inn at the mouth of the Sill River in the Eastern Alps. First mentioned in 1180 as a small market town belonging to the Bavarian counts of Andech, it developed rapidly because of its strategic position at the junction of the great trade routes from Italy to Germany via the Brenner Pass and from Switzerland and western Europe. The bridge (*Brücke*) over the Inn originally carried this traffic and gave the city its name and its insignia. Innsbruck was chartered in 1239, passed to the Habsburgs in 1363, and in 1420 became the capital of Tirol and the ducal residence under Frederick, the duke "of the empty pockets." Napoleon gave the city to the kingdom of Bavaria in 1806,



Fürstenburg building with gilded copper roof (left background), Innsbruck, Austria
Louis Goldman—Rapho/Photo Researchers

and during the War of Liberation (1809) four battles were fought around Berg Isel, a hill (2,461 ft [750 m]) immediately to the south, by Tirolian patriots led by Andreas Hofer against the Bavarians and the French.

The old town has narrow streets lined with medieval houses and arcades. One of the most famous buildings is the Fürstenburg, with a balcony with a gilded copper roof, supposedly built by Duke Frederick and refashioned by the emperor Maximilian *c.* 1500. Other notable landmarks include the Hofburg (1754–70, on the site of a 15th-century ducal residence) and the Franciscan, or Court, church (1553–63), containing the mausoleum dedicated to Maximilian I and the tombs of Hofer and other Tirolian heroes. The university was founded by Emperor Leopold I in 1677, and its great library was a gift of the empress Maria Theresa in 1745. There are four major museums: the Ferdinandeum, with prehistoric, industrial-art, and natural-history collections and a picture gallery; the Tirolean Folk Art Museum; the Museum of the Imperial Rifles; and parts of the collections of the archduke Ferdinand II, in the Castle Ambras. Innsbruck is one of the most popular tourist and health resorts and winter-sports centres in central Europe. The Olympic Winter Games were held there in 1964 and 1976. It is a rail and market centre and manufactures textiles (especially loden garments), shoes, beer, and musical instruments, and there is wood- and metalworking as well as food processing. Pop. (2000 est.) 111,752.

Inoceramus, genus of extinct pelecypods (clams) found as fossils in Jurassic to Creta-

Inoceramus, 35 in. × 34 in., found in the Kansas Niobrara Chalk, of Cretaceous age
By courtesy of the Sternberg Memorial Museum, Hays, Kansas

ceous rocks (laid down from 190,000,000 to 65,000,000 years ago). Especially important and widespread in Cretaceous rocks, *Inoceramus* had a distinctive shell; it is large, thick, and wrinkled in a concentric fashion, making identification relatively simple. The many pits at the dorsal region were the anchoring points for the ligaments that closed the shell.

inoculation, process of producing immunity and method of vaccination that consists of introduction of the infectious agent onto an abraded or absorptive skin surface instead of inserting the substance in the tissues by means of a hollow needle, as in injection. Of the common vaccines, only smallpox vaccine is routinely inoculated. The term inoculation is also commonly used more broadly to mean any introduction of antigenic substances into the tissues. *See also* immunization; vaccine.

İnönü, İsmet (b. Sept. 24, 1884, Smyrna, Ottoman Empire—d. Dec. 25, 1973, Ankara), Turkish army officer, statesman, and collaborator with and successor to Mustafa Kemal Atatürk as president of the Turkish Republic. Identified with one-party rule between 1939 and 1946, he later emerged as a champion of democracy.

İsmet served on the general staff of the 3rd Army at Edirne and as chief of staff of the army in Yemen. During World War I, he commanded the 4th Army in Syria (1916), and, at the time of the Ottoman surrender (Oct. 30, 1918), he was the undersecretary of war in Constantinople. Later he joined Mustafa Kemal's movement to resist the Allied occupation of Anatolia. In 1920 he was elected to the last Ottoman Parliament as deputy for Edirne. After the Greek occupation of western Anatolia, he was appointed chief of the general staff of the nationalist army and repelled the invaders in the two battles of İnönü (near Ankara) in January and April 1921. From those engagements he later took his surname.

Appointed foreign minister in the government of the Grand National Assembly in Ankara in 1922, İsmet succeeded, with the support of Mustafa Kemal, in gaining most of the Turkish demands in the Treaty of Lausanne (Switz.; July 24, 1923). When the republic was proclaimed on Oct. 29, 1923, İsmet became the prime minister. He remained in power until 1937.

On Atatürk's death on Nov. 10, 1938, İnönü was elected president and became the permanent chairman of the Republican People's Party (RPP). During World War II, Turkey, under his adroit leadership, remained neutral. In the postwar period, however, in response to internal strains and to the Western pressures for a democratic regime, he encouraged the formation of the Democrat Party (DP) in 1946, which defeated the RPP in the elections of 1950. İnönü was replaced as president by Celâl Bayar and led the opposition (1950–60), assuming the role of defender of democracy.

Following the 1960 military coup d'etat, which overthrew the DP government, İnönü formed three coalition governments between 1961 and 1965, but in the general elections of 1965 and 1969 his party suffered overwhelming defeats. During this period İnönü was criticized by the Kemalist and Socialist factions within RPP for the compromises he made with the coalition partners and with the conservatives. Under these pressures he declared his ideological stance as "left of centre," alienating the centrists in his party, who formed the Reliance Party (Güven Partisi) in 1967. İnönü himself, however, was replaced in 1972 as RPP leader by Bülent Ecevit, the head of the leftist faction.

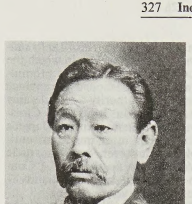
inorganic compound, any substance in which two or more chemical elements other than carbon are combined, nearly always in definite proportions. Compounds of carbon are classified as organic except for carbides, carbonates, cyanides, and a few others. *See* chemical compound.

inosilicate, formerly called METASILICATE, any of a class of inorganic compounds that have structures characterized by silicate tetrahedrons (a central silicon atom surrounded by four oxygen atoms at the corners of a tetrahedron) arranged in chains. Two of the oxygen atoms of each tetrahedron are shared with other tetrahedrons, forming a chain that is potentially infinite in length. Single chains (with a multiple of SiO_3 in the chemical formula), double chains (with Si_4O_{11} in the formula), and more complex chains are possible. Mineral examples include the pyroxenes (single chain) and the amphiboles (double chain).

To make the best use of the Britannica, consult the INDEX *first*

inosinic acid, a compound important in metabolism. It is the ribonucleotide of hypoxanthine and is the first compound formed during the synthesis of purine in organisms. From inosinic acid are derived such important compounds as the purine nucleotides found in nucleic acids and the energy-rich purine nucleotide adenosine triphosphate, in which chemical energy is stored in cells.

inositol, also called CYCLOHEXANEHEXOL, any of several stereoisomeric alcohols similar in molecular structure to the simple carbohydrates. The best known of the inositols is myoinositol, named for its presence in muscle tissue, from which it was first obtained in 1850. Myoinositol is essential for the growth of yeasts and other fungi; it is widely distributed in plants and animals, and large amounts of it are present in the human body, principally as a constituent of a phospholipid that is abundant in the brain. Myoinositol is commonly obtained from grains, in which it is present as the hexaphosphate, phytic acid.



Inoue Enryō (b. March 18, 1858, Echigo Province, Japan—d. June 6, 1919, Dairen, Manchuria), Japanese philosopher and educator who attempted to reinterpret Buddhist concepts so they would be relevant to Western philosophical doctrines. An ardent nationalist, Inoue helped make Buddhism an intellectually acceptable alternative to Western religious doctrines.

After attending the school for priests at the Higashihongan-ji, the main temple of the Jōdo-Shinshū (True Pure Land sect) in Japan, Inoue enrolled in Tokyo Imperial University, where he graduated from the department of philosophy in 1885. Critical of what he considered the excessive Westernization of Japan, especially the conversion of many governmental leaders to Christianity, he founded (1887) the Tetsugaku kan (Philosophical Institute) to promote the study of Buddhism. Inoue's belief that Buddhism epitomized Oriental philosophy gained many adherents, and with their aid he began to publish the highly nationalistic magazine *Nihonjin* ("The Japanese") and embarked on a series of lecture tours throughout Japan and Europe.

In his later life, Inoue conducted an educational campaign to overcome superstitions inspired by folklore interpretations of Japanese mythology. For this purpose he established the Ghost Lore Institute in Tokyo and gained the sobriquet "Doctor Obake," or "Doctor Ghost." He died while on a speaking tour in Manchuria.

Inoue Kaoru, KŌSHAKU (Marquess) (b. Jan. 16, 1836, Chōshū, Nagato Province, Japan—d. Sept. 1, 1915, Tokyo), member of the oligarchy that ruled Japan during the Meiji period (1868–1912).

Inoue was born to a samurai family and was a close boyhood friend of Itō Hirobumi, who later became Japan's first prime minister. Desiring to rid Japan of foreigners, the pair joined an attack on the British legation in Edo (now Tokyo). When this failed they became aware of their powerlessness and decided to study the foreigners firsthand. They left Japan in 1863 and worked their way to England as ordinary sailors. The following year, when news reached them of the crisis in Japan over the bombardment of foreign ships by their own clan, they hurried home to urge their clansmen and others to seek peace. They failed in this effort, and Inoue was attacked and injured by reactionary samurai.

Inoue Kaoru
BBC Hulton Picture Library

With the overthrow of the Tokugawa clan, which had ruled Japan from 1603 to 1867, and the restoration of power to the Meiji emperor, Inoue became a leading member of the government and held important positions in the ministries of finance, industry, and foreign affairs. After Itō became prime minister in 1885, Inoue served successively as foreign minister, minister of the interior, and minister of finance. During the Russo-Japanese War (1904–05) he was named special adviser to the minister of finance and at the request of the Emperor attended all important state councils.

He was closely associated with the financial world and had connections with the giant Mitsui *zaibatsu*. The *zaibatsu* were extremely large, family-owned financial empires. He retired from active politics in 1898 but continued to have an important influence on the state, remaining until his death one of the elder statesmen, or *genrō*, whose advice the Emperor sought on difficult political questions. He became a marquess in 1907.

Inoue Tetsujirō (b. 1855, Buzen Province, Japan—d. 1944), Japanese philosopher who opposed Christianity as incompatible with Japanese culture and who worked to preserve traditional Japanese values. At the same time, using Western philosophical methods, he helped to create a systematic history of the theories of Oriental philosophy and sought to develop a synthesis of Western philosophies (notably German) and Oriental philosophies.

Inoue was the son of a physician in the administration for Kyushu (Chikuzen, now Fukuoka Prefecture). Graduated from Tokyo Imperial University (1880), he served in the Ministry of Education before returning to the university in 1882, lecturing on the history of Oriental philosophy.

His essay on new forms of poetry, *Shintaishishō* (1882), contributed to the introduction of Western poetry styles. After further studies at the universities of Heidelberg and Leipzig in Germany (1884–90), he became professor of philosophy at Tokyo Imperial University. He later served as dean of the university's faculty of literature (1897–1904).

Inoue's essay on the relations between the

Imperial family and religion, *Teishitsu to shūkyō no kankei,* in 1890—the year in which the Imperial rescript on education was promulgated, demanding unquestioned acceptance of Imperial will and authority—considerably influenced public opinion. It attacked Christianity and urged the maintenance of Japan's unique traditions. His most important anti-Christian polemic, however, was his article "Kokka to Yaso-kyō to no shòtotsu" ("Conflict Between the Nation and Christianity"), published the following year.

In 1900 Inoue published *Nihon yōmei gakuha no tetsugaku,* a study of the Japanese philosophy derived from the teachings of Wang Yang-ming. His biography of the Santama Buddha, *Shakamuni-den,* and a study of the philosophy in the Japanese classics, *Nihon kogakuha no tetsugaku,* both appeared in 1902. He dealt with the philosophy of the Japanese Chu-hsi school in *Nihon shushi gakuha no tetsugaku* (1905).

His prestige as a member of the Tokyo Academy (from 1895) and president of the Association of Philosophers (Tetsugaku-kai) considerably influenced the course of Japanese philosophy and thought. He edited a number of magazines, including *Eastern Art and Sciences* and *Light in the Far East.*

After resigning from Tokyo Imperial University (1923), he lectured at the Gakushōin (peers school) and Tōyō University. He entered the House of Peers as an Imperial nominee in 1925 but resigned in the following year.

Inowrocław, town, Bydgoszcz *województwo* (province), north central Poland, in the Kujawy region. First mentioned in 1185 as a trading settlement, the town lay on an ancient trade route between southern Europe and the Baltic Sea. It became capital of the autonomous principality of Kujawy, having allegiance to the Polish crown in the 15th century. An industrial town with good road and rail connections, Inowrocław has salt deposits that provide one-sixth of Poland's needs and that have established the town as a health spa. They also are the basis of a chemical industry there.

The 12th-century Church of the Blessed Virgin contains some of Poland's oldest sculpture. Pop. (1982 est.) 66,500.

input–output analysis, economic analysis developed by the 20th-century Russian-born U.S. economist Wassily W. Leontief, in which the interdependence of an economy's various productive sectors is observed by viewing the product of each industry both as a commodity demanded for final consumption and as a factor in the production of itself and other goods. Certain simplifying assumptions are made, such as that productive resources will always be combined in the same proportions to produce any amount of a final product. Then it is possible to determine the total quantities of various goods that must be produced to obtain a given amount for final consumption.

The analysis usually involves constructing a table in which each horizontal row describes how one industry's total product is divided among various production processes and final consumption. Each vertical column denotes the combination of productive resources used within one industry. If, for example, the first row of a table for a very simple economy describes the distribution of the total production of trucks, it would show that a certain quantity of trucks is used in the production of more trucks, a certain quantity in the production of agricultural commodities, a certain quantity in the production of houses, a certain quantity by private households, and so on. If the numbers are added across the row, the total quantity of trucks produced is obtained. A table of this type illustrates the dependence of each industry on the products of other industries: for example, an increase in food output is also seen to require an increase in the production of trucks.

Input–output tables can be constructed for whole economies or for segments within economies. They are useful in planning the production levels in various industries necessary to meet given consumption goals and in analyzing the effects throughout the economy of changes in certain components. They have been most widely used in planned economies and in developing countries.

input/output device, any of various devices used to enter information and instructions into a computer for storage or processing and to deliver the processed data to a human operator or, in some cases, a machine controlled by the computer. Such devices comprise the peripheral equipment of modern digital computer systems. Apparatus of this kind with direct connection to a system's central processing unit (*q.v.*) is said to be on-line; peripheral equipment working independently of it is termed off-line.

An input device converts incoming data and instructions into a pattern of electronic signals in binary code (*i.e.,* combinations of 0s and 1s) comprehensible to a digital computer, whereas an output device reverses the process, translating the digitalized signals into a form intelligible to the user. Punched-card and paper-tape readers were once extensively used for inputting but have now been supplanted in large measure by more efficient devices. These include video display terminals consisting of a cathode-ray tube, typewriter-like keyboard, and interactive graphic devices such as a light pen, trackball, or joystick. Other direct entry mechanisms are optical laser scanners (*e.g.,* those used with point-of-sale terminals in retail stores) that can read bar-coded data or optical character fonts; and voice-recognition devices capable of understanding simple verbal commands. Output equipment, some of which can also be used for inputting, includes video display terminals, high-speed printers, console typewriters, and audio response units that convert text and other processed data into spoken words. Certain kinds of auxiliary storage devices, as for example magnetic tape and magnetic disk units, double as input/output devices (*see* computer memory).

inquest, judicial inquiry by a group of persons appointed by a court. The most common type is the inquest set up to investigate a death apparently occasioned by unnatural means. Witnesses are examined, and a special jury returns a verdict on the cause of death. In England inquests are also required when there is loss or injury in a fire. The inquest is confined to common-law jurisdictions that have a coroner system.

Although the European civil-law system has a long tradition of the use of medical evidence and professional witnesses in court, it has no procedure similar to the inquest. *See also* coroner's jury.

Inquisition, in Roman Catholicism, a papal judicial institution that combatted heresy and such things as alchemy, witchcraft, and sorcery and wielded considerable power in medieval and early modern times. The name is derived from the Latin verb *inquiro* ("inquire into"), which emphasizes the fact that the inquisitors did not wait for complaints but sought out heretics and other offenders.

After the Roman Church had consolidated its power in the early Middle Ages, heretics came to be looked upon as enemies of society. With the appearance of large-scale heresies in the 11th and 12th centuries—notably among the Cathari and Waldenses—Pope Gregory IX in 1231 instituted the papal Inquisition for the apprehension and trial of heretics.

The inquisitorial procedure was quite detailed; but, in general terms, it gave a person suspected of heresy time to confess and absolve himself, and, failing this, the accused was haled before the inquisitor and interrogated and tried, with the testimony of witnesses. The use of torture to obtain confessions and the names of other heretics was at first rejected but was authorized in 1252 by Innocent IV. On admission or conviction of guilt, a person could be sentenced publicly to any of a wide variety of penalties, ranging from simple prayer and fasting to confiscation of property and imprisonment, even life imprisonment. Condemned heretics who refused to recant, as well as those who relapsed after condemnation and repentance, were turned over to the secular arm, which alone could impose the death penalty.

The medieval Inquisition functioned only in a limited way in northern Europe; it was most employed in northern Italy and southern France. During the Reconquista in Spain, the Catholic powers used it only occasionally; but, after the Muslims had been driven out, the Catholic monarchs of Aragon and Castile determined to enforce religious and political unity and requested a special institution to combat apostate former Jews and Muslims as well as such heretics as the Alumbrados. Thus in 1478 Pope Sixtus IV authorized the Spanish Inquisition.

The first Spanish inquisitors, operating in Seville, proved so severe that Sixtus IV had to interfere. But the Spanish crown now had in its possession a weapon too precious to give up, and the efforts of the Pope to limit the powers of the Inquisition were without avail. In 1483 he was induced to authorize the naming by the Spanish government of a grand inquisitor for Castile, and during the same year Aragon, Valencia, and Catalonia were placed under the power of the Inquisition. The first grand inquisitor was the Dominican Tomás de Torquemada, who has become the symbol of the inquisitor who uses torture and confiscation to terrorize his victims. The number of burnings at the stake during his tenure has been exaggerated, but it was probably about 2,000.

In general, the procedure of the Spanish Inquisition was much like the medieval Inquisition. The auto-da-fé, the public ceremony at which sentences were pronounced, became an elaborate celebration. Under the inquisitor general and his supreme council were 14 local tribunals in Spain and several in the colonies, including those in Mexico and Peru. The Spanish Inquisition was introduced into Sicily in 1517, but efforts to set it up in Naples and Milan failed. The emperor Charles V in 1522 introduced it into the Netherlands, where its efforts to wipe out Protestantism were unsuccessful. The Inquisition in Spain was suppressed by Joseph Bonaparte in 1808, restored by Ferdinand VII in 1814, suppressed in 1820, restored in 1823, and finally suppressed in 1834.

A third variety of the Inquisition was the Roman Inquisition, established in 1542 by Pope Paul III to combat Protestantism. It was governed by a commission of six cardinals, the Congregation of the Inquisition, which was thoroughly independent and much freer from episcopal control than the medieval Inquisition had been. Its establishment has been seen by some as an attempt to counterbalance the severe Spanish Inquisition at a time when a great part of Italy was under Spanish rule.

Under Paul III (1534–49) and Julius III (1550–55), the action of the Roman Inquisition was not rigorous, and Julius ruled that, although the tribunal had general authority, its action should be limited especially to Italy. The moderation of these popes was imitated by their successors with the exceptions of Paul IV (1555–59) and Pius V (1566–72),

Under Paul IV the Inquisition functioned in such a way that it alienated nearly all parties. Although Pius V (a Dominican and himself formerly grand inquisitor) avoided the worst excesses of Paul IV, he nevertheless declared at the beginning of his reign that questions of faith took precedence over all other business and made it clear that his first care would be to see that heresy, false doctrine, and error were suppressed. He took part in many of the activities of the Inquisition.

After Protestantism had been eliminated as a serious danger to Italian religious unity, the Roman Inquisition became more and more an ordinary organ of papal government concerned with maintaining good order and good customs as well as purity of faith among Catholics. In his reorganization of the Roman Curia in 1908, Pius X dropped the word Inquisition, and the congregation charged with maintaining purity of faith came to be known officially as the Holy Office. In 1965 Pope Paul VI reorganized the congregation along more democratic lines and renamed it the Congregation for the Doctrine of the Faith.

inquisitorial procedure, in law, one of the two methods of exposing evidence in court (the other being the adversary procedure; *q.v.*). The inquisitorial system is typical of countries that base their legal systems on civil or Roman law.

Under the inquisitorial procedure, the pretrial hearing for bringing a possible indictment is usually under the control of a judge whose responsibilities include the investigation of all aspects of the case, whether favourable or unfavourable to either the prosecution or defense. Witnesses are heard, and the accused, who is represented by counsel, may also be heard, though he is not required to speak and, if he does, he is not put under oath. In Germany the prosecution participates in the investigation; while in France the prosecution presents its recommendations only at the end of the hearing. In both France and Germany the investigating magistrate will recommend a trial only if he is sure that there is sufficient evidence of guilt. The entire dossier of the pretrial proceedings is made available to the defense.

At the trial the judge, once more, assumes a direct role, conducting the examination of witnesses, often basing his questions on the material in the dossier. Neither the prosecution nor the defense has the right to cross-examine, but they can present effective summations. The jury does not consult the dossier, instead relying on the facts brought out in the trial.

inrō, in Japanese dress, small portable case worn on the girdle. As indicated by the meaning of the word *inrō* ("vessel to hold seals"), these objects, probably originally imported from China, were used as containers for seals. In about the 16th century they were adapted by the Japanese for holding medicine, tobacco, confections, and other small items and became a part of the traditional Japanese male costume. *Inrō* are generally oval or cylindrical in section and usually measure 2 inches (5 centimetres) in width and from 2.5 inches (6.4 centimetres) to 4 inches (10 centimetres) in length. They have from two to five compartments, which are fitted into each other and held together by silken cords running along each side, secured by a bead (*ojime*), and kept from slipping through the kimono sash by a netsuke (*q.v.*), a small carved object at the end of the cords.

Early *inrō* were usually covered with plain black lacquer, but after the middle of the 17th century the more elaborate techniques of carved, painted, and gold lacquerwork were commonly used, making these objects some of the finest examples of Japanese craftsmanship in the Tokugawa (Edo) period (1603–1867).

Inrō depicting a mandarin duck, signed Toyo, Tokugawa (Edo) period
From Melvin and Betty Jahss, *Inro and Other Miniature Forms of Japanese Lacquer Art*; Charles E. Tuttle Co., Inc.

The collecting of *inrō* became especially popular in the late 19th and 20th centuries.

insanity, in criminal law, condition of mental disorder or mental defect that relieves a person of criminal responsibility for his conduct. Tests of insanity used in law are not intended to be scientific definitions of mental disorder; rather, they are expected to identify persons whose incapacity is of such character and extent that criminal responsibility should be denied on grounds of social expediency and justice.

Various legal tests of insanity have been put forward, none of which has escaped criticism. Anglo-American systems, including that of India, base the law of criminal responsibility primarily on the famous case of M'Naghten. In that case (1843) the English judges held that "to establish a defense of insanity, it must be clearly proved that, at the time of committing the act, the party accused was labouring under such a defect of reason, from disease of mind, as not to know the nature and quality of the act he was doing; or if he did know it, that he did not know he was doing what was wrong." Some U.S. courts went further and also relieved from responsibility one moved by an "irresistible impulse."

These rules have been the object of sharp controversy. Critics charge that they express an overintellectualized concept of mental disorder, reflecting outmoded notions of human behaviour. The rules have been criticized as not being based on modern concepts of medical science, thus complicating the work of the psychiatrist in giving expert testimony.

The 1954 decision of *Durham* v. *United States* promulgated a new rule: "simply that an accused is not criminally responsible if his unlawful act was the product of mental disease or mental defect." In simplicity, this test resembles the Japanese: "An act of an insane person is not punishable." Such a rule has been supported by some lawyers and judges and by many psychiatrists, but few U.S. courts have adopted it.

Many U.S. states and several courts have adopted the test proposed by the American Law Institute's Model Penal Code. This test provides a defense to a criminal charge if, at the time of the act, the accused, by reason of mental disorder or defect, lacked "substantial capacity either to appreciate the criminality of his conduct or to conform his conduct to the requirements of the law." In focussing on the volitional as well as the cognitive aspects of incapacity, this test has much in common with the European codes. The Italian penal code, for example, relieves a person of responsibility when he "is deprived of the capacity of understanding or volition." By the early 1980s two U.S. states had abolished the insanity plea; a few other states had passed laws that allowed juries to find defendants "guilty but mentally ill." In such a case, the defendant undergoes treatment at a mental institution before the sentence is carried out.

The major differences between the civil law of insanity and the common-law variant are procedural. The continental codes ordinarily do not make use of lay juries in establishing responsibility, whereas the English-speaking jurisdictions do. Some countries, including Japan and England, identify a form of mental disorder short of insanity that may be taken into account in mitigating punishment.

Insanity is justified as an exemption from responsibility on the grounds that responsibility assumes capacity to make elementary moral distinctions and power to adjust behaviour to the commands of the law. The insane should not be condemned since they cannot be deterred by the threat of penal sanctions. Critics say that the issue of responsibility is less important than the problem of how to identify and treat the disturbed individual. *See also* diminished responsibility.

insect, member of the class Insecta, the largest class of the phylum Arthropoda, which is itself the largest of the animal phyla. Of all the animal species so far described by science, insects account for about five-sixths; in addition to the nearly 1,000,000 insect species known, entomologists estimate there are 1,000,000 to 4,000,000 yet to be described.

A brief treatment of insects follows. For full treatment, *see* MACROPAEDIA: Insects.

Many of the features of insects are those of Arthropoda generally—notably jointed legs and a segmented body covered by a hard exoskeleton, composed, in part, of the protein chitin. The exoskeleton provides protection, much like a suit of armour, and it also serves as the point of attachment for the muscles. The exoskeleton must be molted (shed) periodically during growth.

Insects are unique among the arthropods in that they have only three pairs of legs (all other arthropods have four or more pairs) and in that most insects bear wings (all other arthropods are wingless). Also, unlike most other arthropods, the insects show specific division of the body into three regions: the head, the thorax, and the abdomen.

Insects exhibit a bewildering variety of forms; except in the most primitive insects, even individuals have slightly to strikingly different forms as larvae and as adults. Insects range in size from the barely visible to several inches in length or wingspread; their lifespans range from hours to many years; they may be solitary or social. Insects feed on plants, animals, and organic debris; their interactions with their food source range from mutualism to parasitism to predation.

Despite their diversity, all adult insects share some basic external and internal anatomical features. In all species, for example, the head contains sensory structures and mouthparts. In most insects the mouthparts consist of several structures, including an upper lip (labrum), a pair of jaws (mandibles), a pair of sensory structures (maxillae), and a lower lip (labium). These basic mouthparts have been highly modified for different feeding methods, including chewing, bloodsucking, sucking plant juices, and feeding on nectar. The

sensory structures of the head include a pair of antennae, which typically bear numerous tactile and olfactory bristles, and eyes. Most higher insects have two kinds of eyes: simple eyes, which perceive only light, darkness, and movement; and compound eyes, which are made up of dozens to thousands of separate lenses and presumably form mosaic images.

The thorax consists of three segments, which may be fused. Each segment bears a pair of legs; these may be modified for walking, jumping, grasping, burrowing, or swimming. In most insects, the rear two thoracic segments each carry a pair of wings. Some species, however, have only one pair of wings, and others lack wings entirely.

The abdomen is segmented, having 11 segments (or fewer, if fusion has occurred). It is without appendages except at the hind end, where some species have external reproductive structures, sensory feelers, or both.

Insects possess digestive, circulatory, respiratory, nervous, and reproductive systems. The digestive tract consists of the foregut in the head and thorax, and the midgut and hindgut in the abdomen. Digestive enzymes are secreted by salivary glands and by cells of the midgut; digested food is absorbed chiefly in the midgut. Undigested food residues are expelled from the hindgut through the anus.

Insects have an open circulatory system. This means that the blood (hemolymph) is not confined exclusively to a network of vessels; at some point it is pumped into the interior body cavity where it directly bathes the internal tissues. In fact, insects have only one blood vessel, which runs dorsally the length of the body. The abdominal portion of this vessel is the heart, or pumping organ; the portion that extends through the thorax and head is called the aorta. Blood is discharged from the aorta into the head; it circulates through the head, thorax, and abdomen and is forced into the wings and legs by accessory pumps. As it circulates through the body spaces, the blood distributes nutrients, which it absorbs from the midgut or from the fat body, which is an important storage tissue in insects. The blood picks up wastes which are then removed from it by a system of malpighian tubules that open into the rear end of the midgut. Eventually the blood reenters the heart through small openings called ostia.

Unlike most higher invertebrates (and all vertebrates), insects do not rely on the circulating blood to deliver oxygen to the body cells and to carry away the waste gas carbon dioxide. The respiratory system of insects consists of air tubes, or tracheae, which open at the surface of the abdomen and thorax through pairs of spiracles. The tracheae branch repeatedly, ending in minute, thin-walled tracheoles that reach every part of the body. Oxygen diffuses through the tracheole walls to enter the body cells. At the same time, carbon dioxide diffuses into the tracheoles from the cells.

Insects have a central nervous system composed of double ventral nerve cords joined by paired ganglia (collections of nerve cell bodies and fibres). Each ganglion supplies nerves to one or more segments of the body. These nerves contain sensory nerve cells, which relay information from the senses to the central nervous system, and motor nerve cells, which carry directives from the central nervous system to the muscles and glands. The three main ganglia in the head are fused to form the brain, which sends nerves to the eyes, antennae, and other organs of the head. Besides having sensory organs on the head, most insects are covered with tactile hairs that may be sensitive enough to detect air vibrations. Some species also have well-developed hearing organs, such as the tympanic membrane found on the abdomen in grasshoppers.

Reproduction in insects is sexual. The male reproductive system includes two testes, where sperm are produced; ducts that carry sperm from the testes; and a copulatory organ that deposits sperm in the female. The female system has two egg-producing ovaries and a pair of oviducts that unite to form a vagina. The vagina typically serves both for receiving sperm and for depositing eggs; females of some species have an ovipositor, an abdominal appendage used to deposit eggs.

The class Insecta is divided into two subclasses: the Apterygota, which are primitive and wingless and include the silverfish and bristletails (order Thysanura); and the Pterygota, more advanced winged or secondarily wingless (having lost the wings found in earlier forms) creatures that exhibit some degree of metamorphosis in individuals. The Pterygota are divided into 27 living orders, including the beetles and weevils (Coleoptera), flies, midges, gnats, and mosquitoes (Diptera), mayflies (Ephemeroptera), the bugs (Heteroptera), aphids, leafhoppers, and cicadas (Homoptera), bees, wasps, and ants (Hymenoptera), termites (Isoptera), butterflies and moths (Lepidoptera), lacewings (Neuroptera), dragonflies and damselflies (Odonata), grasshoppers, locusts, crickets, and katydids (Orthoptera), fleas (Siphonaptera), thrips (Thysanoptera), and caddis flies (Trichoptera).

Fossils indicate that primitive insects had developed by the Middle Devonian Period (about 380 million years ago). They probably evolved from a wingless terrestrial arthropod. It is believed that winged insects appeared very early in the Carboniferous Period (about 360 million years ago). Periods of explosive evolution, during which large numbers of new forms developed in relatively short spans of time, are thought to have occurred in the Carboniferous and Permian periods, giving rise to the orders known today as well as those known only as fossils.

Insects' life cycle begins with the fertilized egg, from which hatches the larva. Because the rigid exoskeleton does not allow for growth, it must be shed periodically and replaced by a new and larger one produced by a layer of epidermal cells. In the Apterygota the succession of larval stages (called instars) between molts differs little from one to another or from the adult form. In the Pterygota metamorphosis generally occurs; it may be incomplete, meaning that the larva substantially changes form only in the last molt, emerging as an adult with fully formed wings and genitalia, or it may be complete, as in the butterflies, whose larvae molt into a pupal phase and then again into the adult form. The adult insect exists largely to reproduce. Indeed, in some adult insects this singleness of purpose supersedes even eating. Mating behaviour varies widely among insects but frequently involves the production by male or female of powerful chemical attractants known as pheromones.

Insects are found in almost every terrestrial and freshwater habitat. By sheer numbers as well as by diversity of habit they fulfill many important ecological functions. They promote the decay of organic material and the formation of soil; they are instrumental in the pollination of many plants (the insects and the flowering plants, in fact, evolved together); and they are a major part of many food chains. Their interaction with humans is also various. Frequently they are competitors for food, either in the field or in storage; some insects are carriers of crop, livestock, or human disease; some are nuisances; some can infest and destroy buildings, garments, or carpets. On the other hand, insects produce such valuable commodities as honey, silk, wax, and dyes; some are used for human food; some are valuable in controlling populations of other, potentially harmful, species; and some have proved useful in scientific and medical research.

insect wax: *see* Chinese wax.

insecticide, any toxic substance that is used to kill insects. Such substances are used primarily to control pests that infest cultivated plants or to eliminate disease-carrying insects in specific areas.

Insecticides can be classified in any of several ways, on the basis of their chemistry, their toxicological action, or their mode of penetration. In the latter scheme, they are classified according to whether they take effect upon ingestion (stomach poisons), inhalation (fumigants), or upon penetration of the body covering (contact poisons). Most synthetic organic insecticides penetrate by all three of these pathways, however, and hence are better distinguished from each other by their basic chemistry. Besides the synthetic organics, some organic compounds occurring naturally in plants are useful insecticides, as are some inorganic compounds. Most insecticides are sprayed or dusted onto plants and other surfaces traversed or fed upon by insects.

Stomach poisons are toxic only if ingested through the mouth and are most useful against those insects that have biting or chewing mouth parts, such as caterpillars, beetles, and grasshoppers. The chief stomach poisons are the arsenicals—*e.g.,* Paris green (copper acetoarsenite), lead arsenate, and calcium arsenate; and the fluorine compounds, among them sodium fluoride and cryolite. They are applied as sprays or dusts onto the leaves and stems of plants eaten by the target insects. Stomach poisons have gradually been replaced by synthetic organic insecticides, which are less dangerous to humans and other mammals.

Contact poisons penetrate the skin of the pest and are used against those arthropods, such as aphids, that pierce the surface of a plant and suck out the juices. The contact insecticides can be divided into two main groups: naturally occurring compounds and synthetic organic ones. The naturally occurring contact insecticides include nicotine, developed from tobacco; pyrethrum, obtained from flowers of *Chrysanthemum cinerariaefolium;* rotenone, from the roots of *Derris* species and related plants; and oils, from petroleum. Though these compounds were originally derived mainly from plant extracts, the toxic agents of some of them (*e.g.,* pyrethrins) have been synthesized. Natural insecticides are usually short-lived on plants and cannot provide protection against prolonged invasions. Except for pyrethrum, they have largely been replaced by newer synthetic organic insecticides.

The synthetic contact insecticides are now the primary agents of insect control. In general they penetrate insects readily and are toxic to a wide range of species. The main synthetic groups are the chlorinated hydrocarbons, organic phosphates (organophosphates), and carbamates.

The chlorinated hydrocarbons were developed beginning in the 1940s after the discovery (1939) of the insecticidal properties of DDT (*q.v.*). Other examples of this series are BHC, lindane, Chlorobenzilate, methoxychlor, and the cyclodienes (which include aldrin, dieldrin, chlordane, heptachlor, and endrin). Some of these compounds are quite stable and have a long residual action; they are, therefore, particularly valuable where protection is required for long periods. Their toxic action is not fully understood, but they are known to disrupt the nervous system.

The organophosphates are now the largest and most versatile class of insecticides. Two widely used compounds in this class are parathion and malathion; others are Diazinon, naled, methyl parathion, and dichlorvos. They are especially effective against sucking insects such as aphids and mites, which feed on plant juices. The chemicals' absorption into the plant is achieved either by spraying the leaves

or by applying solutions impregnated with the chemicals to the soil, so that intake occurs through the roots. The organophosphates usually have little residual action and are important, therefore, where residual tolerances limit the choice of insecticides. They are generally much more toxic than the chlorinated hydrocarbons. Organophosphates kill insects by inhibiting the enzyme cholinesterase, which is essential in the functioning of the nervous system.

The carbamates are a relatively new group of insecticides that includes such compounds as carbamyl, methomyl, and carbofuran. They are rapidly detoxified and eliminated from animal tissues. Their toxicity is thought to arise from a mechanism somewhat similar to that for the organophosphates.

Fumigants are toxic compounds that enter the respiratory system of the insect through its spiracles, or breathing openings. They include such chemicals as hydrogen cyanide, naphthalene, nicotine, and methyl bromide and are used mainly for killing insect pests of stored products or for fumigating nursery stock.

The advent of synthetic organic insecticides in the mid-20th century made the control of insects and other arthropod pests much more effective, and such chemicals remain essential in modern agriculture despite their environmental drawbacks. By preventing crop losses, raising the quality of produce, and lowering the cost of farming, modern insecticides increased crop yields by as much as 50 percent in some regions of the world in the period 1945–65. They have also been important in improving the health of both humans and domestic animals: malaria, yellow fever, and typhus, among other infectious diseases, have been greatly reduced in many areas of the world through their use.

But the use of insecticides has also resulted in several serious problems, chief among them environmental contamination and the development of resistance in pest species. Because insecticides are poisonous compounds, they may adversely affect other organisms besides harmful insects. The accumulation of some insecticides in the environment can in fact pose a serious threat to both wildlife and humans. Many insecticides are short-lived or are metabolized by the animals that ingest them, but some are persistent, and when applied in large amounts they pervade the environment. When an insecticide is applied, much of it reaches the soil, and groundwater can also become contaminated from direct application or runoff from treated areas. The main soil contaminants are the chlorinated hydrocarbons such as DDT, aldrin, dieldrin, heptachlor, and BHC. Owing to repeated sprayings, these chemicals can accumulate in soils in surprisingly large amounts (10–100 pounds per acre), and their effect on wildlife is greatly increased as they become associated with food chains. The stability of DDT and its relatives leads to their accumulation in the bodily tissues of insects that constitute the diet of other animals higher up the food chain, with toxic effects on the latter. Birds of prey such as eagles, hawks, and falcons are usually most severely affected, and serious declines in their populations have been traced to the effects of DDT and its relatives. Consequently, the use of such chemicals began to be restricted in the 1960s and banned outright in the 1970s in many countries.

Cases of insecticide poisoning of humans also occur occasionally, and the use of one common organophosphate, parathion, was drastically curtailed in the United States in 1991 owing to its toxic effects on farm labourers who were directly exposed to it.

Another problem with insecticides is the tendency of some target insect populations to develop resistance as their susceptible members are killed off and those resistant strains that survive multiply, eventually perhaps to form a majority of the population. Resistance denotes a formerly susceptible insect population that can no longer be controlled by a pesticide at normally recommended rates. Hundreds of species of harmful insects have acquired resistance to different synthetic organic pesticides, and strains that become resistant to one insecticide may also be resistant to a second that has a similar mode of action to the first. Once resistance has developed, it tends to persist in the absence of the pesticide for varying amounts of time, depending on the type of resistance and the species of pest. Insecticides may also encourage the growth of harmful insect populations by eliminating the natural enemies that previously held them in check. The nonspecific nature of broad-spectrum chemicals makes them more likely to have such unintended effects on the abundance of both harmful and beneficial insects.

Because of the problems associated with the heavy use of some chemical insecticides, current insect-control practice combines their use with biological methods in an approach called integrated control. In this approach, a minimal use of insecticide may be combined with the use of pest-resistant crop varieties; the use of crop-raising methods that inhibit pest proliferation; the release of organisms that are predators or parasites of the pest species; and the disruption of the pest's reproduction by the release of sterilized pests.

See also chemosterilant; fumigant; miticide; pest.

insectivore, a member of the mammalian order Insectivora, which includes the shrews, moles, hedgehogs, and other groups. Insectivores are generally small, active, nocturnal mammals that depend on insects for food. They are found in most parts of the world except Antarctica, Australia (where certain marsupials fill similar ecological niches), and South America.

A brief treatment of insectivores follows. For full treatment, *see* MACROPAEDIA: Mammals.

There are nine families of living insectivores: hedgehogs and gymnures (Erinaceidae), moles (Talpidae), shrews (Soricidae), solenodons and almiquis (Solenodontidae), tenrecs (Tenrecidae), otter shrews (Potamogalidae), golden moles (Chrysochloridae), elephant shrews (Macroscelididae), and tree shrews (Tupaiidae; classed by some authorities in the Primates). Fourteen families of extinct insectivores are known from the fossil record. Insectivores exhibit some of the characteristics of primitive placental mammals and are in general not very specialized. For those reasons it is difficult to discern when they first appeared, but tree shrews are found in the fossil record in Early Paleocene times (approximately 65 million years ago).

Although insectivores are a diverse group, certain features of natural history and behaviour are common to many or most species. They are short-lived; the average life span of some shrews has been estimated at six weeks, although one year is probably a more typical figure. They tend to be solitary except during the breeding season and in the temporary association of mother and immature young, and they are frequently territorial. Most insectivores are nocturnal, but tree shrews and elephant shrews are diurnal, and some other groups, such as moles, are apparently active by day and night. Tree shrews and some tenrecs are partly arboreal, and otter shrews and some other species are partly aquatic, but in general insectivores live on the ground.

The most numerous insectivores in terms of species are the shrews, which account for nearly 300 of the 400-odd species. Some shrews are very small, the tiniest of them being the Savi's pygmy shrew (*Suncus etruscus*) of the Mediterranean, whose body measures 35 mm (1.5 inches) in length. Shrews are extremely active, alternating periods of intense feeding with short periods of rest. The amount of food that is eaten daily may exceed double or triple their own body weight. Typically they forage in and on the leaf mold of woodlands, where they construct shallow runways. Shrews tend to be solitary but communicate with each other by various high-pitched squeaks and clicking sounds.

Hedgehogs are stout, spiny animals active at dusk or at night. They take a wide range of food, including such invertebrates as millipedes, insects, and slugs, the young of ground-nesting birds, and fruits and berries. Hedgehogs are able to cope with shortages of food by becoming dormant, a state in which chemical and physiological changes help conserve energy. As a natural defense against predators a hedgehog will roll itself into a ball by contraction of a well-developed skin muscle that acts like the drawstring of a purse. Eleven species of hedgehog are known in the Old World.

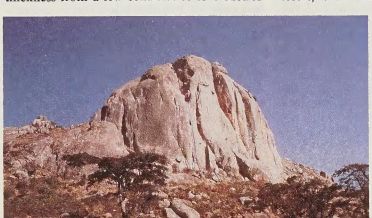
The related moonrats are much larger, about the size of an opossum, and lack spines. The three species live in lowland forests and mangrove swamps in Malaysia. They are recorded as being aggressive, and, when alarmed, they produce a foul smell from secretions of their anal glands.

True moles form a specialized group of burrowing insectivores. The bones of the forelimbs are short and wide and are used in a backward sweeping motion when burrowing. Moles build extensive burrow systems consisting of an underground nest chamber surrounded by concentric rings of tunnels interconnected by radiating tunnels. Mounds of earth often mark their excavations. Moles feed mainly on earthworms. They detect food mainly by smell and touch.

Golden moles have thick top fur and dense underfur with an unusual iridescent bronze sheen. The eyes are vestigial. These moles dig with two large pointed claws on each forefoot together with the snout, which is protected by thick leathery skin. They tend to burrow near the surface. Eleven species of golden mole are known in southern Africa.

The tenrecs live only on Madagascar and the neighbouring Comoros islands. In their isolation the 20 tenrec species exhibit a variety of forms that resemble other families of insectivores—hedgehogs, shrews, water shrews, moles, etc. The common tenrec (*Tenrec ecaudatus*) is one of the largest insectivores, some 41 cm (16 inches) long. Its coat is a mixture of stiff hairs and spines. Most tenrecs are nocturnal and remain during the day in underground burrows. During the dry season, they burrow into the earth and become dormant.

Only two species of solenodon are known from the islands of Cuba and Hispaniola. They are about the size of guinea pigs, with extremely long pointed snouts, small eyes, and large naked ears and tail. As do some other insectivores, they secrete a poisonous saliva used to subdue prey as large as mice. The population of solenodons has declined since the introduction of cats, dogs, and rats to their native islands.

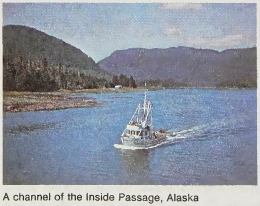


The three species of otter shrews are large amphibious insectivores. Two digits of the hind feet are fused and are thought to be used in grooming. Otter shrews live in tunnels in the banks of streams, and crabs appear to be a favourite item of their food.

The 28 species of elephant shrews resemble long-nosed rodents. Confined to the African continent, many species live among rocky hills and scrubland, but the giant elephant shrews *Petrodomus* and *Rhynchocyon* inhabit tropical forests. Elephant shrews feed mainly on ants.

insectivorous plant: *see* carnivorous plant.

inselberg (from German *insel,* "island," and *berg,* "mountain"), isolated hill that stands



above well-developed plains and appears not unlike an island rising from the sea. Although the term is usually applied generally, it is sometimes restricted to hills that are formed under tropical and subtropical conditions, composed of plutonic rocks such as granite and gneiss and characterized by steep, curved sides of smooth, bare rock. Inselbergs occur as ridges, ranges, or isolated individuals. Their formation is a result of the resistance to erosion by structural irregularities. Bare rock domes, which may stand 450 m (1,500 feet) above the plains, are more specifically called bornhardts and display an onionlike peeling (exfoliation) of concentric rock shells (in thickness from a few centimetres to 6 metres

Granite kopje near Inyanga, Zimbabwe
D.C.H. Plowes

[from about an inch to about 19 feet]) from the surface. A pediment, or low-angle slope slightly concave upward, is usually present at the base of the inselberg; the hill-plain junction is usually quite sharp. In its later stages an inselberg may develop into a kopje (koppie), *i.e.*, a residual hill composed of a pile of large boulders, in form similar to a tor. Isolated hills similar to inselbergs but formed under nontropical conditions are known as monadnocks.

Inside Passage, also called INLAND PASSAGE, or MARINE HIGHWAY, natural sheltered sea route extending for more than 1,000 miles (1,600 km) from Seattle (Wash., U.S.) northwest to Skagway (Alaska, U.S.). It comprises channels and straits between the mainland and islands (including Vancouver Island, British Columbia, Can., and the Alexander Archipelago, Alaska) that protect it from Pacific storms. In most places there is ample depth for all vessels; anchorages are numerous, and extensive surveys have identified practically all hazards to navigation. It is the route generally used by coastal shipping to Alaska and is favoured for its scenic beauty and dependable smoothness. Towns along the passage include Victoria, Vancouver, and Prince Rupert (B.C.) and Ketchikan, Wrangell, Petersburg, and Juneau (Alaska).

insight, in learning theory, immediate and clear learning or understanding that takes place without overt trial-and-error testing behaviour.

A good deal of the scientific knowledge concerning insight phenomena derives from work on animal behaviour that was conducted by the 20th-century German Gestalt psychologist Wolfgang Köhler. In one experiment Köhler placed a banana outside the cage of a hungry chimpanzee, Sultan, and gave the animal two sticks, each too short for pulling in the food but joinable to make a single stick of sufficient length. Sultan alternately tried unsuccessfully to use each stick, and he even used one stick to push the other along to touch the banana. Later, after apparently having given up, Sultan accidentally joined the sticks, observed the result, and immediately ran with the longer tool to retrieve the banana. The solution reappeared immediately when the problem was repeated. This result, however, is ambiguous. A number of already conditioned responses appear to have been brought to the problem, so that the necessary motor skills were already available once Sultan accidentally rearranged the sticks.

Insight is experienced in human learning, of course, but, as with Sultan, only in situations in which already acquired responses are seen to be applicable when the stimulus properties of the situation are rearranged.

Insight is also considered essential to certain methods of psychotherapy, particularly psychoanalysis, in which achieving new understanding of the unconscious motives and bases of pathological behaviour is thought an important step toward recovery.

insolvency, financial condition in which the total liabilities of an individual or enterprise exceed the total assets so that the claims of creditors cannot be paid. There are essentially two approaches in determining insolvency: insolvency in the equity sense and under the balance-sheet approach. Insolvency in the equity sense denotes the inability of the debtor to pay his debts as they become due in the ordinary course of business. Insolvency under the balance-sheet approach means that the total liabilities of the debtor exceed his total assets.

Insolvency is distinguished from bankruptcy in that bankruptcy denotes a particular legal status to be determined and declared by judicial decree. For an individual or a corporation to be declared bankrupt, certain additional requirements, such as committing an act of bankruptcy, for example, are necessary. Thus, insolvency, although an essential factor, is not the sole ingredient necessary in determining bankruptcy.

insomnia, the inability to sleep adequately. Insomnia varies greatly in pattern and degree; the responsible causes may include poor sleeping conditions, circulatory or brain disorders, a breathing disorder known as apnea, psychosomatic disorders such as tension, or other physical or mental distress. Insomnia is not harmful if it is only occasional; the body is readily restored by a few hours of extra sleep. If, however, it is regular or frequent, it may have injurious effects on the other systems and functions of the body.

Treatment of mild insomnia may involve simple improvement of sleeping conditions or such traditional remedies as warm baths, milk, or systematic relaxation. Severe or chronic insomnia may necessitate the temporary use of barbiturates or tranquilizing drugs, hypnosis, or, because many chronic cases are psychogenic, psychotherapy; apnea and its associated insomnia may be treated surgically. The prolonged use of drugs as a relief from frequent or recurring insomnia can have harmful effects. The body tends to build up a tolerance to the soporific qualities of the drug, necessitating more potent dosage; habitual use can lead to addiction.

installment credit, also called INSTALLMENT PLAN, or HIRE-PURCHASE PLAN, in business, credit that is granted on condition of its repayment at regular intervals, or installments, over a specified period of time until paid in full. Installment credit is the means by which most durable goods such as automobiles and large home appliances are bought by individuals. Installment credit involves the extension of credit from a seller (and lender) to a purchaser; the purchaser gets physical possession and use of the goods he has bought, but the seller retains legal title to them until every installment has been paid. The purchaser usually is advanced the goods after making an initial fractional payment called a down payment. If the purchaser defaults on his payments at some point, all previous payments are forfeited to the seller, who may also take possession of the goods.

The appeal of installment buying is that it allows prospective purchasers to enjoy the advantages of owning a relatively expensive good while paying for it gradually out of their future income, instead of having to save the necessary purchase price out of their income first. Installment credit can thus greatly expand the purchasing power of ordinary consumers. Installment credit for the purchase of durable consumer goods first appeared in the furniture industry of the United States in the 19th century. But such credit arrangements only acquired great economic importance around the time of World War I, when they were adopted in the United States on a wide scale in the purchase of automobiles. Installment credit now accounts for the majority of purchases of automobiles, expensive home appliances, and furniture, among other consumer goods.

Specialized companies called finance companies service both the retailers and consumers who use installment arrangements. *See* finance company.

instinct, an involuntary response by an animal to an external stimulus, resulting in a predictable and relatively fixed behaviour pattern.

A brief treatment of instinct follows. For full treatment, *see* MACROPAEDIA: Behaviour, Animal.

Instinctive behaviour is an inherited, adaptive mechanism that serves to promote the survival of an animal or species. It is most apparent in fighting and sexual activity. Certain animal behaviour, such as exploring and play, can be modified, but, in general, inherited behaviour is a sequence of acts that is internally motivated; it may be triggered by external conditions but is only secondarily influenced by them.

The simplest form of instinctive behaviour is the reflex action, or the response of a single organ to a stimulus. Some lower animals are governed by chain reflexes; in millipedes, for example, the motion of one leg stimulates the

motion of another. Most animals, however, are capable of fixed action patterns in which several body systems participate. A number of these fixed patterns lead to one goal, but others may have several functions, such as the distinctive display actions of courtship. Patterns of motor behaviour, such as gesturing and dancing, are also used by insects, birds, and fish to communicate and enable a species to distinguish its signals from those of any other.

Among the fixed action patterns that may be modified by learning processes in some species is nest-building behaviour. Jackdaws, for example, learn how to select appropriate materials through trial and error, but canaries, even ones that have been reared in man-made cloth nests, have an innate ability to choose the right materials and to line the nest with feathers.

All animals have instinct. In general, the higher the animal form, the more flexible the behaviour. Among mammals, learned behaviour often prevails eventually over fixed action patterns, as when a young rat learns through experience to adjust its instinctive heaping and smoothing motions to the appropriate stage of nest building. In humans, behaviour is heavily influenced by the socialization process, and the issue of heredity versus environment continues to be a controversial subject.

Institut Canadien, literary and scientific society that came into conflict with the Roman Catholic church in 19th-century French Canada. Founded in Montreal on Dec. 17, 1844, it soon became a forum for discussing the problems of the day, maintaining the largest free library in Montreal. The membership of the parent organization in Montreal reached 700, and branches were established all over French-speaking Canada.

In general, the Institut Canadien became the centre of a movement critical in tone and liberal in spirit, with neither approval of nor respect for the conservatively orthodox institutionalism of church and state in Quebec. The institute publicly displayed books that were listed by the church as undesirable.

Because of these tendencies, the institute came under attack by ecclesiastical leaders, foremost among whom was Ignace Bourget, bishop of Montreal from 1840 to 1876. By 1858 all the branches of the institute outside Montreal ceased to function, but the parent body refused to change its course and in 1865 appealed to Rome. Meanwhile, in 1868, the other Canadian bishops declared their support of Bourget's position. In 1869 the church formally condemned the movement, and most of its active membership withdrew. The Montreal institute survived until after the end of the century but was no longer particularly influential.

Institut Géographique National (IGN), one of the foremost centres of mapmaking and geographic research in France, specializing in aerial and ground surveys and maps; it is located in Paris. Its origins can be traced to a mapmaking group organized in 1719, the Engineers and Geographers for Armies and Camps, which produced several geodetic and triangulation maps of France. During the reign of Louis XV, the group made the first map of the whole of France, engraved on leather and preserved in the institute's library. The group was reorganized in 1794 as the Polytechnical School and in 1887 was divided into the Geographic Service of the Armies and the Historical Service of the Armies. In 1940 the former was converted into the Institut Géographique National, which in 1967 became a public establishment of the state. The institute administers the National School of Geographic Sciences and has an extensive specialized library. It also has a small fleet of airplanes for aerial surveys.

Institute for ———; *see under* substantive word (*e.g.,* Sex Research, Institute for).

Institutes of the Christian Religion, Latin CHRISTIANAE RELIGIONIS INSTITUTIO, French INSTITUTION DE LA RELIGION CHRÉTIENNE, John Calvin's masterpiece, a summary of biblical theology that became the normative statement of the Reformed faith. It was first published in 1536 and was revised and enlarged by Calvin in several editions before the definitive edition was published in 1559.

The first edition, written in Latin and published in Basel, where Calvin was in exile, included a dedication to the French king Francis I. Calvin intended his work to be a statement of French Protestant beliefs that would refute the king, who was persecuting French Protestants and incorrectly calling them Anabaptists (radical Reformers who wished to separate the church from the state). It consisted of six chapters that discussed the Ten Commandments, the Apostles' Creed, the Lord's Prayer, the sacraments of Baptism and the Lord's Supper, disputed sacraments, and Christian liberty. Most of the themes of Calvin's mature thought were contained in the first edition.

The first French edition, prepared by Calvin and published in Basel in 1541, was the first great work in argumentative French prose. It influenced French thought and literary style.

The final edition, in Latin and published in Geneva in 1559, was more than four times longer than the first edition. It was organized into four books concerning Creator, Redeemer, Spirit, and church. The dominating themes dealt with God's sovereignty, his grace, and his redemption of undeserving sinners. This edition was published in French (1560), in English (1561), and eventually in many other languages.

institutional economics, also called INSTITUTIONALISM, school of economics that flourished in the United States during the 1920s and '30s. It viewed the evolution of economic institutions as part of the broader process of cultural development.

American economist Thorstein Veblen laid the foundation for institutional economics with his criticism of traditional static economic theory. He tried to replace the concept of people as the makers of economic decisions with the idea that people are continually affected by changing customs and institutions. Veblen saw the primary motive of the American economic system as pecuniary rather than technological: business enterprise, he believed, was carried on for the amassing of money rather than the production of goods. Another economist commonly associated with the institutional school was John R. Commons, best known for his labour research. He emphasized the collective action of various groups in the economy and their operation within a system of continually evolving institutions and laws. Although institutionalism never became a major school of economic thought, its influence has continued, particularly in the works of economists seeking to explain economic problems from a perspective that incorporates social and cultural phenomena.

Institutional Revolutionary Party, Spanish PARTIDO REVOLUCIONARIO INSTITUCIONAL (PRI), Mexican political party that dominated the country's political institutions from its founding in 1929 until the end of the 20th century. Virtually all important figures in Mexican national and local politics belonged to the party. Originally called the National Revolutionary Party (Partido Revolucionario Nacional), it was renamed the Mexican Revolutionary Party (Partido de la Revolución Mexicana) in 1938 and took its current name in 1946.

The PRI was founded by former president Plutarco Elías Calles in a period of conflict with the Roman Catholic church, rebellion in the military, and disputes with the United States. The party leadership—a coalition of regional and local political-military bosses and labour and peasant leaders—represented the new power structure that had emerged as a result of the Mexican Revolution (1910–20). This coalition sought a more conservative evolution (though often under "revolutionary" guises) and more stability in government. Control of the party was exercised by the Central Executive Committee, whose chief was selected by the president of Mexico and was entrusted with the task of approving party nominees for all important elective positions except the presidency. The incumbent president, who under the Mexican constitution could serve only one term, selected his own successor.

The establishment of the PRI shifted power from political-military chieftains to state party units and to sectors of the party representing peasants, urban labourers, and the military. Pres. Lázaro Cárdenas (1934–40) enhanced the authority of the peasant wing of the party and balanced existing party sectors with a so-called popular sector representing disparate groups such as civil servants, the professions, small businessmen, small farmers, artisans, youth, and women. Under Cárdenas, the PRI established a large patronage system that doled out benefits in return for political support. Cárdenas also attracted party support by introducing land reform and nationalizing the oil industry (1930). Although the PRI was widely popular, it occasionally resorted to repression and—according to its critics—electoral fraud.

In the late 1970s the party's political monopoly was threatened when opposition parties gained a few seats in the Chamber of Deputies. The PRI remained in the majority but continued to lose congressional seats in later elections. In 1988 opposition candidates won 4 of the 64 Senate seats—the first time in 59 years that the PRI conceded losing a Senate election—and in the same year the PRI's presidential candidate, Carlos Salinas de Gortari, won the general election by what was then the narrowest margin in the party's history. In 1989 the PRI lost its first state gubernatorial race. Several states elected non-PRI governors in the mid- and late 1990s, and in 1997 a non-PRI candidate captured the mayoralty of Mexico City.

In 1994 Salinas' hand-picked successor, Luis Colosio, was assassinated, and the party subsequently chose as its presidential candidate Ernesto Zedillo. Although Zedillo won the election comfortably, his margin of victory was even narrower than that of Salinas. In 1999 Zedillo broke from tradition by refusing to nominate a successor. In the following year Francisco Labastida, the PRI's candidate, was defeated for the presidency by Vicente Fox of the National Action Party. Thus ended the PRI's 71-year period of continuous rule.

Instruction of Catherine the Great: *see* Catherine the Great, Instruction of.

instrument landing system (ILS), electronic guidance system designed to help airline pilots align their planes with the centre of a landing strip during final approach under conditions of poor visibility. The ground equipment of the ILS consists of two directional transmitters that send out radio beams, sometimes of microwave frequencies (*i.e.,* frequencies of more than 1,000 MHz), from either side of the runway's centreline. The radio pulses are picked up by instruments on the plane and then processed and converted into precise directional and altitude information. These data are shown on an instrument display in the form of horizontal and vertical lines, which enable the pilot to determine his exact position in relation to the runway and maneuver his craft into proper alignment with it. The

ILS can be tied into a plane's automatic pilot, whereby ground-based instruments guide the plane into position while those on the aircraft control airspeed by means of an automatic throttle. The instrument landing system was introduced in 1929 and was approved and adopted by the International Civil Aviation Organization (*q.v.*) in 1949.

Instrument of Government (English constitution, 1653): *see* Government, Instrument of.

instrumentalism, also called EXPERIMENTALISM, a philosophy advanced by the American philosopher John Dewey holding that what is most important in a thing or idea is its value as an instrument of action and that the truth of an idea lies in its usefulness. Dewey favoured these terms over the term pragmatism to label the philosophy on which his views of education rested. His school claimed that cognition has evolved not for speculative or metaphysical purposes but for the practical purpose of successful adjustment. Ideas are conceived as instruments for transforming the uneasiness arising from facing a problem into the satisfaction of solving it.

instrumentation, in technology, the development and use of precise measuring equipment. Although the sensory organs of the human body can be extremely sensitive and responsive, modern science and technology rely on the development of much more precise measuring and analytical tools for studying, monitoring, or controlling all kinds of phenomena.

Some of the earliest instruments of measurement were used in astronomy and navigation. The armillary sphere, the oldest known astronomical instrument, consisted essentially of a skeletal celestial globe whose rings represent the great circles of the heavens. The armillary sphere was known in ancient China; the ancient Greeks were also familiar with it and modified it to produce the astrolabe, which could tell the time or length of day or night as well as measure solar and lunar altitudes. The compass, the earliest instrument for direction finding that did not make reference to the stars, was a striking advance in instrumentation made about the 11th century. The telescope, the primary astronomical instrument, was invented about 1608 by the Dutch optician Hans Lippershey and first used extensively by Galileo.

Instrumentation involves both measurement and control functions. An early instrumental control system was the thermostatic furnace developed by the Dutch inventor Cornelius Drebbel (1572–1634), in which a thermometer controlled the temperature of a furnace by a system of rods and levers. Devices to measure and regulate steam pressure inside a boiler appeared at about the same time. In 1788 the Scotsman James Watt invented a centrifugal governor to maintain the speed of a steam engine at a predetermined rate.

Instrumentation developed at a rapid pace in the Industrial Revolution of the 18th and 19th centuries, particularly in the areas of dimensional measurement, electrical measurement, and physical analysis. Manufacturing processes of the time required instruments capable of achieving new standards of linear precision, met in part by the screw micrometer, special models of which could attain a precision of 0.000025 mm (0.000001 inch). The industrial application of electricity required instruments to measure current, voltage, and resistance. Analytical methods, using such instruments as the microscope and the spectroscope, became increasingly important; the latter instrument, which analyzes by wave length the light radiation given off by incandescent substances, began to be used to identify the composition of chemical substances and stars.

In the 20th century the growth of modern industry, the introduction of computerization, and the advent of space exploration have spurred still greater development of instrumentation, particularly of electronic devices. Often a transducer, an instrument that changes energy from one form into another (such as the photocell, thermocouple, or microphone) is used to transform a sample of the energy to be measured into electrical impulses that are more easily processed and stored. The introduction of the electronic computer in the 1950s, with its great capacity for information processing and storage, virtually revolutionized methods of instrumentation, for it allowed the simultaneous comparison and analysis of large amounts of information. At much the same time, feedback systems were perfected in which data from instruments monitoring stages of a process are instantaneously evaluated and used to adjust parameters affecting the process. Feedback systems are crucial to the operation of automated processes.

Most manufacturing processes rely on instrumentation for monitoring chemical, physical, and environmental properties, as well as the performance of production lines. Instruments to monitor chemical properties include the refractometer, infrared analyzers, chromatographs, and pH sensors. A refractometer measures the bending of a beam of light as it passes from one material to another; such instruments are used, for instance, to determine the composition of sugar solutions or the concentration of tomato paste in catsup. Infrared analyzers can identify substances by the wavelength and amount of infrared radiation that they emit or reflect. Chromatography, a sensitive and swift method of chemical analysis used on extremely tiny samples of a substance, relies on the different rates at which a material will adsorb different types of molecules. The acidity or alkalinity of a solution can be measured by pH sensors.

Instruments are also used to measure physical properties of a substance, such as its turbidity, or amount of particulate matter in a solution. Water purification and petroleum-refining processes are monitored by a turbidimeter, which measures how much light of one particular wavelength is absorbed by a solution. The density of a liquid substance is determined by a hydrometer, which measures the buoyancy of an object of known volume immersed in the fluid to be measured. The flow rate of a substance is measured by a turbine flowmeter, in which the revolutions of a freely spinning turbine immersed in a fluid are measured, while the viscosity of a fluid is measured by a number of techniques, including how much it dampens the oscillations of a steel blade.

Instruments used in medicine and biomedical research are just as varied as those in industry. Relatively simple medical instruments measure temperature, blood pressure (sphygmomanometer), or lung capacity (spirometer). More complex instruments include the familiar X-ray machines and electroencephalographs and electrocardiographs, which detect electrical signals generated by the brain and heart, respectively. Two of the most complex medical instruments now in use are the CAT (computerized axial tomography) and NMR (nuclear magnetic resonance) scanners, which can visualize body parts in three dimensions. The analysis of tissue samples using highly sophisticated methods of chemical analysis is also important in biomedical research.

instrumentation, also called ORCHESTRATION, in music, arrangement or composition of music for instruments. The word orchestration usually indicates music written for an orchestra, and in that sense, it is a narrower term than instrumentation, which can be applied to non-Western musical ensembles as well as to instrumentation for musical groups that are not strictly orchestral.

A brief treatment of instrumentation follows. For full treatment, *see* MACROPAEDIA: Music, Art of.

In most cases instrumentation is part of the business of composition, but there are occasions when the two activities are carried out by different performing traditions, as with Wolfgang Amadeus Mozart's arrangement of George Frideric Handel's *Messiah,* or the orchestral versions of works by Johann Sebastian Bach created in the early part of the 20th century by Sir Edward Elgar, Arnold Schoenberg, and many others. Conductors may also decide to alter the instrumentation of works that they perform, though this practice finds less favour now than it did in earlier times. In the field of light music, however, there is frequently a degree of specialization, with the composer providing the tune, and the arranger the harmony and orchestral colour.

The history of instrumentation is inevitably bound up with the history of the orchestra, which had its beginnings in the early part of the 17th century. In his opera *Orfeo,* Claudio Monteverdi gave suggestions for the use of a large ensemble of bowed string, plucked string, wind, and keyboard instruments, but this was unusual, and he did not indicate the use of the instruments in any detail. His chamber drama *Il combattimento di Tancredi e Clorinda* ("The Combat of Tancredi and Clorinda") is one of the earliest works in which the instrumentation is specified by means of a score, though here for only four lines of strings.

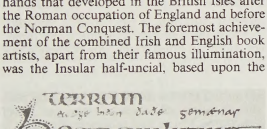
Ever since Monteverdi's time the strings have been regarded as the foundation of the orchestra, to which composers in the 18th century often added oboes, bassoons, and horns. Other instruments were reserved generally for particular occasions: trombones to suggest solemnity, for instance, or trumpets and drums to add a martial tone. Toward the end of the 18th century, however, these instruments began to be used more frequently without such associations. The orchestra also grew with the introduction of clarinets. These were specially favoured by Mozart, for instance, whose scoring for wind instruments has not been surpassed.

Improvements in instrument design during this same period also increased the flexibility of the wind instruments, and by Ludwig van Beethoven's time the orchestra had achieved the standard composition it still adheres to, with strings in five parts (two of violins, one each of violas, cellos, and double basses) joined by a woodwind family of flutes, oboes, clarinets, and bassoons, a brass group of horns, trumpets, and trombones, and timpani. It is this ensemble that provides the mass effects of Beethoven's *Fifth Symphony* and the delicacy of his *Pastoral Symphony* and Franz Schubert's *Great Symphony.*

Further developments were at hand. Carl Maria von Weber began to exploit the possibilities of the orchestra for pictorial imagery and its ability to suggest darkness, woodland scenes, and extremes of weather, especially in his opera *Der Freischütz* ("The Freeshooter"). Hector Berlioz emboldened the illustrative manner of Weber and added new instruments to the orchestra for special effects—for example, the harps, English horn, bells, and other percussion instruments in his *Symphonie fantastique.* He also wrote one of the first treatises on orchestration.

This new awareness of the orchestra's potential was shared by most composers later in the century: particularly Franz Liszt, Richard Wagner, Peter Ilich Tchaikovsky, and Richard Strauss. Others, notably Robert Schumann and Johannes Brahms, have been seen as less successful orchestrators, but only because their music does not, in the main, make a

special feature of variety of colour. In truth, the sober gradations of Brahms are as skillful as the vivid tone pictures of Strauss's scoring.



It became common practice in the 19th century for composers to write out works in some kind of draft, perhaps for piano, and then orchestrate them later. Many composers in the 20th century, however, have used the orchestra so subtly and variedly that they have needed to compose directly in orchestral score, without any intermediate stage. In this case, instrumentation becomes inextricably part of the act of composition: it would seem to be so, for example, in the music of Claude Debussy. There are others, such as Maurice Ravel and Olivier Messiaen, who have seen instrumentation as quite separate and have even orchestrated works of their own that were originally created for keyboard. If, however, instrumentation is the art of finding new sounds within a fixed body of instruments, arguably the greatest master of it in the 20th century is Igor Stravinsky.

Insubres, the most powerful Celtic people of Gallia Cisalpina (Cisalpine Gaul), in northern Italy. Despite their defeat at Clastidium (modern Casteggio) by Roman forces in 222 BC, they continued to be troublesome and aided the Carthaginian general Hannibal in the Second Punic War (218–201 BC). The Insubres were finally subdued in 196 BC and gradually lost their identity in the rise of municipal communities. They were granted Latin rights in 89 BC and full Roman citizenship 40 years later.

insula (Latin: "island"), in architecture, block of grouped but separate buildings or a single structure in ancient Rome and Ostia. The *insulae* were largely tenements providing economically practical housing where land values were high and population dense. Distinct from the *domus,* the upper-class private residence, they were inhabited primarily by the labouring class.

Insulae were constructed of brick covered with concrete and were often five or more stories high despite laws limiting them to 68 feet (21 metres), under Augustus, and then 58 ft, under Trajan. The street level characteristically housed artisans' workshops and commercial establishments. The residences above were reached by an interior common staircase, receiving light and air from the street and an inner court. Many *insulae* were encircled with open or enclosed balconies of wood or concrete. Pumping devices could raise water only to lower apartments; tenants of higher apartments had to use public water and sanitary facilities. Cheap construction and a limited water supply caused frequent collapses and serious fires.

Insular script, in calligraphy, any of several hands that developed in the British Isles after the Roman occupation of England and before the Norman Conquest. The foremost achievement of the combined Irish and English book artists, apart from their famous illumination, was the Insular half-uncial, based upon the

Insular script from the Lindisfarne Gospels. Hiberno-Saxon, c. 700 (British Library, Cotton Nero D. IV)

Reproduced by permission of the British Library

standard uncial writing but admitting such cursive features as ascenders (*b, d, f, h, l*), descenders (*f, g, p, q*), and connections between letters. The Lindisfarne Gospels and the Book of Kells are its most famous landmarks. A second distinctive Insular script was the pointed minuscule that, by the 8th century, was beginning to attain the status of a book hand, as witness the Venerable Bede in his *Historia ecclesiastica gentis Anglorum* ("Ecclesiastical History of the English People"), written in about 731. Both Insular scripts were carried to the Continent by missionaries and used throughout Europe.

insulator, any of various substances that block or retard the flow of electrical or thermal currents.

A brief treatment of insulators follows. For full treatment, *see* MACROPAEDIA: Matter: Its Properties, States, Varieties, and Behaviour.

Although an electrical insulator is ordinarily thought of as a nonconducting material, it is in fact better described as a poor conductor or a substance of high resistance to the flow of electric current. Different insulating and conducting materials are compared with each other in this regard by means of a material constant known as resistivity. *See also* semiconductor.

Electrical insulators are used to hold conductors in position, separating them from one another and from surrounding structures. They form a barrier between energized parts of an electric circuit and confine the flow of current to wires or other conducting paths as desired. The insulation of electrical circuits is a necessary requirement for the successful operation of all electrical and electronic apparatus. Various types of materials are used as electrical insulators, the selection being made primarily on the basis of the specific requirements of each application. The copper conductors utilized in the electrical wiring of homes and industrial plants are insulated from each other and from the building by rubber or plastics. Overhead power lines are supported on porcelain insulators that are unaffected by outdoor exposure. Large electric generators and motors that operate at high voltages and high temperatures are frequently insulated with mica. In some applications, solid insulation is employed in conjunction with liquid or gaseous insulation. In high-voltage transformers, for example, solid insulation provides mechanical rigidity, while oil or other liquid substances contribute to increased insulation strength and serve to remove heat from the equipment. In the microscopic structures of integrated circuits, insulating materials such as silicon nitride may be employed in thicknesses as small as a micron.

Thermal insulating materials include fibreglass, cork, and rock wool, a mineral wool that is produced by blowing a jet of steam through molten siliceous rock or limestone or through slag. These and other substances of low thermal conductivity retard the rate of heat flow. They break up the heat-flow path by their opacity to radiant heat and by interposing numerous air spaces. Thermal conductivity is usually not constant for any given material but varies with temperature. Conductivity decreases with increasing temperature in most metals and other crystalline solids, but it increases in amorphous substances such as glass.

insulin, hormone that regulates the level of sugar (glucose) in the blood and is produced by the beta cells of the islets of Langerhans in the pancreas. Insulin is secreted when the level of blood glucose rises—as after a meal. When the level of blood glucose falls, secretion of insulin stops, and the liver releases glucose into the blood.

Insulin is a simple protein in which two polypeptide chains of amino acids are joined by disulfide linkages. Insulin helps transfer glucose into cells so that they can oxidize the glucose to produce energy for the body. In adipose (fat) tissue, insulin facilitates the storage of glucose and its conversion to fatty acids. Insulin also slows the breakdown of fatty acids. In muscle it promotes the uptake of amino acids for making proteins. In the liver it helps convert glucose into glycogen (the storage carbohydrate of animals) and it decreases gluconeogenesis (the formation of glucose from noncarbohydrate sources). The action of insulin is opposed by glucagon, another pancreatic hormone, and by epinephrine.

Inadequate production of insulin is responsible for the condition called diabetes mellitus. Severe diabetics require periodic injections of insulin, which is extracted from the pancreas of pigs, sheep, and oxen. Insulin was first isolated as a pancreatic extract in 1921 by the Canadian scientists Sir Frederick G. Banting and Charles H. Best. By the early 1980s certain strains of bacteria had been genetically modified to produce human insulin.

