1

With a marker, draw a big rectangle on one side of a water bottle.

2

3

Repeat the above steps on the rest of the empty water bottles.

4

The plunger is the stand for the waterfall. Find a spot on the plunger about five inches from the bottom. Angle the bottle downward so water can flow out of it.

6

Place a bowl where the water will pour out.

7

The next bottle will go above the first bottle. Make sure it's aiming into the first bottle so the water flows from one bottle to another. Clip the bottle and duct tape it into place onto the plunger handle.

5

Clip the binder clip onto the bottle and use duct tape to attach one of the binder clip arms to the plunger handle.

TIP: If you don't like where you've put your bottle, you can just unclip your bottle and reposition it, instead of taking the binder clip off of the handle.

8

Add the third bottle above the second bottle. Again, make sure it's aiming into the second bottle. Clip the bottle and duct tape it into place. Repeat this as many times as you can until you've run out of room on the plunger handle.

9

Time to test the fountain! Pour some water into the top bottle. If the water spills anywhere, just adjust the position of the bottles and try again.

TIP: Place an aluminum pie plate underneath your fountain while you're testing it to catch any spills.

10

Once everything is working, go ahead and decorate it. You can use more recycled bottles, hangers or whatever you like!

Wow! An amazing water bottle waterfall. Now, that's Artzooka!
