

## Magic Light Gloves

### check list:

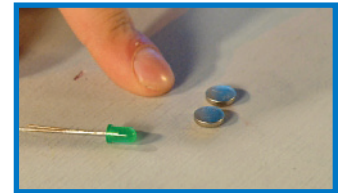

1. LED light that doesn't flash
2. two standard one-and-a-half volt batteries
3. masking tape
4. old pair of gloves

Before you begin, let's make sure that your LED light is similar to the one we're going to use. You'll need a non flashing LED light that has wires coming out of the back.

It looks like this in the package:

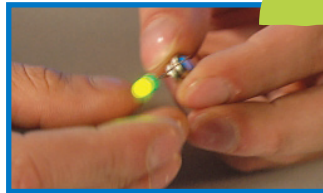

You'll also need two standard one-and-a-half volt batteries.

# 1

Take a look at the batteries: there's a positive side (with a + sign) and negative side (with a - sign). Stack the batteries, making sure that the positive and negative sides are together.

# 2

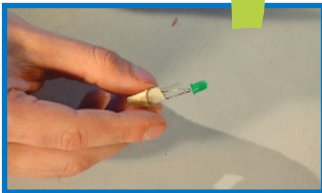

Put one wire from the LED light on one side of the batteries and the other wire on the other side. The LED will light up!

# 3

Now that you know how it works, tape the batteries and the LED light together with masking tape. Tape one wire securely, but don't tape the other wire as tight. You will want a small gap so when you press down on the wire, it will light up. And when you let go, the light will go out.

# 4

If you have any extra wire, just fold it up and tape it so it doesn't poke your finger.

# 5

Poke the light through one of the fingertips of the glove. If the light doesn't poke through the glove easy, you might need to cut a small hole in the fingertip.

# 6

Repeat the above steps to make another magic light glove.

# 7

Put the gloves on your hands, and when you press down on tip of the glove, the LED light will light up. When you stop pressing, the light will go out.

**Spectacular! Now you have everything you need to put on an amazing Artzooka magic light show.**