Insull, Samuel (b. Nov. 11, 1859, London—d. July 19, 1938, Paris), British-born American public utilities magnate whose vast Midwest holding company empire collapsed in the 1930s.

After working with one of Thomas A. Edison's London representatives, Insull went to the United States in 1881 to become Edison's private secretary. When the Edison General Electric Company was formed in Schenectady, N.Y., in 1889, Insull became a vice president. Three years later he became president of the Chicago Edison Company.

By 1907 all of Chicago's electricity was provided by Insull's firm, now the Commonwealth Edison Company. Use of central power stations brought extension of his electrical power system to most of Illinois and parts of neighbouring states by 1917. His systems grew rapidly during the 1920s, not only because of central stations but also as a result of his formation of holding companies, the first of which was Middle West Utilities (1912). After Insull's vigorous promotion of such companies' stocks, various circumstances related to the Depression brought about the collapse of his top companies, which went into receivership in 1932. Insull fled to Europe and fought to escape extradition. He was returned to Chicago in 1934 and tried three times for fraud, violation of federal bankruptcy laws, and embezzlement, but he was acquitted each time. He spent most of the rest of his life in Europe.

insurance, a contract for reducing losses from accident incurred by an individual party through a distribution of the risk of such losses among a number of parties. In return for a specified consideration, the insurer undertakes to pay the insured or his beneficiary some specified amount in the event that the insured suffers loss through the occurrence of a contingent event covered by the insurance contract or policy. By pooling both the financial contributions and the "insurable risks" of a large number of policyholders, the insurer is typically able to absorb losses incurred over any given period much more easily than would the uninsured individual. While the destruction of an automobile in a traffic accident imposes a heavy financial loss on an individual, for example, one such loss is of relatively small consequence to an insurer who is collecting sufficient premiums on a large number of automobiles.

A brief treatment of insurance follows. For full treatment, *see* MACROPAEDIA: Insurance.

"Insurable risks" constitute a subclass of all risks to persons and property and have the following characteristics: first, the risks must be such that pooling is both feasible and advantageous to the two parties. This means that the accidents insured against must be of sufficient frequency and similarity to allow for reasonably precise statistical estimation of the liabilities the insurer can expect to suffer

across the entire group of those insured; that the losses resulting must be potentially so severe as to produce an incentive for the insured to insure against them; and that the accidents covered must not be so probable as to minimize (through exorbitant premiums) the advantage gained by the individual in pooling his risks with those of others. Second, the class of insured objects must be such that the likelihood of their simultaneous destruction is minimized. (Historically, many fire insurance companies failed through the overconcentration of their policyholders in one particular city or even neighbourhood, in an era of frequent citywide conflagrations.) Third, the possible losses must be truly accidental in nature and not such that the insured could cause them to occur. Fourth, the risks covered by the insurance contract must be such as to allow for determination of whether and to what degree losses have in fact been incurred as a result of accidents insured against. Moreover, the insurance agreement must meet the more general requirements of the law of contracts, such as the legal competence of the two parties, legality of purpose, and so on.

There are many different kinds of insurance. Their diversity may most easily be seen by considering them under the three overlapping categories of objects insured, contingencies insured against, and manner of payment for both premiums and benefits. Objects insured may be further divided between property and person (including "corporate persons" such as incorporated businesses). Property insured includes almost every form of tangible property: personal effects, homes and other real estate, bank deposits, automobiles, plate-glass windows, airplanes and ships, all manner of goods in transit, and so on. Aspects of the person insured include life and limb, health, employment and ability to work, retirement income, and, for businesses, assets subject to employee fraud and embezzlement, to name only a few. Contingencies insured against include a large variety of natural accidents such as fire, explosion, flood, wind, lightning, earthquake, disease, and so on, as well as a very large class of contingencies arising from legal liability for negligent behaviour, among which are professional malpractice, debtor insolvency, personal accidents, and even personal liability of corporate directors for mismanagement of a corporation. The manner of payment of premiums and benefits varies somewhat from policy to policy in any area of insurance, but the most significant variations are to be found in the numerous forms of life insurance. Term insurance, under which a person is covered for a fixed contribution over a fixed period of years, has much the same form as any type of casualty insurance, in that no associated benefits are accrued. Whole life insurance typically requires premiums for a fixed period of years and stays in effect throughout the life of the insured or until maturation, accumulating a cash value along the way. Universal life policies, which have tended to replace endowment contracts, offer a combination of savings and insurance protection so configured that the policyholder may increase or decrease each of the two elements as savings or death-protection needs change over the owner's life. Annuities differ from life insurance in that these contracts are used to liquidate a principal sum rather than provide a death benefit. The life insurer pays the owner at regular intervals an income composed of both interest and principal so designed that the owner will not outlive the income. The policy anticipates that the principal sum will have been exhausted by the time of the owner's death.

The earliest forms of insurance were the so-called bottomry contracts on shipping, which have been discovered in cuneiform records dating as far back as the third millennium BC. This type of insurance normally took the form of a loan to the shipowner, the repayment of which was made contingent on the safe completion of the voyage. The development of the bottomry contract into full-fledged marine insurance and likewise its extension to land journeys began in the late European Middle Ages as a consequence of and spur to the expansion of long-distance trading.

The next form of insurance to emerge was fire insurance, encouraged by London merchants in response to the Great Fire of 1666. By this time the joint stock company was an established legal form, and many of the new fire insurance companies adopted this structure. Others (the mutual insurance societies) retained the outward form of mutual self-help traditional to the medieval urban guilds. The 17th century saw a proliferation of fire and (as the sciences of demography and statistics emerged) life insurance organizations on a corporate basis, in contrast to the more or less ad hoc syndicates of underwriters providing marine insurance in earlier periods. (Lloyd's of London, perhaps the world's most renowned insurance establishment, is unique in its retention of the latter form.)

Casualty insurance further expanded in the 19th century to cover the implements and products of new industrial technologies: steam engines and boilers, railroads, plate-glass windows, and so on. In the late 19th and early 20th centuries, the growing political power of workers and labour unions helped foster various forms of social insurance, such as social security, workers' compensation, unemployment and disability insurance, and health insurance. Another feature of the insurance industry in the 20th century has been the greatly expanded role of various liability insurance contracts, notably those for automobiles.

intaglio, in sculpture, work in which the design is incised into the block, all lines appearing below the surface; it is thus the opposite of relief sculpture and is sometimes called "hollow relief." When the technique is used in casting, the design is cut in reverse into a plaster shell, which is then filled with the casting substance; the hollow impressions of the mold appear in relief on the cast. The most common use of intaglio is for engraved seals and precious stones, which are formed to produce a positive imprint when pressed into a plastic material such as heated wax. This form of intaglio has been used since antiquity, an example being Mesopotamian cylinder seals.

intaglio, in visual arts, one of the four major classes of printmaking techniques, distinguished from the other three methods (relief printing, stenciling, and lithography) by the fact that the ink forming the design is printed only from recessed areas of the plate. Among intaglio techniques are engraving, etching, drypoint, aquatint, and mezzotint (*qq.v.*).

Intaglio printing is the opposite of relief printing, in that the printing is done from ink that is below the surface of the plate. The design is cut, scratched, or etched into the printing surface or plate, which can be copper, zinc, aluminum, magnesium, plastics, or even coated paper. The printing ink is rubbed into the incisions or grooves, and the surface is wiped clean. Unlike surface printing, intaglio printing—which is actually a process of embossing the paper into the incised lines—requires considerable pressure. Intaglio processes are probably the most versatile of the printmaking methods, as various techniques can produce a wide range of effects.

Virtually all intaglio plates are printed by similar means, using a roller press. This is essentially composed of two bearing rollers with a movable flatbed sandwiched horizontally between them. A viscous ink is forced into the incisions of the intaglio plate with a roller, and the excess ink is wiped away. The inked plate is laid face up on the bed, a sheet of wet printing paper is laid over it, and a blanket (to ensure even pressure) is draped over them both. Then the upper roller of the press is turned and the bed is drawn through; a pressure of several tons transmitted through the blanket presses the wet paper into the ink-filled crevices of the plate, thus producing the printed image.

Intef II, also called WAHANKH INTEF (fl. 21st century BC), third king of the 11th dynasty (2081–1939 BC) in Egypt, who, during his long reign, successfully warred against the allies of the Heracleopolitans—rulers of Middle and Lower (northern) Egypt composing the 9th and 10th dynasties.

In 2065 BC Intef II succeeded his father, who had declared his independence of the Heracleopolitans and gathered the five southernmost nomes (administrative districts) of Upper Egypt under his leadership. Intef II started his reign with a vigorous thrust northward; his tomb inscription suggests that he expanded his kingdom by conquest, thus acquiring two very important areas—Abydos, the chief religious centre (sacred to Osiris) of the Middle Kingdom, and the Thinite nome, home of the earliest kings of a united Egypt. Perhaps following this successful war, Intef concluded peace with the Heracleopolitans. After a prosperous reign of 50 years, Intef was buried in a tomb in western Thebes.

integral, in mathematics, either a numerical value equal to the area under the graph of a function for some interval (definite integral) or a new function the derivative of which is the original function (indefinite integral). These two meanings are related by the fact that a definite integral of any function that can be integrated can be found using the indefinite integral and a corollary to the fundamental theorem of calculus. The definite integral (also called Riemann integral) of a function $f(x)$ is denoted as

$$\int_a^b f(x)\,dx$$

(*see* integration [for symbol]) and is equal to the area of the region bounded by the curve (if the function is positive between $x = a$ and $x = b$) $y = f(x)$, the x-axis, and the lines $x = a$ and $x = b$. An indefinite integral, sometimes called an antiderivative, of a function $f(x)$, denoted by

$$\int f(x)\,dx,$$

is a function the derivative of which is $f(x)$. Because the derivative of a constant is zero, the indefinite integral is not unique. The process of finding an indefinite integral is called integration.

integral equation, in mathematics, equation in which the unknown function to be found lies within an integral sign. An example of an integral equation is

$$f(x) = \int_{-\infty}^{\infty} \cos(xt)\,\varphi(t)\,dt,$$

in which $f(x)$ is known; if $f(x) = f(-x)$ for all x, one solution is

$$\varphi(x) = \frac{2}{\pi}\int_0^{\infty} \cos(ux)\,f(u)\,du.$$

integral transform, mathematical operator that produces a new function $f(y)$ by integrating the product of an existing function $F(x)$ and a so-called kernel function $K(x, y)$ between suitable limits. The process, which is called transformation, is symbolized by the equation $f(y) = \int K(x, y)F(x)dx$. Sev-

eral transforms are commonly named for the mathematicians who introduced them: in the Laplace transform, the kernel is $\exp(-xy)$ and the limits of integration are zero and plus infinity; in the Fourier transform, the kernel is $(2\pi)^{-1/2}\exp(-ixy)$ and the limits are minus and plus infinity. (*See also* Fourier transform; Laplace transform.)

The value of integral transforms lies in the simplification that they bring about, most often in dealing with differential equations subject to particular boundary conditions. Proper choice of the class of transformation usually makes it possible to convert not only the derivatives in an intractable differential equation, but the boundary values, as well, into terms of an algebraic equation that can be easily solved. The solution obtained is, of course, the transform of the solution of the original differential equation, and it is necessary to invert this transform to complete the operation. For the common transformations, tables are available that list many functions and their transforms.

integrated circuit (IC), also called MICROCIRCUIT, an assembly of electronic components, fabricated as a single unit, in which active semiconductor devices (transistors and diodes) and passive devices (capacitors and resistors) and their interconnections are built up on a chip of material called a substrate (most commonly made of silicon). The circuit thus consists of a unitary structure with no connecting wires. The individual circuit elements are microscopic in size.

A brief treatment of integrated circuits follows. For full treatment, *see* MACROPAEDIA: Electronics.

During World War II the need to reduce the size of electronic equipment spurred engineers to study methods of miniaturizing circuit construction. Printing was used for the first time in circuit construction; electronic parts mounted on a ceramic block were connected by printed patterns etched in a metal foil bonded to the block. The invention of the transistor in 1947 revolutionized electronic circuits in a number of ways. It was not only the first solid-state device capable of amplification, but it also demonstrated some of the vast potential of semiconductors. It could also be made extremely small. Transistors were quickly adopted for use in printed circuitry. The first circuit in which at least one element was contained within the substrate itself, called a monolithic integrated circuit, was demonstrated in 1958. By the end of the decade the basic techniques and equipment for circuit integration were available.

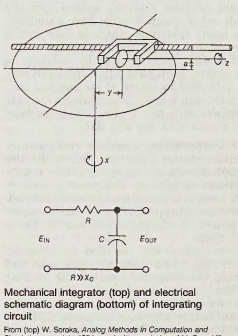
Early ICs consisted of about 10 individual components on a silicon chip 3 mm (0.12 inch) square. The development of large-scale integration (LSI) during the early 1970s made it possible to pack thousands of transistors and other components on a chip of roughly the same size. This technology gave rise to the microprocessor, an IC that contains all the arithmetic, logic, and control circuitry needed to carry out the functions of a digital computer's central processing unit. Very large-scale integration (VLSI), developed during the 1980s, has vastly increased the circuit density of microprocessors (as well as of memory and support chips). This technology has yielded microprocessors containing more than 20,000,000 transistors on a chip less than 2 cm (0.79 inch) square.

There are several types of integrated circuits. Monolithic integrated circuits, also called semiconductor, or silicon integrated, circuits, are formed by the superposition of layers of materials in various patterns to form a single, three-dimensional block of circuitry. The circuit elements are formed by the particular patterns and topology of conducting, semiconducting, and insulating layers that have been used in building up the structure.

The range of electronic functions that can be performed by integrated circuits is vast and includes digital circuits, such as the logic circuits used in computers, and analog circuits, such as those used in amplifiers. In many areas of application, the performance of integrated circuitry is far superior to that of conventional circuits. Because of their small size, low power requirements and heat generation, modest cost, reliability, and speed of operation, they make possible electronic systems that would otherwise be impractical. Most important, computer technology would be severely restricted without the capabilities of integrated circuits.

Integrated circuitry continues to grow in sophistication and complexity even as it shrinks in size. Cost effectiveness and mass production have made the technology available to all levels of the electronics industry. The revolution in consumer electronics, manifested in the enormous popularity of such devices as self-focusing cameras, programmable microwave ovens, and personal computers, would have been unthinkable without integrated circuitry.

integration, in mathematics, technique of finding a function $g(x)$ the derivative of which, $Dg(x)$, is equal to a given function $f(x)$. This is indicated by the integral sign "$\int$," as in $\int f(x)$, usually called the indefinite integral of the function. (The symbol dx is usually added, which merely identifies x as the variable.) The definite integral, written



$$\int_a^b f(x)\,dx$$

with a and b called the limits of integration, is equal to $g(b) - g(a)$, where $Dg(x) = f(x)$.

Some antiderivatives can be calculated by merely recalling which function has a given derivative, but the techniques of integration mostly involve classifying the functions according to which types of manipulations will change the function into a form the antiderivative of which can be more easily recognized. For example, if one is familiar with derivatives, the function $1/(x+1)$ can be easily recognized as the derivative of $\log_e(x+1)$. The antiderivative of $(x^2+x+1)/(x+1)$ cannot be so easily recognized, but if written as $x(x+1)/(x+1) + 1/(x+1) = x + 1/(x+1)$, it then can be recognized as the derivative of $x^2/2 + \log_e(x+1)$. One useful aid for integration is the theorem known as integration by parts. In symbols, the rule is $\int f Dg = fg - \int g Df$. That is, if a function is the product of two other functions, f and one that can be recognized as the derivative of some function g, then the original problem can be solved if one can integrate the product gDf. For example, if $f = x$, and $Dg = \cos x$, then $\int x \cdot \cos x = x \cdot \sin x - \int \sin x = x \cdot \sin x - \cos x + C$. Integrals are used to evaluate such quantities as area, volume, work, and, in general, any quantity that can be interpreted as the area under a curve.

integrator, instrument for performing the mathematical operation of integration, important for the solution of differential and integral equations and the generation of many mathematical functions.

The earliest integrator was a mechanical instrument called the planimeter (*q.v.*). The illustration (top) shows a simple mechanical integrator of the disk-and-wheel variety, which has essential parts mounted on mutually perpendicular shafts, with a means of positioning the wheel in frictional contact with the disk, or turntable. In use, an angular displacement of the disk causes the wheel to turn correspondingly. The radius of the integrating wheel introduces a scale factor, and its positioning on the disk represents the integrand. Thus the rotations of the disk and the wheel are related through multiplicative factors and the number of turns made by the integrating wheel (for any number of turns of the disk) will be expressed as a definite integral of the function represented by the variable position of the wheel on the disk.

Mechanical integrator (top) and electrical schematic diagram (bottom) of integrating circuit

From (top) W. Soroka, *Analog Methods in Computation and Simulation*, copyright 1954, used with permission of McGraw-Hill Book Company; (bottom) M.H. Weik, *Standard Dictionary of Computers and Information Processing*

Electronic integrators or electrical integrating circuits have largely displaced mechanical integrators. The illustration (bottom) shows an electrical circuit that acts as an integrator. For time-varying input, if the resistance R shown in the schematic diagram is very large compared with the capacitive reactance X_C of the capacitor C, the current will be almost in phase with the input voltage E_{IN}, but the output voltage E_{OUT} will lag the phase of the input voltage E_{IN} by almost 90°. Thus the output voltage E_{OUT} is the time integral of the input voltage E_{IN}, as well as the product of the current and the capacitive reactance, X_C.

Viewed as analogues, many common devices can be considered as integrators—examples being the odometer and the watt-hour meter. *See also* analog computer; differential analyzer.

integument, in biology, network of features that forms the covering of an organism. The main purpose of an integument is to protect the organism from the outside world and against drying out of internal parts.

A brief treatment of integuments follows. For full treatment, *see* MACROPAEDIA: Integumentary Systems.

The integuments of unicellular animals consist of an external cell wall that maintains the shape of the cell and affords protection. Multicellular invertebrates have an outer layer of epithelial cells, and these may secrete a variety of surface coatings, ranging from the mucous coat of cnidarians to the tough cuticle of insects. In arthropods (insects, crustaceans, and spiders), rigid, noncellular materials deposited by the epithelial layer provide the animal with a protective armour or form an exoskeleton to which muscles are attached.

The integument of all vertebrate animals is made up of two main layers: a relatively thin outer layer, the epidermis; and a thicker, tougher inner layer, the dermis. The closely packed cells of the epidermis provide a barrier against desiccation, microbes, radiation, and chemicals. The underlying dermis is composed of connective tissue in which are nerve endings, muscle cells, and blood and lymph vessels. It provides nourishment for the epidermis and is most highly developed in mammals.

Vertebrates have various skin types. The smooth, flexible skin of fishes facilitates swimming and is covered with dermal scales. Amphibians have a thick, horny layer of surface epidermis whose thickness depends on the amount of time that the animal typically spends out of water. Reptiles have a similarly thick horny epidermis, which in their case is protected from desiccation by waxes and is covered with scales formed by overlapping folds of skin. Birds have a thin epidermis covered with feathers except at the legs and feet, where the skin is scaly. Mammals are the only vertebrates with hair or fur, which insulates them against cold. *See also* skin.

Intel Corporation, American manufacturer of semiconductor computer circuits. Besides microprocessors, the company makes microcontrollers (single-chip computers), memory chips, computer modules and boards, network and conferencing products, and parallel supercomputers. Its headquarters are in Santa Clara, Calif.

The company was founded in 1968 by Robert Noyce and Gordon Moore, who had invented the integrated circuit while working at Fairchild Semiconductor. They formed their own company, N M Electronics, in order to manufacture large-scale integrated (LSI) circuits. The two men were soon joined by Andrew Grove, who remained the company's head into the mid-1990s. The new company soon changed its name to Intel (from "*integrated electronics*").

The large-scale integrated circuits that Intel began making late in 1968 were semiconductor memories, which were then 10 times more expensive than magnetic core memories (the industry standard at the time). The company achieved its first breakthrough in 1970 with the 1103, a 1-kilobyte dynamic random-access memory (DRAM) that was the first chip with the capacity to store a significant amount of information. In 1971 Intel introduced the 4004, a chip containing 2,300 transistors that was the world's first microprocessor. (A microprocessor is a chip that contains all the arithmetic, logic, and control circuitry necessary to perform as the central processing unit of a computer.) With these products, Intel's semiconductor chips began to replace magnetic cores as the memories of computers.

Intel's 8080 (introduced 1974) was an 8-bit microprocessor—*i.e.,* it processed information in groups of 8 bits (binary digits) at a time. The world's first general-purpose microprocessor, the 8080 provided some of the first microcomputers used in cash registers, automatic teller machines, and a wide range of consumer products. IBM chose to use Intel's 8088 microprocessor (introduced 1978) in its first personal computer (the IBM PC), and because IBM's personal computer design was widely accepted, the 8088 and subsequent Intel microprocessors became a standard for all PC-type machines. In the following years Intel produced a series of faster, more powerful microprocessors. By the end of the 20th century Intel's top microprocessor, the Pentium 4, contained about 42 million transistors and a central processing unit (CPU) that operated at up to 1.7 GHz (two arithmetic logic units each operated at double the CPU rate). Although the company faced growing competition during the 1990s, its microprocessors were installed in more than 80 percent of new PCs.

intellectual-property law, the legal regulations governing an individual's or an organization's right to control the use or dissemination of its ideas or information. Various systems of legal rules exist that empower persons and organizations to exercise such control. Copyright law confers upon the creators of "original forms of expression" (*e.g.*, books, movies, musical compositions, and works of art) exclusive rights to reproduce, adapt, and publicly perform their creations. Patent law provides the inventors of new products and processes with exclusive rights to make, use, and sell their inventions. Trademark law empowers the sellers of goods and services to apply distinctive words or symbols to their products and to prevent their competitors from using the same or confusingly similar insignia or phrasing. Finally, trade-secret law prohibits rival companies from making use of wrongfully obtained confidential, commercially valuable information (*e.g.*, soft-drink formulas or secret marketing strategies).

Consolidation of intellectual-property law. Until the middle of the 20th century, copyright, patent, trademark, and trade-secret law commonly were considered analogous but distinct. In most countries, for example, they were governed by different statutes, and few controversies involved more than one of these fields. During the last half of the 20th century, however, the lines between these fields became blurred. Increasingly, they were considered to be closely related, and eventually they became known collectively as "intellectual-property law." Perceptions changed partly as a result of the fields' seemingly inexorable growth, which frequently caused them to overlap in practice. In the 1970s, for example, copyright law was extended to provide protection to computer software. Later, during the 1980s and '90s, courts in many (though not all) countries ruled that software also could be protected through patent law. The result was that the developers of software programs could rely upon either or both fields of law to prevent consumers from copying, and rivals from selling, identical or closely similar programs.

The integration of copyright, patent, trademark, and trade-secret law into an increasingly consolidated body of intellectual-property law was reinforced by the emergence in many jurisdictions of additional types of legal protection for ideas and information. Courts in the United States, for example, invented a "right of publicity" that enables celebrities to prevent others from making commercial use of their images and identities. Similarly, the European Union has extended extensive protections to the creators of electronic databases. Computer chips, the shapes of boat hulls, and folklore also have been covered by intellectual-property protections.

Internet domain names. Beginning in the 1990s, the exclusive right to use Internet domain names—unique sequences of letters (divided, by convention, into segments separated by periods) that correspond to the numerical "Internet Protocol Addresses" that identify each of the millions of computers connected to the Internet—became a highly contested issue. Domain-name labels enable "packets" of information transmitted over the Internet to be delivered to their intended destinations. The mnemonic character of domain names (*e.g.*, http://www.britannica.com) also assists consumers in locating Internet-based businesses. As commercial activity on the Internet grew, evocative domain names became increasingly valuable, and struggles over them multiplied, especially as a result of the activities of so-called "cybersquatters," who registered popular domain names with the aim of selling them to businesses at huge profits. The task of allocating domain names throughout the world and of resolving disputes over them has been largely assumed by a private organization, the Internet Corporation for Assigned Names and Numbers (ICANN). With the assistance of the World Intellectual Property Organization (WIPO), ICANN promulgated a Uniform Domain-Name Dispute-Resolution Policy to resolve domain-name controversies and has licensed several arbitration services to interpret and enforce it. In 1999 the United States established a similar national system, known as the "Anticybersquatting Consumer Protection Act," which is administered by the federal courts. Under the law, individuals can be fined up to $100,000 for registering a domain name in "bad faith." Defenders of the law contended that it was crucial to protect the commercial value of trademarks and to shield businesses from extortion. Critics argued that the legislation was too broad and could be used by companies to suppress consumer complaints, parody, and other forms of free speech.

The World Trade Organization and intellectual-property law. The Agreement on Trade-Related Aspects of Intellectual Property Rights (commonly known as TRIPS) has contributed greatly to the expansion of intellectual-property law. Negotiated as part of the Uruguay Round (1986–94) of the General Agreement on Tariffs and Trade (GATT), the TRIPS Agreement obligates members of the World Trade Organization (WTO; *q.v.*) to establish and enforce minimum levels of copyright, patent, and trademark protection within their jurisdictions. Countries that fail to do so are subject to various trade sanctions. Despite the agreement, global rates of piracy of software, music, movies, and electronic games remain high, in part because many countries in Africa and Latin America have not met the deadlines imposed by the agreement for revamping their intellectual-property laws. Other countries, particularly in Asia, have formally complied with the agreement by passing new laws but have not effectively enforced them.

Economic and ethical issues. The tightening of laws governing intellectual property has been paralleled by a steady increase in the economic and cultural importance of intellectual-property rights. The entertainment industry has long been heavily dependent on intellectual property; the fortunes of record companies and movie studios are closely tied to their ability to enforce their copyrights on their products. Similarly, pharmaceutical companies have used the monopoly power created by their patent rights to charge high prices for their products, which has enabled them both to cover the enormous costs of developing new drugs and to make considerable profits. Other, newer industries have become equally or even more dependent on intellectual-property rights. The developers and distributors of computer software, for example, insist that their ability to remain in business is dependent on their power to prevent the unauthorized reproduction of their creations. Intellectual-property protection is widely thought to be even more important to the rapidly growing biotechnology industry, where the development of new techniques of genetic engineering or new life-forms employing such techniques can be extremely expensive. Biotechnology firms argue that, if they were unable to prevent rivals from imitating their creations, they would not be able to recoup their costs and thus would have no incentive to invest in the research and development necessary for scientific breakthroughs. Companies selling goods and services over the Internet have made similar claims concerning the importance of their domain names.

The strengthening of intellectual-property rights has not received unanimous praise. Some critics argue that it is immoral for pharmaceutical companies to use their patent rights to set prices for their AIDS drugs at levels that cannot be afforded by most of the people in Africa and Latin America who are afflicted by the disease. Others point out that many patented drugs are developed using the genetic material of plants found in tropical regions and the knowledge of indigenous groups concerning the plants' medicinal powers. Current patent law, however, awards the exclusive right to market and profit from such drugs to the pharmaceutical companies, leaving uncompensated the countries and indigenous

groups whose contributions were essential to the finished products.

Trends. Despite the strengthening of intellectual-property laws, the growing economic and cultural importance of intellectual-property rights, and the popular view that such rights are socially desirable, the future of intellectual property remains in some doubt. Intellectual-property rights are threatened principally by the proliferation of technologies that facilitate the violation of copyright and patent rules. At the beginning of the 21st century, the sector most affected by these technologies was the music industry, as the combination of compression technologies and "peer-to-peer" copying systems led to widespread unauthorized copying and distribution of digital music. One such system, known as Napster, acquired some 70 million subscribers before courts in the United States compelled its closure.

Analogous developments threaten copyrights on movies, books, and software. Similarly, the owners of patent rights or other intellectual-property rights on new plant varieties complain that the unauthorized replication of their inventions is common. The developers of these materials have sought (and often have secured) legislative reinforcements of their legal positions, but those reinforcements often are not sufficient to stem violations.

To combat the threat and to provide themselves with effective protection, many developers have turned to technological shields or to alternative sources of revenue. Encryption systems for music, movies, and software; "terminator genes" that prevent the natural reproduction of genetically engineered plants; and government prizes and subsidies for artistic or technical advances may eventually partially replace intellectual-property law in some areas. Nevertheless, the system of intellectual-property rules is likely to play an evolving and vital role in economic and social life in the 21st century. (W.W.F.)

intelligence, in government operations, evaluated information concerning such things as the strength, activities, and probable courses of action of other nations who are usually, but not necessarily, opponents.

A brief treatment of intelligence follows. For full treatment, *see* MACROPAEDIA: Intelligence and Counterintelligence.

The goal of every intelligence service is to produce reports consisting of evaluated information that can be given to leaders to help them in their decision making. There are three main steps to producing such reports. It first must be decided what it is that must be known, then information must be gathered, and finally it must be evaluated and analyzed. The first step—deciding what information to gather—presents many possibilities. Political intelligence—the most desired information—is perhaps the least tangible, as correct analysis of the political situation in a country can be very difficult. Political intelligence includes everything from information on party organization and ideological rivalries to detailed biographies of all key and even subordinate figures. The next most sought-after intelligence concerns military and technological information. This is known as "hard" intelligence, for it is readily quantifiable and verifiable (*e.g.,* the number of active troops in Libya), unlike "soft" political intelligence (*e.g.,* who will form the next government in Bolivia). Information regarding economics, social and religious movements, agriculture, and climate also is important.

The gathering of intelligence may entail many methods. Contrary to the impression created by spy films, most intelligence comes from open public sources, such as foreign newspapers, radio and television broadcasts, government reports, and scientific and technical journals. Foreign diplomats also provide information. The remaining intelligence is gathered by covert means such as satellites, the deciphering of secret transmissions, and agents in foreign countries.

The concept of intelligence is not new. The military treatise *Ping-fa* (*The Art of War*), written about 400 BC by the Chinese military philosopher Sun Tzu, mentions the use of secret agents and the importance of good intelligence. Knowledge of an enemy's intentions has always been important, and consequently intelligence systems have been in use from ancient times. It was not until the late 18th century, though, that a distinction was made between internal security and the external foreign intelligence functions of a country. It has been suggested that World War I itself was the partial result of poor intelligence, as none of the nations involved had intended to go to war. Such an experience served as a strong lesson, and with rapid developments in technology (especially in electronics and aeronautics), intelligence services grew in the 1920s and '30s and then expanded rapidly during World War II. In the years following came the Cold War, in which global opponents confronted each other with intelligence agencies rather than armies.

In the second half of the 20th century, the most prominent intelligence services were the Central Intelligence Agency (CIA) of the United States, the KGB (Komitet Gosudarstvennoy Bezopasnosti) of the Soviet Union, Great Britain's MI-5 and MI-6, the DGSE (Direction Générale de la Sécurité Extérieure) of France, China's Social Affairs Department, and the Mossad of Israel.

intelligence, mental quality that consists of the abilities to learn from experience, adapt to new situations, understand and handle abstract concepts, and use knowledge to manipulate one's environment.

A brief treatment of intelligence follows. For full treatment, *see* MACROPAEDIA: Intelligence, Human.

Although definitions of intelligence vary, theorists agree that it is a capacity or potentiality rather than a fully developed attainment and that it has a biological basis. It is thought of as a combination of the innate characteristics of an individual's central nervous system—which are genetically endowed—and of developed intelligence—which is molded by experience and learning.

Intelligence can be measured, though imperfectly, by intelligence tests, among them the Stanford-Binet Intelligence Scale and the Wechsler scales. These tests are intended to determine an individual's intelligence quotient (IQ); this was originally calculated according to the relation of mental age to chronological age, but the use of the concept of mental age in assessing IQ scores has been largely discontinued. IQ is now more often assessed on the basis of the statistical distribution of scores. (*See* intelligence test.)

Although high intelligence might seem to guarantee an individual person a high degree of achievement in society, many other factors make long-term predictions unreliable. The mechanisms for turning intellectual ability into social achievement are not fully understood. School achievement tests taken early in life provide a good correlation with IQ tests taken at the same time, but the results cannot predict achievement beyond school age.

There is no known method for evaluating innate intelligence. Although the relationship between heredity and environment in the development of intelligence is not fully understood, this relationship has been studied in various ways, including that of examining the individual achievement levels of sets of identical or fraternal twins who are reared apart.

It is useful to distinguish between intellectual level—the single, mass-related test score—and intellectual pattern—the variations each person experiences in specific levels of ability. A person's intelligence level may be 120, but the level of verbal ability, for example, may be far superior to that of the skill used in solving mathematical equations. In addition, individual abilities develop at different rates throughout childhood and up to about age 25, when there is an overall slowing down of intellectual development. It is extremely difficult, therefore, to coordinate intellectual level with intellectual pattern, since IQ tests are designed to reflect general intelligence at the time that the test is taken and do not always take into account either the influence of the cultural and economic milieu or any number of specific intellectual abilities that may not be fully developed.

About 1900, psychologists began to develop tests that led to the empirical study of the structure of human intelligence. Later, statistical techniques were applied to the test results, and comparisons made between sample findings helped to evaluate the relative importance of individual abilities to create a comprehensive picture of intelligence. Until about 1950 psychological opinion was divided between those who advocated the concept of a unified intellect and those who favoured the breakdown of intelligence into a range of specific abilities. After the 1950s the work of J.P. Guilford became a major influence in intellectual theory. Guilford broke down the concept of general intelligence into 120 specific abilities classified under three general headings: logical processes, the kinds of information processed, and the products of such processing. These measurement-based studies of the structure of intelligence were supplemented in the 1970s by direct studies of the mental processes underlying intelligence and the way these cognitive processes operate in various environmental contexts. The building of computer models of human cognition and investigations of the biological basis of intelligence in the brain are other promising approaches to understanding human intelligence.

Increasingly, intellectual level has been correlated with environmental influences, particularly the effect of socioeconomic structure upon genetic endowment. Studies show that similar groups of people provide divergent test results if they come from different cultural backgrounds. Such factors as nutrition, educational resources, family life and child-rearing practices, and social expectations play a significant role in determining how individuals utilize their genetic potential.

intelligence, artificial (computer science): *see* artificial intelligence.

intelligence test, series of tasks designed to measure the capacity to make abstractions, to learn, and to deal with novel situations.

The most widely used intelligence tests include the Stanford-Binet Intelligence Scale and the Wechsler scales. The Stanford-Binet is the American adaptation of the original French Binet-Simon intelligence test; it was first introduced in 1916 by Lewis Terman, a psychologist at Stanford University. The individually administered test, revised in 1937, 1960, and 1972, evaluates persons two years of age and older and is designed for use primarily with children. It consists of an age-graded series of problems whose solution involves arithmetical, memory, and vocabulary skills.

The test is scored in terms of intelligence quotient, or IQ, a concept first suggested by German psychologist William Stern and adopted by Lewis Terman in the Stanford-Binet Scale. The IQ was originally computed as the ratio of a person's mental age to his chronological (physical) age, multiplied by 100. Thus, if a child of 10 had a mental age of 12 (that is, performed on the test at the level of an average 12-year-old), then the child was

assigned an IQ of (12/10) × 100, or 120. A score of 100, for which the mental age equaled the chronological age, was average; scores above 100 were above average, scores below 100 were below average. The concept of mental age has fallen into disrepute, however, and few tests now involve the computation of mental ages. Yet many tests still yield an IQ; this figure is now computed on the basis of the statistical percentage of people who are expected to have a certain IQ. Intelligence test scores follow an approximately "normal" distribution, with most people scoring near the middle of the distribution curve and scores dropping off fairly rapidly in frequency away from the curve's centre. For example, on the IQ scale about 2 out of 3 scores fall between 85 and 115 and about 19 out of 20 scores fall between 70 and 130. A score of about 130 or above is considered gifted, while a score below about 70 is considered mentally deficient or retarded.

Intelligence tests have provoked a great deal of controversy about what kinds of mental abilities constitute intelligence and whether the IQ adequately represents these abilities, with debate centring on cultural bias in test construction and standardization procedures. Critics have charged that intelligence tests favour groups from more affluent backgrounds and discriminate against less privileged racial, ethnic, or social groups. Consequently, psychologists have attempted to develop culture-free tests that would more accurately reflect an individual's native ability.

Intelsat, abbreviation of INTERNATIONAL TELECOMMUNICATIONS SATELLITE ORGANIZATION, also called (1964–73) INTERNATIONAL TELECOMMUNICATIONS SATELLITE CONSORTIUM, organization founded in 1964 by the telecommunication agencies of 18 nations, including the United States, which proposed the organization. Intelsat owns communications satellites and the ground stations from which they are controlled, but the transmitting and receiving apparatus in each country is owned by the Intelsat member from that country. Within several years the membership of Intelsat had grown to include agencies from most of the nations of the world.

The consortium contracted with the U.S. National Aeronautics and Space Administration (NASA) to launch its satellites. The first of these was Early Bird, later renamed Intelsat 1, which was placed in a stationary orbit over the Atlantic Ocean at the Equator in 1965. Within a few years, other members of the Intelsat series were orbited over the Pacific and Indian oceans, establishing a commercial telecommunication system accessible from any place on the surface of the Earth.

intendant, administrative official under the ancien régime in France who served as an agent of the king in each of the provinces, or *généralités*. From about 1640 until 1789, the intendancies were the chief instrument used to achieve administrative unification and centralization under the French monarchy. They also controlled municipal administration. Their great power made them unpopular, and it was partly to remedy their excess of power that the so-called *assemblées provinciales*, with consultative and administrative powers, were set up throughout France in 1787; the powers of the intendants were suppressed in 1789.

intendente, royal official appointed by the 18th-century kings of the Bourbon dynasty in Spain. Modeled after the French intendants, the *intendentes* were to serve as instruments of royal centralization and administrative reform but were frequently resisted as conflicting with local privileges. In the Spanish colonies the system was imposed in Cuba (1765) after the brief British occupation of Havana. With the creation of the new viceroyalty of La Plata, the system was applied throughout that area.

intension and extension, in logic, correlative words that indicate the reference of a term or concept: "intension" indicates the internal content of a term or concept that constitutes its formal definition; and "extension" indicates its range of applicability by naming the particular objects that it denotes. For instance, the intension of "ship" as a substantive is "vehicle for conveyance on water," whereas its extension embraces such things as cargo ships, passenger ships, battleships, and sailing ships. The distinction between intension and extension is not the same as that between connotation and denotation.

intensive agriculture, in agricultural economics, system of cultivation using large amounts of labour and capital relative to land area. Large amounts of labour and capital are necessary to the application of fertilizer, insecticides, fungicides, and herbicides to growing crops, and capital is particularly important to the acquisition and maintenance of high-efficiency machinery for planting, cultivating, and harvesting, as well as irrigation equipment where that is required.

Optimal use of these materials and machines produces significantly greater crop yields per unit of land than extensive agriculture, which uses little capital or labour. As a result, a farm using intensive agriculture will require less land than an extensive agriculture farm to produce a similar profit. In practice, however, the increased economies and efficiencies of intensive agriculture often encourage farm operators to work very large tracts in order to keep their capital investments in machinery productively engaged—*i.e.,* busy.

intention (Latin: *intentio*), in scholastic logic and psychology, a concept used to describe a mode of being or relation. In knowing, the mind is said to "intend" or "tend toward" its object, and a thing as known, or in the knowing mind, has "intentional being." Intention may mean either the mind knowing or the knowledge itself, analogous to the use of perception for the act of perceiving or for the thing perceived. First intention is knowledge of a thing as it is in itself; second intention, knowledge of the thing as known. Thus, the term man is in first intention in the statement "man is mortal," but in second intention in "man is a species." Logic was held by the scholastics to consist of the study of second intentions.

intentionality, in phenomenology, the characteristic of consciousness whereby it is conscious *of* something—*i.e.,* its directedness toward an object.

The concept of intentionality enables the phenomenologist to deal with the immanent-transcendent problem—*i.e.,* the relation between what is within consciousness and what extends beyond it—in a manner different from that employed by many philosophers who have claimed that an experienced, represented, and remembered object (*e.g.,* a tree) is inside consciousness (immanent), whereas the real object itself is outside the mind (transcendent). These philosophers have made this distinction the ground of a doubt about the existence of things and of skepticism about the possibility of knowledge of things.

Phenomenologists have noted that this distinction is a question of meaning and thus pertains to the reflective, or ontological, level; it is a distinction made, however, on the level of the everyday world, that of the natural attitude. Thus, in order to reach the level of meaning, phenomenologists—contrary to these other philosophers—"bracket" existence (*i.e.,* exclude from consideration the question of existence or nonexistence as things) by the phenomenological reduction and deal exclusively with the indubitable—with consciousness and the immediately given evidence of consciousness. On this level, the immanent is what is given adequately (*e.g.,* one sees the front side of the tree) and the transcendent is what is aimed at, or intended (the tree). Thus, the problem of how to move from the immanent to the transcendent is solved by an analysis of how an object comes to have meaning for consciousness and of how consciousness relates to the object. This procedure is called intentional analysis, or the analysis of the constitution of meaning. *See also* MACROPAEDIA: Philosophical Schools and Doctrines: *Phenomenology*.

Inter-American Development Bank, Spanish BANCO INTERAMERICANO DE DESARROLLO, international organization founded in 1959 by 20 governments in North and South America to finance economic and social development in the Western Hemisphere. The largest charter subscribers were Argentina, Brazil, Mexico, Venezuela, and the United States. Subscribers now include nearly 30 countries in North and South America and more than 15 countries in Europe, as well as Japan and Israel. During its first 40 years the bank distributed more than $85 billion in loans, and by the beginning of the 21st century its annual loan disbursement had exceeded $10 billion.

Inter-Governmental Maritime Consultative Organization (IMCO): *see* International Maritime Organization.

interaction, fundamental: *see* fundamental interaction.

interactionism, in the philosophy of mind, those dualistic theories that hold that mind and body, though separate and distinct substances, causally interact.

In the 17th century René Descartes gave interactionism its classical formulation. He could give no satisfactory account of how the interaction takes place, however, aside from the speculation that it occurs in the pineal gland deep within the brain. This problem led directly to the occasionalism of Nicolas Malebranche, a 17th–18th-century French Cartesian, and to various other accounts of the mind-body relation. These include the theory of Gottfried Wilhelm Leibniz, a 17th–18th-century German philosopher-mathematician, of a harmony between the mind and body preestablished by God at creation, and the rejection of dualism by the 17th-century Dutch Jewish rationalist Benedict de Spinoza in favour of a monistic theory of mind and body as attributes of one underlying substance.

The main difficulty confronting the interactionist is that mind and body are so radically different in quality that it is difficult to imagine how two such alien things could influence one another. *See also* mind-body dualism.

interactive multimedia, any computer-delivered electronic system that allows the user to control, combine, and manipulate different types of media, such as text, sound, video, computer graphics, and animation. Interactive multimedia integrate computer, memory storage, digital (binary) data, telephone, television, and other information technologies. Their most common applications include training programs, video games, electronic encyclopaedias, and travel guides. Interactive multimedia shift the user's role from observer to participant and are considered the next generation of electronic information systems.

A personal computer (PC) system with conventional magnetic-disk memory storage technically qualifies as a type of interactive multimedia. More advanced interactive systems have been in use since the development of the computer in the mid-20th century—as flight simulators in the aerospace industry, for example. The term was popularized in the early

1990s, however, to describe PCs that incorporate high-capacity optical (laser) memory devices and digital sound systems.

The most common multimedia machine consists of a PC with a digital speaker unit and a CD-ROM drive, which optically retrieves data and instructions from a CD-ROM disk. Many systems also integrate a handheld tool (*e.g.*, a control pad or joystick) that is used to communicate with the computer. Such systems permit users to read and rearrange sequences of text, animated images, and sound that are stored on high-capacity CD-ROM disks. Systems with CD write once-read many (WORM) units allow users to create and store sounds and images as well. Some PC-based multimedia devices integrate television and radio as well.

Among the interactive multimedia systems under commercial development by the mid-1990s were cable television services with computer interfaces that enable viewers to interact with television programs; high-speed interactive audiovisual communications systems that rely on digital data from fibre-optic lines or digitized wireless transmissions; and virtual reality systems that create small-scale artificial sensory environments.

intercalation, insertion of days into a calendar to bring it into line with the solar year (year of the seasons). One example is the periodic inclusion of leap-year day (February 29) in the Gregorian calendar now in general use. To keep the months of a lunar calendar (*e.g.*, the Hindu calendar) in their proper seasons, an entire month must be intercalated or extracalated (dropped) periodically, because there are a fractional number (between 12 and 13) of cycles of lunar phases (months) in a solar year. In astronomically primitive cultures, intercalation and extracalation were done empirically, whenever seasons and their properly associated months became noticeably out of step.

Intercession, Cathedral of the: *see* Saint Basil the Blessed.

intercolumniation, in architecture, space between columns that supports an arch or an entablature (an assemblage of moldings and bands that forms the lowest horizontal beam of a roof). In Classical architecture and its derivatives, Renaissance and Baroque architecture, intercolumniation was determined from a system codified by the 1st-century BC Roman architect Marcus Vitruvius Pollio.

The measurement between columns is calculated and expressed in terms of the diameters of the columns in the building—*i.e.* two columns were expressed as being 3 diameters (3D) rather than 9 feet (2.7 m) apart. This system conveniently and universally expressed the measurement of a particular unit of space, the size of which varied from building to building, according to the Classical order used (*see* order).

Vitruvius established five standard measurements for intercolumniation: 1½ diameter interval (D), called pycnostyle intercolumniation; 2D, called systyle; 2¼ D (the most common ratio), called eustyle; 3D, called diastyle; and 4 or more D, called araeostyle.

Although the five standard ratios prevailed, variations in actual building practice occurred frequently. In Doric temples the intercolumniation at the corners was sometimes half as wide as the intercolumniation along the front and lateral sides of the building.

In Japanese architecture intercolumniation is based on a standard unit, the *ken,* which is divided into 20 sections, each termed a minute of space; each minute is subdivided into 22 units, or seconds.

intercourse, sexual: *see* sexual intercourse.

interdict, in Roman and civil law, a remedy granted by a magistrate on the sole basis of his authority, against a breach of civil law for which there is no stipulated remedy. Interdicts can be provisionary (opening the way for further action) or final.

An exhibitory interdict, which usually involves rights over things, is an order requiring that a person or thing be produced. A restorative interdict is an order requiring someone to restore something taken away, undo something that has been done, or end a specific type of interference with a right.

In medieval canon law, an interdict involves the withholding of certain sacraments and clerical offices from certain persons and even territories, usually to enforce some type of obedience. The power to impose interdict on states or dioceses belongs to the pope and general councils of the church, but individual parishes, groups, or persons may be placed under interdict by local bishops. Interdicts were frequently used, either actually or as a threat, against recalcitrant monarchs throughout the Middle Ages.

interest, the price paid for the use of credit or money. It may be expressed either in money terms or as a rate of payment.

A brief treatment of interest follows. For full treatment, *see* MACROPAEDIA: Economic Theory.

Interest may also be viewed as the income derived from the possession of contractual promises from others to pay sums in the future. The question may be asked, "What is the value today of a promise to pay $100 a year from now?" If the answer is $100, then no interest income is generated. Most people, however, would require an inducement to give up $100 today and for the next year. If $5 were sufficient inducement—that is, if they would buy such a promise for $95—then interest income of $5 has been generated at a rate of just over 5 percent.

Various theories have been developed to account for and justify interest. Among the better known are the time-preference theory of the Austrian, or Marginalist, school of economists, according to which interest is the inducement to engage in time-consuming but more productive activities, and the liquidity-preference theory developed by J.M. Keynes, according to which interest is the inducement to sacrifice a desired degree of liquidity for a nonliquid contractual obligation. It may be mentioned that in Marxist theory interest, like capital itself, is a portion of labour expropriated by the capitalist class by virtue of its political power.

interest group, also called SPECIAL-INTEREST GROUP, any aggregate of individuals that, on the basis of one or more shared concerns, makes claims upon groups or society in general in order to promote its objectives.

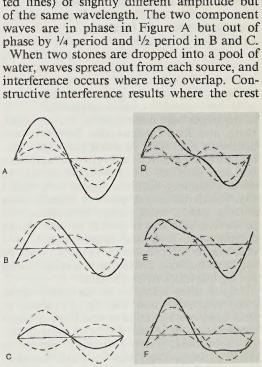
A brief treatment of interest groups follows. For full treatment, *see* MACROPAEDIA: Political Parties and Interest Groups.

In developing societies, the prominent type of interest group is the primordial one—based on kinship, lineage, neighbourhood, or religion. In industrialized societies, the prominent type is the associational one—created to serve a goal. Associational groups may take different forms.

When any interest group tries to influence government, it becomes a "pressure group." Any interest group that is not a part of the government and does not itself seek to govern the country in its own name but does seek to influence that government for its own purposes is a pressure group.

A political party differs from a pressure group in that a party has a structure and presents candidates for public office, whereas a pressure group seeks to influence both government and parties. But what begins as a pressure group may become a political party. The British Labour Party began in 1900 as a collection of trade unionists trying to secure the election of working-class MPs to Parliament; later it broadened its program and membership.

Although all pressure groups seek out the influential agencies of government, they can only resort to influential organs that are accessible. In any system the influence of government organs varies. Strategy for an interest group thus consists in determining the influential organ that is accessible.



Where the population is not divided ideologically or culturally, interest groups are "secondary"—independent of government, politically neutral, possessed of specialized objectives, and distinct from parties. In Britain there are formal channels by which to influence the executive; groups influence parties by securing their members' nomination, by financial assistance, or by participating in party caucuses and promoting amendments at committee stage. In the United States, lobbying and appearing at hearings is important, but contact with the presidency and the media can be decisive.

interface, surface separating two phases of matter, each of which may be solid, liquid, or gaseous. An interface is not a geometric surface but a thin layer that has properties differing from those of the bulk material on either side of the interface. A common interface is that between a body of water and the air, which exhibits such properties as surface tension, by which the interface acts somewhat like a stretched elastic membrane. Interfacial effects, or processes that occur at interfaces, include the evaporation of liquids, the action of detergents and chemical catalysts, and the adsorption of gases on metals.

interference, in physics, the net effect of the combination of two or more wave trains moving on intersecting or coincident paths. The effect is that of the addition of the amplitudes of the individual waves at each point affected by more than one wave.

If two of the components are of the same frequency and phase (*i.e.*, they vibrate at the same rate and are maximum at the same time), the wave amplitudes are reinforced, producing constructive interference; but, if the two waves are out of phase by ½ period (*i.e.*, one is minimum when the other is maximum), the result is destructive interference, producing complete annulment if they are of equal amplitude. The solid line in Figures A, B, and C represents the resultant of two waves (dotted lines) of slightly different amplitude but of the same wavelength. The two component waves are in phase in Figure A but out of phase by ¼ period and ½ period in B and C.

When two stones are dropped into a pool of water, waves spread out from each source, and interference occurs where they overlap. Constructive interference results where the crest

Component waves and their resultants

of one coincides with the crest of the other. Two wave trains of light from a double slit produce interference, an effect that is visible on a screen as a pattern of alternating dark and light bands caused by intensification and extinction at points at which the waves are in phase and out of phase, respectively.

Interference also occurs between two wave trains moving in the same direction but having different wavelengths or frequencies. The resultant effect is a complex wave. A pulsating frequency, called a beat, results when the wavelengths are slightly different. Figures D, E, and F show complex waves (solid lines) composed of two component interfering waves (dotted lines), the ratio of their wavelengths being 1:2 and of their amplitudes 1:3.

Interference between waves traveling in opposite directions produces standing waves (*q.v.*).

interferometer: *see* optical interferometer; radio interferometer.

interferon, any of several related proteins that are produced by the body's cells as a defensive response to viruses and are important modulators of the immune response. Interferon was named for its ability to interfere with viral proliferation. The various forms of interferon are the body's most rapidly produced and important defense against viruses, and it is primarily due to their action that most viral infections are not life-threatening to humans. Interferons can also combat bacterial and parasitic infections, inhibit cell division, and promote or impede the differentiation of cells. They are produced by all vertebrate animals and possibly by some invertebrates as well.

Interferons are categorized as cytokines, small proteins that are involved in intercellular signaling. Interferon is secreted by cells only in response to stimulation by a virus or other foreign substance, but it does not directly inhibit the virus's multiplication. Rather, it stimulates the infected cells and those nearby to produce proteins that prevent the virus from replicating within them. Further production of the virus is thereby inhibited and the infection is stemmed.

Three forms of interferon—alpha (α), beta (β), and gamma (γ)—have been recognized. These interferons have been classified into two types: type I includes the alpha and beta forms, and type II consists of the gamma form. This division is based on the type of cell that produces the interferon and the functional characteristics of the protein. Type I interferons can be produced by almost any cell upon stimulation by a virus; their primary function is to induce viral resistance in cells. Gamma interferon is secreted only by natural killer cells and T lymphocytes; its main purpose is to signal the immune system to respond to infectious agents or cancerous growth.

Interferons were discovered in 1957 by Alick Isaacs and Jean Lindenmann. Research conducted in the 1970s revealed that these substances could not only prevent viral infection but also suppress the growth of cancers in some laboratory animals. Hopes were raised that interferon might prove a wonder drug able to cure a wide variety of diseases, but its serious side effects, which include flulike symptoms of fever and fatigue as well as a decrease in the production of blood cells by the bone marrow, deflated expectations for its use against less serious diseases.

Despite these setbacks, in the 1980s alpha interferon came into use, in low doses, to treat hairy-cell leukemia (a rare form of blood cancer) and, in higher doses, to combat Kaposi's sarcoma, which frequently appears in AIDS patients. The alpha form also has been approved for treating the viral infections hepatitis B, hepatitis C (non-A, non-B hepatitis), and genital warts (condylomata acuminata). The beta form of interferon is mildly effective in treating the relapsing-remitting form of multiple sclerosis. Gamma interferon is used to treat chronic granulomatous disease, a hereditary condition in which white blood cells fail to kill bacteria.

interior design, the planning and design of man-made spaces, a part of environmental design and closely related to architecture.

A brief treatment of interior design follows. For full treatment, *see* MACROPAEDIA: Decorative Arts and Furnishings.

The design of interior spaces is undertaken to create a harmonious and appropriate environment for the human activities to be pursued in those spaces. Interior decoration is an important part of interior design, and the terms are sometimes used interchangeably, though strictly the designer is concerned with larger concepts and the overall organization of space; the decorator works to select the best fabrics, furniture, colours, and accessory furnishings to enhance the entire interior space.

The interior designer must consider the form and character of the exterior architecture; the site, size, character, and lighting of the interior spaces; the function of those interiors; the lifestyle and socioeconomic needs of the people who will use those spaces; and the appropriateness of any design features to be incorporated. The designer's goal is to create a coordinated and harmonious whole where the architecture, site, function, and visual aspects of the interior are unified and pleasing to mind and body. Scale is a vital factor in interior design. Furniture and accompanying accessories must be in proportion to the space they occupy and also to the human needs. Character is equally vital—whether the "feel" of the space is to be formal or informal, for example.

The design and decoration of residential spaces involve a personal statement about the status, taste, and lifestyle of its residents. Such interiors can be infinitely varied, though the overall good design criteria such as harmony of colour, texture, lighting, scale, and pleasing proportion remain paramount. The design of nonresidential spaces such as offices, hospitals, stores, and educational buildings invites a more standardized approach on the part of the designer, who will often strive for clear organization of systems and functions ahead of purely aesthetic considerations.

Interior Lowlands, the broad, generally flat areas of the central part of the North American continent. The name is used in regional geologic and physiographic descriptions of North America and the conterminous United States. From the tectonic view, the continental Interior Lowlands are areas largely undisturbed by mountain building in past geologic time. They extend from central Saskatchewan, in Canada, south to the rim of the Coastal Plain and are bounded by the Great Plains on the west, the Canadian Shield on the north and east, and the Appalachian Mountains on the east.

In the regional physiography of the conterminous United States, the Interior Lowlands are composed chiefly of the great Central Lowland of the Midwestern states and the Great Plains landform region to the west. Their related uplands include the Superior Upland, Appalachian Plateau (but not the Appalachian Mountains), the Interior Low Plateaus, and the Ozark Plateau.

interior monologue, in dramatic and nondramatic fiction, narrative technique that exhibits the thoughts passing through the minds of the protagonists. These ideas may be either loosely related impressions approaching free association or more rationally structured sequences of thought and emotion. Interior monologues encompass several forms, including dramatized inner conflicts, self-analysis, imagined dialogue (as in T.S. Eliot's "The Love Song of J. Alfred Prufrock"), and rationalization. It may be a direct first-person expression apparently devoid of the author's selection and control, as in Molly Bloom's monologue concluding James Joyce's *Ulysses* (1922), or a third-person treatment that begins with a phrase such as "he thought" or "his thoughts turned to."

The term interior monologue is often used interchangeably with "stream of consciousness." But while an interior monologue may mirror all the half thoughts, impressions, and associations that impinge upon the character's consciousness, it may also be restricted to an organized presentation of his rational thoughts. Closely related to the soliloquy and dramatic monologue, the interior monologue was first used extensively by Édouard Dujardin in *Les Lauriers sont coupés* (1887; *We'll to the Woods No More*) and later became a characteristic device of 20th-century psychological novels. *See also* consciousness, stream of.

Interlaken, town, Bern canton, central Switzerland. It lies along the Aare River, in the Bernese Highland. Its name is derived from its position on the flat plain (Bödeli), 1,864

Interlaken, Switz., on the Aare River
Sven Samelius

feet (568 m) above sea level, between Lakes (*inter lacus*) Brienz to the east and Thun to the west. The town grew up around a convent of Augustinian canons (1130–1528). It is one of Switzerland's oldest and most frequented summer tourist resorts, and its main avenue (Höheweg) is lined with hotels. Interlaken commands a magnificent view of the Jungfrau (13,642 feet [4,158 m]) to the south and is a starting point for many Alpine excursions. Textiles and watches are manufactured there. Pop. (1990) 5,176.

interleukin (IL), any of a group of naturally occurring proteins that are important in the activation of lymphocytes. Discovered in the 1970s, several known types of interleukin are recognized as crucial constituents of the body's immune system.

The best-known interleukins are IL-1 and IL-2. IL-1 is produced by macrophages that have come in contact with foreign particles (antigens) and microbes. In the presence of the antigen, the activated macrophage secretes IL-1, which induces helper T cells to produce IL-2. The IL-2 produced by helper T cells stimulates the division and proliferation of more helper T cells and also of cytotoxic T cells, which are lymphocytes that kill infected body cells. In this manner, IL-1 and IL-2 ensure a plentiful supply of T cells to fight specific infectious agents.

In the 1980s researchers began the experimental use of IL-2 as an anticancer agent. Lymphocytes drawn from cancer patients were inoculated in the laboratory with genetically reproduced IL-2. The stimulated lymphocytes, now called lymphokine-activated killer (LAK) cells, were injected back into the patients along with additional doses of IL-2. The drug produced toxic reactions and appeared to be only modestly effective in killing some types of cancer cells.

Interlingua, also called LATINO SINE FLEXIONE, simplified form of Latin intended for use as an international second language. Interlingua was originally developed in 1903 by the Italian mathematician Giuseppe Peano, but lack of clarity as to what parts of Latin were to be retained and what were to be discarded led to numerous "dialects" of Interlingua, confusion, and its dying out among enthusiasts. In the late 1940s and early 1950s, the linguist Alexander Gode, with the sponsorship of the International Auxiliary Language Association, reformulated and revived Interlingua and promoted its use in the international scientific community. As reformulated, Interlingua's grammar is not much more complex than that of Esperanto; it has only one form for nouns (taken from the Latin ablative case), no gender, no case, plurals in -*s*, one form for adjectives with no noun-adjective agreement, one definite article, and verbs with no inflection for person or number. Abstracts and summaries are published in Interlingua by several international scientific journals, but in general the language has not been widely adopted.

interlocutory decree, generally, a judicial decision that is not final or that deals with a point other than the principal subject matter of the controversy at hand. An interlocutory decree of divorce in the United States or a decree nisi in England, for example, is a judicial decree pronouncing the divorce of the parties provisionally but not terminating the marriage until the expiration of a certain period. The purpose of requiring such a period of time is to discourage quick and easy divorce, to encourage reconciliation, and to enable the court to supervise the arrangements to be made for the children of the marriage. In England the time is also used to give the court an opportunity to discover collusive practices by which the parties may have deceived the court.

In England the interlocutory period is six weeks, whereas in the United States, in those states requiring that a decree of divorce be preceded by an interlocutory decree, the period of delay varies from three months to one year. *See also* judgment.

interlude, in theatre, early form of English dramatic entertainment, sometimes considered as the transition between medieval morality plays and the Tudor dramas. Interludes were performed at court or at great houses by professional minstrels or amateurs at intervals between some other entertainment, such as a banquet. Although most interludes were sketches of a nonreligious nature, some plays were called interludes that are today classed as morality plays. John Heywood, one of the most famous interlude writers, brought the genre to perfection in his *The play of the wether* (*c.* 1533) and *The Playe Called the foure P.P.* (*c.* 1544). The Earl of Essex is known to have had a company of interlude players in 1468; the first royal company was apparently established in 1493.

intermediate goods: *see* producer goods.

Intermediate-Range Nuclear Forces Treaty, abbreviation INF TREATY, nuclear-arms-control accord reached by the United States and the Soviet Union in 1987 in which those two nations agreed to eliminate their stocks of intermediate-range and shorter-range (or "medium-range") land-based missiles (which could carry nuclear warheads). It was the first arms-control treaty to abolish an entire category of weapon systems. In addition, two protocols to the treaty established unprecedented procedures for observers from both nations to verify firsthand the other nation's destruction of its missiles.

The INF Treaty defined intermediate-range ballistic missiles (IRBMs) and ground-launched cruise missiles (GLCMs) as those having ranges of 1,000 to 5,500 km (620 to 3,400 miles) and shorter-range ballistic missiles (SRBMs) as those having ranges from 500 to 1,000 km.

The deployment of IRBMs in Europe first became an arms-control issue in the late 1970s, when the Soviet Union began replacing its older single-warhead SS-4 and SS-5 IRBMs with newer and more accurate SS-20s, which could deliver three nuclear warheads apiece from a distance of 5,000 km. Mounted on mobile launchers based in the European part of the Soviet Union, the SS-20s could strike targets anywhere in western Europe in less than 10 minutes.

Under pressure from its western European allies in the North Atlantic Treaty Organization (NATO), the United States in 1979 committed itself to deploying two intermediate-range weapons systems of its own in western Europe: the Pershing II and the Tomahawk cruise missile. Mounted on mobile launchers, the Pershing II was an IRBM that could carry a single nuclear warhead a distance of about 2,000 km and strike within the vicinity of Moscow in less than 10 minutes.

The SS-20 and the Pershing II could deliver warheads to their targets with unprecedented accuracy. They thus had the capability to destroy reinforced command bunkers and missile silos deep within enemy territory. Such missiles, it was argued, were not defensive in nature but were actually destabilizing "first-strike" weapons that directly threatened both the military command structure of NATO and political targets within the Soviet heartland. This created the political incentive for both sides to curtail such weapons through arms-control negotiations.

INF negotiations began in October 1980, three years after the first SS-20s were deployed in the Soviet Union and three years before the first Pershings and Tomahawks were deployed in western Europe under NATO auspices. The treaty as finally approved was based upon the "zero option" proposed by the United States in November 1981. Under this proposal, NATO would forego deploying its intermediate-range missiles if the Soviets dismantled their SS-20s and the older IRBMs it was replacing. After five years of interrupted and often acrimonious negotiation, the Soviet Union accepted the concept of elimination (rather than mere reduction) of all land-based IRBMs and, in July 1987, expanded it to include a "double-zero" option. This proposal called for the elimination not only of all of the superpowers' intermediate-range missiles but also of their shorter-range missiles as well. These SRBMs consisted of the U.S. Pershing 1A and the Soviet SS-12 and SS-23. The United States agreed to this proposal. The Soviet Union also agreed to on-site verification of the missiles' destruction.

The treaty incorporating these commitments was signed in Washington, D.C., on Dec. 8, 1987, by U.S. President Ronald Reagan and Soviet General Secretary Mikhail Gorbachev. It was ratified by the U.S. Senate and the Supreme Soviet the following year.

The INF Treaty called for the progressive dismantling, over three years, of 2,619 missiles, about half of which were deployed at the time of signing. About two-thirds of the missiles affected were Soviet, and the rest were American. Each country was allowed to keep intact the warheads and guidance systems of the destroyed missiles. Also destroyed were missile launchers and various kinds of support equipment and structures. Teams of observers from both countries were given access to certain operating bases, support facilities, and elimination facilities in order to verify the withdrawal and destruction of the missile systems. In order to ensure the permanent elimination of intermediate-range missiles, each country was given the right for 13 years to conduct periodic inspections of operating bases and support facilities and to monitor one production plant at which weapons of the INF category might be produced.

intermediate vector boson, type of boson associated with the electromagnetic and weak forces in unified form. *See* W particle.

intermetallic compound, any of a class of substances composed of definite proportions of two or more elemental metals, rather than continuously variable proportions (as in solid solutions). The crystal structures and the properties of intermetallic compounds often differ markedly from those of their constituents. In addition to the normal valences of their components, the relative sizes of the atoms and the ratio of the total number of valence electrons to the total number of atoms have important effects on the composition of intermetallic compounds. *See also* alloy.

intermezzo (Italian: "interlude"), plural INTERMEZZI, or INTERMEZZOS, in music and theatre, an entertainment performed between the acts of a play; also a light instrumental composition. In the late 15th and 16th centuries, classical and contemporary plays were performed with intermezzi written by the finest composers of the time and consisting of solo songs, madrigals and other part-songs, dance, and, occasionally, spoken dialogue. In subject matter, they were often allegorical or pastoral.

By 1600 the intermezzi were frequently elaborate spectacles that attracted more attention than the play. In Italy, opera evolved within the framework of the intermezzo. Comic intermezzi were performed between the acts of 17th- and 18th-century serious operas. Usually for soprano and bass, and sung throughout, they gave rise to opera buffa, the characteristic Italian form of comic opera. Giovanni Battista Pergolesi's famous and influential opera buffa, *La serva padrona* (1733; *The Maid as Mistress*), was originally a series of intermezzi performed between the acts of his serious opera *Il prigionier superbo* (*The Haughty Prisoner*).

In the 19th century, "intermezzo" was often used as a title for light instrumental pieces, such as the piano intermezzi composed by Franz Schubert and Johannes Brahms. The orchestral intermezzo in Pietro Mascagni's one-act opera *Cavalleria rusticana* (1889; *Rustic Chivalry*) forms an interlude between the opera's two sections.

internal-combustion engine, any engine in which a fuel-air mixture is burned in the engine proper so that the hot gaseous products of combustion act directly on the surface of its moving parts, such as that of a piston or turbine rotor blade. Internal-combustion engines are the most widely used of all present-day power-generating systems. They include gasoline engines, diesel engines, gas-turbine engines, pure jet engines, and rocket engines and motors.

A brief treatment of internal-combustion engines follows. For full treatment, *see* MACROPAEDIA: Energy Conversion.

Internal-combustion engines constitute one class of what are known as heat engines, devices that derive their power either directly or indirectly from an exothermic reaction (*e.g.*, combustion). The other principal class of heat engines consists of external-combustion engines, of which the steam engine and the Stirling engine are notable examples. Unlike internal-combustion systems, these engines employ a secondary working fluid that is interposed between the combustion chamber and the power-producing elements. In the steam engine, for instance, fuel is burned in a furnace external to the engine, and a portion of the energy liberated is transferred through boiler or heat-exchanger walls to the secondary

working fluid consisting of water. The water is converted into steam, which is then conveyed through pipes to the engine in which the pressure of the steam acts on pistons or turbine runners. In effect, the steam engine and other external-combustion systems operate with a high-pressure working medium produced by utilizing the expansion that accompanies the vaporization of a liquid. Internal-combustion engines, on the other hand, make use of the large volume of hot combustion products that become a high-pressure gaseous medium when confined.

Internal-combustion engines are commonly divided into two major subclasses: continuous-combustion engines and intermittent-combustion engines. The first type, exemplified by the jet engine, is characterized by a steady flow of fuel and air into the engine where a stable flame is maintained for continuous combustion. In the second variety, typified by the gasoline-reciprocating piston engine, discrete quantities of fuel and air are processed in a cyclical manner, with a periodic ignition of the fuel–air mixture.

internal energy, in thermodynamics, the property or state function that defines the energy of a substance in the absence of effects due to capillarity and external electric, magnetic, and other fields. Like any other state function, the value of the energy depends upon the state of the substance and not upon the nature of the processes by which it attained that state. In accordance with the first law of thermodynamics, when a system undergoes a change of state as a result of a process in which only work is involved, the work is equal to the change in internal energy. The law also implies that if both heat and work are involved in the change of state of a system, then the change in internal energy is equal to the heat supplied to the system minus the work done by the system.

Sometimes it is convenient to represent the internal energy as a sum of terms that can be interpreted as kinetic energy, potential energy, and chemical energy.

Internal energy is an extensive property—that is, its magnitude depends on the amount of substance in a given state. Its value usually is calculated with reference to some standard state rather than being expressed in absolute terms.

Internal Macedonian Revolutionary Organization (IMRO), Macedonian VATRESHNA MAKEDONSKA-REVOLUTSIONNA ORGANIZATSIYA, Bulgarian VŬTRESHNATA MAKEDONO-ODRINSKA REVOLUTSIONNA ORGANIZATSIYA, secret revolutionary society that operated in the late 19th and early 20th centuries to make Macedonia an autonomous state but that later became an agent serving Bulgarian interests in Balkan politics.

Founded in November 1893 at Resna under the leadership of Damyan Gruev, Gotse Delchev, and Yane Sandanski, IMRO adopted the slogan "Macedonia for the Macedonians" and a program aimed at winning autonomy for Macedonia from its Ottoman Turkish rulers and at creating a Balkan federation, in which Macedonia would be an equal partner with all other Balkan states.

Having swiftly gained widespread support among the Christian Slav populations of Macedonia, IMRO began violent anti-Turkish activities in 1897 and in 1903 staged a major but unsuccessful rebellion that was also supported by a parallel, pro-Bulgarian organization, Vzhovists. Subsequently, its organization deteriorated, and, after Macedonia was seized from the Turks and divided between Serbia and Greece (Balkan Wars, 1912–13), IMRO's terrorist bands operated in conjunction with Bulgaria's foreign policy, which was designed to force a redistribution of Macedonia. By the end of World War I, however, IMRO's indiscriminate and unprincipled use of terror had alienated both its Macedonian and Bulgarian supporters.

Under Todor Aleksandrov, however, IMRO reestablished itself as an influential factor in Balkan politics, particularly by participating in the overthrow and assassination of Bulgaria's prime minister Aleksandŭr Stamboliyski (June 1923), who had tried to ease relations with other Balkan states. IMRO then obtained control of the Petrich (*i.e.,* the Macedonian) district of Bulgaria and pursued its terrorist activities in Bulgaria and Yugoslavia with the unofficial approval and protection of the Bulgarian war ministry and with clandestine support from the Italian government. After Aleksandrov was assassinated (1924), however, the organization split into two rival factions, which engaged in frequent gunfights in Sofia in an effort to annihilate one another.

In May 1934 Colonel Kimon Georgiev seized power in Bulgaria, arrested IMRO's leaders, and disarmed its members.

internal medicine, medical specialty that deals with the diagnosis and medical, as opposed to surgical, treatment of diseases of adults. It is broadly identical with the practice of the physician, as opposed to that of the surgeon. Internal medicine, which deals with the entire patient rather than a particular organ system, is in effect the parent of other medical specialties such as cardiology, dermatology, and gastroenterology. An advanced practitioner of internal medicine is called an internist in the United States and many other countries.

In 1936 the American Board of Internal Medicine was established in the United States, with the object of formally certifying specialists in internal medicine. Professional qualifications for certification include graduation from an approved medical school, followed by an internship of not less than one year and, further, a prolonged program of intensified training and experience. The core of this program consists of two to three years of full-time residency training in a hospital.

Additional study in the program may be devoted to work in any clinical, investigative, or basic science field related to internal medicine. The training program for internists emphasizes advanced knowledge of anatomy, microbiology, biochemistry, pathology, pharmacology, and physiology. Completion of training is followed by written and oral examinations given by the board and then by certification.

The development of internal medicine as a scientific discipline began with Thomas Sydenham's concept of disease, articulated in the 17th century. Sydenham closely observed clinical phenomena at the patient's bedside and conceived for the first time the possibility of a variety of distinct "diseases," as opposed to general illness caused by the imbalance of "humours," which was then the prevailing theory of disease causation. Sydenham's work created a framework for the classification of diseases, which was built upon by François Boissier de Sauvages, who in 1763 published the first methodical nosology, or description of disease symptoms. Sauvages emphasized symptomatology as the basis for disease classification, since there was no information then available about the causes of diseases.

From the time of Sauvages until the 20th century, internists could do little to treat diseases. Unlike surgeons, who could remove the offending organ, internists had no specific therapies; most of the "treatments" that physicians could offer made the patient worse, not better. The measure of an internist's skill was the accuracy of his diagnosis and the reliability of his advice about the probable outcome of the disease. Only with the development of disease-specific therapies at the beginning of the 20th century did internal medicine become effective in the cure, rather than just the supportive care, of patients. As more and more specific medications and courses of therapy became available and the volume of medical knowledge increased, more and more subspecialties devoted to particular organ systems split off, leaving internal medicine as the specialty of physicians dealing with all problems of the adult patient.

internal pair production, electromagnetic process classified as a form of gamma decay. *See* gamma decay; pair production.

International, FIRST, formally INTERNATIONAL WORKING MEN'S ASSOCIATION, federation of workers' groups that, despite ideological divisions within its ranks, had a considerable influence as a unifying force for labour in Europe during the latter part of the 19th century.

The First International was founded under the name of International Working Men's Association at a mass meeting in London on Sept. 28, 1864. Its founders were among the most powerful British and French trade-union leaders of the time. Though Karl Marx had no part in organizing the meeting, he was elected one of the 32 members of the provisional General Council and at once assumed its leadership. The International came to assume the character of a highly centralized party, based primarily on individual members, organized in local groups, which were integrated in national federations, though some trade unions and associations were affiliated to it collectively. Its supreme body was the Congress, which met in a different city each year and formulated principles and policies. A General Council elected by the Congress had its seat in London and served as the executive committee, appointing corresponding secretaries for each of the national federations; organizing collections for the support of strikes in various countries; and, in general, advancing the International's goals.

From its beginnings, the First International was riven by conflicting schools of socialist thought—Marxism, Proudhonism (after Pierre-Joseph Proudhon, who advocated only the reform of capitalism), Blanquism (after Auguste Blanqui, who advocated radical methods and a sweeping revolution), and Mikhail Bakunin's version of anarchism, which dominated the International's Italian, Spanish, and French-Swiss federations. The First International split at its Hague Congress in 1872 over the clash between Marx's centralized socialism and Bakunin's anarchism. In order to prevent the Bakuninists from gaining control of the association, the General Council, prompted by Marx, moved its headquarters to New York City, where it lingered until it was formally disbanded at the Philadelphia Conference in July 1876. The Bakuninists, assuming leadership of the International, held annual congresses from 1873 to 1877. At the Ghent Socialist World Congress in 1877, the Social Democrats broke away because their motion to restore the unity of the First International was rejected by the anarchist majority. The anarchists failed, however, to keep the International alive. After the London anarchist Congress of 1881, it ceased to represent an organized movement. The International was early proscribed in such countries as Germany, Austria, France, and Spain. French and German proposals that it be outlawed by concerted European action failed, however, because of British reluctance to suppress the General Council in London. It should be noted that the International's renown at the time as a formidable power with millions of members and almost unlimited resources was out of proportion with the association's actual strength; the hard core of its individual members probably seldom exceeded 20,000. Although so accused, it did not organize the wave of strikes that swept France, Belgium,

and Switzerland in 1868, but its support and rumoured support of such strikes was very influential.

International, SECOND, also called SOCIALIST INTERNATIONAL, federation of socialist parties and trade unions that greatly influenced the ideology, policy, and methods of the European labour movement from the last decade of the 19th century to the beginning of World War I.

The Second International was founded at a congress in Paris in 1889. Unlike the First International, it was based on the membership of national parties and trade unions only. It was not a centralized organization, like the first, but rather a loose federation that did not set up an executive body, the International Socialist Bureau, until 11 years after its foundation. Its headquarters was in Brussels, where the second congress of the International met in 1891. The congresses met in a number of cities at various intervals, not on a yearly basis. By 1912 the Second International represented the socialist and social democratic parties of all European countries, the United States, Canada, and Japan, with a voting strength of nearly nine million. Although it had no mandatory power, it was recognized by its member parties as their highest moral authority.

The Second International stood for parliamentary democracy and finally, at its London Congress in 1896, expelled from its ranks the anarchists, who opposed it. Yet, after much debate, the Second International rejected the theory of the gradual achievement of socialism and cooperation with nonsocialist parties in office, and it reaffirmed the Marxist doctrine of the class struggle and the inevitability of revcluction. Its main concern, however, was the prevention of a general European war. After extended debate it rejected the use of a general strike to ward off the imminent danger of a general European war. It demanded the introduction of compulsory courts of arbitration for the settlement of disputes between nations; and the reduction of armaments with total disarmament as the ultimate aim. In a resolution drafted by Vladimir Lenin, Rosa Luxemburg, and L. Martov and adopted by its Stuttgart Congress in 1907, however, the International pledged its member parties in belligerent countries to use the social and economic crisis brought about by war to promote social revolution.

The power groupings in World War I confronted the socialist parties in the belligerent countries with a dilemma. With the exception of the Serbian and Russian socialists, all such parties supported the war efforts of their respective countries. This situation split the International: a growing minority within these parties rebuked the majority for its desertion of the antiwar principles of the Second International. At a conference held in Zimmerwald, Switz., in 1915, these "Internationalists" called for an immediate cessation of the war and for peace negotiations based on the principle of "no annexations, no indemnities." The minority socialists opposed to the war were themselves divided, however; a "left" group led by Lenin urged an effort to transform the imperialist war into a transnational class war and opposed a revival of the Second International, which had by then ceased to function.

In an attempt to reconstruct the Second International after the war, a commission of socialist leaders in the Allied countries convened a congress of the International at Geneva in 1920. When this congress met, however, only a small fraction of the prewar membership of the Second International attended. The rift in the international socialist movement, produced by dissensions over the war policy pursued by the majority of the socialist parties, and their hostility to the Bolshevik Revolution, which had aroused the sympathy of many workers, had destroyed the common ground for the reinstitution of the Second International.

In 1923 those who had remained loyal to the Second International joined with several national socialist parties to form the Labour and Socialist International (*q.v.*). This union of socialists opposed to the Soviet-dominated Third International (or Comintern) never attained the power and influence of the Second International, however, and Adolf Hitler's conquests in 1940 destroyed most of its basis in Europe. After World War II the Socialist International (*q.v.*) was reinstituted in gradual stages culminating in its first postwar congress in 1951, in Frankfurt am Main, Ger.

International, THIRD, also called COMMUNIST INTERNATIONAL, byname COMINTERN, association of national communist parties founded in 1919. Though its stated purpose was the promotion of world revolution, the Comintern functioned chiefly as an organ of Soviet control over the international communist movement.

The Comintern emerged from the three-way split in the socialist Second International over the issue of World War I. A majority of socialist parties, comprising the International's "right" wing, chose to support the war efforts of their respective national governments against enemies that they saw as far more hostile to socialist aims. The "centre" faction of the International decried the nationalism of the right and sought the reunification of the Second International under the banner of world peace. The "left" group, led by Vladimir Lenin, rejected both nationalism and pacifism, urging instead a socialist drive to transform the war of nations into a transnational class war. In 1915 Lenin proposed the creation of a new International to promote "civil war, not civil peace" through propaganda directed at soldiers and workers. Two years later Lenin led the Bolshevik seizure of power in Russia, and in 1919 he called the first congress of the Comintern, in Moscow, specifically to undermine ongoing centrist efforts to revive the Second International. Only 19 delegations and a few non-Russian communists who happened to be in Moscow attended this first congress; but the second, meeting in Moscow in 1920, was attended by delegates from 37 countries. There Lenin established the Twenty-one Points, the conditions of admission to the Communist International. These prerequisites for Comintern membership required all parties to model their structure on disciplined lines in conformity with the Soviet pattern and to expel moderate socialists and pacifists.

The administrative structure of the Comintern resembled that of the Soviet Communist Party: an executive committee acted when congresses were not in session, and a smaller presidium served as chief executive body. Gradually, power came to be concentrated in these top organs, the decisions of which were binding on all member parties of the International. Moreover, Soviet domination of the Comintern was established early. The International had been founded by Soviet initiative, its headquarters was in Moscow, the Soviet party enjoyed disproportionate representation in the administrative bodies, and most foreign communists felt loyal to the world's first socialist state.

The notion that world revolution was not imminent led in 1921 to a new Comintern policy in order to gain broad working-class support. "United fronts" of workers were to be formed for making "transitional demands" on the existing regimes. This policy was abandoned in 1923, when the Comintern's left wing gained temporary control. Joseph Stalin's assault on the left group of his party, however, brought the expulsion of the Comintern's first president, Grigory Y. Zinovyev, in 1926 and a further rapprochement with moderate socialism. Then Stalin's move against the right wing of his party led to another turn in Comintern policy. In 1928 the sixth congress adopted a policy of "extreme leftism" set forth by Stalin: once again, moderate socialists and social democrats were branded as the chief enemies of the working class. The dangers of the rising fascist movement were ignored. In Germany in the early 1930s, the communists focused their attacks on the social democrats and even cooperated with the Nazis, whom they claimed to fear less, in destroying the Weimar Republic. World revolution was once more to be considered imminent, despite Stalin's own concentration on "building socialism in one country." At the Comintern's seventh and last congress in 1935, Soviet national interests dictated a new policy shift: in order to gain the favour of potential allies against Germany, revolutionary ardour was dampened, and the defeat of fascism was declared the primary goal of the Comintern. Now communists were to join with moderate socialist and liberal groups in "popular fronts" against fascism. By now the Comintern was being used as a tool of Soviet foreign policy. The program of popular fronts (*q.v.*) ended with the signing of Stalin's pact with Adolf Hitler in 1939. Soon, however, Germany and the Soviet Union were at war, and in 1943 Stalin officially dissolved the Comintern in order to allay fears of communist subversion among his allies. From the Soviet point of view, Moscow was confident of its ability to control the foreign communist parties; and, in any case, much of the Comintern organization was preserved intact within the Central Committee of the Communist Party of the Soviet Union. In 1947 Stalin set up a new centre of international control called the Cominform (*q.v.*), which lasted until 1956. The international communist movement broke down after 1956 owing to a developing split between the Soviet Union and China, among other factors.

International, FOURTH, a multinational body composed of Trotskyist organizations that was first formed in opposition to the policies of the Stalin-dominated Third International, or Comintern.

The idea of a Fourth International was first presented in the late 1920s by various opponents of the Soviet leader Joseph Stalin, particularly the followers of Leon Trotsky. Trotsky at first opposed the idea, but by July 1933, with the victory of Nazism in Germany, he called for a Fourth International, because he opposed the Comintern's condoning of fascism. Trotsky also intended the Fourth International to unite the various anti-Stalinist splinter groups from communist parties around the world.

The formation of the new International was difficult, though, because Stalin's secret police killed many potential Trotskyists in the period 1934–38, so that the ranks of the Trotskyist movement were thin. Nevertheless, a founding conference was held in Périgny, Fr., in 1938; it proclaimed the Fourth International and adopted a program calling for a broad range of goals between those of minimum reform (*e.g.*, higher wages, better working conditions) and those of the maximum program (*i.e.*, the overthrow of capitalism and the transition to socialism).

Trotsky died in 1940, and after World War II the Fourth International's leadership fell to Michel Pablo and Ernest Germain, two Belgian Trotskyists. When in 1949 Pablo predicted "degenerated workers' states for centuries" and, consequently, called for the dissolution of the International, a factional fight erupted, culminating in 1953 in the Fourth International's split into two factions—the International Committee and the Interna-

tional Secretariat, which supported Pablo. The chief importance of the Fourth International lies in disseminating information to the many extreme left-wing groups affiliated to one or another of its fragments.

international agreement, instrument by which states and other subjects of international law, such as certain international organizations, regulate matters of concern to them. The agreements assume a variety of forms and styles, but they are all governed by the law of treaties, which is part of customary international law.

A treaty, the typical instrument of international relations, is defined by the 1969 Vienna Convention on the Law of Treaties as an "agreement concluded between States in written form and governed by international law, whether embodied in a single instrument or in two or more related instruments and whatever its particular designation. Contractual treaties are treaties by which the parties agree to exchange pieces of territory or settle a dispute or claims—that is, by which they deal with a particular kind of business. Lawmaking treaties, which have grown tremendously in number and significance since World War II, are instruments in which the parties formulate principles or detailed rules for their future conduct."

Some multilateral agreements set up an international organization for a specific purpose or a variety of purposes. They may therefore be referred to as constituent agreements. The United Nations Charter (1945) is both a multilateral treaty and the constituent instrument of the United Nations. An example of a regional agreement that operates as a constituent agreement is the charter of the Organization of American States (Charter of Bogotá), which established the organization in 1948. The constitution of an international organization may be part of a wider multilateral treaty. The Treaty of Versailles (1919), for example, contained in Part I the Covenant of the League of Nations and in Part XIII the constitution of the International Labour Organisation.

The term supranational is of recent origin and is used to describe the type of treaty structure developed originally by six western European states: France, Germany, Italy, The Netherlands, Belgium, and Luxembourg. The first treaty was that of Paris, signed in 1951, establishing the European Coal and Steel Community (ECSC); the second, the Rome treaty, signed in 1957, establishing the European Economic Community (EEC); the third, the Rome treaty of the same date establishing the European Atomic Energy Community (Euratom). A clause in the ECSC treaty provides for the complete independence of the members of the executive organ from the governments that appoint them.

Treaties, however, are not the only instruments by which international agreements are concluded. There are single instruments that lack the formality of a treaty called agreed minute, memorandum of agreement, or modus vivendi; there are formal single instruments called convention, agreement, protocol, declaration, charter, covenant, pact, statute, final act, general act, and concordat (the usual designation for accords with the Holy See); finally there are less formal agreements consisting of two or more instruments, such as "exchange of notes" or "exchange of letters."

In the absence of an international legislature, the multilateral treaty is the chosen instrument for adapting international law to changing circumstances brought about by rapid technological developments and the ever-growing interdependence of nations.

Despite the extreme diversity of international agreements, it is possible to classify them according to the functions that they serve in international society. Three such broad functions may be discerned; namely, the development and codification of international law, the establishment of new levels of cooperation and integration between states, and the resolution of actual and potential international conflict.

The Vienna Convention on the Law of Treaties contains a compromissory clause (whereby participants agree to submit disputes to arbitration or the International Court of Justice) for certain types of disputes and a procedure of conciliation for others. The resistance of states to compulsory arbitration or adjudication is indicative of their limited commitment to universal integration through the rule of law. In this respect the European Economic Community is an exception, providing as it does for the compulsory settlement of disputes arising under the three constituent treaties by the Court of Justice, which is open even to individuals. It may be noted that western Europe was the cradle of nationalism and the doctrine of the sovereignty of states. Now it may have become the cradle of supranational integration.

International Amateur Athletic Federation (IAAF), track-and-field organization of national associations of more than 160 countries; founded at Stockholm, Sweden, 1912. In 1936 the IAAF took over regulation of women's international track-and-field competition from the Fédération Sportive Féminine International, which had been founded in 1921. The major aims of the IAAF are to establish friendly cooperation between members; eliminate hindrance to participation in international meets on racial, religious, or political grounds; and compile rules and regulations governing competition. The IAAF is the ratifying body for all official world records in track-and-field events. It is recognized by the International Olympic Committee (IOC) and is financed by members' fees, publication sales, and the promotion of championships. Headquarters are in London.

International Association of Universities (IAU), nongovernmental educational organization founded in 1950 to promote cooperation at the international level among the universities of all countries as well as among other bodies concerned with higher education and research. Membership consists of individual universities and institutions of university rank in 96 countries. The General Conference, convened every five years, elects an administrative board composed of the president and 14 members. The association is supported by members' dues and grants from UNESCO and maintains information centres in 120 countries, carrying out a research program with UNESCO. English and French are official languages of the association, but German, Russian, and Spanish are also used. Publications include *International Handbook of Universities* (triennially) and *International List of Universities and Other Institutions of Higher Education* (biennially).

International Atomic Energy Agency (IAEA), autonomous intergovernmental organization dedicated to increasing the contribution of atomic energy to the world's peace and well-being and ensuring that agency assistance is not used for military purposes. The agency was established on Oct. 23, 1956, with the approval of a statute that came into force on July 29, 1957. Its activities include research on the applications of atomic energy to medicine, agriculture, water location, and industry; the operation of conferences, training programs, fellowships, and publications to promote the exchange of technical information and skills; provision of technical assistance, especially to less developed countries; and the establishment and administration of radiation safeguards.

International Bank for Economic Cooperation (IBEC), international bank instituted by an agreement signed by Bulgaria, Hungary, East Germany, Mongolia, Poland, Romania, Czechoslovakia, and the Soviet Union in October 1963 to facilitate economic cooperation among the member countries and to promote their development. It began operations in January 1964. Cuba and Vietnam joined afterward.

Its functions include making multilateral settlements in transferable rubles, advancing credit to members to finance temporary trade imbalances, accepting deposits of uncommitted funds in transferable rubles, accepting gold and convertible currencies on deposit, and conducting arbitrage and other financial operations with them. It also performs other banking operations.

General policy decisions are made by the Council, which is composed of representatives from each of the 10 member nations. A 10-member Board acts as the executive body.

International Bank for Reconstruction and Development (IBRD), byname WORLD BANK, international organization affiliated with the United Nations (*q.v.;* UN) and designed to finance projects that enhance the economic development of member states. Headquartered in Washington, D.C., the bank is the largest source of financial assistance to developing countries. Together with the World Trade Organization and the International Monetary Fund (*qq.v.;* IMF), it plays a central role in overseeing economic policy in developing countries and defining the global macroeconomic agenda.

Origins. Founded in 1944 at the United Nations Monetary and Financial Conference, which was convened to establish a new post-World War II international economic system, the IBRD officially began operations in June 1946. Its first loans were geared toward the postwar reconstruction of western Europe. Beginning in the mid-1950s, it played a major role in financing investments in infrastructural projects in developing countries, including roads, hydroelectric dams, water and sewage facilities, maritime ports, and airports.

The IBRD provides loans at market rates of interest to middle-income developing countries and creditworthy lower-income countries. It is a member of the World Bank Group, which comprises four other constituent institutions: the International Development Association (*q.v.;* IDA), the International Finance Corporation (*q.v.;* IFC), the Multilateral Investment Guarantee Agency, and the International Centre for Settlement of Investment Disputes.

From 1968 to 1981 the president of the World Bank was former U.S. Secretary of Defense Robert S. McNamara. Under his leadership, the bank formulated the concept of "sustainable development," which regarded capital flows (in the form of development assistance and foreign investment) to developing countries as a means of narrowing the income gap between rich and poor countries. The bank has expanded its lending activities and has developed into a powerful and authoritative intergovernmental body.

Organization. Although related to the UN, the IBRD is not accountable to either the General Assembly or to the Security Council. Each of the bank's more than 180 members are represented on the board of governors, which meets once a year. The governors are usually their countries' finance ministers or central bank governors. Actual decision-making

power is wielded largely by the bank's 24 executive directors. Five major countries—the United States, Japan, Germany, the United Kingdom, and France—appoint their own executive directors. The other countries are grouped by regions, each of which elects one executive director. Throughout the IBRD's history, the bank president, who serves as chairman of the Executive Board, has been an American citizen. The United States is the bank's largest shareholder.

Voting power is based on a country's capital subscription, which is based in turn on its economic resources. The wealthier and more developed countries constitute the bank's major shareholders and thus exercise greater power and influence. For example, in the late 1990s the United States exercised nearly one-fifth of the votes, more than double that of Japan, the second largest shareholder. Because developing countries hold only a small number of votes—*e.g.*, in the late 1990s, approximately 2 percent of the votes were held by 25 African countries combined—the system does not provide a significant voice for these countries, which are the primary recipients of IBRD loans and policy advice.

The bank obtains its funds from the capital subscriptions of member countries, bond flotations on the world's capital markets, and net earnings accrued from interest payments on IBRD and IFC loans. Approximately 10 percent of the subscribed capital is paid directly to the bank, with the remainder subject to call if required to meet obligations.

The IBRD's more than 10,000 staff members are posted in more than 70 countries. The bank has consultative as well as informal ties with the world's financial markets and institutions and maintains links with nongovernmental organizations in both developed and developing countries.

Debt and policy reform. Beginning in the 1980s, the bank became increasingly involved in shaping economic and social policies in indebted developing countries. As a condition of receiving loans, borrowing countries were required to implement stringent "structural adjustment programs," which typically included severe cuts in spending for health and education, elimination of price controls, liberalization of trade, deregulation of the financial sector, and privatization of state-run enterprises. Although intended to restore economic stability, these programs frequently resulted in increased levels of poverty, mounting unemployment, and spiraling external debt.

Following the end of the Cold War, the IBRD and the IMF played important roles in overseeing free-market reforms in eastern Europe. These reforms, which included the creation of bankruptcy and privatization programs, were controversial because they frequently led to the closure of state-run industrial enterprises. The bank also has provided reconstruction loans to countries that have suffered internal conflicts or other crises.

The World Bank is the world's largest multilateral creditor institution, and as such many of the world's poorest countries owe it large sums of money. Indeed, for dozens of the most heavily indebted poor countries, the largest part of their external debt—in some cases constituting more than 50 percent—is owed to the World Bank Group. According to some analysts, the burden of these debts—which according to the bank's statutes cannot be cancelled or rescheduled—has perpetuated economic stagnation in these countries.

(Mi.Ch./Ed.)

International Boundary Waters Treaty (1909), treaty between the United States and Great Britain establishing an International Joint Commission of Americans and Canadians to oversee any issue related to waters on the boundary between the United States and Canada. The treaty was signed on Jan. 11, 1909, calling for an annual meeting of the Joint Commission. These meetings are still being held to regulate use of the waters and also safeguard water quality.

International Brigades, groups of foreign volunteers who fought on the Republican side against the Nationalist forces during the Spanish Civil War (1936–39). So called because their members (initially, anyway) came from some 50 countries, the International Brigades were recruited, organized, and directed by the Comintern (Communist International), with headquarters in Paris. A large number of the mostly young recruits were Communists before they became involved in the conflict; more joined the party during the course of the war. The French were the largest single foreign group (some 10,000); Germany, Austria, Poland, Italy, the United States, the United Kingdom, Yugoslavia, Czechoslovakia, Canada, and Hungary were also represented by significant numbers of volunteers.

"The Internationals—United with the Spaniards We Fight the Invader," poster by Parrilla, published by the International Brigades, 1936–37

By courtesy of the Abraham Lincoln Brigade Archives, Brandeis University Library

The first group of 500 trainees arrived in Albacete, Spain, on Oct. 14, 1936. As other trainees and Soviet arms arrived, they were placed under the command of representatives of the Comintern. There were seven brigades in all, and each one was divided into battalions by nationality (*e.g.*, the French-Belgian Commune de Paris Battalion, the American Abraham Lincoln Battalion, the British Battalion). The number of volunteers probably never exceeded 20,000 at any one time, but the total number of volunteers, including a small number of women, reached about 37,000.

From 1936 to 1938 the brigades, despite some difficulties, operated effectively on the Republican side, and their organization was imitated by other units of the Republican army. From 1937 on, recruits for the brigades diminished, and men lost in action or by desertion were replaced mainly by Spanish Communists. The brigades were formally withdrawn from Spain late in 1938, when the Soviet Union began to decrease its support for the Spanish Republic. The last battle in which they participated was that of the Ebro. A farewell parade was held for the volunteers in Barcelona on Nov. 15, 1938.

International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers of America: *see* Teamsters Union.

International Bureau of Weights and Measures, French BUREAU INTERNATIONAL DES POIDS ET MESURES (BIPM), international organization founded to bring about the unification of systems of measurement, to establish and preserve fundamental international standards and prototypes, to verify national standards, and to determine fundamental physical constants. The bureau was established by a convention signed in Paris on May 20, 1875, effective January 1876. In 1921 a modified convention was signed.

The convention provides for a General Conference that meets every four years to consider required improvements or modifications in standards, an International Committee of Weights and Measures composed of 18 scientists elected by the Conference (meets annually), and several consultative committees. The bureau headquarters at Sèvres, France, serves as a depository for the primary international standards and as a laboratory for certification and intercomparison of national standard copies.

International Business Machines Corporation (IBM), leading American computer manufacturer, with a major share of the market both in the United States and abroad. Its headquarters are in Armonk, N.Y.

It was incorporated in 1911 as the Computing-Tabulating-Recording Company in a consolidation of three smaller companies that made punch-card tabulators and other office products. The company assumed its present name in 1924 under the leadership of Thomas Watson, a man of considerable marketing skill who became general manager in 1914 and had gained complete control of the firm by 1924. Watson built the then-floundering company into the leading American manufacturer of punch-card tabulating systems used by governments and private businesses. He also developed a highly disciplined and competitive sales force that adapted the company's custom-built tabulating systems to the needs of particular customers.

In 1933 IBM purchased Electromatic Typewriters, Inc., and thereby entered the field of electric typewriters, in which it eventually became an industry leader. During World War II, IBM helped construct several high-speed electromechanical calculators that were the precursors of electronic computers. But the firm refrained from producing these electronic data-processing systems until Watson's son, Thomas Watson, Jr., became president of the company in 1952 and sponsored an all-out push into that field. Having entered the computer field, IBM's size allowed it to invest heavily in development. This investment capability, added to its dominance in office-calculating machines, its marketing expertise, and its commitment to repair and service its own equipment, allowed IBM to quickly assume the predominant position in the American computer market. By the 1960s it was producing 70 percent of the world's computers and 80 percent of those used in the United States.

IBM's specialty was mainframe computers—*i.e.*, expensive medium- to large-scale computers that could process numerical data at great speeds. The company did not enter the growing market for personal computers until 1981, when it introduced the IBM Personal Computer. This product achieved a major share of the market, but IBM was nevertheless unable to exercise its accustomed dominance as a maker of personal computers. New semiconductor-chip-based technologies were making computers smaller and easier to manufacture, allowing smaller companies to enter the field and exploit new developments such as workstations, computer networks, and computer graphics. IBM's enormous size hindered it from responding rapidly to these accelerating rates of technological change, and by the 1990s the company had downsized considerably. In 1995 IBM purchased Lotus Develop-

ment Corporation, a major software manufacturer.

IBM's products include virtually every type of equipment needed for information processing, storage, and retrieval. In addition to being the world's largest manufacturer of computers, the company produces electric typewriters, electronic cash registers, and other business machines.

International Campaign to Ban Landmines (ICBL), international coalition of nongovernmental organizations established in 1992 to ban the use, production, trade, and stockpiling of antipersonnel land mines. In 1997 the coalition was awarded the Nobel Prize for Peace, which it shared with its founding coordinator, American Jody Williams (*q.v.*). At that time, the ICBL was made up of 1,000 humanitarian, medical, and developmental groups from more than 60 nations.

In October 1992 Williams coordinated the launch of the ICBL with the organizations Handicap International, Human Rights Watch, Physicians for Human Rights, Medico International, Mines Advisory Group, and Vietnam Veterans of America Foundation. The coalition addressed the failures of the 1980 Geneva Convention on Inhumane Weapons by seeking a total ban on antipersonnel land mines and increased resources for mine clearance and victim assistance. Their efforts led to a 1996 conference in Ottawa, Ont., Can., that culminated in the Mine Ban Treaty of December 1997. As a result, there was a marked yearly decrease in the rate of people, mostly civilians, maimed or killed by antipersonnel land mines, averaging about 18,000 annually in the early 21st century. (J.Wi.)

International Church of the Foursquare Gospel, Pentecostal denomination established by Aimee Semple McPherson (*q.v.*), a popular revivalist preacher, in Los Angeles, Calif., in 1927. During a revival campaign in Oakland, Calif., four years earlier, "Sister" Aimee claimed to have seen a vision of four living creatures reminiscent of the one recorded in the Old Testament Book of Ezekiel (1:5–10). She interpreted the faces of these four creatures—a lion, a man, an ox, and an eagle—as symbolizing perfection, and she equated a perfect, foursquare, full gospel with one that would stress four themes: salvation, Holy Spirit baptism, healing, and the Second Coming of Christ. These four themes became the hallmark of her preaching, and, in a short time, hundreds flocked to her meetings; in two years she was able to dedicate Angelus Temple in Los Angeles as the "mother church" of the Foursquare Gospel Association. By the late 20th century the Foursquare Gospel Church had become one of the largest Pentecostal denominations. *See* Pentecostalism.

International Civil Aviation Organization (ICAO), intergovernmental specialized agency associated with the United Nations (UN). Established in 1947 by the Convention on International Civil Aviation, which had been signed by 52 states three years earlier in Chicago, the ICAO is dedicated to developing safe and efficient international air transport for peaceful purposes and ensuring a reasonable opportunity for every state to operate international airlines. The ICAO's activities have included establishing and reviewing international technical standards for aircraft operation and design, crash investigation, the licensing of personnel, telecommunications, meteorology, air navigation equipment, ground facilities for air transport, and search-and-rescue missions. The organization's permanent headquarters are in Montreal.

International Confederation of Free Trade Unions (ICFTU), the world's principal organization of national trade union federations. The ICFTU was formed in 1949 by Western trade union federations that had withdrawn from the World Federation of Trade Unions (WFTU) after bitter disagreements with communist-led unions in the WFTU. The chief founders of the new organization were the American Federation of Labor–Congress of Industrial Organizations (AFL–CIO) of the United States and the Trades Union Congress of Great Britain. The stated purpose of the new federation was to ensure "collaboration between the free and democratic trade union movements throughout the world."

The primary strength of the ICFTU lies in the trade union federations of western Europe, North America, the Commonwealth, and Latin America. By the late 20th century the ICFTU included more than 200 member organizations representing 125,000,000 workers in 140 countries and territories. The ICFTU's headquarters are in Brussels, Belg.

International Convention for the Protection of Literary and Artistic Works: *see* Berne Convention.

International Court of Justice (ICJ), byname WORLD COURT, the principal judicial organ of the United Nations (*q.v.*; UN). The idea for the creation of an international court to arbitrate international disputes first arose during the various conferences that produced the Hague Conventions in the late 19th and early 20th centuries. The body subsequently established, the Permanent Court of Arbitration, was the precursor of the Permanent Court of International Justice (PCIJ), which was created by the League of Nations. From 1921 to 1939 the PCIJ issued more than 30 decisions and delivered nearly as many advisory opinions, though none were related to the issues that threatened to engulf Europe in a second world war in 20 years. The ICJ was established in 1945 by the San Francisco Conference, which also created the UN. All members of the UN are parties to the statute of the ICJ, and nonmembers may also become parties. The court's inaugural sitting was in 1946.

The ICJ is a continuing and autonomous body that is permanently in session. It consists of 15 judges—no two of whom may be nationals of the same state—who are elected to nine-year terms by majority votes in the UN General Assembly and the Security Council. The judges, one-third of whom are elected every three years, are eligible for reelection. The judges elect their own president and vice president, each of whom serves a three-year term.

The seat of the ICJ is at The Hague, but sessions may be held elsewhere when the court considers it desirable to do so. The official languages of the court are French and English.

The ICJ's primary function is to pass judgment upon disputes between sovereign states. Only states may be parties in cases before the court, and no state can be sued before the court unless it consents to such an action. Under article 36 of the court's statute, any state may consent to the court's compulsory jurisdiction in advance by filing a declaration to that effect with the UN secretary-general, and by 2000 more than 60 countries had issued such a declaration. The declaration (the "optional clause") may be made unconditionally, or it may be made on condition of reciprocity on the part of other states, or it may be made for a certain time. In proceedings before the court, written and oral arguments are presented, and the court may hear witnesses and appoint commissions of experts to make investigations and reports when necessary.

Cases before the ICJ are resolved in one of three ways: (1) they can be settled by the parties at any time during the proceedings; (2) a state can discontinue the proceedings and withdraw at any point; or (3) the court can deliver a verdict. The ICJ decides disputes in accordance with international law as reflected in international conventions, international custom, general principles of law recognized by civilized nations, judicial decisions, and writings of the most highly qualified experts on international law. Although the judges deliberate in secret, their verdicts are delivered in open court. Any judge who does not agree in whole or in part with the court's decision may file a separate opinion, and few decisions represent the unanimous opinion of the judges. The court's judgment is final and without appeal.

The court's decisions, numbering about 70 from 1946 to 2000, are binding. They have concerned issues such as land and maritime boundaries, territorial sovereignty, diplomatic relations, the right of asylum, nationality, and economic rights. The ICJ is also empowered to give advisory opinions on legal questions at the request of other organs of the UN and its specialized agencies when authorized to do so by the General Assembly. Although advisory opinions—numbering about 25 over its first 50 years—are not binding and are only consultative, they are considered important. They have concerned issues such as admission to the UN, the expenses of UN operations, and the territorial status of South West Africa (Namibia) and Western Sahara. The court may also be granted jurisdiction over certain cases by treaty or convention. By the late 1990s approximately 400 bilateral and multilateral treaties deposited at the UN conferred compulsory jurisdiction to the ICJ.

Although the court itself has no powers of enforcement, few state parties to a case before the ICJ (or before its predecessor, the PCIJ) have failed to carry out the court's decisions. Two exceptions are Albania, which failed to pay £843,947 in damages to the United Kingdom in the Corfu Channel case (1949), and the United States, which refused to pay reparations to the Sandinista government of Nicaragua (1986). The United States also withdrew its declaration of compulsory jurisdiction and blocked Nicaragua's appeal to the UN Security Council. In general, however, enforcement is possible because the court's decisions, though few in number, are viewed as legitimate by the international community. (K.A.Mi.)

International Criminal Court (ICC), permanent judicial body established by the Rome Statute of the International Criminal Court (1998) to prosecute and adjudicate allegations of genocide (*q.v.*), war crimes, and crimes against humanity. On July 1, 2002, after the requisite number of countries (60) ratified the agreement, the court began sittings. It is headquartered in The Hague.

The ICC was established as a court of last resort to prosecute the most heinous offenses in cases where national courts fail to act. Unlike the International Court of Justice (*q.v.*; ICJ), which hears disputes between states, the ICC handles individual prosecutions. The court's jurisdiction extends to all offenses occurring after July 1, 2002, committed either in a state that has ratified the agreement or by a national of such a state.

Although the Rome Statute was widely praised (some 140 countries eventually signed the agreement), few countries in the Middle East or Asia joined. Further, by 2002 China, Russia, and the United States had declined to participate, and the United States had threatened to withdraw its troops from United Nations peacekeeping forces unless its citizens (both military and civilian) were exempted from prosecution by the ICC.

International Criminal Police Organization: *see* Interpol.

international date line, also called DATE LINE, imaginary line extending between the North Pole and the South Pole and arbitrarily demarcating each calendar day from the next. It corresponds along most of its length to the 180th meridian of longitude but deviates eastward through the Bering Strait to avoid dividing Siberia and then deviates westward to include the Aleutian Islands with Alaska. South of the Equator, another eastward deviation allows certain island groups to have the same day as New Zealand.

The date line is a consequence of the worldwide use of timekeeping systems arranged so that local noon corresponds approximately to the time at which the Sun crosses the local meridian of longitude (*see* standard time). A traveler going completely around the Earth, carrying a clock that he advanced or retarded by one hour whenever he entered a new time zone and a calendar that he advanced by one day whenever his clock indicated midnight, would find on returning to his starting point that the date according to his own experience was different by one day from that kept by persons who had remained at the starting point. The date line provides a standard means of making the needed readjustment: a traveler moving eastward across the line sets his calendar back one day, and one traveling westward sets his a day ahead.

International Development Association (IDA), United Nations specialized agency affiliated with but legally and financially distinct from the International Bank for Reconstruction and Development (World Bank). It was instituted in September 1960 to make loans on more flexible terms than those of the World Bank. IDA members must be members of the bank, and the bank's officers serve as IDA's ex officio officers. Headquarters are in Washington, D.C.

Most of the IDA's resources have come from the subscriptions and supplementary contributions of member countries, chiefly the 26 wealthiest. Although the wealthier members pay their subscriptions in gold or freely convertible currencies, the less developed nations may pay 10 percent in this form and the remainder in their own currencies.

international exchange, also called FOREIGN EXCHANGE, the market in which national currencies are bought and sold by those who require them for various transactions. The sellers and buyers may include exporters, importers, multinational corporations, persons wishing to send money gifts to friends or relations, or governments.

A brief treatment of international exchange follows. For full treatment, *see* MACROPAEDIA: International Trade.

The market in currencies operates much like any other market, with principals interested in doing business and intermediates who profit by arranging the transactions and in so doing helping maintain a stable and organized set of prices. The principal difference between the international exchange market and markets for other goods is the existence of a parity price established for each currency—*i.e.,* an equality of purchasing power established by law between different currencies at a given ratio. Parity is determined by the government responsible for a given currency in terms of a gold valuation registered with the International Monetary Fund (IMF). Actual prices quoted on the market fluctuate constantly and are almost always different from the parity price but may not deviate from it by more than a set amount without provoking government intervention to restore the price to its proper range.

The art of the middlemen is arbitrage (*q.v.*), and its effect is to smooth out the temporary price discrepancies from which the arbitrageur profits and thus reduce the necessity for official interventions in the market. When intervention becomes necessary it usually takes the form of selling currencies by central banks in such amounts as to satisfy the unusually strong demand that has driven up those currencies' price relative to the national currency. Another tool used by governments is the manipulation of short-term interest rates, by which inflows or outflows of capital may be encouraged.

Transactions in which one currency is exchanged directly for another are called spot transactions. Many transactions involve contracts to exchange currencies at a specified rate on a specified future date; these are forward exchanges. In forward exchanges, differences in the short-term interest rates in the countries involved must be taken into account in order to achieve interest parity. Again, in forward transactions the agency of the arbitrageur and occasionally the intervention of governments serve to smooth fluctuations in price. Forward transactions make it possible for debtors and creditors to protect themselves against possible large changes in exchange rates (*i.e.,* devaluations or revaluations of national currencies) by covering, or making forward commitments opposite the future payment or receipt; they also allow for hedging, whereby asset holders may by similar means protect against losses due to large exchange-rate changes. The anticipation of such changes will also incite speculation in currencies, which frequently has the effect of multiplying movements of funds in international markets.

International Exhibition of Modern Art (1913): *see* Armory Show.

International Federation for Information and Documentation, French FÉDÉRATION INTERNATIONALE D'INFORMATION ET DE DOCUMENTATION (FID), international library organization that was founded in 1895 as the Institut International de Bibliographie (IIB) to promote a unified and centralized approach to bibliographic classification. The IIB was founded by two Belgian lawyers, Paul Otlet and Henri Lafontaine. In 1905 the IIB published the Universal Decimal Classification, a classificatory system for publications that was an expanded version of the Dewey Decimal Classification. The IIB was renamed the Fédération Internationale de Documentation in 1938. The FID's current aims are to promote, through international cooperation, research in and development of information science and documentation management in the physical sciences, social sciences, and humanities. It is concerned with problems in the organization, storage, retrieval, dissemination, and evaluation of information by both mechanical and electronic means. The FID has consulting status with many international organizations. In the late 20th century it had national members in more than 65 countries and more than 300 affiliated organizations and individuals. Its headquarters are in The Hague, Neth.

International Finance Corporation (IFC), United Nations specialized agency affiliated with but legally separate from the International Bank for Reconstruction and Development (World Bank). It was founded to stimulate the economic development of its members by providing capital for private enterprises when sufficient private capital is not available. The corporation officially came into existence on July 24, 1956, and its aid has been aimed at less developed areas. Executive directors of the World Bank also serve as directors of the IFC. Headquarters are in Washington, D.C.

In financing only predominantly private enterprises, it makes loans without government guarantee of repayment. Unlike most other organizations of its kind, the IFC cannot stipulate where the proceeds of its loans will be spent. The IFC seeks to diversify its investments; commitments have been made in the fields of tourism development, animal feeds, iron and steel, fertilizers, and textiles.

International Fund for Agricultural Development (IFAD), United Nations specialized agency that supports increased food production in poor communities. The World Food Conference adopted a resolution in November 1974 that brought IFAD into existence in June 1976. IFAD's members fall into three categories: Category I, "industrialized countries," includes most of the developed nations of western Europe as well as Japan, the United States, and others; Category II, "petroleum-exporting developing countries," includes the major petroleum producers of the Middle East, Africa, and elsewhere; Category III includes more than 100 "recipient developing countries." Countries in Categories I and II are obliged to provide revenue for the fund; countries in Category III may contribute but are not obliged to do so, though recipient countries must be members of IFAD.

IFAD is committed to bringing about worldwide recognition that, as well as being a technical problem, food production is determined by both political and social issues. In view of this attitude, IFAD assists only underdeveloped agricultural countries and their poorer communities. The fund's priorities are threefold: first, to raise food production in developing countries; second, to employ farmers who are either poor or landless; third, to reduce malnutrition. IFAD's headquarters are in Rome, Italy.

International Geophysical Year (IGY), worldwide program of geophysical research that was conducted from July 1957 to December 1958. IGY was directed toward a systematic study of the Earth and its planetary environment. The IGY encompassed research in 11 fields of geophysics: aurora and airglow, cosmic rays, geomagnetism, glaciology, gravity, ionospheric physics, longitude and latitude determinations, meteorology, oceanography, seismology, and solar activity. Because the IGY period was chosen to coincide with the maximum sunspot cycle, when solar flares and other disturbances are prevalent, research on the Sun was especially significant.

In 1950 a group of geophysicists led by the American scientist Lloyd V. Berkner proposed a third International Polar Year, an international scientific effort that would utilize the advances made in instrumentation, rocketry, and information processing since the Second International Polar Year of 1932–33. These proposals soon broadened from the field of polar studies to a wider array of geophysical research. The parent body of international scientific organizations—the International Council of Scientific Unions—sanctioned the broader study of proposals for what became known as the International Geophysical Year. National IGY committees were then established by scientific organizations in many countries, and more than 70 nations ended up cooperating in IGY.

The IGY pioneered in the use of rocketry to conduct studies of high-altitude and upper-atmosphere phenomena. Several of the earliest artificial satellites launched by the Soviet Union and the United States in the late 1950s were used to gather data for the IGY.

In retrospect, perhaps the most important achievement of the IGY was its verification in 1958 of scientists' suggestion that there existed a continuous system of submarine mid-oceanic ridges that encircled the globe. The implications of this mountain chain, the largest on Earth, were only understood in the 1970s with the recognition of plate tectonics as a basic phenomenon of the Earth's crust.

The discovery of the Van Allen radiation belts, which surround the Earth at altitudes of thousands of kilometres, was another major achievement of IGY. The inner Van Allen belt was first delineated by instruments aboard the early Explorer satellites in 1958, and the space probes Pioneers III and IV discovered the second Van Allen belt soon afterward. Specific discoveries and findings represented only a part of the technical results of IGY. Most of the effort involved the collection of synoptic data—*i.e.,* data that gave a comprehensive overview of global physical phenomena.

The success of the IGY inspired the formation of several other cooperative international research programs, notably the International Years of the Quiet Sun (1964–65), the International Hydrological Decade (1965–75), and the International Decade of Ocean Exploration (1970–80).

International Harvester Company: *see* Navistar International Corporation.

International Herald Tribune (IHT), daily newspaper published in Paris, France, that was long considered the staple source of English-language news for American expatriates, tourists, and businesspeople in Europe. By the early 21st century it was sold in more than 180 countries.

The IHT's roots are in the *Paris Herald,* which was established in 1887 by James Gordon Bennett, Jr., who had inherited the *New York Herald* from his father, James Gordon Bennett. After the younger Bennett died in 1918, Frank Andrew Munsey bought the Paris edition along with its New York City parent.

The *Paris Herald Tribune* enjoyed great popularity—as the Paris edition of the *New York Herald Tribune*—and was affectionately called "Le New York" by many Parisians. The paper shared its own reportage with the *New York Herald Tribune* and had full access to the parent paper's stories. It was shut down for four years when the Germans occupied Paris in World War II, but it regained its old momentum and fared well until the 1960s, when rising costs, falling revenues, and a lengthy strike swept the *New York Herald Tribune* into a series of mergers and eventual extinction. Rescued by a joint venture of *The New York Times, The Washington Post,* and Whitney Communications, the Paris edition was renamed the *International Herald Tribune* in 1967. The *Post* and *Times* companies were the sole co-owners until the New York Times Company purchased full ownership of the IHT in 2003. New formats and features introduced in 2004 included thematic weekday business features, a redesigned back page with news and weather forecasts for business travelers, and expanded editorial and opinion pieces on weekends.

International Ice Patrol, patrol established in 1914 by the agreement of 16 nations with shipping interests in the North Atlantic Ocean after the *Titanic* collided with an iceberg and sank (1912). The patrol locates icebergs in the North Atlantic, follows and predicts their drift, and issues warnings to ships in the vicinity. Reconnaissance is conducted by the U.S. Coast Guard, using planes equipped with radar that can detect icebergs in all but the roughest sea conditions. The Coast Guard exchanges information with the Canadian Ice Services and also receives reports from passing ships. During the patrol season, which normally extends from February through July, the Coast Guard broadcasts twice daily by radio, over the World Wide Web, and by radio facsimile, issuing reports on the locations of all known sea ice and icebergs. Approximately 1,000 icebergs are tracked each year.

International Investment Bank, Russian MEZHDUNARODNY INVESTITSIONNY BANK, international bank founded in 1970 and operational in 1971, designed to provide long- and medium-term credit for capital construction in member states. The founding members were Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, the Soviet Union, and Vietnam. The bank was headquartered in Moscow, and its council met not less than twice yearly. It granted credits to the banks and economic enterprises of member states. Along with the Council for Mutual Economic Assistance (Comecon), the International Investment Bank was superseded in 1991 by the Organization for International Economic Cooperation, an advisory body set up to promote cooperation between the countries of eastern Europe on a market (rather than a centrally planned) basis.

International Labour Organisation (ILO), specialized agency of the United Nations whose aim is to facilitate the improvement of conditions of labour and living standards throughout the world.

The ILO was created after World War I in 1919, by the Treaty of Versailles, as an affiliated agency of the League of Nations. After the United Nations was established during World War II, the ILO became the first specialized agency to be affiliated with it, in 1946.

The functions of the ILO include the development and promotion of standards for national legislation to protect and improve conditions of work and standards of living. It provides technical assistance in social policy and administration and in workforce training and fosters cooperative organizations and rural industries. It compiles labour statistics and conducts research on the social problems of international competition, unemployment and underemployment, labour and industrial relations, and technological change (including automation). It is concerned with the protection of international migrants and the safeguarding of trade-union rights. The ILO was awarded the Nobel Prize for Peace in 1969 in recognition of its activities.

In its first decade, the ILO was concerned primarily with legislative and research efforts, with the definition and promotion of proper minimum standards of labour legislation for adoption by member states, and with arranging for collaboration among workers, employers, government delegates, and ILO professional staff. During the 1930s the ILO sought ways to combat worldwide unemployment and economic depression. After World War II the breakup of European colonial empires and the claims of the developing nations brought forth new tasks for the ILO; its membership was no longer predominantly that of European, economically developed states but increasingly that of developing countries around the world. Among intergovernmental organizations the ILO is unique in that member states are represented not only by delegates of their governments but also by delegates of those states' employers and workers, especially trade unions. At the beginning of the 21st century, about 175 nations were members of the ILO.

National representatives to the ILO meet at the annual International Labour Conference. The executive authority of the organization is vested in the Governing Body, which is elected by the Conference. The International Labour Office in Geneva, composed of the permanent Secretariat and professional staff, handles the day-to-day operations of the ILO. It is under the supervision of an appointed director general and has international civil servants and technical-assistance experts working in countries throughout the world. Among the ILO's most widely used publications are the *International Labour Review* and the *Year Book of Labour Statistics.*

International Ladies' Garment Workers' Union (ILGWU), former industrial union in the United States and Canada that represented workers in the women's clothing industry. When the ILGWU was formed in 1900, most of its members were Jewish immigrants employed in sweatshops—*i.e.,* small manufacturing establishments that employed workers under unfair and unsanitary conditions. Successful strikes in 1909 and 1910 in New York City by the ILGWU resulted in a "protocol of peace" between the women's clothing industry and labour. The protocol greatly improved conditions for the garment-makers; wages were increased, working hours were reduced, the union was recognized by the clothing manufacturers, and a board of arbitration was established to handle labour-management disputes. David Dubinsky, who later served as the union's president from 1932 to 1966, led a successful battle against a communist attempt to gain control of the ILGWU in the 1920s. When resolutions that would have allowed craft unions to organize the workers in mass-production industries were defeated at the convention of the American Federation of Labor (AFL) in 1935, the ILGWU and seven other AFL unions formed the Committee for Industrial Organization (CIO). All eight were expelled from the AFL in 1937. When the CIO became the Congress of Industrial Organizations in 1938, the ILGWU withdrew and two years later returned to the AFL.

Under Dubinsky's leadership the union grew from 45,000 members in 1932 to 450,000 in the 1960s. He transformed the ILGWU from a faction-ridden, insolvent regional union into a strong and progressive international organization that succeeded in improving the pay and working conditions of its members. The union was also a founder of the Liberal Party in New York state.

From the 1970s the ILGWU's membership shrank as firms in the United States shifted much of their apparel production to Asia and Latin America to take advantage of lower labour costs. In 1995 the ILGWU merged with the Amalgamated Clothing and Textile Workers' Union to form a new union, the Union of Needletrades, Industrial and Textile Employees (UNITE).

international law, also called PUBLIC INTERNATIONAL LAW, or LAW OF NATIONS, the body of legal rules that apply between sovereign states and other entities having international personality. International law means public international law as distinguished from private international law, which deals with the differences between the municipal or internal laws of different countries.

A brief treatment of international law follows. For full treatment, *see* MACROPAEDIA: International Law.

International law has developed from the necessity of nations to coexist peacefully; it is anchored in self-interest and a variety of practical considerations. Although there is no effective international law-enforcing body, individual states have shown an increasing willingness to adhere to legal principles of mutual cooperation. In fact, many states now incorporate agreed principles of international law into their own municipal jurisdictions.

International law is generated by three discrete processes: by the process of international customary law, by treaties, and by general principles of law recognized by civilized nations. International customary law is essentially the international law of unorganized society. The basic rules of international customary law can be summarized in the following fundamental principles: sovereignty, recognition, consent, good faith, freedom of the seas, international responsibility, and self-defense.

Rules of sovereignty define the limits of jurisdiction that subjects of international law have over their own territory as well as over

persons and things outside their territory. The rules of recognition cover situations such as the co-option of new subjects of international law, the recognition of the territorial claims of another state, and the grant and withdrawal of nationality. The rules on consent enable subjects of international law, when entering into agreement, to modify and to supplement as they see fit, but without prejudice to the rights of third parties, any of the rules of international customary law or the general principles of law recognized by civilized nations. Good faith characterizes the spirit in which parties to a consensual engagement must interpret and execute that engagement; good faith is identified with the requirements of reasonableness, common sense, and equity. The rules protecting the freedom of the seas preclude the appropriation by any individual subject of international law of any portion of the high seas as distinct from the subsoil and bed of the sea. The ability to exercise permitted jurisdiction varies according to the state of peace or war between the parties concerned. The rules on international responsibility can be reduced to two propositions, namely, that the breach of any international obligation by the organ of a subject of international law constitutes an illegal act, or international tort, and that the subject has a duty to make reparation. The rules of self-defense mainly govern the measures that may be taken against illegal acts attributable to another subject of international law and against acts of individuals, ships, or aircraft that disentitle any other subject of international law from the grant of protection.

International law is also created by treaties. Treaties and other consensual engagements are legally binding undertakings by which the subjects of international law may declare, modify, or develop existing international law as they see fit or agree on transactions. Among the bodies of international rules governed by treaties and other agreements, five are of special significance: territory, diplomatic law, and immunity; the protection of nationals abroad; freedom of commerce and navigation; extradition and asylum; and succession to international rights and obligations.

Global multipurpose institutions such as the United Nations play an important role in the development of international law. They are best understood as organizational superstructures of international customary law on a consensual and confederate basis. Their impact on international law is threefold: they have been responsible for the modification, by express consent, of the rules underlying the fundamental principles of international law, for the indirect modification of these rules by acquiescence on the part of member states in the action of organs not actually authorized to exercise lawmaking functions, and for the initiation of the further codification and development of international law.

International Load Line (marine engineering): *see* Plimsoll line.

International Maritime Organization (IMO), formerly INTER-GOVERNMENTAL MARITIME CONSULTATIVE ORGANIZATION (1948–82), United Nations (UN) specialized agency created to develop international treaties and other mechanisms on maritime safety, to discourage discriminatory and restrictive practices in international trade and unfair practices by shipping concerns, and to reduce maritime pollution. The IMO has also been involved in maritime-related liability and compensation cases. Headquartered in London, the IMO was created by a convention adopted at the UN Maritime Conference in 1948. The convention came into force on March 17, 1958, after it was ratified by 21 countries—7 of which were required to have at least one million gross tons of shipping. Its current name was adopted in 1982.

International Monetary Fund (IMF), United Nations (UN) specialized agency, founded in 1944 to secure international monetary cooperation, to stabilize currency exchange rates, and to expand international liquidity.

Origins. Having experienced the economic devastation caused by two world wars and the Great Depression, many countries recognized a need for a new international monetary system to stabilize currency exchange rates without backing currencies entirely with gold, to reduce the frequency and severity of balance-of-payments deficits (which occur when more foreign currency leaves a country than enters it), and to eliminate destructive mercantilist trade policies, such as competitive devaluations and foreign exchange restrictions—all while preserving each country's ability to pursue independent economic policies. Multilateral discussions led to the UN Monetary and Financial Conference in Bretton Woods, N.H., in July 1944. Delegates representing 44 countries proposed a fund to supervise the international monetary system and promote world trade, investment, and economic growth by maintaining convertible currencies at stable exchange rates. Countries with temporary, moderate balance-of-payments deficits would be able to finance their deficits by borrowing foreign currencies from the IMF rather than by imposing exchange controls, devaluations, or deflationary economic policies.

The Articles of Agreement entered into force on Dec. 27, 1945, and the IMF's headquarters were established in Washington, D.C. It began financial operations in 1947.

Organization. The IMF is headed by a board of governors, each of whom represents one of its approximately 180 members. Although the governors attend annual meetings, the fund's day-to-day operations are administered by an executive board, consisting of 24 executive directors who meet at least three times a week. Eight directors represent individual countries (China, France, Germany, Japan, Russia, Saudi Arabia, the United Kingdom, and the United States), and the others represent the fund's remaining members, grouped by world regions. The executive board is chaired by a managing director, who is appointed for a renewable five-year term and supervises the fund's staff. The managing director is usually a European and—by tradition—not an American.

Each member contributes to the IMF a quota subscription. Quotas are reviewed every five years and are based on each country's wealth and economic performance. The quotas form a pool of loanable funds and determine the amount a country can borrow and its voting power. For example, the United States' nearly $50 billion contribution to date—the most of any member—accounts for approximately 18 percent of total quotas. Accordingly, it exercises 18 percent of the votes.

Operation. The IMF's principal activities have included stabilizing currency exchange rates, financing members' short-term balance-of-payments deficits, and providing advice and technical assistance to borrowing countries. The IMF initially supervised a modified gold-standard system of pegged, or stable, currency exchange rates. Each member declared a value for its currency relative to the U.S. dollar, and in turn the U.S. Treasury agreed to buy and sell gold to other governments at $35 per ounce. To eliminate competitive devaluations, the IMF permitted exchange-rate movements of greater than 1 percent only in cases of "fundamental balance-of-payments disequilibrium." In August 1971 U.S. President Richard Nixon ended this system by refusing to sell gold to other governments at the stipulated price. Since then each member has been permitted to choose the method it uses to determine its exchange rate (*q.v.*): a free float, a managed float, a pegged-exchange arrangement, or a fixed-exchange arrangement.

Members with balance-of-payments deficits may borrow money in foreign currencies, which must be repaid with interest, by purchasing with their own currencies the foreign currencies held by the IMF. Each member may immediately borrow up to 25 percent of its quota in this way. The amounts available for purchase are denominated in Special Drawing Rights (SDRs), whose value is calculated daily as a weighted average of four currencies: the U.S. dollar, the euro (*q.v.*), the Japanese yen, and the British pound sterling. SDRs were created as an international reserve asset by the IMF in 1969 to supplement members' existing reserve assets. Countries use the SDRs that have been allocated to them by the IMF to settle international debts. SDRs are not part of the quota subscriptions supplied by members and thus are not part of the general asset pool available for loans. The IMF uses the SDRs as their unit of account for all transactions. Because drawing on the IMF by a country raises the fund's holdings of that country's currency and lowers its holdings of another country's currency by an equal amount, the fund's total resources remain constant. The country repays the loan over a specified period by repurchasing its own national currency. Countries whose currencies are borrowed by other member governments receive remuneration—about 4 percent of the amount borrowed.

Additional loans are available for members with financial difficulties that require them to borrow more than 25 percent of their quotas. The IMF uses an analytic framework known as financial programming to determine the amount of the loan and the macroeconomic adjustments and structural reforms needed to reestablish the country's balance-of-payments equilibrium. The IMF's financing programs include a variety of facilities, each of which has its own access limit, disbursement plan, maturity structure, and repayment schedule. The typical IMF loan features an annual access limit of 100 percent of a member's quota, quarterly disbursements, a one- to three-year maturity structure, and a three- to five-year repayment schedule. The IMF charges the same interest rate—approximately 4.5 percent—to each borrowing country.

Each loan is accompanied by a "letter of intent" specifying the conditions required by the IMF. Explicitly authorized since 1968, these conditions typically require borrowing governments to reduce their budget deficits; to eliminate monopolies, price controls, interest rate ceilings, and subsidies; to deregulate selected industries, particularly the banking sector; to lower tariffs and eliminate quotas; to remove export barriers; and to devalue their currencies if faced with fundamental balance-of-payments deficits. The adjustments are intended to increase exports and reduce imports to enable countries to earn sufficient foreign exchange to pay their foreign debts. Most loans require that countries meet quarterly targets to receive the next installment.

The impact of IMF loans. The impact of IMF loans has been widely debated. The IMF's opponents argue that the loans enable member countries to pursue reckless economic policies, knowing that the IMF will bail them out. This safety net, critics charge, delays needed reforms and creates long-term dependency. Opponents argue that the IMF rescues international bankers who have made bad loans and thereby encourages them to approve ever-riskier international investments. Critics also contend that IMF loan conditions provide uniform remedies that are not adequately tailored to each country's unique circumstances. These conditions reduce economic growth and deepen and prolong financial crises, creating severe hardships for the poorest people in bor-

rowing countries and strengthening local opposition to the IMF. (L.J.McQ.)

International Olympic Committee, organization formed in Paris in 1894 to conduct, promote, and regulate the modern Olympic Games (*q.v.*).

international organization, institution drawing membership from at least three states, having activities in several states, and whose members are held together by a formal agreement. In 2000 there were approximately 250 international governmental organizations (IGOs), which were established by intergovernmental agreements and whose members are states, and 6,000 nongovernmental organizations (NGOs), whose members are associations or individuals.

IGOs range in size from three members to more than 185 (*e.g.,* the United Nations [*q.v.*; UNJ), and their geographic representation varies from one region (*e.g.,* the Organization of American States) to all regions (*e.g.,* the International Monetary Fund). Whereas some IGOs are designed to achieve a single purpose (*e.g.,* the World Intellectual Property Organization), others have been developed for multiple tasks (*e.g.,* the North Atlantic Treaty Organization).

Although nascent international organizations were formed by Greek city-states and were envisioned by European writers such as Pierre Dubois (*c.* 1250–*c.* 1320) and Emeric Crucé (*c.* 1590–1648), they did not appear in their contemporary form until the 19th century. Following the French revolutionary and Napoleonic wars of the late 18th and early 19th centuries, leaders of the major European powers met periodically, in a system of consultation known as the Concert of Europe, to attempt to preserve the status quo and to protect their governments from internal rebellion. Later in the 19th century, various international organizations, such as the International Telegraph Union (1865; now the International Telecommunication Union), were established to provide specialized services and to perform specific tasks. In 1899 and 1907 European and non-European states met to develop rules to regulate armaments and the conduct of war. These conferences produced the Hague Conventions, which included agreements on the peaceful settlement of war, the treatment of prisoners of war, and the rights of neutral states. These various meetings and agreements served as precursors to the international organizations of the 20th century, such as the League of Nations (*q.v.*) and the UN.

International organizations serve many diverse functions, including collecting information and monitoring trends (*e.g.,* the United Nations Environment Programme), delivering services and aid (*e.g.,* the World Health Organization), and providing forums for bargaining (*e.g.,* the European Union) and settling disputes (*e.g.,* the World Trade Organization). IGOs also serve useful purposes for individual states, which often use them as instruments of foreign policy to legitimate their actions and to constrain the behaviour of other states.

Although specialized international bureaucracies manage the operations of most IGOs, ultimate authority rests with member states. IGOs often work closely with other organizations, including NGOs (*e.g.,* Greenpeace and Amnesty International), which serve many of the same functions as their IGO counterparts and are particularly useful for mobilizing public support and providing information and expertise. Most NGOs are based in developed states with pluralist political systems, and, though only a small fraction have an international scope, they have played a significant role in international relations. (K.A.Mi.)

International Organization for Standardization (ISO), specialized international organization founded in Geneva in 1946 and concerned with standardization in all technical and nontechnical fields except electrical and electronic engineering (the responsibility of the International Electrotechnical Commission). Its membership extends to more than 80 countries, and each member is the national body "most representative of standardization in its country"—in Western industrial countries usually a private organization, such as the American National Standards Institute (ANSI) and the British Standards Institute (BSI), but in most other countries a governmental organization.

International Paper Company, major American manufacturer of pulp and paper products, including stationery, printing paper, specialty paper products, and packaging materials. It also is one of the world's largest private owners of timberland. Headquarters are in Purchase, N.Y.

international payment, a payment made between countries either in settlement of a trade debt, as a unilateral transfer of funds, for capital investment, or for some other purpose. The causes of such payments, the methods of making them, and accounting for them are matters of concern to economists and national governments.

A brief treatment of international payments follows. For full treatment, *see* MACROPAEDIA: International Trade.

For statistical data on international transfers and payments, *see* BRITANNICA BOOK OF THE YEAR.

International debts are settled either from accumulated balances of foreign exchange, or by loans from the creditor to the debtor, or by drawings on the International Monetary Fund (*q.v.*), or by movements of gold. Whenever this process is multilateral rather than bilateral, it provides an additional advantage. For if, in terms of the total annual turnover of transactions between them, England is in debit to the United States and in surplus with the Commonwealth and the latter in surplus with the United States but in debit to England, there is no net change in the foreign-exchange position of the countries concerned if the various credits and debits exactly cancel out. In practice, however, it does not work out so smoothly; there always have been considerable fluctuations in net credit and debit positions within any given year as well as between years. The way in which a country balances its international accounts is one of the most important problems of its balance of payments.

The balance of payments is a systematic record of all economic transactions during a given period between residents (including the government) of one country and residents (including the governments) of other countries, referred to for convenience as foreigners. The transactions are presented in the form of double entry bookkeeping with credit entries balanced on the debit side, and vice versa. The balance of payments of a country thus necessarily balances. There can be no surplus or deficit in a country's balance of payments as a whole.

Countries are greatly concerned about the types of transactions giving rise to the receipts and payments of foreign exchange and how these compare in size with one another. The standard schedule for reporting a country's balance of payments to the International Monetary Fund (IMF) is divided into two major sections: the current account and the capital and monetary gold account. The current account is in turn subdivided into two sections; one records goods and services, the other transfer payments. The capital account is also subdivided into two major sections; one records the transactions in nonmonetary sectors, the other in monetary sectors.

Often the balance of goods and services is discussed as if it were the balance on current account. The current account as a whole has always had a basic importance, since it is the counterpart of the capital account. A nation with a deficit on total current account is ipso facto decreasing its capital assets abroad (including gold) or increasing its capital liabilities to foreigners. A nation with a current-account surplus is gaining foreign assets or reducing its foreign liabilities.

A deficit in the balance of goods and services is not necessarily an indication of pressure on a country's exchange rate. It may be matched by an inflow of investment capital that strengthens the immediate exchange position and builds up a country's future exporting capacity. Similarly, a surplus in the balance of goods and services may be no indication of a strong exchange position.

In public discussions a deficit in the balance of trade is often referred to as an "unfavourable trade balance" and a surplus as a "favourable trade balance." Other terms used for the same phenomena are export surplus and import surplus, or credit balance and debit balance. The more important item, net total on current account, is often designated by the terms surplus or deficit in a country's balance of current payments.

International Physicians for the Prevention of Nuclear War, international organization of doctors who are opposed to the nuclear arms race and who seek to educate the public on the catastrophic medical consequences that would result from a nuclear war. The group was awarded the Nobel Prize for Peace in 1985.

International Physicians was founded (in 1980) and led by several American and Soviet physicians under the leadership of Bernard Lown and Yevgeny I. Chazov, respectively. The organization promotes research on the medical, psychological, and biospheric effects that a nuclear war would have. At the time that it was awarded the prize, the group had more than 135,000 members in 41 countries, with about 30,000 of them in the United States and about 60,000 in the Soviet Union. International Physicians was criticized in some quarters for allegedly letting itself be drawn into the antiwar propaganda activities of the U.S.S.R.

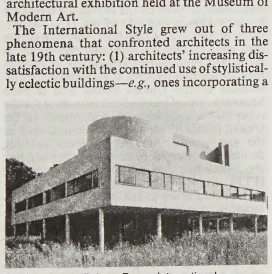
International Society for Krishna Consciousness: *see* Hare Krishna.

International Society of Christian Endeavor, original name UNITED SOCIETY OF CHRISTIAN ENDEAVOR, interdenominational organization for Protestant youth in Canada, Mexico, and the United States. It was founded in 1881 by Francis Edward Clark, who served as president until 1927. Members of the society pledged to try to make some useful contribution to the life of the church.

The purpose of the International Society of Christian Endeavor is "to promote an earnest Christian life among its members, to increase their mutual acquaintance, to train them for work in the church, and in every way to make them useful in the service of God and their fellow men." The organization publishes a periodical, *Christian Endeavor World,* and holds conventions biennially.

The World's Christian Endeavor Union, (WCEU), organized in 1895, is a cooperative organization for Christian Endeavor groups in more than 75 countries. It holds conventions every four years. Headquarters for both organizations are in Columbus, Ohio.

International Standard Book Number (ISBN), in bibliography, 10-digit number assigned before publication to a book or edition thereof, which identifies the work's national, geographic, language, or other convenient group, and its publisher, title, edition, and volume number. The ISBN is part of the Interna-



tional Standard Bibliographic Description (ISBD), which was prescribed by the International Organization for Standardization; delegates adopted the numbering system in 1969. The ISBN provides a standard for the arrangement of bibliographic information in single- and multivolume publications; its numbers are assigned by publishers and administered by designated national standard book numbering agencies—*e.g.,* R.R. Bowker Company in the United States, Standard Book Numbering Agency Ltd. in the United Kingdom, National Library in Brazil, the Staatsbibliothek Preussischer Kulturbesitz (Prussian State Library) in Germany, and the Research Library on African Affairs in Ghana.

International Standard Serial Number (ISSN), in bibliography, eight-digit number that provides a concise and unambiguous identification code for serial publications. Unlike the International Standard Book Number (ISBN), this number's only significance is its unique identification of a particular publication; it does not record such characteristics as subject, language, or publisher. The ISSN is used by librarians, authors, publishers, and subscription services for such various purposes as administration, copyright, ordering, and inventory control.

The ISSN was developed by a technical committee of the International Organization for Standardization. It stipulated that a "key title" should be agreed upon for assignment of a standard citation control element; serial numbers, including new assignments for a changed title, are provided through guidelines established by the International Serials Data System (ISDS). ISSN registrations are made available routinely by the U.S. Library of Congress, which includes the number on serial catalog cards and, when possible, in its publication *New Serial Titles.* The ISDS in Paris also makes comprehensive ISSN information available on microfiche.

International Style, architectural style that developed in Europe and the United States in the 1920s and '30s and became the dominant tendency in Western architecture during the middle decades of the 20th century. The most common characteristics of International Style buildings are rectilinear forms; light, taut plane surfaces that have been completely stripped of applied ornamentation and decoration; open interior spaces; and a visually weightless quality engendered by the use of cantilever construction. Glass and steel, in combination with usually less visible reinforced concrete, are the characteristic materials of construction. The term International Style was first used in 1932 by Henry-Russell Hitchcock and Philip Johnson in their essay entitled *The International Style: Architecture Since 1922,* which served as a catalog for an architectural exhibition held at the Museum of Modern Art.

The International Style grew out of three phenomena that confronted architects in the late 19th century: (1) architects' increasing dissatisfaction with the continued use of stylistically eclectic buildings—*e.g.,* ones incorporating a mix of decorative elements from different architectural periods and styles that bore little or no relation to the building's functions; (2) the economical creation of large numbers of office buildings and other commercial, residential, and civic structures that served a rapidly industrializing society; and (3) the development of new building technologies centring on the use of iron and steel, reinforced concrete, and glass. These three phenomena dictated the search for an honest, economical, and utilitarian architecture that would both use the new materials and satisfy society's new building needs while still appealing to aesthetic taste. Technology was a crucial factor; the new availability of cheap, mass-produced iron and steel and the discovery in the 1890s of those materials' effectiveness as primary structural members effectively rendered the old traditions of masonry (brick and stone) construction obsolete. The new use of steel-reinforced concrete as secondary support elements (floors, etc.) and of glass as sheathing for the exteriors of buildings completed the technology needed for modern building, and architects set about incorporating that technology into an architecture that openly recognized its new technical foundation. The International Style was thus formed under the dictates that modern buildings' form and appearance should naturally grow out of and express the potentialities of their materials and structural engineering. A harmony between artistic expression, function, and technology would thus be established in an austere and disciplined new architecture.

Savoye House, Poissy, Fr., an International Style residence by Le Corbusier, 1929–30
Pierre Boizeaux—Rapho/Photo Researchers

The International Style grew out of the work of a small group of brilliant and original architects in the 1920s who went on to achieve great influence in their field. These major figures included Walter Gropius and Ludwig Mies van der Rohe in Germany and the United States, J.J.P. Oud in The Netherlands, Le Corbusier in France, and Richard Neutra and Philip Johnson in the United States.

Gropius and Mies were best known for their structures of glass curtain walls spanning steel girders that form the skeleton of the building. Important examples of Gropius' work are the Fagus Works (Alfeld-an-der-Leine, Ger.; 1911), the Bauhaus (Dessau, Ger.; 1925–26), and the Graduate Center at Harvard University (Cambridge, Mass.; 1949–50)—all of which show his concern for uncluttered interior spaces. Mies van der Rohe and his followers in the United States, who did much to spread the International Style, are most clearly identified with glass-and-steel skyscrapers such as the Lake Shore Drive Apartments (Chicago; 1949–51) and the Seagram Building, done jointly with Philip Johnson (New York City; 1958). Oud helped to bring more rounded and flowing geometric shapes to the movement. Le Corbusier, too, was interested in the freer treatment of reinforced concrete but added the concept of modular proportion in order to maintain a human scale in his work. Among his well-known works in the International Style is the Savoye House (Poissy, France; 1929–30).

In the 1930s and '40s the International Style spread from its base in Germany and France to North and South America, Scandinavia, Britain, and Japan. The clean, efficient, geometric qualities of the style came to form the basis of the architectural vocabulary of the skyscraper in the United States in the 1950s and '60s. The International Style provided an aesthetic rationale for the stripped-down, clean-surfaced skyscrapers that became the status symbols of American corporate power and progressiveness at this time.

By the 1970s, some architects and critics had begun to chafe at the constraints and limitations inherent in the International Style. The bare and denuded quality of the steel-and-glass "boxes" that embodied the style by then appeared stultifying and formulaic. The result was a reaction against modernist architecture and a renewed exploration of the possibilities of innovative design and decoration. Architects began creating freer, more imaginative structures that used modern building materials and decorative elements to create a variety of novel effects. This movement became prominent in the late 1970s and early '80s and became known as Postmodernism.

International System of Units, also called SI SYSTEM, French SYSTÈME INTERNATIONAL D'UNITÉS, international decimal system of weights and measures derived from and extending the metric system of units. Adopted by the 11th General Conference on Weights and Measures in 1960, it is abbreviated SI in all languages.

Rapid advances in science and technology in the 19th and 20th centuries fostered the development of several overlapping systems of units of measurements as scientists improvised to meet the practical needs of their disciplines. The early international system devised to rectify this situation was called the metre-kilogram-second (MKS) system. The General Conference on Weights and Measures added three new units (among others) in 1948: a unit of force (the newton), a unit of energy (the joule), and a unit of power (the watt). All three units are named for eminent scientists.

The 1960 International System builds upon the MKS system. Its seven basic units, from which other units are derived, are currently defined as follows: for length, the metre, defined as the distance traveled by light in a vacuum in 1/299,792,458 second; for mass, the kilogram (about 2.2 pounds avoirdupois), which equals 1,000 grams as defined by the international prototype kilogram of platinum-iridium in the keeping of the International Bureau of Weights and Measures in Sèvres, France; for time, the second, the duration of 9,192,631,770 periods of radiation associated with a specified transition of the cesium-133 atom; for electric current, the ampere, which is the current that, if maintained in two wires placed one metre apart in a vacuum, would produce a force of 2×10^{-7} newton per metre of length; for luminous intensity, the candela, defined as the intensity in a given direction of a source emitting radiation of frequency 540×10^{12} hertz and that has a radiant intensity in that direction of 1/683 watt per steradian; for amount of substance, the mole, defined as containing as many elementary entities of a substance as there are atoms in 0.012 kilogram of carbon-12; and for thermodynamic temperature, the kelvin (*see* absolute zero).

International Telecommunication Union (ITU), specialized agency of the United Nations that was created to encourage international cooperation in all forms of telecommunication. Its activities include maintaining order in the allocation of radio frequencies, setting standards on technical and operational matters, and assisting countries in developing their own telecommunication systems.

The origin of the ITU can be traced to 1865, when the International Telegraph Union was established by a convention signed in Paris. The International Telecommunication Convention of 1932, which merged the International Telegraph Convention and the International Radiotelegraph Convention, provided that the International Telecommunication Union would succeed the International Telegraph Union when the convention became effective in 1934. It was made a specialized agency of the United Nations in 1947, and the convention has been revised several times.

The organization of the ITU includes: (1) the Plenipotentiary Conference, which is the supreme organ of the ITU and meets every four years; (2) World Administrative Conferences,

which meet according to technical needs; (3) the ITU Council, which meets annually and is responsible for executing decisions of the Plenipotentiary Conference; (4) the General Secretariat, responsible for administrative and financial services; (5) the Radiocommunications Sector, which was formed by the merger of those activities of the former International Consultative Radio Committee and the former International Frequency Registration Board that were concerned with the assignment of radio frequencies; (6) the Telecommunication Standardization Sector, which was formed by the merger of the former International Telegraph and Telephone Consultative Committee with the standards-setting activities of the International Consultative Radio Committee and conducts technical studies and sets international standards for telecommunications; and (7) the Telecommunication Development Sector, which facilitates the growth of telecommunications in developing nations.

The ITU has had its headquarters in Geneva since 1948, when it was moved from Bern.

International Telecommunications Satellite Consortium: *see* Intelsat.

international trade, the sale and purchase of consumer or capital goods and services, raw materials, securities, or gold across national borders. Such transactions may be accomplished by barter or, more typically, through the exchange of national currencies.

A brief treatment of international trade follows. For full treatment, *see* MACROPAEDIA: International Trade.

For statistical data on international trade, *see* BRITANNICA BOOK OF THE YEAR.

Trade across national borders is as old as national borders themselves, but no fully satisfactory theory has been devised to account for its various aspects. The earliest theory of trade, mercantilism, developed in the 16th century and expressed the interests of the rising merchant class. With its insistence on the accumulation of national wealth in the form of gold by encouraging exports and discouraging imports, mercantilism was an inconsistent and ultimately self-defeating theory.

The classical school of British economists suggested a more useful approach. David Ricardo, in particular, was able to show that international trade would work to the advantage of both partners and increase the real income of all concerned if it were left to develop freely. In demonstrating his "principle of comparative advantage," Ricardo disproved the common assumption that a nation whose production of goods was less efficient, hence more costly, than that of other nations could not hope to engage in trade with more productive nations because, if such trade were to occur, the more productive nation would gain nothing from it.

The classical position on trade, as elaborated further by John Stuart Mill and other economists through the 20th century, firmly supported free trade and laissez-faire. It was, however, built on several simplifying assumptions that limited its ability to explain or prescribe for certain real-world situations. As an essentially static model, for example, it could not offer guidance on the sensitive subject of trade between capital-rich industrial countries and developing nations that produce chiefly primary products while attempting to build an industrial base of their own.

Free trade has throughout history been the exception rather than the rule. For numerous reasons, governments generally choose to erect barriers to trade, ranging from simple tariffs through sundry forms of regulation to outright prohibition. The most common motives for erecting such barriers include revenue generation from tariffs, protection of domestic industry or employment, national defense, a desire for self-sufficiency, or autarky, and persistent imbalances in international exchange.

International Whaling Commission (IWC), an intergovernmental organization that regulates whaling, a competitive industry based on the hunting of a common global resource. The commission was created after World War II by the Allied Powers, who were eager to increase fat and meat supplies but noted previous failures to control the rapid escalation of whaling. In 1946 the Allies invited interested countries to a Convention for the Regulation of Whaling; 14 responded, agreeing to a Schedule of rules and creating the IWC "to provide for the proper conservation of whale stocks and thus make possible the orderly development of the whaling industry." At the beginning of the 21st century, 40 countries belonged to the commission, but membership has fluctuated over the years. Member countries each send one voting commissioner to annual meetings held in Britain or elsewhere. One of the commissioners is elected to a three-year term as chairman. At annual meetings, commissioners review and revise policy (the Schedule of the Convention) and encourage and publish scientific research. Changes to the Schedule require a three-quarters majority and are binding on members unless formal objections are registered.

The work of the IWC is done principally through finance-administration, technical, and scientific committees; other committees address aboriginal whaling, rule-breaking, and ad hoc matters. The scientific committee in particular supports the IWC's management procedures (*i.e.*, regulations) by studying whale biology and by assessing whale populations and sustainable catches. Enforcement of regulations is the responsibility of national governments.

During the IWC's first decades, the chief regulations concerned closed seasons, closed areas, and global whale-catching quotas. The IWC, however, had limited powers and enforcement capabilities and ultimately failed to conserve either the great whales or the whalers. The number of whale catches rose from about 35,000 in 1946 to a peak of 66,000 in 1962. Thereafter, as whale stocks declined, the IWC's quotas usually exceeded catches, and most countries stopped whaling by 1970.

With little whaling to oversee, the IWC changed its membership and focus. Many nonwhaling members joined after 1972 and IWC meetings became a focal point for anti- and pro-whaling interests. The issue was now the very survival of the great whales. In 1982, after a decade of debates, the IWC instituted a trial moratorium on commercial whaling for 1986–90, pending scientific investigation of stocks. In 1994 the commission declared that the moratorium was now an indefinite "pause in commercial whaling." By 2000 the IWC's primary concern was with refining controls for small whales and whaling in coastal waters.

International Working Men's Association: *see* International, First.

Internationale, L', English THE INTERNATIONAL, Russian INTERNATSIONAL, former official socialist and communist song. It was the anthem of the First, Second, and Third Internationals and, until 1944, the national anthem of the U.S.S.R.

About 1871 a Parisian transport worker, Eugène Pottier, wrote the words (as a poem), which begin, "Debout, les damnés de la terre" ("Arise, the wretched of the earth") and acclaim, "Nous n'étions rien—donc, soyons tout!" ("We were nothing—thus let us be everything!"); somewhat later a Lille industrial worker, Pierre Degeyter, wrote the music. Translated into Russian (in two successive versions), the *Internationale* was the Soviet national anthem until it was replaced on March 15, 1944, by *The Hymn of the Soviet Union* (*Gimn Sovetskogo Soyuza*), formerly referred to as the "Song of Stalin."

Internet, a system architecture that has revolutionized communications and methods of commerce by allowing various computer networks around the world to interconnect. Sometimes referred to as a "network of networks," the Internet emerged in the United States in the 1970s but did not become visible to the general public until the early 1990s. By the beginning of the 21st century approximately 360 million people were estimated to have access to the Internet. It is widely assumed that at least half of the world's population will have Internet access by 2010.

The Internet provides a capability so powerful and general that it can be used for almost any purpose that depends on information, and it is accessible by every individual who connects to one of its constituent networks. It supports human communication via electronic mail (e-mail), "chat rooms," newsgroups, and audio and video transmission and allows people to work collaboratively at many different locations. It supports access to digital information by many applications, including the World Wide Web. The Internet has proved to be a spawning ground for a large and growing number of "e-businesses" (including subsidiaries of traditional "brick-and-mortar" companies) that carry out most of their sales and services over the Internet. The Internet has clearly transformed business as well as society.

Early networks. The first computer networks were dedicated special-purpose systems such as SABRE (an airline reservation system) and AUTODIN I (a defense command-and-control system), both designed and implemented in the late 1950s and early 1960s. By the early 1960s computer manufacturers had begun to use semiconductor technology in commercial products, and both conventional batch-processing and time-sharing systems were in place in many large, technologically advanced companies. Time-sharing systems allowed a computer's resources to be shared in rapid succession with multiple users, cycling through the queue of users so quickly that the computer appeared dedicated to each user's tasks despite the existence of many others accessing the system "simultaneously." This led to the notion of sharing computer resources (called host computers or simply hosts) over an entire network. Host-to-host interactions were envisioned, along with access to specialized resources (such as supercomputers and mass storage systems) and interactive access by remote users to the computational powers of time-sharing systems located elsewhere. These ideas were first realized in ARPANET, established in 1969 by the Advanced Research Projects Agency (ARPA) of the U.S. Department of Defense. ARPANET was one of the first general-purpose computer networks. It connected time-sharing computers at government-supported research sites, principally universities in the United States, and it soon became a critical piece of infrastructure for the computer science research community in the United States. Tools and applications, such as the simple mail transfer protocol (SMTP, commonly referred to as e-mail) for sending short messages and the file transfer protocol (FTP) for longer transmissions, quickly emerged. In order to achieve cost-effective interactive communications between computers, which typically communicate in short bursts of data, ARPANET employed the new technology of packet switching. Packet switching takes large messages (or chunks of computer data) and breaks them into smaller, manageable pieces (known as packets) that can travel independently over any available

circuit to the target destination, where the pieces are reassembled. Thus, unlike traditional voice communications, packet switching does not require a single dedicated circuit between each pair of users.

Commercial packet networks were introduced in the 1970s, but these were designed principally to provide efficient access to remote computers by dedicated terminals. Briefly, they replaced long-distance modem connections by less expensive "virtual" circuits over packet networks. In the United States, Telenet and Tymnet were two such packet networks. Neither supported host-to-host communications; in the 1970s this was still the province of the research networks and would remain so for many years.

DARPA (Defense Advanced Research Projects Agency; formerly ARPA) supported initiatives for ground-based and satellite-based packet networks. The ground-based packet radio system provided mobile access to computing resources, while the packet satellite network connected the United States with several European countries and enabled connections with widely dispersed and remote regions. With the introduction of packet radio, connecting a mobile terminal to a computer network became feasible. However, time-sharing systems were then still too large, unwieldly, and costly to be mobile or even to exist outside of a climate-controlled computing environment. A strong motivation thus existed to connect the packet radio network to ARPANET in order to allow mobile users with simple terminals to access the time-sharing systems for which they had authorization. Similarly, the packet satellite network was used by DARPA to link the United States with satellite terminals serving the United Kingdom, Norway, Germany, and Italy. These terminals, however, had to be connected to other networks in European countries in order to reach the end users. Thus arose the need to connect the packet satellite net, as well as the packet radio net, with other networks.

Foundation of the Internet. The Internet resulted from the effort to connect various research networks in America and Europe. First DARPA established a program to investigate the interconnection of "heterogeneous networks." This program, called Internetting, was based on the newly introduced concept of open architecture networking, in which networks with defined standard interfaces would be interconnected by "gateways." A working demonstration of the concept was planned. In order for the concept to work, a new protocol had to be designed and developed; indeed, a system architecture was also required.

In 1974 Vinton Cerf, then at Stanford University in California, and Robert E. Kahn, then at DARPA, collaborated on a paper that first described such a protocol and system architecture—namely, the transmission control protocol (TCP), which enabled different types of machines on networks all over the world to route and assemble data packets. TCP, which originally included the Internet protocol (IP), a global addressing mechanism that allowed routers to get data packets to their ultimate destination, formed the TCP/IP standard, which was adopted by the U.S. Department of Defense in 1980. By the early 1980s the "open architecture" of the TCP/IP approach was adopted and endorsed by many other researchers and eventually by technologists and businessmen around the world.

By the 1980s other U.S. governmental bodies were heavily involved with networking, including the National Science Foundation (NSF), the Department of Energy, and the National Aeronautics and Space Administration (NASA). While DARPA had played a seminal role in creating a small-scale version of the Internet among its researchers, NSF worked with DARPA to expand access to the entire scientific and academic community and to make TCP/IP the standard in all federally supported research networks. In 1985–86 NSF funded the first five supercomputing centres, at Princeton University, the University of Pittsburgh, the University of California at San Diego, the University of Illinois, and Cornell University. In the 1980s NSF also funded the development and operation of the NSFNET, a national "backbone" network to connect these centres. By the late 1980s the network was operating at millions of bits per second. NSF also funded various nonprofit local and regional networks to connect other users to the NSFNET. A few commercial networks also began in the late 1980s; these were soon joined by others, and the Commercial Internet Exchange (CIX) was formed to allow transit traffic between commercial networks that otherwise would not have been allowed on the NSFNET backbone. In 1995, after extensive review of the situation, NSF decided that support of the NSFNET infrastructure was no longer required, since many commercial providers were now willing and able to meet the needs of the research community, and its support was withdrawn. Meanwhile, NSF had fostered a competitive selection of commercial Internet backbones connected to one another through so-called network access points.

From its origin in the early 1970s, control of the Internet steadily devolved from government stewardship to private sector participation and finally to private custody with government oversight and forbearance. Today a loosely structured group of several thousand interested individuals known as the Internet Engineering Task Force participates in a grass-roots development process for Internet standards. Internet standards are maintained by the nonprofit Internet Society, an international body with headquarters in Reston, Virginia. The Internet Corporation for Assigned Names and Numbers (ICANN), another nonprofit, private organization, oversees various aspects of policy regarding Internet domain names and numbers.

Commercial expansion. The rise of commercial Internet services and applications helped to fuel a rapid commercialization of the Internet. This phenomenon was the result of several other factors as well. One important factor was the introduction of the personal computer and the workstation in the early 1980s—a development that in turn was fueled by unprecedented progress in integrated circuit technology and an attendant rapid decline in computer prices. Another factor, which took on increasing importance, was the emergence of Ethernet and other "local area networks" to link personal computers. But other forces were at work too. Following the restructuring of AT&T in 1984, NSF took advantage of various new options for national-level digital backbone services for the NSFNET. In 1988 the Corporation for National Research Initiatives received approval to conduct an experiment linking a commercial e-mail service (MCI Mail) to the Internet. This application was the first Internet connection to a commercial provider that was not also part of the research community. Approval quickly followed to allow other e-mail providers access, and the Internet began its first explosion in traffic.

In 1993 federal legislation allowed NSF to open the NSFNET backbone to commercial users. Prior to that time, use of the backbone was subject to an "acceptable use" policy, established and administered by NSF, under which commercial use was limited to those applications which served the research community. NSF recognized that commercially supplied network services, now that they were available, would ultimately be far less expensive than continued funding of special-purpose network services.

Also in 1993 the University of Illinois made widely available Mosaic, a new type of computer program, known as a browser, that ran on most types of computers and, through its "point-and-click" interface, simplified access, retrieval, and display of files through the Internet. Mosaic incorporated a set of access protocols and display standards originally developed at the European Organization for Nuclear Research (CERN) by Tim Berners-Lee (*q.v.*) for a new Internet application called the World Wide Web. In 1994 Netscape Communications Corporation (originally called Mosaic Communications Corporation) was formed to further develop the Mosaic browser and server software for commercial use. Shortly thereafter the software giant Microsoft Corporation (*q.v.*) became interested in supporting Internet applications on personal computers (PCs) and developed its Internet Explorer Web browser (based initially on Mosaic) and other programs. These new commercial capabilities accelerated the growth of the Internet, which as early as 1988 had already been growing at the rate of 100 percent per year.

By the late 1990s there were approximately 10,000 Internet service providers (ISPs) around the world, more than half located in the United States. However, most of these ISPs provided only local service and relied on access to regional and national ISPs for wider connectivity. Consolidation began at the end of the decade with many small to medium-size providers merging or being acquired by larger ISPs. Among these larger providers were groups such as America Online, Inc. (AOL), which started as a dial-up information service with no Internet connectivity but made a transition in the late 1990s to become the leading provider of Internet services in the world—with more than 25 million subscribers by 2000 and with branches in Australia, Europe, South America, and Asia. Widely used Internet "portals" such as AOL, Yahoo!, Excite, and others were able to command advertising fees owing to the number of "eyeballs" that visited their sites. Indeed, during the late 1990s advertising revenue became the main quest of many Internet sites, some of which began to speculate by offering free or low-cost services of various kinds that were visually augmented with advertisements. By 2001 this speculative bubble had burst.

Future directions. While the precise structure of the future Internet is not yet clear, many directions of growth seem apparent. One is the increased availability of wireless access. Wireless services enable applications not previously possible in any economic fashion. For example, global positioning systems (GPS) combined with wireless Internet access would help mobile users to locate alternate routes, generate precise accident reports and initiate recovery services, and improve traffic management and congestion control. In addition to wireless laptop computers and personal digital assistants (PDAs), wearable devices with voice input and special display glasses are under development.

Another future direction is toward higher backbone and network access speeds. Backbone data rates of 10 billion bits (10 gigabits) per second are readily available, but data rates of 1 trillion bits (1 terabit) per second or higher will eventually become commercially feasible. If the development of computer hardware, software, applications, and local access keeps pace, it may be possible for users to access networks at speeds of 100 gigabits per second. At such data rates, high-resolution video—indeed, multiple video streams—would occupy only a small fraction of available bandwidth. Remaining bandwidth could be used to transmit auxiliary information about the data being sent, which in turn would enable rapid customization of displays and prompt resolution

of certain local queries. Both public and private research has gone into integrated broadband systems that can simultaneously carry multiple signals—data, voice, and video. In particular, the U.S. government has funded research to create new high-speed network capabilities dedicated to the scientific research community.

More machines and devices are being interconnected through the Internet. In 1998, after four years of study, the Internet Engineering Task Force published a new 128-bit IP address standard intended to replace the conventional 32-bit standard. By allowing a vast increase in the number of available addresses (2^{128}, as opposed to 2^{32}), this standard will make it possible to assign unique addresses to almost every electronic device imaginable. Thus the expressions "wired" office, home, and car may all take on new meanings, even if the access is really wireless.

The dissemination of digitized text, pictures, and audio and video recordings over the Internet, primarily available today through the World Wide Web, has resulted in an information explosion. Clearly, powerful tools are needed to manage network-based information. Information available on the Internet today may not be available tomorrow without careful attention being paid to preservation and archiving techniques. The key to making information persistently available is infrastructure and the management of that infrastructure. Repositories of information, stored as digital objects, will soon populate the Internet. At first these repositories may be dominated by digital objects specifically created and formatted for the World Wide Web, but in time they will contain objects of all kinds in formats that will be dynamically resolvable by users' computers in real time. Movement of digital objects from one repository to another will still leave them available to users who are authorized to access them, while replicated instances of objects in multiple repositories will provide alternatives to users who are better able to interact with certain parts of the Internet than with others. Information will have its own identity and, indeed, become a "first-class citizen" on the Internet.

Kahn, "A Protocol for Packet Network Intercommunication," *IEEE Transactions on Communications*, 22(5):637–648 (May 1974), is the paper that first detailed the overall architecture of the Internet and its operation; Barry M. Leiner *et al.*, "The Past and Future History of the Internet." *Communications of the ACM*. 40(2):102–108 (February 1997), gives a concise overview of the history of the Internet, together with some speculations on future directions; a more recent history of the Internet is Janet Abbate, *Inventing the Internet* (1999).

(R.E.Ka.)

interplanetary medium, thinly scattered matter that exists between the planets and other bodies of the solar system, as well as the forces (*e.g.*, magnetic and electric) that pervade this region of space. The material components of the interplanetary medium consist of neutral hydrogen, plasma gas of electrically charged particles (chiefly protons and electrons produced by the ionization of hydrogen released by the Sun), cosmic rays, and dust particles.

Extremely small amounts of neutral hydrogen have been detected throughout much of interplanetary space; *e.g.*, at the orbit of the Earth the concentration of nonionized hydrogen is about 0.01 atom per cubic centimetre. Some of the neutral hydrogen that enters the solar system from interstellar space is reduced in quantity by photoionization and charge exchange with the solar wind plasma. The solar wind is a flow of completely ionized gas with a density of about 1,000,000 protons and 1,000,000 electrons per cubic centimetre that continuously expands outward through the solar system from the Sun's corona. This outflow of plasma transports the magnetic fields of force present at the surface of the Sun radially away from it and is responsible for deflecting both the tail of the Earth's magnetosphere and the tails of comets away from the Sun.

Most of the cosmic rays in the solar system originate beyond its boundaries, presumably in exploding stars called supernovae. Some are emitted by the Sun during solar flares. All such primary cosmic rays consist of atomic nuclei—principally the nuclei of hydrogen atoms (protons) and substantial numbers of nuclei of such heavier elements as lithium, boron, neon, and sulfur—and some electrons. Cosmic rays are distinguished from the particles of the solar wind by their extremely high speeds (*i.e.*, they travel near the speed of light) and their kinetic energies, which measure millions of electron volts as opposed to the 800 electron volts of solar wind particles.

Relatively small amounts of dust exist in the solar system, most of which appear to be orbiting the Sun in planes near the zone of planetary orbits. Much of the dust is thought to have been produced by collisions between asteroids. The dust grains vary considerably in density, ranging from 2 to 8 grams per cubic centimetre. Some originating from comets have a lower density. Particles that measure one micrometre or less in size are quickly blown out of the solar system by radiation pressure from the Sun. About 16,000 tons of interplanetary dust particles of larger size are estimated to enter the Earth's atmosphere each year.

The magnetic field lines of the Sun are carried outward into space by the solar wind, but the lines of force remain attached to the surface of the Sun. Because of its rotation, the lines assume a spiral structure. Closely associated with the interplanetary magnetic field are electric forces that act to attract or repel charged particles. The intensity of the electric field is directly proportional to the intensity of the magnetic field and to the sine of the angle between the direction of the solar wind and the direction of the magnetic field. Besides the Sun, the planets Earth, Mercury, Jupiter, Saturn, Uranus, and Neptune are known to have a measurable magnetic field.

Interpol, byname of INTERNATIONAL CRIMINAL POLICE ORGANIZATION, organization that exists to facilitate the cooperation of the criminal police forces of more than 125 countries in their fight against international crime. The aims of the organization are to promote the widest possible mutual assistance between all the criminal police authorities of the affiliated nations within the limits of the laws existing in those countries and to establish and develop all institutions likely to contribute effectively to the prevention and suppression of ordinary crime. A general secretariat headed by a general secretary controls the everyday workings of Interpol. Each affiliated country has a domestic clearinghouse (called the National Central Bureau, or NCB) through which its individual police forces may communicate either with the general secretariat or with the police of other affiliated countries.

Interpol's principal target is the international criminal, of which there are three main categories: those who operate in more than one country, such as smugglers, dealing mainly in gold and narcotics and other illicit drugs; criminals who do not travel at all but whose crimes affect other countries—for example, a counterfeiter of foreign bank notes; and criminals who commit a crime in one country and flee to another. At its headquarters in Lyon, France, Interpol maintains a voluminous record of international criminals and others who may later fall into that category, containing particulars of their identities, aliases, associates, and methods of working, gathered from the police of the affiliated countries. This information is sent over Interpol's telecommunications network or by confidential circular.

There are four types of confidential circular. The first type asks that a particular criminal be detained in order that extradition proceedings can be started. The second does not ask for detention but gives full information about the criminal and his methods. The third describes property that may have been smuggled out of the country in which a crime was committed. A fourth deals with unidentified bodies and attempts to discover their identity.

Interpol began in Europe, which is not surprising since many countries of Europe have common frontiers and a criminal can, for example, be in one of four other countries within an hour of having committed a crime in Belgium. After World War I there was a great increase in crime; one of the countries most affected was Austria, and the Viennese police president, Johann Schober, obtained his government's support in 1923 for calling together representatives of the criminal police of other countries. The representatives of 20 nations met to discuss the problems facing them, and the International Criminal Police commission was formed that year. Vienna was the home of its first headquarters, and Schober became its first president. From 1923 until 1938 the commission flourished. In 1938 the Nazis seized Austria—and Interpol with it. All of its records were taken to Berlin. The outbreak of World War II brought Interpol's activities to a standstill. After World War II, the French government offered Interpol a headquarters in Paris, together with a staff for the general secretariat consisting of officials of the French police. This offer was gratefully accepted and Interpol was thus revived, although its complete reorganization was necessary, since all its prewar records had been lost or destroyed.

Interpol flourished, and by 1955 the number of affiliated countries had increased from 19 in 1946 to 55. A modern and complete constitution for the organization was ratified in 1956, under which its name was changed to the International Criminal Police Organization. The organization continued to progress, and by the mid-1980s the number of affiliated countries had risen to more than 125, representing all the continents of the world.

interrogation, in criminal law, process of questioning by which police obtain evidence. The process is largely outside the governance of law except for rules concerning the admissibility at trial of confessions obtained through interrogation and limitations on the power of police to detain suspected persons against their will. *See also* confession.

In the United States relatively elaborate safeguards have been placed on the interrogatory powers of the police. In *Escobedo* v. *Illinois* (1964) and *Miranda* v. *Arizona* (*q.v.*; 1966), the Supreme Court required that the police inform a suspected person of his right to remain silent and of his right to have legal counsel present at his interrogation. These decisions were criticized as having achieved questionable safeguards of suspected persons' rights at great detriment to law enforcement. Some commentators pointed out that similar restrictions could not be found in the legal procedures of other countries. Most agreed that in Escobedo and Miranda, the Supreme Court stretched the constitutional requirements of right to counsel and freedom from self-incrimination for the purpose of achieving social justice for indigent defendants.

In Great Britain interrogation is regulated by the "judges' rules." If an officer has sufficient evidence that an offense has been committed, he must caution the suspect. After a suspect has been formally charged, he must be cautioned again before further questioning can

take place. Continental European countries give their police far greater freedom to question suspects, but the power to hold a person on suspicion is limited in much the same manner as in Anglo-American countries. *See also* arrest; search and seizure.

Interrogation of the Old Men, The, Irish Gaelic AGALLAMH NA SEANÓRACH, also called DIALOGUE OF THE ANCIENTS, or COLLOQUY OF THE ANCIENTS, in Gaelic literature, the preeminent tale of the Old Irish Fenian cycle of heroic tales. The "old men" are the Fenian poets Oisín (Ossian) and Caoilte, who, having survived the destruction of their comrades at the Battle of Gabhra, return to Ireland from the timeless Land of Youth (Tír na nÓg) to discover they have been gone 300 years. They meet St. Patrick, who interrogates them about the deeds of Finn and the heroes of the past. Oisín joins his mother in a fairy mound; Caoilte travels with St. Patrick throughout Ireland, recounting the legends, history, and myths associated with each place they visit, while St. Patrick's scribe Brogan records the tales. This framework combines the traditional Irish *Dinnsheanchas* ("Histories of Places") with heroic legend and folklore. St. Patrick's delight in the tales and his desire to record them confirm the sympathetic attitude of monastic scribes to the pagan past.

The *Interrogation* was probably compiled from older sources and oral tradition by a single author in about 1200. Preserved in the 16th-century manuscript *The Book of the Dean of Lismore*, it is written in prose with verse passages that later gave rise to the Ossianic ballads.

interstate commerce, in U.S. constitutional law, any commercial transactions or traffic that cross state boundaries or that involve more than one state. The traditional concept that the free flow of commerce between states should not be impeded has been used to effect a wide range of regulations, both federal and state. A further extension of the established notion regarding the free flow of trade was introduced when Title II of the 1964 Civil Rights Act (*q.v.*)—dealing with discriminatory practices in public accommodations—was upheld by the Supreme Court. The court decided that a business, although operating within a single state, could affect interstate commerce with its restrictive laws and was, therefore, at odds with the federal legislation that proved to be enabling of the Constitution's commerce clause (*q.v.*).

Other specific historical instances of federal government action to regulate interstate commerce can be cited.

The Interstate Commerce Commission (ICC), established in 1887, was intended originally to regulate the railroad industry. It was expanded to deal with trucks, ships, freight forwarders, and other interstate carriers. The regulations concerned rates, routes, services, mergers, bills of lading, and securities issued by carriers. In the wake of the deregulation of the trucking and other industries in the 1970s and '80s, the ICC was eliminated in 1996, and many of its remaining responsibilities were shifted to the Department of Transportation.

The Sherman Act (1890), followed by the Clayton Act (1914), made illegal any acts that tended to interfere in free competition between and among industries, businesses, and all interstate commercial ventures. The Sherman Act specifically involved trusts, or monopolies, while the Clayton Act also concerned itself with stock acquisition and sale and forbade interlocking directorates as an impediment to free competition and, therefore, a bar to free interstate commerce.

The Federal Trade Commission (FTC) was established by the Federal Trade Commission Act of 1914, which gave the FTC powers—judicial, legislative, and executive—to administer the Sherman and Clayton acts.

The fair-trade legislation of 1937 protects manufacturers by permitting them to maintain an image of quality by charging a higher price through their retailers. These laws, which forbade discounters from selling the goods at lower than retail prices, were considered protective of interstate commerce because they restricted cutthroat competition. In recent years, however, these laws have been challenged, and the challenges have been upheld, showing the laws to be actually restrictive of interstate commerce rather than protective.

The Civil Aeronautics Board (CAB), which operated from 1938 to 1984, was involved in setting interstate routes as well as regulating fares for the commercial airlines. With the deregulation of the airline industry, however, the role of the CAB was much diminished, and its residual functions were assumed by the Department of Transportation.

The Federal Communications Commission (FCC) was created to protect the right of the public to its airwaves through licensing and by overseeing the practices of broadcasters in radio and television. Again, the application to interstate commerce is that radio (and television) air belongs to all Americans even if the broadcast is local, the station privately funded, and the signal not intended to be picked up beyond the state lines.

In essence, the bulk of interstate-commerce regulatory agencies are to be found in the FCC (broadcasting) and FTC (antitrust provisions).

The several states also have some authority to regulate aspects of interstate commerce. Under the provisions of the states' police powers, interstate shipments may be banned, and, in the absence of federal laws to the contrary, state laws regulating highway traffic will invariably be upheld. In both examples, the burden on interstate commerce must not be so great as to outweigh either a state's greater interest or its implied powers of regulation in the absence of congressional legislation. Under the provisions of the commerce clause, a state may, in certain instances, tax goods in interstate commerce, providing that no congressional legislation prohibits such action (*Hammerstein* v. *Superior Court* [340 U.S. 602; 1951]).

Interstate Commerce Commission (1887–1996), the first regulatory agency established in the United States, and a prototype for independent government regulatory bodies. *See* regulatory agency.

interstellar medium, region between the stars that contains vast, diffuse clouds of gases and minute solid particles. Such tenuous matter in the interstellar medium of the Milky Way system, in which the Earth is located, accounts for about 5 percent of the Galaxy's total mass.

A brief treatment of the interstellar medium follows. For full treatment, *see* MACROPAEDIA: Galaxies.

The interstellar medium is filled primarily with hydrogen gas. A relatively significant amount of helium has also been detected, along with smaller percentages of such substances as calcium, sodium, water, ammonia, and formaldehyde. Sizable quantities of dust particles of uncertain composition are present as well. In addition, primary cosmic rays travel through interstellar space, and magnetic fields thread their way across much of the region.

In most cases, interstellar matter occurs in cloudlike concentrations, which sometimes condense enough to form stars. These stars, in turn, continually lose mass, in some instances through small eruptions and in others in catastrophic explosions known as supernovae. The mass is thus fed back to the interstellar medium, where it mixes with matter that has not yet formed stars. This circulation of interstellar matter through stars determines to a large degree the amount of heavier elements in the cosmic clouds. Interstellar matter in the Milky Way Galaxy is found primarily in the system's outer parts (*i.e.*, the so-called spiral arms), which also contain a large number of young stars and nebulae: This matter is closely concentrated in a plane, a flat region commonly known as the galactic disk.

The interstellar medium is studied by several methods. Until the mid-20th century, virtually all information was obtained by analyzing the effects of interstellar matter on the light from distant stars with the aid of optical telescopes. Since the early 1950s, much research has been conducted with radio telescopes, which enable astronomers to study and interpret radio waves emitted by various constituents of the interstellar medium. For example, neutral (*i.e.*, non-ionized) hydrogen atoms absorb or emit very small amounts of radio energy of a particular wavelength—namely, 21 cm. By being measured at this point and compared with nearby wavelengths, absorbing or radiating hydrogen clouds can be detected.

Optical and radio emissions have provided much of the information on the interstellar medium. In recent years, the use of infrared telescopes on orbiting satellite observatories has also contributed to knowledge of its properties, particularly the relative abundances of the constituent elements.

intertropical convergence zone (ITCZ), also called EQUATORIAL CONVERGENCE ZONE, belt of converging trade winds and rising air that encircles the Earth near the Equator. The rising air produces high cloudiness, frequent thunderstorms, and heavy rainfall; the doldrums, oceanic regions of calm surface air, occur within the zone. The ITCZ shifts north and south seasonally with the Sun. Over the Indian Ocean, it undergoes especially large seasonal shifts of 40°–45° of latitude.

interval, in music, the distance in pitch between one tone and another, whether sounded simultaneously (harmonic interval) or successively (melodic interval). Simple intervals encompass one octave or less. Compound intervals exceed the range of one octave and are heard as varieties of their simple counterparts: a tenth (octave plus a third, *e.g.*, c–c′–e′) is associated by the ear with a third (an interval encompassing three notes, *e.g.*, c–e).

There are four perfect (P) intervals: prime, or unison (P1); octave (P8); fourth (P4); and fifth (P5), corresponding to the lowest in the harmonic overtone series. The other intervals (seconds, thirds, sixths, sevenths) have major (M) and minor (m) forms that differ in size by a half step (semitone).

Both perfect and major intervals may be augmented (A), or enlarged by a half tone—for example, c–e (M3) to c–e♯ (A3), or c–g (P5) to c–g♯ (A5). Perfect and minor intervals may be diminished (d), or narrowed by a half tone—for example, e–g (m3) to e–g♭ (d3), or f–c (P5) to f♯–c (d5). Enharmonic intervals are those that, in the system of equal temperament tuning, sound identical but are notated differently—for example, c–e♯ and c–f—according to the key in which the interval is written.

Intervals are calculated in terms of ratios between the constituent frequencies—for example, 2:1 for the octave, since the frequency of the higher pitch of an octave is twice that of the lower. For purposes of measurements of intervals outside the system of equal temperament, especially with reference to non-Western music, the octave is conveniently divided into 1,200 cents, with one semitone, or minor second, corresponding to 100 cents. So measured, the interval of a minor third, to cite but one instance, contains 300 cents in equal temperament, 294 in Pythagorean tuning, and 316 in just intonation.

intestate succession, in the law of inheritance, succession to property that has not been

disposed of by a valid last will or testament. Although laws governing intestate succession vary widely in different jurisdictions, they share the common principle that the estate should devolve upon persons standing in some kinship relation with the decedent. Modern laws of intestacy have tended not to emphasize the traditional concern that property be kept within the bloodline through which it came to the decedent. Modern practice also tends to favour the rights of the surviving spouse, whether or not he or she is regarded as kin, and (in most jurisdictions) to ease restrictions on inheritance by illegitimate children.

intestinal diverticulum, abnormal pocket in the wall of the intestine, found singly or in large numbers along the small intestine but more frequently along the colon (diverticulosis). Diverticulosis occurs in 5 to 10 percent of persons more than 40 years old; its cause is unknown, but weakness of the intestinal wall and increased pressure within the channel of the intestine are probably significant factors.

The diverticula usually produce no symptoms, although occasionally they may bleed, even when there is no inflammation. In about 20 percent of persons with diverticulosis, the diverticula become inflamed (diverticulitis), producing pain, chills and fever, obstruction of the bowel, and, in severe cases, bleeding and perforation of the intestinal wall. Whereas medical treatment is usually adequate for mild and uncomplicated cases, surgical removal of infected portions of the colon may become necessary.

intestinal gas, volatile material contained within the digestive tract. Intestinal gas consists principally of swallowed air and partly of by-products of digestion. In humans the digestive tract contains normally between 150 and 500 cubic centimetres of gas. During eating, air is swallowed into the stomach; this is either eructated or passed on to the intestines.

Gas in the stomach contains approximately 15 to 16 percent oxygen and 5 to 9 percent carbon dioxide; the rest is nitrogen. The air that is breathed contains about 21 percent oxygen; thus, some of the swallowed oxygen is absorbed by the blood capillaries in the stomach. Carbon dioxide is formed by reduction of the food by the stomach's gastric juices. Nitrogen is an inert element that is neither used nor absorbed as a gas, and it is usually passed on.

The small intestine absorbs some of the carbon dioxide and oxygen and rapidly passes the remaining gas to the large intestine. If obstructions occur in the small intestine, gas pockets can accumulate containing as much as 3,500 cubic centimetres of gas. These pockets distend the small intestine, causing severe pain. Normally, gas passes through the small intestine with the regular intestinal movements.

In the large intestine, or colon, the gas volume is usually 100 to 200 cubic centimetres. Most of the oxygen has been removed, and the amount of carbon dioxide has increased. New gases formed from bacterial fermentation are added in the colon. Of the new gases produced, hydrogen is the major component. Some of this is absorbed by the blood and released through the lungs during breathing. Other gas products formed are methane, hydrogen sulfide, ammonia, and various sulfur-containing mercaptans. Excess gas in the colon is eventually passed from the body by a process known as flatulence. Certain foods, such as beans, pork, onions, cabbage, and cauliflower, because of their high sulfur content, are known to increase gas production. Cows and other animals that eat mainly plant life have a larger volume of intestinal gas than do human beings and may produce several litres of gas daily.

intestinal juice, clear to pale, yellow, watery secretion composed of hormones, digestive enzymes, mucus, and neutralizing substances released from the glands and mucous-membrane lining of the small and large intestines. Some of the functions of intestinal juice are to neutralize hydrochloric acid coming from the stomach; to release gastrointestinal hormones into the bloodstream; and to provide digestive enzymes, which facilitate the digestion and absorption of food. Intestinal-juice secretions are liberated under the influence of hormones, the vagus nerve, and the mechanical stimulation produced by the presence of food.

intestinal obstruction, functional or mechanical blockage of the alimentary canal. There is functional blockage when the muscles of the intestinal wall fail to contract normally in the wavelike sequence (peristalsis) that propels the intestinal contents. Mechanical obstructions include a narrowing of the channel (stricture), adhesions, the presence of a foreign object, pressure from outside, hernia, volvulus, and intussusception. In a hernia (*q.v.*), a loop of intestine protruding from the abdomen may be compressed at the point where it passes through the abdominal wall. A volvulus (*q.v.*) is a twisting of the intestine upon itself, and an intussusception (*q.v.*) is the telescoping of a section of intestine into an adjacent portion.

In obstructions high in the intestinal canal, the loss of fluids and chemicals through vomiting is frequent. Obstructions in the lower reaches of the small intestine (ileum) and in the large intestine are inaccessible to evacuation by vomiting. In such cases, the intestine above the obstruction becomes distended by accumulated material and swallowed air, the pressure in the intestinal channel may cause death of tissue in the walls of the intestine, and the walls may become abnormally permeable, allowing noxious agents to escape into the abdominal cavity and thence into the bloodstream. The signs and symptoms of intestinal obstruction, as well as the treatment, depend upon the nature of the obstruction and its location.

intestinal squeeze, pain and possible injury to the small or large intestine caused by expansion of trapped gases when a pilot or underwater diver goes from areas of greater pressure to areas of less pressure. Under normal atmospheric conditions, intestinal discomfort can be felt when air or gas collects in the intestines. Relief is obtained by expelling the gas when it begins to expand the intestinal walls. When a pilot ascends from normal land environments to higher altitudes, the pressures exerted upon the body are reduced. Gases in the body expand proportionally to the reduction in pressure. Swallowed air or gases formed by the breakdown of food products, if not expelled by burping or by expelling gas through the anus, will distend the intestines. On the other hand, divers, as they descend underwater, experience an increasing amount of pressure, which compresses the gases within their bodies. As a diver returns to the surface, however, bodily gases begin to expand. If a diver swallows air while at depth or if food products produce gases, he is confronted with the same situation as the pilot when pressure is reduced.

The usual symptoms are a bloated feeling and pain. If the gas cannot be relieved, the intestinal tissue may rupture or the pain may be severe enough to cause fainting. Intestinal squeeze can be avoided in many cases by selecting a diet before working that does not usually cause intestinal gas. Carbonated beverages, cabbage, beans, fruits, nuts, and spicy foods are thus to be avoided. *See also* decompression sickness.

intestine, tubular part of the alimentary canal that extends from the stomach to the anus. The intestine is the site of most chemical digestive processes and the place where digested food materials are either absorbed for use by the body or collected into feces for elimination. The anterior part of the intestine, which is linked to the stomach, is called the small intestine (*q.v.*) and is followed by a shorter, wider segment called the large intestine (*q.v.*) that terminates in the anus.

Inthanon, Mount, Thai DOI INTHANON, mountain in northwestern Thailand that is the country's highest peak (8,481 feet [2,585 m]). It lies southwest of Chiang Mai, in a spur of the Danen Range between the Chaem (west) and Ping (east) rivers.

Inti, also called APU-PUNCHAU, in Inca religion, the sun god; he was believed to be the ancestor of the Incas. Inti was at the head of the state cult, and his worship was imposed

Inti (upper left) depicted as the sun god in the Inca royal coat of arms, illumination from the manuscript of Felipe Guamán Poma de Ayala, 1560; copy in the British Library of the original in the Royal Library, Copenhagen
Photograph by Michael Holford

throughout the Inca empire. He was usually represented in human form, his face portrayed as a gold disk from which rays and flames extended. Inti's sister and consort was the moon, Mama-Kilya (or Mama-Quilla), who was portrayed as a silver disk with human features. Among the 20th-century Quechua people, Inti is occasionally confused with Christ or God.

Inti-raymi was one of a cycle of *raymi,* or "festivals." Held in June (after the Spanish conquest, in May or June to coincide with the feast of Corpus Christi), Inti-raymi honoured the sun god and was celebrated with animal sacrifices and ritual dances.

Inti Cusi Huallpa Huáscar: *see* Huascar.

Intimism, variety of late 19th- and early 20th-century painting that made an intense exploration of the domestic interior as subject matter. It was practiced principally by Pierre Bonnard and Édouard Vuillard, the two most distinguished members of the Nabis (*q.v.*). To convey the warmth, comfort, and quiet isolation of interior scenes, Bonnard and Vuillard used the Impressionist broken-colour technique of capturing the light and atmosphere of the fleeting moment. But, unlike the Impressionists, who derived their colours from precise observation of the visual world, these painters exaggerated and distorted natural colour to express mood.

Both artists displayed a strong decorative sense in the arrangement of dense areas of colour. Using rich, subdued colours, Vuillard produced paintings characterized by harmo-

By courtesy of the Phillips Collection, Washington, D.C.

nious composition and exquisite form. Bonnard, somewhat less concerned with formal structure, infused a playful tenderness into his bright, gently coloured scenes (which usually included the unobtrusive figure of his wife). Although Intimism was not a major movement, its achievements were considerable enough to give it an important place in the art of the period.

Intolerable Acts, also called COERCIVE ACTS (1774), in U.S. colonial history, four punitive measures enacted by the British Parliament in retaliation for acts of colonial defiance, together with the Quebec Act establishing a new administration for the territory ceded to Britain after the French and Indian War (1754–63).

Angered by the Boston Tea Party (1773), the British government passed the Boston Port Bill, closing that city's harbour until restitution was made for the destroyed tea. Second, the Massachusetts Government Act abrogated the colony's charter of 1691, reducing it to the level of a crown colony, substituting a military government under General Thomas Gage, and forbidding town meetings without approval.

The third, the Administration of Justice Act, was aimed at protecting British officials charged with capital offenses during law enforcement by allowing them to go to England or another colony for trial. The fourth Coercive Act included new arrangements for housing British troops in occupied American

"The Bostonians in Distress," mezzotint by Philip Dawe, 1774, following the closing of the city's harbour

By courtesy of the Library of Congress, Washington, D.C.

dwellings, thus reviving the indignation that surrounded the earlier Quartering Act, which had been allowed to expire in 1770.

The Quebec Act, under consideration since 1773, removed all the territory and fur trade between the Ohio and Mississippi rivers from possible colonial jurisdiction and awarded it to the province of Quebec. By establishing French civil law and the Roman Catholic religion in the coveted area, the act raised the spectre of popery before the mainly Protestant colonies.

The Intolerable Acts represented an attempt to reimpose strict British control over the American colonies, but after 10 years of vacillation, the decision to be firm had come too late. Rather than cowing Massachusetts and separating it from the other colonies, the oppressive measures became the justification for convening the First Continental Congress later in 1774.

intonation, in phonetics, the melodic pattern of an utterance. Intonation is primarily a matter of variation in the pitch level of the voice (*see also* tone), but in such languages as English, stress and rhythm are also involved. Intonation conveys differences of expressive meaning (*e.g.,* surprise, anger, wariness).

In many languages, including English, intonation serves a grammatical function, distinguishing one type of phrase or sentence from another. Thus, "Your name is John," beginning with a medium pitch and ending with a lower one (falling intonation), is a simple assertion; "Your name is John?", with a rising intonation (high final pitch), indicates a question.

Intracoastal Waterway, navigable toll-free shipping route, extending for about 3,000 miles (4,800 km) along the Atlantic Ocean and Gulf of Mexico coasts in the southern and eastern United States. It utilizes sounds, bays, lagoons, rivers, and canals and is usable in many portions by deep-draft vessels. The route is federally maintained and is connected to inland waterways in many places. It was originally planned to form a continuous channel from New York City to Brownsville, Texas, but the necessary canal link through northern Florida was never completed; hence, it is now in two separate sections—the Atlantic and the Gulf.

The Atlantic Intracoastal Waterway serves ports from Boston to Key West, Fla. The route is linked by several essential manmade canals, including the Cape Cod, Chesapeake and Delaware, and Chesapeake-Albemarle. The lowest controlling depth is 6.1 feet (1.9 m) in the Dismal Swamp Canal of Virginia and North Carolina. During World War II, the route became important as a means of avoiding the submarine menace along the coast. Commercial traffic (oceangoing vessels and barges) serves the heavily concentrated industrial areas north of Norfolk, Va; whereas, to the south, the waterway accommodates mainly pleasure craft traveling to the Florida resort areas.

The Gulf Intracoastal Waterway serves ports for more than 1,100 miles (1,800 km) between Brownsville, Texas, and Apalachee Bay, Fla. It lies mainly behind barrier beaches and provides a 150-foot-wide, 12-foot-deep channel. At its eastern end, the waterway is not directly connected with its Atlantic counterpart, except via the open waters of the Gulf of Mexico and the 6-foot-deep Okeechobee Waterway in southern Florida. The heaviest commercial activity is centred at New Orleans and extends eastward to the Black Warrior–Tombigbee river system at Mobile Bay, Ala., and westward to the major Texas ports. The Plaquemine–Morgan City Waterway provides direct connection west of New Orleans with the extensive Mississippi River valley system of inland waterways, and the Harvey Lock at New Orleans furnishes a direct entrance to the Mississippi River. Part of the Gulf route at New Orleans consists of the Inner Harbor Navigation Canal, an artificial waterway that is the axis of a major industrial district. Among the principal items moved on the route are

petroleum and its products, industrial chemicals, pipe and other supplies for the oil fields, and sulfur.

Intramuros, urban district and historic walled city within Metropolitan Manila, in the Philippines. The name, from the Spanish word meaning "within walls," refers to the fortified city founded at the mouth of the Pasig River shortly after 1571 by the Spanish conquistador Miguel López de Legazpi.

Intramuros, though formally subject to the viceroyalty of New Spain in Mexico City, became the capital of the New Spanish island dominion and flourished during the 17th and 18th centuries. The 146 acres (59 hectares) within the original 20-foot- (6-metre-) thick walls contain Manila Cathedral, Fort Santiago, San Augustin Church, the University of the City of Manila, and other monuments to the Spanish colonial period. Urban congestion during the late 19th and early 20th centuries gradually encircled the site (the moat was filled in 1905) and wore down and replaced the distinctive Spanish colonial architecture with government offices; in 1944 U.S. bombing completed the reduction of the city to rubble. The site was cleared after World War II, but reconstruction proceeded slowly. The pentagonal walls, seven gates, and small plazas that distinguish Intramuros from the surrounding Malay and Americanized districts of Manila have been restored, together with a few period houses.

Intrepid (British spy): *see* Stephenson, William (Samuel).

intrigue, comedy of, also called COMEDY OF SITUATION, comic form in which complicated conspiracies and stratagems dominate the plot. The complex plots and subplots of such comedies are often based on ridiculous and contrived situations with large doses of farcical humour. An example of comedy of intrigue is William Shakespeare's *Comedy of Errors,* a humorous exploitation of the confusion resulting from twin masters and their twin servants. Shakespeare's play is itself a version of two plays by the Roman comedy writer Plautus (*c.* 254–184 BC), *Menaechmi* and *Amphitruo*.

In the hands of a master such as Molière, the comedy of intrigue often shades into a comedy of manners. Thus, *Le Médecin malgré lui* (1666; *The Doctor in Spite of Himself*), which begins as a farce based on the simple joke of mistaking the ne'er-do-well woodcut-

ter Sganarelle for a doctor, gradually becomes a satire on learned pretension and bourgeois credulity as Sganarelle fulfills his role as a doctor with great success.

intrinsic factor, a glycoprotein (*i.e.,* a complex compound containing both polysaccharide and protein components) with which vitamin B_{12} (cyanocobalamin) must combine to be absorbed by the gut. Intrinsic factor is secreted by parietal cells of the gastric glands in the stomach, where it binds with the vitamin. Thus bound, intrinsic factor protects vitamin B_{12} from digestion as it passes through the gastrointestinal tract and facilitates the vitamin's absorption in the ileum of the small intestine. Vitamin B_{12} is necessary for red blood cell maturation. A lack of intrinsic factor may result in inadequate absorption of the vitamin and cause pernicious anemia.

The term *intrinsic factor* was coined in the late 1920s by the American physician William B. Castle, whose research into the cause of pernicious anemia indicated that two substances were involved: one that is produced in the body (intrinsic) and the other—an extrinsic factor, later identified as vitamin B_{12}—that is supplied in the diet.

introspection (from Latin *introspicere,* "to look within"), the process of observing the operations of one's own mind with a view to discovering the laws that govern the mind. In a dualistic philosophy that divides the stuff of the natural world (matter, including the human body) from the contents of consciousness, introspection is the chief method of psychology. Thus, it was the method of primary importance to many philosophers, including Thomas Hobbes, John Locke, George Berkeley, David Hume, James Mill, John Stuart Mill, and Alexander Bain—as it was to the 19th-century pioneers of experimental psychology, especially Wilhelm Wundt, Oswald Külpe, and E.B. Titchener.

To all these men the contents of consciousness appeared to be immediate experience: to have an experience was to know that one has it. In this sense introspection appeared to be self-validating; it could not lie.

Wundt and Titchener believed that introspection finds in consciousness a dynamic mixture of essentially sensory materials—sensations proper, images, and feelings that closely resemble sensations. This view is known as classical introspection and became unpopular after Titchener. Many other psychologists found other kinds of content in consciousness. The German philosopher Franz Brentano saw consciousness as constituted of both sensory contents and more impalpable acts.

Controversy about the results of introspection made it quite clear by 1920 that introspection is not infallible and, later, that its fallibility is due to the fact that it is not immediate but is an observational, inferential process that takes time and is subject to errors of observation. By 1940 both the concept of dualism and the word introspection had largely disappeared from scientific psychology in the United States, where behaviourism, which rejected the significance of consciousness, ruled.

Actually, the repudiation of dualism by modern experimental psychology led only to the surrender of the word introspection, not to the abandonment of the method. The general method (not classical introspection) is used without the name in phenomenological description as the Gestalt psychologists used it, as the phenomenologists and existentialists—mostly in Europe—use it, and as it is employed in the description of experience in studies of perception. Introspection is also used in psychophysics, where are determined the relations of conscious events, usually of a sensory nature, to magnitudes of the stimulus, especially in the determination of the sensory thresholds and sensory scales. It is also used in the reports of patients as they describe their conscious states to psychiatrists and psychoanalysts in free association.

introvert and extrovert, basic personality types according to the theories of the 20th-century Swiss psychiatrist Carl Jung. An introvert is a person whose interest is generally directed inward toward his own feelings and thoughts, in contrast to an extrovert, whose attention is directed toward other people and the outside world. The typical introvert is shy, contemplative, and reserved and tends to have difficulty adjusting to social situations. Excessive daydreaming and introspection, careful balancing of considerations before reaching decisions, and withdrawal under stress are also typical of the introverted personality. The extrovert, by contrast, is characterized by outgoingness, responsiveness to other persons, activity, aggressiveness, and the ability to make quick decisions.

This typology is now regarded as overly simplistic because almost no one can be accurately described as wholly introvert or extrovert. Most persons fall somewhere between Jung's two types—*i.e.,* they are ambiverts, in whom introversive and extroversive tendencies exist in a rough balance and are manifested at different times in response to different situations.

intuition, in philosophy, the power of obtaining knowledge that cannot be acquired either by inference or observation, by reason or experience. As such, intuition is thought of as an original, independent source of knowledge, since it is designed to account for just those kinds of knowledge that other sources do not provide. Knowledge of necessary truths and of moral principles is sometimes explained in this way.

Some necessary truths—for example, statements of logic or mathematics—can be inferred, or logically derived, from others. But not all such statements can be so derived, and there must be some statements not inferred (*i.e.,* axioms). Furthermore, the interconnected character of such a system, the derivability of statements from axioms, presupposes rules of inference. Because the truth of axioms and the validity of basic rules of inference cannot themselves be established by inference—since inference presupposes them—or by observation—which can never establish necessary truths—they may be held to be objects of intuition.

Axioms are ordinarily truisms; consequently, self-evidence may be taken as a mark of intuition. To "see" that one statement follows from another, that a particular inference is valid, enables one to make an "intuitive induction" of the validity of all inferences of that kind. Other nonformal necessary truths (*e.g.,* "nothing can be both red and green all over") are also explained as intuitive inductions: one can see a universal and necessary connection through a particular instance of it.

Moral philosophers from Joseph Butler to G.E. Moore have held that moral assertions record knowledge of a special kind. The rightness of actions is discovered by a special moral faculty, seen as analogous to the power of observation or the power of intuiting logical principles. This theory, like that which holds logical principles to be the outcome of intuition, bases its case on the self-evident and unarguable character of the assertions with which it is concerned.

Much the same argument can be brought against both theories. The axioms of logic and morality do not require for their interpretation a special source of knowledge, since neither records discoveries; rather, they record resolutions or conventions, attitudes that are adopted toward discourse and conduct, not facts about the nature of the world or of man.

Two further technical senses of intuition may be briefly mentioned. One, deriving from Immanuel Kant, is that in which it is understood as referring to the source of all knowledge of matters of fact not based on, or capable of being supported by, observation. The other is the sense attached to the word by Benedict Spinoza and by Henri Bergson, in which it refers to supposedly concrete knowledge of the world as an interconnected whole, as contrasted with the piecemeal, "abstract" knowledge obtained by science and observation.

intuitionism, school of mathematical thought introduced by the 20th-century Dutch mathematician L.E.J. Brouwer that contends the primary objects of mathematical discourse are mental constructions governed by self-evident laws. Intuitionists have challenged many of the oldest principles of mathematics as being nonconstructive and hence mathematically meaningless. *Compare* formalism; logicism.

intussusception, telescoping of a segment of the intestine into an adjacent segment, producing a mechanical obstruction of the alimentary canal. Primary intussusception is sometimes congenital and rarely appears later than the third year; it arises in the course of intestinal development, but the mechanism producing it is unknown.

Secondary intussusception may occur at any age and appears to be triggered by the development of a growth projecting into the intestinal lumen; if the wall at that point is weakened, it may buckle when peristalsis forces the growth toward the anus and the segment of the gut immediately anterior to the growth is pulled along and becomes ensheathed by a posterior segment. The blood supply to the engulfed segment may be so impaired as to cause gangrene and severe constriction or complete blockage of the canal. Treatment is usually surgical removal of the growth and of the affected part of the intestine.

Inugsuk culture, Eskimo culture that developed from the Thule culture (*q.v.*) in northern Greenland during the 12th and 13th centuries. It was distinguished by an increased dependence on hunting by means of a kayak (a one-man skin boat) and implements associated with this development. Dog-drawn sleds and umiaks (large, open skin boats) also provided transportation. Bone, wood, whalebone, and stone were used in manufacture. There were distinctive types of harpoon heads as well as articles that show a Norse influence (there were Norse settlements in southern Greenland from 985 to about 1500), such as small wooden containers produced by the coopering technique and trade goods such as church-bell metal and woven wool cloth.

The Inugsuk culture spread southward along the west coast of Greenland to its tip and then moved northward along the east coast. In northeastern Greenland the Inugsuk mixed with earlier cultural elements, forming the hybrid Northeast Greenland mixed culture, beginning about the 16th century.

From about 1600, individual coastal settlements began to lose contact with one another, some becoming depopulated or breaking up. In the 18th and 19th centuries, descendants of the Inugsuk Eskimo again came into contact with European culture, this time with whale hunters and then Danish colonizers. The Northeast Greenland Eskimo disappeared in the 19th century, for unknown reasons. Present Greenland culture is based on the mixture of European and Eskimo cultures.

Inuit, the Eskimo (*q.v.*) of Canada and Greenland.

Inuit language, the northeastern division of the Eskimo languages, spoken in northern Alaska, Canada, and Greenland. *See* Eskimo-Aleut languages.

Inukai Tsuyoshi (b. May 5, 1855, Okayama, Japan—d. May 15, 1932, Tokyo), Japanese

politician and prime minister whose assassination marked the end of party participation in the Japanese government in the period preceding World War II.

Of samurai origin, Inukai began his career as a reporter. He became minister of education in 1898 and then founded a new political party, the Constitutional National Party (Rikken Kokumintō). In 1913 he headed a popular movement against the autocratic and unpopular government of the former army general Katsura Tarō. As a result of Inukai's efforts, Katsura was forced to resign, opening the way for the gradual development of a cabinet selected by the majority party in the Diet (Japanese parliament).

In 1922 Inukai organized another new party, the Reform Club (Kakushin Kurabu), and the following year he again joined the cabinet, this time as minister of communications. In 1924, however, he destroyed this coalition government when he left it to join the Friends of Constitutional Government (Rikken Seiyūkai), the largest party in Japan; and in 1929 he became president of that party.

In 1931 Japanese troops occupied Manchuria (the Northeast Provinces of China), the first step in the process that led to the Pacific conflict of World War II. When the cabinet of Wakatsuki Reijirō fell, Inukai was able to organize a cabinet of his own, becoming prime minister in December 1931. His government immediately took the country off the gold standard and began efforts to reflate the economy.

Inukai was staunchly opposed to the continued attempts by the military to usurp the decision-making functions of the cabinet. He prepared to send a representative to negotiate with the Chinese and tried to halt any further military activities, whereupon he was assassinated during an attempted coup d'état by ultranationalist naval officers.

inulin, polysaccharide that is a commercial source of the sugar fructose. It occurs in many plants of the family Asteraceae (Compositae), particularly in such roots and tubers as the dahlia and the Jerusalem artichoke. Inulin forms a white, crystalline powder that is as sweet as sucrose. The inulin molecule is a small, inert polysaccharide that readily passes through the digestive system and remains neutral to cellular activity. Because it is not absorbed by the body, it is used to sweeten foods consumed by diabetic patients.

Consult the INDEX *first*

Inuvik, northwestern region of the Northwest Territories, Canada. Inuvik region was created in the early 1970s by the territorial government and was formerly part of Mackenzie and Franklin districts. It extends from Wrigley northward along the middle reaches of the Mackenzie River, which forms its heartland, to the river's delta on the Beaufort Sea of the Arctic Ocean and including Banks Island, the westernmost island in the Canadian Arctic Archipelago, to the north. The region includes the Richardson and Mackenzie mountains (in the northwest and southwest, respectively), the Mackenzie River lowlands (centre), and the Franklin Mountains (east). Most of the region lies in a subarctic coniferous forest-tundra vegetation zone. Inuvik town, located on the Mackenzie River delta, is the regional headquarters and the area's major commercial and transportation centre. The region's economy, once based on fur trapping and whaling, now includes the development of petroleum and natural-gas resources. The population is a mix of Athabascan-speaking North American Indians, Inuit (Eskimo), and other Canadians. Pop. (1996) 9,445.

Inuvik, town, Inuvik region, Northwest Territories, Canada. It lies along the East Channel of the Mackenzie River delta, just east of the northernmost point of the Yukon. Planned as a model community by the Canadian government, with an Inuit (Eskimo) name meaning "place of man," it was built (1954–62) on firm, well-drained land to avoid the building, road, and sewer construction problems that had plagued Aklavik, which was established on shifting permafrost and silt.

Igloo-shaped Roman Catholic church in Inuvik, N.W. Terr.

By courtesy of the Canadian Government Travel Bureau, Ottawa; photograph, Ted Grant

Inuvik is the government headquarters of Inuvik region. The town is now the major commercial and transportation centre for the area and has schools, a hospital, and hotel facilities. It is a centre for trappers, sealers, and walrus hunters, is a base for oil exploration of the area, and specializes in Inuit handicrafts and garments. Pop. (1996) 3,296.

Invar, also called NILVAS, alloy of iron that expands very little when heated; it contains 64 percent iron and 36 percent nickel. Developed in France, Invar was formerly used for absolute standards of length measurement and is now used for surveying tapes and in watches and various other temperature-sensitive devices. The trademark name was selected by the alloy's inventor, the Swiss physicist Charles-Édouard Guillaume, to express the invariability of its dimensions when heat is applied.

invention, in music, any of a number of markedly dissimilar compositional forms dating from the 16th century to the present. While its exact meaning has never been defined, the term has often been affixed to compositions of a novel, progressive character—*i.e.,* compositions that do not fit established categories. The earliest-known use of the term in *Premier livre des inventions musicales* (1555; "First Book of Musical Inventions") by the Frenchman Clément Janequin clearly alludes to the composer's highly original programmatic chansons—secular French part-songs containing extramusical allusions (*e.g.,* imitations of battle sounds). Similarly capricious or novel effects occur in John Dowland's *Invention for Two to Play upon One Lute* (1597); Lodovico da Viadana's *Cento concerti ecclesiastici . . . Nova inventione* (1602; "One-Hundred Ecclesiastical Concerti . . . New Invention"), the first sacred collection to require a basso continuo; and Antonio Vivaldi's *Il cimento dell'armonia e dell'invenzione,* opus 8 (1720; "The Contest Between Harmony and Invention"), which contains, among others, a number of programmatic concerti.

Best known perhaps is the set of two-part inventions and 15 three-part sinfonias (often called *Three-Part Inventions*) for clavier (*c.* 1720) by J.S. Bach, each of which is characterized by the contrapuntal elaboration of a single melodic idea and for which Francesco Bonporti's *Invenzioni* for violin and bass (1712) may have served as a model.

Twentieth-century composers of pieces entitled "Invention" include the Austrian Alban Berg, the Germans Boris Blacher and Wolfgang Fortner, and the Russian-American composer Alexander Tcherepnin, who followed Bach's lead more or less directly.

inventory, in business, any item of property held in stock by a firm, including finished goods held for sale, goods in the process of production, raw materials, and goods that will be consumed in the process of producing goods to be sold. Inventories appear on a company's balance sheet as an asset. Inventory turnover, which indicates the rate at which goods are converted into cash, is a key factor in appraising a firm's financial condition. Fluctuation in the ratio of inventory to sales is known as inventory investment or disinvestment.

The money value of the inventory also appears on the income statement in determining the cost of the goods sold. The cost of goods sold is determined by adding the inventory on hand at the beginning of the period and the cost of purchasing and producing goods during the period and subtracting from this total the inventory on hand at the end of the period. For financial statements inventories are usually priced (1) at cost or (2) at cost or market value, whichever is lower. The cost of the merchandise and materials purchased usually fluctuates during the year, and it is necessary to determine which cost is to be used for inventory purposes. Three methods are in general use: average cost; first in-first out (FIFO), which assigns the cost of the last units purchased to the inventory and the cost of the first units purchased to the goods that were sold; and last in-first out (LIFO), in which the reverse pattern is followed.

Inveraray, royal burgh (town), Argyll and Bute council area, historic county of Argyllshire, Scotland, on Loch Fyne on the Atlantic coast near the mouth of the River Aray. It was made a royal burgh in 1648. Inveraray was the ancestral seat of the Campbells of Argyll and was rebuilt by them in the 18th century. The buildings are now officially preserved. The castle, which was constructed in French château style in the 1740s, was damaged by fire in 1975, and many art treasures were lost. Pop. (1991) 512.

Invercargill, city, Southland local government region, South Island, New Zealand. The city lies along the Waihopai River near its confluence with the New River estuary and is the southernmost city of South Island. The surrounding area was bought from the Maoris by the New Zealand Company in 1853. Two years later the first settlers arrived at the site, then known as Kelly's Point. Its name was changed in 1857 to honour the colonizer Captain William Cargill. It was surveyed in 1859 and proclaimed a town in 1861, a borough in 1871, and a city in 1930. Most of the early settlers were Scots.

Invercargill is the centre of a sheep- and dairy-farming region and has food-processing plants, woolen mills and sawmills, joineries, foundries, storage facilities, and engineering plants. Pop. (1996) 53,241.

Inverclyde, council area, west-central Scotland, lying entirely within the historic county of Renfrewshire. Inverclyde extends along the River Clyde and the Firth of Clyde on the north and encompasses an area of hills and valleys to the south. Its economy historically depended on docks, shipbuilding, and marine engineering at Port Glasgow, Greenock, and Gourock. These industries declined during the late 20th century, but the economy benefited from growing electronics manufacturing and service sectors. The banks of the Clyde are industrialized, but higher land to the west, where

Creuch Hill rises to 1,446 feet (441 m), is rural, with dairying and sheep farming. Greenock is the administrative centre. Area 61 square miles (158 square km). Pop. (1999 est.) 85,190.

Inverell, town, northeastern New South Wales, Australia, at the junction of the Swanbrook and Macintyre rivers in the Western Slopes district. Established in 1848 as a stock station, it was declared a town in 1858 and a municipality in 1872, when it was given its Gaelic name, which means "meeting of the swans."

In 1979 amalgamation of the municipality with neighbouring shires created Inverell Shire. It serves an area of mixed farming (wheat, sheep, grapes, potatoes, tobacco, fruits, fodder, and dairying), and tin, silver, bauxite, diamonds, sapphires, and zircon are worked locally. Inverell has sawmills, brick and engineering works, slaughterhouses, and food-processing plants. A rail terminus, it is on the Gwydir Highway and has air links to Sydney (285 miles [459 km] southwest) and Brisbane. Pop. (1996) 9,378.

Invergordon, small North Sea port, Highland council area, historic county of Rossshire, historic region of Ross and Cromarty, Scotland, on the deep sheltered waters of the Cromarty Firth.

Situated on one of the deepest and safest harbours in Great Britain, Invergordon served as a Royal Navy dockyard between World Wars I and II. Rapid industrialization followed the establishment of Europe's largest grain distillery in 1960 and the British Aluminium smelting plant soon afterward. Although the aluminum plant closed in the late 20th century, the town benefited from the discovery and exploitation of North Sea oil. Britain's only submarine pipe-coating plant is situated there to manufacture protective coating for the pipelines that bring crude oil and gas ashore. Pop. (1991) 3,929.

Articles are alphabetized word by word, not letter by letter

Inverness, royal burgh, Highland council area, historic county of Inverness-shire, Scotland. It is the long-established centre of the Highlands (*q.v.*) and lies at the best crossing place of the River Ness, which flows from Loch Ness at the east end of Glen Mor. Situated astride the river and the Caledonian Canal, it commands the route system of northeastern Scotland.

The 19th-century castle on the River Ness, Inverness, Scot.
J. Allen Cash—EB Inc.

Inverness was the capital of the Picts (*q.v.*) under King Brude, who was visited and converted by St. Columba *c.* 565. By the 12th century Inverness had become a burgh nestling under the castle attributed to King Malcolm III Canmore, which remained a royal residence and fortress for centuries.

The present 19th-century castle overlooks the river and, on the site of a fortress destroyed in 1746 by the Jacobites, now houses law courts. The few old surviving buildings include the old Town Cross (1685), the Town Steeple (formerly a prison), the old High Church (1769–72), and St. Andrew's Cathedral (1866–71).

Inverness is the commercial, educational, and tourist centre of a large area and has light engineering, woolen, and food-processing industries. Both manufacturing and services have expanded to meet the needs of the offshore oil industry. Inverness Airport—at Dalcross, 8 miles (13 km) northeast—provides service to domestic destinations. Pop. (1991) 41,234.

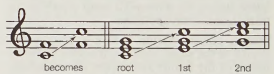
Inverness-shire, also called INVERNESS, historic county of northern Scotland. It is Scotland's largest historic county and includes a section of the central Highlands (*q.v.*), Glen Mor, and a portion of the Highlands to the north. It also encompasses several islands of the Inner and Outer Hebrides, such as Skye, Harris (part of Lewis and Harris), North Uist, Benbecula, South Uist, Barra, and the Small Islands. Those of the Outer Hebrides (Harris, the Uists, Benbecula, and Barra) are part of the Western Isles council area, and the remainder of the county (including the Inner Hebrides and the entire mainland area) lies within the Highland council area.

Cairns (heaped stones), stone circles, and brochs (dry stone towers) provide evidence of prehistoric settlement in the county. When the area entered the historical record, in Roman times, it was the home of the Picts (*q.v.*). Inverness was the capital of the Picts under King Brude when St. Columba arrived about 565 to promote Christianity. When Scotland was united in subsequent centuries, Inverness-shire formed part of the province of Moray. The county came under the control of a succession of landowning dynasties during the Middle Ages, including the MacIntoshes, the Frasers, the Chisholms, and the Grants. Along the Atlantic coast the MacDonalds, Camerons, and MacLeods were subject to the Lords of the Isles. During the 15th and 16th centuries, however, the Stuart kings used the influence of the chiefs in the growing clan system to exert control over Inverness-shire.

In the 17th and 18th centuries the county's clans took different sides in the religious and political controversies surrounding the English Civil Wars and the Jacobite risings, and internecine strife shook Inverness-shire. The British government built Forts George, Augustus, and William and a system of military roads in the county in the late 17th and early 18th centuries to facilitate the area's pacification. The government reduced the power of the chiefs and cleared the way for acquisition of much of the land by outsiders. These landlords forcibly evicted thousands of crofters (small-scale tenant subsistence farmers) in the "Highland clearances" of the early 19th century to create large sheep-farming estates. Large-scale emigration ensued to the Scottish Lowlands and to Canada, the United States, and Australia. Widespread popular sympathy for the crofters in Scotland brought protective legislation later in the century, but economic hardships caused crofters and other rural inhabitants to migrate to urban areas well into the 20th century. The development of tourism and the exploitation of North Sea oil during the 20th century, however, brought renewed economic vitality to parts of Inverness-shire.

inversion, in chemistry, the spatial rearrangement of atoms or groups of atoms in a dissymmetric molecule, giving rise to a product with a molecular configuration that is a mirror image of that of the original molecule.

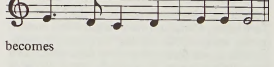
The reaction is usually one in which an atom or a group of atoms in the molecule is replaced by another atom or group. The phenomenon of inversion is sometimes known as Walden inversion, after the German chemist Paul Walden, who discovered it in 1895. The idea that inversion is the stereochemical consequence of a nucleophilic displacement reaction was introduced by the British chemists Sir Christopher Ingold and E.D. Hughes (*see* substitution reaction).



inversion, in literary style, the syntactical reversal of the normal order of the words and phrases in a sentence, as, in English, the placing of an adjective after the noun it modifies ("the form divine"); a verb before its subject ("Came the dawn"); or a noun preceding its preposition ("worlds between"). It is most commonly used in poetry in which it may both satisfy the demands of the metre and achieve emphasis:

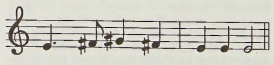
> In Xanadu did Kubla Khan
> A stately pleasure dome decree:
> (Coleridge, "Kubla Khan")

Inversion used simply for the sake of maintaining a rhyme scheme is considered a literary defect, although it is a common convention in folk ballads:

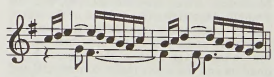


> Then up spoke the captain of our gallant ship,
> And a well-spoken man was he;
> "I have married a wife in Salem town,
> And tonight she a widow will be"
> ("The Mermaid," anonymous)

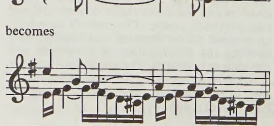
inversion, in music, rearrangement of the top-to-bottom elements in an interval, a chord, a melody, or a group of contrapuntal lines of music. The inversion of chords and intervals is utilized for various purposes, *e.g.,* to create a melodic bass line or (with certain chords) to modulate to a new key. To invert a chord or an interval is to rearrange its notes so that the original bottom note becomes an upper note; for example,



An interval (such as c′–f′) and its inversion (f′–c″) are complementary: together they form an octave. A three-note chord (triad) can be inverted twice from its original, or root, position.



Inversions of melody and counterpoint enable a composer to elaborate on basic musical material; they are common in fugues. To invert a melody means to change its ascending intervals to descending ones and vice versa; for example:



becomes

In inverted counterpoint, the original order of the contrapuntal lines is rearranged. In this way a line sounds above the line that it originally sounded beneath; for example,

becomes

invertase (enzyme): *see* sucrase.

invertebrate, any animal that lacks a vertebral column, or backbone, in contrast to vertebrates, all of which possess some form of cartilaginous or bony internal skeleton. More than 90 percent of living animals are invertebrates. Worldwide in distribution, they range in size from minute protozoans to giant squids.

Apart from the absence of a vertebral column, invertebrates have little in common. They are generally soft-bodied animals without a rigid internal skeleton for the attachment of muscles but often with a hard outer skeleton (as in most mollusks, crustaceans, and insects) that serves, as well, for body protection.

The taxonomic term Invertebrata, formerly used in contrast to Vertebrata (still a valid subphylum name), has no validity in modern classifications.

investigative powers, legislative: *see* legislative investigative powers.

Investigator Strait, channel, about 60 mi (100 km) long and nearly 30 mi wide, between Yorke Peninsula to the north and Kangaroo Island to the south, leading eastward from the Indian Ocean into Gulf St. Vincent, South Australia. It merges (east) with the Backstairs Passage (channel), and its western entrance is marked by the three rocky Althorpe Islands, which rise to 285 ft (87 m). Now heavily used as an approach to Adelaide on the gulf coast and as an area for game fishing, it was navigated in 1802 by the English explorer Matthew Flinders and is named after his ship.

Investiture Controversy, conflict during the late 11th and early 12th centuries involving the monarchies of what would later be called the Holy Roman Empire (the union of Germany, Burgundy, and much of Italy), France, and England, on the one hand, and the papacy on the other. At issue was the customary prerogative of rulers to invest and install bishops and abbots with the symbols of their offices. The controversy began *c.* 1078 and was concluded by the Concordat of Worms in 1122.

Until the 11th century, the rulers' practice of appointing bishops worked most often to the benefit of all and was accepted by everyone, including the popes. By mid-century, however, nominations of bishops by temporal rulers, especially those for Italian dioceses, became controversial. Pope Gregory VII (1073–85) accepted lay investiture at the start of his papacy, but his increasing estrangement from King Henry IV (1056–1105/06) over the sovereign's refusal to obey papal commands disrupted the harmony between the two offices. Gregory VII banned completely the investiture of ecclesiastics by all laymen, including kings, at a council in Rome in November 1078 and formalized the prohibition in March 1080. The renunciation of this customary prerogative was problematic for all rulers but especially for Henry IV. The results of the struggle between Henry and Gregory, which generated civil war in Germany, were far-reaching. In Germany the power of the aristocracy, at the expense of the monarchy, was permanently enhanced, while in northern Italy the rise of the Lombard communes with papal support weakened imperial authority there. Gradually, the extreme papalists widened their opposition to any lay control over the episcopate. In 1106 Henry I of England renounced the practice of investing prelates with the symbols of their spiritual office, and the church conceded that homage to the king should precede episcopal consecration. A similar compromise was effected by the Concordat of Worms (1122) between the emperor Henry V and Pope Calixtus II; and in Germany (but not in Burgundy or Italy) the emperor also acquired the right to have elections conducted in his presence.

investment, process of exchanging income during one period of time for an asset that is expected to produce earnings in future periods. Thus, consumption in the current period is foregone in order to obtain a greater return in the future.

For an economy as a whole to invest, production must exceed consumption. Throughout the history of capitalism, investment has been primarily the function of private business; during the 20th century, governments in planned economies and developing countries became investors. From the standpoint of an individual, two types of investment may be distinguished: investment in the means of production and purely financial investment. Although at the individual level both types may provide a monetary return to the investor, from the standpoint of the entire economy, purely financial investments appear only as title transfers and do not constitute an addition to productive capacity.

Before the 1930s, investment was thought to be strongly affected by the going rate of interest, with the rate of investment likely to rise as the rate of interest fell. Since then, empirical investigation has shown business investment to be less responsive to interest rates and more dependent on businessmen's expectations about future demand and profit, technical changes in production methods, and the expected relative costs of labour and capital.

Because investment increases an economy's capacity to produce, it is the factor responsible for economic growth. For growth to occur smoothly, it is necessary that savers intend to save the same amount that investors wish to invest during a time period. If intended saving exceeds intended investment, unemployment may result; and if investment exceeds saving, inflation may occur.

investment, marginal efficiency of: *see* marginal efficiency of investment.

investment bank, firm that originates, underwrites, and distributes new security issues of corporations and government agencies. The investment banking house operates by purchasing all of the new security issue from a corporation at one price and selling the issue in smaller units to the investing public at a price sufficiently high to cover expenses of sale and leave a profit. The responsibility for setting the public offering price rests on the investment bank because it is in close contact with the market, is familiar with current interest rates and yields, and is best able to judge the probable demand for the issue in question.

In the underwriting and distribution of most security issues a syndicate of investment banking firms is organized. If the amount of capital sought is large enough to prohibit one investment banking firm's undertaking the risk of purchasing the entire issue, the investment bank that initiates the issue with the corporation organizes a group of investment bankers to divide the liability for the purchase, with the originator acting as manager of the group.

If the market coverage that can be obtained by the members of the syndicate is deemed insufficient, selected dealers are used to bring about a wider distribution. Securities are sold to the dealers at a reduction (known as a concession), which reimburses the dealer for his expenses and provides him with a profit if the distribution is performed skillfully.

When new securities are to be issued, an investment firm having close contact with the corporation is asked to originate the issue. This process often is called private negotiation. An alternative arrangement is competitive bidding, under which the corporation settles upon the terms of the issue to be offered and invites banking firms to submit bids. The issue will be sold to the highest bidder.

investment casting, precision-casting technique for forming metal shapes. A typical process for bronze castings involves the following six steps:

1. A gelatin mold is formed around the solid sculptured form.
2. The mold is removed from the sculptured form, and the inside of the mold is filled with wax or coated with a layer of wax of the same thickness as that desired for the final casting.
3. The outer gelatin mold is then removed, and a second mold, of heat-resisting clay, is formed around the wax shell, the interior of which is filled with a clay core.
4. The mass is baked, hardening the clay and melting the wax, which runs off through openings in the outer mold.
5. The hardened mold is packed in sand, and molten bronze is poured through the openings to fill the space vacated by the lost wax.
6. The mold is broken, and the bronze form remains.

In modern foundries, plastics, or occasionally frozen mercury, are used in place of the wax. Coated with a refractory cement instead of clay, the mold is packed in a porous cement, dried, and heated. The plastic melts, leaving cavities to be filled with molten metal. For all except the smallest forms, the molds are usually made in sections. The process is used for manufacturing jewelry, dentures, sculpture, and many small industrial parts that require minutely precise details. *See also* cire-perdue.

investment credit, tax incentive that permits businesses to deduct a specified percentage of certain investment costs from their tax liability, in addition to the normal allowances for depreciation. Investment credits are similar to investment allowances, which permit businesses to deduct a specified percentage of certain capital costs from their taxable income.

Both investment credits and investment allowances differ from accelerated depreciation by offering a percentage deduction at the time an asset is purchased, in addition to its full depreciation allowances. In effect, they are subsidies for investment. Proponents of investment credits argue that they are easier to use than depreciation allowances and that they apply equally to all businesses or individuals regardless of their tax rate. Opponents claim that the investment credit favours wealthier investors, although few deny that it does provide an incentive to investment.

Investment credits and investment allowances were adopted by the United States in 1962 in order to protect domestic business from foreign competition, but they were eliminated in the Tax Reform Act of 1969 in an attempt to counteract rising inflation. The U.K. has also experimented with investment allowances, but in the late 1960s it changed the allowance to a direct government subsidy.

investment trust, also called CLOSED-END TRUST, financial organization that pools the funds of its shareholders and invests them in a diversified portfolio of securities. It differs from the mutual fund, or unit trust, which issues units representing the diversified holdings rather than shares in the company itself.

Closed-end trusts have a fixed amount of outstanding shares that are bought and sold in the market; the price of these shares therefore depends both on the market value of the underlying securities and on the demand for and supply of investment trust shares. In most modern investment trusts, management has complete discretion over the portfolio, subject to general charter provisions.

The English and Scottish investment trusts formed as early as 1860 are generally considered the prototype of the modern organizations, although the idea probably had its beginning with the investment trust authorized in Belgium by King William I of The Netherlands in 1822. The early U.S. trusts

copied the basic idea of diversification practiced by the British organizations but were less soundly managed. The collapse of the American stock market in 1929 brought enormous losses and many failures to the investment trusts. After a period of confusion throughout the 1930s, strong survivors and new companies became widely accepted and grew rapidly under new federal regulation.

invisible trade, in economics, the exchange of physically intangible items between countries. Invisible trade can be distinguished from visible trade, which involves the export, import, and reexport of physically tangible goods. Basic categories of invisible trade include: services (receipts and payments arising from activities such as customer service or shipping); income from foreign investment in the form of interest, profits, and dividends; private or government transfers of monies from one country to another; and intellectual property and patents.

Services account for the vast majority of invisible trade. Such services include freight and passenger transport; banking, other financial services, and insurance; scientific-technical exchange; and international tourism. Income gained from foreign investment is the second largest contributor to invisible trade, and private and government transfer is the smallest.

In many developing countries, receipts for invisibles are exceeded by payments for them. This deficit is closely tied to the foreign debt and interest payments often made by developing countries to the developed nations. The growing external debt of some developing countries—and their inability to repay the loans and interest—not only threatens the economies of those developing nations but also threatens the foreign-investment sector of invisible-trade earnings for many developed countries. Conditions such as these have brought calls for creditor nations to offer debt relief to debtor nations.

inyoite, a colourless and transparent borate mineral ($CaB_3O_3(OH)_5 \cdot 4H_2O$) that occurs as massive granular or sperulitic aggregates in borate deposits. The structure of the mineral consists of two $BO_2(OH)_2$ tetrahedrons and a BO_2OH triangle linked by calcium and hydroxyl-hydrogen bonds. Inyoite alters by partial dehydration to meyerhofferite and colemanite, both of which are used as raw materials for borax and other boron-related products. Originally found near Death Valley, in Inyo county, Calif., U.S., inyoite has also been discovered lining gypsum deposits at Hillsborough, N.B., Can., and in western Kazakhstan. For detailed physical properties, *see* borate mineral (table).

Io, in Greek mythology, daughter of Inachus, the river god of Argos. Under the name of Callithyia, Io was regarded as the first priestess of Hera, the wife of Zeus. Zeus fell in love with her and, to protect her from the wrath of Hera, changed her into a white heifer. Hera persuaded Zeus to give her the heifer and sent Argus Panoptes ("the All-Seeing") to watch her. Zeus thereupon sent the god Hermes, who lulled Argus to sleep and killed him. Hera then sent a gadfly to bother Io, who therefore wandered the earth, crossed the Ionian Sea, swam the strait that was thereafter known as the Bosporus (meaning Ox-Ford), and at last reached Egypt, where she was restored to her original form and became the mother of Epaphus.

Io was thus identified with the Egyptian goddess Isis, and Epaphus with Apis, the sacred bull. Epaphus was said to have been carried off by order of Hera to Byblos in Syria, where he was found by Io. This part of the legend connects Io with the Syrian goddess Astarte. Both the Egyptian and the Syrian parts, in fact, reflect interchange with the East and the identification of foreign with Greek gods.

Io, also called JUPITER I, innermost of the four large moons (Galilean satellites) discovered around Jupiter by the Italian astronomer Galileo in 1610. It was probably also discovered independently that same year by the German astronomer Simon Marius. Io is the most volcanically active body in the solar system.

Jupiter's moon Io, photographed by the Galileo spacecraft on June 28, 1997. A volcanic plume is visible above Io's limb
NASA/JPL/Caltech

Io rotates at the same rate that it revolves around Jupiter (1.769 Earth days) and so always keeps the same face to Jupiter. It has a nearly circular, very-low-inclination orbit with a mean radius of about 422,000 km (262,000 miles). The orbit is forced to be slightly eccentric by a gravitational resonance between Io and the Jovian moon Europa. The forced eccentricity causes intense tidal heating of Io by Jupiter's powerful gravitational field, which is the energy source that powers the volcanoes.

Io is about 3,630 km (2,260 miles) in diameter, making it a little larger than Earth's Moon. Its average density of about 3.55 grams per cubic centimetre is characteristic of rocks but not ices. Io's surface is a strikingly coloured landscape of erupting volcanic vents, pools and solidified flows of lava, and deposits of sulfur and sulfur compounds. There is no evidence of impact craters; the volcanic flows are so extensive and frequent that they are resurfacing the entire moon every few thousand years. Beneath the crust lies a layer of molten rock and a core of molten iron and iron sulfide about 1,800 km (1,110 miles) across.

When the Voyager 1 spacecraft flew by Io on March 5, 1979, it observed nine active volcanoes ejecting fountains of fine particles hundreds of kilometres into space. Observations at higher resolution by the Galileo spacecraft some 20 years later indicated that as many as 300 volcanoes may be active on the satellite at a given time. Volcanic material—mostly ionized atoms of oxygen, sodium, and sulfur—ejected into space creates a doughnut-shaped cloud of charged particles that follows Io's orbit and wraps part of the way around Jupiter. As the moon travels in its orbit, passing through the magnetic field of Jupiter, it produces an electric current of some five million amperes along a flux tube of spiraling electrons that links Io with the giant planet.

Ioannes (Greek personal name): *see under* John.

Ioánnina, also spelled YANNINA, or JANINA, city and capital, *nomós* (department) of Ioánnina, in the Epirus (Ípiros) region of northwestern Greece. It is located on a plateau on the western side of Lake Ioánnina (ancient Pambotis), facing the gray limestone mass of Mount Mitsikéli.

Ioánnina was first mentioned in ecclesiastical registers of the 9th and 10th centuries as an important Byzantine city. At the beginning of the 13th century it was the capital of the Greek Despotate of Epirus. After 1318 it reverted to the Byzantine Empire and was made a metropolitanate by Andronicus II, but in 1349 it fell to the Serbs. Subsequently it was contested by the Italians, Albanians, and Turks, to whom it succumbed about 1430. From 1788 to 1822 it was the centre of the Albanian-born despot Ali Paşa Tepelenë, whose revolt against the sultan's rule, although quickly suppressed by his assassination, helped trigger the War of Greek Independence (1821–29). Ioánnina and southern Epirus were finally united with the Greek kingdom in 1913.

As a regional agricultural and commercial centre, Ioánnina declined somewhat with the partition of Epirus between Greece and Albania in 1913. The city remains the commercial centre of Epirus and is noted for its metalwork and embroidery. It is the seat of a metropolitan bishop and a divisional headquarters of the Greek army. The University of Ioánnina opened in 1970. Pop. (1991) 56,699; *nomós,* 158,193.

IOC: *see* International Olympic Committee.

iodine (I), chemical element, a member of the halogen elements, or Group VIIa of the periodic table.

A brief treatment of iodine follows. For full treatment, *see* MACROPAEDIA: Chemical Elements: *Halogen elements.*

Iodine is a nonmetallic, nearly black crystalline solid that is used in medicine, in chemical syntheses, in the manufacture of dyes, in analytical chemistry, and in photography. At room temperature, solid iodine sublimes to a deep violet vapour that is irritating to the eyes, nose, and throat. Iodine dissolves in alcohol and slightly in water to give brown solutions and in carbon tetrachloride and carbon disulfide to give violet solutions.

Iodine is never found in nature uncombined. It is sparingly present in seawater as iodide ion, I^-, to the extent of approximately 50 milligrams of iodine per ton of seawater. Appreciable quantities are found in a number of natural brines. Iodine occurs in animals and plants, generally in very small amounts, but very abundantly in seaweeds. Dispersed as a trace element in rocks, iodine is not sufficiently concentrated to form independent minerals. A formerly important source of iodine for commercial preparation is the saltpetre or nitrate deposits of Chile, in which iodine is present as solid iodates, especially calcium iodate, $Ca(IO_3)_2$. A French manufacturer of saltpetre from seaweeds, Bernard Courtois, discovered (1811) iodine in water that was used to extract the soluble material from seaweed ash. Since that time, in France and Great Britain and, more recently, in Japan, iodine has been recovered from seaweeds.

Iodine is an essential microconstituent in the human body, which contains an average of 14 mg (0.00049 ounce) of the element, concentrated mostly in the thyroid gland. The thyroid gland secretes iodine-bearing hormones, especially thyroxine, which are essential for maintaining normal metabolism in all the body's cells. Where insufficient iodine is present in the food supplies, as in North America's Great Lakes region, The Netherlands, and most mountainous areas of the world, the main source of iodine is table salt to which potassium iodide or other iodizing chemicals have been added. Iodine deficiency leads to endemic goitre and myxedema.

Iodine at high concentration is poisonous and may cause serious damage to skin and tissues. In dilute alcoholic solution (tincture of iodine) or aqueous solution, it has limited use as a topical antiseptic.

In chemical compounds the common oxidation states are -1 (iodides), $+5$ (iodates), and $+7$ (periodates). Iodine combines readily with most metals and some nonmetals to form

iodides. The iodide ion is a strong reducing agent; that is, it readily gives up one electron. Although the iodide ion is colourless, iodide solutions may acquire a brownish tint as a result of oxidation of iodide to free iodine by atmospheric oxygen. Molecules of elemental iodine, consisting of two atoms (I_2), combine with iodides to form polyiodides (typically $I_2 + I^- \rightarrow I_3^-$), accounting for the high solubility of iodine in solutions containing soluble iodide. The aqueous solution of hydrogen iodide (HI), known as hydriodic acid, is a strong acid that is used to prepare iodides by reaction with metals or their oxides, hydroxides, and carbonates. Iodine exhibits a +5 oxidation state in the moderately strong iodic acid (HIO_3), which can be readily dehydrated to yield the white solid iodine pentoxide (I_2O_5). Periodates may take a form represented by potassium metaperiodate (KIO_4) or silver paraperiodate (Ag_5IO_6), for example, because the large size of the central iodine atom allows a relatively large number of oxygen atoms to get close enough to form bonds.

The only naturally occurring isotope of iodine is stable iodine-127. An exceptionally useful radioactive isotope is iodine-131, which has a half-life of eight days. It is employed in medicine to monitor thyroid gland functioning, to treat goitre and thyroid cancer, and to locate tumours of the brain and of the liver. It is also used in investigations to trace the course of compounds in metabolism. Several iodine compounds are used as contrast mediums in diagnostic radiology. In aqueous solution even minute amounts of iodine in the presence of starch produce a blue-black colour.

atomic number	53
atomic weight	126.9044
melting point	113.5° C (236° F)
boiling point	184° C (363° F)
specific gravity	4.93 (20° C)
oxidation states	−1, +1, +3, +5, +7
electronic config.	2-8-18-18-7 or $(Kr)4d^{10}5s^25p^5$

iodine deficiency, condition in which an organism does not take in enough iodine, an element that directly affects thyroid gland secretions, which themselves to a great extent control heart action, nerve response to stimuli, rate of body growth, and metabolism.

Simple goitre (enlargement of the thyroid gland) is the most common form of iodine deficiency illness and is found particularly in mountainous regions and areas far from salt water. Lowest incidence of this disease occurs along seacoasts. When the supply of iodine is only moderately deficient, the thyroid gland works harder to synthesize hormones in normal quantities, but the affected individual may continue in general good health despite the possible presence of goitre. In cases of severe and prolonged deficiency, however, there may be a deficit of thyroid hormones, resulting in myxedema, a condition characterized by dry skin, loss of hair, puffy face, flabbiness and weakness of muscles, weight increase, diminished vigour, and mental sluggishness.

Prevention of iodine deficiency is most simply accomplished by eating seafood regularly or by use of iodized table salt. To overcome natural iodine deficits, government health officials in Canada and other nations have made dietary iodine additives mandatory.

Sporadic goitre remains a mystery because it occurs in areas where iodine intake is more than adequate. Foods such as cabbage and turnips contain a potentially dangerous progoitrin substance believed to inhibit normal intake of iodine by body tissues. During the heat of cooking, however, the offending enzyme usually is destroyed.

A lack of iodine during infancy may cause a condition known as cretinism, in which mental and physical development is severely impaired. This condition can be prevented if the mother maintains a diet of foods high in iodine during pregnancy.

iodine value, also called IODINE NUMBER, in analytical chemistry, measure of the degree of unsaturation of an oil, fat, or wax; the amount of iodine, in grams, that is taken up by 100 grams of the oil, fat, or wax. Saturated oils, fats, and waxes take up no iodine; therefore their iodine value is zero; but unsaturated oils, fats, and waxes take up iodine. (Unsaturated compounds contain molecules with double or triple bonds, which are very reactive toward iodine.) The more iodine is attached, the higher is the iodine value, and the more reactive, less stable, softer, and more susceptible to oxidation and rancidification is the oil, fat, or wax. In performing the test, a known excess of iodine, usually in the form of iodine monochloride, is allowed to react with a known weight of the oil, fat, or wax, and then the amount of iodine remaining unreacted is determined by titration.

Drying oils used in the paint and varnish industry have relatively high iodine values (about 190). Semidrying oils, such as soybean oil, have intermediate iodine values (about 130). Nondrying oils, such as olive oil, used for soapmaking and in food products, have relatively low iodine values (about 80).

iodized salt, table salt with small amounts of iodine added, usually as potassium iodide, to ensure against dietary deficiency of iodine. Where iodized salt is used, particularly in Switzerland and the United States, endemic goitre has disappeared.

In the United States, iodized salt contains 1 part in 10,000 iodide and, in Switzerland, 1 part in 200,000. The World Health Organization recommends 1 part in 100,000. *See also* iodine deficiency.

iodoform, also called TRIIODOMETHANE, a yellow, crystalline solid belonging to the family of organic halogen compounds, used as an antiseptic component of medications for minor skin diseases.

First prepared in 1822, iodoform is manufactured by electrolysis of aqueous solutions containing acetone, inorganic iodides, and sodium carbonate. Several reagents convert iodoform to methylene iodide (diiodomethane), a dense liquid, colourless when pure but usually discoloured by traces of iodine, used as a heavy medium in gravity separation processes.

Iodoform's antiseptic action, discovered in 1880, made it an important medicinal, but it has been largely displaced by more effective substances.

Iogaila (Lithuanian duke): *see* Władysław II Jagiełło.

Iol, modern CHERCHELL, or SHARSHAL, ancient seaport of Mauretania, located west of what is now Algiers in Algeria. Iol was originally founded as a Carthaginian trading station, but it was later renamed Caesarea and became the capital of Mauretania in 25 BC. The city was famous as a centre of Hellenistic culture, and under the Romans it became one of the most important ports on the African coast.

The modern town of Cherchell is a small fishing port, occupying a much smaller area than did the ancient settlement.

Iolaus, ancient Greek hero, the nephew, charioteer, and assistant of Heracles. He was the son of Iphicles, himself mortal half brother of Heracles by the same mother.

Iolaus aided Heracles in his second labour, the slaying of the Hydra and its ally the crab. He also went with him to the far west to capture the cattle of the giant Geryon. Hence he was associated with various places in Sicily and, later, in Sardinia. Iolaus had a hero cult at Thebes, but elsewhere he was worshipped only in conjunction with Heracles.

iolite (mineral): *see* cordierite.

ion, any atom or group of atoms that bears one or more positive or negative electrical charges. Positively charged ions are called cations; negatively charged ions, anions. Ions are formed by the addition of electrons to, or the removal of electrons from, neutral atoms or molecules or other ions; by combination of ions with other particles; or by rupture of a covalent bond between two atoms in such a way that both of the electrons of the bond are left in association with one of the formerly bonded atoms. Examples of these processes include the reaction of a sodium atom with a chlorine atom to form a sodium cation and a chloride anion; the addition of a hydrogen cation to an ammonia molecule to form an ammonium cation; and the dissociation of a water molecule to form a hydrogen cation and a hydroxide anion.

Many crystalline substances are composed of ions held in regular geometric patterns by the attraction of the oppositely charged particles for each other. Ions migrate under the influence of an electrical field and are the conductors of electric current in electrolytic cells.

ion, carbonium (chemistry): *see* carbonium ion.

ion-exchange capacity, measure of the ability of an insoluble material to undergo displacement of ions previously attached and loosely incorporated into its structure by oppositely charged ions present in the surrounding solution. Zeolite minerals used in water softening, for example, have a large capacity to exchange sodium ions (Na^+) for calcium ions (Ca^{2+}) of hard water. High cation-exchange capacities are characteristic of clay minerals and numerous other natural and synthetic substances possessing ion-exchanging properties.

ion-exchange reaction, any of a class of chemical reactions between two substances (each consists of positively and negatively charged species called ions) that involves an exchange of one or more ionic components. Such reactions are widely used for purposes of purification, concentration, and ion separation in industry and in the laboratory.

A brief treatment of ion-exchange reactions follows. For full treatment, *see* MACROPAEDIA: Chemical Reactions.

During an ion exchange process, ions attached to or incorporated within the molecular structure of insoluble substances, called ion exchangers, exchange with ions present in a surrounding solution. The process has also been called base exchange and exchange adsorption. Ion exchangers are essentially insoluble acids or bases, the salts of which are also insoluble. Ion exchangers may undergo exchange either with positively charged ions (cations) or negatively charged ions (anions). In the former case the process is referred to as cation exchange and in the latter as anion exchange.

Numerous substances, of both natural and synthetic origin, possess ion exchanging properties. These include proteins, synthetic resins, cellulose, bone, living cells, silicate minerals, and soils. For commercial and laboratory uses the inorganic ion exchangers include the natural zeolites, glauconite and greensand, and synthetic zeolites such as the sodium alumino-silicates. Inorganic ion exchangers have been prepared from insoluble salts, heteropoly acids, and hydrous oxides. These include compounds such as zirconium and titanium phosphates, zirconium and tin oxides, ammonium molybdophosphate, and many other insoluble compounds possessing ion exchanging properties. Inorganic ion exchangers are of special interest because they are more stable than organic ion exchangers under certain condi-

tions, such as high temperature and ionizing radiation. The most important organic ion exchange reactions employ synthetic resins. The synthetic resins are plastics that may be chemically modified to impart or enhance their ion-exchanging properties.

Ion exchangers can take a variety of geometric shapes, forms, and internal structures. Among the most important forms are sheets, or membranes, which are widely used for electrochemical purposes. The structure of the synthetic resins can be modified to enhance or impart desired properties. These include the chelating resins, into which are incorporated chemical groupings possessing a preferential affinity for a given ion or group of ions. Another type of ion-exchange material is paper impregnated with ion-exchanging substances for use in paper chromatography.

Ion-exchange resins. An ion-exchanging resin consists of a polymeric organic network or backbone and ionized or functional groups that undergo exchange. A very effective organic network is formed by the polymerization of styrene in the presence of varying amounts of divinylbenzene, which serves to crosslink the long chains of styrene into a three-dimensional fishnet-type of structure. Functional groups are introduced subsequently into the polystyrene or, in the case of other ion exchangers, may be part of the monomer. Ion-exchange resins are prepared in the form of very small spheres or beads. The most common particle diameters used for water treatment are in the range from 0.84 to 0.297 mm (0.033 to 0.012 inch), but for certain difficult separations smaller sizes are used.

A typical ion-exchange reaction can be written as follows:

$$A^+ + B^+Res^- \rightleftharpoons B^+ + A^+Res^-$$

in which Res^- stands for an ion fixed in the resin or other type of exchanger and A^+ and B^+ are univalent cations (monopositive ions).

Special resins are synthesized so as to contain functional groupings that have a specific or marked affinity for certain ions. Other special resins include types that undergo oxidation-reduction reactions. Instead of exchanging ions, these electron-exchange polymers exchange electrons.

Techniques. Contact between a solution and an ion exchanger involves either a batch or a column process. In the batch process the resin is simply mixed with solution and agitated continuously or intermittently until equilibrium is reached—a period of a few minutes or several days, depending on the resin and type of ions being exchanged. After equilibration the resin is removed by filtration. Batch techniques are infrequently employed for industrial purposes, but are often used in the laboratory for fundamental studies of the mechanism of ion-exchange reactions.

Column methods generally involve fixed-bed operation, which refers to the use of a packed column of resin through which is passed the feed or regenerant solution. The resin is supported on a porous support while solution flows through by gravity or under pressure. The solutions are usually passed down through the resin, though upflow operation is not uncommonly employed, especially when it is desired to remove suspended particles from the resin bed during regeneration.

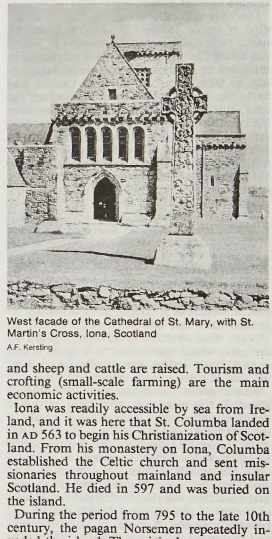
A fixed-bed cycle generally consists of the following steps: (1) saturation of the bed with solution until the desired or undesired ions break through to a predetermined level, (2) removal or elution of the retained ions by regenerant solution, and (3) rinsing the bed free of regenerant so that the cycle can be repeated. Between cycles the bed may be backwashed by upflow through the system.

Most applications of ion exchange involve column operation because of the completeness of separation that can be obtained and the ease with which automatic instrumentation can be employed. Column techniques correspond to the use of a large number of batch operations in series, an analogy closely akin to fractional distillation processes.

ion-exchange resin, any of a wide variety of organic compounds synthetically polymerized and containing positively or negatively charged sites that can attract an ion of opposite charge from a surrounding solution. The resins commonly consist of a styrene-divinylbenzene copolymer (high molecular weight substance), although other compositions, such as methacrylic acid–divinylbenzene and phenol-formaldehyde polymers, are also employed. The electrically charged groups are commonly sulfonic or carboxylic acid salts or quaternary ammonium salts. Polymers containing acid groups are classified as acid, or cation, exchangers because they exchange positively charged ions, such as hydrogen ions and metal ions; those containing ammonium groups are considered basic, or anion, exchangers because they exchange negatively charged ions, usually hydroxide ions or halide ions.

Ion-exchange resins are light and porous solids, usually prepared in the form of granules, beads, or sheets. When immersed in solution, the resins absorb the solution and swell; the degree of swelling is dependent on the polymeric structure and the total ion concentration of the solution.

Resins of suitable chemical compositions and physical properties may be synthesized at will for specific ion-exchange applications; thus, they comprise the bulk of synthetic ion-exchange materials used in the laboratory and industry. In industrial and domestic applications, ion-exchange resins are used for the removal of calcium, magnesium, iron, and manganese salts from water (water softening), for purification of sugar, and for concentration of valuable elements, such as gold, silver, and uranium from mineral ores. In chemical analysis, ion-exchange resins are used for the separation or concentration of ionic substances, and in chemical synthesis, some ion-exchange resins have been used as effective catalysts, notably in esterification and hydrolysis reactions.



Two separate types of resins are commonly classed as ion-exchange resins, although their functions do not involve an interchange of ions. These are the chelating resins and the electron-exchange resins. Chelating resins are styrene-divinylbenzene polymers to which iminodiacetate groups are introduced. This functional group forms complexes with all the metallic elements except the alkali metals, with stabilities that vary with the different metals; in analytical chemistry, they are used for the separation of trace amounts of metals. Electron-exchange resins accept or donate electrons to the surrounding solution and are used in oxidation-reduction reactions; examples include polymers prepared from hydroquinone, phenol, and formaldehyde.

A group of minerals that have ion-exchanging properties is the zeolites (*q.v.*).

ion pair, in physics and chemistry, a duplex of charged particles (ordinarily charged atoms or molecules), one positive, the other negative. An ion pair, for the physicist, is the positively charged particle (positive ion) and the negatively charged particle (negative ion) simultaneously produced by the addition of sufficient energy to a neutral atom or molecule to cause it to dissociate into oppositely charged fragments. Thus, an energetic electron passing near or through an oxygen molecule, O_2, may force one of the electrons out of the molecule. The result is an ion pair consisting of the positive oxygen ion, O_2^+, and the negative detached electron, e^-.

An ion pair, in the context of chemistry, consists of a positive ion and a negative ion temporarily bonded together by the electrostatic force of attraction between them. Ion pairs occur in concentrated solutions of electrolytes (substances that conduct electricity when dissolved or molten). Thus, in concentrated solutions of sodium chloride, some positive sodium ions, Na^+, and some negative chloride ions, Cl^-, are paired together. Upon colliding, two oppositely charged ions stay together only for a short period of time. On the average, a certain population of these pairs exists at any given time, although the formation and dissociation of ion-pairs is continuous.

Iona, island of the Inner Hebrides, Strathclyde region, Scotland. It is 3 miles (5 km) long by 1.5 miles (2.4 km) wide, with its highest point just under 330 feet (100 m) above sea level, and is separated by the Sound of Iona (0.7 miles [1.1 km] wide) from the large island of Mull. Most of the island is rough grazing land, but there is some permanent pasture,

West facade of the Cathedral of St. Mary, with St. Martin's Cross, Iona, Scotland
A.F. Kersting

and sheep and cattle are raised. Tourism and crofting (small-scale farming) are the main economic activities.

Iona was readily accessible by sea from Ireland, and it was here that St. Columba landed in AD 563 to begin his Christianization of Scotland. From his monastery on Iona, Columba established the Celtic church and sent missionaries throughout mainland and insular Scotland. He died in 597 and was buried on the island.

During the period from 795 to the late 10th century, the pagan Norsemen repeatedly invaded the island. The original monastery was burned down and the monks murdered. Iona's insecurity led to the transfer in 849 of the relics of St. Columba to the safety of Kells in Ireland. By the 11th century the monastery had been rebuilt and was included by the Norsemen (by now converted to Christianity) in their diocese of Man and the Isles. In 1154 this see was put under the archbishop of Trondheim, in Norway, and it retained this status until 1266, when the Hebrides were ceded to Scotland.

Throughout centuries of invasion and warfare, the reputation of the island as a holy place flourished, and it became the burial place of Scottish, Irish, and Norwegian kings.

The monastery was suppressed after the Protestant Reformation, and in 1693 the island passed into the overlordship of the Campbells of Argyll, until 1899, when the 8th Duke of Argyll presented the ruined abbey to the Church of Scotland. The abbey was gradually rebuilt and was opened again for public worship in 1912.

In 1938 George MacLeod, a Glasgow minister, founded the Iona Community. Pop. (1981) 268.

Iona Community, missionary group of clergy and laymen within the Church of Scotland. It was founded in 1938 by George MacLeod, a parish minister in Glasgow who hoped to infuse a new vitality into Christianity. He was convinced that the wide gap between actual life and theoretic religion should be closed and that, as in the ancient Celtic church of St. Columba, the Irish missionary who established a monastery on the island of Iona, the spiritual and the material should be intertwined. The pitiful condition of many of the ancient buildings on Iona offered MacLeod and his seven comrades an opportunity to show something of the spirit that had impelled Columba and his 12 followers, more than 1,300 years earlier, to leave their native Ireland to spread the gospel. With the approval of the Church of Scotland, they began their work of restoring the ruins, and in 1959, when the cloisters, the sanctuary, and the sacristy were finished, the abbey was consecrated.

Iona Community members spend most of the year working on the Scottish mainland, chiefly in industrial parishes. The primary conditions of membership, however, entail residence for part of the summer on Iona and personal participation in the physical work of restoration.

Ionesco, Eugène, Romanian EUGEN IONESCU (b. Nov. 26 1909, Slatina, Rom.—d. March 28, 1994, Paris, France), Romanian-born French dramatist whose one-act "antiplay" *La Cantatrice chauve* (1949; *The Bald Soprano*) inspired a revolution in dramatic techniques and helped inaugurate the Theatre of the Absurd. He was elected to the French Academy in 1970.

Ionesco was taken to France as an infant but returned to Romania in 1925. After obtaining a degree in French at the University of Bucharest, he worked for a doctorate in Paris (1939), where, after 1945, he made his home. While working as a proofreader, he decided to learn English; the formal, stilted common-

Ionesco, 1959
Mark Gerson

places of his textbook inspired the masterly catalog of senseless platitudes that constitutes *The Bald Soprano.* In its most famous scene, two strangers—who are exchanging banalities about how the weather is faring, where they live, and how many children they have—stumble upon the astonishing discovery that they are indeed man and wife; it is a brilliant example of Ionesco's recurrent themes of self-estrangement and the difficulty of communication.

In rapid succession Ionesco wrote a number of plays, all developing the "antilogical" ideas of *The Bald Soprano;* these included brief and violently irrational sketches and also a series of more elaborate one-act plays in which many of his later themes—especially the fear and horror of death—begin to make their appearance. Among these, *La Leçon* (1951; *The Lesson*), *Les Chaises* (1952; *The Chairs*), and *Le Nouveau Locataire* (1955; *The New Tenant*) are notable successes. In *The Lesson* a timid professor uses the meaning he assigns to words to establish tyrannical dominance over an eager female pupil. In *The Chairs,* an elderly couple await the arrival of an audience to hear the old man's last message to posterity, but only empty chairs accumulate on stage. Feeling confident that his message will be conveyed by an orator he has hired, the old man and his wife commit a double suicide. The orator turns out to be afflicted with aphasia, however, and can speak only gibberish.

In contrast to these shorter works, it was only with difficulty that Ionesco mastered the techniques of the full-length play: *Amédée* (1954), *Tueur sans gages* (1959; *The Killer*), and *Le Rhinocéros* (1959; *Rhinoceros*) lack the dramatic unity that he finally achieved with *Le Roi se meurt* (1962; *Exit the King*). This success was followed by *Le Piéton de l'air* (1963; *A Stroll in the Air*). With *La Soif et la faim* (1966; *Thirst and Hunger*) he returned to a more fragmented type of construction. In the next decade he wrote *Jeux de massacre* (1970; *Killing Game*); *Macbett* (1972), a retelling of Shakespeare's Macbeth; and *Ce formidable bordel* (1973; *A Hell of a Mess*). *Rhinoceros,* whose protagonist retains his humanity in a world where humans are mutating into beasts, remains Ionesco's most popular play.

Ionesco's achievement lies in having popularized a wide variety of nonrepresentational and surrealistic techniques and in having made them acceptable to audiences conditioned to a naturalistic convention in the theatre. His tragicomic farces dramatize the absurdity of bourgeois life, the meaninglessness of social conventions, and the futile and mechanical nature of modern civilization. His plays build on bizarrely illogical or fantastic situations using such devices as the humorous multiplication of objects on stage until they overwhelm the actors. The clichés and tedious maxims of polite conversation surface in improbable or inappropriate contexts to expose the deadening futility of most human communication. Ionesco's later works show less concern with witty intellectual paradox and more with dreams, visions, and exploration of the subconscious.

Ionia, ancient region comprising the central sector of the western coast of Anatolia (now in Turkey). It was bounded by the regions of Aeolis on the north and Caria on the south and included the adjacent islands. Ionia consisted of a coastal strip about 25 miles (40 km) wide that extended from Phocaea at the mouth of the Hermus River in the north to the territory of Miletus south of the Maeander River, thus extending for a north-south distance of about 100 miles (160 km). Its habitable area consisted principally of three flat river valleys, the Hermus (modern Gediz), Cayster (Küçük Menderes), and Maeander (Büyük Menderes), that led down between mountain ranges of 5,000–6,000 feet (1,500–1,800 m) to empty into deeply recessed gulfs of the Aegean coast.

The region bordered on the Hittite empire before 1200 BC. This particular stretch of coast was known as Asia by the early Greeks. The name Ionia, however, does not appear in any records of this time, and Homer does not recognize any Ionic settlement of the Asiatic coast in Achaean times. The name Ionia must therefore have been first applied to this coast subsequent to the collapse of the Achaean kingdoms in Greece in the face of the Dorian invasion, when Ionic Greek refugees migrated eastward across the Aegean to Anatolia about 1000–900 BC.

The original Greek settlements in the region were numerous and small, but by the 8th century BC they had confirmed their possession of the whole coastline and had consolidated themselves into 12 major cities—Phocaea, Erythrae, Clazomenae, Teos, Lebedus, Colophon, Ephesus, Priene, Myus, and Miletus on the mainland, with the islands Chios and Samos. These Greek Ionian cities formed an exclusive religious league, the Panionion.

The cities of Ionia were pioneers of Greek civic (and probably constitutional) development in the 8th and 7th centuries. They seem to have played little part in Greek maritime enterprise of the 8th century in the Mediterranean, but after 700 BC Ionic seamen of Miletus and Phocaea became active in the Black Sea area and along the Mediterranean coasts of France and Spain, planting numerous colonies. Miletus alone is said to have been the mother of 90 cities. By the end of the 7th century the Ionian cities had achieved great prosperity through their trading enterprises, their colonization efforts, and their manufacture of ceramics, textiles, and metalware.

In this period and down to about 500 BC, Ionic rational thought dominated the intellectual life of Greece. Hecataeus of Miletus pioneered the Greeks' study of geography. His city, Miletus, was the birthplace of natural philosophy in the persons of Thales and Anaximander, and Ionians at home and overseas (Heraclitus, Pythagoras, and Parmenides) would lay the foundations of Greek philosophy. The Ionic dialect of Greek became the language of literature and learning, and Ionic architecture, sculpture, and bronze casting were also influential.

The overseas expansion of Ionia in the 7th century was in part due to the need of a new population outlet after deep Ionic penetrations inland had provoked opposition and conflict with the rising power of Lydia under the Mermnads. After repeated conflicts, most of Ionia finally came under Lydian rule in the reign of Croesus (*c.* 560–546). After Croesus' fall at the hands of Achaemenian Persia, the cities of Ionia were unable to effectively oppose the latter. The Ionians mounted an unsuccessful revolt against Persian rule in about 499 BC, but their fleet was crushed in a naval battle off Lade five years later. This revolt against the Persians marked the opening phase of the Greco-Persian Wars.

After the Greeks' victory over Persia at the Battle of Salamis in 480 BC, the Ionian cities regained their independence and helped to form the Delian League with Athens. They had come under Athenian control by the late 5th century, however. Sparta gained influence in Ionia in the last stages of the Peloponnesian War (413–404) but abandoned the Ionian mainland to Persia in 387 BC.

Ionia was nominally independent again from 334 to 301 under the rule first of Alexander the Great and then of Antigonus I Monophthalmus. The region then became part of the Seleucid and later of the Attalid kingdom. In 133 BC Ionia passed under Roman rule and became part of the Roman province of Asia. Under the Roman Empire the principal cities of Ionia experienced a revival of prosperity, and many of the impressive ruins on their sites date from that time. Ephesus, Miletus, Smyrna, and Chios were among the most splendid cities of the Roman world and continued to flourish in Byzantine times.

Ionian, any member of an important eastern division of the ancient Greek people, who gave their name to a district on the western coast of Anatolia (now Turkey). The Ionian dialect of Greek was closely related to Attic and was spoken in Ionia and on many of the Aegean islands.

The Ionians are said to have migrated to western Anatolia from Attica and other central Greek territories following the Dorian immigration (*c.* 1000 BC) that upset the Achaean kingdoms on the mainland. This is confirmed by the fact that the same four "tribes" (*phylai*) found among the Athenians reappear in the

inhabitants of Miletus and other Ionian cities. Homer in his epics gives the Ionians but a passing mention, but in the Homeric *Hymn to Apollo*, roughly corresponding in time to the first certain written reference to the Ionians by the Assyrian king Sennacherib (reigned 704–681 BC), they are noted as the great and wealthy people who frequent the festival of Apollo at Delos.

By the time of Herodotus (*c.* 450 BC), Greek thinkers had worked out a detailed ethnological theory, identifying the Ionians with the aboriginal element in Greece (Pelasgoi) and the Dorians with the immigrant northern Hellenes proper. This hypothesis introduced an element of racialism into Greek interstate polemics. The Ionians of Asia, because of their exposed position, had been subjected by Persia and came to be despised as "soft" in comparison to the military, disciplined cadres of the Peloponnesian Dorians.

From about 700 BC, expansion and accompanying colonization brought the Ionians of Euboea to eastern Sicily and Cumae near Naples, and Samians to Nagidus and Celenderis in Pamphylia. Among the Ionian cities, Miletus, which was said to have founded 90 colonies, was instrumental in opening up the Black Sea, while Phocaea was active in the Mediterranean, establishing a colony at Massilia (Marseille). "Ionians" (Homeric: Iawones; Persian: Yauna; Hebrew: Yewanim; Turkish and Arabic: Yunani) became and remained the Oriental term for all Greeks.

The contribution of Ionians to Greek culture was of major importance, including the Homeric epics and the earliest elegiac and iambic poetry. In the 6th century, Ionic rational thought dominated intellectual life, fostering the study of geography and nature and research into matter and the universe. Ionians at home and overseas also laid the foundation of Greek philosophy and historiography. In the age after Alexander the Great, Attic Ionic, the literary language, became the basis of Koine, or "common speech," the language of practically all later Greek writing, including the New Testament, down to the present day. Ionians were also substantial artists in the areas of architecture, sculpture, and castbronze statuary. *See also* Ionia.

Ionian Islands, Modern Greek ΙΟΝΙΟΙ ΝΗΣΟΙ, island group off the west coast of Greece, stretching south from the Albanian coast to the southern tip of the Peloponnese, and often called Heptanesos ("Seven Islands"). The islands are Corfu (Kérkira), Cephalonia (Kefallinía), Zacynthus (Zákinthos, Zante), Leucas (Levkás), Ithaca (Ithákī), Cythera (Kíthira), and Paxos (Paxoî), with their minor dependencies. Their combined land area is 891 square miles (2,307 square km).

With good rainfall and much arable soil, the Ionian Islands produce timber, fruit, and flax and raise pigs, sheep, and goats. Their exports include currants, wine, cotton, salt, olives, and fish, and the islands are largely self-sufficient in grains. Their harbours are superior to those of the west coast of Greece and more conveniently located for international shipping. The islands are subject to severe earthquakes, which in 1953 caused considerable damage to towns and facilities in Cephalonia. Zante, and Ithaca. (For physical description and classical history, *see* the articles on individual islands.)

Because of their strategic maritime location between the Greek and Italian mainlands, intervention from outside has affected the islands and their people since classical times. Leo IV the Wise (*c.* AD 890) formed most or all of the islands into a province of the Byzantine Empire as the *theme* of Cephalonia. The Norman adventurer Robert Guiscard captured Corfu (1081) and Cephalonia, but his death (1085) prevented the establishment of a dynasty. When the Latin empire (1204–61) was established at Constantinople, the Venetians received Corfu; but in 1214 the Greek despotate of Epirus annexed the first Venetian colony, and a long period of Epirote, Sicilian, and Neapolitan-Angevin rule followed until 1386, when Corfu submitted voluntarily to the Venetian republic. In 1479 the Turks captured the islands of Cephalonia, Zacynthus, Leucas, and Ithaca, annexing them to their empire. The Venetians soon counterattacked and retook them during the 15th and 16th centuries.

The Venetians won the adherence of the principal local families on the islands by the bestowal of titles and appointments. The Roman Catholic church was established there, and the Italians and Greeks intermarried. Greek ceased to be spoken except by the peasantry, who remained faithful to the Greek Orthodox communion. On the fall of the Venetian republic in 1797, the islands were awarded to France, whose rule was quickly ended by a Russo-Turkish force (1798–99). Reclaimed by France in 1807 and made an integral part of the French empire under Napoleon, the islands were placed by the Treaty of Paris (1815) under the exclusive protection of Great Britain.

An Ionian senate and legislative assembly began to function in 1818, but real authority was vested in a British high commissioner. Schools of higher learning and a judiciary were set up, but the inhabitants resented the restrictions imposed by the firm British rule. After 1848 periodic insurrections by the peasantry, notably in Cephalonia, had to be put down with force, and the Ionian parliament voted for immediate union with the new Greek kingdom. In 1864 Britain ceded the islands to Greece as a gesture marking the accession of a new Greek king, George I (the former Prince William George of Glücksburg), son of Christian IX of Denmark. Following their annexation, the prosperity of the islands decreased, partly because of the loss of the special tax and trading privileges granted under the protectorate. The islands were occupied by Italy and, later, Germany during World War II. They were liberated with the rest of Greece in 1944. Pop. (1991 prelim.) 191,003.

Ionian school, school of Greek philosophers of the 6th to 5th century BC, including Thales, Anaximander, Anaximenes, Heracleitus, Anaxagoras, Diogenes of Apollonia, Archelaus, and Hippon. Although Ionia was the original centre of their activity, they differed so greatly from one another in their conclusions that they cannot be said to have represented a specific school of philosophy. Their common concern to explain phenomena in terms of matter or physical forces, however, distinguished them from later thinkers.

Ionian Sea, Latin MARE IONIUM, Italian MARE IONIO, part of the Mediterranean Sea, lying between Greece (east), Sicily (southwest), and Italy (west and northwest). Though considered by ancient authors to be part of the Adriatic Sea, the Ionian Sea is now seen as a separate body of water. In the Ionian Sea, south of Greece, the Mediterranean reaches its greatest depth (16,000 feet [4,900 m]).

The Ionian is connected with the Tyrrhenian Sea by the Strait of Messina and with the Adriatic Sea by the Strait of Otranto. The Ionian Sea includes the gulfs of Squillace and Taranto (Italy) and Arta, Patras, and Corinth (Greece). The main Ionian ports are Syracuse and Catania (Sicily), Taranto (Italy), Kérkira (Ionian Islands), and Pátrai (Greece). The Ionian Islands lie off the western coast of Greece.

Ionic alphabet, most important variety of the eastern form of the ancient Greek alphabet, developed late in the 5th century BC. In 403 the Ionic alphabet used in the Anatolian city of Miletus was adopted for use in Athens, and by the middle of the 4th century the Ionic had become the common, 24-letter, classical Greek alphabet.

ionic bond, also called ELECTROVALENT BOND, type of linkage formed from the electrostatic attraction between oppositely charged ions in a chemical compound. Such a bond forms when the valence (outermost) electrons of one atom are transferred permanently to another atom. The atom that loses the electrons becomes a positively charged ion (cation), while the one that gains them becomes a negatively charged ion (anion).

A brief treatment of ionic bonds follows. For full treatment, *see* MACROPAEDIA: Chemical Bonding.

Ionic bonding results in compounds known as ionic, or electrovalent, compounds, which are best exemplified by the compounds formed between nonmetals and the alkali and alkaline-earth metals. In ionic crystalline solids of this kind, the electrostatic forces of attraction between opposite charges and repulsion between similar charges orient the ions in such a manner that every positive ion becomes surrounded by negative ions and vice versa. In short, the ions are so arranged that the positive and negative charges alternate and balance one another, the overall charge of the entire substance being zero. The magnitude of the electrostatic forces in ionic crystals is considerable. Accordingly, these substances tend to be hard and nonvolatile.

An ionic bond is actually the extreme case of a polar covalent bond, the latter resulting from unequal sharing of electrons rather than complete electron transfer. Ionic bonds typically form when the difference in the electronegativities of the two atoms is great, while covalent bonds form when the electronegativities are similar. *Compare* covalent bond.

Ionic order, one of the orders of classical architecture. Its distinguishing feature is the twin volutes, or spiral scrolls, of its capital. *See* order.

ionium-thorium dating, method of establishing the time of origin of marine sediments according to the amount of ionium and thorium they contain.

Because uranium compounds are soluble in seawater, while thorium compounds are quite insoluble, the thorium isotopes produced by the decay of uranium in seawater are readily precipitated and incorporated in sediments. One of these thorium isotopes, thorium-230 (also known as ionium), has a half-life of about 80,000 years, which makes it suitable for dating sediments as old as 400,000 years. Thus, the amount of ionium in sediments can be used as a rough measure of the age of sediment. Accurate dating by measurement of ionium alone requires that the rate of sedimentation of ionium be constant with time, an assumption that does not hold for many sediments; any thorium-232 present in seawater will also precipitate, and the decay of the ratio of ionium to thorium-232 can be used as a measure of time. This method does not require a constant rate of sedimentation of ionium but simply that the two isotopes are precipitated in a constant proportion.

The validity of the ionium-thorium age method is based upon the following assumptions: (1) the ratio of thorium-230 (ionium) to thorium-232 in ocean water remains constant during the age span of the sample to be dated; (2) during precipitation there is no chemical fractionation of ionium and thorium, so that they are precipitated in a constant ratio; (3) the sediments do not contain any detrital material that has a significant amount of either nuclide; and (4) after deposition the thorium isotopes do not migrate within the sediments. When these assumptions are valid, an accurate

date may be obtained for the age of marine sediments.

ionization, in chemistry and physics, any process by which electrically neutral atoms or molecules are converted to electrically charged atoms or molecules (ions). Ionization is one of the principal ways that radiation, such as charged particles and X rays, transfers its energy to matter.

In chemistry, ionization often occurs in a liquid solution. For example, neutral molecules of hydrogen chloride gas, HCl, react with similarly polar water molecules, H_2O, to produce positive hydronium ions, H_3O^+, and negative chloride ions, Cl^-; at the surface of a piece of metallic zinc in contact with an acidic solution, zinc atoms, Zn, lose electrons to hydrogen ions and become colourless zinc ions, Zn^{2+}.

Ionization by collision occurs in gases at low pressures when an electric current is passed through them. If the electrons constituting the current have sufficient energy (the ionization energy is different for each substance), they force other electrons out of the neutral gas molecules, producing ion pairs that individually consist of the resultant positive ion and detached negative electron. Negative ions are also formed as some of the electrons attach themselves to neutral gas molecules. Gases may also be ionized by intermolecular collisions at high temperatures.

Ionization, in general, occurs whenever sufficiently energetic charged particles or radiant energy travel through gases, liquids, or solids. Charged particles, such as alpha particles and electrons from radioactive materials, cause extensive ionization along their paths. Energetic neutral particles, such as neutrons and neutrinos, are more penetrating and cause almost no ionization. Pulses of radiant energy, such as X-ray and gamma-ray photons, can eject electrons from atoms by the photoelectric effect to cause ionization. The energetic electrons resulting from the absorption of radiant energy and the passage of charged particles in turn may cause further ionization, called secondary ionization. A certain minimal level of ionization is present in the Earth's atmosphere because of continuous absorption of cosmic rays from space and ultraviolet radiation from the Sun.

ionization chamber, radiation detector used for determining the intensity of a beam of radiation or for counting individual charged particles. The device may consist of a gas-filled, cylindrical container in which an electric field is maintained by impressing a voltage that keeps the wall negative relative to a wire extending along the axis. When a photon or a charged particle enters the chamber, it converts some of the gas molecules to positive ions and electrons; under the influence of the electric field, these particles migrate to the wall and the wire, respectively, and cause an observable pulse of current to flow through the circuit joining these elements.

A proportional counter is a modified ionization chamber, one in which a higher voltage is impressed, making the electric field near the axial wire intense enough to accelerate the approaching electrons to energies so high that their collisions with the gas molecules cause further ionization. This effect, called gas multiplication, makes the output electric pulse proportional to the ionization produced by the radiation entering the counter and thus permits differentiation among particles of various kinds and energies.

A Geiger-Müller counter results from the application of a still-higher voltage across the electrodes of a proportional counter. Individual particles of various kinds and energies entering a Geiger-Müller counter produce essentially the same large output pulse, making the instrument an excellent counter of individual particles. The mixture of gases within a Geiger counter quenches the avalanche of ions produced by a single particle of radiation so that the device can recover to detect another particle. An additional significant increase in voltage causes a continuous current to flow through the gas between the electrodes, rendering the device useless for detecting radiation.

Articles are alphabetized word by word, not letter by letter

ionization potential, also called IONIZATION ENERGY, in chemistry, the amount of energy required to remove an electron from an isolated atom or molecule. There is an ionization potential for each successive electron removed; the ionization potential associated with removal of the first (most loosely held) electron, however, is most commonly used.

The ionization potential of a chemical element, expressed in electron volts, is usually measured in an electric discharge tube in which a fast-moving electron generated by an electric current collides with a gaseous atom of the element, causing it to eject one of its electrons. For a hydrogen atom, composed of an orbiting electron bound to a nucleus of one proton, an ionization energy of 13.6 electron volts is required to force the electron from its lowest energy level entirely out of the atom. The magnitude of the ionization potential of an element is dependent on the combined effects of the electric charge of the nucleus, the size of the atom, and its electronic configuration. Among the chemical elements, removal of an electron is hardest for the noble gases and easiest for the alkali metals. The ionization energy required for removal of electrons increases progressively as the atom loses electrons, because the positive charge on the nucleus of the atom does not change, and therefore, with each removal of an electron, the remainder are held more firmly.

The ionization potential is a measure of the capability of an element to enter into chemical reactions requiring ion formation or donation of electrons. It is also generally related to the nature of the chemical bonding in the compounds formed by the elements. *See also* binding energy; electron affinity.

ionosphere, region of the Earth's atmosphere in which the number of ions, or electrically charged particles—resulting from the action of extraterrestrial (primarily solar) radiation on the neutral atoms and molecules of the air—is large enough to affect the propagation of radio waves. The ionosphere begins at a height of about 50 km (30 miles) above the surface but is most distinct at altitudes above about 80 km (50 miles).

A brief treatment of the ionosphere follows. For full treatment, *see* MACROPAEDIA: Atmosphere.

Discovery of the ionosphere extended over nearly a century. As early as 1839, the German mathematician Carl Friedrich Gauss speculated that an electrically conducting region of the atmosphere could account for observed variations of the Earth's magnetic field. The notion of a conducting region was reinvoked by others, notably in 1902 by the American engineer Arthur E. Kennelly and the British physicist Oliver Heaviside to explain the transmission of radio signals around the curve of the Earth's surface, before definitive evidence was obtained in 1925. For some years the ionrich region was referred to as the Kennelly-Heaviside layer.

The ionosphere consists of three layers: the D region, the lowest, is strongly ionized during the day and is responsible for the attenuation of shortwave and broadcast-band radio signals, an effect that largely disappears at night; the E layer, extending from 90 to 140 km (56 to 90 miles), is a region of ionized molecules and strong electric currents; and the F region, from 140 km up, is characterized by ionized atoms and contains the stratum (designated as F2) in which ion concentration reaches a maximum. The E and F regions are responsible for the long-distance propagation, by reflection, of radio signals in the shortwave and broadcast bands. Extending upward from the F layer is a region called the magnetosphere, wherein the Earth's magnetic field largely controls the movement of ions. The magnetosphere contains the highly energetic charged particles of the Van Allen radiation belts, though its ion content is little affected by them. At distances of 8 to 14 Earth radii (roughly 51,000 to 89,000 km, or 31,700 to 55,500 miles) on the sunward side and farther out elsewhere, the magnetosphere and the ionosphere end at a boundary known as the magnetopause, beyond which is the domain of the solar wind (continual flow of electrons and atomic nuclei from the Sun).

Ionization in the ionospheric region is chiefly effected by solar radiation at X-ray and ultraviolet wavelengths. The particles ionized are mainly molecular nitrogen and molecular and atomic oxygen, but at a height of about 1,000 km (620 miles) there is a region, sometimes called the protonosphere, in which protons (hydrogen nuclei) constitute the dominant ionic species.

iora, smallest of the fairy bluebird species. *See* fairy bluebird.

Iorga, Nicolae (b. June 18, 1871, Botoşani, Rom.—d. Nov. 28, 1940, Strejnicu), scholar and statesman, Romania's greatest national historian, who also served briefly as its prime minister (1931–32).

Appointed professor of universal history at Bucharest (1895), Iorga early established his historical reputation with his *Geschichte des rumänischen Volkes* (1905; "History of the Romanian People"), his five-volume *Geschichte des osmanischen Reiches* (1908–12; "History of the Ottoman Empire"), and studies of the Crusades.

From the time of his first election to the Romanian Parliament (1907), he played an important role in national politics. He founded his own party, the National Democrats, and in 1931–32 he served as prime minister and also minister of education. A man of enormous energy, he had already by 1933 written an estimated 800 books and 10,000 articles and founded a people's university at Vălenii de Munte (1908), the Southeast European Institute (1913), and numerous periodicals. He subsequently published a monumental 10-volume national history (*Istoria Românilor;* 1936–39). His strongly nationalist writings and lectures influenced all of Romanian intellectual life.

Iorga supported the regime of his former pupil, King Carol II, who had returned from exile in 1930 to claim the national throne. In November 1940 Iorga was assassinated by terrorists of the national Fascist Iron Guard.

Ioshkar-Ola (city, western Russia): *see* Yoshkar-Ola.

Iowa, North American Indian people of Siouan linguistic stock who in their prehistoric period migrated westward from north of the Great Lakes to the general area of the present state of Iowa. In 1836 they ceded their lands to the United States and moved to a reservation on what is now the Kansas-Nebraska border. Some were later moved to a reservation in Indian Territory (present Oklahoma). Their estimated population in the mid-18th century was 1,100. In the late 20th century there were more than 100 Iowa descendants living on the reservation in Kansas-Nebraska and more than 100 living in Oklahoma.

Unlike many Plains people, the Iowa were not solely hunters. Their semisedentary, agricultural way of life bore more resemblance to that of the Eastern Woodlands tribes. They raised corn (maize) and traded fur pelts and clay pipes with the French. They lived in oven-shaped, earth-covered houses, using tepees when hunting or on the warpath. Like the

Mew-hew-she-kaw (The White Cloud), chief of the Iowa, painting by George Catlin, 1834

By courtesy of the American Museum of Natural History, New York

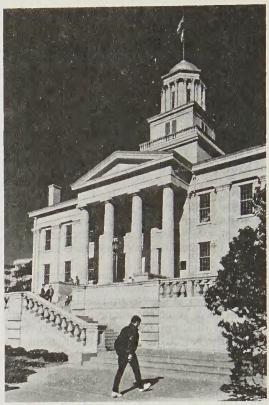
Osage and Kansa, Iowa warriors wore a scalp lock decorated with deer hair. They recognized three grades of battle exploits: victorious captaincy, killing an enemy, and decapitating and scalping an enemy.

Iowa, constituent state of the United States of America, lying in the Midwestern region in the north-central United States, bounded on the north by Minnesota, on the east by Wisconsin and Illinois, on the south by Missouri, and on the west by Nebraska and South Dakota. The landscape is typified by gently rolling prairie. The capital is Des Moines.

A brief treatment of Iowa follows. For full treatment, *see* MACROPAEDIA: United States of America: *Iowa.*

The French explorers Jacques Marquette and Louis Jolliet were probably the first Europeans to reach Iowa, but permanent settlement did not take place until the 1830s. Iowa became a part of the United States with the rest of the Louisiana Purchase in 1803. Following the purchase of eastern Iowa from the Sauk and Fox Indians in the 1830s, settlers from the Eastern states rapidly moved in. Iowa became a territory in 1838 and the 29th state in 1846. The population grew rapidly but stabilized about 1900.

Iowa's terrain and rich soils are products of the glaciation that covered much of North America during the Pleistocene epoch, between 1,600,000 and 10,000 years ago. Most of the state is overlain by glacial drift. Lakes or swamps that were left by the ice have long since been drained by natural erosion, leaving a rolling landscape of great uniformity. Broad, flat uplands cover 12,300 square miles (32,000 square km) of the state's central and north-central portions. The most varied relief in the state is in the northeast, where tributaries of the Mississippi River have cut deeply into the underlying bedrock.



Iowa winters are cold and summers warm and humid. In the northwest, January's average temperature is 14° F (−10° C), in the southeast, 22° F (−6° C). Winter snowfall is generally light. The average July temperature is 74° F (23° C). Precipitation ranges from less than 28 inches (700 mm) in the northwest to 35 inches (889 mm) in the southeast. Summer thunderstorms increase precipitation significantly.

Iowa was settled largely by immigrants from states lying directly to the east and from northwestern Europe. The people were and continue to be mostly Protestant. In the 20th century the only notable immigration into Iowa has been that of blacks to the larger urban areas. Blacks, however, compose only a small percentage of the total population. Iowa is about three-fifths urban—less urban than any bordering state except South Dakota. The state's population grew only slightly between 1970 and 1980 and then began slowly to decrease.

Iowa is one of the nation's leading states in production of livestock (especially hogs), corn (maize) for feed, soybeans, and oats and hay. Iowa's manufacturing output is closely related to its agricultural predominance; in the 20th century it became a major breadbasket of the United States. The main industries are devoted to food processing and the manufacture of agricultural machinery. One famous exception is the manufacture of refrigeration equipment in Amana. Except for the mining of portland cement and gypsum, mineral resources play a minor role in the economy.

In the 1920s Iowa developed an extensive rural-road system designed to serve the relatively low population density. Inland-waterway traffic is carried along the Mississippi and Missouri rivers.

The major cultural centres in Iowa are the large state and smaller private universities and colleges. The fine arts are notably supported at the University of Iowa, where the regional painter Grant Wood did much of his work. There is a natural-history museum and planetarium at Cherokee and a Norwegian-American historical museum at Decorah. Folk traditions are maintained in the Amana Colonies (Oktoberfest) and in the Dutch community of Pella, with its annual tulip festival. Area 56,275 square miles (145,753 square km). Pop. (2000) 2,926,324.

The Old Capitol at the University of Iowa, Iowa City, Iowa

Iowa City, city, seat (1839) of Johnson county, east-central Iowa, U.S., on the Iowa River, 27 miles (43 km) south of Cedar Rapids. Founded as territorial capital of Iowa in 1839, it lost the state capital to Des Moines in 1857 but retained the University of Iowa (1847).

The Old Capitol (1840) stands on the university campus. With the arrival of the railroad (1855), the city became an important dispersal point for westward immigrants. Its economy, centred on the university and its medical centre, is supplemented by light manufactures (including adhesive paper, toothbrushes, and toiletries) and farming (hogs, cattle, and grain). The Herbert Hoover birthplace (a national historic site) is in West Branch, 10 miles (16 km) east, and the Amana Colonies, seven Old-World villages, are 20 miles (32 km) west-northwest. Coralville, just to the west, was the starting point for the Mormon handcart expedition to Utah of 1856. Inc. 1853. Pop. (2000) city, 62,220; Iowa City MSA, 111,006.

Iowa Great Lakes, leading resort area in northern Iowa, U.S., embracing Spirit, West Okoboji, East Okoboji, and Silver lakes, in Dickinson county, just south of the Minnesota state line. All four lakes are of glacial origin. Spirit Lake, the largest (4 miles long by 3 miles wide [6.4 km long by 4.8 km wide]), lies just north of Spirit Lake town, which is the chief community of the region. West Okoboji Lake is noted for its crystalline clarity.

A number of state parks, including Mini-Wakan, provide public access to the lakes, which have swimming, boating, and fishing facilities. Rich in Indian lore, the region was the scene of the so-called Spirit Lake Massacre (March 1857) of more than 30 white settlers by a band of Sioux led by the renegade Inkpaduta. The incident, commemorated by several historical cabin sites including the Gardner Log Cabin-Museum in Arnolds Park, provided the background for MacKinley

Sailing on Okoboji Lake, Iowa Great Lakes

Kantor's novel *Spirit Lake* (1961). The Spirit Lake Fish Hatchery is in Orleans just north of the town of Spirit Lake, and Ocheyedan Mound (1,675 ft [511 m]), 25 mi west, the highest point in the state, is where the Indians mourned their dead (its name means "spot where they weep").

Iowa River, river formed by the confluence of East and West branches, near Belmond in Wright County, north central Iowa, U.S. It flows generally southeast past Iowa Falls, Marshalltown, and Iowa City.

At Columbus Junction, about 25 mi (40 km) below Iowa City, the Iowa River is joined by the Cedar River, and the combined streams enter the Mississippi River nearly 20 mi south of Muscatine. Above Iowa City the river is dammed for flood control and recreation to form Coralville Reservoir and Lake Macbride. Its course with its headstreams is about 330 mi.

IPA: *see* International Phonetic Alphabet.

Ipameri, city, southeastern Goiás state, south central Brazil. Lying in rolling uplands between the Veríssimo and Corumbá rivers, tributaries of the Paranaíba, it is primarily a cattle-shipping centre that also houses meat-processing and rice-hulling plants. Additional income is derived from the gathering and selling of rock crystals and rutile for use as gemstones. The city is on the railroad linking Goiânia, the state capital, and Anápolis with São Paulo and Belo Horizonte. It is also accessible by highway from Goiânia, which lies to the northwest. Pop. (2000 prelim.) 18,798.

Ipatieff, Vladimir Nikolayevich, Ipatieff also spelled IPATYEV (b. Nov. 21 [Nov. 9, old style], 1867, Moscow—d. Nov. 29, 1952, Chicago), Russian-born U.S. chemist who was one of the first to investigate high-pressure catalytic reactions of hydrocarbons and who developed a process for manufacturing high-octane gasoline.

In 1887 Ipatieff became an officer in the Imperial Russian Army and later attended the Mikhail Artillery Academy (1889–92), St. Petersburg, where he served as professor of chemistry (1898–1906). In 1897 he went to Munich to study and, while there, discovered the structure of isoprene, the basic molecular unit of rubber. Continuing his studies of hydrocarbons after his return to Russia, he soon learned to control and direct high-pressure catalytic reactions.

At the outbreak of World War I, Ipatieff was appointed chairman of the chemical committee of the Russian government, and throughout the war he served in administrative positions in the chemical industry. In spite of his anti-Communist feelings, he continued to work for the government after the Russian Revolution, but in 1930 he left the U.S.S.R. and accepted a position with the Universal Oil Products Company, Chicago. There he developed his catalytic processes for industrial use. Among the most important applications of these processes was the manufacture of high-octane gasoline from low-octane fuels.

Ipek (Yugoslavia): *see* Peć.

Iphicrates (b. *c.* 418 BC—d. *c.* 353), Athenian general known chiefly for his use of lightly armed troops (peltasts); he increased the length of their weapons and improved their mobility by reducing defensive armour.

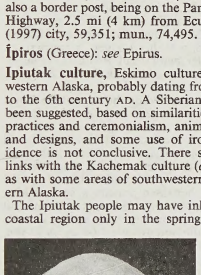
Iphicrates used his peltasts skillfully in the Corinthian War (395–387), nearly annihilating a battalion of Spartan hoplites near Corinth in 390. After the war he served the Persians as a mercenary commander, then returned to Athens. His expedition (373) to relieve Corcyra of a Spartan siege was successful, but he failed in attempts to recover Amphipolis (367–364).

Retiring to Thrace, Iphicrates fought for the Thracian king Cotys against Athens. The Athenians soon pardoned him and made him a commander in their struggle against their rebelling allies (Social War, 357–355). Iphicrates and two of his colleagues were prosecuted by Chares, the fourth commander, after they had refused to give battle during a violent storm. Iphicrates was probably acquitted but he died soon afterward.

Iphigeneia, in Greek mythology, eldest daughter of Agamemnon, king of Mycenae, and his wife Clytemnestra. Her father had to sacrifice her to the goddess Artemis in order that the Achaean fleet, of which he was leader, might be delivered from the calm (or contrary winds) by which Artemis was detaining it at Aulis and proceed on its way to the siege of Troy.

Iphigeneia served as a key figure in certain Greek tragedies: in the *Agamemnon* of Aeschylus, in the *Electra* of Sophocles, in Euripides' unfinished *Iphigeneia in Aulis*, and in his earlier play *Iphigeneia in Tauris*, in which she was saved by Artemis, who substituted a hind. Variants of her story are found in later authors. In some localities she was identified with Artemis, and some ancient writers claimed that Iphigeneia was originally the goddess Hecate.

Iphigeneia's story was also popular with later European dramatists, providing the plot of the *Iphigénie* by Racine and of the *Iphigenie auf Tauris* of Goethe. Racine's play was the basis for Gluck's opera *Iphigénie en Aulide.*



Ipiales, city, Nariño department, southwestern Colombia, in the Andes Mountains on the banks of the Río Guáitara, at 9,505 ft (2,897 m) above sea level. It is known as the "city of the three volcanoes."

The Spanish settlement was founded in 1585 by missionaries working among the indigenous Pasto Indians. It contains well-known Indian markets and the sanctuary of the Virgin of Las Lajas. Ipiales is an important regional manufacturing centre, producing woollen and cotton textiles, articles of sisal, and beer. It is also a border post, being on the Pan-American Highway, 2.5 mi (4 km) from Ecuador. Pop. (1997) city, 59,351; mun., 74,495.

Ípiros (Greece): *see* Epirus.

Ipiutak culture, Eskimo culture of northwestern Alaska, probably dating from the 2nd to the 6th century AD. A Siberian origin has been suggested, based on similarities in burial practices and ceremonialism, animal carvings and designs, and some use of iron; but evidence is not conclusive. There seem to be links with the Kachemak culture (*q.v.*) as well as with some areas of southwestern and western Alaska.

The Ipiutak people may have inhabited the coastal region only in the spring and summer months, moving inland for the rest of the year. Coastal dwellings were semi-subterranean huts. Seals and walrus were a major source of food and were hunted with harpoons from the edge of the ice. Bows and arrows were preferred for hunting caribou. Fish and birds were a minor part of the diet.

Burial skull of the Ipiutak culture, Alaska, with artificial eyes of jade and ivory; in the American Museum of Natural History, New York City

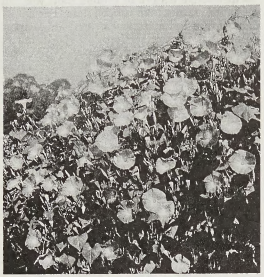
By courtesy of the American Museum of Natural History, New York City

A distinctive feature of Ipiutak tools was the use of flint rather than rubbed slate. The abundant flint of Point Hope was used for weapon points, knives, and scrapers. Ipiutak artifacts show more decoration than those of any other Eskimo culture; both geometric and realistic designs were used. Their sculpture, carvings in ivory and antler of real or imaginary animals, was finely crafted.

Elaborate burial customs, a ghost and a bear cult, and shamanism are suggested.

Ipiutak culture lacked a number of elements of typical Eskimo culture, such as stone or clay lamps and cooking pots, harpoon floats, bow drills, and slate implements.

Ipoh, capital of Perak state, West Malaysia (Malaya), on the Sungai (River) Kinta. Surrounded by steep hills, except to the south, it lies on a flat alluvial plain in the Kinta Valley (*q.v.*). The name comes from a local tree, whose poisonous resin was once used by Aboriginals for hunting. The modern town dates from the 1890s, when British tin-mining companies transferred operations from around Taiping to the rich Kinta ores. Immigrant Chinese were brought in to work the tin deposits, and their descendants now operate the open-pit mines and dominate the town.



The countryside around Ipoh is pocked with large sandpits from which the ore is extracted, either by dredging or by washing with high-pressure hoses. Beneath the Kinta gravels is a limestone structure riddled by solution; north and south of the city limestone rocks rise through the alluvium with gigantic caves that are used as Chinese temples. In addition to tin, rubber from foothill plantations is marketed.

The Chenderoh Dam on the nearby Sungai Perak, together with diesel generators, supplies electricity for the Tasek Industrial Estates (more than 40 factories). Ipoh has a spacious rectangular layout, and in the suburbs are imposing residences of wealthy mineowners. As the nation's mining capital, Ipoh is the most important station on the Kuala Lumpur–Butterworth railway and the focus of highways across the valley. A small airstrip links the area with other major west coast cities. Ungku Omar Polytechnical Institute (1969) is located in the city. Pop. (1991 prelim.) city, 382,633.

Ipomoea, also spelled IPOMAEA, genus of about 500 mostly warm-climate trees, shrubs, and twining and trailing herbaceous plants of the family Convolvulaceae with funnel-shaped flowers. Certain species of *Ipomoea* are sometimes considered as the separate genera *Batatas, Quamoclit, Calonyction, Pharbitis,* and *Exogonium.*

The genus *Ipomoea* is important to man for the beauty of its flowers and for the tuberous roots of two species. Sweet potato (*I. batatas*), a perennial, forms roots as it trails along the ground. The edible "potatoes" are enlarged food-storage portions of the roots. Its leaves are oval to lobed and the 5-centimetre (2-inch) flowers are pink to rose violet. It probably originated in tropical South America. Jalap (*I. purga*) is an upright herb with solitary, reddish flowers, native in tropical Mexico. Its apple-sized, turnip-shaped roots are the source of an ancient purgative, still in use. Heavenly blue morning glory (*I. violacea*)—a twining, perennial vine, usually cultivated as a garden annual—bears clusters of blue to purplish, sometimes white, flowers, 12 cm across, among heart-shaped leaves. It

is native to tropical America. This vine bears seeds containing the alkaloids *d*-lysergic and *d*-isolysergic acids (similar to LSD), and the seeds are used traditionally among Mexico's Zapotec Indians for ceremonial and curative purposes. Common morning glory (*I. purpurea*), an annual vine that bears heart-

Common morning glory (*Ipomoea purpurea*)
Derek Fell

shaped leaves and purple, pink, or white flowers about 7 cm (3 inches) across, has become a troublesome weed in parts of southeastern North America. One of the largest flowering ipomoeas is the moonflower (*I. bona-nox,* or *Calonyction aculeatum*), a rampant, perennial climber with 15-centimetre (6-inch) white, fragrant, night-blooming flowers. It contains a milky juice used for coagulating *Castilla* rubber. Bush morning glory (*I. leptophylla*), with tuberous roots and erect branches to about 120 cm (47 inches) tall, bears 7.5-centimetre purple or pink flowers. It is native to central North America. The morning glory tree, or casahuate (*I. arborescens*), is one of several similar tropical American tree and shrub morning glories.

Ippitsusai Bunchō (d. 1791), Japanese artist in the ukiyo-e school, which depicted subjects drawn from everyday life.

Ippitsusai studied with Ishikawa Yukimoto, a painter of the traditional Kanō school. He gained repute as a colourist, particularly in his painting of actors (*nigeo-e,* "portraits"). His main works include the *E-hon butai ōgi* ("Picture Book of Stage Fans"), a work done with Suzuki Harunobu in 1770; the "Yamashita Kyōnosuke no ushiro men" (showing the dances of Yamashita Kyōnosuke); and the "Nakamura Matsue no shirotabi" ("White Cloth of Nakamura Matsue").

Ippolitov-Ivanov, Mikhail (Mikhaylovich) (b. Nov. 19, 1859, Gatchina, Russia—d. Jan. 28, 1935, Moscow), Russian composer

Ippolitov-Ivanov
Novosti Press Agency

of orchestral works and operas influenced by Caucasian and Georgian folk music.

Ippolitov-Ivanov studied under Nikolay Rimsky-Korsakov at the St. Petersburg Conservatory and in 1882 became conductor of the symphony orchestra and director of the music school in Tiflis (now Tbilisi), Georgia. He taught at the Moscow Conservatory (1893–1906), served as its director (1906–22), and was conductor of the Mamontova Opera (1899–1906). In 1924–25 he reorganized the Georgian State Conservatory, formerly the Tbilisi School. After 1925 he was conductor at the Bolshoi Theatre.

Ippolitov-Ivanov's 11 years in the Caucasus led to the lifelong interest in Georgian folk music that inspired several of his orchestral compositions: *Caucasian Sketches* (1895) suite, *Armenian Rhapsody* (1909), and the symphonic poem after a poem by Mikhail Lermontov, *Mtsyri* (1922; "The Novice"). These works were seldom performed after the mid-20th century; likewise, his seven operas did not remain popular.

iproniazid, the first drug of the monoamine-oxidase inhibitor series to be introduced into medicine (1958). It was employed as an antidepressant until it was found to cause liver damage. Prior to its introduction as an antidepressant, iproniazid was studied as a drug similar in function to the antituberculotic drug isoniazid, which it resembles in chemical structure. It prevents the enzymatic breakdown of norepinephrine, the brain-neurotransmitter substance concerned with emotional stimulation. It does so by inhibiting the enzyme monoamine oxidase.

Iproniazid has been replaced in antidepressant therapy by other members of the monoamine-oxidase inhibitor series (*e.g.,* isocarboxazid, phenelzine, and tranylcypromine) and the tricyclic antidepressant drugs (*e.g.,* imipramine, amitriptyline, and nortriptyline), which have less severe side effects.

Ipsen, Bodil, original name BODIL LOUISE JENSEN (b. Aug. 30, 1889, Copenhagen, Den.—d. Nov. 1964, Copenhagen), Danish actress who, with her frequent stage partner, the character actor Poul Reumert, reilluminated the dramas of Henrik Ibsen and August Strindberg.

Ipsen first appeared on the stage at the Royal Theatre, Copenhagen, in 1909. She showed wide versatility, achieving success in roles both comic (Rosalind in *As You Like It*) and serious (Nora in *A Doll's House*), although her mature career emphasized dramatic portrayals. Her Lady Macbeth achieved special distinction; her Ibsen principals, such as Mrs. Alving (*Ghosts*), garnered great acclaim, and her Strindberg heroines, such as the title role in *Miss Julie* and Alice in *Dance of Death,* brought her wide repute. In the latter roles Ipsen was complemented by the celebrated actor Reumert, whose dramatic career paralleled her own.

Ipsen appeared in Danish films as early as 1913; her best-known performances in silent films were in the Dickens classics *David Copperfield* (1922) and *Little Dorrit* (1924); later, she received particular acclaim in *Go Home With Me* (1941). Two films codirected with Lau Lauritzen, Jr., are among Ipsen's best-known works—*Afsporet* (1942) and *Red Meadows* (1945).

Ipsus, Battle of, military engagement fought at Ipsus, Phrygia, in 301 BC between two camps of the "successors" (*diodochoi*) of Alexander the Great, part of a struggle that accelerated the dismemberment of Alexander's empire begun after his death.

In 302 a coalition representing Lysimachus, king of Thrace, Seleucus I Nicator of Babylon, Ptolemy I Soter of Egypt, and Cassander of Macedonia moved against Antigonus I Monophthalmus, king in Asia Minor, and his son Demetrius I Poliorcetes. Although the combined strength of Seleucus and Lysimachus in troops was only slightly inferior to the 70,000 foot soldiers and 10,000 horses of Antigonus, it was the allies' superiority in elephants that proved invaluable for victory. The elephants prevented Demetrius, who had pursued too far after defeating the opposing cavalry, from returning to rescue his father. Antigonus was killed, Demetrius fled, and Asia Minor was added to the dominions of Lysimachus.

Ipswich, North Sea port and district (borough), county of Suffolk, England, at the head of the Orwell Estuary. It has an area of 16 square miles (40 square km). Ipswich prospered as a port for the export of East Anglian textiles from medieval times to the 17th century. In 1200 King John granted the town its first charter, and it was incorporated in 1446. A period of decline was followed by renewed expansion in the 19th century when light-engineering firms were established in the town. Today, engineering and various agricultural industries are important.

Outstanding buildings in Ipswich include Christchurch mansion (16th century) and Sparrowe's House, in part a 15th-century structure with a 17th-century pargeted facade. The older churches are nearly all towered flint structures, wholly or mainly Perpendicular in style. There are several old coaching inns, including the Great White Horse of *Pickwick Papers* fame. Ipswich was the birthplace of Cardinal Thomas Wolsey.

Ipswich harbour extends 11 miles (18 km) downstream to Shotley Point and is still of modest importance, but the city prospers mainly as a major agricultural market and service centre for the extensive and rich farming area of Suffolk. Pop. (1986 est.) 118,300.

Ipswich, town (township), Essex county, northeastern Massachusetts, U.S. It lies along the Ipswich River (there bridged since 1764), 25 miles (40 km) north-northeast of Boston. Settled in 1633 as Agawam, it was incorporated in 1634 and renamed after Ipswich, Eng. Lace making, the town's first industry, was carried out on machines smuggled to the American colonies in defiance of British export laws. The town's Rebellion Tablet commemorates the public denunciation of British taxation without representation by the Reverend John Wise in 1687. Ipswich was the home of several leading writers of the colonial period, including Nathaniel Ward and the poet Anne Bradstreet.

Modern Ipswich has developed as a summer resort noted for seafood (the celebrated Ipswich clam), with light manufactures, including electronic components and tools and dies. More than 50 colonial houses have been preserved, notably the John Whipple House (1640). Pop. (1990) 11,873.

Ipuwer, ancient Egyptian sage. He perhaps served as a treasury official during the last years of Pepi II Neferkare (reigned *c.* 2294–*c.* 2200 BC) and is known only because of the discovery of one poorly preserved manuscript relating his speech to the king and the royal court. Ipuwer's manuscript, often called "The Admonitions of an Egyptian Sage," is especially valuable for its commentary on the political and economic situation at the close of the Old Kingdom.

IQ (from "intelligence quotient"), a number used to express the relative intelligence of a person. The IQ is determined by dividing a person's mental age as reported on a standardized test by his chronological age and then multiplying the resulting figure by 100. *See* intelligence test.

īqāʿāt, in Islāmic music, rhythmic modes—*i.e.,* patterns of strong, intermediate, and weak beats, separated by pauses of various lengths.

A well-developed system of such modes was described by medieval theorists. Although six or eight basic modes are included in most treatises, many more have actually been used.

The complete pattern, or period, repeated throughout the piece, is composed of smaller sections analogous to the feet of poetic metres. The various modes are said to be linked with the universe, and each has a character appropriate to music of a different mood.

Regularity of the rhythmic pattern is not obvious because the rhythmic accents do not necessarily coincide with melodic stresses. A voice or solo instrument carries the melody, while the rhythm is added by percussion or by slapping the knees. Pauses are often marked by gestures. The two lines (rhythm and melody) are united in the arrangement of large sections, but individual beats may clash. A rhythmic mode varies somewhat, and the tempo can be varied within traditional limits.

Iqāʿāt are in use in today's Arabic music. Iranian music followed similar rhythmic principles in medieval times but now is much freer rhythmically.

Iqaluit, formerly FROBISHER BAY, town and headquarters of Baffin region, Northwest Territories, Canada. It lies at the head of Frobisher Bay, on southeastern Baffin Island. Iqaluit is the largest community in the eastern Canadian Arctic. It was established as a trading post in 1914 and became an air base during World War II. It later was the site of construction camps for the DEW (Distant Early Warning) line of radar stations, and it also has a meteorological station. Iqaluit is an outlet for Inuit (Eskimo) art, and its Nunuuta Sunaqutangit Museum has Arctic displays. Pop. (1991) town, 3,552.

Iqbāl, Sir Muḥammad, also spelled MUḤAMMAD IKBĀL (b. Nov. 9, 1877, Sialkot, Punjab, India [now in Pakistan]—d. April 21, 1938, Lahore, Punjab), Indian poet and philosopher, known for his influential efforts to direct his fellow Muslims toward the establishment of a separate Muslim state, an aspiration that was eventually realized in the country of Pakistan. He was knighted in 1922.

Early life and career. Iqbāl was born at Sialkot, India (now in Pakistan), of a pious family of small merchants and was educated at Government College, Lahore. In Europe from 1905 to 1908, he earned his degree in philosophy from the University of Cambridge, qualified as a barrister in London, and received a doctorate from the University of Munich. His thesis, *The Development of Metaphysics in Persia,* revealed some aspects of Islāmic mysticism formerly unknown in Europe.

On his return from Europe, he gained his livelihood by the practice of law, but his fame came from his Persian- and Urdu-language poetry, which was written in the classical style for public recitation. Through poetic symposia and in a milieu in which memorizing verse was customary, his poetry became widely known, even among the illiterate. Almost all the cultured Indian and Pakistani Muslims of his and later generations have had the habit of quoting Iqbāl.

Before he visited Europe, his poetry affirmed Indian nationalism, as in *Nayā shawālā* ("The New Altar"), but time away from India caused him to shift his perspective. He came to criticize nationalism for a twofold reason: in Europe it had led to destructive racism and imperialism, and in India it was not founded on an adequate degree of common purpose. In a speech delivered at Aligarh in 1910, under the title "Islam as a Social and Political Ideal," he indicated the new Pan-Islāmic direction of his hopes. The recurrent themes of Iqbāl's poetry are a memory of the vanished glories of Islām, a complaint about its present decadence, and a call to unity and reform. Reform can be achieved by strengthening the individual through three successive stages: obedience to the law of Islām, self-control, and acceptance of the idea that everyone is potentially a vicegerent of God (*nāʾib,* or *muʾmin*). Furthermore, the life of action is to be preferred to ascetic resignation.

Three significant poems from this period, *Shikwah* ("The Complaint"), *Jawāb-e shikwah* ("The Answer to the Complaint"), and *Khizr-e rāh* ("Khizr, the Guide"), were published later in 1924 in the Urdu collection *Bāng-e darā* ("The Call of the Bell"). In those works Iqbāl gave intense expression to the anguish of Muslim powerlessness. Khizr (Arabic: Khiḍr), the Qurʾānic prophet who asks the most difficult questions, is pictured bringing from God the baffling problems of the early 20th century.

> What thing is the State? or why
> Must labour and capital so bloodily disagree?
> Asia's time-honoured cloak grows ragged
> and wears out . . .
> For whom this new ordeal, or by whose hand prepared?
>
> (Eng. trans. by V.G. Kiernan.)

Notoriety came in 1915 with the publication of his long Persian poem *Asrār-e khūdī* (*The Secrets of the Self*). He wrote in Persian because he sought to address his appeal to the entire Muslim world. In this work he presents a theory of the self that is a strong condemnation of the self-negating quietism (*i.e.,* the belief that perfection and spiritual peace are attained by passive absorption in contemplation of God and divine things) of classical Islāmic mysticism; his criticism shocked many and excited controversy. Iqbāl and his admirers steadily maintained that creative self-affirmation is a fundamental Muslim virtue; his critics said he imposed themes from the German philosopher Friedrich Nietzsche on Islām.

The dialectical quality of his thinking was expressed by the next long Persian poem, *Rumūz-e bīkhūdī* (1918; *The Mysteries of Selflessness*). Written as a counterpoint to the individualism preached in the *Asrār-e khūdī,* this poem called for self-surrender.

> Lo, like a candle wrestling with the night
> O'er my own self I pour my flooding tears.
> I spent my self, that there might be more light,
> More loveliness, more joy for other men.
>
> (Eng. trans. by A.J. Arberry.)

The Muslim community, as Iqbāl conceived it, ought effectively to teach and to encourage generous service to the ideals of brotherhood and justice. The mystery of selflessness was the hidden strength of Islām. Ultimately, the only satisfactory mode of active self-realization was the sacrifice of the self in the service of causes greater than the self. The paradigm was the life of the Prophet Muḥammad and the devoted service of the first believers. The second poem completes Iqbāl's conception of the final destiny of the self.

Later, he published three more Persian volumes. *Payām-e Mashriq* (1923; "Message of the East"), written in response to J.W. von Goethe's *West-östlicher Divan* (1819; "Divan of West and East"), affirmed the universal validity of Islām. In 1927 *Zabūr-e ʿAjam* ("Persian Psalms") appeared, about which A.J. Arberry, its translator into English, wrote: "Iqbāl displayed here an altogether extraordinary talent for the most delicate and delightful of all Persian styles, the ghazal," or love poem. *Jāvīd-nāmeh* (1932; "The Song of Eternity") is considered Iqbāl's masterpiece. Its theme, reminiscent of Dante's *Divine Comedy,* is the ascent of the poet, guided by the great 13th-century Persian mystic Jalāl ad-Dīn ar-Rūmī, through all the realms of thought and experience to the final encounter.

Iqbāl's later publications of poetry in Urdu were *Bāl-e Jibrīl* (1935; "Gabriel's Wing"), *Zarb-e kalīm* (1937; "The Blow of Moses"), and the posthumous *Armaghān-e Hijāz* (1938; "Gift of the Hejaz"), which contained verses in both Urdu and Persian. He is considered the greatest poet in Urdu of the 20th century.

Philosophical position and influence. His philosophical position was articulated in *The Reconstruction of Religious Thought in Islam* (1934), a volume based on six lectures delivered at Madras, Hyderābād, and Aligarh in 1928–29. He argued that a rightly focused man should unceasingly generate vitality through interaction with the purposes of the living God. The Prophet Muḥammad had returned from his unitary experience of God to let loose on the earth a new type of manhood and a cultural world characterized by the abolition of priesthood and hereditary kingship and by an emphasis on the study of history and nature. The Muslim community in the present age ought, through the exercise of *ijtihād*—the principle of legal advancement—to devise new social and political institutions. He also advocated a theory of *ijmāʿ*—consensus. Iqbāl tended to be progressive in adumbrating general principles of change but conservative in initiating actual change.

During the time that he was delivering these lectures, Iqbāl began working with the Muslim League. At the annual session of the league at Allahābād, in 1930, he gave the presidential address, in which he made a famous statement that the Muslims of northwestern India should demand status as a separate state.

After a long period of ill health, Iqbāl died in April 1938 and was buried in front of the great Bādshāhī Mosque in Lahore. Two years later, the Muslim League voted for the idea of Pakistan. That the poet had influenced the making of that decision, which became a reality in 1947, is undisputed. He has been acclaimed as the father of Pakistan, and every year Iqbāl Day is celebrated by Pakistanis.

(S.McD.)

BIBLIOGRAPHY. Aspects of his thought are explored in K.G. Saiyidain, *Iqbal's Educational Philosophy,* 6th ed. rev. (1965), a standard analysis of the relevance of Iqbāl's ideas about education written by a distinguished Indian educationist; Annemarie Schimmel, *Gabriel's Wing,* 2nd ed. (1989), a thorough analysis of Iqbāl's religious symbolism, including a comprehensive bibliography in English; Syed Abdul Vahid, *Iqbal: His Art and Thought,* new ed. (1959), a standard introduction; Hafeez Malik (ed.), *Iqbal, Poet-Philosopher of Pakistan* (1971), representative Pakistani views; and S.M.H. Burney (S.M.H. Barnī), *Iqbal, Poet-Patriot of India* (1987), focusing on nationalism and secularism in his poetry.

iqṭāʿ, in the Islāmic empire of the Caliphate, land granted to army officials for limited periods in lieu of a regular wage. It has sometimes been erroneously compared to the fief of medieval Europe. The *iqṭāʿ* system was established in the 9th century AD to relieve the state treasury when insufficient tax revenue and little booty from campaigns made it difficult for the government to pay army salaries.

Land subject to the *iqṭāʿ* was originally owned by non-Muslims and thus was subject to a special property tax, the *kharāj.* While the land remained legally the property of its owner, the *iqṭāʿ* was a grant of appropriation to a Muslim officer entitling him to collect the *kharāj* from the owner. Out of this the officer was expected to pay the smaller *ʿushr,* or tithe, on income, but was allowed to keep the balance as his salary. However, it proved difficult for the government to extract any payments from the officers, and the Būyids, an Iranian dynasty (reigned 932–1062), made the *iqṭāʿ* a grant of usufruct by which the *muqṭaʿ* (recipient officer) collected taxes from the land—calculated to approximate his usual pay. As the officer usually lived in a city remote from his *iqṭāʿ,* he had little interest in the land or its cultivators. The grant was merely a wage, and as soon as the land or its people were depleted, it

was exchanged for a more productive area. By the time that the Seljuq regime (1038–1194) ended, the *iqṭāʿ* had been introduced into the provinces and the number and size of *iqṭāʿat* had proliferated drastically, accounting for as much as half the land of the state, while the term of ownership also had grown, occasionally leading to hereditary succession. With this new permanence *muqṭaʿs* began to show an interest in the land and its maintenance, buying up neighbouring territory and binding the peasants to the soil by refusing to let them leave without having paid their taxes. The system survived the Mongol invasion of the 13th century but during subsequent Ottoman rule was replaced by an essentially similar arrangement that was called the timar.

The *iqṭāʿ* reappeared under the Il-Khans in Iran (reigned 1256–1353), where it was granted either as a hereditary allotment or for a specified period.

In Ayyūbid (1169–1250) Egypt, the *iqṭāʿ* approximated the *muqāṭaʿah* system, common in the caliphal domains, under which certain districts or peoples, such as Bedouins, Kurds, or Turkmen, paid a fixed tax directly to the state treasury, bypassing any intermediary tax collector. Thus, the Egyptian *iqṭāʿ*, primarily agricultural land, was leased for a limited time for a contracted sum of money. The power of the *muqṭaʿ* was strictly limited by extensive state controls and a deliberate distribution of land so as to avoid monopoly by any one *muqṭaʿ*.

Iquique, capital of Iquique *provincia* and of Tarapacá *región,* northern Chile. It is located on a rocky peninsula in the rainless Atacama Desert, overlooking the Pacific Ocean. Its anchorage is protected from the open sea by the low, barren offshore island of Serrano, which is connected to the mainland by a stone causeway. Founded in the 16th century, the city was partially destroyed in 1868 and 1875 by earthquakes, but some old wooden houses from that time still stand. During the desert's nitrate boom of the 19th and early 20th centuries, Iquique was Chile's major export port. Following the decline in nitrate prices, the city stagnated.

In an effort to revive the economy, new port facilities have been installed and new industries established. Fish-meal plants and canneries are in operation. Guano on the coast and offshore islands is exploited, and salt deposits to the south are worked. New lands have been opened up by irrigation for the cultivation of fruits (especially citrus), sugarcane, and olives. Tourism, based on sport fishing and beach facilities, also contributes to the economy. Iquique is linked to other cities by the main north–south Pan-American Highway and by railroad; it also has an airport. Pop. (1999) 159,815.

Iquitos, Amazon River port and capital of Loreto *departamento,* northeastern Peru. It is located about 2,300 miles (3,700 km) upstream from the Atlantic Ocean and 640 miles (1,030 km) north-northeast of Lima. It was founded in 1864 at the site of an Indian village and became the chief shipping port for the region during the rubber boom of the late 19th century. After 1912, when production dropped drastically, the city's population declined.

Iquitos remained stagnant until the 1950s, when interest in the economic development of eastern Peru was renewed. The city has many older buildings dating from the late 19th century, with glazed tiles and ironwork imported from Europe. Iquitos is connected to Lima by air. It is the site of the National University of the Peruvian Amazon (founded 1961) and is the cultural, religious, and tourist centre of eastern Peru. Iquitos has become the centre

Central Plaza with the cathedral in the background, Iquitos, Peru
Walter Aguiar

for oil exploration in the Peruvian Amazon. Pop. (1998 est.) 334,013.

Iradier, Eduardo Dato: *see* Dato Iradier, Eduardo.

Iráklion, also spelled HERAKLEION, historically CANDIA, largest city, principal port of the Greek island of Crete, and capital of the *nomós* (department) of Iráklion. The city lies on the north coast just northwest of the ancient Minoan capital of Knossos. Its name derives from the ancient Roman port of Heracleum, which likely occupied the same site. As the capital of Saracen Crete in the 9th century AD, it took the Arabic name Khandaq ("Moat"), which was corrupted to Candia by the Venetians, to whom the island was sold in 1204. Most of the extensive system of walls built around the city by the Venetians survives.

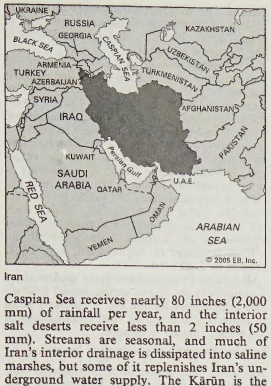
In 1669 the city was ceded to the Turks after a siege of more than 20 years. During the long Turkish occupation, which ended in 1897, Candia was known as Megalokastro. The Turks permitted its harbour to silt up, and the port of Canea (Khaniá), the future capital of Crete, took over Megalokastro's former commercial preeminence. The Turkish rule ended after an insurrection (1897) by the Greek population, demanding union with Greece. Iráklion was part of the international protectorate of Crete (1897–1913) and then became part of Greece. During the German invasion in 1941 the city suffered heavy damage from bombing.

After World War II the city gained considerable commercial prominence, with a new harbour with moles, an airport, and several hotels to serve the tourist trade. Among the port's principal exports are grapes (especially sultanas), olives and olive oil, wine, carobs, citrus, almonds, soap, vegetables, and leather. Numerous earthquakes, notably in 1664, 1856, and 1926, have taken their toll of the city's buildings and monuments, including many fine churches and mosques. A modern museum contains one of the finest collections of Minoan antiquities in Greece. Pop. (1991) city, 116,178; *nómos,* 264,906.

Iran, officially ISLAMIC REPUBLIC OF IRAN, Fārsī (Persian) JOMHŪRĪ-YE ESLĀMĪ-YE ĪRĀN, country, southwestern Asia, covering an area of 634,562 square miles (1,643,510 square km). The capital is Tehrān (Teheran).

Extending about 2,200 miles (3,540 km) from northwest to southeast and 1,200 miles (1,900 km) from northeast to southwest at its widest point, Iran is bordered on the north by Turkmenistan, the Caspian Sea, Armenia, and Azerbaijan, on the east by Pakistan and Afghanistan, on the south by the Persian Gulf and the Gulf of Oman, and on the west by Turkey and Iraq. The population in 2002 was estimated to be 65,457,000.

A brief treatment of Iran follows. For full treatment, *see* MACROPAEDIA: Iran.



For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Iran occupies a high plateau lying more than 1,500 feet (460 m) above sea level and rimmed on all sides by mountains whose average elevation is more than 6,500 feet (2,000 m). The only real lowlands in the country are those of the Kārūn River basin along the border with Iraq, the narrow coastlands along the Persian Gulf and the Gulf of Oman, and the marshy coasts along the Caspian Sea. In the north are the Elburz Mountains, with towering volcanic peaks that include the country's highest, Mount Damavend (18,386 feet [5,604 m]). The Elburz run along the southern shore of the Caspian Sea to join the Khorāsān (Khurasan) border ranges in the east. The latter, together with the Baluchistan ranges to the south, demarcate the interior plateau on the east. The largely barren plateau is characterized by vast salt deserts. The country's largest mountain range, the Zagros, stretches from Iran's northwestern boundary with Armenia to the Makran Mountains in the southeast.

Precipitation over Iran is generally light. Only the narrow coastal region along the

The Venetian fort, Iráklion, Greece
Tiers—Monkmeyer

Iran

Caspian Sea receives nearly 80 inches (2,000 mm) of rainfall per year, and the interior salt deserts receive less than 2 inches (50 mm). Streams are seasonal, and much of Iran's interior drainage is dissipated into saline marshes, but some of it replenishes Iran's underground water supply. The Kārūn is the country's only navigable river. Temperature extremes are common in Iran and vary from a summer high near the Persian Gulf of 131° F (55° C) to a winter low recorded in Azerbaijan (Āzārbāyjān) in the northwest of −35° F (−37° C).

More than half of Iran's surface area is wasteland, most of which is uninhabitable salt deserts. About one-third of the country's land area is arable—of which only a portion is under cultivation—and roughly one-fourth is suitable for grazing. Nearly one-third of the agricultural land area is irrigated, mostly in the hilly margins between desert and the mountains. About one-eighth of the country is forested, mostly near the Caspian Sea, with oak, beech, linden, elm, and a few broad-leafed evergreens. The abundant wildlife of the country includes wolves, foxes, leopards, lynx, gazelles, and deer. There are also wild goats and sheep.

Iran's enormous proven reserves of petroleum are located mostly in the southwestern part of the country near the head of the Persian Gulf. The country's reserves account for about one-tenth of global reserves. Iran also has about one-seventh of the world's reserves of natural gas, and there are substantial reserves of coal, copper, and iron ore.

The people. Iran is a diverse and polyglot society. Ethnic Persians are the most numerous (roughly half of the total population) and widely distributed ethnic group. The Kurds, a nomadic people, dwell in the western mountains and have resisted government efforts to assimilate them. Also inhabiting the western mountains are the seminomadic Lurs, thought to be aboriginal inhabitants. Closely related are the Bakhtyārī tribes who live in the Zagros Mountains west of Eṣfahān (Isfahan). Both groups speak Lurī, a Persian dialect, as do the Balochi, who inhabit Balochistan. The Armenians, with a different ethnic heritage, have maintained their Indo-European linguistic identity.

Approximately one-fourth of the Iranians speak Turkic languages. The three principal Turkic ethnic groups are the Azerbaijanians in the northwest corner of Iran, the Qashqāʾī in the Shīrāz area to the east of the Persian Gulf, and the Turkmen of the Khorāsān region in the northeast. Semites—Jews, Assyrians, and Arabs—constitute only a small percentage of the population.

The vast majority of Iranians are Muslims, mostly of the Shīʿite sect; Shīʿite Islām is the official state religion. The Kurds and the Turkmen are Sunnite Muslims. Religious minorities include Christians, Jews, Bahāʾīs, and Zoroastrians.

Iran's population is relatively young; about one-third is younger than age 15. Rates of population growth, formerly high, came in line with world averages by the early 21st century. Life expectancy is some 68 years for men and 70 years for women.

Economy. Iran has a mixed economy largely financed by petroleum production. Iran in the early 1990s faced a huge foreign debt and other serious economic dislocations stemming from the decade-long Iran-Iraq War (1980–90), while its population continued to grow at a rapid pace. The revival of oil exports and initial efforts to shift the economy onto a peacetime basis were undertaken at this time, with encouraging results.

The agricultural sector accounts for about one-fifth of the gross domestic product (GDP) and employs one-eighth of the workforce. Production is hampered by poor cultivation methods, lack of water, and limited access to markets. It has not kept pace with domestic demand, resulting in heavy reliance on imported foodstuffs. The country's most important crops are wheat, potatoes, barley, grapes, rice, corn (maize), sugar beets, sugarcane, and tobacco. Iran also produces a large amount of timber annually. The offshore-fishing industry is important in Iran both for domestic consumption and for export (particularly of sturgeon caviar).

Mining and manufacturing, dominated by petroleum production, account for almost one-seventh of the GDP and employ about one-eighth of the labour force. Iran's petroleum industry, nationalized in the 1950s, suffered extensive damage in the Iran-Iraq War. The state-owned gathering and distributing system for natural gas is one of the largest in the Middle East. Other mineral resources are largely undeveloped.

Other major industrial products are textiles (particularly woven carpets, a traditional export), processed foods, automobiles, electrical machinery, iron and steel, and cement. Large investments in industry in the 1970s made possible by petroleum earnings accelerated development, but problems persist, including a shortage of skilled labour, an inadequate infrastructure, and insufficient raw materials.

More than four-fifths of Iran's electricity is generated from domestic fuels; hydropower provides the remainder. Foundations for a national electrification network were laid in the 1970s, but progress has been slow.

After the revolution in 1979, the Islāmic republic nationalized all major industries, banks, and insurance companies. It committed itself to heavy investment in both the agricultural sector and selected industries, with the ultimate goal of economic independence, but unstable internal conditions and the war with Iraq made economic growth under such conditions impossible until the mid-1990s, when reviving oil production helped to stabilize the nation's finances and free-market initiatives sparked a rise in domestic agricultural and industrial production.

Petroleum and petroleum products account for nearly all of Iran's exports, and major classes of imports include nonelectrical machinery, iron and steel, food, and transport equipment. Iran's major trading partners are Japan, Germany, Italy, France, and the United Kingdom.

Government and social conditions. The constitution of the Islāmic republic of Iran, adopted in 1979, vests supreme political authority in the *rahbar,* the leading theologian in the country. If no individual is able to fill this position, an elected council of three to five theologians assumes the *rahbar*'s functions. The leading theologian (or religious leadership) in Iran appoints the six clerical members of the 12-member Council of Guardians. This council reviews all bills passed by the unicameral Islāmic Consultative Assembly (Majles) to determine both their constitutionality and their conformity to Islām. The Majles has 290 members popularly elected to four-year terms. Executive responsibility in Iran is shared by the president, who is elected to a four-year term by popular vote, and the prime minister, who is nominated by the president and approved by the Majles. Several political parties compete for elective office. The highest judicial power rests with the religious jurists composing the Supreme Court and the High Council of the Judiciary.

Health conditions outside the capital are poor. Many small towns and rural areas suffer from unsanitary conditions and a shortage of medical personnel and facilities. Contagious diseases such as scarlet fever, whooping cough, pulmonary tuberculosis, and typhoid fever are prevalent. The infant mortality rate, formerly a major problem, has fallen below the world average.

Although primary education for five years is compulsory, many rural children never attend school because of either parental objection or a lack of facilities. The secondary-school system in Iran is relatively undeveloped, and it serves for the most part to prepare small numbers of students for university-level education. Rates of literacy have improved greatly; more than three-fourths of Iranians are literate.

The press is supervised by the Islāmic Republic News Agency and is subject to censorship.

Cultural life. Iran has produced many historically renowned poets, including Nezāmī, Ferdowsī, Saʿdī, and Omar Khayyam. The country is also famous for its architecture, especially its mosques. Persian rugs are still admired for their artistry and craftsmanship.

History. Habitation in Iran can be dated to Lower Paleolithic times (*c.* 100,000 BC), but recorded history and civilization began with the Elamites in Khūzestān, *c.* 3000 BC. After 2000 BC Indo-European Iranians appeared and began to coalesce into kingdoms. The Medes flourished about 728–550 BC but were overthrown (550 BC) by the Persians led by Cyrus II the Great. The Persian Achaemenid dynasty established a vast Middle Eastern empire that was the largest of its kind until the coming of the Romans. The invasion of Alexander the Great brought this great empire to an end, but the Macedonian Seleucid state that followed was eclipsed by the native Parthians (247 BC–AD 226), who created a Hellenized Persian empire. Near-incessant clashes with Rome weakened the Parthian empire, and it passed to the Sāsānians, an Iranian people from Fārs, the same area that had spawned the Achaemenid Persians a thousand years before.

The Sāsānians established Zoroastrianism as the official religion. Costly and debilitating wars with the Byzantines left the Sāsānian empire easy prey for conquest by Arab Muslims. This took place by 640. For 850 years Iran was ruled by various Sunnite Islāmic dynasties, including the Ṣaffārids, the Sāmānids, the Ghaznavids, and the Seljuqs. The Ṣafavids, who gained ascendancy in 1502, imposed Shīʿite Islām as Iran's official religion.

The Ṣafavid dynasty (1502–1736) was followed by frequent internal conflict. By 1779 the Qājārs had established their rule, but European politics intervened and seriously affected the future of Iran. The southward extension of the Russian Empire toward the Middle East threatened Britain's empire in the Indian subcontinent, and these two nations engaged in trade and diplomatic rivalries in Iran, turning it into a semicolonial state that was economically controlled by the two European powers. Riots broke out at the turn of the

20th century in protest of the rule of the Qājār monarch Nāṣer od-Dīn Shāh. His son Moẓaffar od-Dīn Shāh, an ineffectual ruler, was forced to convene a national assembly (the Majles) and to grant a constitution in 1906.

In the famine and bankruptcy that followed World War I, a coup in 1921 brought Reza Khan to power. In 1925 he deposed the last Qājār ruler and declared himself shah (styled Reza Shah Pahlavi). He abdicated under British pressure in 1941—owing partly to his close German ties—and his son, Mohammad Reza Shah Pahlavi, ascended the throne. Mohammad embarked on a modernization and Westernization program that alienated many of the country's religious leaders, whose power he restricted. Demonstrations against him occurred in the 1970s, and in 1979 his government collapsed and he fled the country. Ruhollah Khomeini, a Shīʿite ayatollah in exile in Paris, returned to lead the movement that set up an Islāmic republic in 1979.

After the revolution, strict Muslim codes were enacted, and Western influence in Iran was suppressed. In 1980 Iraq launched an invasion of Iran, with devastating effects on the economies of both countries. The Iran-Iraq War became a bloody and expensive stalemate, resulting in numerous casualties. After Khomeini died in 1989, Iran's international isolation lessened. Mohammad Khatami, elected president in 1997, undertook political reforms.

Iran-Contra Affair, U.S. political scandal in which members of the National Security Council (NSC) became involved in secret weapons transactions and other activities that either were prohibited by the U.S. Congress or violated the stated public policy of the government. In early 1985 the head of the NSC, Robert C. McFarlane, undertook the sale of antitank and antiaircraft missiles to Iran in the mistaken belief that such a sale would secure the release of a number of U.S. citizens who were being held captive in Lebanon by Shīʿite terrorist groups loyal to Iran. This and several subsequent weapon sales to Iran in 1986 directly contradicted the U.S. government's publicly stated policy of refusing either to bargain with terrorists or to aid Iran in its war with Iraq, a policy based on the belief that Iran was a sponsor of international terrorism. A portion of the $48 million that Iran paid for the arms was diverted by the NSC and given to the Contras, the U.S.-backed rebels fighting to overthrow the Marxist-oriented Sandinista government of Nicaragua. The monetary transfers were undertaken by NSC staff member Lieutenant Colonel Oliver North with the approval of McFarlane's successor as head of the NSC, Rear Admiral John M. Poindexter. North and his associates also raised private funds for the Contras. These activities violated the Boland Amendment, a law passed by Congress in 1984 that banned direct or indirect U.S. military aid to the Contras.

The NSC's illegal activities came to light in November 1986 and aroused an immediate public uproar. Poindexter and North lost their jobs and were prosecuted, President Ronald Reagan's public image was tarnished, and the United States suffered a serious though temporary loss of credibility as an opponent of terrorism.

Iran-Iraq War (1980–90), prolonged military conflict between Iran and Iraq during the 1980s. The war began on Sept. 22, 1980, when Iraqi armed forces invaded western Iran along the countries' joint border.

The roots of the war lay in a number of territorial and political disputes between Iraq and Iran. Iraq wanted to seize control of the rich oil-producing Iranian border province of Khūzestān. Iraqi President Saddam Hussein wanted to reassert his country's sovereignty over both banks of the Shaṭṭ al-ʿArab, a river formed by the confluence of the Tigris and Euphrates rivers that was historically the border between the two countries. Hussein was also concerned with attempts by Iran's new Islāmic revolutionary government to incite rebellion among Iraq's Shīʿite majority. He decided on a preemptive strike against Iran. By attacking when it did, Iraq took advantage of the apparent disorder of Iran's new government and of the demoralization of Iran's regular armed forces.

In September 1980 the Iraqi army carefully advanced along a broad front into Khūzestān province, taking Iran by surprise. Iraq's troops captured the city of Khorramshahr but failed to take the important oil-refining centre of Ābādān, and by December 1980 the Iraqi offensive had bogged down about 50–75 miles (80–120 km) inside Iran after meeting unexpectedly strong Iranian resistance. Iran's counterattacks using the revolutionary militia (Revolutionary Guards) to bolster its regular armed forces began to compel the Iraqis to give ground in 1981. The Iranians first pushed the Iraqis back across Iran's Kārūn River and then recaptured Khorramshahr in 1982. Later that year Iraq voluntarily withdrew its forces from all captured Iranian territory and began seeking a peace agreement with Iran. But under the leadership of Ruhollah Khomeini, who bore a strong personal animosity toward President Hussein, Iran remained intransigent and continued the war in an effort to overthrow Hussein. Iraq's defenses solidified once its troops were defending their own soil, and the war settled down into a stalemate with a static, entrenched front running just inside and along Iraq's border. Iran repeatedly launched fruitless infantry attacks, using human assault waves composed partly of untrained conscripts, which were repelled by the superior firepower and air power of the Iraqis. Both nations engaged in sporadic air and missile attacks against each other's cities and military and oil installations. They also attacked each other's oil-tanker shipping in the Persian Gulf, and Iran's attacks on Kuwait's and other gulf states' tankers prompted the United States and several western European nations to station warships in the Persian Gulf to ensure the flow of oil to the rest of the world.

The oil-exporting capacity of both nations was severely reduced at various times owing to air strikes and to pipeline shutoffs, and the consequent reduction in their income and foreign-currency earnings brought the countries' massive economic-development programs to a near standstill. Iraq's war effort was openly financed by Saudi Arabia and other moderate Arab states and was tacitly supported by the United States and the Soviet Union, while Iran's only major allies were Syria and Libya. Iraq continued to sue for peace in the mid-1980s, but its international reputation was damaged by reports that it had made use of lethal chemical weapons against Iranian troops. In the mid-1980s the military stalemate continued, but in August 1988 Iran's deteriorating economy and recent Iraqi gains on the battlefield compelled Iran to accept a United Nations-mediated cease-fire that it had previously resisted.

In August–September 1990, while Iraq was preoccupied with its invasion of Kuwait, Iraq and Iran restored diplomatic relations, and Iraq agreed to Iranian terms for the settlement of the war: the withdrawal of Iraqi troops from occupied Iranian territory, a division of sovereignty over the Shaṭṭ al-ʿArab waterway, and a prisoner-of-war exchange. The final exchange of prisoners was in 2003.

Iranian languages, subgroup of the Indo-Iranian branch of the Indo-European language family. The subgroup's languages are spoken in Iran, Afghanistan, Tajikistan, and parts of Iraq, Turkey, Pakistan, and scattered areas of the Caucasus Mountains.

Old Iranian, which is closely related to Sanskrit, the ancient Indo-Aryan language, is known from the Avesta (the sacred book of Zoroastrianism) and from Old Persian cuneiform inscriptions of the Achaemenid kings. The Middle Iranian stage (3rd century BC to 8th–10th century AD) was characterized by a significant simplification of the verbal system and, in some areas, by reductions in noun inflection as well. Among the most important representatives of Middle Iranian are Parthian, Pahlavi, and Sogdian. Major modern Iranian languages are Persian, the most widespread; the Kurdish dialects; Pashto, an official language of Afghanistan; and Tajik, spoken in Tajikistan.

All Iranian languages currently spoken show a simplification of the earlier sound systems and a preference for the use of auxiliary verbs in place of the complex verb conjugations of the earlier Iranian languages.

Iranian literature: *see* Persian literature.

Irapuato, city, west-central Guanajuato *estado* ("state"), north-central Mexico. Situated in the fertile Bajío, a valley of the central plateau, the city lies along the Irapuato River, a tributary of the Lerma River, at 5,656 feet (1,724 m) above sea level. It is south-southwest of Guanajuato city, the state capital.

Irapuato was founded in 1547; an Indian hospital and chapel (La Misericordia) were later built there. The population was active in Mexico's colonial and revolutionary wars. Using irrigation waters from the upper Lerma River, Irapuato is an important agricultural and livestock-raising centre and is the state's second largest city. It is famed for its strawberries; corn (maize), wheat, beans, and chickpeas also thrive in the cool, dry climate, and cattle and pigs are raised. A branch railroad line and road join the main Mexico City–Ciudad Juárez railroad and highway at Irapuato. Pop. (2000) 319,148.

Consult the INDEX *first*

Iraq, officially REPUBLIC OF IRAQ, Arabic AL-ʿIRĀQ, or AL-JUMHŪRĪYAH AL-ʿIRĀQĪYAH, Middle Eastern country situated at the northwest end of the Persian Gulf, covering an area of 167,975 square miles (435,052 square km), including 357 square miles (924 square km) of inland water. The capital is Baghdad. Extending about 865 miles (1,390 km) from north to south and 775 miles (1,250 km) from east to west at its widest point, Iraq is bordered on the north by Turkey, on the east by Iran, on the southeast by the Persian Gulf, on the south by Kuwait and Saudi Arabia, and on the west by Syria and Jordan. Pop. (2003 est.) 24,683,000.

A brief treatment of Iraq follows. For full treatment, *see* MACROPAEDIA: Iraq.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Iraq consists primarily of lowlands seldom exceeding 1,000 feet (300 m) in elevation. Less than 15 percent of the country rises above 1,500 feet (450 m). The country can be divided into four major physiographic regions: (1) the alluvial plains of the Tigris-Euphrates river basin in central and southeastern Iraq, (2) Al-Jazīrah, an upland region in the north between the Tigris and the Euphrates rivers, (3) deserts in the west and south, and (4) highlands, including the mountainous region known as Kurdistan, in the northeast. The alluvial plains of the Tigris and Euphrates

Iraq

rivers cover almost one-third of the country and are characterized by low relief, poor natural drainage, and, traditionally, extensive marshlands. North of the alluvial plains is Al-Jazīrah, an arid plateau. The Sinjār Mountains, located in this region, rise to more than 4,900 feet (1,500 m). The whole of western and southern Iraq is a vast desert region, covering about two-fifths of the country. The western desert is called Wādiyah and rises to more than 1,600 feet (485 m). The southern desert in the west has wadis, ridges, and depressions. The southern desert in the east is sandy, with a covering of scrub vegetation. The northeastern highlands, including the mountainous region known as Kurdistan, occupy about one-fifth of the country and consist mostly of a transition zone between mountain and lowland.

Precipitation patterns change over the same general northwest-to-southeast orientation as the country's physiographic regions, with the Tigris-Euphrates basin receiving roughly 16 inches (400 mm) of annual rainfall and the southwestern desert less than 4 inches (100 mm). The northeastern highlands receive as much as 40 inches (1,000 mm) at the highest elevations. The climate of the Tigris-Euphrates basin is overwhelmingly hot in summer and humid near the rivers.

Unrestricted grazing and intensive cutting have reduced the country's forest to less than one-twentieth of the land area, much of it along the rivers. Southwest of the highlands there is steppe vegetation of perennial bushes and low shrubs, changing to thorns and other salt-resistant plants in drier places. Below Al-Qurnah in the lower river basin area, the marshland contains reeds, tall grasses, and sedge.

Iraq has the world's second largest proven reserves of petroleum and was the world's second largest oil exporter in 1980, before the war with Iran and the First Persian Gulf War (1990–91), which damaged production. Although there are petroleum reserves near the Persian Gulf, the major reserves are located in the northern part of the country. Iraq also has substantial reserves of natural gas.

The people. Iraq's population, which is overwhelmingly Muslim, consists of three main groups: Arab Shī'ites, Arab Sunnites, and Kurdish Sunnites. The Arab Shī'ites make up about three-fifths of the total population and live mainly in the south and southeastern parts of the country. Arab Sunnites account for about one-third of the population and are concentrated in the central area of eastern Iraq, around Baghdad. The Kurds, who are Sunnite Muslims and speak a language related to Persian, live in the north and northeast and make up some one-fifth of the population.

Iraq is the only major Arab country in the Middle East with a Shī'ite majority, but it is the Arab Sunnites who dominate the government. The country's official language is Arabic.

The birth rate is high by world standards, while the death rate is comparatively low. Almost 45 percent of the population is under 15 years of age. Approximately two-thirds of the Iraqi population lives in cities and towns.

The economy. Iraq's agrarian economy industrialized rapidly after the 1958 revolution. By 1980 a large and centrally planned economy dominated by the state had developed. Oil production is the mainstay of the economy. The economy was devastated by a series of wars beginning in 1980, and the gross domestic product (GDP) plunged over the next quarter century, particularly during the 1990s when the country was under a strict United Nations trade embargo.

In the aftermath of the Second Persian Gulf War (2003), sanctions were lifted and civil administrators appointed by the United States took over Iraq's public sector. Many enterprises formerly owned by the state were privatized. By that time, however, the economy was in shambles, and the private sector was largely inexperienced. Moreover, oil production and economic development had both declined, the economy faced a huge foreign debt, there was a high rate of inflation, the oil sector had fallen behind the latest technology, and unemployment was high.

About one-eighth of Iraq's total area is arable, and another one-tenth is permanent pasture. Rain-fed irrigation dominates in the north, where winter crops of wheat and barley are cultivated. Irrigation is necessary in the valleys of the Tigris and Euphrates rivers. Throughout the country, careful management of the soils has been required to combat salinity, but the willingness of the upstream states, Turkey and Syria, to equitably divide the water of the two rivers has been vital to the maintenance of sufficient volume for irrigation. Agriculture generally accounts for about one-fourth of GDP. Major crops include barley, wheat, rice, vegetables, corn (maize), millet, sugarcane, sugar beets, oilseeds, fruit, fodder, tobacco, cotton, and dates. Lumbering and fishing contribute little to the economy, and most products are consumed locally.

Oil production contributes the largest single portion to GDP and constitutes almost all of Iraq's foreign exchange. Oil was first discovered in Iraq in 1927 near Kirkūk by a foreign-owned company, but the petroleum industry was nationalized in 1972, as were all foreign-owned oil companies by 1975. During the war with Iran, production and distribution facilities were badly damaged, and, after Iraq's invasion of Kuwait, the UN embargo on Iraq halted all exports until 1997. Oil production again fell following the Second Persian Gulf War and, thereafter, recovered only slowly. Iraq produces significant amounts of phosphates as well as other minerals, including small quantities of salt, steel, and construction stone.

There is both light and heavy manufacturing, but both sectors have developed irregularly. Iraq produces electrical goods, telephone cables, and tires. Petrochemical products for export also were expanded and diversified to include liquefied natural gas, bitumen, detergents, and a range of fertilizers.

The Central Bank of Iraq (founded in 1947) has the sole right to issue the dinar, the national currency. The Rafidain Bank (1941) and the Rashid Bank (1988) are the two state-owned commercial banks. There are other state-owned banks: the Agricultural Co-operative Bank (1936), the Industrial Bank (1940), and the Real Estate Bank (1949). Private banks were granted limited status in 1991; private banking was liberalized in 2003. The Baghdad Stock Exchange opened in 1992.

Except for oil sales and humanitarian needs, international trade largely halted during the 1991–2003 embargo. Major trade partners include France, the United States, Australia, and Italy. Services have traditionally formed a large portion of GDP; nonreligious tourism contributes little to the economy. Transportation is good by the standards of the region, with road, rail, air, and water transport being available and generally convenient.

Government and social conditions. Following the Second Persian Gulf War, the Iraqi government was in a period of transition, from one dominated by a police state at whose head was a charismatic autocrat to a government more representative of Iraq's diverse ethnic and religious constituency. In June 2004 an interim government was established. An interim constitution called for the creation of a unicameral legislature, with a strong prime minister, and the establishment of an independent judiciary. The duties of the president would be largely ceremonial. Elections were to be based on universal suffrage, and both women and men would be eligible to stand for election.

Primary and secondary education in Iraq is free. In theory all children are required to attend primary school, which lasts for six years. In practice, however, many rural children never receive education, because of a lack of facilities. Primary graduates may enroll in a six-year program of secondary education, consisting of intermediate-secondary and intermediate-preparatory levels. Iraq's illiteracy rate is relatively high for the Middle East and prompted the government to launch an anti-illiteracy campaign in the late 1970s.

Under the Ba'th regime, the press was state-owned, and publications were heavily censored. Since the 2003 conflict, a variety of new publications—newspapers, journals, and magazines—have been established, espousing a variety of political and social views.

History. Long known to the world as Mesopotamia, Iraq possesses a history reaching back to the very origins of civilization, for it was here in the fertile valley of the Tigris and Euphrates rivers that one of the world's first urban, literate civilizations was born. Possibly as early as 3500 BC the Sumerians appeared in the delta region of the two rivers. They developed cuneiform writing and grew into a confederation of city-states that included Ur, Uruk, Lagash, and Kish. These cities were forged into an empire under the Akkadian leader Sargon about 2350 BC. As the Akkadians declined, two new centres of power developed: the Babylonians and the Assyrians. By the 7th century BC the Assyrians had created a vast empire covering most of the ancient Middle East. This great empire came to an end in 609 BC. Another resurgence of Babylon followed under the Chaldeans, but all of Mesopotamia fell to the Persians about 550 BC.

Alexander the Great conquered the Persians in 330 BC; after his death in 323 the region was ruled by the Seleucid dynasty until 141 BC. Mesopotamia later became a battleground first between the Parthians and the Romans, then between the Sāsānians and the Byzantines. The constant warfare left the Sāsānians easy prey for the invading Arab Muslims in the 7th century AD. Iraq was again a battleground as rival contenders fought for the caliphate.

In the 8th century Baghdad became the capital of the 'Abbāsid caliphate and the centre of the Muslim world. Both Baghdad and the 'Abbāsid caliphate were destroyed by the Mongols in 1258.

The Ottoman Empire took control of Iraq in the 16th century and held it until 1917. These centuries were marked by insurrections from within and invasions, particularly by the Iranians, from without. European trading began in the Persian Gulf area in the mid-17th century and expanded during the 19th. An Ot-

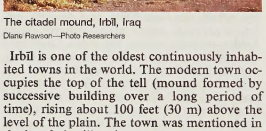
toman railroad concession to the Germans in 1899 alarmed the British, who invaded Iraq during World War I. Under British protection a monarchy was established in 1921, a constitution signed in 1925, and full independence achieved in 1932.

Iraq's pro-German stance during World War II led to a British occupation of the country from 1941 to 1945. Political unrest was endemic after the war. A revolution ended the monarchy in 1958, and a succession of military coups went on until 1968, when the socialist Ba'th Party took control. The Ba'thist leader Saddam Hussein ruled Iraq from the 1970s and used the extensive revenues Iraq earned from its petroleum exports to industrialize the country under his totalitarian rule. In the 1980s Iraq became embroiled in a stalemated war with Iran after having invaded that country in 1980. The Iran-Iraq War was halted by a cease-fire in 1988, but in 1990 Hussein ordered the invasion of neighbouring Kuwait, an act that precipitated the First Persian Gulf War (1990–91), in which an anti-Iraq coalition led by the United States and supported by the United Nations (UN) pushed Iraq's forces out of Kuwait. The terms of peace forbade Iraq from having biological, chemical, or nuclear weapons, and the UN enforced a trade embargo pending Iraq's compliance with arms inspection. Friction between Iraq and the international community continued, culminating in the Second Persian Gulf War (2003).

Iraq-Iran War: *see* Iran-Iraq War.

'Irāqī, in full FAKHR AD-DĪN IBRĀHĪM 'IRĀQĪ HAMADĀNĪ (b. *c.* 1211, Hamadān, Iran—d. November 1289, Damascus, Syria), one of the most outstanding poets of 13th-century Persia.

Very little is known about 'Irāqī's early life. There is evidence that he abandoned a teaching career to follow a group of wandering Ṣūfīs, or mystics, as far as India in search of higher mystical knowledge. After studying for 25 years with his master, Bahā' ad-Dīn Zakariyyā, in Multān, he journeyed to the Hejaz and to the city of Konya in Anatolia. At Konya he wrote what is considered to be his greatest work, *Kitāb al-lamaʿāt* ("The Book of Light Beams"), a profound work in both poetry and prose inspired by the mystical philosopher Ibn al-'Arabī (d. 1240). 'Irāqī later went to Egypt and finally to Syria. A great poet of mystical love, he also is famous for his *Divān* (collected poems) and his *'Ushshāqnāmeh* (Eng. trans., *The Song of the Lovers: 'Ushshāqnāma,* edited and translated by A.J. Arberry, 1939), a mystical work written in *mašnavī* (rhymed couplets) interspersed with ghazels (lyrics).



Irazú, Mount, Spanish MONTE IRAZÚ, active volcano in the Cordillera Central, east-central Costa Rica. The highest mountain in the Cordillera Central, Irazú reaches an elevation of 11,260 feet (3,432 m). It is a popular ascent for tourists, as its cone offers views of both the Atlantic and Pacific coasts of Costa Rica. The crater is linked by paved road to Cartago. The volcano's eruptions of 1963–65 produced ash that dammed a small river, flooding Cartago and causing serious damage to coffee crops. The eruptions also destroyed pastureland and temporarily produced highly acidic rains.

Crater of Mount Irazú in the Cordillera Central, Costa Rica

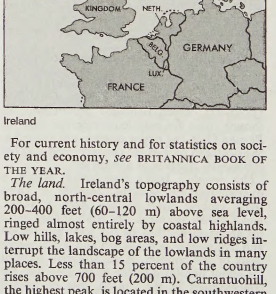
Irbid, town, northern Jordan. The town is built on successive Early Bronze Age settlements and was possibly the biblical Beth Arbel and the Arbila of the Decapolis, a Hellenistic league of the 1st century BC through the 2nd century AD. Modern Irbid is one of Jordan's industrial areas, as well as an agricultural centre for Jordan's most fertile region. The many springs in the area, in addition to the Yarmūk River, provide water for the irrigation of crops. Yarmūk University was founded in the town in 1976. Its languages of instruction are both Arabic and English, with faculties in arts, sciences, economics, education, and engineering. Pop. (1994) 208,329.

Irbīl, also spelled ARBĪL, or ERBĪL, Assyrian ARBA-ILU, Greek ARBELA, ancient town, northern Iraq. It is situated 48 miles (77 km) east of Mosul in the foothills of the mountains that rise to the east. It is a trade centre for agricultural produce. A rail terminus, it is also linked by roads to Turkey, Syria, and Iran.

The citadel mound, Irbīl, Iraq
Diane Rawson—Photo Researchers

Irbīl is one of the oldest continuously inhabited towns in the world. The modern town occupies the top of the tell (mound formed by successive building over a long period of time), rising about 100 feet (30 m) above the level of the plain. The town was mentioned in the late 3rd-millennium-BC correspondence of Shulgi, king of Ur, as Urbillum, and later it was known as Arba-ilu by the Assyrians. It was a centre of communication in the Assyrian empire and long remained a crossroads of caravan routes. In the Battle of Gaugamela, also known as the Battle of Arbela, fought near the town in 331 BC, Alexander the Great decisively defeated Darius III, opening the way for his conquest of Persia. The town became Christian at an early date, and, later (AD 340), Christians were persecuted there. The Muslim conquest in the 7th century did not prevent Irbīl from remaining an active centre of Christianity and the seat of a bishopric. Muẓaffar ad-Dīn, brother-in-law of Saladin, made Irbīl his capital from 1190 until 1232 and constructed several buildings that can still be seen at the foot of the upper town. Irbīl lost its major importance to Mosul in the 13th century but remained a leading town in the region. The population is still a mixture of Christians and Sunnite Muslim Kurds. The University of Ṣalāḥ ad-Dīn in Irbīl was founded in 1968; there is also a technical institute (founded 1976) devoted to agriculture. The crops grown in the surrounding area include sesame, corn (maize), millet, and fruit. Pop. (2003 est.) 850,000.

Iredell, James (b. Oct. 5, 1751, Lewes, Sussex, Eng.—d. Oct. 20, 1799, Edenton, N.C., U.S.), associate justice of the United States Supreme Court (1790–99).



At the age of 17 Iredell was appointed comptroller of the customhouse at Edenton, N.C., to which his father, formerly a Bristol merchant, had migrated. He studied law and became active in the American cause. Although hopeful as late as June 1776 for a reconciliation with Britain, he worked as one of the commissioners to draft and revise the laws of the new state of North Carolina. He served briefly as a superior-court judge and as state attorney general and, in 1787, was charged by the legislature to codify the state's statutes; "Iredell's Revisal" appeared in 1791.

He was a leader of the North Carolina Federalists in supporting ratification of the Constitution, and his letters in its defense (published over the name Marcus) are said to have prompted President George Washington to appoint him to the U.S. Supreme Court. He was the original court's youngest member.

Iredell's opinion in *Calder* v. *Bull* (1798) helped establish the principle of judicial review five years before it was actually tested in *Marbury* v. *Madison.* He is, however, remembered primarily for his dissents, most notably that in *Chisholm* v. *Georgia* (1793), which maintained that an action of assumpsit could lie against a state only by authority of the Constitution, thus lending weight to the campaign for the 11th Amendment.

Ireland, Irish ÉIRE, country occupying the greater part of an island lying to the west of Great Britain. At its farthest extent, Ireland is about 302 miles (486 km) long from north to south and about 171 miles (275 km) from east to west. Ireland's only neighbour is Northern Ireland of the United Kingdom, which occupies the northeastern portion of the island. The remainder of Ireland's boundary consists of coastline, with the Atlantic Ocean to the north, west, and south, and the Irish Sea and St. George's Channel separating it from Great Britain to the east. The capital is Dublin. Area 27,137 square miles (70,285 square km). Pop. (2003 est.) 3,917,203.

A brief treatment of Ireland follows. For full treatment, *see* MACROPAEDIA: Ireland.

Ireland

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Ireland's topography consists of broad, north-central lowlands averaging 200–400 feet (60–120 m) above sea level, ringed almost entirely by coastal highlands. Low hills, lakes, bog areas, and low ridges interrupt the landscape of the lowlands in many places. Less than 15 percent of the country rises above 700 feet (200 m). Carrantuohill, the highest peak, is located in the southwestern highlands and reaches only 3,414 feet (1,040 m) above sea level. The only break in the coastal mountain fringe extends northward from Dublin along the eastern coast. The island's western coast is heavily indented where the mountains of Donegal, Mayo, and Kerry thrust out into the Atlantic Ocean and are there separated by deep, wide-mouthed bays.

The Shannon, the country's major river, drains a wide area of the central lowlands, forming a series of lakes as it flows sluggishly south-southwestward along 161 miles (259 km) of gentle gradient from the plateau country near Sligo Bay to tidewater level at Limerick.

Ireland's climate is especially mild, with Dublin's temperatures averaging more than 40° F (5° C) in January and February and less than 60° F (15° C) in July and August. No part of the country is more than 70 miles (110 km) from the sea, and the warm drifting waters of the Gulf Stream moderate temperatures uniformly throughout the island. The combined effects of high precipitation rates, which range from 100 inches (2,500 mm) annually in the western and southwestern highlands to 30 inches (750 mm) at Dublin in the northeast, and cool year-round temperatures result in extremely humid conditions. The country's general moistness and low evaporation have resulted in large peat, or turf, deposits. Less than one-eighth of Ireland's land area is considered arable, but much of that is highly fertile, and ample grasslands support a substantial livestock population. Less than 5 percent of the country is forested, and there is little indigenous wildlife.

Ireland is not rich in mineral resources, although it does possess minable reserves of lead, zinc, and silver. Its energy resources consist largely of limited reserves of petroleum and natural gas. Peat was an important source of energy during the 20th century; however by the century's end it had largely been replaced by natural gas and by coal and oil imports.

The people. Although Ireland has been invaded and colonized within historic times by Celts, Norsemen, Normans, English, and Scots, racial and ethnic distinctions are virtually nonexistent in the republic today.

Roughly 90 percent of the population of Ireland is Roman Catholic. Other religious groups include Church of Ireland Anglicans, Presbyterians, Methodists, and Jews. The constitution recognizes Irish as the first official language and English as the second. English is universally spoken, however, and taught in all the schools.

The birth and death rates are comparable to those of other nearby European countries. Historically, emigration from Ireland greatly exceeded immigration. However, as the country experienced economic growth in the 1990s, this pattern was reversed. The number of Irish-born people living outside their native land is thought to approximate half the population of the republic. Almost three-fifths of the total population is urban.

Economy. Ireland has a mixed market economy largely based on agriculture, chemical industries, high technology, and services. Economic growth declined in the early 1980s but then grew slowly in the mid-1980s, though unemployment was widespread. During the 1990s, however, Ireland had a booming economy, owing in large part to the growth of its high technology sector, prompting analysts to label the country the "Celtic Tiger." Its unemployment rate dropped to historically low levels, and the Irish economy grew at a pace more than double that of most advanced industrial countries.

Agriculture employs about one-tenth of the workforce and accounts for approximately one-tenth of the GNP. Ireland's accession to the European Economic Community (EEC; now the European Community in the European Union [EU]) in 1973 provided a large market for agricultural products. Farming incomes have been adversely affected by rising production costs. Although the Irish government has intervened with substantial public aid and regulation, agricultural employment has declined. Most of the gross agricultural output consists of livestock and livestock products, particularly cattle. Other important farm products include cereals, poultry and eggs, sugar beets, and potatoes.

State reforestation efforts since World War II have had some success. The fishing industry remains relatively undeveloped despite substantial resources off the island's shores.

Mineral exploration from 1960 led to the discovery and development of several valuable mineral deposits in Ireland. Europe's largest lead-zinc mines opened at Navan in 1977. Other mineral products include gypsum, barite, dolomite, limestone flour, and aggregates. Some oil and natural gas are extracted from offshore fields in the Atlantic Ocean south of County Cork.

Mining, manufacturing, construction, and public utilities together account for roughly two-fifths of the GNP and employ almost one-fourth of the workforce. The Industrial Development Authority actively promotes industrial expansion, often recruiting foreign investment, especially computer and electronics companies. Other important industries include chemicals, metals and engineering, food products, textiles, and tobacco. Services account for as much as one-third of the GNP and employ a comparable fraction of the workforce. Electricity is largely generated from imported fuels.

Tourism is among the largest items in the country's net invisible earnings. Most of the tourists come from Great Britain, Northern Ireland, the United States, and western Europe. A tradition of strong union spirit exists in Ireland, and approximately half of the workforce belongs to trade unions, the vast majority of which are members of the Irish Congress of Trade Unions.

In 1979 Ireland was admitted to the European Monetary System. Voters overwhelmingly approved the Treaty on European Union in 1992, which led to Ireland's adoption of the euro, the EU's single currency, in 1999.

Ireland's net balance of trade is positive. Major import commodities include machinery and transport equipment, chemicals, and mineral fuels. Major export commodities include office machinery, beef, electrical machinery, dairy products, textiles, and live cattle. Investment in the high technology sector reaped dividends. By the beginning of the 21st century Ireland was one of the world's leading exporters of computer software. About half of its exports are directed toward the EU, with roughly one-third going to the United Kingdom.

Government and social conditions. The Irish republic is a parliamentary democracy. According to the country's constitution, which was adopted by plebiscite in 1937, the president of Ireland is head of state and first citizen. He is elected by direct vote of the people for a term of seven years and is eligible for reelection for a second term. The president generally acts on the advice of a 15-member cabinet, or government, headed by the *taoiseach* (prime minister), but he may act in consultation with an advisory Council of State in the exercise of certain functions. When so advised by the prime minister, he may summon and dissolve Parliament. In certain circumstances he may submit a bill passed by Parliament to the people in a referendum.

There are two houses of the Oireachtas—the Dáil (House of Representatives) and the Seanad (Senate). The 166 members of the Dáil are elected by adult suffrage in a secret ballot held at least every five years. The Seanad's 60 members are elected by various vocational, economic, and cultural constituencies, including the prime minister, who chooses 11. The Dáil initiates legislation; the Seanad can only delay. There are three major political parties in the country: Fianna Fáil, Fine Gael, and the Labour Party.

Ireland's Pay Related Social Insurance provides widows' and orphans' pensions, unemployment and disability benefits, deserted wives' allowances, and old-age pensions.

Charges for public health services vary according to income level. Health conditions in Ireland are generally good; the country has a high number of doctors and hospital beds per capita, a low infant mortality rate, and a relatively long life expectancy of 74 years for males and nearly 80 years for females.

Education in Ireland is free and compulsory for children between the ages of 6 and 15. Primary education lasts six years. Graduates enroll in the secondary-school system and may earn an Intermediate Certificate at 15 or 16 years of age and a Learning Certificate at 17 or 18. Secondary schools are privately owned. Both primary and secondary schools are organized almost entirely by religious denominations. Of particular note among Ireland's institutions of higher education is the University of Dublin (also called Trinity College).

Ireland's constitution guarantees freedom of the press. A Censorship of Publications Act, however, forbids the publication of matter that undermines Roman Catholic morality.

Cultural life. Although a few highly successful novels and plays have been written in Irish, the language has little prospect of producing a modern literature of significant proportions, whereas literature in English by Irish authors has profoundly influenced the whole of English literature. The Irish language steadily lost ground in Ireland during the 18th and 19th centuries, but it never ceased to exert a strong, if subtle, influence on the English-speaking culture that was supplanting it. Many of the traditional modes of thought and expression characteristic of the Irish language were gradually absorbed into English, enriching the imaginations and expression of those who wrote and spoke it. It is noteworthy that so small a country should have nurtured such (English-speaking) literary giants as Jonathan Swift, Edmund Burke, George Augustus Moore, William Butler Yeats, Oscar Wilde, George Bernard Shaw, James Joyce, and Samuel Beckett.

History. Human settlement in Ireland was begun sometime around 6000 BC by hunters and fishers on the eastern coast. Celtic penetration dates from the Iron Age, perhaps *c.* 300 BC. In Celtic Ireland a large number of small kingdoms were loosely tied to the larger kingdoms—called the Five Fifths—of Ulster, Meath, Leinster, Munster, and Connaught, dating from the beginning of the Christian era.

St. Patrick arrived in Ireland in the 5th century and is credited with Christianizing the entire country. An extensive monastic life developed that shaped the Irish church. Irish missionaries were sent out over all of Europe.

The Norse invaded Ireland in 795. Norse domination extended into Annagassan, Dublin, Waterford, and Limerick, but it reached an end in 1014, when the Norse were defeated in battle by Brian Boru, Ireland's High King.

Effects of the ecclesiastical-reform movement taking place in Europe during the 11th and 12th centuries reached Ireland and resulted in the establishment of church administration by diocese, whose boundaries generally matched those of existing kingdoms. The English king Henry II, encouraged by Popes Adrian IV and Alexander III, invaded Ireland in 1171, proclaimed himself overlord of the entire island, and secured recognition of his actions from church leaders. The independence of Gaelic Ireland had come to an end.

The Anglo-Norman settlers tended to assimilate into the Gaelic Irish culture, and, by the 15th century, only the Pale, a small region of Ireland surrounding Dublin, remained firmly loyal to the English crown. The real rulers of Ireland were the earls of Kildare, who were officially lords deputy for the English. This arrangement continued into the 16th century until the English Reformation brought new pressures upon Ireland to conform to the ec-

clesiastical acts of Parliament. For 150 years Ireland exported soldiers and churchmen to continental Catholic countries; at the same time there was an influx of Scottish and English migrants onto lands vacated by fleeing Catholic refugees.

By 1691 the Protestant Ascendancy, spurred by deposed King James II's defeat at the Battle of the Boyne, was complete. Anglicans, representing only about one-tenth of the population, gained control of land and political office, excluding not only Catholics but also Presbyterians and Nonconformists from basic civil rights.

During the next century, Irish Protestants began to agitate for lessened English control, and some civil rights were restored to Catholics. A revolt in 1798 finally forced British action and on Jan. 1, 1801, the United Kingdom of Great Britain and Ireland came into existence. The union was not popular in Ireland, however, and the breach between Catholics and Protestants widened. The negative economic consequences of the union were exacerbated by the disastrous famine of 1846–51, and over 2,000,000 people emigrated.

After the famine, a revolutionary movement known as Fenianism sprang up. Its efforts resulted in some Parliamentary reforms. Agitation continued, but several home rule measures failed. In 1912 another home rule measure was near passage when the Ulster Unionists resisted the measure and prepared for civil war. Despite the intervention of World War I fighting broke out within Ireland, and an Irish provisional government was proclaimed in 1916. In 1920 the Government of Ireland Act was adopted, creating a northern and southern Ireland. In 1921 southern Ireland became the Irish Free State. A new constitution was ratified in 1937 that ended the power of the crown and changed the nation's title from the Irish Free State to Éire, though Great Britain continued to formally assert that Ireland had dominion status.

Ireland was neutral during World War II, despite German bombing campaigns in Dublin and pressure from the United States. After the war, Britain formally recognized the independence of Ireland, though it refused to cede Northern Ireland without the consent of the Parliament of Northern Ireland.

In 1973 Ireland joined the EEC. Throughout the 1970s and early '80s, Ireland's economy stagnated, owing in part to the world oil crisis of the 1970s. With a young workforce and the transfer of development funds from the European Community, by the 1990s the country's economy was vibrant, particularly in the high technology sector.

At the end of the 20th century, there was considerable discussion about reforming Ireland's strict social laws. Voters narrowly approved the legalization of divorce in 1995. Although the country did not legalize abortion, it passed legislation that allowed Irish citizens to obtain abortions abroad.

Ireland's prime minister, Bertie Ahern, played a pivotal role in negotiating a peace agreement in Northern Ireland, which was approved by more than 90 percent of Ireland's voters in 1998.

Ireland, Church of, independent Anglican church within both Ireland and Northern Ireland. It traces its episcopal succession from the pre-Reformation church in Ireland.

Christianity was probably known in Ireland before the arrival of St. Patrick in the late 5th century. The church was organized around the monasteries, which became centres of learning and the source of numerous monks who evangelized the Continent in the 7th century. Authority rested with the abbots, and the bishops were limited to their pastoral duties.

The early Irish church was independent of Rome, clung to its own usages, and maintained until 704 its method of calculating the date of Easter. As the result of foreign invasion and poor internal organization, the church gradually declined and was absorbed by the Roman church through the see of Canterbury in England. Obedience to Rome finally was accepted by the 12th century. The liturgy of the English church replaced that of the Irish church and English ecclesiastics were appointed to important positions in the Irish church throughout the Middle Ages.

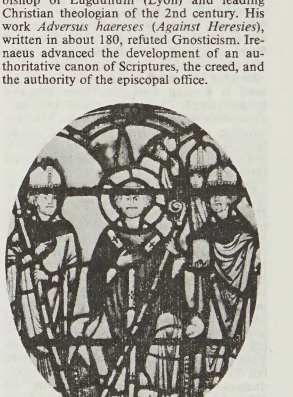
The Reformation began with the passage in 1537 of the Irish Supremacy Act, which asserted the English king's supremacy in the Irish church. It was a superficial Reformation, however. The dissolution of the monasteries was only partial, and liturgical changes were few. Moreover, no attempt was made to win the Irish people to Reformation principles, nor were the differences of religious outlook of the English sovereigns made known to the Irish. The majority of the Irish remained faithful to the Roman Catholic Church. Nevertheless, the (Anglican) Church of Ireland was the established church, and the privileged position of its minority continued to irritate many people.

The Act of Union of 1800 united the parliaments and churches of England and Ireland. The increasing discontent that had confronted the church escalated further in the 1830s with the tithe war, so-called because the church drew its tithes largely from Roman Catholic tenant farmers. The census of 1861 showed that less than one-eighth of the population belonged to the Irish church, while four-fifths were Roman Catholic. In response to this situation the Irish Church Act of Disestablishment became law on Jan. 1, 1871.

The Church of Ireland was brought to rely on its own resources. It reorganized at a convention in 1870, which produced a new constitution that made the General Synod—a body consisting of the bishops and clerical and lay representatives of the several dioceses—the supreme governing arm of the church. Local affairs are managed by diocesan synods. Bishops are elected by an electoral college representative of all dioceses of the province in which the vacancy occurred. The seats of the archbishops are in Armagh and Dublin.

Ireland, John (Nicholson) (b. August 13, 1879, Bowdon, Cheshire, Eng.—d. June 12, 1962, Washington, Sussex), English composer known for his songs and his programmatic orchestral works.

Ireland studied at the Royal College of Music in London, where he later taught composition. He was much drawn to the mysticism and fantasy in the writings of Arthur Machen; some of his compositions, such as *The Forgotten Rite* (1913; for orchestra), were inspired by Machen. His songs, which include settings of poems of Shakespeare, A.E. Housman, and Rupert Brooke, are noted for their subtle evocation of mood. His works include *A London Overture,* the piano suite *Sarnia* (1940–41), a piano concerto, and the *London Pieces* (1917–20), for piano.



Ireland, John, also called JOHANNES DE IRLANDIA (*c.* 1435—d. *c.* 1500), Scottish writer, theologian, and diplomatist, whose treatise *The Meroure of Wyssdome* is the earliest extant example of original Scots prose.

Ireland left the University of St. Andrews without taking a degree and attended the University of Paris (licentiate, 1460). He lived in France until 1483–84, becoming a doctor of theology and being sent on several diplomatic missions by Louis XI. On Louis's death he returned to Scotland and became private chaplain to James III. He was rector of Yarrow and sat in the Scottish parliament. When James died in 1488, he continued as chaplain to the young James IV, and wrote for his edification, in 1490, the work which is his chief claim to fame, *The Meroure of Wyssdome,* a hortatory and pious treatise on the value of wisdom to temporal rulers.

Ireland, John (b. Sept. 11, 1838, Burnchurch, County Kilkenny, Ire.—d. Sept. 25, 1918, St. Paul, Minn., U.S.), first Roman Catholic archbishop of St. Paul. He promoted the integration of immigrant parishes into the life of the U.S. church (and society as a whole)—in opposition to the tendency of many ethnic groups to preserve their European-style churches, with priests of their own nationalities.

Ireland emigrated to the United States in 1849 with his parents, who settled at St. Paul, Minnesota Territory. He was ordained priest at St. Paul in 1861 and became chaplain for the 5th Minnesota Volunteer Infantry during the Civil War. Ireland was appointed bishop-coadjutor in 1875 and then bishop (1884) and archbishop (1888). Ireland's liberal views gave him a reputation outside of the church. Many Europeans considered him the chief U.S. Catholic intellectual. His ideas on social reform and the relation of the church to a democratic society were prophetic. He also encouraged the founding of Catholic colonies in the northwest. In 1889 he helped establish the Catholic University of America, in Washington, D.C., and founded (1894) St. Paul Seminary. He published *The Church and Modern Society* in 1896.

Irenaeus, SAINT (b. *c.* 120/140, Asia Minor—d. *c.* 200/203, probably Lyon; Western feast day June 28; Eastern feast day August 23), bishop of Lugdunum (Lyon) and leading Christian theologian of the 2nd century. His work *Adversus haereses* (*Against Heresies*), written in about 180, refuted Gnosticism. Irenaeus advanced the development of an authoritative canon of Scriptures, the creed, and the authority of the episcopal office.

Irenaeus as bishop (centre), detail of a stained-glass window, 13th century; in the cathedral of Saint-Jean, Lyon
J. Baur and A. Lennoz

Early career. Though his exact birth date is unknown, Irenaeus was born of Greek parents in Asia Minor. His own works establish a few biographical points, such as that as a child he heard and saw Polycarp, the last known living connection with the Apostles, in Smyrna, before that aged Christian was martyred in 155. Eusebius of Caesarea also notes that after persecutions in Gaul in 177 Irenaeus succeeded the martyred Pothinus as bishop of Lugdunum. According to Eusebius, who wrote a history of the church in the 4th century, Irenaeus, prior to his becoming bishop, had served as a missionary to southern Gaul

and as a peacemaker among the churches of Asia Minor that had been disturbed by heresy.

The known biographical data—if taken together with his published works—are sufficient to give a picture of an unusual life. Historical sources testify to a close cultural connection between Asia Minor and southern France (the Rhône Valley) during the 2nd century. According to tradition, the Apostle John, as a very old man who had "seen the Lord" (*i.e.*, Jesus), lived at Ephesus in the days when Polycarp was young. Thus, there were three generations between Jesus of Nazareth and Irenaeus of southern France.

The era in which Irenaeus lived was a time of expansion and inner tensions in the church. In many cases Irenaeus acted as mediator between various contending factions. The churches of Asia Minor continued to celebrate Easter on the same date (the 14th of Nisan) as the Jews celebrated Passover, whereas the Roman Church maintained that Easter should always be celebrated on a Sunday (the day of the Resurrection of Christ). Mediating between the parties, Irenaeus stated that differences in external factors, such as dates of festivals, need not be so serious as to destroy church unity.

Irenaeus' writings: conflict with the Gnostics. Irenaeus adopted a totally negative and unresponsive attitude, however, toward Marcion, a schismatic leader in Rome, and toward Gnosticism, a fashionable intellectual movement in the rapidly expanding church that espoused dualism. Because Gnosticism was overcome through the efforts of the early Church Fathers, among them Clement of Alexandria and Irenaeus, Gnostic writings were largely obliterated. In reconstructing Gnostic doctrines, therefore, modern scholars relied to a great extent on the writings of Irenaeus, who summarized the Gnostic views before attacking them. After the discovery of the Gnostic library near Nağ Ḥammādī (in Egypt) in the 1940s, respect for Irenaeus increased: he was proved to have been extremely precise in his report of the doctrines he rejected.

All his known writings are devoted to the conflict with the Gnostics. His principal work consists of five books in a work entitled *Adversus haereses*. Originally written in Greek about 180, *Against Heresies* is now known in its entirety only in a Latin translation, the date of which is disputed (200 or 400?). A shorter work by Irenaeus, *Demonstration of the Apostolic Preaching*, also written in Greek, is extant only in an Armenian translation probably intended for the instruction of young candidates for Baptism.

Irenaeus asserted in a positive manner the validity of the Jewish Bible (the Old Testament), which the Gnostics denied, claiming that it upheld the laws of the Creator God of wrath. Though Irenaeus did not actually refer to two testaments, one old and one new, he prepared the way for this terminology. He asserted the validity of the two testaments at a time when concern for the unity and the difference between the two parts of the Bible was developing. Many works claiming scriptural authority, which included a large number by Gnostics, flourished in the 2nd century; by his attacks on the Gnostics, Irenaeus helped to diminish the importance of such works and to establish a canon of Scriptures.

The development of the creed and the office of bishop also can be traced to his conflicts with the Gnostics. On the basis of the New Testament alone, which is concerned with the salvation of man, the creed would not be expected to begin with an article about the creation of the world and man. But, because the Gnostics denied that the God revealed in the New Testament was the Creator, the first article of the creed was for polemical reasons directly connected with Genesis ("In the beginning God created the heavens and the earth"). Irenaeus refers to the creed as a "Rule of Truth" used to combat heresy.

The oldest lists of bishops also were countermeasures against the Gnostics, who said that they possessed a secret oral tradition from Jesus himself. Against such statements Irenaeus maintains that the bishops in different cities are known as far back as the Apostles—and none of them was a Gnostic—and that the bishops provided the only safe guide to the interpretation of Scripture. With these lists of bishops the later doctrine of "the apostolic succession" of the bishops could be linked. Even the unique position of authority of the bishop of Rome is emphasized by Irenaeus, though in an obscure passage.

Though there is no evidence, other than legendary, about his death, the last decade of the 2nd century is generally assumed to be the period in which Irenaeus died. (G.Win.)

BIBLIOGRAPHY. A good biography is F.R.M. Hitchcock, *Irenaeus of Lugdunum* (1914). The best edition of *Adversus haereses* is that of W.W. Harvey (1857; Eng. trans. in the "Ante-Nicene Christian Library," 1868–69). See also the English translation of his *Demonstration* by J.P. Smith (1952). A very detailed and readable article may be found in the reference work *Catholicisme, hier, aujourd'hui, demain*, pt. 6, "Irénée de Lyon" (1963–67). For Irenaeus' theology, see J. Lawson, *The Biblical Theology of St. Irenaeus* (1948); G. Wingren, *Man and the Incarnation: A Study in the Biblical Theology of Irenaeus* (Eng. trans. 1959); A. Benoit, *Saint Irénée, introduction à l'étude de sa théologie* (1960).

Irene (*b. c.* 752, Athens—d. Aug. 9, 803, Lesbos), Byzantine ruler and saint of the Greek Orthodox Church who was instrumental in restoring the use of icons in the Eastern Roman Empire.

The wife of the Byzantine emperor Leo IV, Irene became, on her husband's death in September 780, guardian of their 10-year-old son, Constantine VI, and co-emperor with him. Later in that year she crushed what seems to have been a plot by the Iconoclasts (opposers of the use of icons) to put Leo's half brother, Nicephorus, on the throne.

Irene favoured the restoration of the use of icons, which had been prohibited in 730. She had Tarasius, one of her supporters, elected patriarch of Constantinople and then summoned a general church council on the subject. When it met in Constantinople in 786, it was broken up by Iconoclast soldiers stationed in that city. Another council, which is recognized by both the Roman Catholic and Eastern Orthodox churches as the Seventh Ecumenical Council, met at Nicaea in 787 and restored the cult of images.

As Constantine approached maturity, he grew resentful of his mother's controlling influence in the empire. An attempt to seize power was crushed by the Empress, who demanded that the military oath of fidelity should recognize her as senior ruler. Anger at the demand prompted the themes (administrative divisions) of Asia Minor to open resistance in 790. Constantine VI was proclaimed sole ruler and his mother banished from court. In January 792, however, Irene was allowed to return to court and even to resume her position as co-ruler. By skillful intrigues with the bishops and courtiers she organized a conspiracy against Constantine, who was arrested and blinded at his mother's orders (797).

Peter Clayton

Irene reigned alone as emperor (not empress) for five years. In 798 she opened diplomatic relations with the Western emperor Charlemagne, and in 802 a marriage between her and Charlemagne was reportedly contemplated. According to the contemporary Byzantine historian Theophanes, the scheme was frustrated by one of Irene's favourites. In 802 a conspiracy of officials and generals deposed her and placed on the throne Nicephorus, the minister of finance. She was exiled, first to the island of Prinkipo (now Büyükada) and then to Lesbos.

Irene's zeal in restoring icons and her patronage of monasteries ensured her a place among the saints of the Greek Orthodox Church. Her feast day is August 9.

Irene, in full IRENE DUCAS (*b. c.* 1066—d. 1120, Constantinople), wife of the Byzantine emperor Alexius I Comnenus, known from the description of her in the *Alexiad* of their daughter Anna Comnena.

When Alexius became emperor in April 1081 he reportedly planned to repudiate Irene

Irene, detail of a 12th-century mosaic in Hagia Sophia, Istanbul
Colorphoto Hinz, Basel

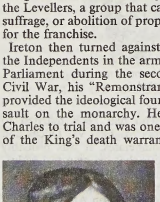
and wed Mary, who had been married to the former emperors Michael VII Ducas and Nicephorus III Botaneiates. It was probably fortunate for Alexius that his plan was foiled, for his repudiation of his wife would have incurred the enmity of the powerful Ducas family. Irene was crowned on April 11, 1081, seven days after her husband.

In violation of the rights of John, the eldest son of Alexius and Irene, the Empress supported the attempts of her daughter Anna to secure the throne for her second husband, Nicephorus Bryennius. Shortly before his death, the Emperor, aware of the intrigues of his wife and daughter, ordered John to proclaim himself emperor. John had himself crowned in the church of Hagia Sophia and then, with his supporters, occupied the heavily fortified Sacred Palace. Alexius died in August 1118, and Irene, frustrated in her attempts to deprive John of the throne, retired to a

monastery that she had previously founded in Constantinople.

Irenidae, songbird family, order Passeriformes, consisting of the leafbirds, ioras, and fairy bluebirds, about 14 species of small brightly coloured birds of the forests and farms of southeastern Asia.

Members range in size from 13 to 25 centimetres (5 to 10 inches) long. They appear to be closely related to the bulbuls (family Pycnonotidae), even to the hairy patch on the nape. They have slightly down-curved bills, short legs, and rounded wings. Leafbirds proper are in the genus *Chloropsis,* ioras are in the genus *Aegithina,* and fairy bluebirds in the genus *Irena.* They eat fruit, buds, and some insects. Many are noted for their striking aerial displays during courtship and for their musical whistles and flutelike calls.



The family, also called Chloropseidae, belongs to the songbird suborder (Passeres).

Ireton, Henry (b. 1611, Attenborough, Nottinghamshire, Eng.—d. Nov. 28, 1651, Limerick, County Limerick, Ire.), English soldier and statesman, a leader of the Parliamentary cause during the Civil Wars between the Royalists and Parliamentarians.

At the outbreak of the Civil War, Ireton joined the Parliamentary army. In November 1642 he commanded a cavalry force in the indecisive Battle of Edgehill, Worcestershire. The following year he met and befriended Oliver Cromwell, then a colonel in the army of eastern England. Cromwell appointed Ireton deputy governor of the Isle of Ely in 1644, and Ireton fought at the Parliamentary victories at Marston Moor, Yorkshire (July 1644), and Naseby, Northamptonshire (June 1645). In the summer of 1646 he married Cromwell's eldest daughter, Bridget.

Although Ireton's military record was distinguished, he earned his fame in politics. Elected to Parliament in 1645, he looked on while a conflict developed between the Independents in the army and the Presbyterians who controlled the House of Commons. In 1647 Ireton presented his "Heads of the Proposals," a constitutional scheme calling for division of political power among army, Parliament, and king and advocating religious tolerance for Anglicans and Puritans. These proposals for a constitutional monarchy were rejected by the King. At the same time they were attacked by the Levellers, a group that called for manhood suffrage, or abolition of property requirements for the franchise.

Ireton then turned against the King. When the Independents in the army triumphed over Parliament during the second phase of the Civil War, his "Remonstrance of the Army" provided the ideological foundation for the assault on the monarchy. He helped to bring Charles to trial and was one of the signatories of the King's death warrant. From 1649 to 1651 Ireton prosecuted the government's cause against Roman Catholic rebels in Ireland, becoming lord deputy of Ireland and acting commander in chief in 1650. He died after the siege of Limerick. A good biography is Robert Ramsey's *Henry Ireton* (1949).

Irgun Zvai Leumi (Hebrew: National Military Organization), byname ETZEL, Jewish right-wing underground movement in Palestine, founded in 1931. At first supported by many non-Socialist Zionist parties, in opposition to the Haganah, it became in 1936 an instrument of the Revisionist Party, an extreme nationalist group that had seceded from the World Zionist Organization and whose policies called for the use of force, if necessary, to establish a Jewish state on both sides of the Jordan.

Irgun committed acts of terrorism and assassination against the British, whom it regarded as illegal occupiers, and it was also violently anti-Arab. Irgun also participated in the organization of illegal immigration into Palestine after the publication of the British White Paper on Palestine (1939), which severely limited immigration. Irgun's violent activities led to execution of many of its members by the British; in retaliation, Irgun executed British army hostages.

Irgun's members were extremely disciplined and daring, and their actions included the capture of ʿAkko (Acre) prison, a medieval fortress that not even Napoleon I had succeeded in capturing. In the last days of the British mandate, it captured a large part of the city of Yafo (Jaffa).

On July 22, 1946, the Irgun blew up a wing of the King David Hotel in Jerusalem, killing 91 soldiers and civilians (British, Arab, and Jewish). On April 9, 1947, a group of Irgun commandos raided the Arab village of Dayr Yāsīn (modern Kefar Shaʾul), killing all 254 of its inhabitants.

After the creation of Israel in 1948 the Irgun's last units disbanded and took the oath of loyalty to the Israeli defense forces on Sept. 1, 1948. Politically, it was the precursor of the Herut (Freedom) Party, one of Israel's most militant right-wing groups, later merged with the Liberals into the Gaḥal Party. *See also* Stern Gang.

Iri, former city, North Chŏlla province, western South Korea. In 1995 it was combined with Iksan county to form the city of Iksan. The port city of Kunsan lies just to the west. Iksan is situated in the northern part of the Honam Plain, the largest granary of South Korea, and it is the market centre for the agricultural products, particularly rice, of the area. The city is also at a junction of rail lines leading to Mokp'o, Mok'o, Taejŏn, and Kunsan, and it has a dense network of highways. Iksan is developing its manufacturing industry, which includes textiles, and tourism is growing in importance. Such research organizations as the Agriculture Agency and the Land Improvement Association are located there, as is Wŏngwang University (1953). Pop. (2002 est.) Iksan city, 332,545.

Irian Jaya, former name (1969–2002) of PAPUA, also called (until 1969) IRIAN BARAT, *propinsi* (province), Indonesia, the western half of the island of New Guinea and its offshore islands—including the individual islands of Yapen, Adi, Waigeo, Batanta, Kofiau, Salawati, Misool, and Yos Sudarsa and the Schouten Islands. Papua (Irian Jaya) fronts the Ceram and Banda seas to the west, the Arafura Sea to the southwest, and the Pacific Ocean to the north; it is bounded by Papua New Guinea to the east. The provincial capital is Jayapura. Papua's former name, Irian, is the Indonesian term for New Guinea, with *jaya* meaning "glorious," or "victorious," and *barat* meaning "west."

The first Europeans to sight the island were the Portuguese in 1511, and what is now Papua province was subsequently visited by Spanish, Dutch, German, and English explorers. The English attempted to found a colony near Manokwari in 1793. The Dutch claimed the western half of New Guinea in 1828, but their first permanent administrative posts, at Fakfak and Manokwari, were not set up until 1898. Haji Misbach, a Muslim communist, was exiled by the Dutch to Irian Barat in 1924, and three years later about 1,300 communists were imprisoned there after an uprising in Java. The Japanese occupied the northern part of Irian Barat in World War II until Allied forces recaptured Hollandia (now Jayapura) in 1944. The Netherlands regained sovereignty of Irian Barat at the end of the war and retained it after granting independence to Indonesia in 1949. In 1962, after protracted negotiations, Irian Barat was placed under United Nations administration. The region was transferred to Indonesia in 1963, with provision that a plebiscite would be held by 1969 to decide its future.

Opposition to Indonesian rule quickly sprang up, led by the Free Papua Movement (Organisasi Papua Merdeka; OPM). The plebiscite took place in 1969, and, though the results were suspect, the area became the Indonesian province of Irian Jaya. The OPM continued to resist Indonesian rule, and violence broke out periodically. By 2002 Indonesia had changed the name of the province to Papua and granted it more autonomy. Efforts were also made to divide Papua into three provinces, one of which, West Irian Jaya (Irian Jaya Barat), was declared in 2003.

The Maoke Mountains, an extension of the cordillera composing the central highlands of Papua New Guinea, stretch about 400 miles (640 km) east-west across the central of Papua and rise to an elevation of 16,502 feet (5,030 m) at Mount Jaya. The summits are heavily forested, except for the highest ones, which consist of glaciated rock. To the north is the east-west valley of the Tariku and Taritatu rivers, tributaries to the northwestward-flowing Mamberamo River. The Van Rees and Gauttier ranges, the latter rising to some 7,450 feet (2,270 m), separate the east-west valley from the northern coastal lowlands. The mostly lowland Bomberai Peninsula lies to the west, and the more mountainous Doberai (Vogelkop; Dutch, "Bird's Head") Peninsula is to the northwest. Extending south of the Maoke Mountains is a wide swampy area imperfectly drained by the Digul, Pulau, Braza, Baliem, Loren, Armandville, Blumen, Semara, and Mapi rivers. The high mountain regions are broken by valleys covered with coarse grass, and tropical rainforest vegetation is common. The low-lying areas north of the central mountain range are clothed with dense rainforests. Among the many varieties of trees are palms (sago, coconut, and nipa), sandalwood, ebony, rubber, casuarina, cedar, breadfruit, and mangrove; orchids and ferns thrive in the rainforests. Wildlife includes marsupials, monotremes (egg-laying mammals), snakes, crocodiles, butterflies, cassowaries, birds of paradise, moundbuilders, bowerbirds, anteaters, flying foxes, wild dogs, wild pigs, opossums, tortoises, frilled lizards, water rats, tree kangaroos, plumed herons, green pigeons, and lories.

Most of the people are engaged in agriculture; the chief products are cacao, fish, nutmeg, rice, shells, timber, vegetables, copra (dried coconut), and copal (varnish resin). Industrial activities include sawmilling, rice milling, and shipbuilding. Crafts include wood carving, leather tanning, basket and mat weaving, and handloom weaving.

One of the largest concentrations of copper ore in the world is at Tembagapura. Despite long-term guerrilla fighting, exploitation of those deposits has taken place at nearby Kokenau, on the south-central coast, the ore being shipped at Amaferi. Oil is also drilled,

and gold and uranium are mined. Papua has been the scene of intense exploration for nickel, petroleum, and additional copper deposits. Among its exports are crude oil, copra, copal, spices, and wood. Internal transport consists of a few secondary coastal roads, riverboats, and airways linking Sorong, Manokwari, Inanwaten, Fakfak, Biak, Nabire, Kokenau, Enarotali, Merauke, Wamena, and Jayapura. The population comprises Melanesians (the original settlers of western New Guinea), Negritos, Papuans, and Europeans. Immigrants from the Celebes, Java, and the Moluccas have settled as traders and fishermen along the coasts and river mouths and on satellite islands. Numerous local languages are spoken, some by only a few people. Although indigenous animism prevails, there are some Muslims and Christians. Area 141,107 square miles (365,475 square km). Pop. (2000) 2,220,934.

Iridaceae, the iris family of flowering plants, belonging to the order Liliales. The family is known for ornamental genera such as *Iris, Gladiolus,* and *Crocus.*

The Iridaceae contains some 80 genera and an estimated 1,700 species of mostly perennial herbs; there are a few shrubs and evergreen herbs as well. The family is nearly worldwide in distribution, but it is most abundant and diversified in Africa. Most species are native to temperate, subtropical, and tropical regions. Species of *Iris, Gladiolus,* and *Crocus* grow best in rich soil.

In addition to *Iris, Gladiolus,* and *Crocus,* the Iridaceae includes ornamental genera such as the blackberry lily, or leopard flower (*Belamcanda*), a native of China and Japan, and the blue-eyed grasses (*Sisyrinchium*), which are widely dispersed in the Western Hemisphere. The capsule wall of the blackberry lily recurves at maturity to display shiny, black seeds resembling the fruit of the blackberry. The delicate blue-eyed grasses are attractive plants for naturalistic gardens. Plants of the genus *Freesia* are widely grown commercially for cut flowers.

Members of *Iris* also yield orrisroot (a substance used in the manufacture of perfumes, soaps, powders, and dentrifices). The feathery stigmas of *Crocus sativa* yield saffron, which is used as flavouring and food colouring and as a medicinal ingredient.

The underground stems of members of the iris family may be one of at least three structural types: rhizomes, bulbs, and corms. In *Iris* the stem is horizontal, robust, and ringed with leaf-scars. It is a rhizome that often grows partially exposed but is firmly rooted in the soil.

Species of *Iris* native to southwestern Europe produce bulbs. This type of stem is short and conical and from it many leaf bases arise, one inside the other. These bases are seamless and constitute the bulk of the bulb. Bulblets arise from the stem, between the leaf bases, to propagate the plant.

The corm of *Gladiolus* is an underground stem in the shape of a doughnut without a hole. On the concave upper surface a small cluster of leaves is located. Among the leaf bases, cormlets arise to reproduce the plant. Rhizomes, bulbs, and corms are efficient in the vegetative reproduction of the Iridaceae.

Reproduction by seeds is also very important in the iris family and is essential in the development of new hybrids. In *Crocus* only one flower may develop from each corm, but in many other genera, as in *Iris* and *Gladiolus,* an inflorescence (flower cluster), sometimes branched, arises from the underground stem.

Flowers of the showy garden irises possess three sepals (falls), three petals (standards), and three broad, pollen-receptive stigma branches, under which the pollen-producing anthers are hidden. These flower parts are located above the ovary (inferior ovary), which consists of three carpels unified into a single pistil. Ovules within the ovary portion become seeds, and the ovary matures into fruit. Members of the Iridaceae produce dry capsules, a fruit that splits open to release the seeds. Most plants in the family have long, narrow leaves, generally with parallel venation.

Bulbous irises may be stored under carefully controlled temperatures, and, when potted, they are brought into flower in cooler months of the year. Insects are the pollinators in the iris family, attracted by the showy flower parts.

iridescence, interference of light either at the surface or in the interior of a material that produces a series of colours as the angle of incidence changes. Best known are the colours seen in precious opal resulting from the interference of light by submicroscopic layers of nearly spherical particles 1,500–3,000 angstroms in diameter that are arranged in a regular pattern. Common opal lacks this layering, and scattered light merely gives a milky opalescence. Internal iridescence is due to closely spaced fractures or lamellae such as planes of differing composition caused by exsolution. Most familiar are the colours of labradorite and peristerite resulting from lamellae about 1,000 angstroms thick. Surface iridescence occurs on some ore minerals (*e.g.,* hematite and sphalerite).

iridium (Ir), chemical element, one of the platinum metals of Group VIII of the periodic table. It is very dense and rare and is used in platinum alloys. A precious, silver-white metal, iridium is hard and brittle, but it becomes ductile and can be worked at a white heat, from 1,200° to 1,500° C (2,200° to 2,700° F). It is one of the densest terrestrial substances. In the massive state the metal is practically insoluble in acids and is not attacked even by aqua regia. It can be dissolved in concentrated hydrochloric acid in the presence of sodium perchlorate at 125° to 150° C (257° to 302° F).

Because of difficulties in preparation and fabrication, the pure metal has few applications. Iridium is chiefly used in the form of platinum alloys. Platinum-iridium alloys (5 to 10 percent iridium) are readily workable metals that are much harder and stiffer and more resistant to chemical attack than the soft pure platinum. Such alloys are used for jewelry, pen points, surgical pins and pivots, and electrical contacts and sparking points. The international prototype standard kilogram of mass is made from an alloy containing 90 percent platinum and 10 percent iridium.

Pure iridium probably does not occur in nature; its abundance in the Earth's crust is very low, about 0.001 parts per million. Though rare, iridium does occur in natural alloys with other noble metals: in iridosmine up to 77 percent iridium, in platiniridium up to 77 percent, in aurosmiridium 52 percent, and in native platinum up to 7.5 percent. Iridium generally is produced commercially along with the other platinum metals as a by-product of nickel or copper production.

Iridium-containing ores are found in South Africa and Alaska, U.S., as well as in Myanmar (Burma), Brazil, Russia, and Australia. In the late 20th century South Africa was the world's major producer of iridium.

The element was discovered in 1803 in the acid-insoluble residues of platinum ores by the English chemist Smithson Tennant; the French chemists H.-V. Collet-Descotils, A.-F. Fourcroy, and N.-L. Vauquelin identified it at about the same time. The name *iridium,* derived from the Greek word *iris* ("rainbow"), refers to the various colours of its compounds. Natural iridium consists of a mixture of two stable isotopes, iridium-191 (37.3 percent) and iridium-193 (62.7 percent). The chemistry of iridium centres on oxidation states of +1, +3, and +4, though compounds of all states from 0 to +6 are known with perhaps the exception of +2.

atomic number	77
atomic weight	192.2
melting point	2,410° C (4,370° F)
boiling point	4,527° C (8,181° F)
specific gravity	22.4 (20° C)
valence	1, 3, 4
electronic config.	2-8-18-32-17 or $(Xe)4f^{14}5d^{9}$

iridosmine, also called OSMIRIDIUM, mineral consisting of an alloy of iridium and a smaller proportion of osmium. It occurs in gold-bearing conglomerates, as at the Witwatersrand in South Africa, and in gold sands, as in California and Oregon, U.S. Because of their hardness and resistance to corrosion, both natural and synthetic iridosmine are used for tips of pen nibs, surgical needles, and sparking points in engines. Similar alloys composed of more osmium than iridium are called siserskite. Both iridosmine and siserskite crystallize in the hexagonal system. For detailed properties, *see* native element (table).

Irigoyen, Hipólito, Irigoyen also spelled YRIGOYEN (b. July 12, 1852, Buenos Aires, Arg.—d. July 3, 1933, Buenos Aires), Argentine statesman who became his country's first president elected by broad popular suffrage. He was driven from office during his second term by a military coup in 1930.

Irigoyen became a lawyer, teacher, rancher, and politician and in 1896 took control of the Radical Party. His relentless effort to obtain free elections succeeded in winning from the conservative oligarchy the Sáenz Peña Law (1912). Under this provision for the secret ballot, he was elected president. During his term (1916–22) he and his Radical Party followers in Congress maintained Argentina's neutrality in World War I. Measures regulating labour conditions were also passed, but these were not strongly enforced, and in 1919 a serious strike, in part politically inspired, was violently broken by the government.

Reelected overwhelmingly in 1928, despite the opposition of his former close associate, Marcelo T. de Alvear, who had served as president from 1922 to 1928, the increasingly senile Irigoyen lost his grip on affairs. Corruption and stagnation within his administration cost him much support, which went over to the opposition formed by his long-time conservative enemies. The Great Depression further weakened his position, and a relatively bloodless military coup in 1930 ended his career.

Austere in personal life, obscure in many of his public declarations, yet popular almost to the end of his career, Irigoyen failed to implement in Argentina the democratic reforms that he had advocated before reaching power.

Iris, in Greek mythology, the personification of the rainbow and a messenger of the gods. According to the Greek poet Hesiod, she was the daughter of Thaumas and the ocean nymph Electra. In Hesiod's works, at least, she had the additional duty of carrying water from the River Styx in a ewer whenever the gods had to take a solemn oath. The water would render unconscious for one year any god or goddess who lied. In art, Iris was normally portrayed with wings, and her attributes were the herald's staff and a vase.

Iris (Greece): *see* Evrótas River.

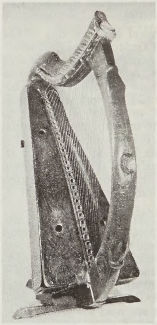
Iris, genus of about 300 species of plants in the family Iridaceae including some of the world's most popular and varied garden flowers, centred in the North Temperate Zones. Some of its most handsome species, however, are native to the Mediterranean and central Asian areas. The iris is the fleur-de-lis of the French royalist standard. It is a popular subject of Japanese flower arrangement, and it is also the source of orrisroot, from which "essence

of violet" perfume is made. Irises are either bulbous or rhizomatous (with thick, creeping underground stems) and have six petallike floral segments, the more erect inner ones called standards and the usually drooping outer ones called falls.

Best known are the bearded, or German, group—the common garden irises. These are hybrids of pale-blue *I. pallida,* yellow *I. variegata,* purple-blue *I. germanica,* and perhaps other southern European species. They are hardy, rhizomatous types with sturdy, swordlike leaves and tall stems (to 90 cm [3 feet]) of three to many flowers. With the introduction in 1900 of taller, heavier, larger-flowered *I. mesopotamica,* even larger hybrids were created, many of them fragrant, in a full range of colours and combinations, often with brightly contrasting "beards" on the falls. Dwarf bearded irises, most of which flower in early spring, are for the most part varieties of the almost stemless *I. pumila* and the taller *I. chamaeiris,* both from dry, rocky places in southern Europe.

Best known of the beardless, rhizomatous group is perhaps the water-loving Japanese iris (*I. kaempferi*), frequently featured in Japanese watercolours. Its almost flat flowers consist of long, somewhat drooping falls, surrounding narrower, shorter standards. The Siberian iris (*I. sibirica*), from grasslands in central and eastern Europe, has slender, straight stalks with clustered heads of violet-blue or white blooms. The yellow, or water, flag (*I. pseudacorus*) is a swamp plant native to Eurasia and North Africa; the blue flag (*I. versicolor*) occupies similar habitats in North America.

Two outstanding bulbous irises are both from mountains of Spain. They have narrow standards, somewhat broader falls, and spiky, linear foliage. Spanish iris (*I. xiphium*), violet



Blue flag (*Iris versicolor*)
J.C. Allen and Son

with yellow or yellow-spotted falls, grows in damp, sandy places. English iris (*I. xiphioides*), so named because of its popularity in British horticulture, bears bright-blue flowers. Dutch irises are sturdier, earlier-flowering hybrids created in The Netherlands.

iris, in anatomy, pigmented muscular curtain at the front of the eye, between the cornea and the lens and perforated by an opening called the pupil. The iris consists of two sheets of smooth muscle with contrary actions, expansion and contraction. These muscles control the size of the pupil and thus determine how much light reaches the sensory tissue of the retina. The sphincter pupillae is a circular muscle that constricts the pupil in bright light; the dilator pupillae expands the opening when it contracts. The amount of pigment contained in the iris determines eye colour. When there is very little pigment, the eye appears blue; with increased pigment, the shade becomes deep brown to black.

Irish elk, genus (*Megaloceros*) of extinct giant elk commonly found as fossils in Pleistocene deposits in Europe and Asia (the Pleistocene Epoch began 1,600,000 years ago and ended about 10,000 years ago). The Irish elk, about the size of the modern moose, had the largest antlers of any form of deer known—in some specimens, 4 m (about 13 feet) across. The antlers differed from those of the modern elk; the main part was a massive single sheet from which arose a series of pointed projections, or tines. Several species of *Megaloceros* are known; those from Ireland and Denmark are the largest. It is possible that *Megaloceros* survived as late as 700 or even 500 BC.

Irish harp, Irish Gaelic CLAIRSEACH, Scottish Gaelic CLARSACH, traditional harp of medieval Ireland and Scotland, characterized by

Irish harp, probably 14th century; in the British Museum, London
By courtesy of the trustees of the British Museum, London

a huge soundbox carved from a solid block of wood; a heavy, curved neck; and a deeply outcurved forepillar—a form shared by the medieval Scottish harp. It was designed to bear great tension from the heavy brass strings (normally 30 to 50), which were plucked by the fingernails to produce a ringing, bell-like sound. It is strung diatonically (seven notes per octave).

Known in the above form since the 11th century, it belonged to the world of strongly coloured medieval instruments and survived almost unchanged in Ireland until the end of the 17th century. The disappearance of aristocratic patrons, coupled with changes in musical styles, contributed to the disappearance of the instrument, its musical style, and playing technique by the end of the 18th century.

The modern, lighter, gut-strung Irish harp stems from the efforts of John Egan of Dublin (*c.* 1820) to revive the older harp. To produce a full chromatic (12-note) octave, it is provided with turnable hooks on the neck near each string, raising the string's pitch by a semitone when necessary.

Irish Hospitals' Sweepstakes: *see* Irish Sweepstakes.

Irish language, also called ERSE, or GAELIC, Irish GAEILGE, a member of the Goidelic group of Celtic languages, spoken in Ireland. As one of the national languages of the Republic of Ireland, Irish is taught in the public schools and is required for certain civil-service posts.

Grammatically, Irish still has a case system, like Latin or German, with four cases to show differing functions of nouns and pronouns in a sentence. In phonology it exhibits initial sandhi, in which the first consonant of a word is modified according to the prehistoric final sound of the previous word in the phrase (*e.g., an tobar* "the well," *mo thobar* "my well").

Records in the Irish language date back to the ogham inscriptions, written in sets of strokes or notches, of the 5th century AD; the Latin alphabet began to be used shortly thereafter. Irish literature dates from the 8th century. *See also* ogham writing; Celtic languages.

Irish literary renaissance, flowering of Irish literary talent at the end of the 19th and the beginning of the 20th century that was closely allied with a strong political nationalism and a revival of interest in Ireland's Gaelic literary heritage. The renaissance was inspired by the nationalistic pride of the Gaelic revival (*q.v.*); by the retelling of ancient heroic legends in books such as the *History of Ireland* (1880) by Standish O'Grady and *A Literary History of Ireland* (1899) by Douglas Hyde; and by the Gaelic League, which was formed in 1893 to revive the Irish language and culture. The early leaders of the renaissance wrote rich and passionate verse, filled with the grandeur of Ireland's past and the music and mysticism of Gaelic poetry. They were mainly members of the privileged class and were adept at English verse forms and familiar with lyric poetry that extolled the simple dignity of the Irish peasant and the natural beauty of Ireland.

The movement developed into a vigorous literary force centred on the poet and playwright William Butler Yeats. Though he contributed to the foundation of the Abbey Theatre, the first Irish national theatre, he wrote only a few plays, which were beautiful but difficult to stage. His chief colleague was Lady Isabella Augusta Gregory, who took a leading part in the Abbey's management and wrote many plays. The Irish Literary Theatre, established in 1898, also excelled in the production of peasant plays. The greatest dramatist of the movement was John Millington Synge, who wrote plays of great beauty and power in a stylized peasant dialect. Later, the theatre turned toward realism, mostly rural realism. Lennox Robinson, best known for his political play, *The Lost Leader* (1918), and his comedy, *The Whiteheaded Boy* (1916), and T.C. Murray, author of *The Briary Gap* (1917), were among the early realists. In reaction to peasant realism, Sean O'Casey wrote three great dramas of the Dublin slums: *The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), and *The Plough and the Stars* (1926).

In poetry, in addition to Yeats, the mystic George Russell (pseudonym AE) composed works of enduring interest. Notable among their younger contemporaries were Padraic Colum, Austin Clarke, Seumas O'Sullivan (James Sullivan Starkey), F.R. Higgins, and Oliver St. John Gogarty. The Irish Republican movement had its poets in Patrick Henry Pearse, Thomas MacDonagh, and Joseph Plunkett, all executed in 1916 for their part in the Easter Rising.

The noteworthy prose fiction of the renaissance includes the historical tales of Emily Lawless and Standish James O'Grady. James Stephens also wrote stories and poetry.

Irish literature, either of two literatures, one in the native language (Irish, or Gaelic) of Ireland and the other in the language of the English conquerors; the latter is often called Anglo-Irish literature. For a discussion of the former, *see* Celtic literature. The history of Anglo-Irish literature is inextricably intertwined with that of English literature (*q.v.*).

Irish moss, also called CARRAGEEN (*Chondrus crispus*), species of red algae, a small,

Irish moss (*Chondrus crispus*)
Walter Dawn

tufted seaweed with thin fronds from 5 to 25 cm (2 to 10 inches) long, that grows abundantly along the rocky parts of the Atlantic coast of the British Isles, Europe, and North America. The name is also used loosely for several other red seaweeds found associated with *Chondrus*. Other names descriptive of its appearance are pearl moss, curly moss, and jelly moss. The plant is soft and cartilaginous, varying in colour from a greenish yellow to a dark purple; when sun-dried and bleached it has a yellowish, translucent, hornlike aspect and consistency. The principal constituent of Irish moss is a gelatinous substance, carrageenan. Carrageen extract is produced commercially by boiling dried Irish moss and is used for curing leather and as an emulsifying and suspending agent in pharmaceuticals, food products, cosmetics, and shoe polishes. In North America it is harvested from shallow water by dredging with special rakes; in Europe it is obtained from plants cast ashore.

Irish needle lace, lace made with a needle in Ireland from the late 1840s, when the craft was introduced as a famine-relief measure. Technically and stylistically influenced by 17th-century Venetian needle lace, it arose in several centres through the enterprise of individuals, especially the mother superiors of convents, who unraveled old examples to learn the technique and then taught the pupils of convents or local schools. Tyrran in County Armagh was a needle-lace centre from 1849 to 1865. Among other centres were Youghal in County Cork and its offshoots at Kenmare in County Kerry and New Ross in County Wexford.

Irish Potato Famine, also called GREAT POTATO FAMINE, GREAT IRISH FAMINE, or FAMINE OF 1845–49, famine that occurred in Ireland in 1845–49 when the potato crop failed in successive years. The crop failures were caused by late blight (*q.v.*), a disease that destroys both the leaves and the edible roots, or tubers, of the potato plant. The causative agent of late blight is the fungus *Phytophthora infestans*. The Irish Potato Famine was the worst famine to occur in Europe in the 19th century.

By the early 1840s, almost one-half of the Irish population—but primarily the rural poor—had come to depend almost exclusively on the potato for their diet, and the rest of the population also consumed it in large quantities. A heavy reliance on just one or two high-yielding varieties of potato greatly reduced the genetic variety that ordinarily prevents the decimation of an entire crop by disease, and thus made the Irish vulnerable to famine. In 1845 the *Phytophthora* fungus arrived accidentally from North America, and that same year Ireland had unusually cool, moist weather, in which the blight thrived. Much of that year's potato crop rotted in the fields. This partial crop failure was followed by more devastating failures in 1846–49, as each year's potato crop was almost completely ruined by the blight.

The British government's efforts to relieve the famine were inadequate. Prime Minister Sir Robert Peel did what he could to provide relief in 1845 and early 1846, but under the Liberal cabinet of Lord John Russell, which assumed power in June 1846, the emphasis shifted to reliance on Irish resources and the free market, which made disaster inevitable. Much of the financial burden of providing for the starving Irish peasantry was thrown upon the Irish landowners themselves (through local poor relief). But because the peasantry was unable to pay its rents, the landlords soon ran out of funds with which to support them. British assistance was limited to loans, helping to fund soup kitchens, and providing employment on road building and other public works. Cornmeal imported from the United States helped avert some starvation, but it was disliked by the Irish, and reliance on it led to nutritional deficiencies. Despite these shortcomings, by August 1847 as many as 3,000,000 people were receiving rations at soup kitchens. All in all, the British government spent about £8,000,000 on relief, and some private relief funds were raised as well. Throughout the famine, many Irish farms continued to export grain, meat, and other high-quality foods to Britain because the Irish peasantry lacked the money to purchase them. The government's grudging and ineffective measures to relieve the famine's distress intensified the resentment of British rule among the Irish people.

The famine proved to be a watershed in the demographic history of Ireland. As a direct consequence of the famine, Ireland's population of almost 8,400,000 in 1844 had fallen to 6,600,000 by 1851. The number of agricultural labourers and smallholders in the western and southwestern counties underwent an especially drastic decline. About 1,100,000 people died from starvation or from typhus and other famine-related diseases. The number of Irish who emigrated to North America and Britain during the famine may have reached 1.5 million. Ireland's population continued to decline in the following decades owing to overseas emigration and lower birth rates. By the time Ireland achieved independence in 1921, its population was barely half of what it had been in the early 1840s.

Irish Rebellion (1798), an uprising of Irish Roman Catholics seeking parliamentary reform and complete Catholic emancipation.

During 1795 an alliance between radicals and discontented sections of the working class had brought a new association of United Irishmen into being; it was secret and organized on military lines and aimed at a radical reform of the Irish Parliament and "a national government." Agrarian discontent was rife, and many of the Irish peasantry who had formed secret societies of their own joined the new society. But in the north of Ireland, agrarian strife took a sectarian form, the Catholic "defenders" clashing with the Protestant Peep O'Day Boys and with the Orange Society, founded in 1795, which was strongly conservative. A large French expedition sailed for Ireland in 1796 under the command of General Lazare Hoche, together with the radical Irishman T. Wolfe Tone, who had gone to France at the beginning of the year to obtain help for the United Irishmen. Storms scattered the fleet; and, though some ships reached Bantry Bay, no troops were landed.

The Irish government, threatened by internal conspiracy and foreign invasion, displayed an unconciliatory determination, passing an Insurrection Act in 1796 and suspending the Habeas Corpus Act. During 1797 General Gerard (afterward 1st Viscount) Lake confiscated private arms in the north and suppressed the *Northern Star,* a lively radical newspaper published in Belfast. In the early months of 1798 the tension greatly increased: the United Irishmen were preparing for rebellion, and the government was desperately trying to break their organization. The government managed to arrest a number of the radical leaders in the spring, but in May the rising broke out. Only in eastern Ulster and Wexford was the rising widespread. The rebels in the north were defeated at Antrim and Ballinahinch; while the Wexford rebels defeated the government troops in some engagements but failed to take New Ross and Arklow. By the middle of June large forces of government troops under General Lake were concentrated in Wexford, and the rebels were defeated at Vinegar Hill (June 21, 1798). The rebellion was almost over when a small French force landed near Killala; it won a victory at Castlebar but was soon surrounded and captured. A large number of the Irish rebels were sent off to the penal colonies of Australia.

The chief effect of the rebellion was Prime Minister William Pitt's Act of Union, which abolished the Irish Parliament, Ireland being henceforth represented in the British Parliament at Westminster.

Irish Republican Army (IRA), unofficial semimilitary organization based in the Repub-

lic of Ireland that sought complete Irish independence from the United Kingdom.

The IRA was created in 1919 as a successor to the Irish Volunteers, a militant nationalist organization founded in 1913. The IRA's purpose was to use armed force to render British rule in Ireland ineffective and thus to assist in achieving an independent republic, a goal that was pursued at the political level by Sinn Féin (*q.v.*), the Irish nationalist party. From its inception, however, the IRA operated independently of political control, and in some periods it actually took the upper hand in the independence movement.

During the Irish War of Independence (1919–21), the IRA, under the leadership of Michael Collins, employed guerrilla tactics to force the British government to negotiate. The resulting settlement established two new political entities: the Irish Free State, comprising 26 counties, was granted dominion status within the British Empire; and Northern Ireland, made up of six counties and sometimes called the province of Ulster, remained part of the United Kingdom. These terms, however, proved unacceptable to a substantial number of IRA members. The organization split into two factions, one (under Collins' leadership) supporting the treaty and the other (under Eamon de Valera) opposing it. The former group became the core of the official Irish Free State Army, and the latter group, known as "Irregulars," organized armed resistance against the new independent government.

The ensuing Irish Civil War (1922–23) ended with the capitulation of the Irregulars; however, they neither surrendered their arms nor disbanded. De Valera led a portion of the Irregulars into parliamentary politics, but some members remained committed to a united, Republican Ireland—achieved by force if necessary. Recruiting and illegal drilling by the IRA continued, as did intermittent acts of violence. The organization was declared illegal in 1931 and again in 1936. After a series of IRA bombings in England in 1939, the Irish Parliament took stringent measures against it, including for internment without trial. The IRA's activities against the British during World War II severely embarrassed the government of the Free State, which remained neutral. (At one point the IRA sought assistance from Adolf Hitler to help remove the British from Ireland.) Five IRA leaders were executed, and many more were interned.

After the withdrawal of the Irish Free State from the British Commonwealth in 1949, the IRA turned its attention to agitating for the unification of the predominantly Roman Catholic Irish Republic with predominantly Protestant Northern Ireland. Sporadic incidents occurred during the 1950s and early '60s, but lack of active support by Catholics in Northern Ireland rendered such efforts futile. The situation changed dramatically in the late 1960s when Catholics in Northern Ireland began a civil rights campaign against discrimination in voting, housing, and employment. Violence by extremists against the demonstrators—unhindered by the mostly Protestant police force—set in motion a series of escalating attacks by both sides. IRA units were organized to defend Catholic communities in the province and were sustained by support from units in Ireland. In 1970 four members of the Irish government, including future prime minister Charles Haughey, were tried for importing arms for the IRA (they were acquitted).

Conflict over the use of violence quickly led to another split in the IRA. Following a Sinn Féin conference in Dublin in 1969, the IRA divided into "Official" and "Provisional" wings. Although both factions were committed to a united, socialist Irish Republic, the Officials preferred parliamentary tactics and eschewed violence after 1972, whereas the Provisionals, or "Provos," believed that violence—particularly terrorism—was a necessary part of the struggle against the British.

Beginning in 1970, the Provos carried out bombings, assassinations, and ambushes in a campaign they called the "Long War." In 1973 they expanded their attacks to create terror in mainland Britain. It was estimated that between 1969 and 1994 the IRA killed about 1,800 people, including 600 civilians.

The fortunes of the IRA waxed and waned after 1970. The British policy of interning persons suspected of involvement in the IRA and the killing of 13 Catholic protesters on "Bloody Sunday" (Jan. 30, 1972) strengthened Catholic sympathy for the organization and swelled its ranks. In light of declining support in the late 1970s, the IRA reorganized in 1977 into detached cells to protect against infiltration. Assisted by extensive funding from some Irish-Americans, the IRA procured weapons from international arms dealers and foreign countries. It was estimated that in the late 1990s the IRA had enough weapons in its arsenal to continue its campaign for at least another decade. The IRA became adept at raising money in Northern Ireland through extortion, racketeering, and other illegal activities, and it policed its own community through punishment beatings and mock trials. In 1981, after hunger strikes in which 10 Republican prisoners died (8 were IRA members), the political aspect of the struggle grew to rival the military one, and Sinn Féin began to play a more prominent role. Sinn Féin leaders Gerry Adams and Martin McGuinness, together with John Hume (*q.v.*), head of the Social Democratic and Labour Party (SDLP), sought ways to end the armed struggle and bring Republicans into democratic politics. Convinced by the Irish and British governments that a cease-fire would be rewarded with participation in multiparty talks, in August 1994 the IRA declared a "complete cessation of all military activities," and in October a similar cease-fire was declared by Loyalist paramilitary groups fighting to preserve Northern Ireland's union with Britain. However, Sinn Féin continued to be excluded from the talks, owing to Unionist demands for IRA decommissioning (disarmament) as a condition of Sinn Féin's participation. The IRA's cease-fire ended in February 1996 when a bomb in London killed two people, though it was reinstated in July of the following year. Having agreed that decommissioning would occur as part of the resolution of Northern Ireland's sectarian conflict, the IRA's political representatives swore to uphold principles of nonviolence and were included in the multiparty talks beginning in September 1997.

In April 1998 the participants in the talks approved the Good Friday Agreement, which linked a new power-sharing government in Northern Ireland with IRA decommissioning and other steps aimed at normalizing cross-community relations. Significantly, Republicans agreed that the province would remain a part of Britain for as long as a majority of the population so desired, thus undermining the logic of continued IRA military action. Implementation of key parts of the agreement were impeded when Unionists refused to share power with Sinn Féin in the Northern Ireland Executive Committee, the new executive body of the province, until the IRA decommissioned its weapons or pledged a timetable for doing so. In May 2000 the IRA agreed to allow international inspections of its weapons as a first step in the process of putting them "beyond use," though it continued to resist decommissioning and refused to declare an official end to the Long War. (Pa.A./K.C./Ed.)

Irish Sea, Irish MUIR ÉIREANN, arm of the North Atlantic Ocean that separates Ireland from Great Britain. The Irish Sea is bounded by Scotland on the north, England on the east, Wales on the south, and Ireland on the west. The sea is connected with the Atlantic by the North Channel between Northern Ireland and Scotland and by St. George's Channel between the southeastern tip of Ireland and southwestern Wales. The sea is about 130 miles (210 km) long and 150 miles (240 km) wide. Its total area is approximately 40,000 square miles (100,000 square km). Its greatest depth measures about 576 feet (175 m) at the Mull of Galloway, near the sea's junction with the North Channel. In classical times the Irish Sea was known as Oceanus Hibernicus.

There are two principal islands in the Irish Sea. The Isle of Man lies in the centre of the northern part, and Anglesey lies close to the coast of North Wales. Geologic studies indicate that the Irish Sea originated by rifting during the Tertiary Period (66.4 to 1.6 million years ago), and subsidence of its basins was probably initiated or renewed then.

Surface tidal currents reach a speed of more than 4 knots in St. George's Channel, near the Irish coast, and are locally strong elsewhere. Currents are weakest in the west-central Irish Sea. The greatest ranges of tide occur on the northwest English coast. Tidal streams enter the Irish Sea from both the north and the south, meeting near latitude 54° N, just south of the Isle of Man.

On the sea's eastern shores, Liverpool is the largest British port; Manchester is joined to the Irish Sea by the Manchester Ship Canal. On the west, Dublin, with extensive quays on the River Liffey, handles much of the cargo trade of the Republic of Ireland. Herring and whiting are fished, and there is some trawling for cod and flatfish. Fleetwood, lying north of Liverpool, is the chief British fishing port, and Ardglass, Portavogie, and Kilkeel are important in Northern Ireland. Dun Laoghaire, Howth, Skerries, and Mornington—all near Dublin—are important fishing ports for the Republic of Ireland.

Irish terrier, dog developed in Ireland, one of the oldest breeds of terriers. Nicknamed the "daredevil," it has earned the reputation of being adaptable, loyal, spirited, and recklessly courageous. It served as a messenger and sentinel dog in World War I, and it has been used to hunt and to retrieve game. The Irish terrier

Irish Terrier
© R.T. Wilbie/Animal Photography

is a sturdily built dog with racier lines than those of other terriers. It stands 41.5 to 46 cm (16 to 18 inches), weighs 10 to 12 kg (22 to 26 pounds), and is distinguished by its wiry golden-red to reddish brown coat.

Irish wolfhound, tallest of all dog breeds, a keen-sighted hound used in Ireland for many years to hunt wolves and other game. An ancient breed, first mentioned about the 2nd century AD, it is similar in build to the greyhound but far more powerful. The female, which is smaller than the male, stands a minimum of 76 cm (30 inches) and weighs a min-

imum of 48 kg (105 pounds); male wolfhounds may greatly exceed this size. The coat is rough and is long on the brows and underjaw; colours include gray, brindle, red-brown, black, and white. Noted for speed, strength, and hunting ability, the Irish wolfhound is also valued as a gentle, even-tempered companion.

Irkutsk, *oblast* (province), east-central Russia, occupying an area of 296,500 square miles (767,900 square km) west and north of Lake Baikal. It consists mostly of the hills and broad valleys of the Central Siberian Plateau and of its eastern extension, the Patom Plateau. In the south the *oblast* extends to the eastern crestline of the Sayan Mountains. Dense taiga dominated by Siberian and Dahurian larch, with pine, stone pine, fir, and spruce, occurs throughout the *oblast;* in the south there are small patches of mixed forest and steppe. Soils nearly everywhere are underlain by permafrost. Climate conditions are strongly continental. Within the *oblast* is the Ust-Ordynsky Buryat autonomous *okrug* (*q.v.;* district), now inhabited mainly by Russians (about 60 percent) but also by Buryats (about 30 percent) and Tatars, Ukrainians, and Belorussians.

Irkutsk city is the administrative centre, and nearly all the *oblast*'s population is concentrated along the Trans-Siberian Railroad and the Angara River, where there is a developing industrial region based on Cheremkhovo and Azey coal, Zheleznogorsk-Ilimsky iron ore, and local salt and mica deposits. Hydroelectricity is supplied by the Irkutsk, Bratsk, and Ust-Ilimsk dams on the Angara. Petroleum is piped to the *oblast* from the Volga-Urals oil field. Metallurgical, engineering, and chemical industries have grown rapidly in the main towns. In the northeast, near Bodaybo on the Vitim, gold is mined. Over the rest of the *oblast,* timber working is the only important industry. Agriculture is largely confined to the vicinity of the *oblast*'s towns. Reindeer herding and hunting are carried on by the Evenks of the north. The BAM (Baikal-Amur Magistral) Railroad cuts through the centre of the *oblast,* running east from Ust-Kut. Pop. (1996 est.) 2,795,000.

Irkutsk, city and administrative centre of Irkutsk *oblast* (province), east-central Russia. The city lies along the Angara River at its confluence with the Irkut River. It was founded in 1652, during the first Russian colonization of the area; a fort was built in 1661, and Irkutsk rapidly became the main centre of Cisbaikalia and of the Russian trade route to China and Mongolia. It acquired town status in 1686. Its importance grew after the coming of the Trans-Siberian Railroad in 1898. Modern Irkutsk is one of the major industrial cities of Siberia and is especially noted for a wide range of engineering products. There are railway, aircraft, ship, and vehicle repair yards. Other industries include mica processing and consumer-goods manufacture. The Irkutsk hydroelectric station on the Angara River is within the city; its reservoir extends back to include Lake Baikal. The city of Irkutsk, with attractive embankments along the river and many surviving wooden houses on its tree-lined streets, is an administrative and cultural centre for Eastern Siberia and of the Russian Far East. Irkutsk State University (1918) and the Siberian branch of the Academy of Sciences are among the city's many teaching and research institutes. Pop. (1997 est.) 591,000.

Irminger Current, branch of the warm North Atlantic Current, flowing generally westward along the south coast of Iceland. It divides into two currents west of Iceland. One proceeds northward and then eastward around Iceland, and the other flows westward and then southwestward, merging with the East Greenland and, eventually, the West Greenland currents.

Irnerius, also spelled GUARNERIUS, or WARNERIUS (b. *c.* 1055, Bologna [Italy]—d. in or after 1125), one of the scholars who revived Roman legal studies in Italy and the first of a long series of noted legal glossators and teachers of law (late 11th–middle 13th century) at the University of Bologna. Irnerius' most ambitious work was an annotation of the Corpus Juris Civilis of the Byzantine emperor Justinian I (reigned 527–565).

iroko wood, wood of the iroko tree (*Chlorophora excelsa*), native to the west coast of Africa. It is sometimes called African, or Nigerian, teak, but the iroko is unrelated to the teak family. The wood is tough, dense, and very durable. It is often used in cabinetmaking and paneling as a substitute for teak, which it resembles both in colour (light brown to deep golden-brown) and in grain.

iron (Fe), chemical element, metal of Group VIII of the periodic table, the most used and cheapest metal.

Occurrence, uses, and properties. Iron makes up 5 percent of the Earth's crust and is second in abundance to aluminum among the metals and fourth in abundance behind oxygen, silicon, and aluminum among the elements. Iron is the most abundant element in the Earth as a whole (about 35 percent) and is relatively plentiful in the Sun and other stars. In the crust the free metal is rare, occurring as terrestrial iron (alloyed with 2–3 percent nickel) in basaltic rocks in Greenland and carbonaceous sediments in the United States (Missouri) and as a low-nickel meteoric iron (5–7 percent nickel), kamacite. Nickel-iron, a native alloy, occurs in terrestrial deposits (21–64 percent iron, 77–34 percent nickel) and in meteorites as taenite (62–75 percent iron, 37–24 percent nickel). (For mineralogical properties of native iron and nickel-iron, *see* native elements [table].) Meteorites are classified as iron, iron-stone, or stony according to the relative proportion of their iron and silicate-mineral content. Iron is also found combined with other elements in hundreds of minerals; of greatest importance as iron ore are hematite, magnetite, limonite, and siderite. The metal is extracted by smelting with carbon (coke) and limestone. For specific information on the mining and production of iron, *see* MACROPAEDIA: Industries, Extraction and Processing.

The average quantity of iron in the human body is about 4.5 g (about 0.004 percent), of which approximately 65 percent is in the form of hemoglobin, which transports molecular oxygen from the lungs throughout the body; 1 percent is in the various enzymes that control intracellular oxidation; and most of the rest stored in the body (liver, spleen, bone marrow) for future conversion to hemoglobin. Red meat, egg yolk, carrots, fruit, whole wheat, and green vegetables contribute most of the 10–20 milligrams of iron required each day by the average adult. For the treatment of hypochromic anemias (caused by iron deficiency), a large number of organic or inorganic iron (usually ferrous) compounds are used.

Iron, as commonly available, nearly always contains small amounts of carbon, which are picked up from the coke during smelting. These modify its properties, from hard and brittle cast irons containing up to 4 percent carbon to more malleable low-carbon steels containing less than 0.1 percent carbon. Three true allotropes of iron in its pure form occur. Delta iron, characterized by a body-centred-cubic crystal structure, is stable above a temperature of 1,394° C (2,541° F). Below this temperature there is a transition to gamma iron, which has a face-centred-cubic structure and is paramagnetic (weakly affected by a magnet); its ability to form solid solutions with carbon is important in steelmaking. At 912° C (1,674° F) there is a transition to paramagnetic alpha iron, which is also body-centred cubic in structure. Below 770° C (1,420° F), alpha iron becomes ferromagnetic, indicating a change in electronic structure but no change in crystal structure; above 770° C (its Curie point) it loses its ferromagnetism altogether. Alpha iron is a soft, ductile, gray-white metal of high tensile strength. Natural iron is a mixture of four stable isotopes: iron-56 (91.66 percent), iron-54 (5.82 percent), iron-57 (2.19 percent), and iron-58 (0.33 percent). Iron-57, which exhibits a marked Mössbauer effect (recoil-free gamma-ray resonance absorption), has been used in studying magnetism and hemoglobin derivatives and for making a very precise nuclear clock.

Compounds. The most important oxidation states of iron are +2 and +3, though a number of +4 and +6 states are known. Iron(II) compounds are designated ferrous and contain the pale green Fe^{2+} ion or complex ions. Iron(III) compounds are called ferric and contain the Fe^{3+} ion (which is yellow to orange to brown, depending on the extent of hydrolysis) or complex ions.

Three oxygen compounds of iron are known: iron(II) oxide, or ferrous oxide, FeO; iron(III) oxide, or ferric oxide, Fe_2O_3; and ferrosoferric oxide, or ferroferric oxide, Fe_3O_4, which contains iron in both oxidation states. Ferrous oxide is a greenish to black powder used primarily as a pigment for glasses. It occurs in nature as the mineral wuestite, and it can be prepared by heating an iron(II) compound in the absence of air or by passing hydrogen over ferric oxide. Ferric oxide is a reddish-brown to black powder that occurs naturally as the mineral hematite. It can be produced synthetically by igniting virtually any ferrous compound in air. Ferric oxide is the basis of a series of pigments ranging from yellow to a red known as Venetian red. The finely powdered red form, often called jewelers' rouge, is used for polishing precious metals and diamonds, as well as in cosmetics. Ferric oxide forms a number of hydrates with variable structures and compositions. A common form is iron rust, produced by the combined action of moisture, carbon dioxide, and oxygen in the air on metallic iron. Ferrosoferric oxide occurs as the mineral magnetite in the form of magnetic black or red-black crystals. It is prepared by passing steam over red-hot iron. The oxide is widely employed in ferrites, substances with high magnetic permeability and high electrical resistivity used in certain computer memories and coatings for magnetic tape. It is also used as a pigment and a polishing agent.

The action of sulfuric acid on iron results in the formation of two sulfur compounds: iron(II) sulfate, or ferrous sulfate, $FeSO_4$, which is commonly available as the heptahydrate $FeSO_4{\cdot}7H_2O$; and iron(III) sulfate, or ferric sulfate, $Fe_2(SO_4)_3$. Ferrous sulfate heptahydrate, known in commerce as green vitriol, or copperas, is obtained as a by-product of industrial processes using iron ores that have been treated with sulfuric acid. It serves as a starting material for the manufacture of various other iron(II) compounds and as a reducing agent. It is also employed in making inks, fertilizers, and pesticides and for iron electroplating. Ferric sulfate is produced on a large scale by adding sulfuric acid and an oxidizing agent (*e.g.,* nitric acid or hydrogen peroxide) to a hot solution of iron(II) sulfate. It is used to make iron alums and other iron(III) compounds, as a coagulant in water purification and sewage treatment, and as a mordant (fixative) in textile dyeing and printing.

With chlorine, iron forms another group of industrially important compounds: iron(II) chloride, or ferrous chloride, $FeCl_2$; and iron(III) chloride, or ferric chloride, $FeCl_3$. Ferrous chloride is obtained as yellow-green deliquescent (moisture-absorbing) crystals by

passing dry hydrogen chloride gas over red-hot iron. It also can be prepared in hydrated form, $FeCl_2 \cdot H_2O$, by dissolving metallic iron in hydrochloric acid. It is used in the dye industry as a mordant and as a reducing agent. Ferric chloride is generally prepared from ferrous chloride through the action of chloride or nitric acid. It is used to make many other iron(III) compounds and as a chlorinating agent for silver, copper, and some organic compounds. Treating a solution of trivalent iron with the complex iron cyanide hexacyanoferrate(II), $[Fe(CH_6)]^{4-}$, yields a deep-blue precipitate called Prussian blue (*q.v.*). This pigment has a slight reddish tint and is employed in paints, enamels, and lacquers.

A number of iron compounds have been found medically useful. For example, ferrous gluconate, $Fe(C_6H_{11}O_7)_2 \cdot 2H_2O$, and ferric pyrophosphate, $Fe_4(P_2O_7) \cdot xH_2O$, are among the compounds frequently used to treat anemia. Various ferric salts, which act as coagulants, are applied to wounds to promote healing.

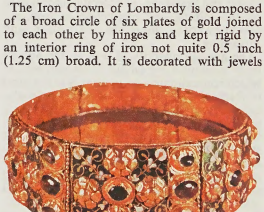
For statistical data on national mine production of ore and reserves (or production capacity), *see* mining (table).

atomic number	26
atomic weight	55.847
melting point	1,538° C (2,800° F)
boiling point	3,000° C (5,432° F)
specific gravity	7.86 (20° C)
valence	2, 3, 4, 6
electronic config.	2-8-14-2 or $(Ar)3d^64s^2$

Iron Act (1750), in U.S. colonial history, one of the British Trade and Navigation acts; it was intended to stem the development of colonial manufacturing in competition with home industry by restricting the growth of the American iron industry to the supply of raw metals. To meet British needs, pig iron and iron bar made in the colonies were permitted to enter England duty free. In the colonies the following were prohibited: the new establishment of furnaces that produced steel for tools, and the erection of rolling and slitting mills and of plating forges; the manufacture of hardware; and the export of colonial iron beyond the empire. The British policy was successful in its goal of suppressing the manufacture of finished iron goods in the colonies, but colonial production of basic iron and pig iron (which were then shipped to England) flourished under the Iron Act.

Iron Age, final technological and cultural stage in the Stone–Bronze–Iron-Age sequence. The date of the full Iron Age, in which this metal for the most part replaced bronze in implements and weapons, varied geographically, beginning in the Middle East and southeastern Europe about 1200 BC but in China not until about 600 BC. Although in the Middle East iron had limited use as a scarce and precious metal as early as 3000 BC, there is no indication that people at that time recognized its superior qualities over those of bronze. Between 1200 and 1000, however, the export of knowledge of iron metallurgy and of iron objects was rapid and widespread. With the large-scale production of iron implements came new patterns of more permanent settlement. On the other hand, utilization of iron for weapons put arms in the hands of the masses for the first time and set off a series of large-scale movements of peoples that did not end for 2,000 years and that changed the face of Europe and Asia.

Iron Cross, German EISERNE KREUZ, Prussian military decoration instituted in 1813 by Frederick William III for distinguished service in the Prussian War of Liberation. Use of the decoration was revived by William I for the Franco-Prussian War of 1870, recreated in 1914 for World War I, and last revived by Adolf Hitler on Sept. 1, 1939, the same day that German forces invaded Poland.



Originally, the Cross had three classes, listed in ascending order: second class, first class, and Grand Cross, the latter being awarded only 19 times through the end of World War I (1918). A special class, the Grand Cross on a radiant star, was created especially for Field Marshal G.L. Blücher after the Battle of Waterloo (1815). It was awarded only once more, to Field Marshal Paul von Hindenburg in 1918. A civilian order of the Cross was created for and conferred upon (1915) the English Germanophile Houston Stewart Chamberlain. From the time of its creation until the end of World War I, 5,719,300 Iron Crosses first and second class were awarded.

During World War II, Hitler decreed the Cross could be conferred on Germans and citizens of countries allied with Germany for exceptional bravery and/or leadership in the face of the enemy. The number of grades was expanded to eight, which, listed in ascending order, are: second class; first class; Knight's Cross; Knight's Cross with oak leaves; with oak leaves and swords; with oak leaves, swords, and diamonds; with golden oak leaves, swords, and diamonds (conferred only once); and an even larger Grand Cross (awarded only once, to Hermann Göring for the Air Force's part in the 1940 French campaign).

The basic design of the medal has remained constant, that of a Maltese Cross of cast iron edged with silver. The World War II design had "1939" etched on the bottom arm, where formerly the dates had been "1813," "1870," or "1914." The reverse side of the World War II medal had "1813" inscribed. The World War II badge also had a swastika, which replaced the previous symbols of the crown and royal cipher. A West German statute of 1957 permitted the Iron Cross to be worn only with the swastika is removed.

Iron Crown of Lombardy, originally an armlet or perhaps a votive crown, as suggested by its small size, that was presented to the Cathedral of Monza, where it is preserved as a holy relic. No firm record exists of its use for coronations before that of Henry VII as Holy Roman emperor in 1312.

The Iron Crown of Lombardy is composed of a broad circle of six plates of gold joined to each other by hinges and kept rigid by an interior ring of iron not quite 0.5 inch (1.25 cm) broad. It is decorated with jewels

Iron Crown of Lombardy, 9th century; in the collection of the Cathedral of Monza, Italy
SCALA—Art Resource

and translucent enamel and is apparently of Byzantine workmanship. The iron ring does not appear in early descriptions, and possibly it was added in the 12th century; only about 1585 or later was it described as being made from a nail used at the Crucifixion of Christ. After much argument the Congregation of Relics at Rome in 1717, though giving no definite ruling on the point, authorized the exposure of the crown for veneration.

Iron Curtain, the political, military, and ideological barrier erected by the Soviet Union after World War II to seal off itself and its dependent eastern European allies from open contact with the West and other noncommunist areas. The term Iron Curtain had been in occasional and varied use as a metaphor since the 19th century, but it only came to prominence after it was used by the former British prime minister Winston Churchill in a speech at Fulton, Mo., U.S., on March 5, 1946, when he said of the communist states, "From Stettin in the Baltic to Trieste in the Adriatic, an iron curtain has descended across the Continent."

The restrictions and the rigidity of the Iron Curtain were somewhat reduced in the years following Joseph Stalin's death in 1953, although the construction of the Berlin Wall in 1961 restored them. The Iron Curtain largely ceased to exist in 1989–90 with the communists' abandonment of one-party rule in eastern Europe.

iron-deficiency anemia, most frequent type of anemia, which may develop when the body's iron loss is high and its iron stores are depleted (*e.g.,* during periods of rapid growth, pregnancy, or menstruation or other sources of chronic blood loss) or when a person's dietary iron intake is low or his assimilation of iron is inefficient (*e.g.,* starvation, intestinal parasite infestation, removal of part or all of stomach). It is estimated that, in the United States, up to 20 percent of small children and 5–10 percent of women ages 15–45 suffer from iron-deficiency anemia. Symptoms include weakness, fatigue, and sometimes pallor, shortness of breath, coldness of extremities, changeable appetite, sore tongue, loss of hair, brittle fingernails, or dry skin. In advanced cases, the red blood cells are small and pale with a low hemoglobin content, body iron stores are depleted, free iron in the blood plasma is decreased, the iron-binding capacity of the plasma increased, and the ability of the intestines to assimilate iron from the diet increased. Treatment consists of the administration of iron; quick improvement is common.

Iron Gate, Romanian PORŢILE DE FIER, Serbo-Croatian GVOZDENA VRATA, the last gorge of the Djerdap gorge system on the Danube River, dividing the Carpathian and Balkan mountains and forming part of the boundary between Serbia and Montenegro and Romania. It is about 2 miles (3 km) long and 530 feet (162 m) wide, with towering rock cliffs that make it one of the most dramatic natural wonders of Europe. Near the town of Sip a large rock reef (called Perigrada) obstructed nearly the whole width of the river until the construction of the Sip Canal in 1896. A joint development project involving Romania and the former Yugoslavia on the Danube River (including a dam and hydroelectric-power plant) was completed in 1972, providing equal amounts of energy to each country and quadrupling the annual tonnage of shipping. The name Iron Gate is commonly applied to the whole 90-mile- (145-km-) long gorge system.

Iron Guard, Romanian GARDA DE FIER, Romanian fascist organization that constituted a major social and political force between 1930 and 1941. In 1927 Corneliu Zelea Codreanu founded the Legion of the Archangel Michael, which later became known as the Legion or Legionary Movement; it was committed to the "Christian and racial" renovation of Romania and fed on anti-Semitism and mystical nationalism. Codreanu established the Iron Guard, a militant subdivision of the Legion, in 1930 and its name became the one commonly applied by outsiders to the movement as a whole. The Legion was dissolved by government fiat in December 1933, but it reappeared as Totul Pentru Ţară (Everything for the Fatherland) and flourished, with some support from King Carol II. Suppressed again after King Carol proclaimed a personal dictatorship (1938), it was revived when the king abdicated (1940). Guardists served in General Ion Antonescu's cabinets (1940–41), but the group was

discredited when the Germans disavowed its pro-German revolt against Antonescu in January 1941.

Iron Knob, town, northeastern Eyre Peninsula, South Australia, 247 miles (397 km) northwest of Adelaide by rail. It is the centre for one of the richest deposits of iron ore in the Southern Hemisphere. Mining rights were acquired in 1897, and in 1901 the Broken Hill Proprietary Company, Ltd. (BHP), began developing the deposits of iron ore in Iron Knob hill. The modern town lies in an extremely arid region and is supplied with water from the Morgan-Whyalla pipelines. The hematite ore is shipped by rail to the port of Whyalla, 35 miles (56 km) southeast. Pop. (1991) 293.

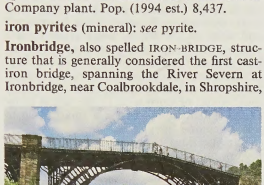
iron mask, the man in the, French L'HOMME AU MASQUE DE FER, political prisoner famous in French history and legend who died in the Bastille in 1703 during the reign of Louis XIV. There is no historical evidence that the mask was made of anything but black velvet (*velours*), and only afterward did legend convert its material into iron.

He was first imprisoned at Pignerol (Pinerolo, in Piedmont) sometime before 1681, then at other prisons before finally being transferred to the Bastille in Paris on Sept. 18, 1698; he died there on Nov. 19, 1703. Buried the next day in the parish cemetery of Saint-Paul, he was registered there under the name of "Marchioly," and his age was given as "about 45." His several moves during his lifetime corresponded with the successive postings of the prison governor Benigne D'Auvergne de Saint-Mars, in whose charge he was evidently especially committed.

The identity of the man in the mask was already a mystery before his death. Of the dozen or more hypotheses, only two have proven tenable: those for Ercole Matthioli and for Eustache Dauger.

Matthioli, a minister of Ferdinand Charles, duke of Mantua, was involved in a duplicitous treaty with Louis XIV, who had him quietly abducted and imprisoned at Pinerolo (1679). It is generally agreed, however, that Matthioli died in the Îles Sainte-Marguerite in April 1694 and that the prisoner in the mask was Eustache Dauger.

The correspondence of Louis XIV's minister Louvois indicates that Dauger, a valet, was arrested on his orders in July 1669. At Pinerolo Dauger served as the valet of another prisoner, Nicolas Fouquet (*q.v.*), and after Fouquet's death in 1680 he was kept in close confinement with another man who had also served Fouquet. From Pinerolo, Saint-Mars took him in 1681 to Exilles (whereas Matthioli then stayed behind), before moving to the Îles in 1687. It is possible that Louvois, an enemy of Fouquet, wanted these prisoners kept in custody, lest they should divulge secrets that Fouquet could have told them. Perhaps this consideration, rather more than his original crime, explains the absolute secrecy to which Dauger was condemned and the precaution of the mask.

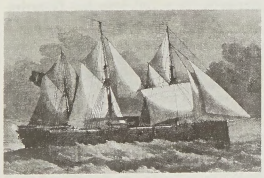


iron meteorite, any meteorite consisting mainly of iron, usually combined with small amounts of nickel. When such meteorites, called irons, fall through the atmosphere, a thin, black crust of iron oxide may form that quickly weathers to rust. Though irons constitute only about 5 percent of meteorite falls, they are relatively easy to distinguish from terrestrial rock and last longer in soil than do stony meteorites; thus irons are found more often than stony or stony-iron meteorites. (The latter, containing stone and iron in about equal amounts, are the rarest group of finds.)

Irons are composed of two minerals, nickel-poor kamacite and nickel-rich taenite, which often occur together. Irons are divided into three groups grading into one another: hexahedrites, octahedrites, and ataxites. Hexahedrites are usually made up entirely of kamacite. Octahedrites contain both kamacite and taenite and constitute the largest group of iron finds. Most ataxites are pure taenite, and they are the rarest group; some ataxite finds may contain up to 69 percent nickel.

Iron Mountain, city, seat (1891) of Dickinson county, southwestern Upper Peninsula of Michigan, U.S., 52 miles (84 km) west of Escanaba. Settled in 1879 and incorporated in 1889, it was named for its proximity to a bluff heavily stratified with iron ore. In the 1930s underground mining became uneconomic, but the industry has revived with open-pit mining and the pelletizing of ore. Tourism and winter sports (based at Pine Mountain ski resort and Vulcan USA) are significant economic factors. Manufactures include wood products, chemicals, and machinery. Guided tours are given of the underground shafts of the Iron Mountain Iron Mine, which ceased production in 1945. The adjoining city of Kingsford (incorporated village, 1925; city, 1947) developed with the establishment of a Ford Motor Company plant. Pop. (1994 est.) 8,437.

iron pyrites (mineral): *see* pyrite.

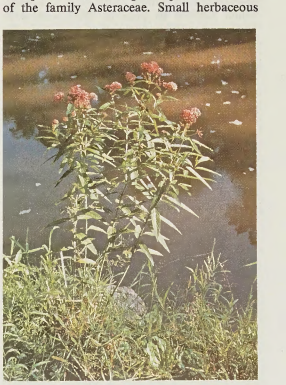


Ironbridge, also spelled IRON-BRIDGE, structure that is generally considered the first cast-iron bridge, spanning the River Severn at Ironbridge, near Coalbrookdale, in Shropshire,

Ironbridge
© Peter Scholey/Robert Harding Picture Library

England. It is now a British national monument. The bridge's semicircular arch spans 100.5 feet (30.6 m) and has five arch ribs, each cast in two halves. Designed by Abraham Darby or Thomas Pritchard, the bridge was erected by Darby in 1777–79. (A similar bridge had been cast in France a few years earlier but not erected.) The bridge is still used for pedestrian traffic, despite a slight humping of the arch.

ironclad, type of warship developed in Europe and the United States in the mid-19th century, characterized by the iron casemates that protected the hull. In the Crimean War (1853–56) the French and British successfully attacked Russian fortifications with "floating batteries," ironclad barges mounting heavy guns, that were towed into position. The French built the first iron warship, the *Gloire,* completed in 1859. The *Gloire*'s iron plates were about 4.5 inches (11 cm) thick



French ironclad *Gloire,* engraving by Smythe after a painting by A.W. Weedon
By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd.

and backed by heavy timber. Displacing 5,617 tons, the vessel carried 36 guns. A sister ship, *Couronne,* soon followed; two British ironclads, the *Black Prince* and *Warrior,* each of 9,210 tons and capable of 14.5 knots, were completed in 1861 and 1862. Meanwhile, at the outbreak of the American Civil War in 1861, Captain James Buchanan Eads of St. Louis, Mo., constructed shallow-draft armoured gunboats for use on the Mississippi River and its tributaries. A flotilla of them captured Confederate Fort Henry on Feb. 6, 1862, and successfully engaged a Confederate squadron in April 1862 at Memphis, Tenn., the first ironclads to fight enemy warships. On March 9, 1862, the *Monitor* and the *Merrimack* (correctly, the *Virginia*) fought their historic duel off Hampton Roads, Va., the first battle between ironclads.

A number of refinements in the years following converted the ironclad into the battleship (*q.v.*).

ironstone china, type of stoneware introduced in England early in the 19th century by Staffordshire potters who sought to develop a porcelain substitute that could be mass-produced. The result of their experiments was a dense, hard, durable stoneware that came to be known by several names—*e.g.,* semi-porcelain, opaque porcelain, English porcelain, stone china, new stone—all of which were used to describe essentially the same product. The first successful manufacture of ironstone was achieved in 1800 by William Turner of the Lane End potteries at Longton, Staffordshire. In 1805 Turner sold his patent to Josiah Spode the Second, Stoke-upon-Trent, who called his bluish gray ceramic products stone china and new stone. A patent was granted to Charles James Mason, Lane Delph, in 1813 for the manufacture of "English porcelain," a white ware that he marketed as Mason's Ironstone China. Job and George Ridgway made a similar product under the name stone china. The wares, usually service pieces and vases based on Oriental shapes, were most often decorated with painted Chinese and Japanese motifs, some of which were executed by transfer printing. An ironstone china called graniteware, or white granite, was a standard of American potteries from about 1860 to 1900.

ironweed, any of about 500 species of perennial plants constituting the genus *Vernonia* of the family Asteraceae. Small herbaceous

Western ironweed (*Vernonia fasciculata*)
Dan Morrill

species are distributed throughout the world, while shrubs and trees are native primarily to tropical regions.

Members of the genus have lance-shaped, toothed leaves that alternate along the stem; clusters of flower heads composed only of disk flowers (no ray flowers); and a ring of overlapping bracts (leaflike structures) below the flower heads. Some autumn-blooming species are cultivated as border plants for their attractive white, purple, or pink flower clusters.

Ironwood, city, Gogebic county, western Upper Peninsula of Michigan, U.S. Ironwood lies along the Montreal River at the Wisconsin border, 90 miles (145 km) east of Duluth, Minn. It is the retail centre of a bistate urban complex in the Gogebic Range that includes

Statue of Hiawatha, Ironwood, Mich.
Milt and Joan Mann from CameraMann

the communities of Wakefield and Bessemer (Michigan; east) and Hurley, Saxon, and Iron Belt (Wisconsin; west). The settlement was laid out in 1885 and named for iron dealer James R. ("Iron") Wood. The Gogebic Range was formerly the site of a prosperous deep-shaft iron-mining industry. Iron mining, which reached its peak in 1920, ceased in 1967, and many miners shifted to work in the copper mines in adjacent Ontonagon county. Ironwood's economy also relies upon tourism, food processing, and the manufacture of clothing and sports equipment. Ironwood is the seat of Gogebic Community College (1932). It is headquarters for the Ottawa National Forest and is a recreation centre noted for its skiing. A 52-foot (16-metre) statue of Hiawatha is an imposing city landmark. Inc. village, 1887; city, 1889. Pop. (1994 est.) 6,806.

ironwork, architectural features of buildings, artwork, utensils, and weapons made of iron.

A brief treatment of ironwork follows. For full treatment, *see* MACROPAEDIA: Decorative Arts and Furnishings: *Metalwork*.

The earliest iron artifacts, dating from about 4000 BC, were made from meteoric iron and were therefore rare. Smelting iron from its ores came into general use about 1400 BC in the Middle East. During the next 500 years iron began to displace bronze in the manufacture of weapons and tools. Before the European Middle Ages, iron was mainly a utilitarian metal, with only secondary efforts in decoration. Arms, armour, and firearms were often decorated, however, usually simply but sometimes with elaborate ornamentation.

During the Middle Ages, iron began to achieve wide uses for a variety of domestic needs. Ironclad doors offered an added degree of protection but also provided new opportunities for decoration. Chests wrapped in iron provided both security and beauty. Wrought iron gates, grilles, railings, and balustrades not only fulfilled a functional requirement for strong structures but also provided the artisan with a new means for expressing ornamentation in architecture. From the 16th century, ironwork developed highly ornate designs, with scrolls, leaves, flowers, and interlaced patterns. As iron became more common, it found wider use in household utensils, fireplace implements, stoves, grates, pans, cauldrons, locks, and hardware. Lanterns, torch holders, candleholders, and chandeliers were also wrought from iron. Most ironwork was forged with hammer and anvil until the 19th century, when cast ironwork became common.

irony, language device, either in spoken or written form (verbal irony), in which the real meaning is concealed or contradicted by the literal meanings of the words, or in a theatrical situation (dramatic irony) in which there is an incongruity between what is expected and what occurs. Verbal irony arises from a sophisticated or resigned awareness of contrast between what is and what ought to be and expresses a controlled pathos without sentimentality. It is a form of indirection that avoids overt praise or censure as in the casual irony of the statement "That was a smart thing to do!" (meaning "very foolish").

Dramatic irony depends on the structure of a work rather than its use of words. In plays it is often created by the audience's awareness of a fate in store for the characters that they themselves are unaware of, as when Agamemnon accepts the flattering invitation to walk upon the purple carpet that is to become his shroud. The surprise ending of an O. Henry short story is also an example of dramatic irony, as is the more subtly achieved effect of Anton Chekhov's story "Lady with the Dog," in which an accomplished Don Juan engages in a routine flirtation only to find himself seduced into a passionate lifelong commitment to a woman who is no different from all the others.

The term irony has its roots in the Greek comic character Eiron, a clever underdog, who by his wit repeatedly triumphs over the boastful character Alazon. The Socratic irony of the Platonic dialogues derives from this comic origin. Feigning ignorance and humility, Socrates goes about asking silly and obvious questions of all sorts of people on all sorts of subjects, only to expose their ignorance as more profound than his own. The nonliterary use of irony is usually considered sarcasm.

Iroquois, any member of the Iroquois Confederacy or, more broadly, of the North American Indian tribes speaking a language of the Iroquoian family—notably the Cayuga, Cherokee, Huron, Mohawk, Oneida, Onondaga, Seneca, and Tuscarora. The Iroquoian linguistic groups occupied a continuous territory around Lakes Ontario, Huron, and Erie, in present-day New York state and Pennsylvania (U.S.) and southern Ontario and Quebec (Canada).

The Iroquois-speaking tribes were semisedentary, practiced agriculture, palisaded their villages in time of need, and dwelt in longhouses that lodged many families. Elm bark was used for sheathing these houses, for making such containers as dishes and barrels, and for building canoes. A village band of several hundred persons was the social and economic unit. Groups of men built houses, erected palisades, fished, hunted, traveled, traded, gamed, defended the village against attacks, and went on the warpath. Outside the towns, parties of women, each directed by a matron, worked fields of corn (maize), beans, and squash. After harvest, family deer-hunting parties ranged far into the forests to camp, returning home at midwinter. Spring runs of fish drew families to nearby streams and lake inlets.

The longhouse family was the basic unit of Iroquois society. Households, or blood lineages, were projected into clans, clans into moieties (half tribes), moieties into tribes or nations, and nations into confederacies. Kinship and locality were the bases for political life. Each community had its council of adult males, who guided the village chief or chiefs. The Iroquois were fond of meetings, spending considerable time in council. Groupings for council were determined by locality, sex, age, and the specific question at hand; and each had its own protocol and devices for gaining consensus. An elaborate Iroquois cosmology was based on the myth of a woman who fell from the sky, and it featured deluge and earth-diver motifs. No other tribes showed such a preoccupation in their mythology with supernatural aggression and cruelty, sorcery, torture, and cannibalism. This lore was relieved by occasional beautiful star myths and journeys to the otherworld. Their formal religion consisted of six agricultural festivals featuring long prayers of thanks. There were also rites for sanctioning political activity, such as treaty making. Much of this culture still survives.

Warfare was ingrained in Iroquois society, and self-respect was dependent on achieving personal glory. War captives were often enslaved or adopted to replace dead kinsmen and made up much of the Iroquois population in the late 17th century.

Iroquois Confederacy, also called IROQUOIS LEAGUE, FIVE NATIONS, or (from 1722) SIX NATIONS, confederation of five (later six) Indian tribes across upper New York state that during the 17th and 18th centuries played a strategic role in the struggle between the French and British for mastery of North America. The five Iroquois nations, characterizing themselves as "the people of the longhouse," were the Mohawk, Oneida, Onondaga, Cayuga, and Seneca. After the Tuscarora joined in 1722, the confederacy became known to the English as the Six Nations and was recognized as such at Albany, N.Y. (1722).

Tradition credits the formation of the confederacy, between 1570 and 1600, to Dekanawidah, born a Huron, who is said to have persuaded Hiawatha, an Onondaga living among Mohawks, to abandon cannibalism and advance "peace, civil authority, righteousness, and the great law" as sanctions for confederation. Cemented mainly by their desire to stand together against invasion, the tribes united in a common council composed of clan and village chiefs; each tribe had one vote, and unanimity was the rule. The joint jurisdiction of 50 peace chiefs, known as sachems, embraced all civil affairs at the intertribal level.

The Iroquois Confederacy differed from other American Indian confederacies in the northeastern woodlands primarily in being better organized, more consciously defined, and more effective. The Iroquois used elaborately ritualized systems for choosing leaders and making important decisions. They persuaded colonial governments to use these rituals in their joint negotiations, and they fostered a tradition of political sagacity based on ceremonial sanction rather than on the occasional outstanding individual leader. Because the league lacked administrative control, the nations did not always act in unison; but spectacular successes in warfare compensated for this and were possible because of security at home.

During the formative period of the confederacy about 1600, the Five Nations remained concentrated in what is now central and upper New York state, barely holding their own with the neighbouring Huron and Mahican, who were supplied with guns through their

trade with the Dutch. By 1628, however, the Mohawk had emerged from their secluded woodlands to defeat the Mahican and lay the Hudson River valley tribes and New England tribes under tribute for goods and wampum. The Mohawk traded beaver pelts to the English and Dutch in exchange for firearms, and the resulting depletion of local beaver populations drove the confederacy members to wage war against far-flung tribal enemies in order to procure more supplies of beaver. In the years from 1648 to 1656, the confederacy turned west and dispersed the Huron, Tionontati, Neutral, and Erie tribes. The Andaste succumbed to the confederacy in 1675, and then various eastern Siouan allies of the Andaste were attacked. By the 1750s most of the tribes of the Piedmont had been subdued, incorporated, or destroyed by the league.

The Iroquois also came into conflict with the French in the later 17th century. The French were allies of their enemies, the Algonquins and Hurons, and after the Iroquois had destroyed the Huron confederacy in 1648–50, they launched devastating raids on New France for the next decade and a half. They were then temporarily checked by successive French expeditions against them in 1666 and 1687, but, after the latter attack, led by the Marquis de Denonville, the Iroquois once again carried the fight into the heart of French territory, wiping out Lachine, near Montreal, in 1689. These wars were finally ended by a series of successful campaigns by New France's governor, the Count de Frontenac, against the Iroquois in 1693–96.

For a century and a quarter before the American Revolution, the Iroquois stood athwart the path from Albany to the Great Lakes, keeping the route from permanent settlement by the French and containing the Dutch and the English. In the 18th century the Six Nations remained consistent and bitter enemies of the French, who were allied with their traditional foes. The Iroquois became dependent on the British in Albany for European goods (which were cheaper there than in Montreal), and thus Albany was never attacked. The Iroquois' success in maintaining their autonomy vis-à-vis both the French and English was a remarkable achievement for an aboriginal people that could field only 2,200 men from a total population of scarcely 12,000.

During the U.S. War of Independence, a schism developed among the Iroquois. The Oneida and Tuscarora espoused the American cause, while the rest of the league, led by Chief Joseph Brant's Mohawk Loyalists, fought for the British out of Niagara, decimating several isolated American settlements. The fields, orchards, and granaries, as well as the morale of the Iroquois, were destroyed in 1779 when U.S. Major General John Sullivan led a retaliatory expedition of 4,000 Americans against them, defeating them near present-day Elmira, N.Y. Having acknowledged defeat in the Second Treaty of Fort Stanwix (1784), the Iroquois Confederacy effectively came to an end. In a treaty that was made at Canandaigua, N.Y., 10 years later, the Iroquois and the United States each pledged not to disturb the other in lands that had been relinquished or reserved. Of the Six Nations, the Onondaga, Seneca, and Tuscarora remained in New York, eventually settling on reservations; the Mohawk and Cayuga withdrew to Canada; and, a generation later, the Oneida departed for Wisconsin.

Iroquois Falls, town, Cochrane district, east-central Ontario, Canada. It lies along the Abitibi River, just west of Lake Abitibi, 190 miles (300 km) north-northwest of North Bay. The town was named for the falls on the river, where, according to Indian legend, Iroquois braves, asleep in their war canoes, were cut loose by captive Huron women and swept to their deaths. It originated as a company town in 1912–13, when the provincial government granted the townsite to the Abitibi Power and Paper Company. Iroquois Falls has planned parks, schools, and a hospital. The nearby falls provide hydroelectric power for the company's huge pulp, paper, newsprint, and sulfite mills. The town, 35 miles (56 km) northeast of Timmins, is just east of the Ontario Northland Railway. Inc. 1915. Pop. (1991) 5,999.

irrational number, any real number that cannot be expressed as the quotient of two integers. For example, there is no number among integers and fractions that solves the problem of finding the square root of two. A counterpart problem in measurement would be to find the length of the diagonal of a square whose side is one unit long; there is no subdivision of the unit length that will divide evenly into the length of the diagonal. It thus became necessary in the history of mathematics to extend the concept of number to include irrational numbers. Each irrational number can be expressed as an infinite decimal expansion with no regularly repeating digit or group of digits. Together with the rational numbers, they form the real numbers (*see* real number).

irrationalism, a 19th- and early 20th-century philosophical trend that claimed to enrich man's apprehension of life by expanding it beyond the rational to its fuller dimensions. Rooted either in metaphysics or in an awareness of the uniqueness of human experience, irrationalism stressed the dimensions of instinct, feeling, and will as over and against reason. The term is used chiefly by continental European philosophers, who regard irrationalism as one of several strong currents flowing into the 20th century.

There were irrationalists before the 19th century. In ancient Greek culture—which is usually assessed as rationalistic—a Dionysian (*i.e.*, instinctive) strain can be discerned in the works of the poet Pindar, in the dramatists, and even in such philosophers as Pythagoras and Empedocles and in Plato. In early modern philosophy—even during the ascendancy of Cartesian rationalism—Blaise Pascal turned from reason to an Augustinian faith, convinced that "the heart has its reasons" unknown to reason as such.

The main tide of irrationalism, like that of literary romanticism—itself a form of irrationalism—followed the Age of Reason and was a reaction to it. Irrationalism found much in the life of the spirit and in human history that could not be dealt with by the rational methods of science. Under the influence of Charles Darwin and later Sigmund Freud, irrationalism began to explore the biological and subconscious roots of experience. Pragmatism, existentialism, and vitalism (or "life philosophy") all arose as expressions of this expanded view of human life and thought.

For Arthur Schopenhauer, a typical 19th-century irrationalist, voluntarism expressed the essence of reality—a blind, purposeless will permeating all existence. If mind, then, is an emergent from mute biological process, it is natural to conclude, as the pragmatists did, that it evolved as an instrument for practical adjustment—not as an organ for the rational plumbing of metaphysics. Charles Sanders Peirce and William James thus argued that ideas are to be assessed not in terms of logic but in terms of their practical results when put to the test of action.

Irrationalism is also expressed in the historicism and relativism of Wilhelm Dilthey, who saw all knowledge as conditioned by one's private historical perspective and who thus urged the importance of the *Geisteswissenschaften* (the humanities). Johann Georg Hamann, spurning speculation, sought truth in feeling, faith, and experience, making personal convictions its ultimate criterion. Friedrich Heinrich Jacobi exalted the certitude and clarity of faith to the detriment of intellectual knowledge and sensation.

Friedrich Schelling and Henri Bergson, who were preoccupied with the uniqueness of human experience, turned to intuitionism, which "sees things invisible to science." Reason itself was not repudiated; it had simply lost its commanding role inasmuch as personal insights are impervious to testing. In its aspect as a vitalism, Bergson's philosophy—as well as that of Friedrich Nietzsche—was irrationalistic in holding that instinctive, or Dionysian, drive lies at the heart of existence. Nietzsche viewed moral codes as myths, lies, and frauds created to mask forces operating beneath the surface to influence thought and behaviour. For him, God is dead and man is free to formulate new values. Ludwig Klages extended life philosophy in Germany by urging that the irrational springs of human life are "natural" and should be followed in a deliberate effort to root out the adventitious reason; and Oswald Spengler extended it to history, which he viewed intuitively as an irrational process of organic growth and decay.

In existentialism, Søren Kierkegaard, Jean-Paul Sartre, and Albert Camus all despaired of making sense out of an incoherent world; and each chose his own alternative to reason—the leap of faith, radical freedom, and heroic revolt, respectively.

In general, irrationalism implies either (in ontology) that the world is devoid of rational structure, meaning, and purpose; or (in epistemology) that reason is inherently defective and incapable of knowing the universe without distortion; or (in ethics) that recourse to objective standards is futile; or (in anthropology) that in human nature itself the dominant dimensions are irrational.

Irrawaddy River, Burmese AYEYARWADY, principal river of Myanmar (Burma), transversing the centre of the country and running throughout its entire course within Myanmar territory. It is the country's most important commercial waterway, having a length of about 1,350 miles (2,170 km).

A brief treatment of the Irrawaddy River follows. For full treatment, *see* MACROPAEDIA: Asia.

The Irrawaddy is formed by the confluence of the Nmai and the Mali rivers, which rise in the glaciers of the high mountains of northern Myanmar. The Nmai, which is larger than the Mali at the confluence, is the eastern branch, and the Mali the western. From their confluence the Irrawaddy flows generally southward, varying in width as it passes through three defiles (narrow gorges) between the confluence and the city of Mandalay.

About 40 miles (65 km) downstream from Myitkyina is the first defile. Below Bhamo the river makes a sharp westward swing and cuts through the limestone rocks of the second defile. The hills flanking the river are higher there, but the passage is much shorter. The third defile begins about 60 miles north of Mandalay.

Farther downriver the Irrawaddy meanders across the densely populated alluvial flats of the central dry zone—the ancient Myanmar cultural heartland—in a broad, open course. Within the central dry zone the river's major tributary, the Chindwin, unites with the Irrawaddy. Continuing south, the lower course flows through a narrow valley between forest-covered mountain ranges—the Arakan (Rakhine) Mountains to the west and the Pegu (Bago) Mountains to the east—after which it enters the Andaman Sea through a wide delta.

The Irrawaddy's total drainage basin covers approximately 158,700 square miles (411,000 square km). Its annual average discharge is 460,000 cubic feet (13,000 cubic m) per sec-

ond, but the volume of the river and its tributaries fluctuates greatly through the year owing to monsoonal rains that occur between June and September. The rapid melting of glaciers in the summer adds further to the volume. In general, from December to March the Irrawaddy varies between its lowest level and 5 feet (1.5 m) above it, while from mid-June to mid-October the river is 20 to 30 feet above its lowest level. Commercial steamer service is maintained throughout the year from Henzada on the delta to Bhamo 670 miles to the north. The river ports (Mandalay, Chauk, Prome, and Henzada are among the most important) find it necessary to have separate high- and low-water landing points.

In the central dry zone the cultivation of wheat, cotton, and oilseeds dominates, while to the south the Irrawaddy delta comprises one of the world's largest rice-growing areas. Rice, other foodstuffs, petroleum, cotton, and teak logs are the major items transported on the river system.

Consult the INDEX *first*

Irredentist, Italian IRREDENTISTA, plural IRREDENTISTI, any of the Italian patriots prominent in the last quarter of the 19th century and the early 20th century who sought to deliver Italian lands from foreign rule. Their name was derived from the words *Italia irredenta* ("unredeemed Italy"), and their object was to emancipate the lands of Trentino (south Tirol), Gorizia, Istria, Trieste, Ticino, Nice, Corsica, and Malta from Austrian, Swiss, French, and British rule.

The Irredentists aimed especially at gaining several Italian-inhabited areas still controlled by Austria after the process of Italian unification (1860–70). In the last two decades of the 19th century, they opposed Italy's adherence to the Triple Alliance, which included Austria. The Irredentists contributed to the pressure that caused the Italian government to enter World War I on the side of the Allies (May 1915). Italy's acquisition of the Istrian peninsula on the north Adriatic and of south Tirol from Austria after the war fulfilled the hopes of many of the Irredentists.

irrigation, the artificial application of water to land. Modern irrigation and the associated practices of drainage, fertilization, mechanization, and mass production for special markets under professional management have produced a revolution in agricultural efficiency.

A brief treatment of irrigation follows. For full treatment, *see* MACROPAEDIA: Farming and Agricultural Technology: *Irrigation and drainage.*

Normally vegetation grows on soil watered by rain. Where rain is so seasonal that it does not meet the requirements of a particular crop or is deficient or practically nonexistent, the drying of the soil to an ever-increasing degree retards, and eventually prevents, vegetable growth. Irrigation can compensate for the vicissitudes of nature by supplying water regularly and in sufficient volume.

The use of irrigation for agricultural purposes is an ancient practice. It can be traced to the early Egyptians, who were irrigating fields with water from the Nile River by 5000 BC. Evidence shows that other ancient civilizations, such as those of the Babylonians and the Chinese, also developed largely as a result of irrigation-based agriculture.

Over the centuries various kinds of techniques and devices were devised to facilitate field irrigation. A major system of irrigation canals and ditches was constructed during the reign of the Babylonian king Hammurabi (1792–50 BC). The one-man scoop for bailing water from rivers for use on fields was eventually replaced by mechanical lifting aids, such as the counter-weighted and animal-powered devices introduced in the Middle East and the portable Archimedes screw invented in Syracuse. Another notable development was the use of large storage reservoirs.

With the advent of steam power, the internal combustion engine, and electricity, irrigation became in many parts of the world a fully mechanized operation. An important mechanical development after World War II was the use of portable irrigation systems of lightweight aluminum pipe.

Much irrigation water is pumped from ponds, lakes, streams, and wells. The more abundant and cheaper water supplies are found in the larger streams and usually are obtained therefrom by diversion dams without pumping. Often these structures raise the level of the water in the river and sometimes provide storage in reservoirs. From them, concrete-lined canals and related structures convey and distribute the water over the land through gravity flow.

irritable bowel syndrome (IBS), relatively common disorder of the intestines characterized by abdominal pain, intestinal gas, and altered bowel habits, including diarrhea, constipation, or both. Other symptoms may include abdominal pain that is relieved after defecation, mucus in the stools, or a sensation of incomplete rectal evacuation. IBS is caused by a motility disturbance of the small and large intestines; this disturbance may result from increased intestinal sensitivity to distension. Stress or the consumption of fatty foods, milk products, certain fruits or vegetables (*e.g.,* broccoli and cabbage), alcohol, or caffeine may cause similar symptoms. Women with the disorder may experience an increase in symptoms during menstruation. Treatment of IBS includes relaxation, exercise, and avoidance of aggravating foods. Antidiarrheal medications or fibre supplements may help lessen symptoms. Although IBS may cause discomfort and emotional distress, the disorder does not result in any permanent intestinal damage.

Irtysh River, river rising from the glaciers on the southwestern slopes of the Altai Mountains in Sinkiang, China. It flows west across the Chinese border through Lake Zaysan, and then northwest across Kazakstan to join the Ob River near Khanty-Mansiysk in Russian Siberia. The largest tributary of the Ob, the Irtysh is 2,640 miles (4,248 km) long and is navigable for most of its course. The Narym, Bukhtarma Om, and Tara are its chief right-bank tributaries, and the Osha, Ishim, Vagay, Tobal, and Konda are its main left-bank ones. The Ust-Kamenogorsk hydroelectric station was completed in 1952 and that at Bukhtarma in 1960. The main river ports are Khanty-Mansiysk, Tobolsk, Tara, Omsk, Pavlodar, Semipalatinsk, and Ust-Kamenogorsk.

Iruma, city, Saitama *ken* (prefecture), Honshu, Japan, on the Iruma River. The city is located on the Musashino uplands and the southern part of the Kaji hills. Iruma is renowned for the cultivation of Sayama green tea. It is the site of a base of the Japanese Air Self-Defense Force. Iruma has undertaken an industrialization program to exploit its railway connections with Tokyo, to the southeast. Its rich archaeological sites have been damaged by urbanization. Pop. (2000 prelim.) 147,905.

Irún, city, Guipúzcoa *provincia,* in the Basque Country *comunidad autónoma* ("autonomous community"), northern Spain. It is situated on the left bank of the Bidasoa River. At Irún the river is bridged to Hendaye, Fr. Irún is the northern terminus of the Spanish Northern Railway and is the most important customs station for Spanish overland trade with the rest of Europe. The city has ironworks, tanneries, potteries, and paper mills. A dependency of neighbouring Fuenterrabía until 1766, Irún became a city in 1913. It underwent heavy siege by Nationalist forces during the Spanish Civil War, capitulating after fierce resistance in September 1936. Pop. (1999 est.) 55,497.

Irvine, royal burgh (town), North Ayrshire council area, historic county of Ayrshire, southwestern Scotland, on the Firth of Clyde. The last of Scotland's five new towns, Irvine was designated in 1967 in an attempt to rehouse overflow population from Glasgow and provide a focus for the economic and industrial rehabilitation of the area. Silting of the harbour and competition from Troon and Ardrossan during the 18th and 19th centuries had earlier resulted in the decline of Irvine as Glasgow's chief outport. The new town incorporates the existing burgh, an old coal-mining area, and an important chemical complex. Industries include chemicals, engineering, and electrical goods, and several foreign firms have operations there. Pop. (1991) 32,988.

Irving, Edward (b. Aug. 4, 1792, Annan, Dumfries, Scot.—d. Dec. 7, 1834, Glasgow, Strathclyde), Church of Scotland minister whose teachings became the basis of the religious movement known as Irvingism, later called the Catholic Apostolic Church.

After working as a mathematics teacher and studying theology part time, Irving was called in 1822 to the Caledonian chapel in London as a preacher. His chapel congregation grew so rapidly that in 1827 a new and larger church was built for him in Regent Square. His popularity waned, however, because of his increasing stress on apocalypticism and eschatology, including his prediction in 1825 that the Second Coming of Christ would occur in 1864.

From 1826 he was the centre of a "school of the prophets," which published the *Morning Watch, or Quarterly Journal of Prophecy* periodically from 1829 to 1833. In 1828 his *Doctrine of the Incarnation Opened* aroused opposition for its denigration of the human side of Christ's nature. After a similar work by him appeared in 1830, he was charged in ecclesiastical courts with maintaining "the sinfulness of Christ's humanity." Despite his protest that he had been misinterpreted, he was excommunicated by the London presbytery, and in 1833 he was deposed from his ministry by the Church of Scotland.

By then a convinced believer in such pentecostal phenomena as speaking in tongues, Irving preached throughout Great Britain, returning to London to assume a minor position in the evolving Catholic Apostolic Church. Formed shortly after his death by several disciples and associates, the sect sought to emphasize the unity of all Christians in a universal church and to prepare for the Second Coming. The church flourished until the end of the 19th century, though later members rejected the name "Irvingites" for their group. A close friend of the English authors Thomas Carlyle, Charles Lamb, and Samuel Taylor Coleridge, Irving was honoured by burial in the Glasgow Cathedral crypt.

Irving, Sir Henry, original name JOHN HENRY BRODRIBB (b. Feb. 6, 1838, Keinton Mandeville, Somerset, Eng.—d. Oct. 13, 1905, Bradford, Yorkshire), one of the most famous of English actors, the first of his profession to be knighted (1895) for services to the stage. He was also a celebrated theatre manager and the professional partner of the actress Ellen Terry for 24 years (1878–1902).

Irving's father, Samuel Brodribb, was a salesman who collected orders for the tailoring department of the local store. His mother, Mary,

Sir Henry Irving, pencil sketch by Phil May, 1889; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

was the daughter of a Cornish farming family. In 1842 Samuel found better employment in Bristol, and, rather than risk the child's health in the damp and dirt of the city, the parents decided to send their young son to Mary's sister, Sarah Penberthy, in Cornwall. For the next six years John was brought up by his aunt and her husband, Isaac, the captain of a Cornish tin mine at Halse Town near St. Ives. Growing up in Cornwall endowed John with a strong constitution. Cornish Methodism, to which his mother was a dedicated adherent, gave him his first taste of spellbinding oratory—the language of John Wesley. When Isaac died suddenly in 1848, Sarah could no longer carry responsibility for the child and returned him to his parents, who by this time had moved to London. There John attended Dr. Pinches' private school.

After leaving school he entered a merchant's office as a clerk, but his spare time and thoughts centred on the plays and players of the London theatre. In 1856 a Brodribb uncle gave him a legacy of £100, which he invested in theatrical necessities such as wigs, swords, and costumes. The legacy also allowed him to buy the leading part in an amateur production of *Romeo and Juliet* at the Royal Soho Theatre. As was the custom of the day, he adopted a stage name—Irving—his choice determined by the romances of Washington Irving and the evangelical sermons of the Scottish preacher Edward Irving. A warm reception of his performance gave him the encouragement he needed. He gave up clerking and joined a theatrical stock company in Sunderland in the north of England as a "walking gentleman" (*i.e.*, in non-speaking parts).

The stock companies that travelled from town to town throughout England at this time constituted the only theatrical academy for a young aspiring actor. In three years Irving played more than 400 different parts in 330 plays, including most of the Shakespeare repertoire. This apprenticeship continued for 10 years in the provincial towns of England, Scotland, and Ireland. His first success in London came in 1866 in a play called *Hunted Down*.

During a Dublin tour the following year he was introduced to Florence O'Callaghan, the daughter of a surgeon general; in July 1869 they were married. A leading part in a long-running comedy titled *Two Roses* sustained the young couple over the birth of their first son, Henry Brodribb, the following August; but a quarrel following the first night of *The Bells* precipitated a permanent separation a month before the birth of their second son, Laurence Sidney.

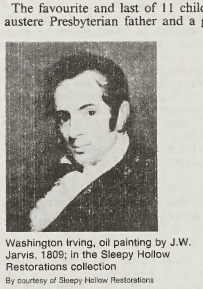
The Bells, staged by the American impresario H.L. Bateman at the Lyceum Theatre, was an instant success, and Irving emerged as one of the leading actors of his day. The part of Mathias, an unconvicted murderer haunted by his conscience, suited Irving's gift for the macabre and the melodramatic, and the play was to remain a feature of Irving's repertoire until his death.

For four years Irving was the star of Bateman's company. When Bateman died in 1875, he continued to play under the management of Bateman's widow until 1877. In 1878 Irving became lessee and manager of the Lyceum Theatre and built around him a dedicated if subservient company. He possessed a strong personal vision of the best that could be accomplished: he paid prodigious attention to detail, took no account of expense for settings and costumes, and hired the best designers and musicians in the country. The Victorian public responded to his lead with packed houses, for the romantic historical fare satisfied their concept of what the theatre ought to be. Although he was criticized for his unusual diction, his special mannerisms, and the shakiness of his literary scholarship, Irving took notice of the press only as a useful instrument in support of his grand design. Box-office figures spoke louder than the word of the critics, and success brought acclaim from the rich and the famous. The Lyceum became the scene for sumptuous post-performance supper parties at which society was further entertained at Irving's expense.

In 1878 he engaged Ellen Terry as his leading lady and thereby began one of the most famous partnerships in the history of the English stage. Their theatrical qualities complemented each other admirably: he the brooding introvert, she the spontaneous, impulsive creature whose charm won every heart. Together, as Hamlet and Ophelia, Shylock and Portia, they drew enormous audiences.

In 1883 Irving embarked on an American tour with the whole company of actors and technicians, as well as the scenic and lighting effects for which his theatre was famous. His reputation had gone before him, and the company enjoyed a triumphal winter season.

For the next few years Irving and the Lyceum company were at the height of their financial success. Each new production sought to outshine the existing repertoire in sumptuousness and elaboration, though each absorbed the profits of the previous season. The plays themselves were of no lasting literary merit, as a young critic named George Bernard Shaw pointed out. He regretted that an actress as talented as Ellen Terry should waste her time on such ponderous trifles. Shaw had written a play, *The Man of Destiny*, that he hoped Irving and Terry might perform. Irving read it, gave Shaw a retainer, and forgot about it. Shaw then accused him of suppressing the play. Irving's retainer, however, had been only a kind gesture to a struggling young author. The two men now became antagonists. In July 1895, when Irving was honoured by Queen Victoria with a knighthood, his status as a national institution made a more inviting target for Shaw. At the same time, through Ellen Terry, Shaw implored Irving to consider the work of the Norwegian playwright Henrik Ibsen. She managed to read Irving two acts of Ibsen's *John Gabriel Borkman*, but Irving's comment was "Threadworms and leeches are an interesting study, but they have no interest to me." Irving's success had been built on the strength of his own theatrical presence expressed through dramatic vehicles of a certain type. With all the signs of popular success around him, he saw no reason to change the formula. His conception of the theatre was that of an "actor's theatre," in which the dramatist was the servant of the performer. Shaw and Ibsen marked the emergence of the "author's theatre," whereby an actor was judged on the fidelity with which he interpreted the vision and message of the playwright.



In 1897 Irving suffered three severe blows. A production by his son Laurence of a play about Peter the Great was a financial disaster. A far more devastating blow was the loss through fire of all the stored scenery for many of the classic productions in the Lyceum repertoire. Insurance coverage was inadequate, and the capital loss was crippling. Then, in 1898, Irving had his first serious illness. The company toured without him, and the box-office receipts fell accordingly.

The final years of Irving's life became a struggle to keep the Lyceum company a going concern. New productions of Shakespeare's *Coriolanus*, as well as of the French playwright Victorien Sardou's play on Dante, hastened rather than stemmed the decline. Tours to America were exhausting, without compensating profits. In 1902 the company went into liquidation, and Irving's reign at the Lyceum ended. On Oct. 13, 1905, after a performance of Alfred, Lord Tennyson's *Becket* at the Theatre Royal in Bradford, Irving died, penniless, at the age of 68.

BIBLIOGRAPHY. The definitive work is *Henry Irving, the Actor and His World* by Laurence Irving (1951). Earlier biographies were Austin Brereton, *The Life of Henry Irving*, 2 vol. (1908); and Bram Stoker, *Personal Reminiscences of Henry Irving* (1906).

Irving, Washington (b. April 3, 1783, New York City—d. Nov. 28, 1859, Tarrytown, N.Y., U.S.), writer called the "first American man of letters," whose greatest literary success was *The Sketch Book*.

The favourite and last of 11 children of an austere Presbyterian father and a genial An-

Washington Irving, oil painting by J.W. Jarvis, 1809; in the Sleepy Hollow Restorations collection

glican mother, young, frail Irving grew up in an atmosphere of indulgence. He escaped a college education, which his father required of his older sons, but read intermittently at the law, notably in the office of Josiah Ogden Hoffman, with whose pretty daughter Matilda he early fell in love. He wrote a series of whimsically satirical essays over the signature of Jonathan Oldstyle, Gent., published in Peter Irving's newspaper, the *Morning Chronicle*, during 1802–03. He made several trips up the Hudson, another into Canada for his health, and, during 1804–06, took an extended tour of Europe.

On his return, he passed the bar examination late in 1806 and soon set up as a lawyer. But during 1807–08 his chief occupation was to collaborate with his brother William and James K. Paulding in the writing of a series of 20 periodical essays entitled *Salmagundi*. Concerned primarily with passing phases of

contemporary society, the essays retain significance as an index to the social milieu.

His *History of New York . . . by Diedrich Knickerbocker* (1809) was a comic history of the Dutch regime in New York, prefaced by a mock-pedantic account of the world from creation onward. Its writing was interrupted in April 1809 by the sudden death of Matilda Hoffman. Grief incapacitated him for a while. In 1811 he moved to Washington, D.C., as a lobbyist for the Irving brothers' hardware-importing firm, but his life seemed aimless for some years. He prepared an American edition of Thomas Campbell's poems, edited the *Analectic Magazine,* and acquired a staff colonelcy during the War of 1812. In 1815 he went to Liverpool to look after the interests of his brothers' firm. In London he met Sir Walter Scott, who encouraged him to renewed effort. The result was *The Sketch Book of Geoffrey Crayon, Gent* (1819–20), a collection of stories and essays that mix satire and whimsicality with fact and fiction. Most of the book's 30-odd pieces concern Irving's impressions of England, but six chapters deal with American subjects. Of these, the tales "The Legend of Sleepy Hollow" and "Rip Van Winkle" have been called the first American short stories. They are both Americanized versions of German folktales. The main character of "Rip Van Winkle" is a henpecked husband who sleeps for 20 years and awakes as an old man to find his wife dead, his daughter happily married, and America now an independent country. The tremendous success of *The Sketch Book* in both England and the United States assured Irving that he could live by his pen. In 1822 he produced *Bracebridge Hall,* a sequel to *The Sketch Book.* He traveled in Germany, Austria, France, Spain, the British Isles, and later in his own country.

Early in 1826 he accepted the invitation of Alexander H. Everett to attach himself to the American legation in Spain, where he wrote his *Columbus* (1828), followed by *The Companions of Columbus* (1831). Meanwhile, Irving had become absorbed in the legends of the Moorish past and wrote his *Conquest of Granada* (1829) and *The Alhambra* (1832), a Spanish counterpart of *The Sketch Book.*

After 17 years' absence, Irving returned to New York in 1832, where he was warmly received. He made a journey west and produced in rapid succession *A Tour of the Prairies* (1835), *Astoria* (1836), and *The Adventures of Captain Bonneville* (1837). Except for four years (1842–46) as minister to Spain, Irving spent the remainder of his life at his home, "Sunnyside," in Tarrytown, N.Y., on the Hudson, devoted to literary pursuits.

Irvington, town, Essex county, northeastern New Jersey, U.S., bordering on Newark. Settled in 1666 as part of a land grant from Sir George Carteret, proprietor of New Jersey, it was known as Camptown until 1852, when it was renamed to honour the author Washington Irving. Heavily industrialized, its manufactures include textiles, metal and rubber products, paper, and pigments. Inc. village, 1874; town, 1898. Pop. (1990) 61,018.

Irwin, Elisabeth Antoinette (b. Aug. 29, 1880, Brooklyn, N.Y.—d. Oct. 16, 1942, New York City), American educator, one of the leaders of the progressive-education movement.

Irwin attended Smith College (B.A., 1903) and became involved in the social-settlement movement, working in New York City. From 1905 to 1909 she worked at odd jobs and as a free-lance journalist, writing about slum conditions in the city. In 1910 she began working as a "visiting teacher," or social worker, for the Public Education Association of New York City (founded 1894). While working for the association as a psychologist, Irwin in 1916 initiated a program of testing and grading according to mental ability. Her next and perhaps best-known innovation was an experiment dubbed the "Little Red School House." This program continued for 10 years. It revised the standard curriculum, incorporating elements of play and group activities and varying the teaching methods, placing less emphasis on strictly academic learning. Financial considerations and other objections finally forced Irwin's program out of the public school in 1932, but many of her ideas on progressive education were later adapted to public-school education. Irwin also wrote a number of articles on progressive education, drawing attention to a child's social and emotional development as well as academic growth.

Irwin, James B., in full JAMES BENSON IRWIN (b. March 17, 1930, Pittsburgh, Pa., U.S.—d. Aug. 8, 1991, Glenwood Springs, Colo.), American astronaut, pilot of the Lunar Module on the Apollo 15 mission (July 26–Aug. 7, 1971), in which he and the mission commander, David R. Scott, spent almost three days on the Moon's surface investigating the Hadley-Apennine site, 462 miles (744 km) north of the lunar equator. The two spent 18 hours outside the Lunar Module, traveled on the Moon's surface in a specially designed vehicle, and collected many rocks and core samples. Alfred M. Worden piloted the Command Module, orbiting the Moon while the others worked below.

Irwin graduated from the U.S. Naval Academy, Annapolis, Md., in 1951 and transferred to the Air Force. He earned a master's degree in aeronautical engineering at the University of Michigan, Ann Arbor, in 1957. At the time he was selected for the manned space program (1966), he was assigned to the Air Defense Command, Colorado Springs, Colo. The Apollo 15 flight was his only space mission.

Irwin resigned from the Air Force and the space program in 1972 to form and become president of High Flight Foundation, a Christian evangelical organization.

Irwin, May, original name ADA CAMPBELL (b. June 27, 1862, Whitby, Canada West [now Ontario, Can.]—d. Oct. 22, 1938, New York, N.Y., U.S.), American comedienne and music-hall performer who popularized such songs as "After the Ball" and "A Hot Time in the Old Town Tonight."

May Irwin
Culver Pictures

Brought to the United States as a young girl, Irwin made her professional debut in 1875 with her sister Georgia (later known as Flo Irwin). They appeared together as The Irwin Sisters in variety houses until 1883. May Irwin developed into a high-spirited comedienne and performed with great success on the legitimate stage (1883–87) with such luminaries as John Drew, Ada Rehan, and Otis Skinner. A witty and nimble entertainer, she preferred the less-formal, improvisational music hall and toured (1887–89) with the Howard Athenaeum Company in farcical sketches. A brief episode from the play *The Widow Jones* (1895), in which she starred with John Rice, was filmed as *The Kiss* (1896); its prolonged close-up of a kiss scandalized audiences and provoked the first demands for screen censorship.

Irzykowski, Karol (b. Jan. 25, 1873, Błażkowa, near Tarnów, Austria-Hungary [now in Poland]—d. Nov. 2, 1944, Żyrardów, Pol.), Polish novelist and literary critic.

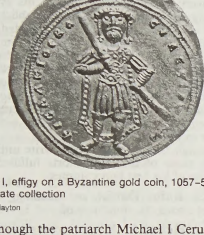
Educated at the University of Lwów, Irzykowski moved in 1908 to Kraków, where he joined the editorial board of *Nowa Reforma,* a liberal newspaper. After World War I he moved to Warsaw, where he contributed articles and theatrical reviews to *Robotnik,* a socialist daily. During the German occupation of Poland he was active in the Polish underground and died as a result of serious wounds received during the Warsaw uprising.

Described as one of the most eccentric figures of the Polish Neoromantic literary world, Irzykowski is remembered as the author of *Pałuba* ("The Hag"), a huge novel begun in 1891 and published in 1903. The book combines a penetrating psychological analysis of its characters with a series of digressions on novel writing. Derided upon its publication, *Pałuba* in 1948 was reprinted following attempts by several critics to rehabilitate Irzykowski's reputation. His diaries appeared in 1964.

ʿĪsā ibn Mūsā (d. 784), nephew of the first two ʿAbbāsid caliphs, military leader, and at one time presumptive heir to the caliphate.

The caliph as-Saffāḥ nominated his brother al-Manṣūr and, after him, ʿĪsā, as heirs. On the accession of al-Manṣūr, ʿĪsā was governor of Kūfah. The new caliph sent him to lead an army against an ʿAlid revolt in Medina, apparently with the hope that he might be killed. In a series of battles, ʿĪsā secured al-Manṣūr's rule but was forced by intimidation to renounce his rights of succession to al-Manṣūr's son Muḥammad al-Mahdī. On al-Manṣūr's death, ʿĪsā again pressed his claim and was defeated in favor of al-Mahdī's son Mūsā al-Hādī.

Isa Town (Bahrain): *see* Madīnah ʿĪsā.



Isaac, in the Old Testament (Genesis), second of the patriarchs of Israel, the only son of Abraham and Sarah, and father of Esau and Jacob. Although Sarah was past the age of childbearing, God promised Abraham and Sarah that they would have a son, and Isaac was born. Later, to test Abraham's obedience, God commanded Abraham to sacrifice the boy. Abraham made all the preparations for the ritual sacrifice, but God spared Isaac at the last moment.

In the Old and New Testaments, God is called the God of Abraham, Isaac, and Jacob, because with them God's relationship of promise and purpose was fixed for all those who descended from them. The story of Abraham's acquiescence to God's command to sacrifice Isaac was used in the early Christian church as an example of faith (Heb. 11;17) and of obedience (James 2:21). In later Jewish tradition the sacrifice of Isaac was cited in appeals for the mercy of God.

Isaac I COMNENUS (b. *c.* 1005—d. 1061, Constantinople), Byzantine emperor who restored economic stability at home and built up the neglected military defenses of the empire.

Isaac was a son of Manuel Comnenus, an officer of the Byzantine emperor Basil II. On his deathbed, Manuel commended Isaac and his other son, John, to the Emperor's care. After having them educated, Basil advanced them to high positions. Isaac, by his prudent conduct in protecting the peoples of the empire, won the confidence of the army during the reigns of Basil's successors.

In 1057 Isaac entered into a military plot to depose the emperor Michael VI and in June of that year Isaac was proclaimed emperor in Paphlagonia in Asia Minor. The rebels marched on Constantinople, captured Nicaea, and defeated Michael's forces at Petroë on August 20. Michael abdicated on August 31, and Isaac was crowned emperor the following day.

Isaac I, effigy on a Byzantine gold coin, 1057–59; in a private collection
Peter Clayton

Although the patriarch Michael I Cerularius had helped bring Isaac to power, the two men soon quarrelled over Isaac's stringent financial policies, including the confiscation of some church property, and over the Patriarch's attempt to subordinate civil power to the church. Isaac demanded that Cerularius resign, and when the Patriarch refused, the Emperor had him arrested and exiled (1058). Cerularius was charged with treason and heresy but died before his trial could take place.

In the spring of 1059 Isaac led a military expedition against the Hungarians, and in the summer of that year he fought against the Pechenegs, who were ravaging the northern frontiers. In November 1059 he became ill. Believing his illness to be mortal, he abdicated (Dec. 25, 1059) and appointed as his successor Constantine X Ducas. Although he recovered, Isaac did not resume his throne, but retired to a monastery, where he spent the remaining two years of his life as a monk, alternating menial offices with literary studies.

Isaac II ANGELUS (b. *c.* 1135—d. February 1204), Byzantine emperor who, although incapable of stemming administrative abuses, partly succeeded, by his defeat of the Serbians in 1190, in retrieving imperial fortunes in the Balkans.

In September 1185 Isaac was unexpectedly proclaimed emperor by the Constantinople mob that murdered his cousin, the emperor Andronicus I Comnenus. His reign was inaugurated by the decisive victory of his general Alexius Branas over the Normans, who, after invading the empire and sacking Thessalonica (1185), were then driven off Greek soil, except for the islands of Cephalonia and Zacynthus (modern Zante). Isaac was unsuccessful, however, in recovering Cyprus from the rebel Isaac Comnenus, who set himself up as an independent ruler of that island in 1185. Isaac II failed to crush the revolt of the Bulgarians and Walachians that broke out toward the end of that year, even though he led expeditions against them in 1186–87. In 1187 he

Isaac II, coin, 12th century; in the British Museum
Peter Clayton

was forced to recognize the second Bulgarian empire.

In 1189 the Byzantine ruler was confronted with the Third Crusade, which, led by German emperor Frederick I Barbarossa, was passing through Byzantine territory. Isaac tried to protect himself by concluding a treaty with Saladin, the sultan of Egypt, but he was soon forced to assist Frederick; he concluded the Treaty of Adrianople with him in February 1190, and in the following month Frederick's forces were transported across the Hellespont to Asia Minor.

Free to turn his attention to the Balkans, Isaac restored Byzantine prestige by defeating Stephen Nemanja of Serbia (1190). With Hungarian help he planned an expedition against the Bulgarians, assembling a Byzantine army for this purpose near the city of Cypsela in the spring of 1195. On April 8, however, he was suddenly overthrown by his brother, who imprisoned and blinded him and assumed the throne as Emperor Alexius III.

In 1201 Isaac's son Alexius made his way to Germany, where he succeeded in bringing about the diversion of the Fourth Crusade to Constantinople in order to restore his father to power. In July 1203 the crusaders captured the city, and on August 1, Isaac, after eight years' imprisonment, was crowned co-emperor with Alexius, who assumed the title Alexius IV. Friction between the crusaders and the townspeople of Constantinople, however, led to a revolution in January 1204; the co-emperors were dethroned, Alexius IV was assassinated on Feb. 8, 1204, and Isaac died several days later.

Isaac OF ANTIOCH, also called ISAAC THE GREAT (d. *c.* 460), Syrian writer, probably a priest of an independent Syrian Christian church and author of a wealth of theological literature and historical verse describing events in Rome and Asia Minor.

According to 5th-century Byzantine chroniclers, Isaac was a native of Amida, near modern Erzurum, Tur. At Rome he composed verse on the civic festivals of 404 and the capture of Rome by the Visigoths under Alaric in 410. During later travels, he was imprisoned briefly by the Byzantines in Constantinople for unknown reasons.

Isaac then settled with the Christian community at Antioch, modern Antakya, Tur., and probably received holy orders from a Jacobite bishop, the head of the Monophysite Christians, a Syrian church that emphasized the divinity in Christ to the diminution of his humanity.

Isaac is credited with a lengthy poetic account of Antioch's destruction by earthquake in 459. He is also the reputed author of two collections of works containing, respectively, 60 and 40 *mēmrē*, or poetic discourses. These writings and a series of commentaries on theological and ascetical subjects are now generally held by contemporary scholars to be the work of perhaps three writers with the same name residing in or about Antioch but of differing theological views. The works have been edited by G. Bickell, *Sancti Isaaci Antiocheni, doctoris Syrorum, opera omnia*, 2 vol. (1873–77; "Complete Works of Holy Isaac of Antioch, Doctor of the Syrians"), and, by P. Bedjan, *Sancti Isaaci Syri Antiocheni homiliae syriacae* (1903; "Syriac Homilies of the Holy Syrian Isaac of Antioch").

Isaac OF NINEVEH, also called ISAAC THE SYRIAN, or ISAAC SYRUS (d. *c.* 700, near Susa in Umayyad Iran), Syrian bishop, theologian, and monk whose writings on mysticism became a fundamental source for both Eastern and Western Christians.

Originally a monk of Bet-Qatraje in Kurdistan, northern Iraq, Isaac was consecrated bishop of Nineveh, near modern Mosul, Iraq, *c.* 670, by the head of the East Syrian Nestorian Church, an independent Christian body that adhered to a doctrine accentuating Christ's human personhood while minimizing his divinity. After five months he resigned his office, possibly because of doctrinal differences with the Nestorians and a closer approximation to the Christology of Greek Orthodoxy (belief affirming in Christ human and divine natures in a single personhood).

Retiring to a solitary monastic life in the desert of Rabban Shapur, Isaac devoted himself to writing on mystical themes. He is reputed to have lost his sight because of assiduous reading. The celebrated 14th-century Syrian theologian Abhdisho bar Berikha records that Isaac wrote seven volumes of ascetical treatises, verse, dialogues, and other writings, of which only 82 chapters on Christian mysticism survive.

Translated at an early date into Arabic, Ethiopic, and Greek, Isaac's extensive writings affected Byzantine and Russian theologians and philosophers from the 10th to the 19th centuries. Latin and, later, Italian and Spanish versions influenced Christian mysticism in the West. The Greek and Latin texts of Isaac's extant works are contained in the series *Patrologia Graeca*, J.-P. Migne (ed.), vol. 86 (1866). An English version, *Mystic Treatises of Isaac of Nineveh*, by A.J. Wensinck, appeared in 1923.

Isaac OF STELLA, French ISAAC D'ÉTOILE (b. *c.* 1100, England—d. *c.* 1169, Étoile, near Poitiers, Aquitaine), monk, philosopher, and theologian, a leading thinker in 12th-century Christian humanism and proponent of a synthesis of Neoplatonic and Aristotelian philosophies.

After studies in England and Paris, Isaac entered the abbey of Cîteaux, near Dijon, in the midst of the Cistercian monastic reform carried out by Bernard of Clairvaux. In 1147 Isaac was elected abbot of Étoile, a Cistercian community. Several years later, he attempted to found a monastery on l'Île (island) de Ré, near the French port of La Rochelle. There he composed a series of Lenten conferences that proposed a proof for God's existence by arguing from the insufficiency of created things and also submitted a theory of atonement. The addresses reflected not only the logical method of the leading 11th-century philosopher Anselm of Canterbury but also adopted notions from the 5th-century Latin and Greek Neoplatonism of Augustine of Hippo and Pseudo-Dionysius the Areopagite.

Returning to Étoile, Isaac later composed his principal work, the *Epistola de anima ad Alcherum* ("Letter to Alcher on the Soul"), a compendium of psychology in the Cistercian tradition of providing a logical basis for theo-

ries of mysticism, done in 1162 at the request of the monk-philosopher Alcher of Clairvaux. This treatise served as the basis for the celebrated medieval tract *De spiritu et anima* ("On the Spirit and the Soul"), long believed to have been Augustine's but now attributed by some scholars to Alcher.

The *Epistola de anima* integrates Aristotelian and Neoplatonic psychological theories with Christian mysticism. In the Platonic tradition, Isaac considers the hierarchical order of reality—body, soul, God—in ascending order of knowability and advances the tripartite division of the soul, viz., rational, appetitive, and emotional functions. His theory of knowledge, however, includes the Aristotelian view of five forms of sense perception, of memory and imagination, and of a reasoning power that abstracts universal concepts from the images of individual objects. The intellect, or the capacity to grasp eternal ideas in time, and the intelligence that enables man to intuit the reality of God exhibit further Neoplatonic orientation. The influence of mysticism appears in his suggestion that the highest level of knowledge depends on the intervention of divine illumination and in his *via negativa* ("way of negation") for knowing God, viz., the reality of God is the negation of every material and human quality. Unexcelled in his grasp of Neoplatonism, Isaac interpreted biblical texts in a philosophical perspective.

An English translation, *Sermons on the Liturgical Year*, Vol. 1, was published in 1979.

Isaac THE ELDER: *see* Israeli, Isaac ben Solomon.

Isaac THE GREAT, SAINT, Armenian SAHAK (b. *c.* 345—d. probably Sept. 7, 439, Ashtishat, Armenia; feast days two weeks before Lent and early in July), celebrated catholicos, or spiritual head, of the Armenian Apostolic (Orthodox) Church, principal advocate of Armenian cultural and ecclesiastical independence and collaborator in the first translation of the Bible and varied Christian literature into Armenian.

Descended from a family of Armenian patriarchs, Isaac was educated in the Hellenistic culture of Asia Minor and at Constantinople. After the death of his wife, he became a monk and *c.* 388, with royal support, was named catholicos of Armenia. He furthered Armenian monasticism and converted his residence into a monastery, integrating his patriarchal administration with the ascetical life of the monks. A reformer, Isaac tightened clerical discipline and enforced celibacy on Armenian bishops. He also established schools and churches and gained Constantinople's recognition of Armenian patriarchal rights, thus creating a distinctive and autonomous Armenian form of Christianity free from direct Greek Orthodox control. With the help of his auxiliary bishop, the monk Mesrob (Mashtots), later a saint, Isaac began *c.* 391 the development of a Greek-inspired Armenian alphabet and literature. The two then directed a group of scholars in translating the Greek and Syriac versions of the Bible into Armenian, completing it *c.* 435. This linguistic achievement and the formation of an Armenian liturgy and ritual preserved Armenian unity during its partition under Greek and Persian rule.

Although he won toleration for the Armenian Church by the Persian overlords, Isaac was forced to resign his office *c.* 428 because of intrigues among the Armenian princes. He resumed the church leadership in 432 in response to popular clamour. A semi-legendary 8th-century history of Armenia Major credits Isaac with writing liturgical texts and music, biblical commentaries on the Old Testament, and a series of letters to the Byzantine emperor, to Proclus, patriarch of Constantinople, and to other Eastern prelates on the Christological controversy. At the national Armenian synod of Ashtishat (435), Isaac promoted the Orthodox doctrine of Christ's personal divinity and denounced the emphasis on his humanity as expressed by Theodore of Mopsuestia. Isaac's letters have been published in the French translation (1841) of the 8th-century history of Armenia Major. Frederick C. Conybeare produced an English version (1898) of partially authentic church legislation attributed to Isaac.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Isaac, Heinrich, Isaac also spelled ISAAK (b. *c.* 1450, Brabant—d. 1517, Florence), one of the three leading composers (with Jakob Obrecht and Josquin des Prez) of the Flemish school in the late 15th century.

A pupil of Florentine organist Antonio Squarcialupi, he taught in the household of Lorenzo de' Medici in Florence (*c.* 1484–92) and set to music some of Lorenzo's own carnival songs. He apparently left Florence during the Medicean exile, entering the service of the emperor Maximilian I about 1494; in 1497 he was appointed court composer. Between 1497 and 1514 he travelled extensively, finally settling in Florence.

Isaac's main publications were a collection of masses (1506) and the posthumous *Choralis Constantinus* (1550–55), one of the few complete polyphonic settings of the Proper of the Mass for all Sundays (and certain other feasts); it also contains five settings of the Ordinary. At least in part the work was commissioned for the diocese of Constance in 1508 and employs plainsongs unique to the Constance liturgy. Isaac left his great monument unfinished; it was completed by his pupil Ludwig Senfl.

In his sacred music Isaac treats the cantus firmus (fixed melody) resourcefully, placing the chant in any voice or sharing it between two parts, either in long notes or embroidered with shorter notes. He also uses it as a thematic basis for composing contrapuntal imitations, a technique that came to dominate 16th-century music.

He wrote about 40 secular songs. His Italian frottole (simply accompanied songs) have charming treble melodies. His polyphonic German lieder normally present the tune in the tenor but, unlike many contemporary lieder, do not cadence into several sections. His famous "Innsbruck, ich muss dich lassen" ("Innsbruck, I must leave you") recalls the style of the simpler frottola. This song was later reworked as a chorale, "O Welt [*"World"*], ich muss dich lassen," familiar through arrangements by J.S. Bach and by Brahms.

His *Missa carminum*, motets from *Choralis Constantinus*, music for the court of Lorenzo de' Medici, and secular works *Virgo prudentissima* have been recorded.

Isaac ben Moses OF VIENNA, byname ISAAC OR ZARU'A (b. *c.* 1180—d. *c.* 1250, Vienna), medieval codifier of Jewish law (Halakha) whose vast compilation, *Or Zaru'a* ("Light Is Sown"), was widely quoted in later Halakhic works. *Or Zaru'a* is also valued by historians for its descriptions of Jewish life in medieval France, Germany, and Italy.

By his own testimony, Isaac was born in Bohemia. Although poor he was determined to become an educated man and embarked upon a nomadic life that brought him into contact with the most respected Jewish scholars of Bohemia, France, and Germany. The *Or Zaru'a* is a compendium of the knowledge he gathered from eminent rabbis—some in the form of correspondence—and his own commentaries and responsa (answers to specific questions) on matters of law. The original manuscript, so vast that it presented a problem for copyists, was copied in sections, over a long period of time, and was widely disseminated only by means of quotations in the works of other Halakhists. Of the surviving manuscripts no two are alike in sequence, thus obscuring any order intended by the author. The first two parts did not appear in published form until 1862. Several abridged versions were produced, including one by Isaac's son Ḥayyim.

Isaac Israeli: *see* Israeli, Isaac ben Solomon.

Isaacs, Barnett: *see* Barnato, Barney.

Isaacs, Jorge (b. April 1, 1837, Cali, Cauca, Colom.—d. April 17, 1895, Ibagué), Colombian poet and novelist whose best work, *María* (1867; *María: A South American Romance*, 1977), was one of the most famous Latin-American novels of the 19th century.

The son of a prosperous English Jew, Isaacs received an excellent education. During the War of the Cauca (1860–63) he was reduced to poverty by the destruction of his estates. Settling in Bogotá in 1864, he published a slight volume of *Poesías*, which attracted considerable attention and, in 1867, the romantic novel *María*, which won immediate recognition and remains his best known work. An idyllic picture, very likely autobiographical, of life in his native Cauca Valley, *María* was translated into several languages. Thereafter, he combined a career in public life with his career in literature.

Although Isaacs continued to write until his death, none of his later efforts fulfilled the promise of his first two volumes.

Isabela, province, northeastern Luzon, Philippines. It has an area of 4,118 sq mi (10,665 sq km). Its eastern section comprises the rugged, sparsely populated Sierra Madre Mountains, which extend to the Philippine Sea. The province was created and named for Queen Isabella II of Spain in 1856. The economy depends on the agricultural production of the valley of the Cagayan River (*q.v.*). The province is one of the rice granaries of the Philippines, and it is known for the fine quality of its tobacco. The main towns include Ilagan (the provincial capital), Cabagan, Tumauini, Cauayan, and San Agustin. There is a technological institute in Cabagan and an agricultural college in Echaque. Fuyot Hot Spring National Park, a 2,024-ac (819-ha) recreational area, is in Ilagan. Most of the inhabitants are Ilocanos and Ibanags. During the 1960s and 1970s Isabela became a stronghold of Filipino Communists. Pop. (2000 prelim.) 1,277,000.

Isabela Island, largest (area 2,249 sq mi [5,825 sq km]) of the Ecuadorian Galápagos Islands, in the eastern Pacific Ocean 600 mi (965 km) west of Ecuador. Named in the 17th century for George Monck, duke of Albemarle, only its northern tip, cut by the Equator, is now known as Albemarle. Five volcanic craters reaching an altitude of 5,540 ft (1,689 m), two of which are still active, dominate the island's centre; hills covered with forests, vines, and orchids separate them from the sandy coastline. Unique to the island are flightless cormorants and penguins. There are also large numbers of land iguanas and a flamingo colony. Villamil, the main port on the southern coast, handles the island's

Giant land tortoises gathered in a rain pond in the Caldera of Alcedo on Isabela Island, Galápagos Islands
Tui De Roy Moore

products, including potatoes, cattle, wild hogs, reptile hides, and fish. Pop. (1990 est.) 901.

Isabella (personal name): *see under* Elizabeth, except as below.

Isabella, name of rulers grouped below by country and indicated by the symbol •.

Spanish ..... Isabel

Jerusalem

• **Isabella I,** byname ISABELLA OF ANJOU, French ISABELLE D'ANJOU (b. 1172—d. 1205), queen of Jerusalem (1192–1205).

Daughter of Almaric I of Jerusalem and Mary Comnenus, she succeeded to the throne of Jerusalem after the death of her sister, Sibyl (Sibylle), in 1190 and the deposition of Sibyl's husband and consort in 1192.

First married to Humphrey IV, lord of Toron, she was separated from her effeminate and irresponsible husband in order to be married to Conrad of Montferrat, lord of Tyre, and, after his assassination (1192), to Henry of Troyes (d. 1197). Her fourth husband was Almaric II, king of Cyprus.

Isabella's daughter Mary (Marie) of Montferrat, succeeded her as queen and was married to John of Brienne (1210).

• **Isabella II,** original name YOLANDE DE BRIENNE (b. 1212—d. May 1, 1228, Palermo), queen of the Latin kingdom of Jerusalem (1212–28) and consort of the Holy Roman emperor Frederick II.

The daughter of John of Brienne and Mary (Marie) of Montferrat, Isabella inherited the throne on her mother's death in 1212, but her father ruled as regent and guardian and even continued to style himself as king (though he had been legally only king consort).

In 1225 Isabella married the emperor Frederick II, the Pope hoping by this bond to attach the Emperor firmly to the crusade in the Holy Land. Immediately upon his marriage, Frederick demanded all the rights of sovereignty in the kingdom of Jerusalem, which he claimed to exercise in his wife's name. His action led to difficulties with John of Brienne, who did not relish the loss of his position. When Isabella died in 1228 after the birth of a son, Conrad, her husband Frederick then continued to rule, though not without opposition.

Spain

• **Isabella I,** byname ISABELLA THE CATHOLIC, Spanish ISABEL LA CATÓLICA (b. April 22, 1451, Madrigal de las Altas Torres, Castile—d. Nov. 26, 1504, Medina del Campo, Spain), queen of Castile (1474–1504) and of Aragon (1479–1504), ruling the two kingdoms jointly from 1479 with her husband, Ferdinand II of Aragon (Ferdinand V of Castile). During their rule there were effected the permanent union of Spain and the beginning of an overseas empire in the New World, discovered by Christopher Columbus under Isabella's sponsorship.

Early life. Isabella was the daughter of John II of Castile and of his second wife, Isabella of Portugal. Three years after her birth her half brother became king as Henry IV. Despite the fact that she had a younger brother, Alfonso,

Isabella I, portrait by an unknown artist; in the Real Academia de la Historia, Madrid
Archivo Mas, Barcelona

and that her early years were spent quietly with her mother at Arévalo, Isabella was soon drawn into Castilian politics. She was brought to court when she was 13 in order to be under the King's eye. At first the opposition to Henry IV gathered round Alfonso, but when the latter died in July 1468, the rebellious magnates naturally turned to Isabella. She did not, however, play the role thus designed for her, and the fruit of her wisdom was recognition as his heiress by Henry IV at the agreement known as the Accord of Toros de Guisando (Sept. 19, 1468).

As heiress of Castile, the question of Isabella's future marriage became a matter of increasing diplomatic activity at home and abroad. Portugal, Aragon, and France each put forward a marriage candidate. Henry seems to have wanted his half sister to marry Afonso V, king of Portugal. As between the Portuguese and Aragonese candidates, she herself, no doubt assisted in her decision by her small group of councillors, came down in favour of Ferdinand of Aragon. A third suitor, the French duc de Guiènne, was sidestepped, and without Henry's approval she married Ferdinand in October 1469 in the palace of Juan de Vivero, at Valladolid. The prospect of an Aragonese consort led to the development of an anti-Aragonese party that put forward the claims of a rival heiress, Henry's daughter Joan, known as la Beltraneja by those who believed that her true father was Beltrán de la Cueva, duque de Albuquerque. The King encouraged this group by going back on the accord of 1468 on the grounds that Isabella had shown disobedience to the crown in marrying Ferdinand without the royal consent. He now rejected Isabella's claim to the throne and preferred that of Joan, for whom he sought the hand of the Duc de Guiènne. Though Isabella and Henry were to some extent reconciled, the long-threatened war of succession at once broke out when the King died in 1474.

Reign. Isabella was at the time in Segovia, which was secured for her claim. She was supported by an important group of Castilian nobles, including Cardinal Mendoza, the constable of Castile (a Velasco), and the Admiral (an Enríquez), who was related to Ferdinand's mother. The opposing faction, which put forward the counterclaims of Joan, included the Archbishop of Toledo; a former supporter, the master of Calatrava (an influential military order); and the powerful young marqués de Villena. They were supported by Afonso V of Portugal, who hastened to invade Castile and there betrothed himself to Joan. The first four years of Isabella's reign were thus occupied by a civil war, which ended in defeat for her Castilian opponents and for the Portuguese king (Feb. 24, 1479). Upon the death of John II of Aragon in the same year, the kingdoms of Castile and Aragon came together in the persons of their rulers.

Spain had emerged as a country. But it was to be long before this personal union would lead to effective political unification. Ferdinand, indeed, in his first will (1475) made Isabella his heir in Aragon and openly declared the advantages his subjects would derive from the union with Castile. But each kingdom continued to be governed according to its own institutions. The two sovereigns were certainly united in aiming to end the long process of *Reconquista* by taking over the last Muslim stronghold in Spain—the Kingdom of Granada. In the event, however, the conquest (which began in 1482) proved difficult and drawn out, and it strained the finances of Castile to the utmost. Although some of the features of the campaign were medieval (like the order of battle), others were novel. Isabella took a close interest in the conduct of the war and seems to have been responsible for improved methods of supply and for the establishment of a military hospital. In 1491 she and Ferdinand set up a forward headquarters at Santa Fe, close to their ultimate objective, and there they stayed until Granada fell (Jan. 2, 1492).

While she was at Santa Fe another event with which the Queen was to become personally associated was in the making, for Columbus visited her there to enlist support for the voyage that was to result in the European settlement of America. Although the story of her offering to pledge her jewels in order to help finance the expedition cannot be accepted, and Columbus secured only limited financial support from her, Isabella and her councillors must receive credit for making the decision to approve the momentous voyage. The terms on which the expedition was to set out to discover a new route to the Indies were drawn up on April 17, 1492. The New World that was discovered as a result of that decision was, with papal confirmation, annexed to the crown of Castile, in accordance with existing practice in regard to such previous Atlantic discoveries as the Canary Islands.

The Queen and her advisers hardly needed Columbus to remind them of the opportunity now offered for the spreading of Christianity. Yet, the unexpected discoveries quickly brought fresh problems to Isabella, not the least of which was the relationship between the newly discovered "Indians" and the crown of Castile. The Queen and her councillors were more ready to recognize the rights of the Indians than was Columbus; she ordered some of those he had brought back as slaves to be released. The Queen was still concerned with these problems when she died in 1504.

Meanwhile, in 1480 the Inquisition had been set up in Andalusia. There is little doubt that this represented the culmination of a long and popular movement against non-Christians and doubtful converts, which had manifested itself frequently in the late Middle Ages in Castile. The expulsion of those Jews who refused conversion was the logical result of the establishment of the Inquisition. Yet, however meritorious the expulsion may have seemed at the time in order to achieve greater religious and political unity, judged by its economic consequences alone, the loss of this valuable element in Spanish society must have been a serious mistake.

It is difficult to disentangle Isabella's personal responsibility for the achievements of her reign from those of Ferdinand. But, undoubtedly, she played a large part in setting up the court as a centre of influence. With her blue eyes, her fair or chestnut hair, and wearing jewels and magnificent dresses, she must have made a striking figure. At the same time display was matched with religious feeling. Her choice of spiritual advisers brought to the fore such different and remarkable men as Hernando de Talavera and Cardinal Cisneros. A policy of reforming the Spanish churches had begun early in the 15th century. But the movement gathered momentum only under Isabella and Talavera. When in 1492 Talavera became archbishop of Granada, his place at the Queen's side was taken by Cisneros, for whom the monarchs secured the crucial position of archbishop of Toledo in 1495. The monarchs were interested in the reform of the secular clergy and still more in that of the orders of monks, friars, and nuns; Isabella took a particular interest in the reform of the Poor Clares. Although when she died there was still much to be done, the rulers and Cisneros together had gone far toward achieving their goals.

Though intensely pious and orthodox in her beliefs and though granted with Ferdinand the title of the "Catholic Kings" by Pope Alexander VI, Isabella could be both imperious and pertinacious in her dealings with the papacy. This was particularly true when she thought the Pope was making bad appointments to Spanish benefices or in any way encroaching on the customary rights of the crown over the Spanish churches. For the vacant see of Cuenca in 1478, for instance, she rejected the Italian cardinal appointed by the Pope, who four years later accepted her alternative Spanish candidate. Subsequently, she successfully rejected the suggestion that the Pope's nephew should become archbishop of Seville. In seeking to control appointments to Castilian sees, the Queen was not simply inspired by national sentiments. She also sought candidates of high standards; judged by her choices of men such as Talavera and Cisneros, Isabella was, indeed, remarkably effective in achieving her objective.

Isabella was almost as interested in education as she was in religion. After she reached the age of 30, she set herself the task of acquiring proficiency in Latin and succeeded in her aim. At court she encouraged such notable scholars as Pietro Martire d'Anghiera, whom she set up as the head of a new palace school for the sons of the nobility. Naturally, many of the outstanding literary works of her reign, such as Antonio de Nebrija's *Gramática Castellana* (1492; "Castilian Grammar"), were dedicated to her. She was also the patron of Spanish and Flemish artists; part of her extensive collection of pictures survives.

The last decade of her reign took place against a background of family sorrows brought about by the deaths of her only son and heir, Juan (1497), of her daughter Isabella, queen of Portugal, in childbirth (1498), and of her grandchild Miguel (1500), who might have brought about a personal union between Spain and Portugal. Instead, her daughter Joan, wife of Philip I and mother of the Holy Roman emperor Charles V, became the heiress of Castile; but this offered little comfort to the Queen because Joan had already, by 1501, shown signs of the mental imbalance that would later earn her the title of "the Mad."

One of the achievements of Isabella's last decade was undoubtedly the success with which the Catholic Kings, acting on her initiative, extended their authority over the military orders of Alcántara, Calatrava, and Santiago, thus giving the crown control over their vast property and patronage. These orders had been for too long exploited by the nobility and were the subject of intense rivalry among those who sought to be elected master of one or other of them. In 1487 Ferdinand became grand master of Calatrava, and by 1499 he had acquired the grand masterships of Alcántara and Santiago. With the capture of Granada, the main work of the orders had been done, and a process that envisaged their ultimate absorption into the lands of the crown was logical and sensible.

Assessment. Good sense and statesmanship were equally reflected in Isabella's will and codicil. Because she left no memoirs, her will is in many ways the most reliable picture of her. In it she sums up her aspirations and her awareness of how much she and Ferdinand had been unable to do. With prudence she comments on the basis of her political program—the unity of the states of the Iberian Peninsula, the maintenance of control over the Strait of Gibraltar, a policy of expansion into Muslim North Africa, of just rule for the Indians of the New World, and of reform in the church at home. If the overall impression is inevitably piecemeal, it is also clear that she gave to her successors an exceptional document. It assures scholars that, in allotting to Isabella the foremost place among their rulers, Spaniards do not misjudge this remarkable woman. (J.R.L.H.)

BIBLIOGRAPHY. The standard biography in English remains W.H. Prescott, *History of the Reign of Ferdinand and Isabella, the Catholic* (1838; rev. ed. by J.H.F. Kirk, 1908). Though antiquated it is reasonably reliable. A more recent biography is Felipe Fernandez-Armesto, *Ferdinand and Isabella* (1975). There are good modern summaries of the reign by J.M. Batista i Roca in *The New Cambridge Modern History,* vol. 1 (1957); and J.H. Elliot in *Imperial Spain, 1469–1716* (1963).

• **Isabella II** (b. Oct. 10, 1830, Madrid—d. April 9, 1904, Paris), queen of Spain (1833–68) whose troubled reign was marked by political instability and the rule of military politicians. Isabella's failure to respond to growing demands for a more progressive regime, her questionable private life, and her political irresponsibility contributed to the decline in monarchical strength and prestige that led to her deposition in the Revolution of 1868.

The elder daughter of Ferdinand VII by his fourth wife, María Cristina, Isabella was proclaimed queen on her father's death in 1833. Her right to succeed to the throne was disputed by supporters of her uncle, Don Carlos, and her accession precipitated civil war (First Carlist War, 1833–39). During Isabella's minority (1833–43), her mother and Gen. Baldomero Espartero, a hero of the civil war, acted successively as regents. In 1843 Espartero was despised by military officers and Isabella was declared of age.
